Unity in Attack

69296

IF unity in military collaboration now and unity in political collaboration after victory were enough, the United Nations would have solid grounds for satisfaction. They are not enough. Between the military operations of to-day and future victory lies an enormous enterprise of reconquest, the reoccupation of Europe. As the first essay in the technique of reoccupation, the entry into North Africa, has shown, this task is at once political and military. Political agreement cannot be postponed until victory. It must begin now. If it is neglected or bungled, the gap between military victory in battle and political victory in creating a lasting peace will not be filled. Bad political arrangements made on the spur of the military moment can crystallise almost immediately into claims and counterclaims and vested interests which effectively frustrate the final settlement. Disagreement between the Allies over these arrangements can dissipate the will to collaborate further before the peace negotiations even begin. It should be graven on the heart of each Allied statesman that to accompany effective military action with ineffective political action is in the long run, even if not in the short, to frustrate the end for which the military action was taken. If people were sceptical on this point before the occupation of French North Africa, the unfortunate course of events there should have convinced them now. Rightly interpreted, the North African muddle can guide the Allied leaders towards the kind of decisions they must take. True, these cover the most delicate problems raised by the Grand Alliance. They posit issues on which

opinion is divided. Many are highly controversial. But North Africa has shown what happens when issues of this sort are not faced directly. It would be absolutely fatal if, for their heraldic symbol, the United Nations were to adopt an ostrich dormant in a heap of sand.

The first principle of Allied political action must be broad agreement between the Allies, and particularly—in Europe—between the three Allies, Britain, Soviet Russia and the United States. This was absent in the North African venture. The British Government specifically dissociated itself from many of the arrangements. The Soviet Union asked questions and otherwise maintained a discreet silence. If it were not still possible to retrieve the situation, the unfortunate precedent would have been established that the invading general, of whatever Allied nation, determines both with whom and on what terms the armies of liberation will deal. The dangers of this precedent to a unified European settlement are obvious. The reoccupation of Europe may well be a converging movement from all three sides of Hitler's fortress. It is essential that as the English-speaking armies advance from the south and west and the Russian armies from the east, the terms of reoccupation should have been discussed and agreed between them in advance. If the virtual exclusion of Britain and Russia from the first North African arrangements were to preface the exclusion of the United States and Russia from the reoccupation of the western fringe or of Britain and the United States from the eastern marches, or to herald quarrelling among

all three when the southern underside is pierced, then not only Gaul but all Europe, and the Grand Alliance itself, might end by being divided into three parts. If, on the other hand, agreement is reached, the concerted action of the occupying authorities, in such matters as immediate physical relief, medical attention, the control of transport, and the preliminary steps in industrial and agricultural revival could pave the way to the kind of international framework without which the national identity of the European peoples can hardly be maintained.

The first particular problem upon which the Allies must agree is their relations with collaborationists—not to give them the severer title of quisings. As the tide of victory turns, the opportunists will make desperate efforts to switch their "loyalty." There are arguments for making use of them. It is contended that, since a great many of them are in charge of the administrative machine, to oust them would mean complete collapse behind the lines at a time when the Allied armies are fully occupied. It is also argued that, after two years of German propaganda, the enslaved peoples have caught such a profound distrust of British, American and Soviet "imperialism" that, if the Allies institute martial law or take over civil government themselves, or bring in with them governors of the nation concerned, the people will suffer a profound reaction.

These arguments must be carefully considered. But are they really valid? North Africa is a rather special case, for there had been no complete German occupation and the Vichy regime functioned there in quasi-independence. Yet even in North Africa, the policy of using collaborationists has hardly proved its worth. To rely upon a bureaucracy which has submitted for two years to Nazi domination is to rely upon the weakest, and the most opportunist, section of the community. It is to perpetuate the influence of men, many of whom were responsible for the initial debacle. The maintenance of the German civil service by the democratic Weimar regime after the last war was similarly defended on the plea of avoiding a "dangerous collapse." The analogy bodes no good. By putting a premium on collaboration, the men of good will, who have kept up the good fight, are agonised and betrayed in what should be their finest hour. It is not impossible to know who are the men of good will. Hitler has helped by arresting them in herds. There is hardly a town or a village in Europe in which some past administrator has not paid the price of loyalty with imprisonment. The undergrounds exist. Contact has been established with many of them. It makes nonsense of their struggle to exclude them from influence in the day of liberation. It is true that they are unknown quantities. But the collaborationists are known quantities, known for their willingness to perpetuate the slavery of Europe. As for the argument of "imperialism," surely it underestimates the desire of Europe's ordinary men and women to be rid of Hitler's imperialism, to be fed and clothed, to be quit of forced labour and the Gestapo.

The chief reason for using an administrative machine dominated by collaborationists is the lack of any other method for maintaining some framework of order. This lack exists; but it exists only because the Allies have not included it among their preparations for war. Hitler did not once invade a country without the most minute arrangements for its civil administration. German soldiers, quisings, near-collaborationists—all were allotted in advance to their particular tasks. It has taken the Allies a long time to learn the lessons of Hitler's military warfare. The lessons of his political warfare are still largely unlearned. The occupation and administration of territory is a highly skilled operation. The Allies need an immediate and concerted effort to pick out and train from among themselves and the European peoples concerned the civil army of reoccupation.

The second principle on which agreement must be reached concerns the relations between the exiled Governments and the leaders, groups and ordinary people who have maintained the fight inside Europe. Here again, North Africa presents a special and more difficult version

of the problem raised by *émigré* governments. General de Gaulle's National Committee has not the legal continuity of some of the other Governments, and is not officially recognised as a Government. Yet the danger of stumbling into a situation in which each territory has a plurality of governments is completely illustrated by North Africa. One may remain in Britain, another may be set up by the invading general, which may or may not represent the genuine forces of liberation within the country concerned—in which case the undergrounds may establish one of their own. It might even be possible to reach a situation in which the three great Allies were each backing a rival government for the same area. A situation of this sort has been faintly foreshadowed in colonial France, and one would need to be a confirmed optimist to suppose that it could not be repeated in an aggravated form in, say, metropolitan France or Yugoslavia.

The only current solution is the establishment of a single exile authority for each state, and the recognition by that authority that it is provisional. General de Gaulle has given the formula in his proposal for a unified French authority,

a temporary . . . central power, founded on national union, inspired by the spirit of war and of liberation, with laws which are the laws of the Republic, to last until such time as the nation has made known her will.

No government in exile can now be fully representative of a nation that has undergone a Nazi occupation. They must return as governments, but as governments approaching the term of their mandate. It is a great thing to preserve continuity. It is possible that the peoples will turn to their exiled leaders as they turned to them after the last war. But they must be able to express their will.

The third principle on which agreement must be sought concerns this freedom of choice. It is admittedly the most difficult. It cannot on that account be most completely shelved. This war is a war of national liberation. It is also an ideological war. The Allies do not see eye to eye on ideology nor on social policy; but there are areas in which they do agree. These areas should be established and, as far as possible, the differences mitigated in advance. If there are certain social groups, forms and traditions in Europe which have played an outstanding part in the preparations for war and in collaboration during the war, it is desirable in the interests of lasting peace to remove their predominant influence. Various aspects of the structure of landed property in Germany and Hungary, for example, the concentration of European industrial ownership and strength in Germany, German economic penetration (which is discussed on page 47), are all fit subjects for agreement in advance of occupation and victory. Similarly, the guarantees covering the right "to make known her will"; the minimum terms necessary to ensure the freedom for which the Allies say they fight—the establishment of the rule of law, an end to arbitrary arrest, secret police, espionage, the concentration camp; the reality behind the guarantee of freedom of worship and of speech—are all questions which, however delicate, will not grow less delicate by being obstinately disregarded. They have arisen in North Africa, over the political record of Darlan, over the arbitrary arrests of Allied sympathisers, over the problem of the amnesty of prisoners. They will arise again, and though differences between the Allies are inevitable, they must be minimised by frank discussion.

In North Africa itself, the Allies have a new chance. General Giraud is uncompromised on the chief issue; he has had no truck with the enemy—and it seems possible that some agreement may be reached between the Fighting French National Committee and his Imperial Council. Mr Harold Macmillan has arrived in North Africa and now has the opportunity of influencing the decisions of General Eisenhower—and Mr. Murphy. But a real improvement cannot depend upon local conditions only. North Africa is not an isolated case. It can be patched up, perhaps, but so long as the policy it represents remains unchanged, there are other and far severer crises ahead.

The Third Colonial System

MORE and more, as reconstruction at home and abroad is discussed, does it become apparent that among men of good will there is a wide measure of agreement on objectives. It is on the ways and means of achieving them that dissension arises, on the programme for translating principles into practice. Colonial policy is in the same position. To the old declaration that each colony has the opportunity to become self-governing has recently been added the promise to raise the colonies' standard of living; but on how to realise both these aims there is far less agreement. There are, of course, certain basic principles that are generally agreed: that the colonial peoples should take an increasingly important share in the government and administration of their colonies; that far more attention should be paid to education, especially technical education; that colonies should not have to pay their own way; and that their economies should be more broadly based.

It is also true that, since the outbreak of war, progress has been made in applying these agreed principles. The "statement of policy on colonial development and welfare," presented to Parliament in February, 1940, recognised that

. . . many colonies cannot finance out of their own resources the research and survey work, the schemes of major capital enterprise, and the expansion of administrative or technical staffs which are necessary for their full and vigorous development,

and proposed that sums up to £5½ millions a year should be available from the Imperial Exchequer for these purposes and for welfare, specifically stating that colonies which received such help should not be subject to any system of financial control as is associated with grants-in-aid. Already before the war, colonial governments were urged to make their colonies as self-supporting as possible in food supplies; and since 1939 necessity has hastened and intensified the process. Nor has the political side been neglected. Last summer, two Africans were appointed to the Gold Coast Administrative Service, and, later, African members were appointed to the Governor's Executive Council in the Gold Coast and Nigeria. In the West Indies, constitutional reform has become a burning topic. It is foolish to deny that in the last two or three years there has been an almost revolutionary change in colonial policy.

Any denial, in fact, would probably come from the Colonial Office itself. In the recent House of Lords debate, Lord Cranborne stressed the evolutionary nature of the British Empire. Any reforms that have taken place in recent years he would regard merely as steps on a

straight and virtually unending path; and it would certainly be the gravest injustice to the long years of patient, and sometimes heartbreaking, efforts of colonial officials if the idea were fostered that it was only in February, 1940, that the need to raise colonial standards of living was realised. Nevertheless, the statement of policy that was then made was such a big step forward that it is impossible not to regard it as marking the clear emergence of a new colonial system—the age of development and welfare, superseding the age of self-support which itself followed the age of tribute. Colonial officials have been heartbroken because they have seen the most urgent schemes held up for lack of funds inside the colony itself. The wish to develop was there, but the means were lacking. Now, both should be available.

If, then, it is agreed that the relations between Great Britain and its colonial empire have entered a new and progressive era, it may be asked why there is such disquiet about colonial policy at home and abroad. The answer may partly be found in the impatience aroused when delay is always justified by reasons of history. More important is the fact that the fundamental questions have not even been faced. The colonies are now allowed to unbalance their budgets, and the deficit will be made up by the United Kingdom taxpayer. But it is still not certain that the Colonial Office sees it as an economic matter and not a financial one. Treasury-mindedness is still there, although the Treasury reins have been discarded. Financial assistance may be given, freely and ungrudgingly, but financial assistance alone will not increase their national income—and therefore their standard of living.

It is possibly with this in mind that the creation of a Colonial Development Board has been proposed in Parliament and the press in recent months. As outlined in the House of Commons last June, such a Board would consist of full-time members for economy and finance, health, education, housing, supply, power and transport; it would also be responsible for spending the moneys voted by Parliament for colonial development and welfare. Development from without could probably be easily imposed upon the colonies by a super public works department of this sort, administered regionally. But if development is to be considered from the standpoint of partnership, which has now officially replaced trusteeship as a definition of the relations between Britain and the colonies, a Colonial Development Board, as suggested, would be an aberration. It could only work on partnership lines if it were to rival the Colonial Office itself.

Unfortunately, to gain the co-operation of the colonies in development must take much time and add enormously

EQUITY & LAW

LIFE ASSURANCE SOCIETY

Established 1844

Wartime Service

● In view of the absence of staff on War duties it has become necessary as a temporary measure to close certain of the Society's Branch Offices

● Arrangements have been made to ensure that the Society's policy-holders and annuitants will receive the best possible wartime service.

Head Office: 163/4, STRAND, LONDON, W.C.2. Telephone: TEMple Bar 0381
(temporarily transferred from 20, Lincoln's Inn Fields)

to the difficulties. Professor Hancock tells* how the mixed farmers in North Nigeria have had to be given advances of about £9 per head to buy their oxen and ploughs, and so on. Interest has to be charged, if "certain failure" is to be avoided. But Mohammedan law forbids interest; consequently, after consultation between the British administrations and the emirs, a hire purchase scheme was evolved. The British Cotton Growing Association, he also points out, once tried hard to persuade the Tiv people south of the Benue to give up growing benniseed in favour of cotton. Obstinate, they refused—to their great advantage. He tells, too, how the prejudices of the Fulani had to be overcome before inoculation of their cattle against rinderpest could be undertaken. "In British West Africa," he says, "the progress of economic policy, even when it has seemed slow, has sometimes been as fast as the people could bear." No person, with the interests of the colonies really at heart, would have the pace quickened intolerably, but what becomes of "time-schedules" in circumstances such as these?

Similar stories could be told from all over Africa. They underline the difference between development and exploitation. If colonial policy always showed the same disinterestedness, little would be needed at the present time except to urge much more boldness and vision. But there are other stories as well. The reservation of land for Europeans in Kenya and Northern Rhodesia is one. The Ottawa duties, forced upon some colonial legislatures against their wishes, are another. The story of the quotas on Japanese rubber shoes and the prevalence of hook-worm has become a classic example of the subordination of trusteeship to vested interests in Great Britain.

Defenders of the Ottawa duties would point to the advantages which the colonies obtained by securing a preferential market for their own products in Great Britain. But this only points to another question which has not yet been answered—the problem of raw materials. When the Government enters into agreements for restricting commodities—or allows bodies of producers to do so—has it the interests of the colonies concerned at heart, or merely the interests of the companies operating in them? It may well be that colonial labourers will gain security of employment and steady wages from a restriction scheme which maintains prices. It may, on the other hand, be equally possible that restriction schemes, which aim at keeping high-cost producers alive, penalise the colonies by restricting the amount of labour that can be employed to a figure consonant with their production quota. What is wanted is that all factors and interests should be given their due weight.

There is also the question of the distribution of the

* *Survey of British Commonwealth Affairs. Volume II. Problems of Economic Policy 1918-39. Part II.* By W. K. Hancock. Oxford University Press. 355 pages. 16s. net. The book cannot be too warmly recommended for anyone interested in the intricacies of the colonial problem. From a wealth of detailed examples, broad trends are picked out and discussed fully and objectively.

financial gains derived from the natural wealth of the colonies. At present, Great Britain takes a disproportionately large share through taxation and through the dividends received by shareholders—not only of the company directly concerned, but sometimes of a non-operating company to which the former has to pay royalties. It should surely be possible either for the United Kingdom to waive all claims to taxation from companies operating in the colonies, and from their shareholders, or else—if this would be giving a bonus to the latter—simply to hand back to the colony all the money it receives.

It is quite certain, in fact, that this country cannot look upon investment in the colonies as a means of returning immediate and high dividends. Investment must rather be regarded in the Wallace sense, as a means of raising the colonies' standards of living, which will eventually make them expanding markets for the manufactures of Britain and other countries as well. This is the turn which the international side of the dual mandate has taken; it is no longer primarily a matter of developing the resources of the colonies for the benefit of the whole world—which, as interpreted, meant basing their whole economy on one or two export commodities—but of increasing productivity, which experience has shown is more likely to be achieved in secondary and tertiary, rather than primary, production. It has already been shown that social complications will make this a long and slow process in colonies with a primitive population. There are others where the population is ready, and even asking, for change.

There is, perhaps, a tendency among people who realise the new emphasis of the dual mandate to ignore its other aspect—that it is exercised on behalf of the colonies until they are able to govern themselves, with the implication that some day they will be. Possibly, this neglect of political trusteeship is due to the fact that full self-government for many of the colonies is remote, whereas their poverty and ignorance are very present. There is no reason, however, why in the new colonial system there should be no place for political progress. On the contrary, it is probable that this will be more easily achieved under a more diverse economy, with wider opportunities for employment and the exercise of individuality. It follows that the process will involve a considerable modification of indirect rule; on the other hand, the aim of indirect rule—that changes should not be imposed on primitive people, but should be absorbed by them—can also be preserved under industrialisation, if colonial governments take care that manufacturing industries are as far as possible owned and run by the people themselves. In West Africa, the British Government has set itself against the alienation of land to Europeans. It must set itself against the alienation of industry as well. It also follows that whenever and wherever even the smallest opportunity arises to promote, say, an African to an important post or to grant more self-government to a whole colony, it must be immediately and unhesitatingly taken.

The National Budget

THE necessity of fitting the Government's Budget into the wider National Budget, of relating Government expenditure to the National Income, found official recognition barely two years ago. The reason was that rule of thumb methods were no longer adequate to deal efficiently with the rising cost of the war. As a counter-part to the physical allocation of the national resources between Government and civilian requirements, it had become desirable to adopt a method of account, showing, in money terms, the size and distribution of the national income, and capable of being used as an instrument of control. By going one step further and adjusting the figures for alterations in prices, they provide a clue to changes in the "real" size, that is, in the volume of the national income and its expenditure under various headings. In short, the additional information about the

Nation's Budget now renders it possible to walk in daylight where it had previously been necessary to grope in the dark. It has brought the realisation that the nation's surplus or deficit, that is, the rate at which Great Britain adds to or draws upon its stock of capital assets by "investment" or "disinvestment," is more important than the surplus or deficit in the Government's Budget which, until recently, stirred emotions to fever heat.

The latest news of the Government's narrower budget is contained in the returns of revenue and expenditure for the nine months to December, 1942. They are of special interest in view of the further substantial increases budgeted for last April, though they are incomplete in that they do not include Lend-Lease supplies. The figures are summarised at the foot of the next page and given in full on page 57. On the revenue side, the ordinary returns show

a substantial increase over the previous year's corresponding figures, amounting to £545 millions, against £469 millions between April-December, 1940 and 1941. For a real comparison, however, it is necessary to deduct the contribution of the Canadian Government, which brings the increase down to £320 millions, £149 millions less than a year ago. Nevertheless, the increase in revenue during the first nine months of the current financial year has almost reached the estimated expansion for the whole year. Clearly, the Government has again underestimated the yield, and again under the heading of customs and excise receipts; the one already exceeds the estimate by £12.2 millions and the other by £33.6 millions. The increase in the duties on spirits, beer, tobacco and, possibly, on entertainments, as well as, presumably, the advance of the purchase tax on luxuries and conventional goods, from silks to jewellery, gramophones and perfumery do not appear to have had the expected deterrent effect on purchases. As computed, miscellaneous receipts, instead of showing a decline, have registered an increase. Motor vehicle duties, on the other hand, have fallen more than expected; perhaps the Treasury did not envisage the need for quite as severe a cut in supplies of petrol and tyres. On direct taxation little comment is required at this stage, except that E.P.T. has not come in as well as a year ago; the income tax collector reaps his biggest harvest in the last quarter of the financial year.

In a narrow sense, the underestimation of revenue has been fortunate, for the increase in ordinary expenditure during April-December, 1942, has exceeded the year's estimated increase by £40 millions. The two under-estimates are not necessarily inconsistent. The rise in wages, which has made for buoyancy in revenue, must also have been reflected in the prices of some of the things which the Government buys. The trend of the cost of the Supply Services remains decidedly upwards; it rose from £1,198 millions in April-June, 1942, to £1,229 millions in July-September and £1,364 millions in October-December, against £1,168 millions during the last quarter of 1941. Total Government expenditure since the beginning of the war is now up to £14,000 millions; three-sevenths of this total has been met by revenue and the remainder by borrowing. The proportion of expenditure covered by revenue has actually risen as expenditure has increased, from 36.5 per cent in the year 1940 to 38.3 per cent in 1941 and 42.4 per cent in the past year.

The more comprehensive national returns of income and expenditure in 1942, as distinct from the Government returns, are not yet available. Since they will presumably not be published before April, an attempt must be made to fill the gap by estimates, or, more truthfully, by a certain amount of reasonable guesswork. The adoption of America's practice of issuing quarterly returns would avoid this need. The results are believed to be sufficiently near the truth to be of assistance in an attempt to assess the wider implications of the effect of the war upon Britain's economy. The following table (the first three columns of figures are taken from the White Paper on the National Income and Expenditure, Cmd. 6347)

shows the national income at factor cost and at market prices, as well as national expenditure and the amount by which it fell below or exceeded the current income at market prices—

NATIONAL INCOME AND EXPENDITURE
(£ Millions)

	1938	1940	1941	1942(a)
Net National Income at Factor Cost	4,595	5,585	6,338	6,950
Indirect Taxes, Rates, etc.	645	920	1,242	1,420
National Income at Market Prices	5,240	6,505	7,580	8,370
Government Expenditure (b)	848	3,126	4,321	4,950
Consumption	4,041	4,424	4,550	4,690(c)
Total Expenditure	4,889	7,550	8,871	9,640

Investment and Disinvestment - 351 - 1,045 - 1,291 - 1,270

(a) Estimated. (b) Omitting debt interest, old-age pensions and similar transfer payments. (c) Obtained by subtraction.

The national income at factor cost has shown a further substantial increase, though the rise appears to have been somewhat less marked than in 1941. Moreover, the outlay for consumption at market prices, too, has shown a further increase, in spite of the growth in Government expenditure. Net disinvestment was probably slightly smaller than in 1941, but still large—though it must be remembered that, in so far as Government expenditure is concerned, some of the assets created may not have lost their economic value after the war.

Since the estimates of the national income and expenditure are based on current prices, they do not show changes in "real" or volume terms. There can be little doubt, however, that, as in earlier years, the figures for 1942 are inflated by a rise in prices. The estimated increase in the national income at factor cost (that is, exclusive of indirect taxes, rates, etc.) amounts to some ten per cent. It would be surprising, however, if the "real" national income had risen by even half as much. The number of workers insured against unemployment showed only a slight rise during the past year, though, as the results of the Ministry of Labour's latest inquiry into earnings reveals, actual earnings have increased by more than wage rates, partly a reflection of an increase in the output of piece-workers, who now form a substantial proportion of the total.

The main question which will have to be answered by the Chancellor of the Exchequer next April is how the still growing cost of the war is to be met, that is, to what extent it is still possible to draw on the stock of assets at home and abroad and to cut down civilian consumption. Since both expedients have already been applied almost to the limit, care will be needed to avoid either injuring the people's health or allowing essential plant and buildings to fall into disrepair. Pushed beyond the limit the reduction in consumption, and disinvestment at home, might have the effect of reducing rather than of increasing production. Another problem is that of inflation. It will be interesting to see by what measures Sir Kingsley Wood proposes to curb the upward trend.

REVENUE (£ Millions)

	Year's Receipts			Nine Months' Receipts		
	Actual 1941-42	Estimated 1942-43	Estimated Inc. (+) or Dec. (-)	To Dec. 31, 1941	To Dec. 31, 1942	Inc. (+) or Dec. (-)
Income Tax	769.7	913.0	+ 143.3	326.9	407.5	+ 80.6

NOTES OF THE WEEK

The Russian Advance

The past week's fighting has brought the Russians substantial successes on three sectors. In the north, Velikiye Luki has been captured. This is the first big "hedgehog" to be wrested from the enemy during the present campaign. Velikiye Luki is a medium-sized town—it had about 90,000 inhabitants before the war—and in all Russia's wars it has been an important key position. A Russian advance in this sector would imperil the enemy's supply lines in the north and outflank the German forces on the Smolensk-Viazma road to the south; but, unless supported by a corresponding advance from the Rzhev area, it may expose the Russians themselves to the dangers which threaten any thin wedge driven too far into an enemy's rear. On the Don, the advance along the Voronezh-Rostov railway seems to have been halted. Millerovo, the important railway junction on the way to Rostov, has so far withstood the Russian attacks. Instead, a new advance has been made from the north-east, along the Stalingrad-Rostov line. Further to the south, the slopes of the Urgeni hills have been cleared of the enemy. The alternative thrusts from the north and east have brought the danger to Rostov much nearer; and it seems likely that this winter will see another battle of Rostov, the fourth one in the course of the war. The most puzzling feature of the campaign here is the position of the encircled German forces in Stalingrad. The fact that they have been able to hold out till now illustrates how obsolete the traditional notions of investment and siege have become. In the Caucasus, the Russians have successfully cut the southern tip of the huge German "bag." The capture of Mozdok and Nalchik has been followed up by a pursuit which may throw the Germans back to the Kuma-Kuban line. The week's "sensation" was the announcement that the southern Russian armies have been fighting under the command of General Zhukov, and not, as was generally assumed, under that of Marshal Timoshenko. The latter, it is suggested, was superseded after the fall of Rostov, the town which he had recaptured from the Germans towards the end of 1941. Thus, the last of the three Marshals who were in command of the Russian armies in 1941—Voroshilov, Budyonny, Timoshenko—has passed from the centre of the stage.

Two Months in Tunisia

Two months have elapsed since the first Allied landings were made in North Africa. The campaign in Tunisia has advanced little from the point which it reached after the first week's fighting. The occupation of Algeria was to all intents and purposes completed with the surrender of Bone on November 12th, the fourth day of the campaign. It seemed that Allied troops were in a position to move into Tunisia without any further delay. The distance between Bone and Bizerta is about 120 miles, a distance which armoured forces, meeting no important resistance on their way, might have travelled in one or two days. Instead of a rapid advance, however, the communiqués reveal a lull between November 12th and 16th. On November 15th, a detachment of British parachutists descended on Tunisian soil, and air-reconnoitring revealed intensive military traffic from Italy, Sardinia and Sicily to Tunisia. The first operations of the First Army in Tunisia were reported on November 16th, four days after the occupation of Bone. During those four days, the enemy, already close at hand to the prize, succeeded in establishing his foothold in both Tunis and Bizerta. The prospect of capturing the Tunisian "tip" without actual fighting vanished. The "race for Tunis" was lost before it began. Allied tactics now switched over to encircling movements. A further four days elapsed before the first clash between the First Army and enemy forces took place some 30 miles to the west of Tunis. On both sides, infantry seems to have been engaged in the first encounters; armoured units and aircraft had hardly appeared on the battlefield. The British infantry obtained a degree of superiority which allowed it to move forward slowly; and during the last ten days of November it advanced to a point only

14 miles to the west of Tunis and captured Djedeida on the Tunis-Bizerta railway.

The enemy was in the meantime pushing in reinforcements to his Tunisian bridgeheads. In spite of very effective interference by Allied submarines and aircraft, he succeeded in ferrying over troops at the rate of perhaps a thousand or so a day. More important, at least six large airfields around Bizerta and Tunis were now at his disposal, while General Anderson's army possessed no bases for short-range fighters. Both sides were building up their strength; and the Germans seem to have obtained an advantage. On December 4th and 5th, they launched an attack on Tebourba and Djedeida. For the first time in the Tunisian campaign, a Panzer division made its appearance. American tanks were quick to follow, but only to follow and not to lead. In the air, too, the German attack obtained some superiority. On December 7th, Tebourba was captured by the enemy; and so was Djedeida. The fighting shifted to the range of hills west of Djedeida and Tebourba and to the railway junction Medjez-el-Bab further to the south. Two German attacks on Medjez-el-Bab on December 6th and 10th failed. Since December 10th, for nearly a month, there has been a lull, with only minor patrol activities. Both sides are again busy building up their reserves, and interfering with one another's supply lines. The lull may soon come to an end; but it is plain now that many more troops and much material may be needed to oust the enemy's seasoned and skilful garrison.

The Test of Battle

The North African campaign has, on the whole, seen the overcoming of the old shortages, inertia and lack of military co-ordination among the Allies. In Tunisia, however, there may perhaps have been some relapse into old failings. There was probably insufficient mobility during the crucial days after the occupation of Bone. It may be argued, too, that there was some tactical light-mindedness in the push to Djedeida before sufficient air and armour protection was secured. Some experts would add the disregard of anti-aircraft weapons to the list of errors. All the factors in the situation, even on the Allied side, are not known; and, mistakes or no mistakes, there is no ground for excessive gloom, if old lessons from past mistakes are remembered and applied quickly enough. The Allied Command in North Africa has still, in many respects, a tremendous advantage over the enemy. It possesses enormous elbow room for deployment and freedom to concentrate its forces at the decisive points. On the other hand, it is true that the Allies are handicapped by their vast land and sea lines of communication, across dangerous waters, and by the fact that a great part of the Allied troops are only now receiving their baptism of fire, against the enemy's most experienced fighting men. On balance, the advantages of General Eisenhower's position outweigh the disadvantages. What gives rise to uneasiness is the possibility that the broad and crucial plan of operations for 1943 may be delayed and even disrupted by further protracted delays in the Tunisian fighting. This is the enemy's hope and intention. General Eisenhower can shatter that hope; but if it is to be done, it were well it were done quickly.

Facts and Efficiency

The first task in war production is to make the right programmes. The second is to see that they are carried out to time. Too often in the past, the programmes made have had only small relation to the size and kind of output achieved. Persistently, an essential link in organisation has been lacking; and it was only last week, with the appointment of Sir Percy Mills to be adviser on the progress of production to Mr Lyttelton, that the need for a continuous

and authoritative surveillance of the execution of programmes was explicitly recognised. When Mr Lyttelton was made Minister of Production, going on for a year ago, he had two main jobs to do, apart from the task of co-ordinating the British and American effort. The first was to weld the programmes of the Supply Departments into a single whole, based upon the nation's available resources and directed precisely towards current military requirements; and the second was to impose upon war industry at every point the highest possible standards of efficiency in management and technique. For both duties, the need to know, from day to day and from week to week, what is going on is imperative; it is only a pity that it has taken nearly a year for the importance of "progressing" to be proclaimed. Sir Percy Mills will be in charge of a progressing Department in Mr Lyttelton's Ministry, which will keep a constant eye on the progress of all supply programmes. The simultaneous appointment of Sir Charles Craven to be industrial adviser reflects the need for greater efficiency in production matters. So far, the appointments are wholly to be welcomed. Whether the men and the methods chosen are the best possible is, perhaps, more open to debate. Apparently, procedure is still to be by committee. Sir Charles Craven will preside at meetings of the executive chiefs of the Supply Departments, and Sir Percy Mills will be called in to advise on interdepartmental production problems. Sir Charles Craven will also be chairman of interdepartmental committees on munition management and labour efficiency, where ideas and information will be exchanged. Sir Percy Mills will be available for these committees too; and, in addition, will remain in charge of the allocation of machine tools "as administered by" the Minister of Production. These new advisers are not after all to be the watchdogs that are wanted, with rights of search and power to act. The official description of their functions as to secure closer inter-departmental "co-ordination" is tepid but true. Moreover, it is explicitly stated that their work will "in no way derogate from the responsibility of the Supply Ministers." Again, it seems the right idea may have been muffled by departmental compromise. The root of the matter is that Mr Lyttelton is not Minister of Production in the full sense of the word. He is hardly even *primus inter pares*, which means that the single central direction of war output, for which a Minister of Production was demanded, is still only partially present.

Lords of Empire

The gap at the Colonial Office has been filled. The Duke of Devonshire becomes Parliamentary Under-Secretary; and his place as Parliamentary Secretary at the India Office is taken by the Earl of Munster. It should be noticed that the Duke has good qualifications for his new post. He was for four years up to May, 1940, Under-Secretary at the Dominions Office; since then, he has been concerned for over two-and-a-half years with India. He is, at least, familiar with the problems of Empire. Nevertheless, the appointment of two peers to fill these imperial posts, placing the Colonies under a Cavendish as well as a Stanley, will evoke some tart comment, at least from across the Atlantic, where the jibe that the British Empire is the preserve of an "effete aristocracy" has been shouted so often that it has now come to be believed. The immediate reason, of course, why these two Under-Secretaryships have been given to peers is the need for a due proportion of Ministerial spokesmen in the Upper House. Moreover, as Lord Toller—*or* was it Lord Mountbatten?—pleaded in "Iolanthe," a peer should not be penalised for the accident of his birth. The Duke is 36; the Earl is only 36. It is abundantly right that youth and merit should be recognised when they occur together. *The Economist* has been criticised for describing Mr Sandys last week as a "fortunate man in being singled out again for office. But the purpose of this comment was not so much to throw doubts on Mr Sandys' abilities, which in the opinion of *ie* are high, as to underline that a young politician is particularly lucky when, for one reason or another, he is singled out and his merits recognised; and the same considerations may well apply to the Duke and the Earl. But it may still be expressed about these appointments to the particular posts at this particular point of time—and tactical discussion. And there are other men—including her peer in the person of Lord Hailey—who would be

regarded by most people as better qualified still to take official responsibility at this crucial stage in Imperial policy.

The Pacific Front

The Inter-State Labour Conference has approved, by 24 votes to 12, Mr Curtin's proposal to send the Australian militia to fight in any territory in the south-west Pacific. The south-west Pacific will be defined for this purpose by the Australian Cabinet; it will not necessarily coincide with the Pacific War Council's definition of the south-west Pacific command. But the decision will presumably mean that, when the necessary legislation has been passed, the militia and the Australian Imperial Force will now be considered as one force for operations in Dutch New Guinea, Timor, the Solomon Islands, Netherlands India and New Zealand. The Conference's decision will strengthen Mr Curtin's position both in his own country and among the other leaders of the United Nations. If his party had refused to support him, he would almost certainly have been compelled to resign. And now that the restriction on sending conscripts out of Australia has been relaxed, Mr Curtin is in a stronger position to press his country's claims in the general strategy of the war. This, in fact, he has already done. On December 31st, he is reported to have said that

Japan must be smashed before she gains overwhelming strength to preserve her conquests. She is building up, not only her capacity to wage war, but also her capacity to resist an offensive.

Australia's feelings in this respect are understandable. In this country, it is difficult not to take it for granted that all efforts must be concentrated on defeating Germany and that the war in the Pacific and China can look after itself. Since, moreover, Allied strategy has already and for some time decided, in the circumstances with unchallengeable wisdom, on "Germany First," Mr Curtin's plea can have no radical effect. But it is as well that the people of this country should realise the cost of this decision. It means that, after the defeat of Germany has been achieved, British ships and British fighting men will still be needed in very great numbers for the defeat of Japan, whose position, as Mr Curtin points out, may then be stronger than it was or is. And it should be realised, too, that there must be no resources and no armies wasted. They must be employed in fighting either Germany or Japan—now. The idea, say, of building up large forces in the United States for use at some future date must be scotched, once and for all.

Diplomatic Exchange

The note which the Foreign Office despatched to the Argentine Government on December 31st drew attention to a serious misunderstanding. For some time past, interested parties have been conscientiously spreading the tale that Argentine neutrality was benevolently viewed in London—that British circles recognised special circum-

stances which justified the failure of the Argentine Government to implement the findings of the Rio Conference. The publication of an article from the *South American Journal*, which lent a little unofficial colour to this view, in the *Information Bulletin* of the Argentine Foreign Office clearly required official rebuttal. No belligerent country can, if it believes in its cause, be in sympathy with a policy of neutrality. Clearly, there are many shades of neutrality. Adopted under duress, it may be the nearest practical approach to opposition to the Axis. The neutrality of Argentina is, however, distinguished by the fact that it is sustained in opposition to majority opinion in Latin America. It is not in any sense the product of overwhelming military pressure. The Government of President Castillo, reigning in a state of siege, does not reflect majority opinion within the country itself. This is reinforced by the recent suppression of two papers guilty of criticising the regime for failing to prevent Nazi espionage and infiltration. An attempt to defend such neutrality by covert claims to British support—which, it was suggested, was forthcoming despite the stricter attitude made known from Washington—was a transparent device. But it demanded repudiation.

Legitimate Government?

The statement and memorandum on Axis looting issued by the British Government in conjunction with sixteen other Allied Governments and the French National Committee—which is discussed in an article on page 47—is a good example of timely agreement upon the policies which will have to be jointly carried through after the war. But it raises one serious question of principle. The memorandum contains the sentence:

In so far as transfers or dealings are confined to the territory of a particular country, the procedure of examination and the decision reached regarding their invalidation will fall to be undertaken by the legitimate government of the country concerned on its return. [Our italics.]

Thus the United Nations commit themselves to the view that the present Governments in exile are fully representative of the peoples they govern. The memorandum goes on to say that:

The parties are agreed so far as possible to follow in this matter similar lines of policy, without derogation to their national sovereignty and having regard to the differences prevailing in the various countries.

The Governments are thus to return to full, immediate and untrammelled sovereignty. Frankly, this will not do. It is no derogation from the worth and capacity of the present Ministers of the various Allied Governments to say that they cannot be fully representative, and must, therefore, as is suggested in an article on page 33, regard their terms of office as provisional and dependent upon "the consent of the governed," whose views may have changed considerably in the years of occupation. And for any post-war Government, the pretensions to unlimited sovereignty implicit in this memorandum are surely exaggerated. Either the nations are going to collaborate upon certain agreed principles, or the chaos of the inter-war years will come again. National sovereignty in the traditional sense is the chief enemy of independent nationhood. Hitler has proved this. It would be tragic indeed if in the very act of undoing Hitler's grand larceny, the nations were to adopt policies and methods which ensured the rise of another Hitler at the appointed time.

A Historian Looks Ahead

Professor J. H. Clapham, who was knighted at the New Year, is the biographer of Industrial Britain; and it is not often that he permits his gaze to look into the future, where there are no documents or statistics to be collated and interpreted. Nevertheless, when he does so, as in last year's Sydney Ball lecture, which has now been reprinted as a Barnett House paper (Oxford University Press, 1s.), what he has to say has all the weight of his massive acquaintance with the recent industrial past. First and foremost among the problems of the future he picks out population. To the losses of war he adds the Western Europeans who will never be "born because of to-day's insecurity and devastation. He sees a future of declining peoples in Britain and Western Europe and perhaps elsewhere; and, as an economist who knows that fewer hands

will count more than fewer mouths in determining wealth and welfare, he is pained and alarmed. Professor Clapham has often been accused by his "cultural" colleagues of an over-emphasis on material factors in history; but of the problem of population, he says, "it is two-thirds spiritual," and he sponsors none of the crude material remedies which are so popular. About the material future, Professor Clapham is a hopeful sceptic.

The mere destruction can soon be put right, and the putting of it right will give plenty of wholesome essential employment. . . . There are ways of dealing with the burden of debts which may prove inconvenient to income-tax payers and those of us who are blessed with a little property, but need not weaken the production-power of the nation. . . . Happily, it is not possible to throw the burden of war on to posterity in the literal sense; for posterity cannot make the planes that are shot down or the ammunition that is blown off.

But the future will not be easy: "Destructive world-wide wars do not lead naturally to *pays de cockayne*." "The plans of the past and most future economic planners may suffer shipwreck."

Planning and People

The obstacle to planning, as Professor Clapham sees it, is men and women. Full employment, he argues, calls for full mobility from job to job, not the mobility of the old free labour market, but the mobility of the worker under orders. Moreover, he hardly believes it likely that, if full employment is consciously sought either by governments or self-governing industrial guilds, it will ever be genuinely found. If there is to be economic progress, he argues, there must be industrial change and decay. Jobs must disappear, and

the state or the cotton corporation, or whatever the controlling party might be, would be slow to dispense with workers if the industry showed signs of contraction.

These doubts, at any rate, pose the fundamental problems of economic planning. Professor Clapham's reminder that the "beautiful economist's scheme of demobilisation" devised at the end of the last war broke down against

the absolute fighting conviction of the British civilian turned soldier that the men who had served longest, whether locomotive driver or golf professional, ought to get home first is very relevant now. Yet, all in all, the Professor's scepticism is not really a denial of the urgent need to seek full employment after the war by deliberate means. As he admits, it is a matter of definition. The planning of investment on a scale large enough and regular enough to maintain resources in productive use is intended to cure only one kind of unemployment—"cyclical" unemployment. The unemployment which Professor Clapham, as a historian, has most in mind is "frictional." It is the wear and tear of economic change; and the statement of his fear that attempts to eliminate this wear and tear might stultify change itself is salutary.

A Quarter's Babies

The Registrar-General's return for the three months ended September 30, 1942, shows that 86,893 boys and 81,745 girls were born, representing a birth-rate of 16.1 per 1,000 of the population. It is a pity that the Ministry of Health felt it necessary to put out these figures with the headline that it is the highest birth-rate for twelve years. Such a statement tends to make people believe that the population decline has been arrested, whereas, of course, it means nothing of the sort. The number of babies born will naturally fluctuate from quarter to quarter; the fact that a great many were born in the third quarter of 1942 may be nothing more than a by-product of the National Service (No. 2) Act of 1941 and the intensified call-up of women—without children. In the nation's grave population problem, as Professor Clapham has just reiterated, it is not the first or second, but the third, fourth and fifth children that decide; the question is whether there is any sign of "larger families in the sense that matters," and this bump-up in births, which is only tiny in relation to the need if decline is to be arrested, gives no answer either way. Moreover, the crucial figure in population statistics is the net reproduction rate—the extent to which women of child-bearing age are replacing themselves. No light is thrown on this by the publication of the crude birth-rate. There is more justification for the Ministry of Health's

pride that the stillbirth rate—3.1 per cent of total births—is the lowest yet recorded. Quite apart from any other consideration, babies are in such short supply that wastage must be avoided as far as possible, and though the infant death-rate, at 40 per 1,000 live births, was down to the low record reached in 1939, it is regrettable that the absolute number was still as many as 6,766. Nor is it reassuring for the future birth-rate that the number of marriages in the third quarter of last year was only 95,713—8,620 fewer than in the corresponding quarter of 1941 and 31,937 below the average for the same period of the previous five years. The marriage-rate, 18.3 persons married per 1,000 of the population, was lower than that of any third quarter since 1926.

Design for Living

Only utility furniture has been manufactured since November 1st, and at last a scheme for distributing it is in operation. It can only be bought by permit, and permits will only be issued to persons setting up a home on marriage—this will normally mean persons married since January 1, 1941—or in anticipation of the birth of a child and to persons who have lost their homes through air-raids. A couple will be granted a maximum of 60 units, and a deduction will be made from this total in respect of any furniture they already have. The number of units to be surrendered for each piece of furniture is given on page 58; it will be seen that sixty will only provide what many people will hardly consider a bare minimum. Extra units may, however, be given to a bombed-out family where there are children, and the nursery furniture can be obtained without a permit. The most interesting thing about the new scheme is that it is the first example of what *The Economist* on December 12th (page 722) called providing a Physical Minimum. Utility clothing has been on the market for some time, but it does not have to conform to a special design, so long as the restrictions on design are complied with. Moreover, there is no needs test before it can be purchased. In the case of furniture, private manufacturers have been asked by the state to produce a necessary article of consumption to a design laid down by the state after consultation with a representative advisory committee. Costs, therefore, as well as prices can be strictly controlled. Distribution is left to the ordinary retailer, although, in order to save transport, the Assistance Board, in granting the permit, will determine the area in which the holder can buy. But it need not all be bought in one shop, and hire-purchase terms will be permitted; in fact, the only unnecessary restriction on actual purchases is the fixing of the period in which the units are valid to a maximum of three months. It is difficult to see why there should be any limit, and, in view of the prices for the furniture, many people will not be able to find the necessary money in three months, even if ample and regular supplies can be guaranteed—which is not certain.

Backs to the Wall

It is not the intention of messages and orders of the day at New Year to give an appreciation of strategy. In every country their object is simply to inspire and hold out hope. For this reason, the messages of Goebbels, Hitler, Goering and Himmler last week should not be regarded as war commentaries. Nevertheless, even as clarion calls, they were significant. Goebbels, the chief propagandist, in his broadcast on New Year's Eve, gave a summary of the articles he has recently published in *Das Reich*. *Das Reich* has a readership of intellectuals, without much in common with the ordinary man and woman in Germany; and Goebbels' broadcast, couched in the same style as his highbrow writings, must have sounded somewhat odd to most of his listeners. The historians, poets and philosophers that Goebbels loves to quote are mere names to the man in the street. It is true that, in his broadcast, Goebbels used this style and these references to get across the need for the German people to endure more hardships: but it is doubtful whether, say, the confused poems and obscure philosophy of Nietzsche are an appropriate vehicle of inspiration and hope for the common man. The reason why Goebbels has set aside his old ability to speak simply and directly about the problems of the hour is, of course, that, in these days, he is not over-anxious to approach the problems which face Germany straightforwardly. Hitler, on the other hand, was straightforward and direct at the

New Year. Both in his message and his order of the day, he listed the military successes of last summer, promised more and better weapons for the troops, and declared with great emphasis that there can be no compromise in this war. This last point is really the key to all these New Year outpourings. The Nazi leaders are actually holding out to the German people, not hope, but the threat that, if the Allies win, Germany and the Germans will be exterminated. They speak of the hardships that the Germans have already come through and of further hardships to come; but they shout that there is no alternative—and, in so doing, they admit the gathering shadows of defeat.

German Diplomacy

It is a matter of routine in Germany that changes are made in the diplomatic service on New Year's Day. This was emphasised last week when it was announced that new diplomatic representatives had been appointed at Tokyo, Madrid, and Stockholm; and it is, admittedly, one reason why too much should not be read into these changes. On the other hand, they obviously have considerable significance in themselves—though what precisely that significance is can only be a matter of speculation. General Ott leaves Tokyo and is replaced by Stahmer, who was at Nanking. It is easy to speculate on the basis that General Ott failed to induce the Japanese to attack Siberia; and it is interesting that a soldier has been replaced in Tokyo by an expert on Far Eastern economics. In Madrid, Molke, who is reputed to be a gifted diplomat, takes the post of Stohrer. Again, it is conceivable that Stohrer is a scapegoat. If Germany really wished to bring Spain into the war before this, then Stohrer has failed, just as he has failed if Germany was actually opposed to the agreement between Spain and Portugal. It remains to be seen what Molke will be able to do in these directions. Stockholm is regarded by the Germans as the most important outpost of Allied propaganda against the Germans. There have recently been clashes between Germany and Sweden on this question; and it may be argued that Prince zu Wied, a professional diplomat, has been taken away because he could no longer cope with this situation. His successor, one Thomson, formerly chargé d'affaires in Washington, was regarded as an expert in American affairs. When he came back to Germany he forecast that the figures of the American war effort were a huge bluff and that lack of organisation and political unity would prevent the use of American productive capacity for war. This does not seem to be a good beginning, from the German point of view, for his work in Stockholm, though it may be that the Nazis think that Stockholm is also the most suitable outpost for German propaganda against the United States. In all these speculations, though, it should be remembered, that these are the Ambassadors of a totalitarian power at war. Their previous personal history and convictions have little or nothing to do with the work they have been sent to perform. The important question is what Hitler has sent them out to do. Is it perhaps, however remotely, to pave the way for the compromise which Hitler has told his own people is impossible?

Trade Unionists

The total membership of trade unions in Great Britain and Northern Ireland at the end of 1941 has been given by the Chief Registrar of Friendly Societies as 7,090,000, which represents an increase of 548,000 compared with the end of 1940 and 860,000 compared with the end of 1939. Membership increased steadily during the past year, and

THE BRITISH LINEN BANK

may soon exceed the peak figure of over eight millions, which was reached in 1920. The chief reason for the growth in trade union membership is the increase in the number of persons employed. The trade unions always gain in strength in times of rising employment, and their membership increased rapidly during the last war from just under four million in 1914 to six and a half million in 1918. The increases have been greatest, as one would expect, in the large unions, such as the Amalgamated Engineering Union and the General Workers' Unions, whose ranks have been swollen by the large-scale entry of women into industry. Although the total number of unions has actually slightly diminished in the past few years, there is still an immense diversity of shapes and sizes. In 1941, 661 unions (or over two-thirds of the total number of unions) had a membership of under 1,000 each, while fourteen large unions, comprising 100,000 or more members, represented only 1.4 per cent of the total number of unions, but accounted for over half of the total membership. It is small wonder that there should be a growing demand in the Labour movement for a greater degree of rationalisation and modernisation of trade union organisation. At the 1942 meeting of the Trades Union Congress a resolution moved by the National Union of Railwaymen called upon the General Council to examine the structure of its affiliated unions "in order to determine where competition and overlapping exist, where such structure is uneconomic and where policy is diverse within an industry." Sir Walter Citrine opposed the resolution, which was defeated by a not very large majority, on the ground that it would interfere with the autonomy of individual unions. The shelving of the resolution did not solve the problem, which is bound to become more acute both during and after the war. An example of diversity of policy within an industry has recently been presented by the railway workers themselves. If the National Union of Railwaymen, the Railway Clerks' Association and the Amalgamated Society of Locomotive Engineers and Firemen had acted in concert instead of separately over their wage claims, the threat of strike action by the engineers would probably never have assumed such dangerous proportions.

Priorities for China

With the start of the New Year, Marshal Chiang Kai-shek has announced measures for improving the quality of the army and for controlling the price level. Conscription by lot is to be extended to various classes of students, to members of the professional classes and to landowners, who are to be trained as a corps d'élite. In the economic field, the upward trend of prices is to be curbed by the

fixing of ceilings for wages, transport charges, rice, wheat, cotton cloth and numerous other goods. These two lines of policy have received considerable attention in the Chinese press, which has emphasised the dual need for fresh military endeavour and improved economic conditions. But such a policy remains dependent on the arrival of Allied supplies. The Chinese realise that the recapture of Akyab on the Burmese coast would be an extension of the defence of India rather than the opening move in an attempt to clear the approach to the Burma Road. And in the Yunnan Province, the Japanese are themselves extending the defence of Burma by attempting to press back the Chinese. Whether or not it is possible or desirable, in view of the urgent campaigns being fought out in the Mediterranean, to reconquer Burma and to reopen the back-door to Free China before the monsoon returns in the late summer, the Chinese will continue to need more aircraft and more artillery. If Burma is not retaken, supplies by air must be substantially increased. Despite recent Japanese reverses in other theatres of the Pacific, relatively few troops have been withdrawn from China, which by purely guerrilla methods is still holding off an enemy equipped with modern weapons. If the balance is to be held in China, equipment must be provided, just as to reconquer Burma equipment—specialised equipment of the kind the Chinese need—must be provided. It is a question of available supplies and priorities; and no doubt the case was fully argued in the light of all competing claims by the Chinese Military Mission which has now left Washington for London en route for Chungking.

Shorter Notes

In a Note called "No Sales," on page 9 of *The Economist*, last week, it was stated that the Board of Trade had requested the shops to refrain from holding sales this year. It is now learned that the initiative came from the retail trade itself, and no request was made by the Board. *The Economist* is gratified to learn that the trade now recognises the interests of the nation in this matter—which, incidentally, coincide with its own.

Temporary officers, both men and women, in the armed forces have been brought within the unemployment insurance scheme. All of them, whether insured in civil life or not, will be credited with a free contribution for each week of service, and on demobilisation—after thirty weeks of service—will be eligible for unemployment benefit.

AMERICAN SURVEY

Political Prospects

The ability of the Administration to concentrate on the direction of the war is likely to be seriously decreased if present political prospects materialise. It seems fairly certain now that the President will have to fight for everything he wants; and that, when he takes independent action, it will run the risk of hostile Congressional investigations.

This is particularly true of domestic matters; but in January two subjects of international concern will have to face the barrage. One is Lend-Lease, which expires unless Congress votes for its continuance and provides the necessary cash. Senator Wheeler has announced his intention of demanding a full-dress investigation of Lend-Lease transactions, and no opportunity will be lost to arouse distrust and dislike of what it stands for in the name of "Americanism versus Internationalism." The other storm centre is the Act giving the Executive the right to conclude reciprocal trade treaties. Both affect the power of the Executive to plan for the post-war period.

Behind these lies a host of complex domestic problems, which will be much more difficult to solve when the new, illiberal elements in Congress get their fingers in the pie. One is labour, no pressing problem in itself, but destined to become one if the Smith Bill and various other

anti-labour enactments are revived. It appears inevitable that there will be an attack on the Wages and Hours Act, with the avowed intention of increasing the working week, but with the practical result of decreasing overtime pay; and the closed shop and maintenance of membership clauses in trade union contracts will come under fire. The elimination of Mr Henderson is only the first taste of blood in the campaign against effective price control by various interested sections. The farm bloc is said to be at work again, and small business is convinced that the regulations affect it unfairly.

The much greater numbers of Conservatives in the new Congress are out to "get" other Government agencies and personalities. The Board of Economic Warfare is, if possible, to be stripped of its powers to the profit of the Reconstruction Finance Corporation; and Mr Hopkins is said to be on the list of those who would not be missed. In fact, the phrases "get Roosevelt," "get Henderson," "get Wallace" are heard too often for the onlooker to have much faith that the new Congress will devote itself, with entirely unselfish devotion, to the job of getting on with the war.

The elections might have gone differently if Mr Roosevelt had been able to spare time from plans for Africa for plans for November. Now he will be forced to divide his time between the war and the home front. So far there have been some indications of appeasement at home; but

it is prophesied that a bold counter-offensive in the field of social security is in the making. It is the kind of tactic at which the President has often been brilliantly successful, but the odds—in Congress at least—are more heavily weighted against him this time. The Irreconcilables have their eyes on 1944, and a radical domestic programme may even be welcomed as the springboard for an attack on all remaining aspects of the New Deal. The President's main hope must be to draw his strength from popular support and its pressure on Congress, which may be too delayed to be effective.

The Fateful Decade

The White Paper issued this week by the State Department is a healthy reminder of a decade, and a state of mind, too conveniently forgotten. In this review of pre-war policy, the Department points, with pardonable pride, to the excellence of its information and the accuracy of the warnings, based on that information, which it conveyed to other arms of the Government and, more obliquely, to the American people and the world. The information was precise and it was impressively on time. As early as 1934 and 1935 the wires were busy with warnings from Berlin, from Tokyo, from Rome with revelations of the ambitions of the Axis and their preparations for war. Even the attack on Pearl Harbour was foreseen by Ambassador Grew almost a year before the disaster took place. Rearmament and diplomatic resistance to aggression were carried on in so far as it was possible for the Executive to do so in the face of popular unwillingness to admit the likelihood of another war. The revelations of the White Paper have aroused indignation, as indeed they should. It is a good thing for the Army and Navy to remember Pearl Harbour. It will be a good thing, too, to jog the memories of those pre-Pearl Harbour Isolationists, now in Congress, who are clamouring for a greater share in the direction of the war. It is not always true, of course, that if the cap fits, it is worn. Senator Vandenberg, with disarming effrontery, reads into this evidence of the awareness of the State Department and the Administration the moral that Congress must set up a joint Congressional committee to supervise war co-operation. It is a good thing, too, at a time when the current policies of the State Department are, for good reasons, the subject of critical appraisal, to be reminded that for the ten years before the war it did its job well—within the limits imposed by its constitution.

\$90 Billion Job

Mr Nelson has spoken of the American war production programme for 1943 as "something better than a ninety billion dollar job." If the estimate of a national income of about \$135,000 millions, based on the assumption of fairly stable prices, proves accurate, this means that about two-thirds of the American national income will go into war production. With the national income for 1942 estimated at \$117,000 millions, the rate of war production was just under \$75,000 millions in December. The share allotted to war production will not, then, increase drastically; but there are to be substantial changes in the pattern. The broad outline of these changes are given in a joint communiqué of the Army, Navy and War Production Boards. The virtual completion of an immense construction programme, combined with a "lean but healthy civilian economy," will make possible double the output of arms produced in 1942. The ordnance programme is to be cut by 15 per cent, and there will be a reduction in the proportion of tanks and motor vehicles in order to more than double the number, and quadruple the weight, of aircraft; to double the merchant shipbuilding goal; and provide for an increase in naval escort vessels. The attainment of these goals will make heavy demands upon the controls, and upon the civilian population, both in their capacity as managers and workers, and in that of consumers. Within the War Production Board it will necessitate the success of the new controlled materials plan; more thorough control over inventories of raw materials, including those of the Services; and more effective enforcement of its regulations by the WPB. Great shifts in the utilisation of manpower will be needed. A figure of 65 millions in the Forces and war production is being quoted against 58 millions now. One of the most dramatic sacrifices will be, as Mr Nelson has made clear, the withering away of much of civilian enterprise and of small business in par-

ticular. Of the \$90,000 millions of war production, he expects to award only about \$1,000 millions to small business. Concentration, which has so far been disappointingly slow, is to be speeded up in the distributive trades, where there is much room for slimming, as well as in industry. The progressive slowing down of production, distribution and transport for civilian use, and the exhaustion of stocks, make the effective control of purchasing power central to the success of the war effort. As Mr Henderson said last week, shortages and rationing are the testing ground of the home front.

The Great Debate

Mr. Wallace's speech ten days ago has succeeded in one of its major aims, that of provoking and clarifying discussion of the post-war settlement. As yet there is little in the way of official administration policy beyond the Atlantic Charter and the Four Freedoms; but Mr Wallace's last speech, with its concrete ideas, is thought to have been a forecast of an early pronouncement by the President. Mr Roosevelt himself has only gone so far as to lay down one primary war aim, the maintenance of peace and the

supreme necessity of planning what is to come after the war and of carrying forward into peace the common effort which will have brought victory in the war.

Even the need for planning has been challenged by the opposition; sharply by some Senators, who feel that the time is not ripe; implicitly by the internationally-minded Republican *Herald Tribune*, which accepts the problems named by the Vice-President, but trusts that the present Administration will not be in a position in 1944 to carry out any of its plans. Nevertheless, plans are being drawn up, and as their outlines become clearer the battle lines appear. The President of the National Association of Manufacturers has frankly disavowed any intention of fighting to supply milk for every Hottentot child or to establish a TVA on the Danube; and an industrialist-sponsored Committee for Economic Development has been formed to protect the principle of free enterprise in the post-war world. Free enterprise is a convenient cloak for a score of special interests and to some it may mean only freedom from Government interference. But it is striking that one of the assumptions of this new committee is that industry must, if it is to retain its freedoms, assure the maintenance of employment by the expansion of production. The maintenance of domestic employment is, of course, the easiest common meeting-ground of unlike minds. Even the "authentic Bourbons" have their ears to the ground and their thoughts on their crowns. But it is the international aspects of the peace that will provoke the bitterest disagreement. The professional Republicans are still deeply tinged with Isolationism, and they are dangerously strong in the new Congress. Despite the bitter-end Isolationists, some measure of economic aid, some degree of post-war collaboration, are certain. The question is largely one of degree and of motive. Action by Congress on Lend-Lease and the Reciprocal Trade Treaties may give some indication of the trend.

Correction.—In the Note on Lend-Lease, last week, two figures for the percentages of food stuffs exported were erroneously given. The correct figures are: Fish, 21 per cent of available supplies instead of 2 per cent; and lamb and mutton, 0.0 per cent instead of 9 per cent.

THE WORLD OVERSEAS

Science and Industry in Eire

[FROM OUR DUBLIN CORRESPONDENT]

December 28th

THE tenth anniversary of the foundation of the Federation of Irish Manufacturers was celebrated this month. The Federation was complimented by the Minister for Industry and Commerce on the successful efforts that its members have made to maintain employment in a period of exceptional difficulty. Most of the protected Irish industries depend upon imported supplies of raw materials and capital equipment. The great reduction in imports caused by the war has raised a host of unprecedented problems. In the solution of these problems, Irish manufacturers have received valuable assistance from Irish scientists. The importance of scientific research to the industrial programme has become apparent under the stress of war. It is to be hoped that, when the period of emergency passes, the rôle of scientific research will not be forgotten. Some of the earlier industrial ventures were undertaken without much preliminary thought. The success of Irish industry as well as that of agriculture after the war will depend upon procuring the latest and best information regarding scientific and technical developments.

As long ago as 1934, there was established an Industrial Research Council. This body, which has a record of useful work to its credit, proved unduly large for the urgent problems of the emergency. A year ago, there was established the Economic Scientific Research Bureau consisting of five members. This Bureau has worked in close co-operation with the Industrial Research Council, the universities and business scientific staffs. It was, unfortunately, set up at such a late date in the war that many materials and machines necessary for its researches proved unobtainable. However, the very urgency of the task with which it was confronted may have accelerated the obtaining of results. The Bureau has at all times been conscious of the necessity of attaining production on a commercial scale. The chairman of the Bureau, Professor Dowling, of University College, Dublin, states that "business men often enter into contracts on a time and material basis. I chuckle when I think that most of our contractual obligations are on a basis lacking in both time and material."

The most difficult problem in Ireland has been to find substitutes for fuel. It has been discovered that turf charcoal is better than wood charcoal or anthracite for producer gas plants. Experiments in the production of peat charcoal

have been very encouraging, and it is hoped that production on a commercial scale may not be long delayed. Investigations are also being conducted into the production of gas from peat. Supplies of phosphorus and sulphur are necessary for many essential industries. Phosphorus has been produced from Irish phosphate rock, and it has been discovered how to make graphite electrodes which had hitherto been imported. A plant has been invented for the production of phosphates in the event of the failure of the supply of electricity. The production of sulphur has proved less easy, but "a quite uneconomic but probably successful method" has been devised. Without these processes many Irish industries would have been deprived of essential materials. The drive for increased tillage requires abundant fertilisers. The large Irish superphosphate industry depends on imported supplies, which, owing to events in North Africa, are now more than ever interrupted. The possibility of using phosphates in County Clare is being investigated. One of the difficulties in introducing new fertilisers is to overcome the prejudice of farmers against the unknown. The refrigerating industries have been gravely embarrassed by the stoppage of imports of carbon dioxide. An emergency plant in University College was devised, and carbon dioxide is now produced from the fermentation processes in Guinness's Brewery on a commercial scale. This enables the creamery industries to carry on. There has also been set up an emergency plant for the production of ammonia. Disinfectants, which were in large demand owing to the outbreak of foot and mouth disease, are being produced in the alcohol factories.

Living and Prospering?

These are but a few examples of the problems which have been investigated, and to some extent solved, by the Scientific Research Bureau. Many other problems confront the country. Ireland possesses no metallurgical industry and suffers from a shortage of all essential metals. A geographical survey is being carried out to discover possible sources of minerals in the country. Electrolytic iron has been produced as a substitute for sheet steel, and it is hoped that sheet iron of this quality may be forthcoming at not too great expense. The experience of the last three years has been a practical lesson in the real cost of self-sufficiency. Two hundred years ago, Berkeley asked, "Could the Irish live and prosper if a brazen wall surrounded their island?" The answer to this question is becoming apparent to-day. The wall of brass arising from the blockade and the interruption of normal shipping services in teaching the Irish people that, although they may live behind it, they cannot prosper. The activities of the Scientific Research Bureau are deserving of all praise, but no substitute materials can make up, except at quite disproportionate cost, for the benefit of the importation of the natural products of other climes and other countries.

Mexico's War Production

[BY A CORRESPONDENT]

December 29th

WHEN Mexico declared war, it was obvious from the beginning that, apart from its guard over the northern approaches of the Panama Canal, and the opening of its air and sea ports to the Allies, the country's chief contribution to the common war effort would come from its production. As Mexico's industrial development is still limited—according to the last industrial census, in 1935, there were only 7,050 industrial firms, with a total invested capital of 827,000,000 pesos and a total employment roll of 205,000 persons—production means mining and agriculture. Mexico has about 31,000 mines, most of them non-ferrous metal mines, and about 275 million acres of agricultural land, to which 25 million acres of forests (chiefly pine, spruce, cedar and mahogany) should be added. While the mines are

almost exclusively controlled by foreign capital, agriculture is largely in Mexican hands. Since the revolution of 1910, in which the demand for land reform was one of the main factors, large farms have given way to small peasant farming. In recent years, both mining and farming in Mexico have passed through a critical stage. In agriculture, shortage of capital, difficulties of transport and lack of a central direction, resulted in stagnation, and the only two agricultural products of great interest to the United Nations are henequen (a hard hemp) and guayule (a rubber-producing plant). Mexico's production of henequen has recently fluctuated between 80,000 and 125,000 metric tons per year, while the output of the latter is estimated at about 8,000 tons for 1942. In both cases, new plantings require a delay of some years before a normal harvest can be secured, but, in the case of guayule rubber, a considerable acreage, planted in recent years, is approaching maturity. Apart from these two commodities, and the possible production of silk, for which the Mexican climate and soil are highly suitable, the United Nations cannot expect much help from Mexican agriculture in the near future.

On the other hand, the prospects for a rapid increase in the production of minerals are good. The nationalist policy, which followed the election of Lazaro Cardenas to the Presidency and reached its climax in the nationalisation of the railways and the expropriation of the foreign oil companies, made the foreign mining companies very reluctant to invest new capital in their Mexican enterprises. As a result, production of most minerals, among which oil, copper, silver, lead, zinc, antimony and quicksilver are the most important, fell well below the record levels reached in 1928 and 1929. In 1941, the production of crude oil reached only 42 million barrels, against 47 million barrels in 1937. The production of copper in 1941 amounted to 48,500 metric tons, against 86,600 tons in 1929; that of zinc fell from 174,000 tons to under 155,000 tons, and of lead from 248,500 metric tons to 155,200 metric tons. As the great majority of the mining companies operating in Mexico are controlled by United States interests, the closer political relations between the Mexican and United States Governments, brought about by President Camacho since June, 1940, and Mexico's entry into the war have greatly improved the outlook for Mexican mining.

Roads and Railways

Last October, it was pointed out in Washington that shipments of Mexican materials to the United States were approaching an annual rate of 1,200,000 metric tons, a tonnage which far exceeds the carrying capacity of the Mexican railway system. In the middle of November, therefore, the United States Government adopted a plan providing for the doubling of Mexico's railway capacity at the expense of the United States Government. The work will be carried out without delay by US engineers. A technical mission of US railway experts has been in Mexico for the past six weeks to lay down the details of the plan. Simultaneously with the extension of the railway system—Mexico has to-day 14,200 miles of railways—an energetic plan to increase the country's roads was initiated. By the end of last year, Mexico had about 42,470 miles of highways, of which close on 8,000 miles were suitable for traffic during the whole of the year. Road development, besides the improvement of existing highways to make them suitable for all-season traffic, will consist in particular of the extension of secondary roads linking the highways with distant mining and agricultural centres. All war transport development is being organised by a new co-ordinating body for war production established by presidential decree early in November. The same body co-ordinates and directs mining and agricultural production on the basis of lists of requirements supplied regularly from Washington. Steps have also been taken to develop promising mineral deposits through newly-formed companies. The formation of such companies, whether Mexican or foreign, is stimulated by a recent decree, under which new enterprises will be freed from taxation for a period of five years.

For the duration of the war, Mexico's economic outlook appears brighter, but whether this prosperity will prove more than a passing phase in its unstable economic history depends to a great extent on future relations between the Mexican Government and foreign Governments and financial interests. Mexico not only requires foreign markets for almost the whole of its production, but also needs foreign funds and technical help for the full development and utilisation of its extensive natural wealth.

HEALTH AND FOOD RATIONS

WHAT IS A HEALTHY DIET?

Before the war many people suffered from malnutrition because they picked the wrong foods from large and varied supplies. Now, the way to be well fed is to make sure of picking the right foods which are still available, even though supplies may be restricted.

Keep a few good sound principles well in mind. *Natural foods are the best*—vegetables contain important vitamins and become plentiful from time to time; National Wheatmeal bread has many valuable elements which were lacking in white bread; milk is available for children, who need it most. Fish liver oil—another natural food—contains the protective and bone-forming vitamins and is an essential supplement to everyone's diet, whether grown-ups or children.

The newspapers, the B.B.C. and the Ministry of Food are constantly publishing excellent recipes. You will find it pays you well to follow them. Diet should be varied if you are to make the best use of it.

Think carefully about food selection. It is well worth your while

This is one of a series of announcements issued in support of the Government's food policy by the makers of

CROOKES'

HALIBUT LIVER OIL

Russia at War

Managers of Industry

ONE of the factors which, at the beginning of the Russo-German war, made Russia's industrial strength something of an unknown quantity was industrial management. Russia's industry is still young; most of it has been built up during the last decade. And Russia's industrial management is even younger; the majority of the present industrial leaders, factory directors, technicians and so on were educated and promoted in the late 'thirties. In 1941, they had only had a few years of administrative and managerial experience. In a sense, they were still on the threshold of their careers when they had to shoulder the enormous responsibilities of industrial evacuation from the west and reconstruction in the east. In 1941, it could not be taken for granted that they would pass the test of war. But the experience of a year and a half of war economy, for all the obvious drawbacks due to the lack of a solid managerial tradition, has on the whole vindicated them.

The history of Russian industrial management in the post-revolutionary period has been stormy. There were two major crises, closely connected with fundamental changes in the economic and political outlook. The first crisis came towards the end of the 'twenties, when the so-called New Economic Policy was abandoned and the country embarked upon speedy industrialisation. The first Five Year Plan posed two great problems. First, there was the need to train a large body of new administrators and technical specialists to man the new plants and factories. In the years before the Plan, there were not more than about twenty thousand engineers in Soviet industry. The demand for engineers was expected to reach a figure about ten times as big towards the end of the first Five Year Plan. The "crisis of the cadres" was solved by a set of expedients which yielded impressive quantitative results. The period of industrial training was cut short; the standards of teaching were radically lowered and simplified; and many schools and colleges were transferred from the Commissariat of Education to the industrial departments of the Government. By 1932, 165,000 engineers had been graduated from colleges and secondary vocational schools. The second problem was social and political. During the NEP period, there was a duality in industrial management. The technical manager was controlled by the party director just as the officer in the army was controlled by the political commissar. This dual control was wasteful of manpower; and it caused continual friction. If continued, it would have obstructed industrial expansion. The regime sought to eliminate it by training administrators and technicians whose "social origin" would guarantee their political loyalty. The sons of the intelligentsia and of the peasants were not allowed to make up more than 35 per cent of the new pupils admitted to technical colleges and schools; the rest were young workers or sons of industrial workers.

The second Five Year Plan was started (in 1933) with a new reform in industrial training. Quantitative achievements had been obtained, as in many other fields, at the expense of quality. It was therefore decided to revise the standard of industrial training. The controls on the "class origin" of students or trainees were discarded. During the period of the second Five Year Plan, the percentage of "proletarian elements" among the students of technical colleges fell from 50 (in 1933) to 34 per cent (in 1938).*

The second great technical crisis developed in 1936-38. The "purges" of that time affected industrial management no less than the army, the diplomatic service and the party. The key positions in the whole of the Soviet industries were filled by new men. The new cadre of industrial managers differed very strikingly from its predecessors. The "Red specialist" of the first Five Year Plan was trained hurriedly and rather superficially, whereas the

industrial managers of the third Five Year Plan were educated more thoroughly according to the improved standards of training which had been made obligatory. A rough idea of the "output of industrial officers" is provided by the figure of 365,000 graduates from engineering colleges and technical schools during the years 1933-37, compared with 165,000 during the previous five-year period. It was largely from these 365,000 new engineers that the present industrial management was recruited.

But the difference between the present managers and their predecessors is not only, or even mainly, a difference in professional training. The industrial manager of the pre-1936 period was more frequently than not an "ideologist." His approach to industrial problems was strongly coloured by political conceptions. To him, the economic ascendancy of Russia was not an aim in itself; it was an experiment in the application of party doctrine. He was, in a sense, a traditionalist of the Bolshevik Revolution. The new industrial manager is of a different, more businesslike and matter-of-fact cast of mind. "Ideological" traditions are not allowed to interfere with the technical needs. His ideals are: fulfilment of the monthly plan, a rising graph of production, absolute obedience and discipline in the workshop and one-man direction of the plant.

In the light of the present war, some of the changes which occurred in 1936-38 have become more understandable. The Soviets were already building up their military strength at that time. This undoubtedly involved more hard labour than before in Soviet factories as well as a lowering of the standard of living of the masses. The old type of industrial manager might have met this situation with some ideological scruples. What was needed now was the subordination of trade unionism (in its Soviet version) to defence economy. The new industrial manager was given almost unlimited powers to establish his authority and to deal with slackness and infringements of labour discipline. Simultaneously, the social and political status of the managerial cadre was raised. Technicians and industrial administrators were the backbone of the governmental machine before the war (recently the army officers have taken a very prominent place beside them). Their salaries were very considerably increased. The campaign against the *uravnilovka* (the equalitarian tendency) was waged vehemently through all the channels of official propaganda. What has followed has all the appearances of a Socialist version of technocracy. The guiding principle of that technocracy can perhaps be expressed in the words which Alexei Tolstoy put in the mouth of Peter the Great: "The undertaking was so vast that there was no time for pity."

The relations between industrial management and the party organisation have also undergone a fundamental change. The once familiar conflict between party cell and factory director has long been forgotten. The fullest unity between party and management has in fact been achieved. The manager is now only very rarely a non-party man. The party, on the other hand, has evolved into an almost non-political body. All its interests and activities have been centred on the problems of production. This has been particularly striking in all the production drives which have taken place in wartime in which the party organisations have usually acted as the auxiliary apparatus of industrial management. "Ideological" issues such as the German problem, or post-war reconstruction, or *l'affaire Darlan*, issues on which public opinion in democratic countries has been more or less divided, have caused no discussion in Russia. The agenda of party meetings have been filled by problems of industrial bottlenecks and military training. The particular responsibility of the party committees has been tasks such as co-ordinating the work of industrial managers on a regional basis, to look after the proper distribution of labour and raw materials between the various factories of a given region.

THE BUSINESS WORLD

Germany's Loot

WITH the turn in the tide of war in the Allies' favour, the rats are on the move. In most of the occupied countries of Europe there have been signs that quislings and collaborators have begun to hedge. Most significant of all, Germans have begun to move their store of plunder to safer neutral holes; and these activities are being watched with a vigilant eye by the United Nations. These activities, and the gigantic campaign of looting of which they form part, have been the subject of two statements. The first was the report on the "Penetration of German capital into Europe," issued last week by the Inter-Allied Information Committee (published by His Majesty's Stationery Office, price 3d.); the second came this week in the Allied declaration on the restitution of property stolen by the Axis, with its warning to all neutral intermediaries who may be induced to lend their aid to the robbers.

The report of the Inter-Allied Information Committee is a carefully compiled and closely documented review of German predatory activities in the occupied countries. These activities fall into two broad categories. First, there is direct robbery—the confiscation of property without compensation. Then, there is an infinite variety of deals to which a pseudo legal veneer has been given, but which, none the less, represent just as brazen looting of the occupied countries as direct pilfering. Open robbery is resorted to wherever Germany is dealing with Jewish property. Whether within Germany or outside it, the process euphemistically known as "aryanisation" is equivalent to confiscation. Such open robbery has been more generally practised in Western Poland, the Protectorate and Slovakia, Alsace and the occupied parts of Soviet Russia. In occupied Western Europe open confiscation has been less blatant; it has taken such forms as the removal of works of art to safer places of custody, notably to the homes of such art lovers as Hermann Goering. No subtlety is required to solve the problem of these acts of plain theft. The need is to keep track of what is taking place, and then to compel restitution.

Difficulties arise in seeking a solution for the problem of Germany's indirect and complex methods of robbery by capital infiltration. All these operations have two features in common: they respect the outward forms of legality; and they involve Germany in no economic cost for its purchases of shares, participations and other interests. One method is the provision of clearing accounts—in which Germany is nearly always a heavy debtor—of "free" sums which are advanced to German firms for the establishment or extension of their business in the occupied countries concerned. In such cases, the capital expenditure by the German firm is, in fact, financed by the central bank of the occupied country, which in its turn holds against it a claim on Germany expressed in Reichsmarks. The procedure comes slightly nearer direct robbery where the infiltration of German capital is financed without the creation of any clearing debt, but out of so-called "occupation costs"; the outstanding example of this procedure is provided by France, where occupation costs have been fixed at a level so appreciably above the actual costs that the German authorities have, as a result, been accumulating large unspent balances of francs at the Bank of France, which have in part been used to buy shares for German concerns on the French stock exchanges, and to finance the direct participation of German firms in French industry. In the case of the

Netherlands, the provision of local currency to finance the invasion of German capital has proceeded, not only by way of spurious occupation costs, but also by breaking down the customs and exchange barriers between that country and Germany. As a result, German Reichsmarks have been provided in unlimited quantities for effecting the purchase of Dutch assets; and the marks have had to be accepted at fixed rates by the Netherlands Bank, which in its turn has seen its claims on Germany increasing, in 1941 alone, from 15.4 million guilders to 929.9 million guilders. These devices provide only the beginning of the tale of German capital infiltration. Where there has been no acquisition of specific share holding control, the same objective of economic subjugation has often been reached by so-called "friendly agreements" between local concerns and their German prototypes, or by the compulsory adhesion of occupied firms to German cartels, who then impose production and sales regulations on their new members. So the story could go on almost indefinitely, through all the various shifts of exchange manipulation and unbalanced trade clearings.

In the report of the Inter-Allied Information Committee these generalities are clothed with the details of specific transactions. The most prominent are to be found in the

CIVILIAN WAR RISKS

spheres of banking, heavy industry and chemicals. The big German banks have acquired control of and administer banks in most of the occupied countries. The close financial links which normally exist between industry and banking in Europe have made this extension of German banking interests a far more formidable encroachment than it may at first sight appear. In the case of heavy engineering industry, the tentacles of the *Reichswerke Hermann Goering* are now to be seen in every part of occupied Europe; equally ubiquitous is the *I.G. Farbenindustrie* in the chemical industry.

It is against this "systematic spoliation of occupied or controlled territory . . . from open looting to the most cunningly camouflaged financial penetration" that the 17 Governments of the United Nations and the French National Committee have, this week, uttered their warning. The objects of these operations is always the same,

to seize everything of value that can be put to the aggressors' profit and then to bring the whole economy of the subjugated countries under control so that they must slave to enrich and strengthen their oppressors.

The signatories reserve all their rights to declare invalid any transaction in property situated in the territories that came under control of the enemy powers or belonged to persons resident in such territories. The warning is especially directed against citizens of neutral countries "who may be persuaded to act as fences or cloaks on behalf of the thieves."

Such, then, is the gigantic and ingenious omelette which it is proposed to unscramble at the end of the war. The task will be far from the easiest of those incumbent on the victors. The fact-finding report of the Inter-Allied Information Committee does not attempt to pronounce on ways and means; and the Foreign Office statement which accompanies the United Nations' declaration puts off any definition of the action which will have to be taken in restituting stolen property until victory has been won. The simple solution of restitution to the rightful owners will not suffice in all cases. Obviously it will be the only fitting solution where stolen property can be identified and restored. But most of the disappropriated owners of property acquired by the enemy through pseudo legal means will have received appropriate monetary compensation for their assets, even if that compensation was provided by the Government or central bank of their country. They may be unable to provide the repurchase money. It is, moreover, unlikely that equal treatment will be meted out to all despoiled countries—whether they

fought for or against the Germans. For it must not be forgotten that nowhere has Germany's economic penetration been more marked and more brutal than in the case of its ally, Roumania. Nor must it be assumed that the unpicking of the fabric of German-made industrial concentration in Europe will necessarily be the right policy after the war. Post-war Europe may need and welcome this industrial integration once it has been divorced from the dire purpose for which it was forged by Germany. It may, therefore, be unwise for the United Nations to commit themselves to the automatic dissolution of these industrial marriages, however great may have been the duress under which some of the parties consented. In any case, it would be attempting the impossible to undo every transaction which the United Nations may declare invalid and to trace it back to its source through the many intermediaries that have taken a hand in it.

A more promising approach to the problem will perhaps be the immediate sequestration of directly or indirectly German-owned foreign property and its subsequent repatriation by some centralised agency forming part of an inter-Allied reparations commission. In the first instance, these assets would form part of the German reparations payments, qualifying for that role with special force because they will be practically the only form in which reparations can be made without involving an exchange transfer problem or economic dislocation; and by this manner of attack on the problem of restitution, the ultimate redistribution of the stolen property might, moreover, be effected on lines that would most directly serve the interests of European reconstruction.

The whole problem will henceforth be kept under continuous review by a committee of experts. They will in the first instance consider the scope and sufficiency of existing legislation in Allied countries to invalidate dealings or transfers of the nature indicated in the United Nations' declaration. In addition, the committee will act as a centralised bureau of information for all suspect transactions. If, at the same time, the members of the committee were required by their terms of reference to give some preliminary thought to the problem of restitution, an important step would have been taken towards a first considered exchange of ideas among the United Nations on the reparations question. The pitiful muddle that was made of this problem after 1918, and the seeds of economic distress and of further wars which were then sown, are sufficient arguments in favour of an early start on the consideration of this basic problem of the peace.

Finance and Banking

Return to Abundance

Helped by the exceptionally heavy ways and means borrowing of the Government at the Bank of England, the money market withstood the seasonal pressure over the turn of the year with ease. Last Saturday, the first working day of the New Year, provided an exceptional turnover of funds. The bulk of the Treasury bills taken up last week were paid for on that short day, while there was an even greater concentration of Treasury deposit receipt payments by the banks. On the other hand, the banks put back into the market all the money that had been called in the earlier part of the week. Dividend payments and the Treasury disbursements on the unconverted part of the Australia 2½ per cent loan further helped to swell the stream of funds returning to the money market. The difficulties created by the exceptional turnover of funds on Saturday were therefore of a physical rather than technical character. By the beginning of this week the credit basis had been further enlarged by Treasury disbursements of some £60,000,000 on vested India loans and the credit position became plethoric, many lenders having unusable balances on Monday and Tuesday. Thereafter, the surplus of credit became rapidly smaller, and by mid-week the position in the market had returned to normal. This week's Bank return nevertheless indicates a position which is still considerably extended. Government securities have fallen by

£44,820,000, representing in large part the repayment of ways and means advances. Bankers' deposits are even more sharply down, namely, by £65,777,000, but this movement still leaves their total at the comparatively high figure of £157,625,000. The reduction in the cash basis during the past week would have been smaller had it not been for a temporary immobilisation of funds in Other accounts; these have risen from £48,821,000 to £82,492,000, probably in connection with the time lag in clearing warrants for repayment of vested India securities.

Floating Debt in December

The floating debt return giving the position on December 31st is notable on many counts. It shows the total floating debt at £4,029,020,000, this being the first occasion on which the £4,000 million line has been passed. The rise in the total over the month was only £96,850,000, but within this movement there were greater changes in the individual floating debt items. Ways and means advances from public departments fell by £125,540,000 to £161,585,000, the lowest level since November, 1941. This movement is probably the counterpart of last month's issue of £123,600,000 of National Defence Loan to the National Debt Commissioners. Treasury bills have risen by £82,610,000.

cannot be computed, as the year closed on a Thursday. If, however, allowance is made for the fact that the whole of the maturities of tender Treasury bills in the last week of the year fell due in December, and that the bulk of the new £75 millions taken up in that week was paid for in January, it will be seen that the total of tender bills outstanding at the close of the year must have been appreciably down on the total for the previous month, and that the rise in tap bills must therefore have amounted to well over £100 millions. Ways and means borrowing from the Bank of England over the turn of the year amounted to £67,750,000, which was £1,750,000 more than at the end of 1941, and was the highest figure recorded since the last war. Treasury deposit receipts continued their record-breaking career. Of the £234 millions which was redeemed last month, £36 millions represented pre-encashments to cover subscriptions to new Government issues. The gross amount raised from this source was £312 millions, lifting the total outstanding to £966 millions. A seasonal reaction in the expansion of this item is now due. The feature of longer-term debt changes last month was again the popularity of tax reserve certificates. The gross amount of £47,050,000 raised through this means provides the largest single receipt item, apart from the special issue of £123,600,000 of 3 per cent National Defence Loan to the National Debt Commissioners. Even allowing for the redemption of £10,197,000 of tax reserve certificates in December, the net amount raised still exceeds that produced by any of the other tap loans of the Government. Recently published company balance-sheets indicate that many large concerns liable to EPT have accumulated substantial amounts of these certificates. It is no doubt in this direction that search must be made for the principal source of demand for tax reserve certificates. In the hands of this type of investor, these certificates represent an extremely expensive form of borrowing for the Government.

Financing Expenditure

The following table summarises the Exchequer returns of the financial year to date (December 31st) and shows

the respective shares of revenue and borrowing in meeting expenditure:—

£000	
Total ordinary expenditure	4,055,481
New Sinking Funds	8,808
Loans repaid:—	
National Savings Bonds	2,507
Public Dept. Advances	33,550
Increase in balances	408
Miscellaneous issues	1,507
Total ordinary revenue	1,766,598
Loans raised:—	
3% Def. Bonds (net)	78,293
3% Savings Bonds 1955-65	46,786
3% Savings Bonds 1960-70	231,473
2½% Nat. War Bds. 1949-51	335,143
3% Nat. War Bds. 1951-53	21,000
3% Funding Loan 1959-69	121,650
3% Nat. Def. Loan 1964-68	123,600
Nat. Savings Certs. (net)	136,150
Tax Reserve Certs. (net)	278,418
"Other debt" (net)	212,960
Floating debt (net):—	
Treasury Bills	212,440
Bank of Eng. Adv.	67,750
Treasury Deposits	470,000
	£4,102,261

The items shown as net are given after allowing for repayments and receipts.

The Bullion Market

The annual circular published by the firm of bullion brokers, Mocatta and Goldsmid, points out that the range of prices quoted for silver in London, namely, $\frac{1}{4}$ d. for cash and $\frac{1}{2}$ d. for forward, are a low record for all time. The circular is perhaps guilty of an excess of discretion in omitting all reference to the official sales of silver at a fixed price which have been the dominant feature of the London silver market throughout 1942, and which have been wholly responsible for this stagnation of prices. There are more exciting subjects for discussion in the review of the silver markets in the United States and India. The circular points out that, despite the prohibition of the use of silver for such non-essential purposes as jewellery in the United States, the industrial consumption of the metal for 1942 should considerably exceed the 80 million ounces reported for 1941, a figure which compared with 41 million ounces for 1940. It is estimated that the industrial consumption of silver in Britain has shown little increase in 1942 over 1941. This is because in this country silver has

not been used to any extent as a substitute for other metals in war production. Of the London gold market, the circular states that business has been chiefly confined to a few sales to the Bank of England, most of which has been by order of the Custodian of Enemy Property. It is added that in January, 1941, the Bank of England announced they were prepared to supply gold to the market through authorised bullion dealers for certain specified purposes. It is understood that these purposes are connected with the satisfaction of genuine and essential industrial requirements, that they have been carefully hedged with conditions and that the business to which the offer of these facilities may have led has been exceptionally small.

US Discount Rates

All Federal Reserve Banks have come into line in reducing from 1 to $\frac{1}{2}$ per cent the rate on member bank advances secured by direct obligations of the US Government having a year or less to run. The rate for advances

secured by Government paper having more than a year to run remains at 1 per cent. The rate for other secured advances to member banks, granted under section 10 (b) of the Federal Reserve Act, has come down from 2 to $1\frac{1}{2}$ per cent in the New York district and that for advances under section 13, to individuals, partnerships or corporations, other than banks, from $3\frac{1}{2}$ to $2\frac{1}{2}$ per cent. The imperfect appreciation of these changes, which has persisted in this country ever since they were made two months ago, is largely due to the manner in which the relevant information is presented in the official Federal Reserve Bulletin. In the tabulation of official discount rates the charges on advances secured by Government paper appear under the following heading: "Advances secured by the direct obligation of the US (maturities not exceeding 90 days)." This 90-day limitation of the maturities does not apply—as would seem indicated by the context—to the obligations of the US securing the advance, but to the currency of the advance itself. Official US banking statistics are, in so many respects, an example to all the world that such a method of presentation is particularly misleading to the outside observer.

Investment

Long Period Equity Trends

The New Year has brought a definite recovery in stock exchange business, but it is of the particular character associated with reinvestment of January 1st dividends and, this year, with the India disbursement. There is also a heavy gamble in progress in home railway stock. Otherwise, the volume of business in industrial equities remains at a rather low ebb and there is no indication, as yet, that the hoped-for recovery in activity in that section is on the way. Prices, however, remain distinctly firm, and the index of *The Financial News* is at a new high, a level last touched in February, 1938. Meanwhile, the publication of *The Actuaries' Investment Index* for December 29th suggests that the recovery in values last month was less than the more highly selective indices indicated. For

* Prices and yields as on January 25, 1938.

industrial equities, ten of the fifteen groups show falls, but the rises in the other five, and particularly those in shipping and stores and catering, were slightly more important, and the index shows a rise of 0.1 to 72.0, the highest since February 1, 1938. The recovery on the month, such as it is, appears to be entirely due to better dividend payments for the year is up by 0.02 to 4.47 per cent. These figures refer to industry only. The feature of the month is a fall of 6.4 points, to 100.2, in the index for insurance share values, but, even so, they are appreciably higher on the year, and 5.2 points above the low of end-February caused by fears of losses in the Far East. Every single group of equities shows a rise on the year, the smallest being 2.6 points in insurance shares. For industrials only, the

average rise is some 19 per cent, with individual improvements ranging from 7.4 for electric light and power to 70 per cent for home railways. It is of some interest to carry the detailed comparison back to the point of February, 1938, when the industrial equity index was actually above that of December 29th at 72.5. Comparison cannot be exact, because at that time aircraft shares were not included. This, however, has little influence on the relative size of the departures from the figures then prevailing for individual groups. All the financial groups show falls on the period of almost five years, that for insurance being 19.9 points and that for investment trusts 11.9. Of fourteen industrial groups, half are up and half down, but there are only five changes of as much as 10 per cent and most are much less. Of the five, four are rises and only one, gas stocks, a fall, but the decline in oil shares is only just short of one-tenth. The only other sharp fall is in coal. Two of the largest rises are in industries which enjoy a secular trend, electrical equipment and motors, but the greatest is due to the shipping shortage.

Northern Ireland Conversion

The latest conversion is an offer of 3 per cent stock of Northern Ireland, repayable 1956-61, in conversion of £2,000,000 of Ulster $3\frac{1}{2}$ per cent stock falling due for redemption at par on April 1st. The new stock is offered at par so there is no turn, and the holder will presumably receive a flat 3 per cent for 18 years. Any stock not taken in conversion will be issued to the various funds under the control of the Northern Ireland Government, so that no question of underwriting or guarantee arises. The offer is perfectly straightforward and it is open until the end of the month. At the moment it was first made, namely the end of December, it did not appear attractive but, if the movement of the past few days in the funds and other trustee securities continues, the position may be different by January 30th. There is no need to reach a decision much before then, but, if it is decided to accept repayment in cash, the possibility of reinvesting now, rather than waiting until the end of March, should be borne in mind as the trend of quotations still appears to be upward.

Railway Stock Recovery

The week brought a burst of buying of home railway stocks, mainly equities and the preferred and deferred stocks, which arose from the splitting of ordinary shares. In face of the virtual stability of receipts under the existing arrangements with the Government, this rise can only reflect a belief that, in the past, the recovery prospects of the lines after the war had been underestimated. It is, of course, true, as will be seen from the following table,

that the yields to be obtained were, until recently, quite out of line with those on other industrial equities, and that even now they are relatively high. One reason for uncertainty about the future was purely political, namely, the question whether the lines should be taken over by the state and, if so, on what basis of compensation. It is difficult to find any sign that developments have occurred which would suggest a more favourable consideration of equity holders in this matter. The railways had been a depressed industry for long before the war, and, even in years of something approaching boom conditions, did not enjoy the prosperity which was theirs before road competition emerged. During the period of physical reconstruction after the war, there may, possibly, be very heavy

loads of low paying traffic, but it is a fair guess that much even of this will be conveyed more cheaply by road. On any extended view, it seems probable that the heavy loads will tend to be less than in the decade 1929-39, because this country will be less free to concentrate upon products of the old staple industries, while every rise in the cost of railway operation will accelerate the movement to bring the labour to the heavy materials rather than the other way round. For twenty years, the roads have been cutting into passenger and light goods traffic. There is every reason to suppose that, before long, airways will relieve the railways, even in this comparatively small country, of long distance mail and parcel traffic and of small consignments of goods urgently required. Current quotations may be fully justified in the sense that at some time in the next quinquennium there will be something like a railway boom, from which the stockholder may, or may not, be allowed to benefit. On a long period view, there seems little justification for them.

Carreras Meeting

The Carreras meeting has been held, and, despite clear indications from influential shareholders, including some investment trusts, and ignoring the suggestions in the press for an amicable settlement, the chairman, Sir Edward Baron, used his votes to bar the re-election of Mr Codrington to the board, and incidentally to secure the election of his own candidate. It appears that all the members of the board not representing the Baron family supported the candidature of Mr Codrington, and there seems very little prospect that future meetings will be characterised by the harmony without which the smooth running of the enterprise may be placed in jeopardy. The main legal action, instituted by the board against the chairman, has yet to be heard, and no further action is likely until it has been decided, nor can the rights of the dispute be determined without much more information than is at present available. Whatever the result, the publicity attaching to the case will have served a useful purpose, if it helps to convince both investors and directors that due heed should always be paid to the conditions under which control is exercised. In this case, the shareholders have nothing to complain of in past results, and, so far as can be gathered from the comments at the meeting, the outlook is good. The result of the recent meeting was, however, the clearest possible indication that, should anything go amiss, complete agreement among the holders of "A" and "B" ordinary capital would fail to secure any adjustment. For all the evidence there is to the contrary, the holders of a majority of the 240,000 £1 ordinary shares could decide to wind up the company forthwith, and all that the £3,500,000 "A" and "B" holders would obtain would be their share in its break-up value, unless they were saved by the votes of £1,300,000 preference shares. It would be beneficial if, in the course of the impending action, a judicial opinion

could be expressed upon both the limitation of such dissociation between financial ownership and voting control, and the question of circumscribing the objects for which such voting control might be used in those cases where it was thought desirable to permit it.

Rhodesian Copper Outlook

The results of the Rhodesian copper companies for the year 1941-42 are now as fully known as the self-imposed limitations of the various boards permit. The information available gives no hint as to the character of the mining results obtained. At Roan Antelope, it is announced that a new method of mining will have to be adopted, and it is freely suggested that this means that this company at least will have to switch back from sub-level stoping, which is cheap, to the more normal process of cutting and filling, owing to the development of underground pressures. Does this mean that, either now or in the near future, the other mines of Northern Rhodesia will have to adopt the more expensive method, and, if so, what effect is this likely to have upon costs? For the period of EPT at 100 per cent, the effect on current profits will be nil. But the post-war refund will be affected and, insofar as the impost is relaxed, the weight of the change will fall on the shareholder. On the basis of the yields obtained pre-war, the Rhodesian copper mines are, perhaps, the cheapest source of the metal in the world. They may remain so even after the rise in costs, which the considerations mentioned above suggest as probable. A scramble for copper after the war is not improbable, and one would suppose that the price fixed will give at least some profit to the higher cost producers. Meanwhile, however, the shareholders' property is being used up to their own detriment. The least they are entitled to is the fullest information as to their properties consistent with a reasonable interpretation of the limits imposed by national security.

Lower Capital Issues

For the first time since the recession following the outbreak of war in 1939, total new capital issues, including those by permission to deal, declined over the twelve months ending December 31, 1942. The total of all classes of capital declined by £42,607,500 to £1,467,195,700, but that of Government issues by only £40,470,300 to £1,457,057,000. The total of the fourth quarter was, however, higher than that of the third quarter, when there was a particularly sharp recession in the total of Government loans. In the latest quarter, Government issues amounted to £327,871,340, against £299,967,300. Savings Certificates, 3 per cent Defence Bonds and $2\frac{1}{2}$ per cent National War Bonds all brought in higher yields, but there was a fall in the total of 3 per cent Savings Bonds of more than £10,000,000 to £84,192,542. The total of non-official issues was very slightly increased in the closing quarter of the year; but the new issue market continued for all practical purposes to be dominated by Government borrowing. The most important issue was that of a nominal half million of Powell Duffryn $4\frac{1}{2}$ per cent debenture stock. In the miscel-

The Secretary, Stock Exchange, London, E.C.2

laneous group, Imperial Cold Storage raised a nominal £375,000 of ordinary capital by issue to shareholders. Among public utilities, Associated Gas issued £388,938 deferred stock by permission to deal. The total of conversions, at £22,239,160, compares with £26,989,173 for the first nine months of the year and £20,724,069 for the third quarter. The increase is, of course, the direct result of the lifting of the Treasury ban last summer. More than £16,000,000 of the total was contributed by the Commonwealth of Australia conversion, nearly £3,000,000 by P. and O. Steam Navigation, and some £1,800,000 by Bowater's Newfoundland. The detailed analysis of new issues provided by the following tables suggests that demand for medium-term Government issues, at current yields and prices, is near if not past, its peak.

TABLE I—TOTAL BORROWING (MILLION £)

Turner and Newall Investments

The full accounts of Turner and Newall for the year to September 30th last suggest that the decline in disclosed profits from £2,754,401 to £2,586,162, before tax—to which attention was drawn in a note in the preliminary statement in *The Economist* of December 19, 1942—is due to a rise in costs. It is not clear whether there has been any fall in turnover, but this does not appear probable. The company's balance sheet shows a rise in net liquid assets, excluding inter-company items, from £3,741,449 to £5,204,476. There is a slight decline in both debtors and creditors, but this is accompanied by a jump in the total of stock and work in progress from £1,970,730 to £2,662,058 and in net loans to subsidiaries from £948,461 to £2,259,136. The directors point out that the necessity for carrying exceptionally heavy stocks has forced the management to modify the datum line principle of valuing stocks which was introduced in September, 1937. Thus, the increase in stock value is in part due to the failure to

write down the total to datum value—there is, of course, a very considerable stock reserve already built up. The consolidated statement shows a rather smaller rise in net liquid assets from £4,800,155 to £5,298,914, while the rise in stocks and work in progress of the group amounts to some £900,000. As the chairman, Sir Samuel Turner, points out, the capital expenditure of the group was again checked last year by war considerations. Demand for all the varied products of the group appears to have been well maintained, while the growth of the war effort in India and the United States has especially favoured the subsidiaries in those countries. In the United States, there has been some difficulty in obtaining an adequate labour supply. The Rhodesian asbestos mines are now operating at maximum capacity and it is anticipated that this will continue throughout the current year. The concern is fortunate in that the expansion which is being engendered during the war is unlikely to become redundant when peace returns. Technical progress in industry should ensure a rising secular demand for the products of the group. In the immediate future, however, a considerable decline in demand for the building material group of products is very probable. The £1 ordinary stock, at 73s. ex dividend, yields £3 8s. 6d. per cent.

Harrods (BA) Results

The accounts of *Harrods (Buenos Aires)* for the year to August 31st last unfortunately fail to show gross income on a basis comparable with recent years. After estimated provision for EPT and after exchange loss which took more than £100,000 in the previous year, total profits are shown at £332,124 against £330,019. Since the concern received a dividend of £145,028, against £135,394, from its subsidiary *South American Stores*, due to the receipt from past profits of a dividend of £9,920 from its subsidiary, *Almacenes Argentinos*, it is clear that earnings of *Harrods (BA)* itself were no more than maintained. There was, however, no rise in charges against profits so that surplus earnings, before allocations to amortisation and obsolescence, amount to £15,631 against £5,466. This sum is fully absorbed by the transfer of £10,000 to buildings obsolescence and £5,000 to amortisation of premises as before, while contingencies receive £631 against £466. In view of the sharp increase in local taxation the latest results are satisfactory. They appear to owe something to greater exchange stability within the continent and, no doubt, a good deal to the rise in Argentine price levels. As with the controlling company, the profits of *South American Stores* and the main subsidiaries were narrowly maintained. The balance sheet shows a slight increase in surplus liquid assets, excluding inter-company items, from £1,021,438 to £1,087,307, while free reserves are reduced from £334,824 to £325,998. There is an increase of £50,000 in the loan to *South American Stores*. The rise of £90,000 in the exchange reserve to £291,000 is due to consolidation with the second exchange reserve fund previously deducted from stocks. Thus, there is a certain overstatement in the apparent increase in the stock figure from £658,427 to £962,179. There is still, unfortunately, no prospect of any payment on ordinary or deferred capital.

Apex (Trinidad) Accounts

The full accounts of Apex (Trinidad), whose preliminary statement was discussed in *The Economist* of December 26, 1942, indicate that, with the current transfer of £242,084 for amortisation of wells, 94 per cent of the original cost had been written off at September 30th last. Before arriving at disclosed profits of £676,746 against £586,329, £32,039 against £33,419 was written off plant, buildings and equipment. Total capital expenditure for the year was reduced from £287,325 to £257,030. The balance sheet shows that last year's increased activity has in no way strained the company's financial position. Net liquid assets are more than £50,000 higher at £469,563 against £411,592. Creditors and provisions have jumped nearly £100,000 to £163,570, but the loan of £50,000 has been eliminated. These changes have financed the transfer of £100,000 to tax reserve certificates and the rise in stocks from £196,137 to £234,182. Total fixed assets have now been written down to £784,667 against which general reserve amounts to £460,000. While there is little doubt that the scope of the company's business has been extended by the war, the development appears to have been sufficiently gradual not to strain the company's resources.

Industry and Trade

Royal Ordnance Factories

Sir Andrew Duncan had already replied in general terms in the House of Commons, last July, to some of the criticisms contained in the report of the Select Committee on National Expenditure about Royal Ordnance Factories. The Ministry of Supply, in a memorandum, published last week as the Select Committee's second report, goes into more detail. It denies the Committee's charge that the surplus capacity of ROFs was excessive, and point out that the particular factory which was alleged to have a surplus labour force of 6,000 no longer has any surplus. Indeed, labour wastage, which is presenting a serious problem, especially among women, is tending all the time to reduce the labour strength, and the question is one of how to keep up the supply rather than of how to transfer surplus labour. The Ministry shows that the rate of absenteeism has been steadily diminishing, and quotes some creditable figures as evidence—in the last eight months in the filling factories the rate was reduced from 12 per cent to 6.6 per cent for men and from 23.5 to 14.6 per cent for women. It is satisfactory to learn that uniform records are now available, and since absenteeism is a problem common to all war industries, it might be found suitable for an investigation into its causes to be carried out on a national basis, a task which some such body as the Industrial Health Research Board might properly undertake. It is also satisfactory to know that hours have been limited—in the vast majority of ROFs, men's hours have been reduced to 60 or less, and women's to 55 or less—and that systematic efforts are being made to upgrade labour and place workers in the jobs for which they are most suited. On the organisational side, the Ministry rejects the suggestion that responsibility for ROFs as a whole should be vested in one single person, but, in order to overcome the difficulties created by dual responsibility, the Director-General of Ordnance Factories (Filling) is to be given a separate administrative staff. Neither the Select Committee's original report, nor the Department's replies, make it easy for the layman to form any conclusion or to obtain a proper perspective of the organisation and efficiency of ROFs. The Select Committee naturally tended to concentrate on their shortcomings, and generalisation from the particular was inevitable; on the other hand, the Ministry appears to dismiss somewhat too lightly some of the very serious criticisms which the Committee had made.

Steel Supplies

The task of the iron and steel industry in 1943 will not be an easy one. During the past year, the reduction in American supplies has been almost completely offset by an expansion in home production; in recent months, the output of steel has probably been at a record rate. But although stocks of raw materials are reported to be still satisfactory, provision for adequate supplies is essential to the maintenance of steel production. So far as iron ore is concerned, there is no reason why the maintenance of low-grade domestic supplies should give rise to serious difficulties; moreover, imports of high-grade ore from North Africa may improve the position of the special steels section. One of the chief problems will probably be scrap. There was an increase in the rate of scrap collection last year, but a special effort will be needed to avoid a shortage this year. Mr George Hicks, Parliamentary Secretary of the Ministry of Works and Planning, has already announced that another 1,000,000 tons of scrap will be required; it can and must be secured. As important as the maintenance of steel production is the need for economy, for making available supplies go further. This is the task of the consumers of steel rather than of the producers. In the immediate future, Sir Charles Wright, formerly Steel Controller, will again be at the helm as Acting Controller in place of Sir John Duncanson, who has had to relinquish his post temporarily owing to illness.

Passenger Transport Facilities

The Ministry of War Transport appears to agree with the main conclusions and recommendations of the Select

Committee's report on passenger transport facilities; and in its reply, points out that steps are being taken, if they have not already been taken, to improve travelling facilities for war workers. The supply of new buses and spare parts is being increased during 1943. A fresh publicity drive is being launched to emphasise the important part played by transport workers in the war effort, as well as to bring home to the public the difficulties of bus undertakings in wartime and to appeal for maximum co-operation and consideration. The two Joint Industrial Councils of the industry have been invited to examine the problem of absenteeism among women bus conductresses and to make recommendations on how to reduce it. More women are to be trained for maintenance work and special courses for motor mechanics are being held at Government Training Centres and Emergency Training Establishments. Progress has been made on the staggering of working hours, and firms are being urged not to alter factory hours without first taking into account the transport problems involved. The Ministry's Regional Commissioners, when they are satisfied that local transport difficulties can be eased by staggering working hours, can take up the matter either direct with the firms, through the local Transport Consultative Committees or, if necessary, through the Regional Production Boards. The Select Committee had quoted instances of unnecessary cross-travelling by workers, and had urged that the Ministry of Labour should avoid this by directing workers to places nearer their homes, wherever possible. The Ministry of Transport reports that its Regional Commissioners are in constant touch with the Regional Controllers of Labour about preventing unnecessary cross-travelling; and that, moreover, the Ministry of Production has recently suggested that District Production Committees should interest themselves in the matter. If all these things have been done and are being done, they should help to ease the workers' transport difficulties. At the same time, the efficiency of transport services will inevitably vary from area to area, and it is essential that the problems should be kept under constant review by those responsible both on the spot and at the top.

Economising Tin

The loss of their Far Eastern sources of tin supplies a year ago compelled Great Britain and the United States to adopt drastic measures of economy and to increase production in other countries. But in view of the stocks held, the sources of supply still available and the scope for economy, a tin shortage, serious enough to hamper the war effort, seemed even then unlikely. Any fears of a serious shortage have now been largely dispelled. Apart from the success achieved in securing a bigger output from some countries, the United States has been able to curtail consumption drastically from about 100,000 tons in 1940 to 65,000 tons in 1941. According to the December issue of *Tin*, the monthly bulletin of the Tin Producers' Association, stocks of primary tin in the United States probably still amounted to no less than 120,000 tons at the end of last year, equivalent to nearly three years' requirements on the assumption that consumption can be cut to 40,000-45,000 tons a year without harmful effect. The belief that consumption can, in fact, be reduced to this level is supported by the big economies secured by the introduction in America of the continuous electrolytic process of coating tin-plate in place of the hot-dipping process. Not only does this process yield a saving in tin up to 50 per cent and more, but it is reported to be cheaper and to improve the quality of tin-plate. Apart from reasons of economy, Great Britain can hardly afford to ignore the new process, if the claims made for it are in accordance with the facts.

Vegetable Prices

The Ministry of Food's scheme for the control of prices and distribution of green vegetables is to begin on January 11th. The first news of the proposals came five or six weeks ago, and they were discussed in *The Economist* of November 21, 1942, on page 646. Under the *Green Vegetables (Maximum Prices) Order*, ceiling prices are fixed for growers, wholesalers and retailers, which take

into account services provided, transport costs, loss of weight through evaporation, and other factors. Although some of the vegetables concerned have hitherto been sold on a unit basis, the control measures necessitate price-fixing by weight. The retail prices per lb are as follows:—

Spring cabbage and spring greens, 6½d.; savoys, 5d.; drumhead cabbages, 4½d.; kales and sprouting broccoli, 4½d.; Brussels sprouts, 7½d.; sprout tops, 6½d.; cauliflower and broccoli, 7d.

It is emphasised that the prices are ceiling prices, and that they should fluctuate, as they have done normally. The trade will be faced with difficulties in dealing with weight prices, but provision has been made to ease them as far as possible. The prices will remain in force until the end of the first week in May, when it is expected that they will be revised to reflect normal seasonal trends, and in the light of experience which will have been gained.

* * *

Gas and Electricity

The Ministry of Fuel and Power is to be commended for lifting the black-out on the publication of statistics relating to the production of coal and to the consumption of coal in the manufacture of gas and electricity. The publication of these figures is an essential precondition of the success of the Ministry's "save fuel" campaign. The accompanying table shows for each month since April, 1941, the percentage change in the consumption of coal for conversion into gas and electricity. It reveals that, previous to the launching of the campaign, the rate of increase in con-

TREND OF GAS AND ELECTRICITY COAL CONSUMPTION

Percentage Increase Month by Month over the Previous Year

	Gas %	Electricity %
1941:—		
September	11.9	15.1
October	11.2	14.7
November	11.7	13.6
December	11.7	13.6
1942:—		
April	11.0	12.0
May	9.3	10.4
June	8.6	9.7
Battle for Fuel Begins		
July	6.5	7.2
August	5.3	6.6
September	3.0	5.6
October	1.3	3.0
November	1.8	4.1
December	2.2	1.6

sumption was substantial and that, since July last year, it has slowed down appreciably. But while the efforts made to secure a reduction in the consumption of gas and electricity have undoubtedly achieved a measure of success, the fact is that it remains above the previous year's level. In the case of electricity the conclusion seems justified that the increase in essential industrial consumption has more than offset the fall in domestic consumption. But since the proportion of total consumption used in industry is much smaller in gas than in electricity, the reduction in the domestic use of gas has probably been comparatively small.

* * *

Cotton Cloth Prices Raised

As a result of the increase in the wages of cotton weavers this week, the Ministry of Supply has issued the Control of the Cotton Industry (No. 39) Order, 1942, which makes several important changes in the provisions of No. 32 Order and provides for an increase in all controlled cloth prices. The new price list, in addition to taking account of the recent wages award, removes certain anomalies in the old schedule, under which inequalities existed between the prices of different classes of cloth. The wages advance has been adjusted by an increase in the appropriate margins and of the holidays with pay allowance from 2 per cent to 4 per cent. New allowances have also been granted for cloths with high picks, the use of reworded weft and by an extra progressive increase in the margins for wide cloths. The amendments do not affect old contracts; these must be carried out at the prices at which they were booked. It is estimated that as a result of the new Order, buyers of cloth will have to pay 2 to 3 per cent more than at the end of last year. There is no question at the present time of spinners obtaining an improvement in their margins, as the wages question in the spinning branch of the industry has not yet been settled.

Coal Export Railway Rebate

The Government seems to be contemplating a fundamental change in the rebate scheme which was applied to the coal export and some other selected traffics under the 1929 Local Government Act. Under that Act the derating fund at the rate of approximately £4 millions per annum granted to the railways was passed on to the extent of seven-tenths to the coal export trade, and between 1930 and 1939 the benefit accruing to the coal exporting districts averaged about £1.8 millions per annum, ranging from £1.2 millions in 1938, when the rebate fund was at its lowest, to nearly £2.4 millions in 1933. When the war broke out the rebate was 1½d. per ton, plus 26 per cent of the remainder of the carriage charges (or, when the charge was a toll, 31 per cent of such toll), but after the loss of the European and Mediterranean markets in the second half of 1940, and the consequent great reduction in the volume of exports, the rebate was raised to 1½d. per ton plus 75 per cent of the remainder of the carriage charges, or equivalent to between 1s. 6d. and 2s. per ton on exported coal, coke and patent fuel. One effect of the decline in the volume of exports has been a considerable increase in the rebate fund at the disposal of the railway companies, and during the recent annual revision proceedings of the Railway Rates Tribunal an intimation was given that it might become expedient to divert the rebate into the new fund created under the Coal Charges Order, where it would be available, after defraying certain administrative expenses, "for any purpose connected with the production or marketing of coal." It was complained by the exporting districts that such action would not merely defeat the original purpose of the rebate, but financially affect very unequally the exporting districts. For the time being, the Railway Rates Tribunal has authorised the continuance of the 1942 rebate rate, but it was suggested to the Tribunal by the Ministry of War Transport that the Government proposed to introduce legislation at an early date dealing with the Rebates Fund and the payment of rebates. It is regarded as probable, writes a correspondent, that in view of the fact that the Coal Charges Fund cannot cover the Government's commitments under the present form of control, the impending legislation will authorise the statutory change foreshadowed during the recent proceedings of the Railway Rates Tribunal.

Farmers and Food

How to secure improvements in farming efficiency was the keynote of Mr. Tom Williams' address to Suffolk farmers, farmworkers and landowners last Saturday. After congratulating the county on its past achievements, he called for renewed efforts and suggested practical ways of eliminating waste and increasing productivity, urging farmers to make full use of the facilities for technical guidance provided by the War Agricultural Committees and the Ministry of Agriculture. The prime objective for 1943, as many Government speakers on this subject have emphasised, must be to save shipping and to increase home production, especially of wheat, barley, potatoes and sugar beet—a crop in which Suffolk has long specialised. In agricultural as in industrial production, labour is the chief bottleneck and with the projected call-up of younger men, the number of women must be increased. The present strength of the Women's Land Army is 52,000, and substantial increases are planned. The Land Army is still the "Cinderella" of the women's services; conscripted women are not allowed to opt for it and the status, remuneration and conditions of service of Land Army girls in general compare unfavourably with those in other forms of national service. If women are to be attracted to agriculture, they should be put on a par with women in other Services. Mr. Williams also said that he hoped before the end of the year that new cottages, exclusively for rural workers, would be built. In view of the importance of improved housing conditions from the standpoint of increasing the farmworker's efficiency, it is to be hoped that the necessary building labour will be released for this purpose. From the other end Lord Woolton has forecast further restrictions in supplies in order to save shipping space, and the extension of points rationing. The Ministry is probably shortly going to add home-produced oats and barley to the national flour. This is sensible, but the Government might go further, by increasing the degree of wheat.

COMPANY MEETING

MUFULIRA COPPER MINES LIMITED

E.P.T. EXCEPTIONAL SEVERITY MR. A. CHESTER BEATTY ON GRAVE ANOMALIES

The thirteenth ordinary general meeting of the Mufulira Copper Mines Limited was held, on the 31st ultimo, in London.

Mr A. Chester Beatty (the chairman) presided.

The following is an extract from the statement by the chairman, which was circulated with the report and accounts for the year ended June 30, 1942:—

The accounts for the year ended June 30, 1942, show that after bringing into account an amount of £123,507, representing an adjustment of previous year's sales, and transferring £130,000 to replacements reserve the profit, before providing for taxation, is £1,811,203, as against £1,766,209 for the previous year.

£1,350,000 FOR TAXATION

The amount set aside in the appropriation account to meet the company's liability for taxation is £1,350,000. Of this about £1,150,000 represents the liability for taxation for the year under review. The balance of about £200,000 is mainly made up of adjustments in respect of tax liabilities for previous years, including, on the one hand, increased liabilities resulting from the increase in the rate of Northern Rhodesian income-tax and the imposition of excess profits tax in that territory, and also the liability in connection with the adjustment of £123,507 for previous year's sales, and, on the other hand, a credit of about £120,000, representing the relief which the company has now obtained under Section 13 of the Finance Act (No. 2) of 1940.

As a result of these various adjustments the amount available for distribution after bringing into account the amount brought forward from the previous year is £540,243. The directors have felt justified in paying this year a dividend of 2s. 3d. per share, less income-tax at the rate of 5s. in the £. The cost of this dividend is £412,499 net. In addition, the directors have transferred £50,000 to general reserve and the carry-forward has been reduced from £129,040 to £127,744.

This dividend of 2s. 3d. per share, which is a nominal distribution of 11½ per cent.,

represents in fact a return of approximately 8 per cent. on the capital employed in the business. This return, especially when it is considered that no dividend was paid last year, is quite inadequate as a return on a business of this nature, with its many risks and the wasting nature of its assets. In point of fact, owing to the exceptional severity of excess profits tax in the case of this company, to which I referred in my statement last year, the profits which we are allowed to retain and distribute are made on a production of copper equal to considerably less than 50 per cent. of the actual production during the year under review. This means that the copper produced in excess of the tonnage required to make our standard profit can be regarded virtually as a donation to the war effort by the shareholders (except to the extent that there may be a 20 per cent. refund after the war of the excess profits tax paid, less income-tax). This is a considerable contribution, both in cash by way of taxation and in metal, and one which shareholders are not called upon to make except in the case of mining concerns paying excess profits tax.

UNSATISFACTORY FEATURES

Unfortunately, there are further unsatisfactory features arising out of this situation. First, apart from making a free gift of some part of the copper production, as mentioned above, the company has been called upon to find cash in order to equip the property to produce much of the extra production required during the war. Some of this additional plant may be of value to the mine in normal times, but much of it may become redundant if and when the demand for copper falls, and to this extent it has to be regarded as a further contribution by the company (unless full relief were to be obtained under the Redundancy Clauses of the Tax Laws).

Secondly, the small amount of profit which the excess profits tax regulations permit the company to retain and distribute does not permit of the setting up of adequate cash reserves to protect the position of the company after the war, unless the shareholders are to forgo part or all of their dividends, which, as mentioned above, are already inadequate as a return on this class of investment.

Thirdly, even if it were possible to set up cash reserves in addition to paying a dividend, the company might be penalised in respect of these cash reserves by the

ruling which the Tax Commissioners are seeking to impose, to the effect that these reserves represent cash which is surplus to the requirements of the company and which therefore would fail to qualify for the statutory percentage, thus tending towards reducing the profit standard of the company for the year.

Fourthly, the Northern Rhodesian Government has imposed a 60 per cent. excess profits tax, and while in the main the Act is based on the provisions of the United Kingdom legislation, there is the important exception that no provision is made for the 20 per cent. post-war refund contained in the United Kingdom legislation. This is a point which we are, of course, trying to rectify.

Lastly, there is one other aspect of the taxation problem which is also shared by other companies registered in this country but operating in the colonies, and that is that owing to the absence of truly reciprocal reliefs it is possible for a company, when it has reached a certain standard of profits, to pay more than 100 per cent. taxation on profits in excess of that standard. In this event, the greater the profit earned the less is left for distribution to the shareholders by way of dividend. This too is a matter which is receiving our careful attention.

I think I have said enough to show you some of the difficulties under which this company and others in a similar position are labouring, and of the very handsome contribution being made by the shareholders towards the war effort.

Conditions at the mine remained satisfactory throughout the year, and the plant ran without interruption for the whole period. The extension of the Selkirk shaft to the 1,400-ft. level is complete, and development has been carried on at a rate sufficient to maintain our fully-developed ore reserves. Ventilation and drainage problems have continued to engage the attention of the management, and measures have been taken to improve air distribution and to increase pumping capacity.

Mr. W. E. Romig, a consulting mining engineer of wide experience, was engaged by the directors to visit the property and make a comprehensive report on the methods of mining the ore-bodies. He made detailed recommendations which were endorsed by the company's engineers and are now being carried into effect.

The report and accounts were adopted.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

A SHARP rise in *The Financial News* ordinary share index to a new high at 94.7 and an increase in turnover, as revealed by the total bargains marked, to the level of early November clearly reflect New Year conditions in the markets. While the rise was fairly general, persistent buying of gilt-edged and other high-grade securities, and a distinctly speculative bout of buying in the home rail market, overshadowed the improvement elsewhere. A total of 905 bargains marked, on the opening day of the week in the gilt-edged market, the highest recorded since the introduction of the record in July last, reflected the widespread nature of the buying, arising from the re-investment of year-end dividends and vesting moneys. Although in aggregate, the volume of business was not unduly large, stock was in short supply. Prices in consequence advanced sharply and steadily. Among Dominion issues to improve, Australian bonds were outstanding, while Corporation issues attracted a good demand. Although sufficient support was forthcoming to raise several Brazilian stocks,

the foreign bond market was quiet. Chilean loans improved, the 5 per cent issue of 1896 rising steadily. Conditions in the home rail market were revealed by the record figure of 2,237 bargains in the first two days of the week. Buying was generally indiscriminate, equities and junior preference stocks advancing under persistent buying pressure coupled with a shortage of stock, while prior charges were marked up steadily. In contrast, the foreign rail market appeared lifeless, although prices were well maintained.

The increase in turnover in the industrial market was less than in Funds and rails and was not accompanied by any marked advance in prices, although the trend was upward. Thus, brewery shares enjoyed a small but steady appreciation in quotations, but among tobacco shares only Carreras and Imps displayed firmness. In the motor and aircraft section, a fall of 1s. for Raleigh Cycle Holding contrasted with improvements for Leyland, Dennis Bros. and Thornycroft, among others. Colliery issues were prominent in a firm heavy industrial group, but gains were in all cases restricted to a few pence. Among textile shares, British Celanese was prominent with a rise of 10½d., but shipping shares were weak. Small but persistent gains were registered for stores issues, although Woolworth fell 1s. 6d., while in the miscellaneous section

Tate & Lyle, Murex, London Brick and Brazilian Traction enjoyed useful gains.

Apart from some quiet investment demand for Rand dividend-paying issues from the Cape, the kaffir market was quiet. Rubber shares were quietly maintained in the early part of the current week, quotations hardly moving. The end of last week, however, witnessed several falls, but United Sua Betong exceptionally advanced 1s. 6d. Tea shares, too, recovered from their earlier dullness, and displayed renewed strength early this week, New Dimbula rising 2s. The oil market was quiet. Leading issues

were generally higher, but little interest was shown in the maintenance of the Shell interim. Trinidad issues were quietly firm.

New York

CONSIDERABLE re-investment demand outweighed the effect of active tax selling on Wall Street at the close of the year, occasioning a general, if small, advance. The new year opened on a less active note, but further re-investment buying maintained prices, while switching between low-priced issues accounted for a considerable turnover. Some profit-taking among leading issues left prices little changed.

* Includes Government issues to Dec. 29, 1942, only.

* Above figures include all new capital in which permission to deal has been granted.

COMMODITY AND INDUSTRY NEWS

Leather Control.—The Minister of Supply has made the Control of Leather (No. 4) Order (S.R. and O., No. 2610), 1942, by which he has taken fuller powers to control supplies of leather capable of being used for the bottoms of footwear. The Order, which came into force on January 1, 1943, makes the usage and consumption of bottom leather by footwear manufacturers subject to licence.

Control of Flax.—The Minister of Supply has made the Control of Flax (No. 16) Order relating to the control of flax, the effect of which is to revoke the schedule of maximum prices of dry spun flax yarns which has been in force since February 20, 1941, and to bring into operation a new schedule.

Fuel Economy.—In view of the Fuel Economy Campaign, the Ministry of Food recently appointed Mr. F. B. Kerridge Director of Fuel Supplies, with responsibility for allocating available supplies of fuel to the food industry, and for ensuring the utmost economy in its consumption. Prior to his appointment, Mr. Kerridge was an assistant inspector in the Armaments Branch of the Ministry of Supply, and was previously one of His Majesty's Inspectors of Mines.

Laundry Charges.—The Board of Trade, after consultation with the Central Price Regulation Committee, have made the Laundry (Maximum Charges) (No. 6) Order (S.R. and O., 1942, No. 2614) permitting laundries throughout Great Britain to increase their present war surcharge on civilian work by a halfpenny in the shilling. Under previous Orders the permitted increase on pre-war charges varies in different parts of the country, and where the present surcharge is 10 per cent or 20 per cent the laundries may calculate the new increase as 5 per cent so as to arrive at a manageable figure. This increase has been allowed in order to cover a recent rise in wages in the laundry trade.

Officers' Uniforms.—The Board of Trade, after consultation with the Control Price Regulation Committee, have made the Uniforms (Retail Bespoke) (Maximum Prices) Order (S.R. and O., 1942, No. 2556), controlling the price of officers' uniforms made by bespoke tailors from PA cloth, including for the first time uniforms of officers of the Auxiliary Territorial Service and the Women's Auxiliary Air Force. This Order revokes the Uniforms (Maximum Prices) Order (S.R. and O., 1942, No. 1289) made last July. The new Order follows the previous one in laying down minimum specifications, and requires all bespoke tailors working to them and using the Government cloth (known as PA cloth) to fix their prices by adding 5 per cent to their cost of production and sale, provided they do not exceed the over-riding maxima (exclusive of purchase tax) laid down in Schedules to the Order. Under the new Order maximum prices (exclusive of purchase tax) are laid down for Army Service dress and greatcoats, Royal Air Force tunics and trousers and greatcoats, and ATS and WAAF jackets, skirts and greatcoats.

Utility Furniture.—Utility furniture is discussed in a note on page 40. The following are the units required for each article, with its maximum retail price:—Wardrobe (4 ft.), 12 units (£14 11s. to £17 4s. 9d.); wardrobe (3 ft.), 10 (£13 2s. 9d. to £14); dressing chest (3 ft.), 8 (£10 10s. to £9 2s.); dressing chest (2 ft. 6 in.), 6 (£9 4s. to £4 3s. 9d.); tall-boy, 8 (£10 2s. 6d. to £9 5s. 3d.); bedstead (4 ft. 6 in. and 4 ft.), 5 (£4 11s. to £3 8s. 6d.); bedstead (3 ft.), 3 (£2 19s. 6d. to £2 5s.); sideboard, 8 (£10 7s. and £7 6s. 6d.); dining table, 6 (£5 15s. 3d. and £4 13s. 6d.); dining chair, 1 (£1 10s. to £1 3s.); kitchen table (4 ft. by 3 ft.), 6 (£3 8s. 6d.); kitchen table (3 ft. by 3 ft.), 2 (£2 4s. to £1 14s. 3d. and 12s. 6d.); kitchen cabinet, 8 (£11 10s. 6d.); fireside chair, 5 (£2 10s. 6d. and

£2 9s.); arm chair, 6 (£6 10s.); bed chair, 7 (£3 19s. 6d.); divan (3 ft. and 2 ft. 6 in.), 8 (£6 3s. 9d. and £5 13s. 6d.); shelves, 3 (£1 12s.); occasional table, 3 (£1 12s. 3d.); fender curb, 1 (17s. to 14s. 3d.); and, obtainable only with special permission, a bed settee, 15 (£13 4s.). Nursery furniture is obtainable without permit. The price of convertible high chairs is £2 5s. 6d., high chairs £1 10s. low chairs £1 1s. 9d., cots £2 9s. 9d. and playpens £1 19s. 6d.

THE CHARTERED BANK OF INDIA AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

CAPITAL (PAID-UP) - £3,000,000
RESERVE FUND - £3,000,000

Branches and Agencies throughout INDIA and the EAST
AFFILIATED BANK IN INDIA

THE ALLAHABAD BANK LTD., with 15 Branches & 30 Sub-Agencies
The Bank offers a complete Banking Service and provides exceptional facilities for financing every description of trade with the East.

Deposits for Fixed Periods or repayable at call or at short notice are received at rates which may be ascertained on application. The Bank also undertakes Trusteeships and Executorships.

Head Office: 38, BISHOPSGATE, LONDON, E.C.2

West End Branch:

28, CHARLES II STREET, HAYMARKET, S.W.1
Manchester Branch: 52, MOSLEY STREET

New York Agency: 65, BROADWAY, NEW YORK CITY

THE UNION BANK OF AUSTRALIA

ESTABLISHED 1857.

LIMITED

Capital Authorised and Issued ... £12,000,000
Paid-up Capital ... £4,000,000
Reserve Liability of Proprietors ... £8,000,000

(Not capable of being called up except in the event of and for the purpose of the bank being wound up)

Reserve Fund ... £3,250,000
Special Currency Reserve ... £1,600,000

Head Office: 71 CORNHILL, LONDON, E.C.3
West End Agency: 15 CARLOS PLACE, W.1.

Drafts are granted on the Bank's Branches throughout the Australian States and Dominion of New Zealand. Telegraphic Remittances are also made. Commercial and Circular Letters of Credit, and Travellers' cheques issued. Bills are purchased or sent for Collection. Deposits are received for fixed periods on terms which may be ascertained on application.

THE BANK OF AUSTRALASIA

(Incorporated by Royal Charter 1833.)

Paid-up Capital ... £4,500,000
Reserve Fund ... 2,500,000
Currency Reserve ... 2,000,000
Reserve Liability of Proprietors under the Charter ... 4,500,000
£13,500,000

Court of Directors:

D. F. ANDERSON, Esq. HON. GEOFFREY C. GIBBS.
J. F. G. GILLIAT, Esq. EDMUND GODWARD, Esq.
C. G. HAMILTON, Esq.

The Last Round Up

THIS year will see the heaviest strain of all on British manpower. On Tuesday, as a preface to the Commons' secret debate on manpower policy, the Minister of Production, primed with the knowledge he elicited in Washington of the scale and regularity of American supplies to this country in 1943, made a general statement on the further concentration of British war industry. This country is already fully mobilised, according to the definitions of only a few months ago; but more men and women are now needed in both the factories and fighting Forces. Mr Lyttelton forecast a double process. Workers will be moved within war industry itself to be concentrated on the most urgent jobs; and workers will be withdrawn from occupations hitherto regarded as essential, either to join the Forces or to fulfil more important industrial tasks.

The difficulties of this last round up should not be underestimated. It is no longer a question of taking in slack. The problem now is to cut into necessary activities with the minimum of lasting harm. The need arises from the opportunities ahead. The gaps left by casualties in the decisive battles which are to come must be filled. If men and materials are forthcoming this year in sufficient volume, great decisions may be gained; if they are not forthcoming, the chance which the mighty feats of the Russian armies are holding open will be lost. There is no choice. Because massive stocks of many kinds of

war equipment have now been piled up, it is possible to focus the industrial effort on the equipment which is immediately most needed, on ships, aircraft, anti-U-boat devices, tanks and new weapons. But it is not possible to get a quart out of a pint pot. Every diversion of manpower and womanpower, from now on, must involve the disturbance and cutting down of employments only recently regarded as indispensable. Nor can the reshuffle be carried out, at the speed required, without inconvenience and hardship to managements and workpeople. And, without the utmost skill in organisation, it will be very hard to prevent output during the change-over from falling instead of mounting. This is the crucial test of skill in administration, of efficiency in management, and of the temper and understanding of civil servants, employers and workers alike.

"These changes are part of an ordered plan." It is this fact, and the fact that it is a plan for victory, which must be hammered home to every man and woman concerned. But there is an even greater duty upon the Government to see that a stop is put at once to the maddening and frustrating inefficiencies which have often disfigured the detailed administration of manpower policy. Moreover, the comb must go through Government service as well as private business. The suspicion lingers that many Government offices, in relation to the gravity of needs, are over-staffed; and that even in the

there are still many pockets of wasted or under-used personnel. The shipment of typists and secretaries across the Atlantic to serve with British missions in the United States inspires observers with no feeling of urgency about the labour shortage. Boys of seventeen are to be asked to volunteer for the Army; boys of eighteen and girls of nineteen are to be called up; essential undertakings in industry, trade and local government are to be further stripped of the minimum number of workers now left to them to carry on their essential duties. It must simultaneously be made plain both that there is to be no further waste of a single man or woman wherever the Government writ runs and also that these denuded civilian undertakings will not be held responsible if they can no longer fulfil all their tasks.

There were, no doubt, those in the Commons' debate, and will be elsewhere, who say that the plan is impossible; that the manpower does not exist for this further effort, and that the limit has been reached. This is not true. The limit will not be reached until the people of this country are living and working under the conditions which the necessities of battle have forced upon less fortunate nations. But it is true that this last effort, if it is honestly and effectively made, will involve privations and dislocations which have hitherto been avoided; and

the duty of employers, trade unions and citizens to accept these disturbances must be matched by a recognition of the duty of the Government, industry and the Services to secure the utmost economy and efficiency in the use of manpower. Without such economy and efficiency, the plan is not possible. It is, for instance, the duty of Mr Lyttelton to see that the highest standards of technical efficiency are ruthlessly imposed upon all industrial managements; the duty of Mr Dalton and Mr Bevin to see that the reserve of labour which remains in retail distribution is withdrawn, not withheld; the duty of Lord Woolton to say less and do more about economising the shipping space which is at present employed to maintain the nation's ample if not abundant diet; and the duty of the War Cabinet, overriding the Treasury, to recognise at last that indiscriminate individual losses due to the pressing of the nation's economy into the shape of total war are entitled to compensation—if only because the absence of compensation has meant that the process of physical mobilisation has been consistently impeded by merely financial considerations. Mr Lyttelton has sketched the material outlines of an all-out bid for victory; and the spirit of the people, whose hearts are high with hope, will not falter if they are given the leadership the hour demands.

Advance in Africa?

THE year 1943 opened with a clear strategical picture. The Russians in the east, the British and the Americans in the south, were reconquering the land bases they needed for a massive and concerted attack upon the citadel of Europe. The distance to be covered was still great—for the Russians, thousands of miles of occupied Russian territory, for the Allies in North Africa, the Tunisian pocket and then the sea. Yet the impetus behind the Allied attacks was also great, and the New Year came in with high hopes and a promise of great military achievement. On the Russian side, the hope and the promise have been fulfilled. The German army is in retreat. Most of the costly gains of the Nazis' summer campaign are being wrested from them. On the Mediterranean front, the advance continues, but only in Tripolitania. Elsewhere the situation is one of military stalemate. There is nothing to match the blows struck in Russia. The combined strategy limps, and once again the Nazis may be able to deal with one front alone while they merely hold or ward off the other attack.

This is the strategic implication of the delays in North Africa; and it is essential that the difficulties and confusions that have arisen there should be judged primarily in the light of the military situation. There is only one job to be done in North Africa. It is neither to determine the future Government of France nor to pave the way for Allied spheres of influence nor to confirm the predominance of this or that French leader. It is, quite simply, to run the Germans out. Anything that impedes this end must be eliminated, anything that speeds it encouraged and maintained. This is the only secure basis for agreement between General Giraud and General de Gaulle. Victory, like the Republic, divides Frenchmen least. It is the simplest foundation upon which to concert Anglo-American policy. Much of the bitterness and distrust generated in recent weeks sprang from the obtrusion of strong, but totally irrelevant, political and personal considerations, while the rumours and discontents have flourished the more for the complete obscurity that has enveloped the North African scene. It is only in recent days that the fog has lifted a little. The scene revealed is not very agreeable, but at least it is preferable to the previous blackout.

In the centre of the picture is the brave, vigorous, but somewhat bewildered figure of General Giraud. There can be no doubt of his single-mindedness. All his activities since he arrived in North Africa have been directed towards building up a French army and securing equip-

ment for it from America. As he said in an interview with Pierre Maillaud (published in the *News Chronicle*):

To-day I cannot afford to deal with the political situation. I must choose. I choose to fight. I must build up an army. Fighting more than anything else will be the cement that will unite the various elements.

General Giraud's policy is perfectly correct. This is the spirit of Fighting France—or of the French underground. *Résistance* is the cement of unity. There is no other. Unhappily, successful fighting demands more than the re-creation of a comradeship of arms in the front line. Behind the battlefield, the supply lines stretch out. If there is sabotage or disorganisation here, the fighting front cannot be maintained. There is now sufficient evidence from North Africa to show that one of the reasons why the Tunisian campaign is hanging fire is the degree of political sabotage and economic dislocation behind the lines. Tangier is still an entry and exit point for German agents. There is a steady leakage of information through *fonctionnaires* of all grades. Some reports speak of sabotage within the transport system, which is at best inadequate. Psychological sabotage, whispering campaigns, the relaying of rumours, continue on a large scale. Economically, the most serious factor is the food and textile shortage. Mr Milton Eisenhower has testified to the urgency of the need for supplies—wheat, tea, sugar, clothing. In the past, great stress was laid by Allied propagandists on the misery of French North Africa under German domination. The food was going to Germany. Very few manufactured products were being sent in exchange. This propaganda, valid in itself, has returned like a boomerang, for in some areas the local population is now worse off than before last November. As this is virtually the Arabs' only concern in the whole campaign, Axis agents have been able to foment their discontent. There is some danger of food rioting.

This is the unhealthy situation with which the Allies—Britain, the United States, Fighting France and General Giraud—have to deal. Mr Macmillan and Mr Bracken have underlined the solidarity of views between London and Washington, and Anglo-American policy is clearly being concerted at the highest level. The prospects of the two Generals coming together are also better. They are in friendly contact, and it has been suggested that General Catroux, who is de Gaulle's right-hand man, and an old and trusted friend of General Giraud, should be sent to prepare the way.

This movement towards agreement on the sure ground of military necessity is a guarantee that the most urgent problems will be attacked. It does not make them less intractable. An end to sabotage and the building up of a stable administration behind the lines—both essential to victory—require a thorough reorganisation of the North African administration; and Mr Macmillan has promised a "housecleaning." But on what principles must it be conducted? Here obviously the danger of introducing irrelevant criteria is immense. Every splintering of French opinion from Cagoulard through Royalist to Radical and Communist is present in North Africa. That is one range of diversity. Every degree of co-operation with and resistance to Germany is equally present. This is another range. The two do not coincide—the terms Right and Left are to a great extent irrelevant to the definition of resistance. All shades of opinion have produced all types of resistance and non-resistance.

Resistance is, of course, the only yardstick. But it is incredibly difficult to apply it in North Africa because, apart from the Fighting French minority at one end and the *Service d'Ordre Légionnaire* at the other, the problem is to sort out from among a mass of people who have collaborated with Vichy those who are collaborationist on "principle" in the Laval manner, because they believe France's future lies with Germany; those who through cynicism are prepared to back a winning Allied side; and those who were *attentiste* because they hoped to serve the Allied cause under cover of Vichy. The collaborationists must be dismissed at once, the cynical *attentistes* used, perhaps, but hardly in positions of authority. The anti-German *attentistes* are men France and the Allies need. The big gaps in the administrative machine can be made good with the best men available among the Fighting French and among the independent French exiles. A Joint Commission, of the type which now deals with political prisoners and refugees, might be given the task of sifting out and reappointing as soon as the two Generals and the two Allies have reached a general settlement.

The political temper of North Africa and the political developments of the last two years give some guidance on the awkward problem of sifting *attentistes* from collaborationists. The general atmosphere in North Africa is not and has not at any time been democratic. The small group of colonists and settlers have relied on strong colonial administrators of the Lyautey type. They feared and resented the attempt of the Blum Government to extend self-government to the Arabs. They watched the liquidation of the Popular Front with some satisfaction. When in June, 1940, the collapse came, although their first reaction was towards carrying on the fight—Peyrouton in Tunisia and Noguès in Morocco called for continued resistance—the defeatism of Vichy, in the persons of Pétain and Weygand, and the anti-democratic propaganda pouring out from the Axis were too strong.

Mandel and his deputies were arrested, and later General Weygand was sent out as Resident-General and Commander-in-Chief; and under him, a first purge of the colonial administration was carried out. De Gaulle and active resisters of all kinds were dismissed. The new administration was pro-Vichy, anti-de Gaulle, anti-British but also potentially anti-German.

During 1941 a split developed in Vichy between *attentistes* and the collaborationists. Weygand belonged emphatically to the former group, and although the Germans could tolerate *attentisme* in France, North Africa was too exposed an outpost to be left in the hands of Weygand, who had plans to organise the colonies in a quasi-independence of Vichy and vigorously opposed the activities of the German Disarmament Commission. In November, 1941, a new purge took place. General Weygand was removed; so was General Delattre Tassigny (who a year later at Montpellier attempted to resist the German occupation of southern France). The gaps in the official ranks were filled with collaborationists, Cagoulards, Doriotistes and their like; the SOL was strengthened. The Directorate-General was abolished and each colony came under the direct control of Vichy. A number of Darlan's associates were made governors under him.

This was the situation which the Allied invasion shattered—in part. The Allied arrangement with Darlan ensured that the more open forms of sabotage would not be exercised. It also saddled General Giraud with a crew of collaborationists, some of whom are on the Imperial Council which "appointed" him. The next steps are clear. The temporary arrangements made by Darlan to reinforce his position must be rescinded in favour of a new representative authority. The purge of 1941 must be taken as a rough guide for the new purge of 1943. Those who came into office in 1941 can be dismissed as collaborationists. Those who remained on in office may be used but with great care. Those who were dismissed can be relied on as honest *attentistes* of the Weygand or Tassigny type. It is a rough rule, but it is probably the most sure and it has the supreme advantage of cutting clean across the political lines of cleavage.

The economic problem is less intractable in the political sense, though the material side of it, shipping, land transport and distribution, may be much more formidable. The Allies have to send in supplies. They have also to control locally produced supplies and to take distribution in hand. The *grands colons*, the big landowners and planters, were in a very strong position between 1940 and 1942. The Germans flattered them, gave them a secure market and a very full share of the rather meagre returns. The proprietors' sympathies are collaborationist and since they control distribution, they are in a good position to sabotage the country's economic life. A plague of hoarding, profiteering and black marketing is raging in North Africa. The solution is to introduce strict measures of

EQUITY & LAW
LIFE ASSURANCE SOCIETY

Established 1844

Wartime Service

• In view of the absence of staff on War duties it has become necessary as a temporary measure to close certain of the Society's Branch Offices.

• Arrangements have been made to ensure that the Society's policyholders and annuitants will receive the best possible wartime service.

Head Office: 163/4, STRAND, LONDON, W.C.2. Telephone: TEMple Bar 0381
(temporarily transferred from 20, Lincoln's Inn Fields)

control and severe punishments similar to those established in, say, Syria to meet a very similar situation. Rationing has proved possible in Palestine. Some of the local officials might be brought over to introduce the system in Morocco and Algeria.

Each week lost in North Africa is a setback to the total strategy of the war. Only firm action in cleansing the bureaucracy and ending the economic crisis can give the Allies the security they need behind the lines. And the action must be speedy.

A Central Medical Service?

THE second assumption made by Sir William Beveridge when framing his plan for social security was that there would be

Comprehensive health and rehabilitation services for prevention and cure of disease and restoration of capacity for work, available to all members of the community.

The need for such services has long been recognised by the public, the Government and the medical profession itself. Nor have the planners been idle. For some years a host of schemes have been prepared for the reform of part or all of the medical services. Since the war the Ministry of Health has said its piece, somewhat belatedly, with a statement of policy confined to the hospital service and is having surveys made of the hospital needs of different regions. Lately it has set up a medical advisory committee, drawn from the profession, to advise the Minister on "the medical aspects of problems relating to the health of the people." From the profession itself the most recent proposals have come from the Medical Planning Commission of the British Medical Association, which issued its draft interim report last June; from Medical Planning Research, a body drawn from the under 45's in the health services, the first part of whose interim general report was published in *The Lancet* of November 21, 1942; and from Dr Stark Murray, whose book "Health for All" is published by Gollancz (6s. net).

The three plans are clearly inspired by different sympathies. That of the BMA may be regarded as more conservative, with concessions—considerable ones—to socialism. Medical Planning Research, on the other hand, is more socialist, with concessions—considerable ones—to private enterprise. Dr Stark Murray is frankly Socialist, with hardly any concessions at all. Since he is also a member of the BMA's Medical Planning Commission, his book may be regarded as the Commission's minority report.

Yet the actual proposals made are very similar. All three plans, like those of other bodies, envisage a health centre in each district, staffed by the general practitioners, which would take over all the ante-natal, infant and child welfare and school medical work at present undertaken by local authorities. It would work in close contact with the local hospital from which it would obtain its consultant and specialist services. The hospital service itself would be integrated, and the present dual system, consisting of voluntary and municipal hospitals, would end. MPR, for instance, envisages a small hospital, serving districts within a radius of 15 miles, which would give outpatient treatment for diseases beyond the scope of the health centre and inpatient treatment for emergency cases, minor illnesses needing nursing, midwifery, infectious illnesses and also the chronic, the infirm and the dying, which would ensure these a far better standard of nursing and comfort than if they are sent to isolated institutions. Its specialist services would be drawn from the key hospital, of which there would be three or more in each region. The key hospital would resemble, in organisation, the present voluntary hospital and consist of a series of medical, surgical and other units. Attached to it there would be long-stay hospitals for special treatment and convalescence.

The picture of the health services thus outlined is a pleasant one. Through the health centre every citizen would be assured of every form of medical service—in the BMA's words, "both general and specialist, and both domiciliary and institutional." The socialisation of medicine—its availability to every citizen, no matter what

his income—seems complete. But the practice of medicine—the relations between doctor and patient—is highly individual. How far is this safeguarded? In accordance with his Socialist faith, Dr Stark Murray dismisses it as unimportant. In fact he denies that medicine is individual in its practice, regarding it rather as the work of a team of doctors, specialists, research workers, bacteriologists and so on, down to the most lowly hospital porter. Significantly, he considers the free choice of doctor a fetish and tends to concentrate on the work of the health centre as a whole and on the hospital rather than on the work of the individual general practitioner. One feels, indeed, that to him the plan is more important than the patient—certainly, than the doctor.

However much truth there may be in his general thesis, that present-day medicine must be the work of a team to be really effective, the layman—the potential patient—is not likely to agree with him on the relative unimportance of the GP-patient link. Nor does either the BMA or MPR. The BMA Commission's report laid down that the widest possible measure of choice, both of doctor and of patient, is essential for the successful running of a medical service. MPR points out that the patient's right to choose his doctor is largely illusory, but makes the pertinent remark that what is important is not so much initial freedom of choice as freedom to change later. It also urges that a medical student intending to become a general practitioner should be trained as such. He should learn not, as at present, to be jack of all specialties, but to be master in his own, very wide, sphere. Further pursuing the ideal of individuality in the general practitioner service, MPR suggests that each doctor at the health centre should have his own consulting-room "as each room should develop its occupant's personality," and it would allow a patient to choose not only his own doctor but his own centre and his own hospital as well, even if they should be outside his own administrative region.

The safeguarding of consumer's choice in this way would certainly help to throw into relief the inefficient doctor, health centre and hospital, which might otherwise tend to result from a socialised medical service. Provided it is safeguarded and provided he gets the best service available, the layman will not be concerned in the question of how the doctors should be paid, whether they should be salaried servants of the State—as Dr Stark Murray would like—or whether they should have a basic salary, with a capitation fee for every person on their list, and special fees for special work—as the BMA Commission and MPR would like; nor will he worry whether the health services are administered by the Ministry of Health or, as MPR suggests, by a corporate body, with governors appointed, for a limited term, by the Privy Council on the advice of the Prime Minister and the Minister of Health, which would spend the national health funds received from the Social Security Fund and from Treasury grants, and would be regional in its administration. But he will note the unanimity of opinion, expressed in all three plans, on the need for avoiding the dead hand of Whitehall in medical practice. Dr Stark Murray describes a state medical service, run from Whitehall, as Fascist. MPR quotes: "It doesn't matter if the patient dies so long as he does it on the right forms"; and both it and the BMA emphasise that the personal responsibility of the doctor for his patient must be absolute.

But if the layman is not vitally interested in the details of administration, as taxpayer he is very much interested in the cost. Here all three planners break down. The

BMA makes no attempt to assess the cost. Dr Stark Murray contrives to make the total cost of the new service exactly the same as the estimate—£140 millions a year—he accepts for the old. More ambitiously, MPR relates the cost to the national income and its own, pre-Beveridge, plan for social security. It estimates the cost in 1938-39 at £160.3 millions, of which the municipal health services accounted for £52 millions; the voluntary services for £23.3 millions; and doctors' and dentists' fees and salaries, masseurs, and medicines—including patent medicines (£20 millions)—for £85 millions. To this existing total of £160.3 millions it adds £40 millions a year for the additional cost of the nursing services under the proposed scheme and £40 millions for additional capital expenditure on new buildings, and subtracts £10 millions for saving on administration, giving a total of £230.3 millions; but it admits this to be only a rough estimate. In the Beveridge Report, the cost of a comprehensive health service is taken, after consultation with the Ministry of Health, at £170 millions a year, but this too is regarded as very provisional. Towards it there would be £40 millions from insurance contributions, leaving £130 millions to be provided from public funds.

Financially this figure can, of course, be borne. It must be, if only because a complete health and rehabilitation service is necessary in order to reduce the claims for sickness benefit. The higher payments for disability proposed in the Beveridge Report will, as the Government actuary there points out, almost certainly lead to greatly increased claim rates, even with careful certification and other measures of control. A health service which in the long run will improve the nation's health, and, in particular, by early diagnosis and full facilities for treatment and rehabilitation, prevent prolonged incapacity, should eventually offset this immediate rise in the cost of disability benefit. But more than finance is involved. The question is, how soon can the service be established? Where on the long and growing list of reconstruction priorities will the building of new hospitals come? Or the building of health centres? Are there enough doctors,

specialists and consultants available for each region, and if not how soon can they be trained? It has been unofficially stated that twice the present number of registered dentists will be necessary for a complete dental service, and it can be taken as certain that the shortage of nurses is even more acute. The proposed rehabilitation service, discussed on page 100, will alone be difficult enough to achieve. Even with the greatest possible measure of agreement among doctors and between doctors and Government—an agreement which, in spite of the similarity of the three plans discussed above, is by no means certain—there are strong practical reasons why the "comprehensive health and rehabilitation services" will be an ideal for some time after the war.

Does this then mean that since Sir William Beveridge's second assumption cannot immediately be fulfilled, his plan must wait until it can be? Must the present system, with its inadequate benefits and its deficiencies in matters of treatment, continue until every citizen has his health centre and a hospital bed awaiting him? There is surely no reason why the insurance proposals should not be adopted, if agreed upon, straightaway under improved national health insurance and workmen's compensation legislation. Every insured person would have the right, as at present, to a free GP service; he would also have the right to a free hospital and specialist service. Whether he would obtain it would depend on the facilities available, but it should be made a condition of appointments, whether full-time or part-time, to hospital staffs and of grants to hospitals that priority in all matters must be given to the most sick and not to those who, if they are allowed to, continue to pay private fees. If the insurance regulations do not merely permit an insured person to have all existing medical facilities, but lay down that he must have them where they are reasonably available, the beginnings of a complete health service would be there, even if the machinery had not been decided upon and the health centres were still unbuilt. At least it should mean that the availability of the health services would be limited by the physical means of the hospitals and doctors and not by the financial means of the sick.

The Pattern of World Trade

THERE has recently been a tendency to belittle the part played by foreign trade, through the international division of labour, in economic progress. The almost lighthearted manner in which this essential pillar of material advancement is nowadays dismissed is largely due to a lack of both knowledge and understanding of the facts. The Economic Intelligence Service of the League of Nations has rendered a signal service by publishing an admirable study* of the complicated pattern of world trade, as it existed before the war. It contains, besides an exposition of the fundamental factors which have influenced the international division of labour in the past, an excellent analysis of the nature, size and distribution of world trade, and of the complicated process by which financial obligations arising from foreign trade were settled—though it might have been interesting if the analysis could have been carried one step further to show, for countries for which statistics are available, the ratio between production and exports. It is impossible, within the scope of a short article, to do more than select a few points; the "Network of World Trade" should be read, every page of it, by all who are interested in finding the right solution to the post-war economic problem. The facts speak for themselves.

The incentive to the international division of economic springs from the uneven distribution of economic resources, geographically, and it has been the means whereby countries have secured a national income—a

level of prosperity—higher than they could possibly have obtained exclusively from their own resources by a policy of self-sufficiency. Climatic conditions and the supply of mineral deposits vary enormously from country to country; perhaps even more important are the disparities in the relative supplies of labour, skill, capital equipment and productive land. As a result of these differences, the activities which yield the highest return vary from country to country; they explain the advantages of international specialisation and the mutual benefits of international exchange. They also explain the advantages which have been derived in the past, by all parties, from the stimulation of production in complementary countries abroad by overseas investment—that is, by supplying countries possessing a plentiful supply of labour and abundant natural resources, but short of capital, with equipment. All this is, or should be, ABC; the point is that these simple truths still hold good, in spite of the chronic tendency of ingenious politicians and pundits to deny them.

During the years before the war, the value of goods entering international trade was roughly equivalent to the national income of the United Kingdom. A little more than one-fifth of world trade consisted of food, and the remainder was distributed, in almost equal proportions, between raw materials and partly manufactured products, and finished goods. The way in which world trade was distributed in 1928 and 1938 (the figures for individual countries have been converted into dollars at the new gold parity) is shown in the first of the accompanying tables. One of its most striking features is the lack of

* The Network of World Trade; League of Nations; 172 pages. Published by Allen and Unwin; price 10s.

symmetry between the distribution of the imports of each of the eight groups of countries and their exports. In 1938, for example, North America imported from non-continental Europe (chiefly the United Kingdom) 8 per cent of its total imports, but sent to non-continental Europe nearly a quarter of its exports. Proportionately, both continental and non-continental Europe purchased twice as much from North America as they exported to that region; and the disparity was even greater in Oceania's trade with North America. In continental Europe, an important fact is that more than half the aggregate trade of the various countries was carried on within the continent before the war.

Secondly, there were certain significant changes in the distribution of the trade of the eight groups of countries between the two years 1928 and 1938. There was a relative decrease in Latin America's imports from and exports to North America and an increase in trade within the Latin American group. Another example was the shift in Russia's trade from continental Europe to non-continental Europe and North America. The distribution of the trade of non-continental Europe also underwent significant, if less violent, changes.

In 1928, more than in 1938, the distribution of the foreign trade of the various countries was determined by their needs. Very reasonably, each country still tended to

(a) The values are shown in dollars according to the parity in force in 1928.

(b) Including Chile.

NOTES TO TABLES AND DIAGRAM

TABLE I.—For the purpose of calculating the percentage distribution of imports and exports, the trade statistics for the various countries have been converted into dollars at the 1934 gold parity (one dollar = 0.88867 grammes of fine gold). Adjustments have been made to secure uniformity of valuation, c.i.f. in the case of imports and f.o.b. in exports. The figures showing the proportion of the trade done within each of the various groups of countries are given in italics.

TABLE II.—The groups of countries have been chosen and arranged so that the balances should illustrate the system of multilateral settlements. The tropics include central Africa, the tropical agricultural and the mineral-producing countries of Latin America, and tropical Asia. Other regions of recent settlement include the British dominions and the non-tropical agricultural countries of Latin America. Non-continental Europe includes, besides the United Kingdom, Iceland, Eire, Spitzbergen and the Faroe Islands. The "rest of the world" includes North Africa, Japan, Korea, Formosa, China and other Asiatic countries, and USSR. Groups A—E cover 90 per cent. of world trade.

Figures not reflecting the direction of international transfer are shown in italics; those of group F because the position of that group, taken as a whole, in the system of settlements cannot be clearly defined; and those relating to trade within the groups because the balances in such trade only represent the cost of transport between the frontiers of the countries concerned.

DIAGRAM.—The balances derived from Table II are given in millions of dollars at the 1928 gold parity. Both import and export balances are shown; the smaller of the two figures in each circle represents the export balance of the group from which the arrows emerge, and the larger figure the import balance of the group to which the arrows point. The difference between the amounts in question is due partly to the inclusion in imports of

transport costs between the frontiers of the exporting and importing countries. The diagram is reproduced from the "Network of World Trade."

THE SYSTEM OF MULTILATERAL TRADE, AS REFLECTED BY THE DISTRIBUTION OF BALANCES OF MERCHANDISE TRADE IN 1928

buy the products it required from the areas which could supply them most advantageously. Often, the purchasing country could not satisfy the needs of the supplying country, at any rate not on advantageous terms. International specialisation cannot be carried out to the best advantage on the basis of bilateral trade. True, the needs of many countries trading with each other are in fact complementary; but it is estimated in the "Network of World Trade" that no less than a quarter of the exchange of merchandise during the "twenties," before bilateralism became an end (or blind alley) in itself in national trade policies, was triangular or multilateral, that is, each country made its purchases in the most suitable areas of supply, and not necessarily from the countries to which they sold their own products.

The system of multilateral trade which began to spread rapidly some seventy years ago, with the improvement in transport and communications, obviously requires complicated facilities for the settlement of multilateral claims. This delicate mechanism is lucidly described in the "Network of World Trade." In general terms, of course, the process is familiar. If country A has a financial claim on country B in respect of an export surplus or services rendered and B cannot discharge it by the shipment of gold, it has to acquire the requisite currency, generally by means of an export surplus, from country C. Country C, in turn, has to offset its import surplus from B with an export surplus to D, and so on until the circle is closed by an export surplus from the last country in the chain to A. The operation of the system in 1928 is shown statistically in Table II, in which the merchandise trade balances of six groups of countries with each other are set out; and the process is further illustrated by the accompanying diagram. (The year 1928 has been selected because of the subsequent disturbances to the system.) It must be remembered that the table and diagram show merchandise trade balances only; they do not take into account claims arising from shipping and other services and in the form of interest from capital investments. All these items have, of course, to be included in order to arrive at a final balance of claims on current account.

After a short interruption during the last war, the system of multilateral exchange continued to function,

though perhaps not as smoothly as before, with beneficial results. Between 1913 and 1929 the volume of world trade rose by some 30 per cent. But in the "thirties" its operation was seriously impeded by the deliberate turnover to bilateral settlement 'between individual countries or groups of countries; and the volume of world trade never reached the 1929 level during the economic recovery from 1933 to 1937. The strait-jacket was on.

During the war multilateral exchange is virtually in abeyance and, seizing their chance, the exponents of self-sufficiency and bilateralism demand that it should be left there. Technological progress, so they argue, has lessened the need for trade; this is the ersatz age, the era of synthetics. And, so they go on, the reduction in Britain's overseas investments, with a consequent fall in interest payments, has lessened the possibilities, as well as the need, for a multilateral system of trade. Such sophistries, if heeded, would spell ruin, above all for Britain, which, perhaps more than any other leading power depends on international specialisation for its standard of life. The facts, it must be repeated, speak for themselves. The League's survey, in cold, hard, unchallengeable figures, proves an unmistakable moral.

International trade is more than the exchange of goods between one country and another; it is an intricate network that cannot be rent without loss.

Multilateral trade will be as beneficent and necessary after the war as it was in the past. Admittedly, the system as it operated before the war may not fit the conditions of the post-war world. For a time, in certain spheres, some measure of bilateralism may be compelled by circumstance—but always, if common sense and progress are to prevail, as no more than a necessary evil, very short-lived and to be sloughed off as the conditions of wealth and wisdom return. If there is to be any economic future for the world, international commerce must again be contrived so that all the countries can secure their import requirements as advantageously as possible. Bilateralism, as a permanent policy of trade, is the economic nonsense of suicidal politicians.

NOTES OF THE WEEK

Year of Decision?

Echoing Disraeli, Mr Churchill recently spoke of "the end of the beginning." Now it may be that the end itself has begun, however long its achievement may take. Victories like those of the Russian armies, added to and continued, can spell victory itself. Britain's share is three-fold. There is the pressing need (emphasised in an article on page 94) to break the block which the enemy has set in Tunisia to the advance to a Second Front. There is the need, no less urgent, to control the menace at sea, where shipping losses (still kept secret) may not have declined much from the high rate of the closing summer months; the capacity of the Allies to import necessities in full or to supply the arms of victory in proportion to their industrial output is seriously impaired. The recent news of successful convoys to Russia and across the Atlantic merely underlines the strength of the submarine threat and the weight of protective power that is needed if a convoy is to come safely through. Thirdly, there is the air weapon. The Allies have won air mastery; the problem is how best to use it. Strategic bombing has been foiled for months by the weather and by the diversion of aircraft and personnel to crucial military and naval tasks. Now, still almost exclusively in British hands, it has restarted. The Ruhr and Berlin have been very heavily raided; and the Luftwaffe has replied with a splutter over London. In all these months, after more than a year of belligerent preparation, its bite will surely be prodigious. It is upon the co-ordination of all these factors, the advancing Russian armies, the massing of Allied armies in Africa, power at sea and superiority in the air, that success in 1943 will depend. No national, political

or professional controversies must be permitted to obstruct the concentration of effort at the right places in the right strength and at the right time. Temporarily, timing and co-ordination seem somewhat awry. The remedy is not, as some shouters suggest, to start again and contrive a brand-new Second Front overnight. It is rather to succeed, and succeed without any more delay, in the plans for action on land, at sea and in the air, and at many points, which were laid last spring and summer.

Full Speed Ahead

All along the Russian front there has been a kaleidoscopic shifting of the lines during the last week or so. In the north, the Leningrad garrison crossed the Neva and joined hands with the Russian forces operating from the Volkhov river. Another vulnerable German wedge is left, based on the Gulf of Finland in the north and on Novgorod in the south; and the raising of the siege of Russia's second capital may be followed by yet another large-scale operation on the Stalingrad pattern. In the region of Velikiye Luki, the Russian Command can claim a further, though limited, advance. The Voronezh offensive has carried the Russians back to almost the same points which they held early last summer. On the Voronezh-Rostov railway, Millerovo and Kamensk, two stubbornly defended German hedgehogs, have fallen; and the northern fringe of the Donetz basin has again become a scene of fighting. The threat to Rostov, though not yet imminent, has grown as the Russian forces have surged forward from Zimovniki to the Manych. South of the Manych, the region of Divnoe has been recaptured; and, at the other end of the Caucasian wedge, more progress has been made along the upper Kuban. A glance at a map shows that what is being fought is the old battle of the railway lines—in reverse; along the entire front, the twisted German wedges and salients are cut by Russia's pivotal communication lines. The entire reversal of the position has been additionally emphasised by the Russian ultimatum to the encircled force of General Paulus at Stalingrad. The German refusal to surrender in a position to all intents and purposes hopeless is an indication of the enemy's resolve to fight stubborn delaying battles at any cost; and the bearing of General Paulus' forces should be taken as a warning against too hasty conclusions about the broken spirit of the Nazi troops. On the other hand, the high numbers of German prisoners taken on the other sectors of the front show that the morale of Hitler's soldiers in the east is by no means uniformly strong. So far, the Germans have lost nearly half the gains they scored during their 1942 offensive. What if they lose the other half? How will the soldiers' morale stand such a blow to the Fuehrer's prestige, to their commanders' infallibility and to their own self-confidence? True, the German army has several alternative defence lines in the rear, a whole series of its own Maginot lines. But experience shows that Maginot lines are of no great use when the spirit of an army is sapped or broken. All that can be said for the time being is that morale is incalculable; its failure may destroy the enemy more quickly than the optimist dreams in his most optimistic flights of fancy or its maintenance may sustain him longer than the pessimist believes possible.

Staff Work

In his war review in the House of Commons on Tuesday Mr Attlee said:—

I have often heard it said, "Oh, yes, the Russians are very good fighters and very brave, but no good at organisation and incapable of staff work." That is absolute nonsense and has proved to be.

This tribute to the Russian staff work is well deserved and timely. Never before has the Russian Command achieved such brilliant successes in timing and co-ordinating its moves. The commanders have diligently learned from the grim experiences of the earlier stages of the war; and the way was paved for these recent achievements by some thoroughgoing reforms in the Red Army. One of them was the establishment of special bodies charged with the co-ordination of operational plans and their execution all along the huge front "line." The official communiqué on the raising of the siege of Leningrad revealed one detail of what seems to be the most important overhaul in the High Command. It said that the "co-ordination between the two forces was entrusted to the representatives of the staff of the High Command—Marshal Zhukov and Marshal Voroshilov." Marshal Zhukov's appearance on the Leningrad front came, in fact, as a surprise to the press, as shortly before he had been described as the commander on the southern front and had been credited with the successes obtained there. It is now clear that Marshal Zhukov acted on both fronts as a sort of supreme liaison officer charged with the special task of co-ordination. And it seems that Marshal Timoshenko may still be commanding in the southern sector.

At the Gates of Tripoli

It is difficult not to follow the campaign in Tripolitania with mixed feelings. Rommel's retreat has proved beyond any doubt his enormous inferiority. The co-ordination of the Eighth Army's various services and the flow of its supplies along the difficult desert trek have been a feat in which General Montgomery's soldiers may rightly take the highest pride. It is disappointing, on the other hand, that since the battle of El Alamein, the Eighth Army has not succeeded in engaging the enemy's main force. At Agaila, only rearguard clashes occurred. Wadi Kebir and Wadi Zemzem were two more missed opportunities of coming to grips with the remnants of the Afrika Korps. And now again Misurata has been given up by Rommel without a shot. All the time the advancing Allies seem to gain too easily in territory while the enemy seems to lose too little in manpower and equipment. The attackers have failed to reap all the fruits of their initial victory, while Rommel refuses to drain the cup of defeat to the last bitter dregs. Rommel's next step can only be a matter of conjecture. Will he make a stand at Tripoli or will he withdraw the Afrika Korps behind the strongly fortified Tunisian frontier? If he chooses to join General Nehring and if he achieves this with his fighting power intact, the Tunisian campaign may become correspondingly more costly.

The Disabled

Since the publication, in 1939, of the final report of the Delevingne Committee on rehabilitation, considerable progress has been made towards the physical and occupational restoration of the disabled. Special accident hospitals have been set up, voluntary social services have extended their activities to post-hospital and follow-up treatment, and a scheme for rehabilitation and resettlement (that is, re-employment) has been put into force by the Ministry of Labour. This last was always stated to be merely an interim scheme, with an emphasis on retraining for warwork. Last week a long-term scheme was proposed in the Report of the Inter-Departmental Committee on rehabilitation and resettlement, which sat under the chairmanship of Mr G. Tomlinson, Parliamentary Secretary to the Ministry of Labour. This Report (Cmd. 6415) is a twofold advance on that of the Delevingne Committee. The latter dealt almost exclusively with fracture cases. The Tomlinson Report covers persons disabled by pulmonary tuberculosis, blindness, deafness, cardiac weakness, neurosis and psychosis as well. Secondly, the Tomlinson Committee has recognised that rehabilitation is of little use to a worker if his return to work is barred by non-medical factors. It has, therefore, devoted much of its Report to the actual resettlement of the disabled worker in a job, either in his original type of employment or in a new one for which special training facilities have to be provided. To effect this, the Committee recommends that employers should be obliged to employ a certain number of the disabled. It, therefore, goes beyond the first two stages of rehabilitation—medical and post-hospital—to the need for legislation for resettling workers who have passed through them. It proposes that restrictions should be laid upon the engagement of non-disabled workers by an employer who is employing less than a prescribed percentage quota of registered disabled—it recommends that a register of disabled persons should be set up, as Professor Girdlestone, of the Wingfield Orthopaedic Hospital, recommended some time ago. Secondly, it proposes that certain occupations should be scheduled for the benefit of the disabled, and that the engagement of non-disabled persons in these occupations should be prohibited unless a special licence has been obtained. The King's Roll scheme, started after the last war, would then come to an end, but disabled ex-service men still in receipt of a pension would be entitled to registration under the new scheme.

Conditions of Success

The Tomlinson Report thus envisages a very complete scheme of rehabilitation and resettlement. But there are conditions that must be fulfilled before it can be in proper working order—as it must surely be if the many casualties of the war's last and biggest battles are to be rightly cared for. The first, as in so many plans, is a high level of employment. It should be noticed that the quota proposal would not impose an obligation on an employer to employ the full percentage quota of disabled persons; it would merely prevent him from engaging more non-disabled

workers while his quota was unfulfilled. In a time of low employment, therefore, the number of disabled persons who could be placed in work would also be low. A more immediate difficulty will be the shortage of personnel and equipment for rehabilitation work. There are at present 21 orthopaedic centres in England and Wales working in the Emergency Hospital Scheme and 60 hospitals earmarked for the specialised treatment of fractures. But other hospitals do not as a rule provide more than ordinary surgical treatment, and when medically disabled persons are brought within the scope of rehabilitation and resettlement, the inadequacy of the existing facilities will be even more apparent. Finance may be provided and the administration set up; but the equipment and staff will still be lacking. In this branch of the health services, probably more than in any other, will the physical shortages, referred to in an article on page 96, be acute. A further disadvantage of the scheme is that, like the Beveridge plan itself, it is divorced from the administration of social insurance. It is still regarded as a separate social service. It does not make rehabilitation, retraining and resettlement an obligation under National Health Insurance or Workmen's Compensation. Instead of drafting these into the framework of the existing legislation, it relies on future financial and administrative plans—which may or may not become realities.

Full Employment

The pamphlet put out by Lever Brothers and Unilever Limited on "The Problem of Unemployment" is a notable contribution to the most important of all current discussions on future economic policy. It is outstanding among the contributions made by industry to the discussion: first, because it recognises, in principle and argument at any rate, that full employment does not mean simply the permanent maintenance of employment in particular industries; and, secondly, because in a remarkable passage it denies the right of industrial associations to determine national policy.

It would involve the placing of overwhelming powers in the hands of organised industry and the public would sense in it the creation of an era of privilege, no matter what safeguards were introduced.

This pamphlet deserves (and in *The Economist*, it is hoped, will receive) more extended treatment than a short Note will allow. Broadly, its diagnosis agrees with the thesis expounded in recent articles in *The Economist*. "Irregularity of capital investment is the real cause of unemployment."

What is needed therefore is the planning of investment so that it will be sufficiently large and sufficiently regular to prevent cyclical fluctuations. The main task in fostering regular capital investment, and through it, regular employment, lies with the Government.

This task, it is argued, can be carried out by "the powerful means of indirect control" which the Government possesses: by its control over the monetary system and the rate of interest; and by the ability it has to regulate the ultimate distribution of the nation's income by expenditure and taxation. There should be two budgets, one balanced annually to meet standing expenditure out of current revenue, and "an extraordinary budget to meet capital expenditure and such emergency measures as should be taken in times of depression to fight unemployment."

In booms [by means of the extraordinary budget] the Government's policy should be to check spending; in slumps, to encourage it. . . . The two-budget system, provided it is used solely for the purpose of regularising economic life, is the most efficacious means of controlling the trade cycle, and is the one that needs most study.

"It is not suggested that industry should take any part in the general direction of anti-unemployment policy." The pamphlet lists the monetary measures, budgetary measures and investment measures, together with special public works, training and re-training schemes. Industry could plan its development as far as possible to avoid "the violent fluctuations in extensions of productive investment that are the root cause of irregularities of employment"; pursue a policy designed to foster "maximum production"; train a redundant workpeople for other work to assist "the fluidity and mobility of labour"; and keep the Government informed at all times of all technical and other considerations needed for the making of a correct policy. Nothing shrewder has yet been said in business circles about the unemploy-

ment problem—though there will doubtless be some pertinent cynicism about its being said on behalf of one of the biggest of monopolists.

Second Thoughts

Two years ago, a defence regulation permitting theatre performances on Sunday was annulled by the House of Commons by 144 votes to 136. Lately, there have been reports that the House is beginning to repent of its decision, and a motion has been tabled to have a new defence regulation made. Mr Morrison is naturally reluctant to reopen the matter until the Government is assured of a majority. Its views are the same as they were two years ago, but it does not wish to court defeat again. In the meantime, the theatrical profession has aired its views at a stormy meeting where the proverbial actor's temperament got the upper hand. From the reports of the meeting, which was called by the bodies representing the acting and allied professions, it is difficult to decide exactly which actor, and actress, was supporting what, but a resolution supporting "the demand of the Services and the public for the opening on Sundays of theatres and music-halls during the war" was carried, after the suggestion had been adopted that a ballot should be taken of all members of the profession including those in the Forces. Whether there is a demand for Sunday theatres can only really be tested, as Mr Ivor Brown stated in last Sunday's *Observer*, by opening them; if there is no demand, they will soon close. But, judged by the crowds in the streets of the West End of London, and in other big towns, on Sundays, the demand is there. Week-end concerts are having an almost unprecedented boom. If the demand is there, it is foolish to state that Sunday shows should be non-commercial. Why should plays be given on a charitable basis, when concerts, cinemas and the BBC are run on the same basis on Sunday as on any other day of the week? Actors themselves, who protest against the "commercialisation of Sunday," are not averse to receiving fees for Sunday work from the BBC. A more serious criticism of Sunday opening is that it might mean a 7-day week for the theatrical profession—including call-boys and dressers as well as actors and actresses. But there is surely no reason why they should not rest on a week-day, when most of their audiences are working. Some provincial repertory theatres, for instance, have for a long time given no performance on Monday, which is always noted for its bad house.

All Rights Reserved

The attempt of General Orgaz, the High Commissioner of Spanish Morocco, to steal a march on the Allies in Tangier, by announcing the incorporation of the zone in the Moroccan Protectorate, was perhaps a little naïve. In law, Tangier remains an International Zone whose status and administration is governed by the Statute of 1925 and the protocol of 1928. Under this arrangement, Britain, France and Italy share the control of the port and its hinterland. The British Government has consistently refused to recognise the legality or the permanence of the Spanish occupation of the zone in June, 1940, when the international administration was terminated and the legislative assembly suppressed. In the ensuing period, a *modus vivendi* has been arrived at between the British and Spanish authorities of which the corner stone is the provisional agreement of February, 1941, which guaranteed the personal rights of British subjects. If the British Government has meanwhile refrained from raising the fundamental

issue, and has assured Madrid that the landings in North Africa last November would in no way compromise the temporary arrangement, this policy was, and remains, a matter of convenience. In the long run, the British Government fails to recognise any change in the *de jure* position and reserves all rights. No mere statement by the Spanish High Commissioner that Tangier is henceforth an integral part of Spanish Morocco can change the British attitude. This must have been clear in Madrid from the start, and the point of the announcement is not immediately plain. Berlin has executed several manœuvres from Tangier in the last two years—including the instigation of the notorious riots last February—and is perhaps attempting once more to embroil the British and Spanish Governments. In fact, relations between the British and Spanish authorities in Tangier have become increasingly cordial in recent months.

Then There Was One

Chile's decision to break off diplomatic relations with the three Axis nations was not unexpected. Hinted at for several months past, the topic has in the last few weeks overshadowed all other political issues in Santiago and in many other South American capitals. Since the return of the Minister of the Interior, Señor Morales, from his visits to Washington and Buenos Aires, the trend of policy has been unmistakable. Delay at the end was apparently due to last fruitless attempts to induce Argentina to pursue a common policy, and to complete the framework of Continental solidarity. There was never any substantial possibility that the issue should be submitted to a plebiscite on the suggestion of the ex-president, Señor Arturo Alessandri. Public opinion is unmistakably behind President Ríos, who needs no special mandate. The resolution of the Senate, endorsing the President's decision to break-off relations, was carried by the very adequate majority of 30 to 10 votes, with two abstentions. In the absence of shortsighted Axis aggression, which cannot be ruled out, Chile is unlikely to enter the war.

Nowhere is the Chilean decision more keenly discussed than in Argentina. The rupture with the Axis in Santiago, coming after the Brazilian decision to become fully belligerent, must lead to a marked advance in public opinion in Buenos Aires. But it is less likely than ever that the Argentine Government will follow suit. The untimely death of General Agustín Justo has robbed the forthcoming presidential elections of the most outstanding candidate opposed to neutrality. There is now little possibility of a change of Government—still less that the Government will change its standpoint. President Castillo's decision to regard the German Naval Attaché, Captain Niebuhr, as *persona non grata* and to insist on his recall cannot be interpreted as a move toward the Allied camp. Captain Niebuhr's implication in certain espionage charges was too notorious to be disregarded by any Government still claiming to remain strictly neutral. His removal is evidence of neutrality rather than of partisanship. The Argentine Government had apparently already made it known that in the event of a rupture between Chile and the Axis its own policy would remain unaffected. Although isolated in the American continent, Argentina will continue to draw its ideological inspiration from Spain and the notion of *Hispanidad*. It is the future of Iberian, rather than Chilean, neutrality which exercises the most powerful influence on the policy of President Castillo and his Foreign Minister, Señor Guinazu.

Cold Comfort for Roumania

The last three months' fighting in Russia has taken a terrific toll of the Roumanian army. When, on Decem-

ber 31st, the Russians gave out the enemy's losses in the Stalingrad area, they claimed the rout or encirclement of ten Roumanian infantry divisions, five cavalry divisions, and one tank division. From other sources comes the news that of the six Roumanian divisions operating before Stalingrad itself, four were annihilated. The number of men killed may well be half a million. The scale of destruction in the last weeks has been so great that even the newspapers have braved the censorship to criticise the Government for persistently painting a false picture, and to appeal for national unity and calm. Since October, 1941, no casualty lists have been published, and newspapers have only been allowed to print a given quota of obituaries. A wave of resignations has marked the disgust of official circles over the Russian carnage. The Orthodox Church, usually a pillar of any current political regime, has been sharply attacked by the Minister of Culture for its failure "to collaborate." At the front, the rate of desertion is so great that the families of deserters are now to be executed in retribution. Among the civilian population, hunger, irritation and despair have led to breaches of the peace. This is the crumbling society which the Germans have somehow to keep on as a going concern. It is not revolt they fear, but a straight collapse, both in the economic sphere and in the field of administration. They have done what they can to bolster up the people's failing morale. The German Minister has even given special assurances that the East is impregnable. Antonescu has seen Hitler at his headquarters and "complete unity of view" was announced. This is cold comfort for Roumanians, who must continue to sacrifice its manpower in a cause which more and more of its people believe to be lost.

"National Militia"

The National Militia, in charge of which Laval has put himself, is no new invention. It is the old *Service d'Ordre Légionnaire* (SOL)—Laval's pretorian guard—under a new name. The change of name merely indicates that the SOL has been separated from the *Légion des Combattants* which brought it into being. This, in itself, is significant. The *Légion* was a mass organisation. As such it was susceptible to the anti-German trend of French public opinion. The SOL itself may also have been infected with "heresies"; hence the necessity to cut it off from the mother organisation. In a message to the National Militia, Pétain has defined its rôle. "Now they and the police remain the only organised force capable of maintaining order." Apparently the other force, the new army which was to be set up under von Runstedt's control, is not to come into being very soon. The other creations, such as the Africa Phalanx, have not been heard of recently; and the famous *Légion Tricolore* was dissolved last week. The Fuehrer's dream of Frenchmen fighting beside the Nazis does not seem near realisation. Indeed, the reported repatriation of French troops from Tunis and Bizerta suggests that the dream has been given up. All that remains has been the task to "maintain order" at home. But, even for this, the National Militia would hardly suffice had it not the backing of the occupying German troops.

ABCA and Beveridge

Sir James Grigg has told the House of Commons why he ordered the withdrawal of the ABCA pamphlet with Sir William Beveridge's summary of his report. His defence was disingenuous and, to say the least, unconvincing. Its main argument was that ABCA discussions are compulsory, and compulsory discussions should be kept free of possible political controversy. Secondly, the official brief, which is issued to help officers in initiating ABCA debates, and the summary of the report "might easily have conveyed the impression that the scheme set out in the Report was settled Government policy"; consequently, he thought discussion should be postponed until after the debate in Parliament, by which time, presumably, the Government will have made up its mind. The second argument can easily be disposed of. If the brief really gave the impression that the plan had been adopted—though Sir James Grigg was surely underestimating the intelligence of army officers when he said so—the obvious thing to do was to issue a new brief telling them to make it quite clear to their men that the plan was still only a plan. As for his main defence, that compulsory discussions must be free of controversial taint, did Sir James Grigg realise the alternative? If this aim is

really achieved, ABCA, instead of having the increasing success it has hitherto won, will become anaemic and insipid, and soldiers will regard it as merely another fatigue. How there can be free discussion of political and semi-political topics, where there is no controversy, it is difficult to see. The whole affair is made even more ridiculous by the fact that, contrary to one or two stories, any soldier can read the Beveridge report as much as he likes, and Command education authorities, according to Sir James Grigg, are encouraged "to provide lectures on the subject by qualified lecturers, both military and civilian, under the ordinary Army Education Scheme."

"Wings for Victory"

Another fillip to the national savings campaign is about to be given by a nation-wide series of "Wings for Victory" weeks in which the arts of publicity and the spirit of local patriotism will be enlisted to encourage the laggard saver to greater efforts of abstinence and to shame the spendthrift. London is to open the effort with a week's campaign from March 6th to 13th, during which it is hoped that at least £150,000,000 will be subscribed to Government loans. This target sets the tone for the whole campaign. It is again to be a campaign of big figures dominated by the big institutional investors, the banks, insurance companies and the like. The old travesty of counting the banks' own subscriptions to longer term Government loans financed by encashments of Treasury deposit receipts, though worn threadbare in the Warships and War Weapons Weeks, is apparently to be repeated. Sir Archibald Sinclair, announcing the campaign and the target figure, suggested that the City of London had "put quite a bit by" for this campaign, evidencing the growth in clearing bank deposits since the War Weapons Week. In its complete misunderstanding and misrepresentation of what is meant by true savings, this suggestion was a most appropriate comment for the occasion. One could disregard these gaffes and recognise the earnest good will and unexceptionable intentions which lie behind them were it not for the fact that by this misdirection of effort the savings campaign tends to defeat the cause which it should serve. The search for the "big figures" and the magic by which these enormous targets are automatically reached and exceeded may do more to bewilder and deter the small saver than to encourage him. To see the banks subscribe their millions to "Wings for Victory" Week cannot inspire the small saver with any spirit of emulation at all. His own contributions appear so swamped by comparison as to lose significance altogether. The risk is, therefore, the discouragement of the very type of saving of which the country needs most—not the conversion of some millions of banks' Treasury deposit receipts into National War Bonds, which is a mere book-entry, but the genuine abstinence from consumption on the part of ordinary people which will set free labour and materials for the war effort.

Shorter Notes

Iraq has declared war on the Axis. This is a fitting close to the strange cycle which goes from the traitor Rashid al Galiani to the trusted statesman, Nuri es-Said. After being the only Arab country partly occupied by the Nazis, Iraq is now the only Arab state at war with Germany. It is not likely that the country will be involved in hostilities as a result.

A Colonial Products Research Council has been set up under the chairmanship of Lord Hankey. It will be an executive body, and its main function will be to consider what colonial raw materials may be of value to industry and to initiate and supervise research in order to increase their use. It is interesting to note that, in announcing the appointment of the new Council, the Colonial Office has reaffirmed the dual mandate—"... the Council will have as their principal objective the promotion of the welfare and prosperity of colonial peoples, and will endeavour also to increase the colonial contribution to the welfare and prosperity of the British Empire and of the world as a whole."

WHAT ARE VITAMINS?

No one had heard of a vitamin until a few years ago and very few people have ever seen a vitamin. But vitamins are important food factors without which no diet can be complete. The essential vitamins in the human diet are A, B₁, B₂, C and D. Vitamin A helps us to see in the dark (the vision of night-fighter pilots depends a lot on vitamin A) and it also helps to protect us from colds and other infections. Vitamin D builds firm bones and strong teeth. Vitamin C is the anti-scurvy vitamin and the vitamins B₁ and B₂ are good for the nerves and the appetite.

There is no danger of vitamin shortage if a careful selection is made from the foods available. Vitamin A is found in carrots, green vegetables, fat fish and fish liver oil; vitamin D, though short in other foods, is abundantly available also in fish liver oil; vitamins B₁ and B₂ in National Wheatmeal bread and yeast extract; and vitamin C in garden produce such as potatoes, swedes and green vegetables.

These natural foods should be included regularly in the diet.

This is one of a series of announcements issued in support of the Government's food policy by the makers of

CROOKES'
HALIBUT LIVER OIL

FULL EMPLOYMENT

The recent articles and letters in *The Economist* on the ways and means of securing Full Employment after the war have been reprinted as a pamphlet. Copies will be available (price 6d.) on Monday next; and applications should be made to *The Economist*, Brettenham House, Lancaster Place, London, W.C.2. (Tel. Temple Bar 3316.)

AMERICAN SURVEY

Ore on the Lakes

(From an Industrial Correspondent)

Cleveland, December 26th

THE 850-mile course from the head of the Great Lakes to the ports on the southern shore of Lake Erie has long been carrying more tons of cargo than any other steamer route in the world. Now the fleet operators are planning to haul 100 million long tons of iron ore alone next year. Because of the concentration upon iron, records are less likely to be broken in the other great bulk cargoes, coal, limestone and grain.

The first cargo of 1942 iron was delivered on March 24th, two weeks earlier than any previous opening. With the help of new or converted icebreakers, the opening next spring may be again advanced by 10 days or more, though almost everything depends on the weather. In most winters, even with the most powerful icebreakers, it would be impossible to take the ships through the narrower channels, not to mention the difficulty of handling frozen ore. Railroad car ferries, however, run all winter on the open lakes.

More than 350 ships will be engaged in the United States and Canadian ore trade of 1943, including about a score which were completed this year or will be delivered before the next close of navigation. Little is heard outside the United States of the shipbuilding industry of the Lakes; but a remarkable programme of bulk carriers has shared the yard capacity with small naval vessels designed to go down the St. Lawrence or Chicago canals to the sea.

In the season which ended this week with the arrival of the last cargo at the blast-furnace docks in Cleveland, a

little over 92 million tons of ironstone were moved. The years goal had been 90 million tons. The 1942 performance exceeded last year's, itself of record-breaking volume, by almost 12 million tons. The ore delivered this year is capable of being smelted into approximately 47 million tons of pig iron; but several million tons will go directly into the steel furnaces. All this ore came from six "ranges" or mining districts not far from Lake Superior. Most of it was mined in the open pits of the Mesabi range, north of the west end of Lake Superior. The Mesabi, a word meaning "giant" in the Chippewa tongue, celebrated the 50th anniversary of its first shipments last month.

Lake Steamers

The largest cargoes of 1942 were again hauled by the Canadian freighter *Lemoine*, which loaded 17,082 gross tons at Superior, Wis., for Hamilton, Ont. On another trip she took 17,775 tons of coal from Ashtabula, Ohio, to Hamilton. The United States Steel Corporation's new 640-foot carrier *Leon Fraser*, with a capacity of 18,600 tons, or one of her four sister ships, is expected to capture next year's record.

The ore trade of the Lakes is handled in a highly specialised type of craft which has developed gradually in 90 years' experience. To-day's carriers have been described as glorified box girders. They are long flat-topped vessels with almost no sheer—straight steel tanks with blunt bow and stern. The pilot house and officers' quarters are just back of the bow and the propulsion machinery and crew's quarters in the stern, with more than 300 feet of hatches between. Saltwater sailors think of these vessels as clumsy and underpowered, but they are rigidly adapted, not only to the mechanical requirements of rapid loading and unloading, but to the competitive economics of the trade. Until this year, speed was never thought so important as minimum time in the turn round; but the introduction of Lentz turbines in the new Steel Corporation's ships is clipping more than a day from the seven days hitherto required for the round trip. In the newest freighters, a pound of coal is now producing almost one horsepower.

The development of Lake shipping has had the help of a number of men from the Clyde. Among those prominent in the construction industry are John T. Webster, formerly vice-president of the Great Lakes Engineering Works; John E. Steinman, general superintendent of the American Ship Building Company; Archibald Rankin, chief engineer of the Manitowoc Shipbuilding Company; and Dean Herbert C. Sadler, of the University of Michigan, a naval architect. All four either served apprenticeships along the Clyde or were graduated from the University of Glasgow. Masters of Lake ships are essentially pilots rather than navigators, according to Mr Webster. They steer by compass and dead reckoning, use miles in place of knots, left and right instead of port and starboard, and are getting away from speaking of fathoms. Most ships on the Lakes now have the gyro compass, the radio direction finder and the ship-to-shore radio.

In the busy seasons, a carrier on the main route is almost never out of sight of another ship. This year, in the approaches to the two series of straits, five or six of them were usually in view. In normal times, most of them carry coal upbound, some of which fuels locomotives as far west as Winnipeg; but in 1942 everything was sacrificed to speed of movement in ore. Most of the ships are owned or managed in Cleveland; and this year they were operated practically as a single fleet under Alexander T. Wood, Office of Defence Transportation director for the Great Lakes, with offices in Cleveland.

In Duluth, Minn., late in the season, a 600-foot ship took on 13,700 long tons of ore in 72 minutes in a routine operation. Unloading on Lake Erie or at the Chicago docks

is a matter of three to five hours. The high ore docks on Lake Superior, on which the trains run out 2,000 feet alongside the ships, the stiff-legged unloading machinery with its 15-ton buckets, and the car dumpers in the coal trade, handling 50 tons at a time, are the spectacular features on an otherwise rather monotonous shore. This mechanical equipment, together with the dimensions of the St. Mary's Canal and the other channels, hold ship design within very close standards.

Due to the subordination of coal to ore this year, the coal movement failed to equal last year's, but did exceed 48 million tons. Far more coal than usual is being handled by rail. About 1.5 million tons of ore in addition were hauled by rail from mines in the Lake Superior district. Fogs, rains and gales made the 1942 season more than usually difficult towards its close, but the ore trade got through without the disasters it has sometimes suffered. About 30 lives were lost near the end of the season in the sinking of an ore barge and its tug, one of the units of a large fleet of tankers and barges which were hauling petroleum and gasoline eastward.

Stocks of iron ore at the furnaces now total about 53 million tons, or about a six-month supply for the furnaces using lake ore. This is the largest pile on record. It occupies all the available storage space; but the margin will be required for the new furnaces which will go into blast next year.

American Notes

Controlled Materials

The new Controlled Materials Plan has been characterised by Mr Eberstadt, vice-chairman of WPB, as "the final plan—not because it is perfect, but because there is a limit to human patience." The main advance is contained in one key sentence:—

Regardless of how the master programme is made up and balanced, it must be kept within the over-all limit imposed by the supply of available raw materials, manpower, and other resources.

At last it has been publicly recognised that indefinite expansion in every direction at the same time defeats its own ends; that plans for increased production must be based on realistic estimates of increased supplies of materials; that provision for essential civilian needs must be given equal consideration with the demands of the Forces; and that one part of the programme can only be increased at the expense of some other part. This is the hardly-learned lesson of the first year of war production.

The responsibility for putting it into practice falls to the Controlled Materials Plan. Its basic assumption is that if the demand for steel, steel alloys, copper, and aluminium can be satisfactorily adjusted to the available supplies, that other goods in short supply automatically will fall into line. The current rubber scare shows that this perhaps is too optimistic. The War Production Board is at present taking the final steps to set CMP in motion. On January 1st, the "claimant agencies" were required to submit to the War Production Board their requirements of "controlled materials" in the second and third quarters of 1943, together with preliminary estimates for the remainder of 1943, and rough guesses for the first half of 1944. By January 15th, the Controlled Materials Branches of the WPB had analysed these figures, and late last week they submitted them to the WPB Requirements Committee, which is in charge of the country's raw materials allocations. On February 1st, the Committee will allocate "controlled materials" for the second quarter of this year to the claimant agencies, who will in turn divide their allotments between their prime-contractors in February and early March. In view of the large amount of preliminary work in starting the new plan, the second quarter of this year is to be treated as a transition period; but the WPB is determined to have the plan in full operation from July 1st. On its successful working, the fulfilment of all major war production schedules will be largely dependent. The CMP, announced by Mr Donald Nelson at a press conference last November, is officially described as "a long-range plan for controlling the flow of critical materials into war production." Its two main aims are (1) to adjust requirements for critical materials to the supply; and (2) to make the quantity and type of materials needed available at the time required to meet approved pro-

Gas contributes to our daily lives in many ways. Gas helps to win the Battle for Fuel by providing half a ton of coke from every ton of coal used in the gas works. Gas-making releases other priceless by-products, from which a thousand and one familiar articles are produced—from the tar for our roads and the flavourings for our foods to explosives, plastics and the homely aspirin tablet.

But for the Gas Industry, the land would never bear such bumper crops. Among the most important by-products of gas-making are agricultural fertilisers, 80,000 tons of which are produced every year by the Gas Industry.

Just now gas and its precious by-products are needed most for war purposes. Do YOUR bit in the Battle for Fuel by burning less gas.

HOW TO SAVE GAS

Ask for helpful pamphlets at your Gas Showrooms or from British Commercial Gas Association, 1, Grosvenor Place, London, S.W.1.

grammes. It represents an improvement of the so-called "Production Requirements Plan" (PRP) which replaced the original priorities system of raw materials allocations from October 1st last, and which, with the exception of the "controlled materials," remains the basis of the country's materials allocation system. The main characteristics of "controlled materials" are their outstanding importance in war production and their scarcity in relation to approved requirements. For the time being, there are three large groups of controlled materials, namely, steel (i.e., carbon and alloy steels), copper and aluminium. Only these materials will be allocated under the special CMP, but manufacturers receiving their steel, copper and aluminium under this plan are accorded automatically increased priority in the purchase of all other raw materials allocated under the general PRP. The main feature of the CMP is the fact that it switches one of seven contract-placing Government departments (Army, Navy, Maritime Commission, Aircraft Scheduling Unit, Lend-Lease, Board of Economic Warfare and Civilian Supply) called "claimant agencies" under the plan, between the consumer of the steel, copper and aluminium (i.e., the war contractor) and the WPB Requirements Committee. In this, it represents a copy of the British steel allocation system, and introduces double control in both the allocation and the use of "controlled materials" without interfering with the strong central direction of the war production effort. The new plan, after having overcome its initial organisational difficulties, will, to use Mr Nelson's words, "assure the use of every bit of critical material in the place where it will do the most good towards winning the war." What this can mean is shown by the fact that the United States, despite the existing "shortages," has more copper, aluminium and steel at its disposal today than the rest of the world put together.

Strike Against Lewis

The strike of two union branches in the Pennsylvania anthracite mines had to be referred to the President for settlement in view of the refusal of the miners to obey the request of the War Labour Board to return to work; it is now reported that the miners have refused even the President's request. Although there is a demand for higher wages, the main and original point at issue is the increase in union dues levied by the United Mine Workers. It is, therefore, an intra-union matter, but raised to national significance, partly because of its effect on coal supplies in the east, and because it is one more expression of discontent with the high-handedness of Mr Lewis. The anthracite miners, who are in a minority in the union, have always had a grievance because they were outweighed by the soft-coal miners; and this was inflamed to strike-pitch by a 50 per cent increase in monthly dues voted by a union which admittedly is one of the wealthiest in the United States, and has at least \$7,000,000 in its treasury. The funds of the union are at the disposal of Mr Lewis, who has not grudged to spend them in his war against the CIO; and the complaint of the strikers that there is no provision for accounting by the leaders suggests that miners are not entirely in sympathy with Mr Lewis's feuds. They also point out that with the existence of the check-off they have no choice but to pay or lose their jobs. The situation is a difficult one for the War Labour Board, which has sanctioned the check-off and maintenance of membership contracts. Latest reports suggest that the President may order a Government seizure of the mines in order to get the strikers to return. But in the end it is likely that the anthracite miners may break away from Lewis entirely and rejoin the CIO, which recently has been scoring local successes against Lewis' District 50 in Pennsylvania industrial elections. The strike is not of vast importance in itself, but it points the continued unsatisfactory nature of union relations in the United States, and is likely to be cited as proof of the need for stricter control of union funds and policies by those whose inclinations are as illiberal and autocratic as those of John L. Lewis himself.

Debate Over Africa

Recent dispatches make it clear that there is no longer the unanimous blank-cheque sanctioning in the United States of North African policy that appeared to exist two or three weeks ago. Among at least the vocal sections of the public there is a vigorous and at times acrimonious

debate going on. There are, for instance, in David Lawrence, of the *New York Sun*, William and Philip Simms, of the Scripps-Howard papers, staunch upholders of the policy of "collaboration," and bitter critics of so-called "British sniping at Eisenhower." Lawrence recently went so far as to suggest that the reason for this sniping was British anxiety to see Eisenhower replaced by a British general, a fantastic and unworthy charge which Mr Bracken's statement has done something to dispel. There is also a tendency to believe that a solution of the North African muddle has been held up by the insistence of some British Cabinet Ministers that a civil administration be established under de Gaulle, an arrangement which the American Government is said to be unwilling to accept. Right at the other extreme is the position taken by a paper like the *Washington Post*, which severely censures the quality of the political advice with which General Eisenhower has been provided, speaks of "hopeless mismanagement by civilian American officials on the spot" and reminds its readers that

Americans should be the last to complain of free speech since we have never been loth to indulge in it, whether the subject was India or Britain's military efforts or the Beveridge plan.

The State Department, which recently was riding so very high, has not been immune. Dorothy Thompson condemns its collaboration with the men of Vichy and its "persistent snubbing of de Gaulle," as likely to wreck resistance in the occupied countries. The *New York Post* demands an end of "Vichy-washy half-measures" and continues:—

We think the time has come to put the State Department in charge of a new set of characters who have no connection with our past diplomatic mistakes. The same department which thought Mussolini would stay out of the war, which thought Japan could be bought off with oil, and that France would hold and Russia collapse, has now performed a reverse miracle. It has actually cast a cloud over our relations with England.

This, of course, is extreme and unfair. The *Herald Tribune*, which by printing an outspoken and anti-State Department dispatch from its London correspondent, Geoffrey Parsons, revealed for the first time the depth and extent of British disquiet over North Africa, complains rather of unnecessary secrecy:—

There has not been a really frank or intelligible news dispatch from North Africa since the landings more than two months ago. . . . The time has come when it is imperative that some wholesome draughts of fresh air be let into the festering North African situation—a condition which urgently demands correction, and a condition, we suspect, which arises less from specific policies adopted in North Africa than from the secrecy, censorship, and propaganda in which they have been wrapped.

Walter Lippmann, the *Tribune's* famous columnist, has had even sharper things to say:—

The time has come to cease misleading the American public by pretending the political situation in North Africa, which is our responsibility, is muddled because of what has been said and thought about it in London. It is just unsportsmanlike to seek for a scapegoat, and unworthy of a great people.

Mr Lippmann was also openly critical of the political judgment of Mr Robert Murphy, and referred to the

inspired campaign in the American press which, only thinly veiled, has made it appear that, in the opinion of the State and War Departments, Eisenhower's military position is being undermined and his army put in jeopardy by the machinations of the British Foreign Office and of de Gaulle, and of those Americans who presumed to suggest—though they acknowledged the temporary necessity for it—that they were not happy at finding themselves in bed with Vichy Frenchmen.

How far either extreme point of view is shared by the public is hard to say. The average American, while not altogether nappy about the North African arrangements, was probably content to accept them as long as they appeared likely to bring results, and inclined to resent criticism which by implication appeared to reflect on a popular American general and the first major expeditionary force. Now that the censorship is beginning to spring leaks, however, the press may be trusted to make clear exactly what is at stake. There are dangers, however; besides the friction and frayed tempers for which the situation is responsible, the greatest lies in the moral that the isolationists will be only too quick to draw in this period of frustration and bewilderment—that American intervention in European or world affairs wins no gratitude, but merely breeds squabbling over issues which appear remote and obscure.

THE WORLD OVERSEAS

The End of the Conservative Party

(From Our Ottawa Correspondent)

December 14th, 1942

WHY the Conservative Party selected John Bracken as its national leader is easily explained by the conviction of many Conservatives that the party was dying on its feet and by their determination to make a fresh start. But why John Bracken should accept the post is a question that escaped the political pundits as they analysed events of the three-day Conservative Convention in Winnipeg, the party's first National Convention since 1938.

There was agreement on one point—that Bracken as Conservative leader marked a historic turning point in Canadian affairs. A veteran agrarian leader, the shrewd long-lasting Premier of Manitoba, Bracken appeared strangely in the line of succession from Sir John A. Macdonald, Sir Robert Borden, Arthur Meighen and R. B. Bennett. His first step was to change the party's name to Progressive Conservative, with more emphasis on progressive. On allowing his name to go before the Convention, Bracken said there would be no misunderstanding his position if the party became generally recognised as a national progressive movement.

In view of the prevailing cynicism regarding political platforms, which are interpreted by many people merely as election apparatus, the importance of Bracken's declaration in accepting the leadership was largely overlooked. But it will undoubtedly sink in as he proceeds. "I shall be guided by a few basic objectives," he said, virtually thrusting aside the laborious platform drafted by delegates.

He listed 14 points of his own "People's Charter." These covered general objectives: the right of every man to have a job at fair wages, on the basis of service given; the right of private enterprise to a fair return and of the producers to a fair share of the nation's income; the right of equal opportunity in education, in social security; the right of the taxpayer to a fair system of taxation; the right of the public to efficient public administration; the right of future generations to a world of plenty and of peace. In a recent speech, Bracken laid down three primary essentials for the post-war world: an international system of security, an international police force and the restoration of international trade.

His 14th point was: "The right of the people to expect from their leaders a determined effort to disencumber society from the barriers to world trade, world progress and world peace." The difference in direction and purpose found in the Conservative Convention's tariff plank may be judged. The Convention plank was: "We believe that the guiding principle of Canadian tariff policy should be (a) to provide gainful occupation, (b) to maintain a high standard of living, (c) to ensure a fair price to the consumer." Well might the *Montreal Gazette* exclaim that the tariff plank was not much different in principle from that adopted in 1927. But those who know Bracken say Bracken's tariff plank will certainly be the party's plank as long as he is leader, and his plank is based on convictions hardened in the years following the Ottawa Agreements, which corresponded to the most devastating years in the history of Canadian agriculture.

Bracken's Career

Bracken's career is not as well known in detail in Canada as it should be. He left the presidency of the Manitoba Agricultural College (he had previously been professor of field husbandry in the University of Saskatchewan) in 1922 to lead the Progressives, who had just won a majority of seats in the Manitoba legislature. His chief opposition through the years was the Liberal Party, until the growing economic pressure in the wheat industry, which coincided with the term of the Bennett Conservative Government

from 1930 to 1935, forced Bracken into sharp opposition to federal policies. He moved naturally towards the Liberals. Then, when the Bennett Government refused to guarantee deposits in the stricken Manitoba savings bank, though it guaranteed the chartered banks against loss in taking over the provincial bank, Bracken effected an alliance with the Liberals. His Liberal-Progressive following won an election. These developments coincided with the beginning of the end of the Conservative Party in Western Canada, which has not come back since the *débâcle* of 1935.

Bracken's divergence from Mackenzie King is equally interesting. The Manitoba Premier campaigned for the Liberals in 1935. The next year his Provincial Government reached a low ebb in its fortunes and became dependent on small Social Credit and Co-operative Commonwealth Federation groups for a clear majority. This was for Bracken the beginning of a revival of the old progressivism. He swung away from the Liberal Party, since the plight of agriculture mended too slowly. He formed a Western Wheat Committee, which became the chief lobby for agricultural rehabilitation. His Government arranged an exchange of Manitoba honey for Munich beer and initiated a barter deal of Manitoba products for German electrical equipment, which the outbreak of war ruined. He began organising an independent Commission to go to Europe to seek

markets for Canadian farm products. Bracken's course was a direct criticism of the farm and marketing policies of the King Government.

At the Ottawa Conference in January, 1941, on the Sirois Report on Dominion-Provincial relations, Bracken was the clearest, most convincing advocate of the reforms set out in that Report. Professor Creighton has said: "In the long run, the Report will certainly be regarded as one of the greatest State papers in the entire history of the British Empire. It includes both a comprehensive, factual survey of the problem of Canadian Federalism in its historical development and a constructive, balanced programme of reform." The Sirois Report or equivalent reforms may be taken to represent Bracken's programme of domestic policies.

Underestimation

John Bracken has always been underestimated. First, the Liberals in 1922 thought to absorb him in due course, as they did many other Progressive leaders. Those they did not absorb are all gone except Bracken. Now again, in 1942, it is obvious that the Conservatives, especially the high-tariff wing, have underestimated him. This is due in part to underestimation of the times. Since the war started, the geographical centre of Canadian agriculture has shifted away from the Eastern Provinces. It is found to-day in Manitoba, and Bracken is the logical voice of agriculture, still Canada's greatest industry. But the war has also destroyed many of the ancient tenets of Canadian protectionism. Industry which has out-produced in quality and undercut in cost some equivalent industries in Britain and the United States will never again enjoy unchallenged its former theories of protection. If it can do it with machine-guns, why not sewing machines, automobiles and harvesting machines? Bracken has stood for reductions in farm costs, and there is no reason to think he will ever change.

The reasons impelling him to accept the Conservative leadership are found in his record. As a political innovator, whose practical success lies in obtaining common agreement among diverse elements, he looks for a new national progressive movement in Canada. It will be the end of the traditional Conservative Party. It will probably cut the ground from under the rising CCF.

But, most important, it will provide an adequate alternative to the present Liberal Government, for which the present Parliament is heavily over-weighted. To ascribe his entry into federal politics to personal ambition is to risk the easy mistake that misses the factors motivating a man's actions. Bracken's actions are based on a conviction that an alternative Government must emerge and on a sense of economic trends in Canada in which he has rarely been mistaken in the past.

Roumanian War Economy

[BY A CORRESPONDENT]

January 12th

A SHORT time ago, the Ministry for Economic Affairs was re-formed with the aim of organising and "steering" Roumania's entire economy by one single Ministry. The activities of the different Ministries for agriculture, public works, finance, supply, the departments for aryanisation, for trade, industry and mining, and the Central Bank, are to be co-ordinated by the new Ministry. The main executive organs are an Economic Council of Ministers and the Commissar for prices. Outstanding among the new departments is the Ministry for Army Supply and War Production, which controls mining and heavy industries. German influence is very noticeable, and the aim is undoubtedly to establish central control over the entire economy.

There is, however, a fundamental difficulty in the way of an effective war economy in Roumania. The country is still predominantly a country of peasants, working small plots of land without modern machinery and organisation. Total mobilisation has deprived agriculture of manpower and draught animals. This explains why the ambitious cultivation plans of 1941 and 1942 could not be fulfilled. Winter sowing in 1942 is reported to have reached only 90 per cent, and total sowing in the 1941-42 agricultural season remained under 90 per cent of the plan. The incorporation of Bessarabia and Transnistria, that is, the Odessa province of Soviet Russia, naturally resulted in a much larger agricultural area.

The lack of an efficient agricultural organisation, which

would enable the peasants to use modern production methods, resulted in a strange adaptation of the Russian system of Kolkhoz. Last summer, the Government decreed the organisation of Peasant Communities. Peasants are to combine in a production community, which is legally established if 15 peasants agree to form it. These communities are registered, and their activities include the purchase or hire of machinery, seeds, breeding livestock and other material. Land may also be bought or rented, and credits may be taken. The peasants belonging to a community will harvest their plots individually, but the output will be sold co-operatively. The whole system appears to be a mixture of feudal traditions, western co-operative experience, and collective principles. Although new communities will have priority rights for all state assistance, the response has so far been poor. A semi-official estimate states that 3,000 peasants, owning altogether 15,000 acres of land, have formed such communities. The total arable land exceeds 25 million acres.

Under German influence, attempts are made to expand the cultivation of root crops, oilseeds, industrial crops and rice. Apart from an increase in the acreage under oilseeds and potatoes, no appreciable success could be reported, and 70 to 80 per cent of the total acreage is still under cereals. The succession of bad harvests made the rationing of bread necessary as well as the suspension of wheat exports. The standard loaf is a mixture of 70 per cent wheat and 30 per cent barley, potato flour, maize or flour made from pulse. After another failure of the sugar beet crop, the sugar shortage has become very pronounced. It seems at first sight a paradox that a steady increase in the livestock population has been reported. It expresses, however, a sort of passive resistance of the peasant population against the requisitioning of the harvest at unremunerative prices. Cereals are fed to livestock instead of being delivered to Government agencies. The system of maximum prices for agricultural produce without effective methods of delivery naturally tends to create a black market, and it seems that the considerable increase in prices for all cereals has not eliminated black market activities. Last year, a free market for maize was re-established, but without any success. No appreciable quantities were released by the peasants, and a new maximum price was decreed.

German purchasing organisations, particularly the *Solagra*, have been active for a long time, and the co-operatives of the *Volksdeutschen* are the main agencies for the collection of agricultural produce for export to Germany which is still continuing on a large scale. In exchange, Germany has delivered some agricultural machinery. Apart from sickles, scythes, spades and other small implements, Germany exported to Roumania, in 1942, 2,814 tractors, 40,000 ploughs, 1,500 seed drilling machines, 2,230 reapers, and 250 threshing machines. This is totally inadequate for replacement of conscribed labour and draught animals, not to mention the intensive agriculture which is the main concern of the Germans. Average yields per acre are only 50 per cent of the yields obtained in central and western Europe. There is no prospect of increasing agricultural production during the war. It may be assumed that, so long as the war lasts, harvests will steadily decline even with favourable weather.

Germany's Industrial Penetration

Roumania's industrial activities are completely dominated by direct collaboration with Germany, and to a smaller extent with Italy. The leading iron and steel works and shipyards, as well as the oil companies, are practically controlled by German concerns, such as the Hermann Goering Works, the Kontinentale Oel AG, Mannesmann and Krupp.

The small manufacturing industry is largely engaged on German sub-contracts for civilian articles, and it seems that some raw materials are still being exported from Germany and Czechoslovakia to Roumania. After the re-organisation of the oil industry, a slight increase in production was reported, and the total output in 1942 is estimated at 5.6 million tons, against 5.1 million tons in 1941. The export of crude oil has been prohibited and the rationing of petrol and fuel oil tightened. Almost the only information on economic activities are regular statistics on the founding of new industrial enterprises. These figures are quite impressive, and German capital interests are considerable. During the first six months of 1942, 75 new firms were established against 50 during the corresponding period of 1941. The capital increased from Lei 173 millions to Lei 309 millions. The figures are, however, deceptive, and are to a considerable extent the result of the so-called aryanisation.

The actual situation is revealed by price movements,

which are much more pronounced than in any other Danubian country. The official price index, listing the maximum prices, increased by roughly 200 per cent from August, 1939, to June, 1942. During the summer and early autumn, the price level remained almost unchanged, but at the end of November and during December of last year prices again rose rapidly. Sugar increased by 60 per cent, petrol by 68 per cent and tobacco by 50 per cent. Postal and traffic rates were also increased. The turnover tax was fixed at 5 per cent against the former 4 per cent, and all excises were levelled up considerably. Wages and salaries, which had been raised some time ago, are again far behind the new general rise. District prefects and mayors have been forced to release foodstuffs and fuel below the maximum prices for the supply of the lowest-paid classes. Black market activities are widespread because of a totally inefficient price control. The so-called price scissors, that is, the difference between low agricultural prices and high prices for industrial commodities, seem to have resulted in the hoarding of money by peasants who appear to hope that one day the price relation may become more favourable.

Financial policy is indicated by the official report that total expenditure during 1941-42, amounting to Lei 160,100 millions, was covered to the extent of 46.3 per cent by revenue. During the first nine months of 1942, excise and other indirect taxes yielded Lei 36,700 millions, against Lei 20,200 millions during the corresponding period of 1941. Monopoly revenue increased in the same period from Lei 7,100 millions to Lei 17,500 millions. The increase in direct taxes was, however, much smaller, rising from Lei 6,800 millions to Lei 10,100 millions. The main part of the revenue is thus derived more and more from indirect taxes. A considerable part of expenditure is accounted for by public works, particularly the improvement of rail and road communications and waterways, but the major part is military expenditure, amounting to Lei 130,000 millions during the last two years, which equals the total military expenditure during the previous twelve years.

Portugal's Budget

January 2nd.

DR. COSTA LEITE, Portuguese Minister of Finance, in his preamble to the estimates for 1943, points out that while both receipts and expenditure are much above the 1942 figures, the practice of spending only within income is still maintained. Aggregate receipts will be greater, despite a heavy drop in import duties. These, put at 460,000 contos (1 conto = £10) in 1939, were estimated at only 300,000 contos for 1942, a sum which is unlikely to be reached, and which justifies a reduction in the 1943 estimate to 250,000 contos. There is a lucid explanation of the Government's financial policy. It is claimed that together the banking system and the Treasury had immobilised over 3 million contos during 1942, funds that would otherwise have

weighed on the market and added to the danger of inflation.

On the expenditure side, national defence accounts for the major outlay, although the increased cost of all material, over and above the items needed by the armed forces, has also affected the figures. There is, nevertheless, no cutting down on social services; on the contrary, a new fund has been started, with 30,000 contos as its nucleus, with the object of improving the lot of Portugal's civil servants. An official enquiry into their means of subsistence, now in progress, appears to show that in view of the increases in the cost of living, their position ought to be improved without delay. The 1943 estimates are given below:—

1943 ESTIMATES			
Revenue	contos	Expenditure	contos
Ordinary	2,302,425	Ordinary	2,292,529
Extraordinary . .	1,167,774	Extraordinary . .	1,176,825
	3,470,199		3,469,354
Estimated Surplus 845 contos.

Patent Reform—II

Encouragement of Enterprise

AN article on patent reform in *The Economist* of January 16th drew a picture of the results of the existing patent legislation, in an industrial set-up very different from that for which it was originally planned, and suggested that a drastic overhaul was needed. The object of the present article is to attempt an analysis of the problems to be solved in encouraging new developments without giving undue power to those who make them available to the public. This is no new problem. Its solution has been attempted more than once in this and other countries; but advance in political ideas, no less than the development of industrial and financial technique, raises the hope that a fresh survey may lead to more promising results.

A study of existing patents suggests that it would be extremely difficult to define just what is capable of securing this protection. What is, however, very evident is that patents are extended to matters of greatly varying degrees of importance. Real discoveries are not the subject matter of patents. Speaking very broadly, the fruits of the pioneer scientific research of the civilised world are made public and become the property of all nations without fee or condition, and without reward to the discoverer, other than the personal satisfactions of standing and kudos. It is only the little bit of tinkering which has a cash value. In the one case, the assurance that the confines of ignorance have been pressed back a step is the reward; in the other, the public is all too often made to pay a very high price for a benefit which must be assumed to be real, since people are ready to pay for it.

Not so very long ago, the above was in no sense an exaggeration of the actual position; but for some decades past an increasing proportion of relatively long period research has been done by a few industrial groups. They are still only seeking the practical applications of principles worked out for them by the professional discoverer, and they are continuously indebted to him for new contributions to their knowledge, but they do, in fact, make a substantial contribution themselves. This research work, carried out by teams of educated experts, sometimes under the direction of a scientist of eminence, is responsible for one of three classes of output whose proper treatment has to be considered. The others, standing above and below it, are respectively, invention and adaptation. The former may be described as the product of genius; the latter of skilled craftsmanship, engaged in improving its tools, whether these are physical machines or scientific processes.

The type of mind, the training and the degree of organisation likely to produce each of these three results differ widely. It is highly improbable that any one system of reward will secure the optimum result in all three cases, or that the protection afforded, and means of granting it, should necessarily be the same in each. A flash of genius is not a thing which it is easy to stimulate or to suppress. Provided that the possessor of genius is sufficiently removed from a subsistence standard to feel reasonably fit, it is other elements in his make-up that decide whether a sense of

success, due to a munificent reward, or a sense of want, caused by the failure of his latest idea to catch on, or something quite different from either of these, is best calculated to strike the next spark. It is certain that genius should be rewarded, when it can be recognised as such, whether its results bring tangible or imponderable improvements; but it is difficult to see why any person, or institution, should be allowed to buy the fruits of genius and reap a profit of hundreds or thousands per cent, while restricting the benefit to the community for a period of seventeen years. Whatever may be the best solution in other cases, it seems a matter for serious consideration whether, insofar as the product of genius is a "gadget," such as the "zip" fastener or the angle poise lamp, the licence of right is not a better method of bringing into harmony the reward of invention and the well-being of the community. Experts go wrong in assessing public taste, as in other matters; but there is little doubt that any competent expert would have a high percentage of successes in guessing whether such products would or would not prove popular.

The second class of "product" which may be the subject of protection by patent is a mere improvement on some existing machine or process. It is eminently desirable that these should be encouraged and that they should pass into general use as quickly as possible. In these days, the technique of all industries is in some degree interdependent. The general spread of the knowledge of an improvement in one quarter will quickly produce others, with snowball effect. The segregation of each improvement withholds the stimulus from the others. Except insofar as knowledge is not only shared, but, occasionally, put to use throughout a monopolistic national or international group, this stimulus may, under existing law, be held up for a considerable term of years. In point of fact, such delay is the rule rather than the exception.

By definition, this class of contribution is the result of craftsmanship, and it seems reasonable to suggest that the reward should go to those actually making the contribution rather than to their employers. In this case, the reward would, presumably, come from the public purse. There can be little doubt that the stimulus to improvements thus produced would be very substantial, since the reward would be certain. There remain, however, two problems to be faced, those of securing that the employer did not actively discourage improvements and that the new idea was made generally available. Provided the first were satisfactorily disposed of, the second would give no trouble, since the actual craftsman would have to communicate and substantiate his claim to the appointed authority to obtain his reward. It is not apparent that, under such a system, there would be any loss to the firms. They would tend to gain by the improvements of others as much as they lost by sharing the contributions of their own workpeople. If necessary the employer could be granted some compensation, possibly through some such machinery as licence of right. There would appear to be no case for any patent rights in mere improvements, but there will, admittedly, exist a border line of doubtful cases which should be considered as a product of genius and treated accordingly.

The third class of subjects for patent, the product of teams of research workers, is by far the most important and, perhaps, the most difficult to deal with. This work is at present carried on by bodies of university standing, sometimes financed in part by industry; by special institutes, set up and financed wholly by sections of industry; and by single firms, usually manufacturers, but occasionally chain stores and similar concerns. In America, some university research institutes run industrial research as a commercial proposition. While much of this work is of a rather pedestrian character, its total effect is of substantial importance. It is eminently desirable that the effective results

of research should be increased; that knowledge of results should be passed on to all conducting allied or parallel work as quickly as possible; and that the results should be incorporated in industrial practice wherever they can be used to benefit the community. Insofar as the results of research are at present considered suitable for protection by patent, there is no certainty that a patent will be taken out, in which case the results remain hidden. If a patent is secured, its use will, in all probability, be restricted to the group responsible for the research until the patent expires. This may be the case whether use is made of it or not. Thus, even if it is asserted that the total amount of research carried out in this country is sufficient in normal times, it is quite evident that the other two desiderata are not obtained.

It is by no means clear why so large a proportion of industrial research should be left in the hands of manufacturers. There is room for independent investigations on a much larger scale by university and similar bodies, and by those engaged in supplying directly the needs of the consumer. There would, indeed, seem to be something to be said for special research in the interests of the consumer, presumably financed out of taxation in the first instance, if other methods proved unsatisfactory. It must be recognised that, until such time as the legal framework ensures that the manufacturer and the distributor work in the public interest, it cannot be left solely to them to safeguard consumers. There would appear to be no reason why research institutes should prove a heavy burden, even if financed by the state, so long as the benefits they conferred were really passed on to the public. It is, however, very doubtful whether such a system could be made to work without some coercion of industry, for it is essential for much research that those carrying it out should live and work in the closest co-operation with the concerns which will eventually use the fruits of their labour. It is one of the criticisms of the present system that this is frequently not the case; but it is believed that this stricture does not apply to really important industrial research groups.

Here, as elsewhere, what is really required is an adjustment of the whole outlook of industry—away from the ideas of organised scarcity and a conservation of the value of existing physical capital, towards a determination to produce the largest possible quantities of desirable goods at the lowest price. It is open to the gravest doubt whether this end can ever be attained while it is possible to obtain a monopoly in the right to use a new machine or process for the present period of 17 years. Something might be achieved by a drastic reduction in the minimum period of protection, coupled with a ban on undue delays in definite application, and with a complete bar on extension by mere improvements or adjustments. It seems, however, that the substitution of the licence of right may be a more fruitful avenue of approach. It need hardly be explained that under this system anyone paying an agreed rent would have the right to use the subject matter of the patent.

It is asserted that this would discourage research and lead to concealment of the results of such investigation as

was still carried out. It is not clear why this would be the case as regards research, except under a quasi-monopolistic organisation of the industries concerned. In the presence of anything approaching free competition, firms would be bound to inquire into matters which affected them intimately. There is a considerable probability that their own discoveries would be more useful to them than to others, although the cumulative effect upon them of all the other progress would be very great. The problem of ensuring disclosure of information which might be inconvenient, at the time, to the discoverer, if he had to allow a rival the use of it, is more difficult to solve. But it is just this course of events which it is necessary to ensure. It is essential to face the fact that one cannot have both the maximum improvement in methods and the maximum protection to existing methods at the same time. What is required is a fair balance between the two, and in the past the scales have been heavily, and increasingly, weighted in favour of the latter. If British industry is not to suffer a continuous hardening of the arteries a change must be made.

There is no ready-made solution to this problem; but one or two contributions towards its solution present themselves. Finance of capital acquisition and extensions might be made subject, in all cases, to the test of acceptability to the market by a limitation on the building up of large reserves, gradually invested in the business. An increased proportion of the capital raised should be redeemable after only a moderate life. This practice has become more general of late, but with the hope of benefiting from a falling rate of interest, rather than of reducing the percentage actually financed by prior charges. Finally, the whole attitude of the Inland Revenue towards the subject of capital replacements might be much more positive than it is. This might, of course, mean a reduction in the tax income from the profits of any given company if competition were fully effective. But in that case the taxpayer would, presumably, reap a larger benefit as consumer than the damage he would suffer, even in the improbable event of a decline in total taxable profit. All these adjustments would tend to remove the accent from the maintenance of the value of existing capital; but they might well not prove sufficient to overcome unwillingness to impart information to a competitor. If that were so, the state would have to apply some sanction in the general interest.

The objects of this and the preceding article have been to sketch the existing effects of the patent laws and to point to objectives rather than to prescribe remedies. It is hoped, however, that they will have indicated that the objections to change are not insuperable. The point will, of course, be raised that this country cannot act alone. The United States is already considering action of a drastic character. But, even if that were not the case, the objection is not valid. By a system of international agreements, on most-favoured-nation lines, this country can protect itself, while enjoying increased benefits from its own research and invention and retaining those it now receives from overseas. Revision of the patent laws may not, by itself, solve problems, but it is an essential ingredient in their solution.

Finance and Banking

More Bank Cash

The position in the money market has eased considerably this week. The banks have again become buyers of bills, and the discount houses have found no difficulty in obtaining the facilities required to take up their allotment of Treasury bills without having further recourse to the special buyer. The Bank return reveals an exceptional expansion in bank cash, the total of bankers' deposits having risen by £20,342,000 to £166,577,000 over the week ending Wednesday. Many currents have contributed to this movement. The most important is evidently a substantial excess of Government disbursements over the amounts paid in taxes and through Government borrowing. That excess is not reflected in Public deposits, which have only fallen by £232,000 from the already low figure of £9,739,000 recorded the previous week. Rather is it evidenced in the rise of £19,390,000 in Government securities, indicating further substantial recourse to ways and means borrowing from the Bank of England. The banks' cash position has also been helped by a further return of notes from circulation, the latest total of the active circulation showing a fall of £4,718,000 on the week. A

further source of help has been the continued clearing of India stock repayment warrants, revealed in a reduction of £3,302,000 in Other accounts. Concurrently with the last movement, Other securities have fallen by £7,430,000, and are returning to the normal level they occupied before the India loan repayments at the beginning of the month. It may seem surprising that the India Government should have been compelled to seek any assistance from the Bank of England for this operation, given the size of its sterling assets. Most of these were invested, and even those in such liquid form as short dated Treasury bills could not be converted into the cash that was immediately required without some assistance from the central bank.

Bank Chairmen's Speeches

Restrictions of paper have necessarily curtailed the feast of wisdom which the bank chairmen spread yearly before their shareholders. It cannot have been shortage of material that is responsible for the cuts, for, with the Kennet and Beveridge reports before them, the new ventures of banking into coupon clearing, the part played by

SUN LIFE ASSURANCE COMPANY OF CANADA

(Incorporated in Canada in 1865 as a Limited Company)

141 SUN OF CANADA HOUSE, PALL MALL EAST, LONDON, S.W.1

the banks in Government finance, to say nothing of the storm of criticism to which the banks have recently been subjected, there would have been ample subjects to fill any chairman's speech of the old proportions. References to more general subjects are sparse. Sir R. Noton Barclay, however, slips in an unconditional mark of approval of the Beveridge plan if only "because it would be a calamity if the conclusion of hostilities should find us without a clearly defined programme for the changed world that will emerge." Lord Wardington referred to the "vicious spiral" of rising wages and prices, but could not allow the clarity of his vision in this matter to harden his heart against the case for giving the staff of his bank a substantial wartime bonus. In most speeches, however, the main inspiration was provided by recent criticism of the banks in Parliament, in the press and on the episcopal bench. Some chairmen, like Mr Beckett, gave the answer direct by arguing that the banks were democratically controlled, that to nationalise them into a monopolistic Government money trust would deprive them of much of their elasticity and efficiency, that there is no such thing as "costless credit." But the most effective answer of all was that of Mr McKenna, who chose the more positive method of expounding one great basic virtue of the banking system, namely, as a labour-saving device. He illustrated his point by impressive details of the work now done by his bank in handling coupon accounts, and then drew the parallel between these services and the comparable functions which the banks perform in conducting the money side of the nation's business. On the whole, there is not much light to be extracted from the bank chairmen's speeches this year. But they are of interest as showing the bankers awake at last to the dangers that beset their institutions as free and independent enterprises and prepared to take up the challenge.

Banks and EPT

The main item of information regarding the banking industry which is to be culled from the chairmen's speeches is Lord Wardington's reference to the disparity between true and published profits and, in consequence, to the assessment of banks to Excess Profits Tax. On the grossed-up published profits, the bank should by now be paying EPT. But Lord Wardington explained very clearly why published profits are no true guide to the taxable profits. The main discrepancies were explained as follows:—

The loss or gain arising from either the sale of investments or the allocations to, or recoveries from, bad debts, come under the category of those sums which must be included in a statement required for the purpose of computing income-tax, but they do not necessarily come into our published profits. . . . In our case the profit of the standard year for EPT was not unfavourable, owing principally to the fact that larger profits than usual were made from the sale of investments. . . . There have been years in which the depreciation of our investments has called for the provision either from profits or reserves of an amount equal to 18.9 per cent. of our earnings, while in other years the actual sale of investments has yielded a surplus available technically to be brought into profit or added to reserve, equal to 16.7 per cent. of our earnings. . . . To show these differences year by year by a closely detailed analysis of our profit and loss would be impracticable. . . . the whole matter [of presenting comparable published profit figures] seems to resolve itself into a question of sound banking judgment.

This official confirmation of the suggested solution of the banks' EPT puzzle proffered in *The Economist* on December 26th last will be most welcome. It will settle once and for all the "mystery" which has of late bemused many financial commentators. But it also confirms the con-

tention of *The Economist* that the banks must be ranked among the favoured in the grand EPT lottery.

Empire Sterling Balances

The latest Treasury order for the vesting or redemption of a number of Indian railway sterling debentures involves stock of a nominal value of about £31,000,000. The repayment of this amount of sterling debt will only nibble at the vast accumulation of sterling resources now in Indian Government hands. On January 8, 1943, these resources amounted to £308,300,000—and this after providing the £58,250,000 required to pay for the previous repatriation of sterling debt effected on the fifth of the month. It will be seen from the appended table that the volume of Empire assets in London has grown appreciably over the latest twelve monthly period available in each case despite further considerable repatriation of sterling debt, notably by India and South Africa.

EMPIRE STERLING ASSETS

India (Jan.)	214,400,000 (1942)	308,300,000 (1943)
Australia (Oct.)	39,700,000 (1941)	59,500,000 (1942)
New Zealand (Aug.)	12,100,000 (1941)	25,200,000 (1942)
Eire (Sept.)	81,076,000 (1941)	93,794,000 (1942)
South Africa (Nov.)	21,670,000 (1941)	1,060,000 (1942)
Total	368,946,000	487,854,000

In addition, there is a substantial balance of Malaya's sterling assets, which at the time of the Japanese invasion were approaching £100,000,000. The various Colonial Currency Boards have increased their sterling assets, and the sterling accumulations of the countries in question have, for the most part, taken the form of interest-free loans to the British Government. Finally, there are the sterling balances accumulated by Allied countries, which by agreement with the British Government are temporarily investing their surpluses in sterling. These surpluses may arise from such diverse causes as an excess of current exports over imports, as in the case of the Belgian Congo, or compensation for sunk ships, as in the case of Norway. On the evidence of the figures given above, and of estimates for the unpublished data, the guess may be hazarded that the sterling assets of Empire and other sterling bloc countries are now in the neighbourhood of £600,000,000, having risen by more than £100,000,000 over the past year. That figure will go some way towards offsetting what remains of Britain's foreign investments and brings well within sight the possibility of this country ending the war as a debtor nation.

Union Discount's Portfolio

An exceptional expansion is shown in the balance-sheet of the Union Discount Company for the end of 1942. Its total has jumped from £87,804,785 to £109,673,092. The whole of the increase in resources available to the company has come from secured loans and deposits. The investments have fallen during the year from £21,918,938 to £19,324,624. The whole of the increase in assets is to be found in the item of bills discounted and short-dated maturities, which this company continues to merge in one item. Its total, after deducting bills rediscounted, has increased over the year from £54,100,577 to £81,361,634. The short-dated maturities included with the bills are probably those maturing within two years, and among them will rank Conversion 5's, which, though they could run to 1964, are almost certain to be converted at the earliest possible redemption date, namely, August, 1944. Conversion 2's redeemable in 1943-45 would also rank for inclusion with the bills. The growth in this composite item over 1942 is in some measure a reflection of the larger volume of Treasury bills issued through the discount market. That it is not attributable to a growth in the holding of commercial bills is indicated by the fall of liabilities in respect of bills rediscounted from £9,153,396 to £6,263,327. In this respect the experience of the Union Discount does not appear to have conformed to that of Alexanders Discount.

National Discount Results

Changes in the National Discount balance-sheet follow very closely those shown by the Union Discount. Invest-

ments have fallen from £15,164,817 at the end of 1941 to £14,815,410 at the end of 1942. This, however, need not imply that the holding of bonds has fallen. Short-dated maturities are, as in the case of the Union Discount, included with bills, and it is probable that the line of demarcation between what is an investment and what is a bond eligible for inclusion in the bill portfolio is roughly the same as that applied by Union Discount. The holding of bills and short-dated maturities of the National Discount has risen over the year from £36,234,466 to £48,738,309. These totals are arrived at after deducting the liability for bills rediscounted. This amounted to £4,130,633 at the end of 1942—against £4,063,328 a year previously. On this evidence, the turnover in commercial bills (to which this item applies) seems to have shown little change. The chairman, in his statement accompanying the report, suggests that there has been a further contraction in the supply of commercial paper and that the company's maintenance of this item is thus gratifying. The only other comment of general interest in the statement is that there have been more opportunities for operations in the short bond market during 1942 of which the company took advantage. That, no doubt, explains the slight increase in the net profit from £180,515 to £192,431.

America's Bullion Reserves

Among the symptoms of the United States' growing war effort is the decline in the rate of accumulation of gold and silver. In the case of each of these metals the net amounts acquired by the US Treasury last year were the smallest for over a decade. The gold reserve on December 30th amounted to \$22,750 millions, an increase of only

\$24 millions over the year. The Treasury's net acquisition of silver during 1942, is estimated by Messrs Handy and Harman at 63,400,000 ounces, the smallest figure recorded since the inauguration of the silver buying programme. The annual review of this firm of bullion dealers states that, as regards the silver situation in the United States during 1942, there was but one outstanding feature, namely the transition of silver from civilian life to active service in America's war effort, a transition which involved at times a sharp conflict between the natural laws of supply and demand, politics and the control administered by Government agencies. In the estimated total of Treasury purchases for 1942 are 14,400,000 ounces of foreign silver contracted for before November 28, 1941, the date on which the buying of foreign silver was discontinued by the US Treasury, while 48 million ounces were derived from domestic production, for which, of course, a highly subsidised price is still paid. It is estimated that the US Treasury holdings of silver on December 31st last were 3,342,600,000 ounces. It appears that when the question of lend-lease US Treasury silver to industry was under discussion in Congress a memorial on silver policy, signed by more than fifty American economists, was presented to the Senate. The gist of it was that unless the bill then before the Senate was amended "it would convert silver certificates into an irredeemable paper money." The economists went on to suggest that any conversion of silver from monetary reserves to industrial uses should be accompanied by corresponding withdrawal of silver certificates. There is much sense in this last suggestion, which overcomes the faultiness of alternative suggestions that silver in the form of electrical wiring in Government factories should still count as part of the Treasury reserve. But the horror expressed at the possibility of silver certificates becoming irredeemable paper currency does not promise too well for the approach to post-war monetary problems.

Investment

Reduced Momentum

It is, presumably, pure accident that the spurt in business last week should have coincided with a slight lull in the progress of the United Nations and this week's excellent performance with a falling off in market activity. Real progress in Tunisia would, in all probability, give the markets a fillip, but even the spectacular gains of the Russian armies have failed, so far, to provide any noticeable stimulus. None the less, the generally firm trend has continued in both equities and fixed interest stocks, although at a reduced rate in each case. The announcement of the further India vesting has failed to promote the buying of the Funds necessary to maintain the rate of advance, but it promises to extend considerably the period over which new demand will exert an upward pressure. Unless, however, India and the Dominions are prepared to take over equity stocks of concerns operating in their own territories—and the general opinion is that they will not—it seems that the list of these adventitious aids to the Treasury's cheap money policy is almost at an end. Nor must it be forgotten that the news of a fresh savings drive, dressed in all the old faded trappings, will divert attention from existing stocks to the tap issues and, in all probability, lead to some sales of the former to provide funds for investment in the latter. Even if it does not do that, it will certainly mean delay in placing "savings" until the local campaign comes round. Thus, there is little net change in the general outlook and the feature of the week has been a relapse in home railway equities. It is still some weeks before the results will be known and it looks as though this market will be irregular. Whether even existing levels will long survive the dividend declarations is thought to be doubtful, unless the available revenues are larger than seems at all probable.

Another India Vesting

Investors, conversant with the rapid accumulation of sterling balances by the Government of India, must have known that it was only a question of weeks or months before the few direct obligations still existing in the London market would be taken over. Of the twelve Indian railway debentures for which the Government is responsible, three are to be repaid in the terms of the prospectus on Feb-

ruary 4, 1944. The remaining nine, mostly irredeemable stocks, are vested in the Treasury, the holders being paid the current price plus interest to March 12th, on which date payment will be made for securities, delivery of which is completed by February 19th. In other cases, payment will be made three weeks after delivery. The usual arrangements are made for placing the proceeds in British Government tap issues. The amount involved is some £31 millions, split as to one-third among the three stocks repayable next year and two-thirds among the nine vested. It may be recalled that, early in October last, the Treasury entered into an arrangement whereby it undertook to meet annuities of the Indian railways, to a total of some £34 millions, in respect of a cash payment of £30 millions, while the end of the year brought the taking over by the Indian authorities of the outstanding securities of the Bengal North-Western and Rohilkund and Kumaon lines at a total cost of some £15½ millions. Added to £27½ millions of India's direct loans which have been repaid since the outbreak of war, this makes a formidable total of some £350 millions. It is true that a few millions of the last named are still held outside this country and India, but, against this, there have been other repayments through normal channels. All these repayments have not, however, kept the accumulation of sterling balances from growing, and, now that virtually all sources are exhausted, it is difficult to see how further accumulations can be met. From the investor's standpoint, there remain only a few non-guaranteed debentures, the railway annuities—not extinguished by the Treasury deal—and some railway "equities." Excluding annuities, these have a total face value of some £12 millions, and it is doubtful whether some would be considered suitable for vesting. In any case, they and direct liabilities of £12½ millions are too small to affect the position. The operation should give a further fillip to the market for fixed interest stocks, which is already showing signs that the special stimulus given by dividend money and the final payments on India 3½ per cent stock is waning.

Far Eastern Compensation

The Joint Committee, representative of commercial interests in the territories occupied by Japan, has received a reply from the Colonial Secretary to its letter of November 26th. This letter is substantially on the same lines

**FOR ALL

**ROYAL
INSURANCE
COMPANY
LIMITED**

Head Office:
LIVERPOOL LONDON
North John St. Lombard St.

as that of October 27th, dealt with in *The Economist* of December 12th, but it is, possibly, a shade more encouraging. It makes it quite clear that, when the extent of damage to private property is known, such contribution will be made from public funds as proves possible. It goes on to emphasise the desire of the Government to undertake, as soon as possible, discussion of practical plans for reconstruction and restoration. In discussing the matter last December, *The Economist* took the view that reconstruction and its finance should both be matters for international planning, and there is no reason to change that opinion. It is, however, clear that there is a duty incumbent upon all industries, whether suffering exceptional loss of capital assets or not, to prepare plans for the resumption of activities in the interests of the general reconstruction. It cannot be said, at this distance of time, what the requirements of those days will be, and it is very difficult for those whose assets are in enemy hands to assess the position. It is not impossible, however, to prepare statistics on the basis of pre-war conditions, with suitable adjustments for changes in costs and other war-time developments, which will provide a framework for future planning. Nor should it be impossible to carry out some of those measures of economy which have repeatedly been urged upon the tin and rubber industries as the accompaniment of, if not the alternative to, restriction.

The Bernales Litigation

Last week saw the conclusion of a further stage in the long process of bringing the case of disappointed investors against the Bernales group to final trial. Last autumn, there had been a demand that the proceedings be set aside, and in October the Master of the Rolls refused this application. The defendants thereupon appealed to Mr Justice Croom-Johnson, who substantially reduced the complexity of the case by ruling that the charge should be limited to one of conspiracy, and the number of plaintiffs to eight. The plaintiffs appealed in turn against this and the better part of last week was devoted by Lords Justice Scott and Goddard to hearing the appeal. In the result, all the plaintiffs remain in, but the trial is limited to one of conspiracy, the claims of deceit and breach of the Companies Act, in respect of liabilities under the prospectuses of the companies concerned, being excluded. The defendants accordingly dropped their cross petitions. Leave by one of them to appeal to the House of Lords on the question of misjoinder was refused. The defence has to be delivered by the first day of the next law term, and there is to be an agreed application that the whole of the conspiracy charge, and any interlocutory applications or further proceedings, shall come before one judge. It is not clear that the plaintiffs lose anything by the limitation of the action to conspiracy. Indeed, it seems to be the only method of retaining all the defendants in the action. A great deal was said concerning the extreme complexity of the case, and it seems certain that the trial will be a protracted and difficult affair. It may be long delayed by the need to collect evidence in Australia. Complexity and difficulty are, however, matters which must be overcome. Otherwise, there can be no adequate protection for the investor. The moral of the tale, up to this point, is that much greater checks ought to be imposed at an earlier stage. In particular, that pyramiding of control through holding companies, and similar devices, ought to be drastically curtailed, and that the full facts concerning all companies in a group, of which any part of the capital of any company is held by the public, should be freely available to all interested.

Suburban and Provincial Scheme

According to the official count at the meeting of ordinary shareholders of Suburban and Provincial Stores last week, the scheme for conversion of that type of capital into 3 per cent preference shares was carried on a poll, having been lost on a show of hands. The voting, by value, was 1,054,657 for and 333,460 against. The majority amounts to almost 76 per cent of the total, so that the necessary 75 per cent was covered, on this count, and the scheme would, normally, go forward. It appears, however, that a number of proxies were rejected as being technically bad, and the committee, set up to oppose the scheme, has instructed counsel to apply to the Court under Section 61 of the Companies Act to have the motion set aside, presumably on the ground that some or all of the rejected

proxies were good. If proxies to the amount of 18,000 shares against the scheme had been admitted—everything else remaining unchanged—the motion would have failed to secure the necessary majority. It seems a little odd that so large a proportion of the independent holders of an equity stock should have voted for a fixed dividend of such modest dimensions. But, on the post-card vote taken by the company before proceeding with the scheme, the vote by value, was £968,343 in favour, and £180,747 against; majority in favour of 84 per cent by value, the number figure being 87 per cent. Thus, while, on the fuller count the favourable vote rose by 86,314, the adverse one increased by 152,713 or 84 per cent.

Insurance Share Index

The accompanying table shows *The Economist* index of insurance shares at December 31, 1942, with comparative figures at half-yearly intervals since the end of 1940. The index is compiled on the basis of an investment of £1.00 in each of twenty-four representative securities in 1913. It keeping with the general trend of Stock Exchange values

Company	Dec. 31, 1940	June 30, 1941	Dec. 31, 1941	June 30, 1942	Dec. 31, 1942

the index again advanced during the past six months, gains being registered by eighteen of the twenty-four companies. Prices at the end of the year, however, were considerably below the peak levels reached in October, substantial falls having occurred in anticipation of, and following, the Beveridge Report. This is particularly the case with the shares of offices interested primarily in industrial life assurance.

Company Notes

Setback for BAT

Although prepared for some decline in profits, the market had not fully discounted the extent of the setback in net receipts of British American Tobacco for the year to September 30th or more than £1,000,000 to £3,065,348. The fall is, of course, fully accounted for by the loss of interests in the Far East and by the loss of income from the American subsidiary, temporarily pledged to the Reconstruction Finance Corporation. After meeting preference charges, there is £2,375,775 against £3,464,674, representing a tax free rate of 10.4 against 14.7 per cent, available for the equity. With a final payment of 4d. per share, free of tax, ordinary capital receives a total tax free payment of 10 against 14.59 per cent, and the small surplus goes to raise the carry forward from £2,338,157 to £2,442,729. At the same time, an interim payment of 10d., tax free, is announced for the first six months of 1942-43, the same rate as that paid in the previous year in two quarterly instalments. Thus there is some indication that the 1941-42 dividend level may be maintained in the current year and that the lowest ebb of wartime misfortune may have been touched. Certainly, the demand for tobacco has been well maintained here in the face of all previous rises in price, and it is probable that this elasticity will be shown elsewhere. The £1 ordinary stock fell 1s. 3d. to 98s. 9d. on

Good news!

Here's good news for those who already hold 500 National Savings Certificates of the seventh or earlier issues. They can continue to save the certificate way—for a new £1 issue of Savings Certificates is now available. The seventh issue is still on sale for those who do not yet hold up to the 500 limit.

★ ★ ★ ★ ★

Each one of these new £1 Certificates will be worth 23/- in ten years' time and the increase is free of income tax. They are available in denominations of 1, 5, 10 and 50 unit Certificates. Savings Stamps may be used in payment for them. The maximum holding of these new Certificates is 250, and after the first ninety days from the date of purchase they may be encashed at short notice.

NOW ON SALE

THE NEW £1 ISSUE OF NATIONAL SAVINGS CERTIFICATES

At all Banks, Post Offices, War Savings Centres
and through Savings Groups

Issued by the National Savings Committee

the preliminary statement at which it yields £2 os. 8d. per cent, tax free.

Amalgamated Cotton Mills Activity

The accounts of the Amalgamated Cotton Mills Trust for the year ended August 29th last reveal that total income from subsidiaries and other sources amounted to £275,734. Since this figure is computed after an undisclosed provision for deferred repairs, it is not fully comparable with the figure of £294,794 received in the previous year. The parent's contribution to the tax liability of the group is almost £60,000 less at £162,441. Total tax is £432,395 against £458,334, but the chairman, Mr A. C. Openshaw, states that the figures shown are estimates, no agreement having yet been reached with the authorities. War damage premiums require a negligible amount compared with £7,413 last year, and after meeting debenture interest and preference dividends, earnings for the equity total £52,322 against only £10,739. Thus, the tax-free ordinary dividend, maintained at 8.33 per cent, and under-earned in the previous year by some 3 per cent, is now covered by earnings of 26.1 per cent. Hence, it is possible to place £30,000 against nil to war contingencies reserve and raise the carry forward £5,589 to £59,300. According to the chairman's statement, the company's mills have operated as fully as possible with the restricted labour supply and at present are extremely busy. Restrictions on exports and supplies to the home market mean, however, that the most remunerative part of the group's business is curtailed, a fact which must inevitably affect results in the current year. The expansion of the group's activity is reflected in a sharp increase in liquid assets—from £1,403,196 to £1,741,606—while the net surplus is up from almost £800,000 to £1,189,581, but a small credit balance on inter-company account has been changed to a debit balance of £374,796. Cash, with the inclusion of £200,000 tax reserve certificates, shows the largest individual increase of some £340,000, but outside debtors are almost halved at £145,022. Stock, however, is valued at £990,079, an increase of almost £120,000, due largely to purchases of raw cotton. The group has been fairly fortunate under the concentration scheme, and, provided labour restrictions permit fair activity of the reduced plant allocated, there is no reason why the ordinary shareholder should not continue to receive a reasonable return on his capital. The 1s. shares standing at 3s. ex dividend yield £2 15s. 7d. free of tax.

Fairey Aviation Accounts

No aircraft manufacturing accounts so far produced have illustrated as well as does the report of Fairey Aviation the extent and the strain of current expansion. In the year to September 30, 1942, disclosed profits, after tax and depreciation, are relatively little changed at £180,036 against £175,773. Thus, equity earnings show a small improvement from a tax-free rate of 17.0 to 17.4 per cent, and the tax-free dividend of 8 per cent is repeated with not quite £100,000 to spare. Since general reserve again receives £100,000, there is a further small reduction in the carry forward from £42,296 to £39,487. The analysis of profits shows nothing exceptional, but the balance sheet considerably amplifies the story. Fixed assets, apart from the writing off of jigs and dies to the total of £24,658, are little changed, but there is a jump of some £580,000 in stocks and work in progress to £2,080,735, while debtors, less reserve, are nearly doubled at £1,391,245. There is also an increase in net loans to subsidiaries from £769,639 to £998,171. The jump in stocks and debtors is financed chiefly by a new secured bank loan of £1,041,541 after deducting cash, which in the previous year amounted to £74,036. Government securities amounting to £105,000 have been liquidated. Creditors, including tax provision,

ROBSON, MORROW & UNDERWOOD are seeking two outstanding men, a Chartered Accountant and an Engineer with a University degree; both with wide commercial experience, who could be trained as INDUSTRIAL CONSULTANTS for work of National Importance; four figure salary and exceptional post-war prospects. Full particulars to ROBSON, MORROW & UNDERWOOD, INDUSTRIAL CONSULTANTS, Victoria Station House, Victoria Street, London, S.W.1.

have only risen from £1,578,530 to £1,699,920. Nevertheless there is a substantial fall in net liquid assets from £725,748 to £648,299. The bank loan will prove self-liquidating, provided the authorities take over any stock and work in progress, and any anxiety which may attach to the present position derives from uncertainty as to the post-war relevance of the actual plant and equipment which the concern may own at the end of hostilities. On this score, the relative stability of the fixed assets is reassuring. The 10s. ordinary shares, at 17s. 6d. ex dividend, yield £4 11s. 5d. per cent tax free.

Plastics Record Profits

In the year to June 30th last, gross profits of British Industrial Plastics rose from £169,124 to the new record level of £295,798. It is plain from the preliminary statement that this rise, unlike the very modest increase of the previous year, has been sufficient to offset higher tax liability and rising production costs. Taxation requires £155,500 against £71,200 and the transfer for depreciation is substantially increased, at £27,341 against £11,755. Despite this, there is an increase in equity earnings from £13,477 to £17,570, so far as ascertainable and the rate of earnings is up from 6.3 to 8.2 per cent. The ordinary payment is restored from 6 to 8 per cent and there is a small increase in the carry forward from £6,288 to £6,698. The consolidated profit statement shows a rise in gross receipts from £114,913 to £223,213, these figures being after general and some special expenses in both cases. The accelerated growth of profit will no doubt encourage those sections of the market which have recently shown a renewed interest in the potentialities of plastics. The industry is acquiring improved techniques during the war and should play an important part in reconstruction. It is, however, very difficult to assess the prospects of any individual firm, especially as large groups are entering the business. One of the latest of these is Wall Paper Manufacturers who have taken over an old established firm. In so far as plastics will be used extensively for decoration, the two businesses will be complementary. The 2s. ordinary shares of British Industrial Plastics, at 5s., yield £3 5s. 1d. per cent, a level which emphasises the expectations of the investor from post-war expansion.

Radio Rentals Record Profits

In the year to August 31st last, Radio Rentals earned record total profits of £187,921, against £159,609. Taxation required £61,500, against £52,605, and the total of depreciation and sums written off radio sets rose from £93,750 to £109,964. There is, however, a reduction in war damage contribution from £3,414 to £1,690, since the Board of Trade has agreed to exempt a large number of sets from compulsory insurance. Thus, a high proportion of the rise in profits is passed on to equity earnings which are almost doubled at £10,650 against £5,723, representing 21.3 against 11.4 per cent. In the absence of any transfer to free reserves the carry forward is raised from £26,653 to £32,303, after repeating the 10 per cent dividend. The most important development of the year, the acquisition of the Rentertainment (London) interests, is shown in the balance-sheet as investment in a subsidiary at £36,665 against nil. A dividend, paid out of profits prior to the date of the acquisition, has been deducted from this valuation. The chairman, Mr H. F. Hunt, suggests that it is to the rationalisation made possible by the merging of the two interests that the rise in gross profits is mainly due. It is unlikely that the increase in the number of subscribers has been considerable. Mr Hunt points out that demand has kept pace with the increase in the number of sets available, but that the acquisition of new sets has been very limited. The balance-sheet decline in debtors and rise in creditors are due, respectively, to prompter payment of subscriptions, and to an increase in the number of payments ahead of schedule, for which the rise in spendable incomes is responsible. The total of initial payments and tax provision is £141,920, which Mr Hunt considers adequate to meet the outstanding EPT liability, pending clarification of the group's obligation. The total valuation of radio sets, the company's most important asset, is some £20,000 lower at £197,548. In the current period, the first full year since the acquisition of the subsidiary, there should be still further scope for economies in distribution. The 5s. ordinary shares, at 10s. 6d. ex dividend, yield £4 15s. 8d. per cent.

Industry and Trade

National Coal Board

The draft scheme for the establishment of a National Wages Board which was submitted to a delegate conference of the Mineworkers' Federation on Friday is, it is understood, the joint production of the Joint Consultative Committee of the industry and the Greene Board of Investigation. In its White Paper on Coal Policy last June the Government expressed the view that it was desirable that a system should be developed by which questions of wages and conditions of employment would be dealt with on a national basis and by a properly constituted national body; and one of its terms of reference to the Board of Investigation was to inquire into the present machinery and methods and to submit recommendations for the establishment of a procedure and permanent machinery for dealing with questions of wages and conditions of employment in the industry. During the discussions which have been in progress since last June, it has been the aim of the Consultative Committee to create a national body which would continue to be based on the principles of collective bargaining and aim at finality in the settlement of disputes by methods of conciliation. Consultations have been held with the Board of Investigation on questions affecting organisation and procedure, and it is understood that in the form in which the scheme was submitted to the miners' delegates it had been accepted by the owners' and miners' leaders and approved by the Board of Investigation. The full details of the agreement are not yet available for publication; but it may be indicated generally that it involves the establishment of a National Conciliation Board, consisting of a Joint National Negotiating Committee of 22 members on which the owners and the workmen are equally represented, and a National Reference Tribunal of 3 members nominated (after consultation with the employers' and workmen's associations) and appointed by the Master of the Rolls or a Lord Justice of Appeal whose decisions shall be binding on both sides. The jurisdiction of the Board will extend to any question raised by either side or referred to it by the Minister of Fuel and Power, and

while the continuance of the existing district conciliation machinery is a fundamental condition of the scheme, provisions of vital importance are those which govern the transfer of district questions to the National Board, and, when necessary, to the Independent Tribunal. It is also a part of the proposed new regime that its decisions shall be binding on non-associated employers as well as on all the workmen for whom the Mineworkers' Federation may be acting.

Rail Strike Threat

At the special delegate conference of the Associated Society of Locomotive Engineers and Firemen last Friday, it was decided to inform the Minister of Labour of the existence of a state of dispute in the industry, in accordance with the Conditions of Employment and National Arbitration Order, and that unless the Minister intervened within 21 days—the period prescribed in the Order—a withdrawal of labour within 24 hours would take place. This decision at any rate gives a breathing space—it is said that a proposal for immediate strike action received considerable support among the delegates—but it places Mr Bevin in an awkward position. According to the Order, if the Minister considers that suitable collective joint machinery for settling disputes exists within an industry, he must refer the dispute to that machinery; only if the joint machinery has failed to produce a settlement can the dispute be referred to the National Arbitration Tribunal, whose award is legally binding. The award of the Railway Tribunal is not binding, but explicit assurances that they would accept it had been given beforehand by the three unions who were parties to the decision. The Tribunal had awarded wage increases to conciliation grades and salaried staffs of five shillings a week, but as enginemens had already received an increase of four shillings this year, the award in their case only amounted to one shilling. Both the National Union of Railwaymen and the Railway Clerks

Association had accepted the award, though neither regarded it as satisfactory, and both are opposed to the action of the ASLEF in precipitating a crisis. It is certain that a strike by the locomen at the present stage of the war would meet with little sympathy from their fellow railway workers and from the great body of trade unionists, and with none from the general public. Even if there is reason for them to be dissatisfied with the Tribunal's award, their threat to strike unless the Minister of Labour acts seems uncomfortably like blackmail.

The Curfew

The city of Birmingham is up in arms against the decision of the Regional Transport Commissioner to introduce a curfew on bus services. The proposal, which was to have come into force this week, was to take off buses after 9.15 p.m. on week-nights and on Sunday mornings; but a deputation, consisting partly of Birmingham Members of Parliament and headed by the Lord Mayor, visited the Minister of Transport last Friday and secured the postponement of the order. They have been given a fortnight to work out, in conjunction with the Regional Commissioner, an alternative scheme which could be introduced if the Minister is satisfied that it would achieve the same object as the curfew, namely the saving of rubber and petrol. The arguments put forward by the opposition are, first, that there appears to be unfair discrimination against Birmingham; and, secondly, that it would prevent war workers and troops from seeking entertainment and relaxation in the city after their day's duty. There is no substance in the first point. Transport restrictions apply all over the country and they are determined in the light of local conditions—there is no attempt at standardisation. Leeds and Sheffield, which are as important industrial centres as Birmingham, both have 9 o'clock curfews. The root of the trouble probably is that Birmingham, with its strong municipal traditions, resents any evidence of the exercise of regional authority. There seems to be more justification for the second argument. If transport services are to be curtailed, there is probably room for more restrictions during the daytime when the buses serve mainly shoppers and non-war workers. The really important thing is that the services for conveying workers to their places of work should not be in any way impaired. The Select Committee on National Expenditure, in their recent report on passenger transport facilities, emphasised the importance of maintaining and improving the services for war workers. In this connection, there is a point which the Board of Trade might look into. Complaints have been made from many industrial areas that owing to the shortage of lamp batteries, workers who would otherwise cycle to their work are obliged to travel by the already overloaded conveyances.

November Retail Trade

Probably very little Christmas shopping of the pre-war variety was done last November, to judge by the retail trade report published in the *Board of Trade Journal* of January 9th. The index for all non-food merchandise showing the average daily value of retail sales (1937 = 100) was

PERCENTAGE CHANGES IN AVERAGE DAILY VALUE OF RETAIL SALES FROM PRECEDING YEAR			
	Food and Perishables	Non-Food Merchandise	Total
Feb.-Nov., 1940.....	+2.6	+6.7	+4.4
" 1941.....	-1.5	-6.8	-3.7
" 1942.....	+4.2	+1.8	+3.2

99 in November, a fall of 13 from the previous month. The December figures may throw interesting light on how far the gift-giving custom has survived for the fourth Christmas of war. The household goods index figure fell substantially—a reflection mainly of the now low stocks of these goods. Household linens, in particular, are in very short supply. Compared with November, 1941, the value of sales in all departments was 4.1 per cent higher. The value (at cost) of stocks at the end of November was 1.4 per cent higher than the year before, the smallest change recorded for five months. Untaxed utility apparel is appearing in the shops in increasing quantities, and for the first time since March, 1941, the index for boots and shoes

stocks rose slightly. The accompanying table, showing the percentage changes in the daily value of retail sales from the preceding year, gives some idea of the changes in turnover during the war. The smallness of the changes is interesting.

More Rationing Changes

From February 7th, the beginning of the next four-weekly food rationing period, a child reaching the age of five is entitled to an adult ration book, without the need to wait for the next general issue of ration documents, though the option of waiting is given. The advantage the adult ration book gives is a doubled meat ration and tea ration. On the other hand, a child's ration book entitles the holder to special allowances of fruit juices and cod liver oil. Certain changes are being made from February 7th in some of these special children's schemes. A pint of milk daily will be available automatically at the reduced price of 2d. a pint. Previously delivery at the reduced price had to be applied for, but since nearly all children are included in the scheme, it has been made general to simplify the administration. The double ration of dried eggs is maintained, as well as the priority rights to oranges. Cod liver oil and fruit juices, mainly orange, blackcurrant and rose-hip syrup, are available to the under-fives. More publicity has been given to their existence since the recent announcement that only 25 per cent of children were getting them. The Ministry of Food has made it easier for busy mothers to get the fruit juices, and it is likely that more children are enjoying them. In case of need, milk and fruit juices may be obtained free. The welcome news that tinned fruit will be on sale from February 7th was announced at the end of last week. There will be English plums, blackberries, gooseberries and rhubarb, and American peaches, apricots, pears, grape fruit and pineapple. The points values are low at six a pound, suggesting that supplies are plentiful. The prices range from 8½d. a lb. for plums and rhubarb to 1s. a lb. for apricots and peaches. The cheese ration will be reduced again from February 7th to 4 ozs. a week, probably for three months. The second egg allocation of this year is to begin at the end of the month.

Bread Production

Bread is an urgent food problem. The Minister of Food has consolidated all the Orders, directions and general licences concerning bread into the Bread (Control and Maximum Prices) Order. It came into force on January 17th, and makes certain changes in the original Orders. The most important of these is the provision requiring bakers to keep the following records: stocks of flour at the end of each week; the quantity of flour bought and sold during each week; the quantity of bread produced, and the amount of flour used; and the name and address of every person to whom bread is supplied otherwise than by retail. This is a necessary step for purposes of rationing bread. National wheatmeal bread will in future be known as national bread. Not more than 12½ per cent of the flour used may be white flour; potato and barm have been added to the list of permitted ingredients. The restriction on shapes and sizes of loaves is slightly modified, and caterers no longer need a licence to make bread for consumption on their own premises.

Rates of Hire for Ships

By agreement between shipowners and the Ministry of War Transport, rates of hire for requisitioned liner shipping have been increased, retrospectively, by an average of about 20 per cent. Increases vary accordingly to the different classes of liners (from coasters to passenger ships) between 10 and 30 per cent, and are designed to offset increases in operating costs, due mainly to higher wages, borne by the owners. The new rates take effect at different dates from January 1 to May 1, 1942, but for the majority the extra payment applies from April 1st. Liner requisition rates are made up of a running allowance of so much per ton to cover operating costs and a capital allowance of 10 per cent on the original cost of each ship, to cover interest and depreciation. The normal basis of depreciation of ships is 5 per cent per annum, so that vessels 20 years old or more,

whose first cost has theoretically been written off in the books, could not be expected to qualify for the full capital allowance. This was recognised in the original requisition agreements made in 1940, by taking the war risk insurance value as the capital value of ships built in 1921 or earlier, where this sum was smaller than the first cost; the allowance was still at the rate of 10 per cent. Under the new agreement, the principle of this provision is extended to cover ageing ships by applying the formula to each vessel as it reaches 20 years of age. Increases in the requisition rates of tramp ships are understood to be in process of negotiation. Their remuneration is on a slightly different basis from that of the liners. The capital allowance is worked out on average values and included in the allowance for operating costs at deadweight rate per ton. By comparison with pre-war profits, on the average, requisition has meant higher earnings for liners and reduced earnings for tramps; but the earnings of both main classes may generally be expected to decline as ships are lost and tend to be replaced by Government securities rather than new tonnage. Shipowners have been studying post-war problems, and a statement from its central planning body on general policy and commercial aviation is to be issued in the near future.

Decline in Business Failures

An interesting phenomenon of the war has been the marked decline in business and professional failures. A ten-year record of failures is given below, on the basis of statistics published by Messrs Seyd and Co., Limited:—

	NUMBER OF FAILURES (including Eire)		
	Professional	Wholesale	Retail
1933.....	515	645	6,223
1934.....	515	528	5,388
1935.....	479	518	5,041
1936.....	455	417	4,775
1937.....	449	438	4,692
1938.....	508	441	4,601
1939.....	503	316	3,869
1940.....	331	170	2,471
1941.....	205	70	748
1942.....	149	36	363

The sharp decline cannot be traced to any single cause. During periods of rising prices, it is generally easier for debtors to meet financial claims arising out of past transactions. In many cases, where businesses had to be suspended for the duration, the settlement of claims may have been held over until after the war. It would be interesting to know to what extent the operation of the Liabilities (War-time Adjustment) Act was responsible for the decline, for its specific object is to prevent war-time difficulties from giving rise to bankruptcies.

Oil and Plastics

Some of the more highly-coloured visions of the coming plastics age need not be taken too seriously. But there can be no doubt that the use of these materials will expand, probably at a fairly rapid rate. Before the war the combined output of Great Britain and the United States was estimated at only about 135,000 tons a year, equivalent, in weight, to one-hundredth of Britain's crude steel capacity. As Dr G. Tugendhat, a director of the Manchester Oil Refinery, Ltd., pointed out during an address to members of the Institute of Plastics in London on January 13th, the oil industry is capable of supplying large quantities of most of the starting materials for the plastics industry. But the oil refining industry of Great Britain is very small; the bulk of requirements are imported not in the crude, but in the refined stage. In view of the growing importance of oil as a basis for the production of chemicals, Dr Tugendhat suggested that it would be in the national interest to import a greater proportion of oil imports in the form of crude oil and to enlarge the refining capacity with a view to securing a foothold in the new chemical industry. In his view, the argument that the construction and operation of refining plant in this country is more expensive than, say, in the United States is no longer valid. While a large-scale change-over from the import of finished oil products to crude oil is hardly feasible before the end of the war, Dr Tugendhat's suggestion seems to deserve serious consideration, especially as the technical experience gained

in the treatment of oil might assist in the development of the chemical industry based on coal.

Hard Fibres

According to an announcement by the Sisal Growers' Association, the Ministry of Supply has agreed to increase its 1943 buying prices for East African sisal by a uniform rate of £4 per ton. The increase amounts to just under 50 per cent in the lowest grade (flume tow waste, now quoted at £12 8s. 6d. per ton) and to just under 20 per cent in the highest grade (No. 1 now quoted at £23 10s. per ton). The price continues to be "free in wagon or other conveyance at East African berth ports," so that sellers remain unaffected by the high sea freight and sea war risk charges. The increase in price appears to have been justified by higher costs of production, and does not, therefore, represent a change in the British Government's commodity bulk-buying policy. The growing Allied need for sisal and other hard-hemp fibres as a result of the losses of Pacific supplies was discussed in *The Economist* of August 1, 1942, page 153. Since then the East African Governments have substantially increased the labour force of the sisal plantations in their territories by making use of compulsory powers. Mexico is reporting increased activity in its Henequen-growing districts. The most important development has been the decision of the United States Government to plant 300,000 acres of farmland in Kentucky, Indiana, Illinois, Wisconsin, Minnesota and Iowa with hemp for fibre and another 50,000 acres in Kentucky with hemp for seed production. The plan, which is jointly carried out by the War Production Board and the Department of Agriculture, is well under way, and the first rope will be available early next year. As the United States has not so far produced hemp on a large scale, the above acreage figure represents a twenty-fold increase on 1942. The acreage for the production of hemp seed, on the other hand, is only one-third larger than in 1942, as last year seed had been raised in the United States on a larger scale to secure the seed requirements for the production programme now initiated.

MIDLAND BANK LIMITED

BANKS' SERVICES TO CUSTOMERS

THE COUPON SCHEME

DEPOSIT FIGURES A NEW RECORD

THE RT. HON. R. McKENNA'S STATEMENT

Inasmuch as the chairman does not propose to deliver a speech at the annual meeting of the Midland Bank, Limited, on January 28th, the following statement has been circulated to shareholders:—

It is fitting that in any review of the bank's affairs we should first recall with deep respect the lasting memory of those who in their country's cause have made the greatest sacrifice of all. With the extension of military operations heavier casualties have become inevitable—in all 123 of our men have died in the war, 21 are missing, and 73 are known to be prisoners. We honour these gallant men, and to the families afflicted by bereavement we offer our very sincere sympathy.

In the past year several more decorations have been won, and we are proud to know that our men and women in the Forces display the qualities of courage, resolution and adaptability that modern war demands.

A welcome addition to the strength of the board of directors has been made by the appointment of Sir George Barstow, who has an outstanding record in the world of insurance. On the other hand, we greatly regret that Sir George Mitchell has felt compelled by considerations of health to resign. Happily the Clydesdale Bank still retains his services as a director, and we trust his health may be fully restored. His place on our board is taken by Mr Robert L. Angus, in whom we shall find another worthy representative of the Clydesdale Bank.

RETIREMENT OF MR ASTBURY

I have to announce an important change in our general management. Mr Astbury, who has loyally deferred his retirement in the special circumstances of war, feels that he may now be relieved of the heavy burden of his office as chief general manager. His career in the bank has been one of great distinction, extending over 51 years. Before joining, at the age of 21, he had business experience in Birmingham, and passing through the earlier stages of promotion he rose to management of important branches and then, by way of a series of head office appointments, to the highest executive position, where he has indeed made a noteworthy contribution. We greatly regret the severance of a valued association in the daily conduct of the bank's affairs, but happily we shall continue to enjoy the advantage of his collaboration with us as a director.

Mr Astbury's retirement takes effect at the end of January, when Mr Sadd and Mr Lederer will become chief general managers. Both have had valuable experience in branch management and have served with conspicuous success in increasingly responsible executive positions. Each has shown exceptional capacity, and we are confident that in their co-operation at the head of the executive they will enhance still further the high reputation they have already earned. We have appointed a new joint general manager, Mr Woods, whose career has marked him out for the wider responsibilities of this position. He has already held with distinction appointments at head office and in the country, and passes now from very successful management of the branch at New Street, Birmingham, which was formerly the head office of the bank.

THE KENNET REPORT

A year ago it was evident that we had to face the prospect of additional calls upon us for recruitment to the Forces. The Kennet Committee appointed to inquire into the possibility of further reduction in bank staffs has recognised that the banks have not been slow to adjust themselves to the higher demands of the fighting services. From this bank alone over 7,000 have joined the Forces, and of these nearly 6,000 were on the permanent staff. The loss in personnel has not been fully made up; before the war the total staff numbered about 14,000, whereas the comparable figure to-day is 12,300. A further reduction, making in all 15 per cent. from the pre-war total, is to be brought about in the near future.

Subject to the maintenance of essential services we are examining every possibility of saving labour; but the substitution of new entrants for established workers must mean some loss of efficiency, with the inevitable result of increasing the burden falling upon the more responsible officials. The willingness and skill with which they have carried on their duties under conditions of exceptional difficulty are gladly acknowledged. The loyalty of the staff as a whole, men and women alike, has been conspicuous, and the cordial working relations between their representatives in the staff association and the management of the bank are of great value in the smooth running of its daily work.

THE BANKS AS A LABOUR-SAVING DEVICE

It is not always recognised that the banks are in essence a labour-saving device, with the added advantage of guaranteeing security. The old notion that they existed to provide a luxury service for the rich man should have been buried long ago. A recent striking example of labour saving is provided by the new service undertaken by the banks under the clothes rationing scheme. Beyond the retail stage, all transfers of coupons and documents representing coupons are made through the banks; we ourselves have about 17,000 traders' coupon accounts and deal with 15 to 20 million coupons a week, apart from the transfer vouchers to which they give rise. The coupons themselves, once they have been counted by the retailer, paid into the bank and credited to his "coupon account," have served their purpose, and from that point all the retailer or the wholesaler need do is to draw "cheques" on his coupon account as he may require to replenish stocks. The banks undertake the necessary book-keeping entries and ensure that traders do not exceed what may be called their "coupon purchasing-power."

Compare the simplicity of this procedure with what would be involved if no such arrangement were in operation. After the retailer had counted the coupons handed over by customers he would have to take care of them on his own premises; he would then have to count out numbers appropriate to his demands upon various suppliers, and dispatch them with due precautions against loss in transit. The wholesaler would similarly have to count out the coupons he received, provide for safe custody, and again count out odd thousands and hundreds and tens and ones according

to his requirements from other wholesalers or manufacturers. So the process of counting and recounting millions of coupons, storing and dispatching them would go on, in continuous repetition of mechanical drudgery. The entire business, except at the unavoidable first stage, is reduced to a task involving a small fraction of the cost in terms of man-hours through the simple device of a "coupon banking" system.

ESSENTIAL SERVICE OF THE BANKS

The device, however new in this form, is really the same as that used in conducting the money side of the nation's business. Substitute currency notes and coin for coupons and the analogy is complete, though the volume is on a vastly larger scale. The great bulk of the counting and recounting of odd amounts of paper currency and coin is dispensed with, and all risk to the owner in storing and dispatching currency is avoided. An enormous volume of work spread over millions of customers and covering an annual turnover of tens of thousands of millions of pounds is rendered unnecessary by the banking machinery and the use of cheques. At a time when manpower is the most vital of all requirements this economy of mass operation becomes of first-rate importance in the national effort. The banks are rightly regarded as performing an essential service, indispensable in carrying on the nation's business in war as in peace.

The economics to be achieved through the banking system have been extended in course of time over a constantly widening range of transactions. Many public authorities find it convenient to pay salaries by the simple process of instructing their banks to credit the banking accounts of their employees with the sums due. There has been increasing resort by public authorities and companies to the method of crediting interest or dividends to the accounts of holders of their stocks and shares, instead of sending out individual warrants. Traders give periodical instructions to their banks to pay stated amounts to their suppliers; customers give "standing orders" to make regular personal payments, and so relieve themselves of the trouble of recording the dates and other details and making the necessary remittances. The banks are indeed a most effective labour-saving device, but they can operate successfully only under the condition that they have the highly experienced staff required for working with speed and complete accuracy.

THE BANK'S FIGURES

Turning to the balance-sheet, deposits are shown at £759 millions, which by a rise of £73 millions on the year makes a new record in British banking. The rate of growth, however, is less than in the previous war years. As before, almost the whole increase is in current accounts, the counterpart of the continuous expansion of the turnover of the nation's business. The great volume of deposits has been built up on the broader cash basis provided for the banks by the monetary authorities as a part of official policy in financing war expenditure. The banks are now, as throughout the war, in an extremely liquid condition—indeed, our own balance-sheet shows an aggregate of cash, balances with other banks, short money, bills and Treasury deposit receipts which covers nearly one-half of the deposits, as against the minimum of about one-third observed as ample before the war. Although this position adversely affects our earnings, it provides a safeguard against any later decline in the total of bank deposits and strengthens us to meet whatever circumstances may arise when the war is over.

Our traditional money market business has again diminished with the change-over to war finance. This is clear from the continued low level of short loans and bills. The bill holding is below the pre-war figure, for, although the Government still

borrow heavily on Treasury bills, most of them are placed outside the clearing banks. On the other hand, almost the whole of our reduced bill holding now consists of Treasury bills, whereas before the war commercial paper made up a large part of the portfolio. In borrowing from the banks the Government has come to rely more and more on the convenient method of Treasury deposits. These have again expanded largely in amount, and are now the second biggest item among the banks' assets.

INVESTMENTS AND ADVANCES

First place, in order of magnitude, had already been taken a year and a half ago by investments, whereas formerly advances were pre-eminent in amount as in earning-power. While our investments have risen further on the year, being now double the pre-war figure, advances have again declined, though less rapidly than before. For all the banks together, less than one-quarter of the deposits is now employed in advances, as against the half which used to be regarded as the upper limit. Much as we may regret the diminution in this outlet for our resources, it puts us in a favourable position with regard to post-war prospects, as it suggests that we shall be able to finance the orderly re-expansion of non-Government business without any such strain on our resources as might lead to heavy sales of investments. In the period of transition a vast demand will arise from the public for goods of all kinds, while measures of reconstruction will make heavy calls upon the productive capacity of industry. Skillfully devised means of regulation will be needed, which in the present strong position of the banks will ensure that as restrictions are gradually lifted the increased demands upon them for accommodation can be met without inflation.

WESTMINSTER BANK LIMITED

VALUE OF PRESENT BANKING SYSTEM

SOME OBJECTIONS TO NATIONALIZATION

FLEXIBILITY v. RIGIDITY

THE HON. RUPERT E. BECKETT'S REPLY TO CRITICS

The annual ordinary general meeting of the Westminster Bank, Limited, will be held, on the 27th instant, at 41 Lothbury, London, E.C.

The following is the statement of the chairman, the Hon. Rupert E. Beckett, circulated with the report and accounts for the year ended December 31, 1942, which will be taken as read:—

The directors have decided to recommend to shareholders that the £1 fully-paid shares be converted into stock. This procedure is finding growing favour among public companies at the present time, as the elimination of definite share numbers effects a considerable saving of labour in the preparation, checking, and registration of transfer deeds and certificates. The change will also be welcomed by the Stock Exchange. It will not be necessary for shareholders to send their existing certificates to the bank for alteration, as when transfers of stock take place in the future the old share certificates will constitute a good delivery on the market. The stock will be transferable in amounts and multiples of £1, and the rights and privileges of shareholders are in no way affected by the change.

The bank is not at present empowered by its articles of association to convert its shares into stock, and as a first step it is necessary to alter the articles by special resolution at a general meeting, of which the statutory 21 days' notice is given with the report and balance-sheet. The extra-

BALANCE SHEET ITEMS

Referring again to the balance-sheet, the valuation of our premises is slightly lower, and happily we have little further damage to record from enemy action. Altogether, roughly one in five of our branches has been destroyed or suffered damage entailing more than a trifling cost of repair—just about the same proportion as that disclosed officially for the effect of the raids upon house-property in the country as a whole. Repairs, however, have been possible to such an extent that enemy action has accounted for only a small proportion of the total number of branches closed. Chiefly in order to release man-power, the number of our offices has been cut down by 340, or one-sixth, since the war began. In addition, the hours of business in many small offices have been curtailed. While this reduction in the facilities offered to the public has been justified in the circumstances of war, it may well be one factor among many in the enlargement of the amount of currency retained in the hands of the public.

The profit and loss account shows that, after allowing for income-tax and N.D.C., there is a net profit for the year of £1,997,000—a small increase on the amount for 1941. In comparing these figures with those for pre-war years it must be remembered that any expansion in our gross trading income resulting from the greater total of assets is heavily counter-balanced by increased expenses; on staff alone, for example, we spend over £6 millions a year. Further, we have suffered a severe loss of income from the curtailment of the volume of business in such services as foreign exchange operations, acceptances and guarantees, and stock exchange transactions on behalf of customers.

DIVIDEND MAINTAINED

In the disposal of the profit now recorded we propose that the final, like the interim, dividend shall be at the same rate as for

some years past, namely 16 per cent. per annum subject to tax. These distributions absorb £1,213,000. In view of the absence of any further serious war damage, we think it unnecessary to make an allocation on this account; but to add to the strength of our position in face of the manifold uncertainties of the future, we have applied £250,000 to reserve for future contingencies. The other appropriation is more noteworthy. For many years until 1931 the reserve fund, shown in the balance-sheet, stood at an amount equal to the paid-up capital; but, partly in view of the heavy depreciation of investments which took place in that year, we wrote roughly £2½ millions off the fund. We feel the time has now come for partial restoration, and for that purpose we have set aside £500,000 out of last year's profit. This leaves the balance carried forward on the profit and loss account somewhat higher on the year.

Our affiliated undertakings are able to present a record of continued good service to the public despite the difficulties which each, in its sphere, shares with our own bank.

THE OUTLOOK

On the last two occasions of our annual meeting the conditions have been dark and foreboding. Though national resolution never flagged, the goal seemed far distant along a hard and tortuous road. To-day the picture is in less sombre colours, for we see now in the events of the war many positive results of our labour and sacrifice in the period of defensive preparation. Although there is still much to do, the final victory seems nearer in prospect and more firmly assured. Thus we go forward in good heart, ready for all further calls that may be made upon us for sacrifice and effort. Fortified by the certainty of triumph, our task is now to bring it to fulfilment with no more suffering and delay than the magnitude of the struggle inescapably demands.

the most profitable outlet for our funds has again sensibly diminished.

The general result is that your bank shows now a liquidity of 49.7 per cent., comparing its resources with its liabilities. There is little further in the accounts that calls for explanation or even comment, but I would direct your attention to one new feature which affects our premises account.

PREMISES ACCOUNT

As this now stands at less than £5,000,000, it is not this year considered necessary to allocate a sum to reduce still further the capital value of our premises. It has, however, been decided to set up a fund for reinstatement and rebuilding and for deferred repairs which cannot be undertaken now, but which will be necessary after the cessation of hostilities. To this fund £200,000 has been allocated.

The accounts of the Ulster Bank, Limited, which also accompany this statement, exhibit the same trends as those shown in the accounts of our own bank. There is an increase in deposits and in investments in Government securities, accompanied by a diminution in the amount of the advances, while the profit brought in shows a small increase over the previous year. That is all I need mention as regards the accounts.

THE KENNET COMMITTEE

A banking feature of the past year was the setting up of the Kennet Committee to inquire into what practical measures could still be taken to secure the greatest possible release of man-power in banking and allied businesses. The committee has recorded its unanimous view "that in all the industries under review employers and employees alike have consistently demonstrated the greatest willingness to perform all that is required in the national emergency." I think shareholders should have this conclusion definitely brought to their notice. Although the banks have received this

EXPANSION OF DEPOSITS AND PROFIT

The accounts for the past year, which accompany this statement, show that the profit earned is £1,237,585, and exceeds that of 1941 by some £47,000. This result has been due to the expansion in our deposits, which at the date of the balance-sheet had risen by £31,000,000 during the year. This increase has been placed at the disposal of the Government by investment in Treasury bills, Treasury deposit receipts, and Government loans. The item advances to customers has again followed the trend of the war years, and has decreased by just over £7,000,000 on the year, which, as you are aware, means that

measure of commendation from this authoritative body, they have been made the target of much and varied criticism from different sources. In Parliament, in certain sections of the Press, in speeches of exalted Clerics, a spirit of criticism, even of resentment, of the banks is frequently manifested.

It is common knowledge that one section of political thought would welcome the disappearance of banks as independent institutions altogether and turn them into mere appanages of the State—this, I think, because supporters of this plan regard the banks as exemplifications of the capitalist system, in spite of the fact that the shareholders in the register of this bank number close upon 80,000, and other banks show doubtless much the same or even greater numbers. I have never learned what advantages are supposed to accrue from nationalisation of the banks, as it is called; therefore, I put it down to political prejudice incapable of coherent explanation. The left wing Press of course follows—or should I say leads—and inspired by these examples there are not a few who join in the hue and cry without expressed reason or logical conviction. I claim that the banks have justified their position; that during the past 100 years their records show that they have upheld and still uphold the best traditions of sanity in trading, and security for those whose funds have been placed in their hands.

IMPORTANCE OF "PERSONAL TOUCH"

Would State banking be easier, more accommodating, more efficient and cheaper than present-day banking? I cannot think so; it seems to me that centralisation of control under the State would accomplish none of these ends. The flexible banking of to-day would have to give place to rigidity. Normal banking regulations would be standardised and made more hard-and-fast to safeguard against all conceivable losses, since public funds and not those of private institutions would be at risk.

Government requirements would inevitably involve the furnishing of much more detailed information and the filling-up of more forms; the process would be far more cumbersome than at present and trade, both domestic and foreign, would suffer thereby. Prolonged delays in the sanctioning of facilities would be likely, and the "personal touch" would be lost entirely in the remote

control of Whitehall. There is nothing in such developments to suggest either a cheapening or improvement of existing banking facilities, and the public would lose the valuable option it now has of turning to a competitive institution if offered what it considered unattractive or unreasonable terms of business.

BANKING NOT A MONOPOLY

I turn now to answer those who urge that banking has become a monopoly, and for that reason advocate putting it under State control. If ever such a danger existed, I should have thought that it was effectually removed as long ago as in 1918, when further banking amalgamations were made subject to the approval of both the Treasury and the Board of Trade. The actual position to-day is that there are eight large banks, and a considerable number of smaller ones, directly competing with each other for business.

Furthermore, there are the Post Office and other savings banks, building societies, etc., whose activities also impinge in some degree upon those of the banks. Surely a monopoly can command its own terms of business, but I have yet to hear of any British bank, in the face of this considerable and widespread competition, able to act in such a dictatorial fashion.

UNFOUNDED CRITICISMS

In the inevitable switch of banking activity during the war from the direct support of trade and industry to that of the Government's wartime programme, critics have found excuses for yet other accusations against the banks. The banks, they say, are paid too highly for their services in connection with the newly created credit, whose basis is Government paper; it is said to be "costless credit" and it is claimed that banks should either not be remunerated at all for handling of it or that existing interest rates should be reduced. In fact, credit created by Government operations comes back to the banks in the form of new deposits.

The customers may place the amounts on deposit account, on which they will receive interest, or pay them into their current accounts. Whilst it is true that not all of these additional deposits attract interest, it should be borne in mind that

the depositors have available to them all the usual services—payment, collection, and clearing of cheques, provision of statements of accounts, the facility of loans and overdrafts, the holding of securities, encashment of coupons, etc.—the maintenance of which services naturally entails considerable expense to the banks. Thus on all their deposits the banks have to pay either in interest or in services, and the phenomenon of "costless credit" for them simply does not exist.

INTEREST RATES

The various Government securities held as assets by the banks earn interest ranging from 1 per cent. for short-term to 3 per cent. for long-term. The Government, and not the banks, is naturally the arbiter of the rates paid. Critics of these rates have recently been answered in Parliament by the Chancellor of the Exchequer, who maintained that, taking a comprehensive view of all the relevant factors, the war was being financed as cheaply as possible, and he therefore did not propose any radical revision of interest rates. The net profits of the banks are indeed appreciably lower than they were in pre-war years, notwithstanding the fact that they are handling a much greater volume of deposits; no charge of excessive wartime banking profits can be sustained.

Just recently a friendly letter in the Press suggested that the banks should issue a statement showing, *inter alia*, what "further changes they contemplate to meet the post-war situation." The banks have successfully carried on through the vicissitudes of more than a century by facing facts and dealing with them as they arose. It is as yet undisclosed what the economic conditions will be when peace returns. The wishful thinking that pervades many men's minds has resulted in forecasts and pronouncements of Utopian schemes, which leave me sympathetic but uneasy, because in my view sound banking precludes taking a plunge into the unknown and stating what bankers would or would not do in conditions as yet hidden from mankind. But of this I have no doubt: the banks can be relied upon to rise to any calls made upon them, and to face new conditions in a spirit of enterprise, progress, and helpfulness to the community.

had been notable and was an encouraging sign for the future.

If the health of the country was sound in a monetary sense, it was largely due to the wise conduct by the banks, over many years, of their own affairs and guidance on the business affairs of all Canadians. They could fairly claim that in Canada their bank system had more than justified its existence and, with irrefutable facts, answer those who talked of the State taking over the banks.

In the last war Canada had made considerable strides in productive industry. To-day they were witnessing an amazing expansion along those lines in the production of many weapons of war which their manufacturers had never contemplated undertaking but which they were now producing, staggeringly large in quantity and of a quality equal to any. In a word, Canada had risen in a single bound to the rank of a major industrial nation.

In conclusion, he said that this bank had opened its doors in 1817. They might take a legitimate pride in what had been accomplished and it would be their endeavour to live up to the record handed down to them by their forebears.

GENERAL MANAGER'S REMARKS

Mr G. W. Spinney (general manager) said that the net profit for the year amounted to \$3,283,000, compared with \$3,437,000 in the previous year. In spite of higher operating costs and lower yields on investments, the net earnings position had been relatively well maintained, but the effect of the increased Dominion Government taxation imposed under the last Federal Budget had been felt during only

part of the year under review. Their total assets amounted to \$1,175,319,000, as compared with \$1,046,551,000 at the end of the previous year. Quick assets aggregated \$896,935,000, or 81.65 per cent. of all liabilities to the public.

Notes of and deposits with the Bank of Canada amounted to \$110,704,000, representing approximately 12 per cent. of all deposit liabilities in Canadian dollars. Investments, not exceeding market value, carried at \$684,147,000, showed an increase in the year of \$185,223,000. At October 31st the average maturity of their bond portfolio, exclusive of Treasury bills and deposit certificates, was approximately 2½ years. Current loans and discounts at \$244,415,000 showed a contraction of \$59,290,000. Total deposits at \$1,064,645,000 showed an increase during the year of \$136,257,000.

In the light of the Dominion Government's heavy borrowing requirements, he felt that the amount of war financing through the Chartered Banks had so far been kept within reasonable and manageable proportions. The extent to which that type of borrowing could be kept in check would depend largely upon the success of the public distribution from time to time of Government loan flotations.

It had been a year of abundance throughout Canada, a total production of cereals surpassing all previous records. The Dominion Bureau of Statistics estimated the 1942 wheat crop at nearly 608 million bushels, which was by a considerable margin the largest which Canada had produced and almost double the 312 million bushels harvested in 1941.

The report was adopted.

LLOYDS BANK, LIMITED

ERRONEOUS IDEAS ABOUT BANK PROFITS

LOW INTEREST ON INVESTMENTS

PROVISION FOR DEPRECIATION AND E.P.T.

LORD WARDINGTON'S REVIEW

The annual general meeting of Lloyds Bank, Limited, will be held, on the 29th instant, at 71 Lombard Street, London, E.C.

The address of the chairman of the bank, the Rt. Hon. Lord Wardington, which would normally have been delivered at the annual general meeting was, as last year, posted to the members with the annual report and balance-sheet on January 21st in order to shorten the business of the meeting.

In his address, Lord Wardington stated:

My lords, ladies and gentlemen,

For general convenience in present circumstances I am adopting the same procedure as I did last year, and am circulating my address to the members in advance of the general meeting to be held on January 29th.

We have lost during the year our old and much-respected friend, the Earl of Selborne. He joined our board in June, 1919, and endeared himself to his colleagues, not only on account of his high principles, and by the charm of his courtesy and of his personal characteristics, but by the help and wisdom which he was always able to bring to our deliberations, owing to the experience and knowledge gained in a long life of devotion to public duties.

I have also to report the resignation of Mr J. H. L. Baldwin, who came to us on the amalgamation of the West Yorkshire Bank. We shall miss the great advantage we have enjoyed from his extensive knowledge of the textile industry in the West Riding, but we could not fail to recognise the difficulty in these days of his attendance in London. It was with great reluctance, therefore, that we felt it would not be fair to urge him to continue on our board.

Sir Eugene Ramsden, Bart., M.P., was elected to a seat on the West Yorkshire local board, and subsequently to the board of Lloyds Bank. Mr W. H. Fraser, chairman of the National Bank of Scotland, has been elected to our board in place of the late Mr R. K. Blair.

THE BALANCE SHEET

In the examination of our accounts you will find a continuation of the same tendencies which prevailed last year. Our deposits have reached further records by their increase of £65,000,000 during the twelve months, while our advances have decreased by £8,000,000. You will notice also an increase in our investments of £30,500,000, in our Treasury deposit receipts of £14,500,000, and in our Treasury bills of £14,000,000. Thus, after allowing for an increase of £7,500,000 in items in transit and cheques in course of collection, the whole of our fresh deposits have been loaned to the Government. This tendency for deposits to increase, which is always to be seen during a period of heavy borrowing by the Government, and particularly noticeable during a time of war, has given rise to more than usual discussion amongst those who believe that it is the result of action by the banks, and without cost to themselves, and that therefore the resultant investment in Government securities should not yield them any interest, or at best a nominal amount.

NATURE OF BANK CREDITS

The money which banks receive from their depositors must be employed in some direction or other, and what better method

can be suggested in the war conditions of to-day than by lending it to the Government? To try to draw distinctions between one deposit and another, and to suggest that one is money belonging to a depositor, and another is self-created by banks and ought therefore to be treated differently, and that, if invested, the bank should not receive the interest appropriate to that investment, is surely a fantastically erroneous idea.

All deposits are the property of the depositors, and all investments should, in fairness, pay the same return to their respective owners, whether they are banks or any other member of the public. The whole subject of the "creation of credit," which admittedly can be made to appear very confusing, has been admirably dealt with by Mr McKenna in the very lucid pamphlet, "What is Banking?" which he has recently published. I would recommend a study of it to those who find a difficulty in understanding the true nature of bank credits.

PROFITS

When we come to our profit we find another refutation of a belief not uncommonly held. It is perhaps not unnatural to conclude that, with such a large increase to our total resources, a corresponding increase to our profits would result. This, however, is not the case. Our net profit of £1,364,081 is an increase of £89,882 compared with 1941, but is less than it was in 1940, and still less than in 1939. As I have already pointed out, the whole of our additional deposits has been invested in Government securities, yielding on an average, after allowance has been made for 10 per cent. held in cash, only 1½ per cent.

On the other hand, there is additional interest to our customers on these extra deposits to be allowed for, and the reduction of advances lessens our interest earnings, while heavier payments to our staff, due to the grant-in-aid and to the more recent special bonus, and to the fact that many more members have been called up and are still having their pay made up to their former salary, with the added burden of the salaries of the new staff, account for a further increase in our expenses. When, in addition, allowance is made for increases in sundry other expenses and for diminution in other earnings, such as foreign exchange business, it is easy to see why our profit is no more than it is.

ALLOCATIONS

It may be of interest to members to see at a glance how our profit has been allocated. Out of every pound earned by the bank in 1942,

- 3s. 2d. went by way of interest to our current, deposit and savings bank customers,
- 8s. 9d. went to salaries, pensions and staff funds, leaving a balance of only
- 8s. 1d. to cover all other expenses, provision for bad debts, income tax, dividend and allocations.

£1 os. 0d.

DEFERRED REPAIRS AND UPKEEP

It only remains for me to add that out of our available balance of £1,892,705 we have placed £100,000 to our general con-

tingencies account and set aside £350,000 to a separate war contingencies fund. It is obvious that in the transition from war to peace the bank will be faced with a number of special non-recurring items of expenditure, for which it will be wise to make some provision. I need only instance, as an example, deferred repairs and upkeep of our premises.

There will be, undoubtedly, a somewhat heavy bill to meet in this connection as soon as wartime restrictions are removed. Other special expenses will occur, and we should like to feel that we had a reserve which will help us in meeting these without allowing the burden to fall too heavily upon our profit and loss account in any particular year. After making these two allocations, there remains a balance which enables us to recommend the payment of our usual dividend and carry forward the slightly reduced sum of £524,745.

COMPUTATION OF PROFITS

What I have said earlier gives a simple explanation why bank profits have not risen proportionately to the increase in deposits and to the consequent addition to assets. Incidentally, it throws some light on the question of liability to excess profits tax. It does not, however, satisfy those who take the published profits of the last few years, and, after adding back income tax, find that the gross figures do show a considerable increase over previous years. It is, perhaps, not unnatural that they should conclude that this is another instance of the "mystery" in which bankers are accused of wrapping up their industry. The explanation, however, is, though slightly complicated, perfectly intelligible.

GUIDING PRINCIPLES

Some years ago, in my address to members, I endeavoured in general terms to explain the principles which guided us in making up our annual profit and loss account. Perhaps it may be helpful at this juncture to repeat what I said on that occasion, and to preface my remarks with a quotation from a recent pronouncement of the Institute of Chartered Accountants. "The prescribed method of computing profits for taxation purposes disallows many important items which are necessary deductions in arriving at profits."

If this fact is understood it is easy to see how inevitable it is that the published figures may differ widely from those approved by the Inland Revenue authorities, and provide no clue to the question whether liability for excess profits tax has been incurred. The loss or gain arising either from the sale of investments, or the allocations to, or recoveries from, bad debts, come under the category of those sums which must be included in a statement required for the purpose of computing income tax, but they do not necessarily come into our published profits.

It is apparent, therefore, that if the standard year for excess profits tax was fortunate in these respects, no tax would be payable in an accounting period which had not enjoyed similar advantages, although there might be nothing in an examination of the published profits of these years to lead to such a conclusion. In our case the profits of the standard year for excess profits tax was not unfavourable, owing principally to the fact that larger profits than usual were made from the sale of investments.

DEPRECIATION OF INVESTMENTS

Again, it is obvious that if in any year a paper depreciation of our investments, as distinct from an actual realised loss, has been incurred, some provision must be made for it, either out of reserves or from profits, though for the purposes of taxation no such deduction from profits is allowed. If, therefore, full provision for such depreciation were debited to our profit and loss account for the year it would have to be written back for purposes of excess profits

tax and would be misleading when comparing such a year with others which do not call for similar provision.

There have been years in which the depreciation of our investments has called for the provision either from profits or reserves of an amount equal to 18.9 per cent. of our earnings, while in other years the actual sale of investments has yielded a surplus available, technically, to be brought into profit or added to reserve, equal to 16.7 per cent. of our earnings.

CONTINGENCIES

It is not always easy to decide whether any item in a particular year is likely to be of a recurring nature, and therefore to be reasonably included in our profit and loss, or whether, on the other hand, it would be wiser to consider it as exceptional and more suitable to be placed to reserve for contingencies in a less favourable year.

All these, and many other factors, make a scientifically accurate comparison of profits one year with another a matter of considerable difficulty. To show these differences year after year by a closely detailed analysis of our profit and loss would be impracticable in any statement short enough to be intelligible. The whole matter seems to resolve itself into a question of sound banking judgment. Our aim is to present figures to you which, having regard to all the circumstances of the time and possible contingencies in the future, constitute a reasonable comparison one year with another.

STAFF BONUS

I feel sure that the bonus to the staff, which I have already mentioned, approved after the most friendly and frank discussions with the representatives of our Staff Association, will be gladly endorsed by our members. The staff have been working under considerable difficulties; many new

duties and regulations have been imposed upon them, and a large number are new to their work, and some time is necessary before they can carry out their duties with the same celerity and accuracy possible for more experienced individuals.

They have also, like the rest of the public, been hard hit by the general circumstances of the present time. Nothing perhaps gives us more anxiety and perturbation than the continual conflict between the arguments of the head and heart in these matters. When one sees on all sides constant increases to wages and salaries being granted, it goes against the grain to take a stand on the hard economic doctrine associated with the "vicious spiral" theory, however clearly the head insists on the soundness of its teaching.

THE KENNET COMMITTEE REPORT

You will have been interested during the year to see the appointment of the Kennet Committee, with the duty committed to them of inquiring as to the release of manpower from banking and allied businesses. Banks gave full evidence on the subject, and were anxious to collaborate with the Committee as fully as possible. You will have been pleased to learn from the Report of the Committee that they paid tribute to the helpful part played by the banks. In fact, I believe all the major recommendations, with the exception of that proposing early closing, were agreed to, if not actually suggested, by the representatives of the banks themselves before the Report had been issued.

In the case of our own bank we have released 5,003 men and women of the permanent staff, and have closed 424 branches and sub-branches. You will readily realise what a strain has been put on our organisation by the great changes involved. Quite apart from the numbers mentioned above, we have engaged 13,000 temporary

staff since the commencement of the war, 6,000 of whom have left our service to join the armed forces or to take up other war work.

Our pre-war number of clerical male staff (excluding our special Army Agency Branch at Pall Mall) was 10,077, and of those there are only 4,600 left in the bank, of whom nearly 200 are awaiting call up to the Forces. When they have gone we shall be left with approximately 44 per cent. of our pre-war male clerical staff, having lost 56 per cent. either to the Forces or by normal wastage such as death, etc.

FACILITIES TO THE PUBLIC

It is interesting to note what a complete reversal of opinion, not apparently due to war conditions alone, has taken place in regard to the facilities given by banks to the public in the number of branches provided. It is not more than a few years back that the cry was, the more branches and the more banks the greater facilities and convenience to the public, and the more beneficial the consequent competition. So much was this the case that Government interposed to prevent any further amalgamation between banks, except with special permission.

At that time there was a definite, though quite unwarranted, fear of closer arrangements being made between banks lest they should develop into a money trust. Now it is argued, not merely on account of war requirements for manpower, but on the ground of economy, that the number of branches in many towns is excessive, uneconomical, and ought to be diminished and that service to the public should take second place.

In the interests of paper economy I have confined my remarks to matters strictly appertaining to the bank's business and have refrained from commenting on the many highly interesting problems of more general application.

district for many years, where he was highly esteemed.

MANAGEMENT AND STAFF

Shareholders will have read in the newspapers the announcement of the retirement on December 31st last of Mr R. Norman Smith, one of the general managers. I cannot allow this event to pass without an expression of sincere regret on my part as well as that of all the directors. Mr Norman Smith has given to the bank 43 years of devoted service. He is well known to, and held in high regard by, innumerable customers and members of the staff and we shall all miss him. I know shareholders will join me in wishing him the long and happy retirement he has so well merited.

For the last three years I have given some details of the changes in the number and composition of the staff which war conditions have imposed upon us in common with all the other banks, and shareholders will be aware of the voluntary action of the banks in economising labour. They will also be aware that the Government included banking in an official inquiry into manpower instituted in the early part of the year under the chairmanship of Lord Kennet, and that after some months of investigation the Committee of Inquiry issued a report adopting as one of its recommendations a suggestion put forward by the banks themselves for a reduction in their pre-war staff, and incidentally paid a tribute to the labour-economising measures which the banks had already carried out voluntarily. The net result is that by the spring our staff will be reduced to 85 per cent. of its pre-war figure, notwithstanding the fact that we shall have lost to the Forces or industry over 3,700 of our pre-war trained staff, which represents 56 per cent. of our strength at the outbreak of war. Of these, 1,200 now hold commissioned rank, and during the past year a further number have been decorated for gallantry in action, in

addition to those mentioned a year ago. Our best wishes for a safe and speedy return go out to all those members of the staff now on active service.

The employees are represented in this bank by separate staff associations for men and women, and contact has been maintained between the board of directors and these associations throughout the year. The result of these conferences has been in every way helpful both in respect to the work of the bank and to the general interests of the employees.

THE PUBLIC AND BANKING SERVICES

Despite depleted numbers and the exigencies of war, it gives me great pleasure to tell you that the high standard of efficiency to which the public is accustomed has been fully maintained and the work of the bank has been carried on with a spirit of utmost goodwill. Both our shareholders and the public may rest assured that this same spirit of helpfulness will be shown by those who have recently been brought into the service of the bank as was shown by those who are now serving in the Armed Forces of the Crown. As some sort of measure of the increase in the volume of work with which reduced staffs have had to cope, I may mention that the grand total of the clearings for 1942, at £48,657 millions, showed an increase of no less than 13.1 per cent. over the previous year.

The closing of offices which, under normal conditions, would have remained open must have caused inconvenience to a number of our customers, and I would like to repeat my appreciation of their considerate attitude when facilities have been withdrawn to which they had become accustomed, and which were of real service to them.

STATEMENT OF ACCOUNTS

The enclosed statement of accounts shows an expansion in deposits, which have now reached the figure of £473,000,000. Cash stands at £51,175,000, being 10.8 per cent. of the deposit liabilities. No revenue is derived from this large holding which, in fact, involves expense in handling. Cheques in course of collection are £24,433,000. Money at call and short notice stands at £16,542,000. Nearly the whole of the holding of bills consists of those issued by the Treasury. The total figure appearing in the balance-sheet against bills discounted is £30,303,000.

Another large lending to the Government consists of Treasury deposit receipts, which total £111,000,000. The investments, the bulk of which are British Government securities, redeemable within a relatively short period, amount to £144,000,000. Advances, normally our main earning asset, continue to decrease owing to the operation of the various Government controls over industry, and are now £104,762,000.

PROFIT AND LOSS

You will, I am sure, be gratified at the result of the year's work, which shows a net profit of £1,132,018, representing an increase on last year. After payment of dividends at the rate of 15 per cent. per annum and allocations of £100,000 to bank premises account, £150,000 to pension fund and £150,000 to War Contingencies Fund, the amount left to be carried forward is £564,175.

EFFORT FOR VICTORY

We have now entered upon the fourth year of the war, when the effort needed to make a real advance towards victory will be very great—and not least in the sphere of national finance. The necessity for curtailing personal expenditure is being impressed upon us continually with increased emphasis by the Chancellor of the Exchequer. The part which we, as bankers, are called upon to play in this matter is to continue to make this fact known among all those with whom we are brought in contact in the course of our daily business, and in this way to direct the minds of the public towards increasing their holdings in one or other of the various Government issues.

DISTRICT BANK, LIMITED

SATISFACTORY RESULTS

E.P.T. AND THE BANKS

FINANCIAL PROBLEMS OF BEVERIDGE REPORT

STATEMENT BY THE CHAIRMAN, SIR R. NOTON BARCLAY

THE BALANCE SHEET

The chairman, Sir R. Noton Barclay, has issued the following statement to the shareholders of District Bank, Limited, prior to the 113th annual meeting to be held on the 29th instant at the head office, Spring Gardens, Manchester.

I am following my wartime practice of circulating to shareholders, in the form of a printed statement, my observations on the report and balance-sheet, as well as on more general affairs.

Some end-of-the-year changes have taken place amongst the bank's principal executive officers. Mr George C. Sumner, the last general manager of the County Bank, and, since the merger, one of our joint general managers, has retired on pension. We extend to him our best wishes for good health and all happiness in the future. Mr Albert Dunn, who before the amalgamation was assistant to Mr Sumner, has been appointed an assistant general manager.

As was to be expected, another year of war has drawn heavily on our staff, not only in numbers but in experience, as the older men are called up for active service. Inevitably, as increased numbers of our men are involved in the greater dangers of war, casualties mount up, and we grieve that 24 are reported to have lost their lives, eleven to be missing and twelve to be prisoners of war. We are proud that some members of the staffs have earned distinction for gallantry in action, although unhappily this has not been without loss of life. I know that you will share my feelings of profound appreciation of so much courage and sacrifice. Our deepest sympathy is tendered to the many relatives and friends who, of necessity, suffer anxiety and sorrow.

STAFF PROBLEMS

In anticipation of the contraction which has occurred in our experienced personnel over the past twelve months, we adopted far-reaching measures to economise in labour. This has been achieved by the fullest possible utilisation of effort in every-day work, by strictly confining activities to essential duties, by longer working hours, and the more intensive training of entrants. The task has not been easy, especially as wartime demands on banking involve us in much intricate procedure. Of necessity, therefore, but fortunately with the kind understanding and tolerance of customers, we have had no option but to curtail certain normal facilities by continuing to close some offices and by limiting hours of business at others. Actually, many steps we had already taken have anticipated the recommendations of the Kennet Committee. To adopt the further suggestions of this Committee will obviously present difficulties, but we shall, of course, do what is expected of us in the further release of manpower.

Our officials and staff are involved in much careful planning which, with the growing strain of their daily work, is a matter of no small consideration, particularly as they are already burdened with many wartime responsibilities, such as the necessary protection of our premises as firewatchers and other Civil Defence tasks. Their whole-hearted support has brought us through the past year with most satisfactory results, and I am pleased once more to express warm appreciation of their loyalty and devotion to arduous duties. As a practical token of this appreciation the board granted to the staff a special bonus which was distributed last month.

Bank figures generally have increased considerably over the past twelve months. Our own deposits show an expansion at £145,967,000, and a satisfactory increase in the number of our customers continues.

The assets side of our balance-sheet gives evidence of the extent to which the bank provides financial assistance to the Government. Over the period of twelve months there has been a marked rearrangement of our principal assets. Holdings of Treasury deposit receipts have increased and at £36,000,000 they are the second largest item, while advances, still third, are nearly £24,250,000, showing little change against 1941 although the average for the past year has run at a lower level. A large portion of them is to enable customers to execute Government contracts. Our investments have been augmented until they now stand at a total of £52,787,000. Here is evidence of an increasing flow of our funds to the Government for use in its present urgent need and, beyond this, by lending our resources to the State in Treasury bills and in Treasury deposits we further facilitate the participation of the Government in financing wartime output. Finally, it may be remarked, that part of our cash represented by balances at the Bank of England is directed to Government use, since the greater portion of the assets of the Central Bank consists of Government securities.

From this it will be seen that practically all our resources are directed to the war effort, and we play a full part in the great objective to which the country is committed.

NET PROFIT

There has been much speculation in the Press and elsewhere as to why the banks have not hitherto been liable to excess profits tax in view of their greatly increased resources. While it is true that the expansion improves the gross earning power of the banks, insufficient weight is given, in comparison with the E.P.T. standard years, to various factors offsetting that gain. The following are points which materially affect the position:—

- Interest is generally paid by the banks on the increased resources.
- A considerable increase in expenses.
- An increase in liquid resources, which are now about 50 per cent. of the liabilities of banks to their customers as against approximately 30 per cent. (the difference is represented by short loans to the Government on Treasury deposit receipts at 1½ per cent., money which, under other circumstances, would be employed in loans to customers or in investments yielding higher returns).
- The income from advances is less as a result of the decline in their volume.
- The reduction of interest on numerous investments, due to repayment and reinvestment of the proceeds at current lower yields or to conversion at lesser rates of interest—e.g., 4½ per cent. Conversion Loan (into a 2 per cent. issue), Dominion, Colonial, Corporation and other securities of a similar class.

On broad lines the position is that our income has been more than sustained by the use of the larger resources at our disposal and the progressive expansion of our business, although the average yield per cent. on our total assets has declined.

The net profit for last year was £421,749 and, in accordance with our invariable custom, was arrived at after fully providing for all bad and doubtful debts and for

NEED FOR CURTAILING PERSONAL EXPENDITURE

MR COLIN F. CAMPBELL ON THE BANK'S PART

The one hundred and tenth annual general meeting of the National Provincial Bank, Limited, will be held, on the 28th instant, at the Head Office, 15 Bishopsgate, London, E.C. 2.

The following is the statement by the chairman, Mr Colin F. Campbell, circulated with the report and accounts:—

As the conditions which prompted me to circulate my observations on the report and balance-sheet in previous years still exist, I am taking a similar course this year, and consequently the proceedings at the annual general meeting on January 28, 1943, will be confined to the necessary business to be transacted.

BOARD OF DIRECTORS

At the annual general meeting last year I reported that the bank had lost the services through death of the Right Hon. Lord Illingworth, P.C. Lord Illingworth had been a director of the bank for over 20 years and his loss has been very much felt. So that we might continue to have the advantage of some representation on the board of the local directors in Bradford, Mr Dudley Holden Illingworth was appointed to fill the vacancy. He has served as a local director since 1919 and

has had a long experience of business in the West Riding, rendering valuable service to the bank. In February, the Right Hon. the Earl of Selborne, P.C., was appointed Minister of Economic Warfare, and, consequently, relinquished his seat on the board.

I have also to report that we have appointed Mr James Cadman, D.S.C., D.L., to a seat on the board. He brings with him a wide and varied business experience which will be most useful to us. Another change which has been made in the constitution of the board of directors is the appointment of Colonel Bertram Abel Smith, D.S.O., M.C., T.D., A.D.C., one of the extraordinary directors. He has been associated with the bank for many years and has had an extensive experience of business in the City of London.

Among the local directors of the bank we have suffered loss through the death of both Mr Gerald C. Mercer, of Maidstone, and Mr W. H. Greville Edwards, of Bristol. Mr Mercer was extremely popular in Maidstone and, in fact, throughout Kent. He had been a partner in the private banking house of Wigan, Mercer, Tasker and Co., acquired by the Union of London and Smiths Bank, prior to the amalgamation with this bank. Mr Edwards had been a local director in the Bristol

taxation and contingencies. With the sum brought forward from the previous account we have a total of £737,691 available. Appropriations were £100,000 to pensions and annuities fund and £60,000 to bank property account, and dividends, being distributed at the same rates as in 1941, absorb £259,673, leaving a sum to be carried forward of £318,018.

NATIONAL AFFAIRS

For the moment everything must, of course, be subordinated to gaining victory, and consequently some would suggest that it is waste of time and energy to start planning now for the post-war years. It would, however, be a calamity if the conclusion of hostilities should find us without a clearly defined programme for the changed world which will emerge. Hence Sir William Beveridge's recent great scheme for a Ministry of Social Security is welcome, if only as an indication of the Government's determination to take active steps in this direction.

The possible effects of this scheme, if adopted, upon the future economic welfare of this country are much discussed at the present time and, whilst the great majority must agree with its objects, it naturally raises many questions in people's minds. I, therefore, think it appropriate to refer briefly to one or two of these.

POSSIBLE EFFECTS OF BEVERIDGE SCHEME

Firstly, can we carry the financial burden which the scheme would involve? What the real additional cost would be it is difficult to estimate. There are even those who calculate that the over-all cost to the nation would not exceed the present actual outlay. Be that as it may, it must, of course, be borne in mind that the benefits mentioned are only tentative. Even on the figures suggested, however, I think the actual additional burden would not really prove as heavy as may appear on the surface. To a large extent the nation is already carry-

ing that burden, if not directly, then indirectly and perhaps in a more costly manner through the social services now ministering to those who suffer from the lack of proper provision. Regarded from this aspect, is it not largely a case of rationalising a financial burden which already exists?

IMPORTANCE OF EXPORTS

Another point relates to one of the hypotheses upon which the scheme is based, the all-important assumption that there shall be no mass unemployment such as was experienced after the last war. If such unemployment is to be avoided no effort should be spared to retain our export trade which, as Sir William Beveridge says in his report, is so essential to Britain in providing payment for her raw materials. In the earlier days of the war the authorities were very anxious to encourage exports in order to find exchange wherewith to purchase the necessary supplies from abroad. Since the institution of Lend-Lease, however, the Government has not the same direct interest in preserving overseas outlets through which hitherto a large volume of British manufactures has passed. For instance, some of these are to-day entirely closed to the textile trade owing to lack of either or both quotas and export licences. On the other hand some markets are still fairly well supplied with our products. Recalling our bitter experience after the last war, wherein we found difficulty in regaining markets once lost to us, could there not now be a more even distribution to safeguard our re-entry into such markets? Obviously, everything at present must be subject to the exigencies of war, but we must not close our eyes to the ultimate vital need for these outlets, if victory is to ensure the well-being and social betterment of this country.

PEACETIME PROSPECTS FOR EXPORTER

Viewed from the angle of finance, the peacetime prospects for our exports are

not discouraging. On the conclusion of hostilities Britain and America may well be the only countries able to guarantee loans to other nations. Yet reconstruction loans on a vast scale will be required, especially by European countries, and by co-operation in the liberal satisfaction of such needs much might be done to revive our overseas trade. Certainly the prospects would appear good, for the utilisation of the proceeds of such loans on goods and services would stimulate the necessary revival of international trading.

NEED FOR FOSTERING DEMAND

Probably it is true to say that owing to the enormous growth in world productive capacity there is to-day a sufficiency, potential if not actual, to satisfy the essential needs of mankind. In recent years, however, primary products have actually been destroyed in large quantities, and in some industries there has been a wholesale closing down of plant in an endeavour to equate supply to demand. I think we are beginning to realise that this problem should be approached from the opposite angle. Enormous unsatisfied requirements are constantly pressing and the objective should be to convert this consuming power into actual demand, both within our own nation and internationally: in other words the aim should be to foster demand rather than to restrict supply. That this can be accomplished is not beyond human ingenuity.

With proper organisation of employment future planning should achieve a more equal distribution of purchasing power amongst consumers, and this, with control of exchange (at any rate in the early post-war years, so as to facilitate the free flow of goods between producer and consumer) should largely help to bring about the fullest collaboration between all nations in the economic field, with the object of securing for all improved labour standards, economic advancement, and social security, as forecast in the Atlantic Charter.

played, namely, £183,500,000. With £373,015 brought forward from last year's accounts, there is a disposable sum of £949,649. After paying the two dividends of 7½ per cent. each, less tax, costing £312,003 net, we shall have a balance of £637,646.

This year we have placed £100,000 to our published reserve, bringing that fund to £3,700,000, and have added £50,000 to pensions reserve fund. A sum of £100,000 has been transferred to reserve for future contingencies, where it is available to meet any of those requirements that experience teaches us should not be overlooked in an emergency such as that through which we are passing. The bank's reserves are the outcome of more than a century's trading and, being typical of the system of British banking, illustrate why that system, with its other traditional methods, is unsurpassed. These accumulated reserves are not more than prudence dictates as being adequate to maintain the high standard set by our banks. £387,646 is carried forward to next account, an increase of £14,631 on last year.

The balance-sheet shows a high state of liquidity. Cash items, which comprise cash and balances with other banks, market money, Treasury bills and Treasury deposit receipts, total £82,230,000, that is 49 per cent. of deposits. This liquidity, higher now than in normal times, is another factor in limiting profits, and one that is essential in order to provide those safeguards necessary in times of great economic and financial difficulties.

It will be noted, in appraising our part in the national effort, that no less an amount than £108,148,000 out of deposits of £167,339,000 is employed in loans to the Government by way of investments, Treasury deposit receipts and Treasury bills. In addition there are, apart from the large amount advanced to customers who are on war work, the bank's engagements in respect of credits and other obli-

gations entered into in connection with the import of essential commodities.

KENNET COMMITTEE'S REPORT

That is the tale of the bank's war service during the year on the financial side, but there is another aspect. Before the Kennet Committee was set up to inquire into the volume of man power that could be provided by the banks, we had taken measures to arrange for the inevitable release of staff. Many branches had been closed, and in others hours of service to the public had been reduced. Work that could be regarded as non-essential in war time was curtailed, and we had sought to obtain the maximum advantage from mechanisation, substantial saving being made by the adoption of centralised posting of ledgers in appropriate areas. Statistics and returns were steadily cut down.

On the publication of the report of the Kennet Committee it was clear that if the banks were to reduce their staffs to 85 per cent. of their pre-war strength, as recommended by the Committee, further endeavours would be needed to meet this exacting requirement, which has already been studied and is being actively enforced. The report of the Committee, whose investigation had been searching, was in no sense adverse to the banks. Indeed, it stated that banking employers and employees had consistently demonstrated the greatest willingness to perform all that was required in the present emergency.

So far, 56 per cent of our pre-war male managerial and clerical staff have been released to join the forces or some form of national service. All our fit men in their forty-second year and under have been released, with the exception of 4.6 per cent. of our pre-war male staff who have been reserved. The losses have been partially replaced by temporary staff, principally women, many of them inexperienced and requiring to be trained by the remaining staff. I am glad to acknowledge the efficient and willing way in which the work of the bank is discharged by the whole management and staff under very trying conditions.

With deep regret I inform you that 33 of our staff in the forces have lost their lives, on service; 7 are reported missing;

BRITISH CELANESE, LIMITED

PROFIT ESTIMATE EXCEEDED

PROGRESS IN CURRENT YEAR

DR. HENRY DREYFUS'S SPEECH

The twenty-third annual general meeting of British Celanese, Limited, was held, on the 20th instant, at Winchester House, Old Broad Street, London, E.C.2, Dr Henry Dreyfus (chairman and joint managing director) presiding.

The chairman said: Ladies and gentlemen,—I propose with your approval to take the report and accounts as read. (Agreed.)

The profit and loss account shows the balance of trading account of £3,152,115.

RESULT OF YEAR'S OPERATIONS

After provision for general sales and administrative expenses, Excise duty, etc., together with research and advertising, there remains £2,016,290. After charging depreciation, interest and premium on debenture stocks, etc., but omitting the appropriation hitherto made in respect of commutation of royalties, there remains a net profit of £1,498,495, subject to taxation. It will thus be seen that the estimate of profit before taxation which accompanied the directors' original proposals for satisfying the arrears of dividend on the second preference shares has on a comparative basis been exceeded by £167,353.

After providing for taxation, the pay-

and 26 are prisoners of war. The sincere sympathy of all connected with the bank will, I am sure, go out to the relatives in their loss or in the anxiety they may be suffering. An increasing number of those in the forces have received decorations or distinctions for gallantry or other special service. It is with pride I congratulate both them and their relatives, and I have no doubt that the members will wish to join me in sending a message of good wishes to all our staff who are serving in the forces, or in other national service whether at home or abroad.

ACTIVITIES MAINTAINED

While methods of work have been curtailed, the actual volume of business of the bank has not diminished; turnover for 1942 largely exceeded the figures of 1939, the year immediately preceding the war, and the number of cheques cleared was little short of the total for that year. In other ways additional duties have been undertaken, one of these being the conduct of large numbers of clothing coupon accounts since June last. The handling by the banks of these enormous masses of coupons, originally estimated at 3,500,000,000 per annum, in a scheme which has worked smoothly and satisfactorily, is evidence of the adaptability of the banking system.

LENDING TO THE STATE

Another duty to which members of the staff throughout the service devote much time and enthusiasm, both inside and out of the bank, is the receipt and encouragement of applications for Government loans on issue. Our customers are subscribing handsomely to the various loans, and the staff, through groups established over the whole service, is contributing a notable annual amount in regular periodic payments. The coming year and particularly the "Wings for Victory" weeks campaign shortly to be inaugurated will give everyone, both large and small savers, a further opportunity of lending to the State the funds urgently needed to prosecute the war. An increasing effort is required in this direction, and I stress that there should be no relaxation but rather a re-

doubling of the response to the appeal of the Chancellor of the Exchequer.

REPUTATION OF BRITISH BANKING

In times of great national strain it is proper that all aspects of the country's activities should come under review, and that criticism, so long as it is well informed and disinterested, should be focussed upon the working of the economic and social organisation to see that it is functioning efficiently. In this way searchlights have played upon all our industries, and, not least, banking has been subjected to comment from many quarters. It can justifiably be claimed that the banking system, founded on long experience and constantly adapting itself to changing times, has been equal to all the demands of the war. British bankers and the banking system, developed through the centuries from the days of Sir Thomas Gresham, who worked on the very site of our Lombard Street office, can be judged by their record and their reputation, and I do not think I can put it better than in the words of an eminent correspondent, who wrote recently that if there was one thing to which he clung in the present cataclysm it was the flawless integrity of the banks.

I will conclude this statement with a reflection on the change in atmosphere, rather than in our figures, that has taken place since a year ago. As I see it, there is everywhere a renewed patience, good humour, determination to make the best of everything and overcome all difficulties. There is seemingly to-day plenty of reserve buoyancy of spirit, and the bank's bearings, like the nation's, are all free running and cool. It is a general atmosphere which can only be sensed by contact with all sorts of war activities—in the camp, in the factory, on the seas, in the office, on the farm. The wider one's experiences and relationships the more one can sense a new spirit. It is as if the collective spirit were saying to itself "Somehow we have survived the worst and now we are on the right course with lots of steam in the boiler. We know now where we are going. We see the need for it. There are no more doubts. We will get on with it properly and we are going to enjoy the Doing, which will bring us Victory and Peace."

£3,500,000 have been added to the asset values during the last 10 years, you will appreciate that the assets prior to the period mentioned have been depreciated to a much greater extent than 43 per cent.

Stock values are £1,692,748; debtors and payments in advance are £691,366; and cash, tax reserve certificates and Government securities amount together to £2,183,596. The increase in the amounts owing by subsidiary companies is accounted for by a loan made to one subsidiary company for plant construction.

On the liabilities side sundry creditors at £919,371 10s. are approximately the same as last year, but you will see that the taxation reserve of £1,708,628 shows the substantial increase of £614,059; this, of course, is the result of the increase in profit for the year. The 7 per cent. first debenture stock has now been completely repaid, and a new 4 per cent. debenture stock amounting to £550,000 was created during the year, in connection with activities arising out of the war; of this, £162,000 was issued in the same period, since increased to £386,000.

SATISFACTORY RESULTS

The above figures show that substantial progress has been made in the earnings of the company, which confirms statements I have made from time to time about its profit-earning capacity, especially as such results have been obtained from the operation of only part of the company's plant, due to difficult operating conditions which necessitated adjustment from time to time.

I think you will agree with me that these results are satisfactory. You must, however, bear in mind that new difficulties may

MARTINS BANK, LIMITED

INCREASED TURNOVER

HELP TO WAR CONTRACTORS

UNSURPASSED BANKING SYSTEM

MR. F. A. BATES ANSWERS CRITICISMS

Mr Frederic Alan Bates, chairman, has issued to members of Martins Bank, Limited, along with the report and accounts to be submitted to the 112th annual meeting on the 26th inst., the following statement reviewing operations in 1942:—

Since my last annual statement there have been changes upon our Manchester board. Lord Colwyn, wishing to curtail some of his activities, has resigned from that board, of which he had been chairman since the amalgamation of the Lancashire and Yorkshire Bank with Martins. I am glad to say he is retaining his deputy chairmanship of the general board, so that his ripe experience will still be available to us. He has been succeeded in Manchester as chairman by Sir William Clare Lees, Bart. During the year Mr. Angus D. Campbell was elected to the Manchester board, and as he brings with him wide commercial knowledge his collaboration is highly valued.

FEATURES OF YEAR'S FIGURES

The balance-sheet for the year 1942 again bears the impress of the change-over from the world wide trading of peace to the concentrated and specialised production for total war. From these war-time changes arise the three most noteworthy features of the year's figures. Customers' deposits have increased by £9,736,000; Treasury deposit receipts are £18,500,000 more; and advances to custo-

mers are down* by £3,679,000 notwithstanding that the bank is giving great help in many directions to contractors engaged on war work in order to stimulate production. In striking fashion these three features reflect the dormant state of the arts, crafts and industries of peace, while the whole effort of the country with united will is bent towards victory in war.

With regard to the increase in deposits, it will be noted that this is much less than in 1941, mainly due, as I forecast in my last statement, to large sums being withdrawn by customers for the purpose of taking up tax reserve certificates.

To a great extent, the loss of the more remunerative outlet for our funds by way of advances to customers has been offset by the employment of larger deposit resources in Treasury deposit receipts (£46,500,000 at the date of the balance-sheet) and in investment in government loans (£54,128,000), but the small margin of profit earned, coupled with increasing expenses, has resulted in the net profit being some £10,613 less than last year. Excess profits are not being made by the bank out of the war. In point of fact, if they were excessive the appropriate amount would be transferred to the Government by the operation of the excess profits tax.

RESERVE STRENGTH

The net profit is £576,634, a moderate figure considering the large assets em-

arise in future which may influence the results, although you may rest assured that we shall use every endeavour to meet any such difficulties.

The results of the first six months of the current financial year are estimated to show an improvement on those of the corresponding period in the previous year, although such profit increase will be subject to Excess Profits Tax.

E.P.T. BASIS

At the special meeting held on the 29th October, 1942, I mentioned that we expect by the end of the current financial year that the amount paid and accruing in respect of E.P.T. may exceed the sum of £1,000,000, which will provide a cushion in case profits owing to unforeseen circumstances should fall below the standard.

The Report indicates that the basis on which the standard is calculated has been agreed and that a large claim which I mentioned to you at the special meeting has not been allowed. This standard is flexible and may vary as I have explained to you previously, in accordance with the different factors which operate.

At one of our recent meetings I had an opportunity of explaining that the Board wished to be as helpful as possible to the Second Preference shareholders in connection with their participating rights, as well as to the Ordinary shareholders so far as dividends are concerned. You will, however, realise that although large profits have been made the Excess Profits tax standard imposes restrictions in this connection.

Shareholders may, however, rest assured that the Board will give favourable consideration to the claims of the Participating Second Preference and Ordinary shareholders as soon as this can be done without impairing the soundness of the Company's financial position.

RESEARCH ACTIVITIES

The Company continues to be engaged in many directions in extensive research and development of processes, in particular in connection with the war effort. These activities embrace various chemicals used for many different purposes, and especially such chemicals as may be needed for textiles, synthetic or otherwise, and plastics. So far as plastics are concerned we have been in this business for more than 20 years, and virtually all the well-known plastics, as well as new plastic products developed by us, come within the orbit of the Company's activities.

As a result of extensive research over many years we are also progressing with various textile products, including high tenacity yarns and other new textiles built up completely synthetically from coal with or without nitrogen. These will not only play their part in the future of the Company but also in the industry generally.

CONTROL AND CO-OPERATION IN THE INDUSTRY

The volume of rayon production, both for the industry as a whole and for individual firms, continues to be subject to control through the Ministry of Supply and

the Board of Trade. Output is restricted and the available yarn is apportioned between the different sections of the textile industry according to Government directions. During 1942 further cuts were made in export allocations with the result that export demand is far in excess of supply.

Co-operation continues between the different sections of the rayon industry, latterly through the Rayon Council. All the principal sections of the industry, from yarn producers to fabric merchants, are represented on the Council, whose purpose is to provide a common meeting ground where matters affecting the industry may be discussed.

The results of the American and Canadian Celanese Companies which are advertised from time to time in this country will have kept you informed of the continued progress these companies are making.

TRIBUTE TO EMPLOYEES

Finally, may I be permitted to take this opportunity of thanking all our employees in our factories and establishments in different parts of the country for the energy and resourcefulness which they have continued to devote under the increasingly difficult conditions, and who have contributed largely to the satisfactory results obtained.

The report and accounts were adopted and the two classes of preference shares were converted into preference stocks. The re-election of retiring directors and of the auditors concluded the proceedings.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

THE burst of activity which heralded the New Year in the markets has somewhat subsided for the present. Turnover, as reflected in the markings recorded during the past week, shows a fall of nearly 20 per cent. Nevertheless, prices, mainly equities, have continued to advance under the influence of the encouraging war news and the acute shortage of floating stock. Apart from a slight response by several irredeemable and long-dated issues to the news of the Indian Railways vesting order, the gilt-edged market was featureless, prices remaining relatively steady on the reduced turnover. Australian issues improved steadily on the New Guinea successes. A small advance for Chinese bonds was registered in the foreign bond market. But, apart from some minor improvements in Brazilian stocks South American stocks were unchanged. The decline in activity in the home rail market, arising partly from the resumption of air raids and partly the reaction to the recent advance, was considerable, although losses were relatively small, if persistent, and restricted to the junior and marginal preference stocks. The general fall in Argentine rail issues, occasioned by the increased operating costs statement, came to a halt at the close of last week, and until mid-week prices have remained steady at their reduced levels.

Good gains, occasioned by selective buying of heavy industrial stocks, imparted a firm tone to the industrial market. Leading brewery issues enjoyed small but steady gains, but both Imps and Bats were dull,

the latter falling 1s. 3d. on the earnings statement. Changes in the motor and aircraft section were mixed, Leyland, Thornycroft and Albion Motors rising, while J. Lucas fell steadily. Small advances were scattered throughout the heavy industrial section, gains for Hadfields, Firth Brown, Colvilles, and Stewarts and Lloyds ranging from 6d. to 1s. Turnover in the shipping group was slight, the few scattered movements being without significance. Plastics shares attracted considerable support early this week, and, despite a later reaction, De La Rue, ICI and Wall Paper deferred—the latter rising 2s. 3d. on the acquisition of the plastics subsidiary—all enjoyed useful gains. British Celanese, too, were firm, and elsewhere in a buoyant textile group Courtaulds and English Sewing Cotton were higher on balance. A strong demand for both electrical equipment and supply shares occasioned numerous advances in both groups, Associated Electric rising 2s. 6d. Among miscellaneous issues, Turner and Newall, Reckitt and International Nickel were all higher on the week.

An optimistic reading of the Union Budget speech induced a resumption of Cape buying in the kaffir market on Tuesday. Earlier demand centred on Far West Rand issues, but later became more widespread. The shortage of stock was reflected in gains of 3s. 6d. for Blyvoors and numerous advances of 1s. Diamond shares, particularly De Beers, were strong, the deferred and preferred both rising 1½. Rubber shares were quiet with changes almost entirely absent. Some activity developed in the tea market, several issues improving. The oil market was not particularly active, small improvements for leading issues reflecting shortage of stock rather than active buying. VOC, however, weakened on the President's statement on royalties.

New York

ENCOURAGED by the favourable war news, Wall Street witnessed a continuation of the recent upward swing during the past week. Rail and steel issues, including selected industrial stocks, were prominent in the fairly general advance, which remained unchecked by light profit-taking. Early in the current week, on the anticipated technical correction, quotations were reduced throughout the market, although individual losses seldom exceeded a point.

COMMODITY AND INDUSTRY NEWS

Closed Retailers' Register.—The Board of Trade is now prepared to accept applications for admission to the Register of Withdrawing Non-Food Retail Traders. It will be confined to traders who satisfy three conditions: those who (a) have closed a shop since the outbreak of war, (b) were in business continuously for 12 months before closing, or for a total period of two years in the five before closing, and (c) traded in goods or services covered by the location of Retail Businesses Order. Traders will not be eligible for inclusion by reason of the closing of part of their premises, nor in cases where a business has been sold as a going concern. The latter may be put on a supplementary list. Application for registration has been made simple, and sympathetic hearing is promised for persons who do not satisfy condition (b).

Cane Control.—Under the Control of Willow Rod and Willow Sticks (No. 2) Order issued by the Ministry of Supply, the manufacture of a large number of articles made of willow rods or sticks was prohibited from January 18th. They include baskets of all kinds and some miscellaneous articles.

Food Prosecutions.—During November, 1942, there were 2,627 prosecutions under the Food Control Orders, of which 2,448 were successful. Convictions were secured against 44 wholesalers, 584 retailers and 570 other offenders, representing a conviction percentage of 0.220 per wholesale licensee, and 0.097 per retail licensee. Out of the 2,448 successful cases, 141 were dismissed under the Probation of Offenders Act. Fines of £1 and under were inflicted in 953 cases, above £1 and up to £5 in 912 cases, above £5 and up to £10 in 213 cases, and fines above £10 and up to £20 in 62 cases. In 112 cases the fines exceeded £20 and in 55 cases sentences of imprisonment were imposed.

Hearth Furniture.—The manufacture and supply by manufacturers of any forms of hearth furniture other than those listed in Specification BS/BOT No. 16 issued by the British Standards Institution is prohibited as from February 1, 1943. The items listed include tongs, pokers, hearth shovels, trivets, fets and fireguards. Curbs are not included because they are covered by the utility furniture scheme. Manufacture and supply by manufacturers will be restricted to these items. Manufacturers may apply for licences to complete the manufacture of and to supply hearth furniture not included in the specification provided that their manufacture was begun before January 15, 1943.

Fuel Economy.—A Fuel Economy Committee, representative of owners and managing agents of London residential flats and office buildings where central heating and hot-water services are provided, has been formed to discuss fuel economy in respect of such property with the Ministry of Fuel and Power. The committee will act as a liaison body between the Ministry and owners, will advise owners on fuel economy, and the Ministry of any problems which arise. In Government offices coke is to be mixed with coal on open fires, and domestic consumers are also urged to do so by the Ministry of Fuel.

Sisal Prices.—On the basis of representations made by the Sisal Growers' Association, which also acted on behalf of the Kenya and Tanganyika Sisal Growers' Associations, the Ministry of Supply has agreed to an increase of £4 per ton in the basic price for the 1943 East African sisal crop, to meet higher costs of production. Last year's prices varied from £8 8s. 6d. a ton for flume tow waste to £19 10s. 2d. a ton for No. 1 grade. This year's prices range from £12 8s. 6d. to £23 10s. a ton.

Exports to Iceland.—The United States now holds general responsibility for meeting Icelandic requirements. From January 15th, all exports to Iceland from this country have been subject to licence. Certain classes of goods will continue to be supplied in limited quantities. Normal licences will not be granted, even where goods are in process of manufacture already on order, for any goods not appearing in the permitted list. The list includes books and periodicals, spare parts for British machinery, and other goods which can be supplied more easily from this country than from the United States.

Morocco Meeting

SIX times the Prime Minister has gone out to meet an Ally. In June, 1940, he attended the death-bed of France. In August, 1941, he met the President of the neutral United States to talk of the future; and the result, in general terms which have still to be defined, was the Atlantic Charter. In December, 1941, he again met Mr Roosevelt, this time in charge of a state of war, to work out the machinery of Anglo-American co-operation. In June last year, he went to Washington to plan the Allied offensives in Africa. In August, he flew to Moscow to explain to Stalin in person the intentions, and the limitations, of the plans he and Mr Roosevelt had made. Finally, a fortnight ago, he went to Casablanca to meet the President once more—with the freeing of Europe and the resurrection of France in view.

It would be idle to deny that, for all its dramatic quality, the latest meeting has led to a good deal of disappointment. So much was expected of it; so little that is specific has been announced. Largely, of course, disappointment was inevitable. Whatever great decisions were made, or great moves decided, they could not be made public. But there are more particular reasons for disappointment. On every side, it was confidently believed that the political imbroglio in North Africa, the confusion which is a serious and growing liability to the Allied and French cause, was to be ended; that a new start was to

be made and a settlement reached which would register, in its principles and practical effectiveness, the determination of the United Nations, including France, to win both the war and the peace. In fact, no settlement has yet been reached—as far as can be judged at this early stage (which is a qualification that must be made). It is a step forward that General Giraud and General de Gaulle have met; and it may well be that their meeting will result in some military accord between their forces, which are now fighting in almost the same sectors. It may be, too, that the problems of supply and transport in this theatre, upon the solution of which success in Tunisia depends, have been brought nearer to a solution by the deliberations of the experts whom the President and Prime Minister brought with them. But the political problem, it appears, remains insoluble. The ice has been broken; that seems all.

The decisions taken at Casablanca in the wider field of strategy could not, in any case, have been announced; but it is likely that they concerned vital details rather than broad outlines. The outlines of strategy in 1943 must have been laid down, and technical preparations made, many months ago. At Casablanca, it is true, "the entire field of war was surveyed" by the theatre throughout the world, and all resources were marshalled for the more intense prosecution of the war by sea, land

and air." The chiefs of staff and their advisers spent ten days in intensive work. But it seems likely that their task was to fill in the immediate requirements of offensives already planned, in the light of the present state of the fighting.

The general aim of the discussions, the "prime object," was "to draw as much of the weight as possible off the Russian armies by engaging the enemy as heavily as possible at the best selected points"; and the meeting was doubtless dominated by Russia's successes. Those people who expected this meeting to produce a Supreme War Council, of the United States, Britain, Russia and China, were probably doomed to disappointment beforehand, because it is not possible for nations fighting vast battles on fronts thousands of miles apart to work out in common their operations from day to day or even from month to month. All they can do, what indeed they must do, until their several operations merge into one campaign, is to synchronise their operations in the larger framework of an agreed strategy. The renewed warnings of Mr Curtin about the perils of starving the front against Japan underline the difficulties of dovetailing resources which, though huge, are strictly limited. The task at Casablanca was presumably to make sure that the operations prepared and set in train by Britain and the United States will fit in, as they were intended to fit in, with Russia's blows against the common enemy. What is needed is not a new strategy, but ways and means of bringing the strategy already decided more swiftly to a successful conclusion. The object is to stretch the enemy's resources to the utmost, to bring him to battle and to destroy him; and the main obstacles, immediately, are the Tunisian bridgehead and the U-boat campaign. If the Casablanca meeting leads to the reduction of these barriers, it will more than have done its work.

Stalin was not present, though he was invited and, like Chiang Kai-shek, was kept informed. Stalin's contribution to Allied strategy in 1943 is not faltering, and

he has no need to revise or modify his plans. As Mr Churchill has said, he is a man of no illusions. His interest in the discussions at Casablanca is not in their details, but in their successful outcome; he will judge them by their results. Only the chance of a major change in the strategic intentions of his Allies could have brought him from his crucial command of all the Russian fronts to spend ten days in discussions. Many people will argue that a great chance has been lost to co-ordinate in a single programme the political warfare of the United Nations; that the reoccupation of Europe, wherever it may start, will be bogged and frustrated if Britain, the United States and Russia cannot find an agreed formula for their political procedure in the liberated countries. This argument is wholly sound. But there is no sign that Stalin is personally concerned to seek such a formula at this stage. His concerns are two: to expel the Germans from Russia; and to see a Second Front in Europe. The Casablanca meeting to him was presumably a means of speeding the Second Front, which is his Allies' responsibility, not his.

Each meeting between Mr Churchill and Mr Roosevelt since the United States entered the war has marked a notable advance on the road. Almost certainly, the next operations of the Allies will be more efficient and more effective as a result of this one. The thunder which once rolled out from the Brenner when the two dictators met has now been stolen by the two democratic leaders. Mere meetings, of course, do not solve problems. The issues of political warfare were, it seems, not on the agenda; and Generals Giraud and de Gaulle have apparently been left to hoe their own row, which still seems likely to be a painful and possibly protracted process. Mr Roosevelt called the conference "a meeting of the minds with regard to military operations"; and it is in the military sphere that its results are to be looked for. But there is still room, and urgent need, for another meeting that will give political issues the place that they will undoubtedly occupy in the final stages of the fighting.

Peril at Sea

THE war can be lost at sea. In 1940, the Germans tried to occupy Britain, the base of resistance, and failed. In 1941, they tried to occupy the vital centres of Russia and failed again. In 1942, they tried to isolate the Soviets and failed once more, disastrously. The attempt to isolate Britain has gone on continuously and it has not yet failed; and the only way in which the chance of victory can be missed by the Allies is by delay or incompetence in breaking the U-boat threat.

The layman knows no facts or figures about shipping losses. But he can sense the present danger. He knows that Allied strength is measured by its disposition among the actual theatres of war. He knows that the index of Allied battle-power is the capacity to dispatch and deliver more even than the capacity to produce. He knows that the Allies could possess all the ships in the world and still be unable to use them effectively.

The outlines of the present position are well known. More ships are being built, it is true, than are being sunk. But more U-boats, too, are being constructed than are being destroyed; and sinkings of Allied vessels still go on at a grievous rate—with even more grievous losses

of men and cargoes. An American official has lately spoken of the loss of nearly three-quarters of a million gross tons in a single month; and a Canadian official has expressed the view that, in spite of bombs and depth charges, a net addition is being made to the German submarine fleet of ten vessels a month. The Battle of the Atlantic has gone in cycles. The first German attack in 1939 was easily beaten. The second in 1940-41, after the coast of Western Europe came into German hands, was longer and more deadly; but it, too, was beaten. The third began with the entry of Japan into the war. It reached perilous dimensions in the spring and early summer of last year. For months, sinkings outran replacements by a considerable margin. By the late summer, more ships were being built than were being sunk; but this was due to the increased output of American shipyards rather than to the placing of an effective curb on the U-boats. More U-boats than ever before were at sea. They were bigger and better vessels; and, hunting in packs, with the aid of radio to find their objectives, they were striking at convoys again as well as at lone vessels. In November, the Allies opened their Mediterranean offensive. Great expeditions and vast stores had to be ferried across ocean routes. There were not only more attackers; there were more targets as well. And, as the military calls upon shipping to Russia and Africa grew, the number of escort vessels, though much greater than when the war began, became correspondingly insufficient. Month by month, shipping losses have remained dangerously high.

The methods used to cope with the submarine are broadly the same as those which were forced upon the Allies—and their Admiralties—in the last war. They are three, two negative and one more positive: the maximum output of ships; the utmost economy in the use of

shipping space for civilian needs (actually, in spite of the rigid conservation of shipping space that has been practised, it is possible to argue that a faulty import strategy has in fact wasted a great deal of shipping); and the passage of ships in protected convoys. The introduction of the convoy system in the last war saved the situation; and, even to-day, against improved methods of attack, convoys can still pass safely, provided their protection is sufficiently strong. But the protection required, at sea and in the air, is enormous—as recent reports of successful passages to North Africa, to Russia and across the Atlantic have shown. Can sufficient protection of the old style be provided to enable the United Nations to meet their needs and deploy their strength? Or are there new means which should be pressed forward with doubled vigour? New methods are, of course, being employed already. The remarkable work of Coastal Command and the aid given by ship-based aircraft have proved invaluable. Radio devices, now the special charge of Sir Stafford Cripps, are already in operation to detect submarines. The question is whether still more must not be done at once to frustrate the one successful offensive which Hitler is still waging.

All the layman can do is to recount the proposals which those more expert are making; and to urge that, wherever possible, longer and speedier steps should be taken. Because all else depends on shipping, the anti-U-boat campaign must have first priority in both production and personnel. Probably this has already been granted. The limiting factor is, of course, that, priority or no priority, the continuing needs of Africa and Russia from day to day must be met. Operations in the field are priorities in themselves. In equipment, it is plain what is needed to beat off the U-boats: more aircraft, ship-based or flying long-range from land, to cover every gap on the Atlantic and Russian routes; and more naval escorts to give every convoy an effective guard. These are not easily produced in a few months; and it is the few critical months ahead that may be decisive. Moreover, in the short time available, the coat can only be cut according to the cloth. The people who call for the building of great numbers of faster merchant ships to outpace the submarines tend to forget that these speedy vessels compete in their machinery requirements with the destroyers which are required even more. It is reasonable to ask for the maximum number of faster ships that can be built without impeding naval construction and without cutting down too much the carrying capacity of the vessels constructed; but it is not reasonable, or useful, to call for the immediate overhaul of all ship-building programmes on both sides of the Atlantic.

Perhaps, in the next months of crisis, it is a new attitude more than new equipment that is needed. The principle of convoy protection is defence. With the aid of radio detection and sufficient aircraft, it may be possible

to turn defence into attack far more than has yet been done. The accusation is made in some quarters that neither the Air Ministry nor the Admiralty has shown sufficient imagination in hunting the hunter with the technical resources already at their command; and it may indeed be that the technique which will save the day still needs to be forced upon the sea and air chiefs as the convoy system itself had to be forced upon the Admiralty twenty-five years ago. Yet there is need for caution in laying down the law. Resources are not unlimited. To call upon Bomber Command, for instance, to suspend its bombing of other targets in order to bomb only U-boat bases, factories and assembly points is similar to asking the Allied commands to suspend the operations in Africa in order to mount a great offensive against western Europe—which would indeed stop up and seal the U-boats' bolt-holes most effectively. All that can fairly be asked for is that the disposition of resources among all the theatres of war should be done in such a way as to allow the defeat of the U-boats, upon which victory everywhere else depends.

The task is immediate and urgent. No plans for building aircraft carriers to be launched in 1944, or for designing more suitable aircraft, to be put in production a year or two from now, have any relevance. Zero hour is this summer. In the main, the best must be done with the material and equipment already available or forthcoming. That is why the demand for a new attitude and a new outlook seems the most pertinent of all. There are signs of these. Chief among Mr Lyttelton's priorities for manpower in 1943 are ships, aircraft and anti-U-boat devices. The work of the Ministry of Aircraft Production in radiolocation is being translated into sea terms. There is an Anti-Submarine Warfare Committee of the Cabinet. The task now is to infuse the whole of this programme and organisation with a unique sense of urgency: perhaps to make the supervision of this work the whole-time duty of a Cabinet Minister, instead of being the spare time preoccupation of several; to select at every point in technical planning and operations experts and officers devoted to the single aim of opening the sea-ways of victory, and capable of working together as a single team devoted to a single end; and to discover much closer means of collaboration with the United States and Canada in day to day operations than have yet been found.

The pundits are at present undecided whether "March 1918," the last great German offensive, has happened this time or is still to come. One thing is probable: "April 1917," the peak of the U-boat menace, has not yet been passed. There will be an almost incredible flow of ships from Allied yards this year; and belts can, and should, be tightened in every Allied country to save shipping space. But these defensive measures alone will not avert disaster. The only sure means of winning this struggle is to bring the German under-water navy to battle and to destroy it.

FULL EMPLOYMENT

The recent articles and letters in *The Economist* on the ways and means of securing Full Employment after the war have been reprinted as a pamphlet. Copies are now available (price 6d.); and applications should be made to *The Economist*, Brettenham House, Lancaster Place, London, W.C.2. (Tel. Temple Bar 3316.)

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

The Rent Dilemma

IN his attempt to translate into money terms the principle that the rates of benefit or pension provided by social insurance should ensure a standard minimum income adequate for subsistence, Sir William Beveridge was faced with the problem posed by wide variations in rent. Expenditure on rent varies very much, not only from one part of the country to another, but also between different families of equal size (and income) in the same area; and, unlike expenditure on clothing and other necessities, rent cannot be reduced during a temporary interruption in earnings.

The magnitude of regional variations in rent is illustrated by the accompanying table, taken from the

WEEKLY EXPENDITURE ON NECESSARIES, 1937-1938

	Persons per Household	Per Household in Shillings		Per Standard Industrial Household in Shillings		Per cent. of Mean for all Industrial Households	
		Food, Clothing, Fuel and Light	Rent	Food, Clothing, Fuel and Light	Rent	Food, Clothing, Fuel and Light	Rent

Source: Ministry of Labour Family Budget Enquiry.
* The figures in brackets give the number of households in each division for which budgets were obtained. The divisions are those of the Ministry of Labour and National Service.

Beveridge Report. Columns 2 and 3 show the average expenditure on rent, and on food, clothing, fuel and light, ascertained by the Ministry of Labour's inquiry into working-class family budgets in 1937-38. In columns 4 and 5 the figures have been adjusted to show expenditure for "standard" households, that is, for households of equal size. Percentage variations in expenditure from the average expenditure of all industrial households are shown in the last two columns. The disparity between average expenditure on rent is substantial between London, the rest of England and Scotland, and between industrial and agricultural households. Even more marked, however, are the variations in the rent paid by individual households within the same regions. According to the Report of the Unemployment Assistance Board for 1938, some 26.1 per cent of the applicants for unemployment assistance in London paid rent up to 9s. 11d. a week; 55.9 per cent paid from 10s. to 17s. 5d.; and 18.0 per cent paid 17s. 6d. and more. The corresponding figures for England and Wales are 66.6, 29.7 and 3.7 per cent, and for Scotland, 92.8, 6.9 and 0.3 per cent.

The existence of these variations is hardly surprising. To a point, they obviously reflect differences in incomes and habits, in the type and amenities of dwellings, in rates, ground rent, and so on. But they also reflect differences in rent for the same or similar accommodation. In his report Sir William Beveridge examined various suggestions for recognising these differences in the payment of benefit. One proposal is that benefit should be allowed to vary with rent. But this is not compatible with the principle of equal benefit for equal contributions; it would discriminate in favour of families who have deliberately chosen a relatively high standard of housing; and it might encourage landlords

to raise their rents. A variation of this suggestion is to provide benefit on the basis of a "standard" rent of, say, 8s. a week, but to grant an additional allowance to families paying more, up to a maximum rent of 16s. a week. Another variation is the proposal to adjust benefit to rent, but only in respect of unemployment and disability, leaving retirement pensions uniform; this suggestion is made on the ground that pensioners have time to adjust themselves to a lower standard of housing if they have no private savings, while persons temporarily out of work cannot normally be expected to foresee the interruption in earnings or to move to cheaper quarters while it lasts. But while these two modifications of the suggestion to allow benefits to vary with rents actually paid, and especially the second, are less open to objection than the original version, Sir William Beveridge reached the conclusion—and it is hard to deny—that difficulties of both principle and practice are sufficient to justify their rejection.

A second proposal is for regional and occupational discrimination, or both, between contributions as well as benefits, on the ground that a rate of benefit adequate for needs where rents are high will be more than adequate for regions of low rent, and will involve contributions which may appear excessive in relation to earnings. If contributions and benefit payments were based on average London rents, for example, they would both be high in relation to the needs of other towns and, especially, in relation to agricultural households. This suggestion, in Sir William's view, deserves further consideration, though it would introduce complications; and, if the aim were to secure a perfect system of equivalents between regions and occupations, it would probably prove impracticable. In the end, Sir William suggested that in determining standard rates of unemployment and disability benefit, rents at prewar levels might be taken at 10s. a week for a household and at 6s. 6d. for a solitary individual—that is, broadly, the average prewar expenditure on rent of industrial households.

To the two proposals examined by Sir William might be added a third, whereby the state would acquire the existing privately-owned stock of working-class dwellings. This proposal offers a number of advantages. Thus, it would be possible to secure greater equality of rents for similar accommodation, not by raising low ones to the highest level, but by the reverse process; to grant temporary abatement during periods of unemployment or disability, when rents are above those allowed in benefit payments; and, if desirable, to encourage movements of population by the offer of low rents. In so far as special concessions of this kind would be met by subsidy, the cost would fall upon the community as a whole. But this proposal, for all its merits, has obvious drawbacks; and, at this stage, it, too, is probably impracticable.

Sir William recognises that he can only offer palliatives rather than a solution; and he states the basic problem clearly:

The extreme variation of rents, between regions and in the same region, for similar accommodation is evidence of failure to distribute industry and population and of failure to provide housing according to needs. No scale of social insurance benefits free from objection can be framed while the failure continues.

Here is the key to a solution of the problem—the need for a national housing policy after the war. Its first aim must be to ensure adequate and suitable accommodation for the poorer section of the community. There is need for an all-round and uniform improvement in standards; for the provision of additional accommodation in the areas where it is most urgently required; and for the construction of dwellings which take account of the size distribution of families in individual areas; and for houses to be let as well as for sale. Apart from public

works and repairs, this improvement in working-class housing should be made a first charge upon the building industry. The middle-classes were adequately provided with new houses during the interwar period; except for limited local shortages, their additional needs are now less urgent. Although the annual percentage addition to the total stock of dwellings in this country may necessarily be small—the total stock numbered 13 millions before the war—concentration upon the specific task of satisfying the needs of the poorer families would soon remove the existing shortage in this category. Some 500,000 small dwellings a year could probably be built.

Secondly, the dwellings to be constructed should not only be adequate in number, varied in type and size, and of good quality, but they must be within the reach of the class of families for whom they are designed. Quality combined with cheapness offers the only solution to the Rent Dilemma on which the Beveridge plan for uniform benefits breaks down. Simplicity without a stereotyped uniformity must be the aim; but in the case of certain accessories and fittings, complete standardisation might profit the pocket without hurting the eye. Houses and fittings offer an excellent opportunity for the application of the utility principle discovered in war-time. Private builders would carry out the work on a profit basis, subject to maximum prices; but the Government, in conjunction with experts, would control specifications, and examine costs.

Ten Nazi Years

ON January 30, 1933, Adolf Hitler, the leader of a mass party which had already come to constitute an *imperium in imperio* within the democratic German Republic, became Chancellor in a Coalition Cabinet. The nigger in the woodpile was set on the way to become a great nation's Führer. Like Franklin Roosevelt, who also took office almost a decade ago, Hitler has lasted much longer than most people expected. But the omens, on this January 30 ten years later, suggest that the elected President may outlast the "permanent" dictator. The overture to this year's anniversary speech by the Führer has consisted of the frankest warnings to the German people of the very grave crisis in their fortunes which the relentless Russian advance has brought on.

What reserves does the Nazi regime possess to sustain the gathering menace of defeat? For ten years, the Nazi state has steadily grown more and more totalitarian, more and more centrally controlled, more and more regimented, more and more servile. Now, when it would seem that the limit of plans and orders and personal abnegation had been reached, a further surrender to the state is being called for. Goebbels has announced in *Das Reich* that every man between 16 and 65 and every woman between 17 and 45 will now be compelled by law to contribute to the war effort. At the same time, a new broadcaster outlined new enactments which will place civilians under the drastic military law of the *Wehrmacht*. From now on, the civilian refusing to work will be treated as a deserter. Total war, the German people are told, is only now to start—and they thought they had been fighting totally for three and a half years. For a decade, the reins and the belt have both been continuously tightened. Now the German citizen discovers that the greatest tightening of all is called for, in terms of life, limb and endless toil. And what for? Simply, after ten years of sacrifice, to avert disaster. When the Nazis first reeled from the resistance of the Russians, there were reserves of manpower and economic capacity, if not in Germany itself, in German-controlled Europe. Now, at the beginning of its eleventh year, the Nazi regime, with its resources dwindling and its assets wasted, is faced only with the prospect of a grim defence against a combination of stronger powers, growing still stronger. Hitler's Germany has weathered all its storms since 1933,

cheapness, however, is not merely a matter of low building and manufacturing costs. It is also a function of finance, of the rate of interest. One and a half per cent on a £350 dwelling is equivalent to £5 5s. od. a year, or 2s. a week on the rent or hire-purchase instalment. If the rate of interest is to be reduced to the lowest possible level, central and local government will have to provide the funds. A large proportion of the new houses will have to be built to let; and local authorities have experience in this field. In the past the building societies have catered mainly, though not exclusively, for the demands of the middle and higher artisan classes and have financed chiefly houses for sale. Their machinery must be available to the community to assist in carrying out the postwar building programme financed at a low rate of interest.

Variations in working-class rents for similar accommodation in different parts of the country can hardly be removed altogether. Nevertheless, it should be possible, by means of a bold and imaginative housing policy, to cut off the extremes, and to ensure, in all areas, dwellings, adequate in number, type and in standard, within the reach of the poorest and of those in receipt of benefit under any social insurance scheme. On their return from the war the soldiers want decent homes in decent surroundings at prices they can afford, not expensively advertised fancy cottages in fancy gardens at rents or instalments which do not leave enough over for food, clothing and other essentials.

because its power, in terms of men and territories, was steadily expanding. But January 30, 1943, sees only contraction and shrinkage ahead.

These facts are true. The contrast between Nazi Germany now and Nazi Germany only two years ago is glaring. But it would be a misunderstanding of what the Nazi regime is to suppose that it must certainly crumble as its front in Russia has done. The paradox of totalitarian regimes, in which the ruling group occupies every key position in the nation's life, is that the threat of defeat may make them, for a time, politically stronger. The only certain way to shatter the monstrous regiment of Nazis is by complete military defeat or utter physical exhaustion; and neither of these seems due yet. The people of totalitarian Germany have been robbed, physically, mentally, morally and spiritually, of the means of effective opposition. They cannot be expected to take the decision into their own hands. At home, they are not starving. At Stalingrad, they fought to the death. And they still have divisions, weapons and submarines to fight many battles.

Germany is held in a vice; and the history of the last decade explains why and how this has come about. When the Nazis made the coalition with the Conservatives which brought Hitler into power, the two coalition parties had polled only two-fifths of the total vote in the elections of November, 1932. The Nazis themselves had suffered a severe setback. The economic crisis which caused many Germans to look to extreme policies for salvation had run its course; and the Nazis' chance of obtaining a clear majority in a fair election had gone. But Hitler came and stayed. The reason was not his strength, which was waning, but the weakness of those who opposed him. The democratic parties could agree on no common policy. There was fratricidal strife in the Labour movement. The Liberal Party had almost vanished, and the Catholic Centre Party no longer held the balance of political power. The majority of Germans were deeply disillusioned, and there was a widespread clamour for strong government by strong men. It was this sense of disappointment with democratic failures which brought Hitler and his Nazis in.

The Nazis had prepared for this day. The party was organised on military principles of unified command and absolute obedience. In its organisation, it had reproduced

the administration of the Reich, with departments for home and foreign policy, for economics, agriculture and transport and for military affairs. It had its own army, its own police and its judiciary; special shock troops were in action against the trade unions. Conspiratorial groups were at work in the industrial factories, the chambers of commerce and other economic, social and cultural bodies. The democratic parties were blind to this novel danger. The Conservatives, traditionally representing the landed interest and heavy industry, actually hoped to tame and use the uncouth Hitler and his rabble of unemployed. The generals welcomed the national and military spirit of the Nazi party. Liberals, Socialists and Communists believed that given enough rope, the Nazis would hang themselves. So, by their own connivance, the German state was seized and the German people captured.

Hitler and the Nazis rose to power because they seemed to offer the unity and security which the democratic parties had failed to give. There was no effective opposition. With his oversized propaganda battering rams, Hitler set about breaking open doors which actually were already wide open. The old parties and trade unions were not cowards or traitors. It was simply that their programmes had failed; they had fought too long among themselves; and they did not understand what was happening. In the first totalitarian election, the Nazis obtained 92 per cent of the votes. This result cannot be explained entirely by terror or fraud, nor was it due, as Hitler believed, to his own supreme leadership and political intuition. It was the result of a profound reaction to the collapse of democratic organisations in Germany.

Hitler took his chance, and the process of total rule and total organisation began. In 1934, a ruthless campaign of terrorism and repression, carried out by the special militant organs of the Nazi party itself, was directed against all actual and potential opposition both within and without the Nazi ranks—with a violent and calculated brutality which has now reached its zenith in the extermination of Europe's Jews. The Nazi party could now embark on its "planned economy." Actually, the party had no economic programme, and its economic achievements have been vastly overestimated. Between 1934 and the outbreak of war, a tremendous output of weapons and materials of war was indeed achieved; but this was not due to tremendous insight or ability. The two main causes were, first, that a well-equipped and efficient industry already existed when the Nazis came to power; and, secondly, that this industry was only half employed in 1933. The Four Year Plans for agricultural and industrial self-sufficiency were long-

term investment programmes with wartime autarky in view. Employment in peace was provided by preparing for war; and a vast and cumbersome system of controls over production and marketing was established under an equally vast bureaucracy. The characteristic features of a competitive system largely disappeared. Undertakings run by the state or by the party were set up side by side with private concerns. The entrepreneur became less important than the salaried manager or engineer. The position of the worker was changed even more radically. Trade unions were destroyed; compulsory labour was introduced; and the worker lost his status and bargaining power entirely. The Nazi Labour Front is no more than a welfare organisation. In short, almost every group in Germany, land owners, peasants, industrialists and workers, were robbed of their identity, as classes and as individuals, in the new regime. The only differentiation that remained was the difference between Nazi and non-Nazi; and Nazis were placed in control at every point. Not even the *Wehrmacht* retained autonomy. In 1938, when Hitler set up the High Command of the *Wehrmacht*, the last generals credited with an independent political opinion were dismissed.

Step by step, in every field for ten years, Hitler's hold was tightened. Every time he was opposed, either at home or abroad, he prevailed, not because of his own strength or wisdom, but because of the weakness and folly of others. Now, there is a *bouleversement*: when his enemies are strong, he is growing progressively weaker. The attack on Russia has proved to be a supreme mistake—because it failed. The pitcher went to the well once too often. Again and again, first in Germany and then in the wider field of Europe, Hitler gained great triumphs because the opposition was weak. He came to believe that triumph was routine and inevitable. He has been harshly disillusioned; and the German people are now being faced with the consequences of his failure. The end of Hitler may not be immediately at hand. But the end is now certain. His span will not be much more than ten years. On a rising market, he was a world conqueror; on a falling market, he is doomed. A decade of ostentation and violence has left the people of Germany with nothing but their wounds to show for their servile state; and there are worse things to come before they rise again. For ten years, they have said "*Ein Volk, Ein Reich, Ein Führer*." Now they know, in the words of the Arabic proverb quoted by a correspondent to *The Times*, that "The pasture of Treachery and Aggression is unhealthy and indigestible."

Army has smashed the western one. The first stage of the Allied offensive has been concluded with striking success. To the Axis as well as to the Allies, Tunisia has now become the crucial front outside of Europe. Rommel's quick withdrawal from Libya can be explained only by his desire to strengthen to the utmost the Axis grip there. What will be the enemy's next move? What does he hope to achieve in Tunisia? In joining von Arnim's forces, Rommel has run an obvious risk. The distance between the two Allied forces in Africa has been radically shortened. The German force in Tunisia may easily be "sandwiched" between General Alexander's and General Eisenhower's forces. The Germans have, in a sense, invited a dangerous pincer movement against themselves. No commander would do this without at any rate the hope that, by doing so, he could obtain a vantage-point from which he might be able to offset the risk. It may even be that Rommel and von Arnim hope to strike westwards from Tunisia in a counter-offensive against Algeria. Certain facts may encourage this hope: the disproportion in the length of the respective lines of communication which definitely favours the Germans; the relative lack of mobility which has revealed itself on the Allied side during the Tunisian fighting so far; and, last but not least, the political confusion behind the Allied lines. The Axis has once again a chance to combine military operations with political warfare in the enemy

rear. The classical Fifth Column, in the shape of the SOL, the Doriotists and the Cagoullards, is there, probably stronger than it was in any European country in 1940. Such a scheme would fit in with the German conception of dynamic defence only too well. Von Arnim's first pre-occupation is, of course, to make contact with Rommel's forces. Hence the increased German pressure south of Pont du Fahs, in the Ousseltia valley. The Allied Command is undoubtedly aware of the danger; and American tank units have recently supported General Giraud's soldiers against von Arnim's panzer division. The question is whether the Allied wedge in this sector will be strong and deep enough to prevent a junction of the two German armies. Even this will not be enough. The task of the Allies now is to deny the enemy the very possibility of creating a diversion. Only an all-out offensive in Tunisia and the destruction of the enemy's bases can make sure of this.

Russian Prospects

In his latest order of the day Stalin has called the Red Army

Forward to the routing of the German invaders and their expulsion over the boundaries of our motherland.

The Commander-in-Chief of the Red Army has thus defined the general strategic aim of the advance. He has not defined the more immediate objectives. These are being defined in the actual process of fighting. The main thrusts have so far been made at the extreme wings of the front, in the south and in the north. The centre of the front has remained stationary and almost quiet. The Rzhev wedge pointing towards Moscow has not yet been reduced or flattened, and no large-scale fighting has been reported from this region recently. The commander of the central front, Marshal Zhukov, has been active in the south and in the north; and it is not clear whether any other commander has been put in his place. This contrast between the energetic thrusts on the flanks and the relative calm in the centre may be dictated by a purposeful strategic motive. It has been on the flanks that Russia's losses have been most grievous and that the opportunities to redress the position have been most favourable. It is on the flanks that the Soviet Command can obtain springboards for the final offensive, which may take the shape of a gigantic pincer movement towards the Baltic and the Ukraine—with the threat of total envelopment to the German centre. The struggle for the northern springboard round Leningrad is still in its initial stage. The Germans have been trying to undo their first large reverse there by strong counter-attacks; and it remains to be seen whether they will be able to hold their ground. If they fail, the Russian advance in the north can move along the shortest line to the Baltic states and Eastern Prussia. On the southern flank, the Russians have again scored important tactical successes. The last German bridgehead on the left bank of the Don, at Voronezh, has been evacuated; and by the recapture of the Voroshilovsk-Armavir line, as well as of Salsk, the Russians have made a big leap forward towards regaining the whole of the Caucasus. If they add Tikhoretsk and Kropotkin to their prizes, then the enveloped German units in the south-west of the Caucasus may find themselves with only one way of escape open, across the Black Sea to the Kerch peninsula. The fate of the southern springboard will now be decided in the battle for the narrowing Rostov-Don gateway. The German withdrawal from the Caucasus will result in an enormous shortening of their front. This will tend to strengthen their defence, and nobody can say which will prove more decisive for the prospects of that defence; the advantages of a shortened front; or the weakening of Hitler's army through the losses it has sustained since it moved across the Don last summer.

Inside the Fortress

While the enemy may be contemplating a large diversion at the African approaches to his "European fortress," he is at the same time busy strengthening the fortress itself from inside. Political as well as military preparations are in full swing. The attempt to intimidate the subjugated nations has been summed up by the sinister prophecy that "if Germany falls, its dead body will fall over the dead body of France." The old harbour in Marseilles has been cleared of its inhabitants; and the round-up of suspects in the south of France—former members of French democratic organisations, Jews and Allied nationals—has assumed mass

proportions. On the eastern fringe of the fortress, the same measures are being carried out with vastly more ruthlessness. General Sikorski portrayed the picture to an audience of journalists last Tuesday. The peasant population of six Polish districts has recently been removed to an unknown destination. Man-hunting in the streets of Warsaw has now been extended beyond the ghetto walls. General Sikorski explained these prodigies of terror in Poland by the German anxiety to crush underground resistance. To destroy the clandestine cells one by one seems beyond the Gestapo's power; they seek, therefore, to destroy the whole environment which forms the protective cover for the underground organisations. People accustomed to think in terms of a liberal way of life may feel bewildered by the descriptions of this technique. But, if they are to go under, the Nazis are resolved that they will drag Europe with them into the abyss. Only speed in the conduct of the war by the Allies can prevent the Nazis from doing so, and General Sikorski emphasised the danger that the dragging on of the war might bring resistance in the occupied countries to an end—by destruction and exhaustion. The familiar anti-Bolshevik bogey is being used more intensively by Goebbels as the Red Army advances; and its effectiveness should not be underrated. Far too many problems that are of vital interest to the eastern fringe of Europe are still in the twilight of ambiguity. The Poles and other nations would be reassured by a clear and specific statement about Russia's determination to respect their independence and territorial integrity, a statement which would be particularly timely at the present juncture, when the attitude of Germany's eastern neighbours and victims may either speed up or delay the decision in the east. That the right of any nation to self-determination does not imply any excuse for the maintenance of a dictatorial and aggressive regime, or for any sort of a narrow-minded nationalism, goes without saying. But neglect of genuine national feelings, and of the peoples' longing to be the masters of their own fate, would only play into the hands of the enemy, and help him to demoralise Europe's resistance.

To What End?

The Bill to set up a Ministry of Town and Country Planning was read a second time in the House of Commons on Tuesday. A function of the new Minister, Mr W. S. Morrison, will be

to secure consistency and continuity in the framing and execution of a national policy with respect to the use and development of land throughout England and Wales.

Existing powers under the Town and Country Planning Acts, which were transferred from the Ministry of Health to the Ministry of Works and Planning last year, will pass to the new Department; the Ministry of Works and Planning will become Works alone. In Tuesday's debate, very little indication was given of what Mr Morrison's power and authority will be; and in several speeches very little understanding was shown of what they ought to be. The old confusion between the specific task of planning land use and the wider and more general task of social and economic planning at large was very evident, particularly in the speech of Mr Greenwood. Perhaps it is not

NOTES OF THE WEEK

The End of an Empire

The struggle for springboards on the African theatre has entered a new stage. The last German and Italian rearguards are leaving the Tripolitanian soil. When General Montgomery entered Tripoli, Mussolini's dream of restoring the Roman Empire faded against the background of that city's Roman ruins. Hardly a tear will be shed in Libya after 30 years of Italian rule, of which more than twenty were filled with Fascist oppression. General Montgomery has dealt with the political aspect of his conquest in a radical manner. The leading Fascists are to be interned at once, Fascist activities banned and party funds frozen. No leader of the Black Shirts has been called in to aid the administration; there has been no political patchwork this time. The laconic and trenchant phrase: "Fascist leaders interned, Fascist activities banned and party funds frozen" may well become, and ought to become, the motto of Allied commanders.

Red Light in Tunisia

For more than a year the Middle East was overshadowed by the threat of a gigantic pincer movement by the Axis from the west and from the east. The Russians in the Caucasus are breaking the eastern jaw, and the Eighth

surprising that members should be so mistaken about Mr Morrison's proper functions when those functions are still so shadowily defined. But for Mr Greenwood to suggest that what is wanted, *instead* of the Ministry of Town and Country Planning, is a Home Front Cabinet, composed of all the Ministers whose departments are concerned in any kind of planning, is nonsense. The fact is that *both* are needed: the Home Front Cabinet to initiate and supervise planning projects over the whole field of social and economic life, no matter what the departments which will act as agents; and a Ministry to plan land use within the framework of the policy made by this Cabinet or Committee. The two needs are quite distinct. The Ministry of Town and Country Planning is an agent in a particular field; and, while Mr Greenwood is right to say that general planning machinery is needed at Cabinet level, probably under a non-departmental Minister with this work as his special and exclusive province, he is quite wrong to suggest that the new Ministry of Land Use will be redundant. Partly because of this confusion the debate got little further than the Bill itself. There was a hint of progress in Sir William Jowitt's explanation that the power to set up commissions to deal with land use and development will probably include the acquisition of development rights and the management of property; and in the announcement that local authorities are to be vested with wider powers to buy land—which is essential if any of the projects to reconstruct blitzed areas are to be realised. But until the Government has made known in clear-cut, if general, terms what its decisions are on the main recommendations of the Uthwatt and Barlow Reports, everybody concerned in physical planning—the new Ministry, local authorities, property owners, industrialists and Parliament alike—will be left in the dark, with no assurance at all that the multitude of plans which are being made for building a better Britain in terms of bricks and mortar will ever see the light of day.

Rising Expenditure

War expenditure did not, after all, reach its peak last year. Then, the fact that mobilisation was virtually complete, and that the construction of war industry's capital equipment had practically been accomplished, suggested that a plateau had been reached. But expenditure has gone up. The daily rate of expenditure on the war in October was £12,750,000. In recent weeks, it has been about £14 millions, an increase of nearly 10 per cent, with an increase of 33 per cent in the expenditure devoted to "miscellaneous war services." In part, of course, this increase is merely seasonal. Expenditure in the last quarter of the year is always higher than in the previous quarters. But this is not the sole explanation. It is an important indication of the changed character of the war that the dynamic element in war expenditure is no longer production at home, but expenditure overseas—in Africa and the other parts of the world where offensive operations are proceeding. The Chancellor of the Exchequer made this plain on Tuesday, when he asked Parliament for a further vote of credit of £900 millions to carry over until the end of the financial year in March. Once again the Budget estimates will be overspent when the year ends by some 5 per cent; but revenue, too, is exceeding expectations by an appreciable margin. "We are now incurring substantial expenditure in this country by way of reciprocal aid to our Allies"; the scale and character of this reciprocal aid is indicated in a Note on page 143. What is received by way of Lend-Lease from the United States does not appear in the British Budget, just as what is received by the United States from Britain under reverse Lend-Lease does not appear in the American Budget. But, just as the goods and services supplied in this way to the various United Nations do appear in the American Budget, so do those supplied by Britain to the United States and other Allies appear in the British accounts. The prospect is that war expenditure will increase further, not only because of the mounting cost of overseas offensives, and the cost of reciprocal aid, but also because the rate of war output at home, in spite of the high degree of mobilisation and productivity already achieved, is to be stepped up still more this year. This was the burden of Mr Lyttelton's statement last week, when he forecast a further concentration of manpower in both production and the fighting Services. In spite of the vast productive power of the United States, British output remains the essential core of Allied warfare in many theatres; and the success achieved so far in avoiding significant inflation and financial disorder promises well for similar success in the final total

stage of the struggle. Members were very right to underline the crying need for economy in the use of both material and financial resources; but the aptest comment was that of Mr Pethick-Lawrence—"This is therefore the time for the peak of our sustained effort to be reached."

The Foreign Service

The Government has issued in a White Paper (Cmd. 6420) proposals for the reform of the Foreign Office, forecast by Mr Anthony Eden last June, when he announced new methods of recruitment and superannuation for the Foreign Service and the post-war fusion of the Diplomatic and Consular Services. After the war, entry into the Foreign Service will be in two stages. Success in a preliminary examination, taken by men between the ages of 21 and 23, will entitle candidates to eighteen months' training at the expense of the state, to be spent mainly abroad, and to cover a wide field of experience—political, social and economic. Up to 25 per cent of the candidates will be chosen, not by examination, but by personal interview, on the basis of record and personality. After training, a second examination will be held to decide final entry into the Service. This system cuts out the present penalisation of candidates without private means, who cannot afford the period of education abroad, which is practically indispensable. It should effectively widen the range of choice, and bring people with a wider variety of talents into the Foreign Service. At the other end of the diplomatic career, the pensioning off at a relatively early age of those not competent to undertake higher appointments—a method already usual in the Armed Services—will materially assist the promotion of abler younger men. So urgent is the need to free the upper reaches of diplomacy from inefficiency that the Government proposes to introduce a special Superannuation Bill at once.

All the proposed reforms dealing with recruitment, training and advancement can be sincerely welcomed. Whatever kind of specialisation an official may engage in afterwards, it is essential that his interests should be wide and liberal and that he should bring a trained mind to his work. The other side of the reforms—the fusion of the Diplomatic and Consular Services—raises wider issues. It is proposed because the greatly increased range of interests covered by the term "international relations" makes the old conception of diplomacy too narrow. Political understanding and contacts with purely political circles are not enough. The successful official must have knowledge of economic and social matters; he must know something about labour movements; it is as well that he should understand and know how to deal with the press. At present, the gaps are filled by the appointment of expert advisers to missions abroad. With the broader training and the fusing of the Diplomatic, Commercial and Consular Services, the Government hopes to make it unnecessary to appoint these special advisers except for purely technical matters. Yet can purely diplomatic officials really fulfil the wide variety of functions imposed by the new conditions of international affairs?

Food for India

The announcement that the British Government has arranged for shipments of wheat to India was no surprise. For some time, there have been reports of famine in some districts and serious shortages in others for reasons which are discussed on page 145. It is clear that the shipments alone will not relieve matters unless steps are taken to have the wheat properly distributed. This the Indian Government intends to do; it has announced that it will allocate the wheat to the deficiency areas, and the Provincial Governments concerned will supervise its distribution to consumers. The shipments must also be big enough to allay the fear of famine, since it is this fear which has caused the hoarding of food, by some consumers as well as by producers and dealers, and intensified the shortage. The wheat, which will presumably come from Australia, is there in plenty, and India, whose sterling balances at the beginning of this month were over £300 millions, has money in plenty to buy it with. The difficulty, especially at this stage of the war, will be to find the ships to take it. India's food shortage, therefore, besides being of serious concern to British rule in India, has an international significance. All over the world, these food shortages are becoming acute. When the United Nations were on the defensive, it was

easy to say that they were inevitable, but the impression was allowed to grow that famine relief and victories would march hand-in-hand. Undoubtedly, the food situation in the Middle East and North Africa would have been much worse if the Allies were not in control. But it is still very tight, and must continue to be so long as ships are needed to bring men and weapons rather than food. The problems, therefore, that are now being faced in India and the Middle East will be even more difficult when the Allies land in starving Europe. Clearly, the best way to end the famine is speedy victory, and, however hard the decision, food ships must come second to victory ships. But once the "unconditional surrender" of the Axis has been achieved, the food ships must be sent with the least possible delay. There must be no general raising of the British people's rations until their hundred million Allies have been fed.

An Unnecessary Incident

Before the war, the Labour party toyed with the idea of challenging the Speaker's unopposed return to Parliament at a general election. They did this, not from any dislike of the present Speaker or dissatisfaction with him, but because they held that a constituency which is represented by the Speaker, who holds office for an indefinite term, is disfranchised. Happily, this theory had only a short run, but it was generally regarded as a blunder while it lasted. The high offices of the House of Commons should be kept entirely free from personal or party differences if their occupants are to fulfil their duties conscientiously and impartially. Last week's incident in the House, therefore, which arose from Sir Dennis Herbert's resignation and Mr Attlee's motion to appoint a new Chairman and Deputy-Chairman of Ways and Means, was particularly regrettable. Mr Austin Hopkinson took it upon himself to oppose the motion. The reason that he gave, speaking as "an independent member," was that the Conservative party had not been consulted through the 1922 Committee about the nomination of Major James Milner, Labour Member for South-east Leeds, as Deputy-Chairman. Personal and party prejudices were thus blatantly uppermost, because Mr Hopkinson raised no objection to the fact that Colonel Clifton Brown, Conservative member for Hexham, had been nominated Chairman, although the Labour, or any other, party had not been consulted. Fortunately, he found only one supporter in the House, although other members, while not objecting in any way to the nominations, thought that there should have been private consultations before they were made to the House. Mr Eden, however, was quite firm that there was no precedent for notice or consultations—and, indeed, as Mr Aneurin Bevan said, it would be most undesirable for names to be hawked about in private beforehand—and the motion was passed, without a division. But the incident did not add to this Parliament's laurels.

Home Front

The Home Front Handbook issued by the Ministry of Information brings together facts and figures on most aspects of the war. In the choice of topics the Ministry has been guided by the questions which are most frequently put from abroad; indeed, it is designed primarily for use overseas. The subjects it covers range from absenteeism to civil defence, coal, guns, national savings, nutrition, rationing, shelters, vitamins, war damage and workmen's compensation. The chapter on manpower begins with a useful analysis of the number of persons available for employment in the war effort. The number of persons aged 16-64 is 33,250,000, including 16,000,000 men and 17,250,000 women. Of the total number of women in this age group, 10,000,000 are married or occupied in necessary household duties; between the ages of 18-64 only 4,250,000 women are unmarried. The contribution of married women is revealed by the fact that, exclusive of domestic service, some 6,750,000—a figure considerably in excess of the number of unmarried women—are engaged full time in industry and in the Forces; a further 300,000 are occupied on part-time work. The reason for the heavy call which this war has made upon British women was made plain by Mr Winant, American Ambassador in London, in a speech before the Council of State Governments in Baltimore this week. In this war, he said, 125 workers are needed on

munitions in Britain for every 100 in the fighting Services, compared with 65 in 1914-18; and, according to the Ministry of Information's Compendium, as long ago as December, 1941, one million more men were employed on munitions than at the end of the last war.

Manpower in War Industry

In the latest bulletin of the Oxford Institute of Statistics Messrs M. Kalecki and J. Steindl have made an attempt to estimate the volume and proportions of the manpower resources of Britain and America devoted to war production. Instead of the usual financial approach to the problem, starting from estimates of national income and expenditure—which is defective owing to the lack of adequate data for making adjustments for changes in prices—the authors have based their calculations on the transfer of manpower from peace to war occupations. Mr Steindl admits the limitations of this approach, since manpower is only one of the factors of production. On the basis of a series of ingenious calculations and assumptions, Mr Kalecki estimates that the volume of insured employment in Britain has increased from 13.1 million in 1938 to the equivalent of 14.5 million "1938 workers" in 1941. The latter figure does not represent the actual number of insured persons, but what the number would have been if working hours had remained at the 1938 level. Of the increase of 1,500,000, some 500,000 represent actual additional workers and the remaining million the increase in the working hours of those already insured. Of the total number of "1938 workers" insured in 1941, he estimates that 7,500,000, or about 50 per cent, were on war work. Apart from the increase of 1,500,000 in the total number, the equivalent of some 5,500,000 "1938 workers" were transferred to war work from peacetime occupations; 1,500,000 were transferred from those ministering to civilian consumption; 3,000,000 from those engaged in the production of investment goods; and 1,000,000 from the export industries. The number of workers already engaged directly or indirectly on war work in 1938 was 600,000. Mr Steindl shows that the number of persons employed on war work in the United States was 10,500,000 in the second quarter of 1942. After allowing for differences in weekly working hours between the two countries, he reaches the conclusion that, at that time, the number of workers in war industry was 10,000,000 in the United States, compared with 8,000,000 (1938 workers) in this country. In other words Britain was then employing on war work 4 persons for every five thus engaged in the United States. In his introduction to the articles, the editor of the bulletin estimates that the ratio has increased since the second quarter of 1942, but that there are probably still less than two American war workers for every one British. Moreover, since a substantial proportion of American war workers are still engaged in the construction of factories and other equipment, a process which has been virtually completed in this country, Britain's output, in terms of actual fighting equipment, is still appreciably greater than is suggested by a mere comparison of numbers of war workers. "The argument that an extra ten per cent from Britain is negligible in view of the vast US production is not valid, and will not be valid during 1943." Great Britain's contribution of munitions, in fact, will play a decisive part in the battles of the coming months.

War Pensions

The dependants of members of the women's Auxiliary Forces of all ranks who may be disabled or killed are to be compensated at the same rate as the dependants of men in the Forces. This is the chief concession announced in

the Royal Warrant which the Minister of Pensions presented to Parliament last week. The Warrant which replaces that of June 29, 1940, gives effect to certain modifications which are already practised by the Ministry; and it embodies the improved rates of pensions introduced in February, 1942, in order to meet the increased cost of living. The list of women's dependants has been extended, and is now the same as that applicable to men; a dependent husband and dependent children are to become eligible for pensions even if the marriage took place after the wife joined the Services. A further concession entitles women to receive the "constant attendance" allowance, if totally disabled, and education allowances for their dependent children on the same terms as men. These improvements in conditions will be generally welcomed—they were approved by the all-party committee which has been advising the Minister of Pensions—but they will probably lead to a renewed demand for bringing other scales of war pension and compensation into line. Women disabled in the Services are still to receive pensions at about two-thirds those of men, and it certainly seems somewhat anomalous that there should be one rule for a woman and another for her grandmother.

Axis Lend-Lease ?

The German-Japanese and Italo-Japanese Economic Agreements, which were signed last week in Berlin and Rome, are officially described as the economic supplement to the Tripartite Pact. The aim is "total and unreserved mutual assistance." The draft of the two treaties, which are identical, as published by the Italian telegraph agency *Stefani*, does no more than list the heads of co-operation: economic, financial and administrative. It is in Tokyo that the practical side of the project is being hammered out; there, three executory agreements have been signed by the German Ambassador, Ott, and the economic emissary, Wohltat, for Germany, and the Japanese Minister of Foreign Affairs, Tani. It is understood that the practical details are still being negotiated. The essence of the scheme is an attempt to provide the Axis with a pale imitation of the Lend-Lease mechanism. The immense raw material resources of Japan and the technical and mechanical skill of Germany are to be pooled and exchanged. What contribution Italy is to make is less clear. German newspapers stress the absence of any strict accounting or necessity to repay item for item, and also the long-term significance of the arrangement by which the New Order in Asia and the New Order in Europe are to become complementary. It is not yet known when the agreements come into effect—or how. The outstanding snag is, of course, transport. Replying to the questions of neutral correspondents, the German official spokesman, Schmidt, refused to commit himself as to how the mechanism of exchange is to be provided. And the *Giornale d'Italia* on January 22nd last pertinently asked what form of economic collaboration could take place during the war. "Direct and intensive exchanges cannot certainly take place during the conflict." That would seem to be a reasonable conclusion, despite the occasional success of an Axis blockade-runner and the immediate and optimistic creation of a *Deutsche Bank für Ostasien* with a branch in Tokyo. There is an interesting suggestion that co-operation in the exchange of experience can take place at once; but it remains to be seen whether any of the signatories will bring themselves to part with armament patents.

Rara Avis

President Castillo lost no time in informing his countrymen that Argentine policy remains unaffected by Chile's break with the Axis. The announcement was expected. Had Argentina intended to abandon its neutrality at the present juncture, the crucial step would have been taken in co-operation with Chile, and not in consequence of that country's decision. For the moment, the effect on Argentine opinion is confined to an almost imperceptible strengthening of the prestige of pro-Ally supporters. The Chilean move attracted the minimum of press comment in Argentina. Immediately, the topic seems to have been superseded by the storm raging over the publication in Montevideo of the substance of three United States memo-

randas on Nazi espionage—the same memoranda, significantly enough, which precipitated Chile's decision. The publication was undertaken by the Inter-American Committee of Political Defence, in the absence of a full statement of the facts by the Argentine Government. Since the United States memoranda were presented last November, drawing attention to the work of four groups of Axis spies, legal action has been taken by Argentina in which the Federal Prosecutor has intervened. It is because of his failure to waive diplomatic immunity and submit to the findings of the Courts, that the German naval attaché, Captain Niebuhr, is now forced to leave the country. Official annoyance at the publication in Montevideo is based on the view that it is "prejudicial and redundant" while the charges are *sub judice*. But, in defence of the publication, it must be admitted that the Castillo administration has consistently shown slight consideration of public opinion; that the terms of the charges must exercise an important influence on the formation of public opinion; and that their full content has been withheld for some three months. The Uruguayan press, which has repeatedly emphasised the position in which Argentina now finds itself, isolated in the sub-continent, continues to point out that this neutrality is not the product of a free and informed popular judgment.

Trade Unions and Technicians

Sir Stafford Cripps, addressing a conference of the Association of Supervisory Staffs and Engineering Technicians last week-end, spoke of the role of the trade unions, which he described as "the repositories of the democratising forces within industry" in post-war Britain. He said that, while the primary function of trade unions is to guard the financial interests of their members and to ensure decent working conditions, they will have to become much more closely associated with responsibility for production. This co-operation has developed rapidly since the war and has reached a far higher pitch, at every level of production, than was achieved in the last war. The position in wartime, when a common purpose transcends many prejudices and obstacles, is, of course, very different from what it will be in peace-time. But it is equally true that the transition from war to peace will bring forth many problems in which trade union co-operation is just as vital as it is today—a fact stressed by Mr Bevin in a recent speech. The occasion of Sir Stafford's remarks raises an interesting question from the view-point of trade union organisation—the position of supervisory and technical staffs. These workers are becoming increasingly organised. Their Association, which is affiliated to the Trade Union Congress and which originated in 1917 as the National Foremen's Association of the Engineering and Allied Trades, is said to have increased its membership five-fold since the beginning of the war, and to be nearly 10,000 strong. A resolution calling for the representation of supervisory and technical staffs on Joint Production Committees was passed at the 1942 TUC meeting, and has been put into effect in many factories. The question has arisen whether they should be represented on the managerial or the workers' side, and whether they should be full members of the committee or co-opted to deal with particular problems. Whatever solution is found, it is clearly essential that foremen and technicians should be drawn into the discussion of production problems within the factories through the production committees, and that all members of the establishment, whether management, foremen, technicians or shop stewards, should work together to achieve maximum productive efficiency.

The LCC on the Public Schools

Once again, the unending controversy over the public schools has reared its head. This time, the occasion is the report from a sub-committee of the LCC Education Committee outlining the evidence which should be given to the Fleming Committee. The Fleming Committee was set up by Mr Butler last June to consider how the association between the public schools and the general educational system can be developed and extended. These terms of reference were certainly not encouraging. They assumed that the present association was on the right lines, and consequently promised no far-reaching recommendations for reform of the country's education as a whole. It is

hardly surprising, therefore, that the LCC sub-committee suggests that the Council should declare itself opposed to the kind of collaboration thus envisaged. But if its report is not a surprise, it is most certainly a mistake. It is absurd to say that the public schools are "educationally undesirable" even "while present principles guiding their management and recruitment continue." The education in a boys' public school is eminently desirable; what is wanted is to make it available to any boy who can benefit by it, irrespective of his social environment and his parents' means. This clearly cannot be achieved so long as the public schools are regarded as mainly for boys of a certain class, no matter what their intellectual abilities, with a few scholarships for the bright boys from the state schools. Competition for all their very limited (relative to the total child population) vacancies must be allowed to all boys, no matter where they receive their primary education. The LCC sub-committee is on stronger ground when it refers to the social undesirability of the public schools. But, here again, it is not so much the transient snobbery that may occasionally be inculcated that is important, as Lord Latham, leader of the LCC, seems to suggest, but the fact that the important posts in national life, whether in Government or in industry, are given far too often to ex-public school boys who, since they were not chosen for that form of education because of any inherent virtue of intellect or character, cannot always fill them adequately. It is this which, as the war has proved, is socially undesirable, and the LCC committee has missed an opportunity in drafting such a purely destructive report instead of placing the real issues properly on record.

The Press and News

The annual report of the council of the Empire Press Union contains, as might have been expected, consider-

able criticism about the release of news. Some of these have much justification, especially the statement on the public relations departments of the different Ministries:—

Valuable as some of these offices are, it can hardly be said that their output of usable press material has been proportionate to the expansion of public relations staff.

Too often these public relations departments, instead of merely giving the facts, write up their own stories, and put their own gloss upon the announcements. They tend, therefore, to be advocates for their Ministers and Ministries, speaking to a brief, instead of simply the means by which policy and information are made known to the public. Of more interest is the Empire Press Union's comments on the effects of the new censorship powers announced last March. It will be recalled that Mr Bracken suddenly announced that henceforward the censors would have power to stop Press messages "calculated to produce ill-feeling between the United Nations or between them and a neutral country." Since the occasion for this ban was the material cabled out by a few Dominion correspondents, which, Mr Bracken said, had done "appalling harm to the war effort," it is interesting to note that the comment of the Empire Press Union is satisfied that no legitimate criticism of policy or administration has been stopped. But it states that there was, to begin with at least, some delay, while censors referred messages to higher authority, and also that overseas newspaper readers have been made doubtful about the extent to which messages are modified by the censorship. But this doubt is bound to be a regrettable by-product of any form of censorship, and it must have existed even before the new powers were given. On the whole, they have probably done more good, in restraining the virulence of certain correspondents, than harm, and they have certainly been wisely and leniently exercised.

AMERICAN SURVEY

Two-Way Traffic

The Administration's campaign to put Lend-Lease operations in their proper perspective is now well under way. Mr Stettinius, in a personal statement and a report to Congress, has ably stated the general argument for reciprocal aid, and has supported it by a series of new figures on the size and variety of British and Dominion contributions to the American war effort. The American forces in the United Kingdom have received supplies, other than construction materials, amounting to a greater tonnage than the supplies sent to them from the United States, and vast quantities of other facilities and services as well. In the Pacific area, American forces are supplied almost entirely with food from Australia and New Zealand, thus

freeing shipping from the United States for the transport of tanks and guns. Another striking example of British reciprocal aid which Mr Stettinius cited was the fact that Great Britain provided two-thirds of the warships and transports employed in the original North African landing. The Lend-Lease Administrator explained that, in most cases reciprocal aid is not expressed in terms of dollars, as many of the services, and, in particular the "pooling of brains," are impossible to express in dollar figures; and he argued that, in any case, it is impossible to compare the loss of, say, 1,000 Russian lives with the contribution of 1,000 fighter aircraft. In another statement last week, Mr Stettinius emphasised the predominant share of Lend-Lease material that is going to Russia, and the fact that

BANKERS TRUST COMPANY

NEW YORK

Complete banking facilities

London Office:

Incorporated with limited liability in the U.S.A.

Britain also has made massive contributions to the present Russian campaign. The Bill to extend Lend-Lease has now been introduced into Congress, and the political squall over it appears to be dying down. Events have proved an even more persuasive advocate than Mr Stettinius' big guns. It was difficult for the Opposition to complain about supplies going to Russia during a week of resounding Russian victories; and the entry of the Eighth Army into Tripoli provides a definitive rebuttal of the charge that weapons sent to Britain were being hoarded or misused. The case for Lend-Lease is too good for the Opposition to make much headway; it will have to content itself with finding fault with its smaller aspects, such as the cost of administration. It is a pity, indeed, that the impressive account of British contributions to the common cause was not made public long ago, before so much play was made with the false idea that the United States stood alone in providing supplies and services for its Allies.

* * *

The Case for Expediency

"Our Government's Case for Expediency" is the title and theme of an article in the February *American Mercury* which has aroused much comment in the United States. The writer is Mr Kingsbury Smith, a well-known Washington correspondent, who has covered the State Department for many years and is thought to reflect the views of that group in the Department which was most enthusiastic over the deal with Darlan. The argument is put with brutal simplicity.

Winning the war—winning it at the least possible cost of American lives—is the first objective of Washington strategy. Spreading the four freedoms around the world is something we would like to see done after the Axis is defeated. . . .

Criticism of the deal with Darlan, according to Mr Smith, comes in the main from two sources: the de Gaulle Government in England and those persons, both in this country and England, who contend we have broken faith with the entire "free" movement. But he also mentions "certain factions in England" who disliked the prospect of having a violent Anglophobe at the helm of liberated France. Mr Smith is convinced that the French are "realistic enough to keep their eyes on the main goal—the defeat of Nazi Germany," and he goes on—

The American Government's position in respect to Africa is that it welcomes the support of every Frenchman who wants to fight the Axis. It doesn't want to have to settle a political difference between Frenchmen as a prerequisite to their joining the Allied cause, especially not at the cost of American lives.

Of the future, Mr Smith has this to say:

The factor about the Darlan affair which makes it of such overriding importance to this country is that it is the first of several such hurdles which must be crossed on our way to victory. The men who lead our armies must make bold, summary decisions, not in the light of ideals, but in the light of military realities. . . .

Our State and War Departments . . . are convinced that the safest policy for this government to follow is one of military expediency. Until Germany is disarmed, we will deal with those who want to help destroy the enemy. . . .

When victory has been won, then will be the time for political argument, for choosing leaders and establishing permanent regimes, and for seeking support for the four freedoms.

This is expediency naked and unashamed—though the question whether this particular case of military expediency has in fact proved militarily expedient (which is very uncertain, to say the least, and has in any case still to be proved) is not dealt with. Mr Hull was himself reported to have spoken sharply this week when questioned about criticisms of the North African policy of his Department made by Mr Walter Lippmann and others; but Mr Smith's defence would appear to be most damaging to a Secretary of State whose immense influence rests largely upon his record as a man of ideals.

Back to the Farm

A proposal to recruit a voluntary land army of 3,500,000 in order to get in next year's harvest has been made by Mr Wickard, the Secretary of Agriculture, and

Mr McNutt, the Manpower Commissioner. There has been a heavy drain on agricultural labour during the past two years. Mr Wickard put it at about 3,000,000. It is this depletion of the farm labour supply which is the main moving force behind the current Senate investigation into the size of the armed forces, and which is a more potent factor even than the additional \$100 millions of "incentive" payments. Mr Wickard has promised to increase production. The voluntary land army, without which the agricultural goals for 1943 cannot be met, is to be drawn in the main from housewives and persons in non-essential occupations in urban areas. In addition, Mr Wickard indicated in his report to the President that he was in favour of some further form of wage control to discourage migration from the country to industrial centres. The response to the call for volunteers is certain to be heavy; and the farmer will be grateful for any help that is available. But already the hired labour force contains a high proportion of inexperienced hands; and it is thought that there may be a more dangerous scarcity of labour in marketing, transporting and processing the crops than in the actual harvesting. Additional mechanisation is out of the question. Farm machinery is so short that farmers are required to obtain permits from their local agricultural boards before they may buy new machines. Any substantial expansion beyond the 1942 harvest is therefore unlikely; and Mr Wickard warned that, as about one-fifth of the total production will be needed for military and Lend-Lease purposes, a full-scale rationing programme will be necessary in 1943. Even so, lack of transport will make some fresh foods unobtainable in certain areas. Already there is a lengthy list of foods which it is announced the Government intends to ration shortly. In view of the local shortages already existing, there is considerable support for a speeding up of the rationing programme in order to avert more serious scarcities later.

Pay-as-You-Go

Many of the same problems crop up in every country at war. On March 15th the first instalment of the higher American income tax is due from many millions of people who have not previously enjoyed that privilege. The Tax Bill was enacted so late that even the most prudent taxpayer lacked time to put aside sufficient reserves. Nor have American tax-payers gone through the gradual hardening process available to British tax-payers. The need of a pay-as-you-go arrangement became obvious in the last session of Congress, and, indeed, the new 5 per cent Victory tax, included in the Bill, is being collected at the source. It is agreed that an extension of this principle to the income tax is essential if there are not to be wholesale tax defaults in March. The most ingenious scheme is that put forward several months ago by Dr Beardsley Ruml, of Macy's. His proposal, which for obvious reasons recommended itself to certain tax-payers, was that the Treasury should entirely remit taxes on income earned in 1941, and that monthly or weekly payments in 1942 should be applied to taxes due on 1942 income. The plan provides that 1942 incomes should be assumed to be equal to those earned in 1941, until the end of the year when adjustments would be made. The plan was so warmly received that warnings have been necessary to remind tax-payers that it is not yet law, and that they may yet be liable for taxes on last year's income. Dr Ruml agreed that the Treasury would hardly feel the loss, which would only gradually become apparent as tax-payers died fully paid up. This the Treasury hotly contested, pointing out that, during 1941, many incomes, both personal and corporate, reached peaks that will not be attained again during the war, owing to the concentration of industry, price control, rising costs, and legislation covering profits. The plan, if adopted in the form proposed, undoubtedly would prove a windfall to many tax-payers in the higher brackets. In a modified form, however, it is necessary if collection of an increasingly heavy tax-burden is to be made practicable and bearable. Another kind of pay-as-you-go tax—a spending or sales tax—also appears certain. The difference is that a spending tax would be levied on income theoretically available for spending after exemptions for savings, taxes, life insurance premiums, and debt obligations. Its advantage over the general sales tax is that it could be graduated in accordance with ability to pay, and would reach hoards as well as money put into circulation. Its administrative feasibility is more doubtful, and it was on this score that the Senate Finance Committee turned down the Treasury's proposals last year.

THE WORLD OVERSEAS

Food Subsidies in Canada

(From Our Ottawa Correspondent)

December 31st

THE cost of living will henceforth be subsidised directly to offset any pressure upon price levels, which could be restrained, but not entirely controlled, under the policy of a universal price ceiling. As announced by Mr Ilsley, the Minister of Finance, on December 3rd, the commodities marked initially for price reductions, through subsidy, removal of duties and taxes, or by direct sale at a loss through a Government agency to the trade, were tea, coffee, oranges and liquid milk. The cost of reducing the price of these items will be \$40 millions a year.

While the decision to subsidise the cost of living, as Mr Ilsley said, contained a most solemn reaffirmation of the policy of rigorous control, it was also a strategic retreat on the part of the Canadian Government from the policy of a universal price ceiling, established a year before in preference to selective price control. The price increases which had occurred since the basic period of the ceiling policy, and which had forced a shift to the plan of selected subsidies, had chiefly taken place in foods. During October, there was an increase of nearly three points in food prices. Leading the rise were beef, oranges, butter, potatoes, lard and lemons, all high in essentiality in the Canadian diet.

The introduction of subsidies will not, by any means, imply a relaxation of the general price ceiling. Canadian experience of one year with an over-all ceiling has been highly successful, measured in terms of economic stability and of benefit to consumers. The principle of subsidies is not new, as it has been used to the extent of \$30 millions in taking up adjustments between manufacturers, wholesalers and retailers in order to safeguard retail prices. A brief review will substantiate claims that have been made on behalf of the ceiling. The inflationary spiral set in, in Canada, in the spring of 1941. In succeeding months, from April 1 to November 1, 1941, the cost of living index rose by 7.1 per cent, or at a rate of 1 per cent a month. The price structure, with a few exceptions, was frozen at the level corresponding to the highest price recorded on a particular commodity between September 15 and October 11, 1941.

From December 1, 1941, when the ceiling was established, the spiral of inflation was held in check. The cost of living index moved up only 2.8 points, from 115.8 to 118.6 (1935-39 = 100). But the surge of prices was plainly upward as the first year's trial with the general ceiling ended, and food prices were in the lead at a time when food prices normally declined in Canada. It is true that control of prices by a lawful ceiling restrained a rise in the cost of living that might have amounted to 10 or 12 per cent. But it is equally true that the ceiling itself, extending across the entire range of Canadian prices, was not enough to restrain indefinitely the pressures on the cost of living.

Inflation Warnings

It was, therefore, time to strengthen the barricades. The Canadian people received plenty of warning that the battle against inflation had not been won. Donald Gordon, chairman of the Wartime Prices and Trade Board, repeated it. "The threat of a disastrous inflation is as real now," he said on December 16th, "as it ever was." Again, on September 30th, he said: "We must beware of any assumption that the battle against inflation had been won." Again, on October 22nd, he gave warning that increasing purchasing power in the hands of the people will force prices up unless direct controls fight every step of the way.

The nature of the cumulative pressure on prices was well known. Prices of important imports rose as foreign prices beyond Canadian control advanced. Shipping and other costs added to prices of imports. Seasonal declines in Canadian prices failed to materialise, indicating that lessened supplies meant higher unit costs. Despite heavy

taxation, designed to drain more than \$2,000 million into the Treasury, and heavy public borrowing such as the Third Victory Loan which diverted nearly a billion dollars from public savings, the volume of purchasing power in the hands of the public was expanding, like water in a reservoir rising higher and higher behind the dam of price control. Earnings of industrial workers increased substantially. Wage rates, despite the wages ceiling, increased in twelve months by 13 per cent on the average. The season of 1942 was one of the most productive in the history of Canadian agriculture, and farm income rose by 20 per cent.

There was, too, an important technical reason why the cost of living should not be allowed to rise. The price ceiling was linked with the wages ceiling through the device of the cost of living bonus, which provided that employers would be compelled to pay cost of living bonuses to employees, adjusted quarterly for each full point of change in the cost of living index. This index had shown, on July 2nd, a rise of 2.4 points over the index of October 1, 1941, and the National War Labour Board then ordered payment of bonuses and increases in existing bonuses. The rate of bonus was 25 cents a week for each point increase in the index, which had risen 17 points since the outbreak of war, a total of \$4.25 a week, or, in the case of employees receiving less than \$25 a week, 17 per cent of wages received. That a further bonus would become payable, when the January 1, 1943, index reading was reported, seemed certain.

Under these circumstances, the decision was made to bring the cost of living, at least in part, back to the level of the basic period. "It is sufficient," said Mr Ilsley, "if by the reduction of certain prices whether they have risen or not, the total cost of the consumer's budget is moved back." The reductions were four cents a pound on tea, 10 cents on coffee and two cents a quart on milk, and duties and taxes were removed from oranges to permit their price to revert to the base period. Tea and coffee were recently rationed, as was butter.

The critical issues that compelled the adoption of selected subsidies for items in the cost of living index went largely unrecognised in Canada through an unfortunate twist in the publicity surrounding the announcement. The subsidies, announced shortly before Christmas, were interpreted as specially good news for the consumer, as indeed they were. The fact that the general ceiling policy, which had notably preserved the Canadian economy from the ravages of inflation for one year, would not suffice to preserve it unscathed for another year dropped into the background. Somehow, the point that the battle against inflation is intensifying, rather than diminishing, was lost and with it the opportunity to harden civilian morale against the day when rationing will become more onerous and fresh restraints upon purchasing power will become inevitable.

India's Food Position

[BY A CORRESPONDENT]

THE British Government has arranged to ship large quantities of wheat to India in the next two months. This announcement underlines the serious food position which has developed in recent months. India normally produces about 60 million tons of food grains, consisting of about 26½ million tons of rice, some 10 million tons of wheat, 9½ million tons of jowar and bajra and 14 million tons of barley, maize, gram and other grains. In addition, nearly 1½ million tons of rice was imported from Burma. Of this total supply of 61½ million tons, India used to be able to spare its neighbours about 1 million tons. It is thus evident that, with rice from Burma no longer available, India is

barely self-supporting, even given normal harvests. But India needs to be more than self-supporting at the present time. Ceylon, also deprived of Burma rice, has to receive supplies from the nearest source, while Iran has been in need of wheat, which the United Nations have tried to meet, and again from the nearest source—India. Quantity figures of exports are not published, but in the Council of State some months ago the Commerce Secretary said that total grain exports from September, 1939, to June, 1942, were 827,000 tons of rice, 430,000 tons of wheat and wheat flour and 278,000 tons of other grains and pulses. The bulk of the rice had gone to Ceylon, Arabia, South Africa and Mauritius, the bulk of the wheat to Burma, Iran and Arabia.

This is the background to the problem facing the Government. A "Grow More Food Campaign" is being encouraged variously. The Provincial and States Governments have offered inducements by such concessions as reduced irrigation rates, reservation—as far as possible—of canal water exclusively for food crops, allotments of fallow and waste land free of rent and land revenue charges, distribution of manures and improved seed and the provision of temporary loans to cultivators. There are some 105 million acres of the land described as cultivable waste, and it is hoped that at least five million acres of this area will be brought under cultivation. Another five million acres, usually under short staple cotton and raw jute, are also expected to be turned over to food crops. The increased yield of foodstuffs from the increase in food acreage is expected to be not less than 1,700,000 tons, of which a considerable proportion should be available by next April.

Addressing the first meeting of the Central Food Advisory Council at the end of August, Sir Jogendra Singh, member of the Executive Council, said the shortage of rice was about 2,200,000 tons, but that seasonal variations in some years had been large, and in the year 1940-41 ranged around 4,400,000 tons. The reported shortage, compared with total annual production of 26,500,000 tons and variations which have been experienced before, was not too large; he looked, moreover, for an additional 850,000 tons of rice as a result of India's grow more food campaign and other measures. The last wheat harvest had yielded about 10,700,000 tons, which would more than cover normal consumption of about 9,900,000 tons, but fell short of estimated total wartime requirements. It is hoped that wheat production will be increased by about 450,000 tons as a result of the production drive. Though the price of wheat is more than 100 per cent above pre-war, the position has been aggravated by the tendency of the producer to hoard his surplus.

Speaking two months later, Sir Jogendra Singh referred to the complications caused by transport difficulties, and said that the situation had been still further complicated by the action of various Provinces and States, which, in their anxiety to conserve their own supplies, had restricted the even flow of commodities from one region to another. It is only fair to add that some of these restrictions, if official provincial purchasing can be so described, are motivated by the creditable aim of thwarting dealers intent on hiding stocks and pushing up prices. Some months ago the Punjab Government purchased 80,000 tons of grain, which is stored in suitable centres as a precaution against artificial or real shortages and as a steady influence on the market. In December, the same Government bought another 52,000 tons of grain, including 37,000 tons of wheat, which was expected to meet the requirements of the Punjab's town-dwellers for three months. It is by purchases such as these and the opening of fair price shops in Bombay and elsewhere that the authorities are most likely to outwit the machinations of country and town dealers, who in the countryside are often also moneylenders to the cultivators and the only convenient buyers of their small crop surpluses. But the dealing aspect is only one side of the problem. What was said in the Simon Report twelve years ago is still true to-day, namely, that there is little incentive for the rural cultivator to add to his wealth by producing more than he requires for the immediate needs of himself and his family. No doubt the war has made some difference, in that local rather than distant demand has much increased; but, on the whole, the economic incentive will not play so strong a part in stimulating output for sale as it does in the west.

Small Holdings

One consideration limiting incentive is the break-up of holdings in a country which is essentially one of small holdings. A special enquiry some years ago in 2,400 villages in the Punjab showed that 18 per cent of the owners' holdings were under one acre, 25 per cent were between one

and three acres, 15 per cent were between three and five acres, and a further 18 per cent were between five and ten acres. These figures would be on the high side for India as a whole, for the number of cultivated acres per cultivator in the Punjab is about nine, which is three times as much as it is in the United Provinces, Bengal and Bihar. Even in the Punjab, it is estimated that Rs. 30 (45s.) per acre is considered sufficient capital for farming, against the £15 which was quoted as one pre-war figure for Britain. But the holdings, small as they are, are not in solid blocks. If a father owning three isolated fields of one acre each, and leaving three sons, dies, the sons do not take one field each, but one-third of each field. There are innumerable cultivators whose total holdings amount to one acre or less, and even these tiny areas are often split up into a number of disconnected fragments; not infrequently, some of the component parts are so small that the owner cannot cultivate them without trespassing on his neighbour's land. In the Ratnagiri District of the Bombay Province, there have been individual plots as small as 1/160th part of an acre. Strenuous efforts are being made to secure the realignment of holdings. They have met with some little success, notably in the Punjab, but a vast amount remains to be done.

Moreover, on these Indian farms are some 13 million wooden ploughs. The indigenous plough serves the purpose of plough, harrow and cultivator, and is combined with a levelling beam. Harvesting is performed with the sickle. Grain is separated by treading out with oxen or beating out by hand, and winnowing is done with the help of the wind. The average farmer's stock of seed has often disappeared by the next sowing season, because it has been sold or eaten by the family, and he may have to borrow grain, usually of a poor standard, from the local grain-dealer at a high rate of interest.

Better methods of farming and the still greater use of improved seed, available through the Provincial Governments' Agricultural Departments, would do something to remove the disparity in yields compared with other producing countries. The average yield of rice per acre in India in 1938-39 was 731 lb., compared with 1,481 lb. in the USA, 2,307 lb. in Japan, 2,079 lb. in Egypt and 3,000 lb. in Italy. Before the war, where Germany was producing 22.6 quintals of wheat per hectare and Great Britain 20.6, the figure for India was only 7.

All this is not to minimise the valuable work done by the Indian Agricultural Departments nor the success achieved in persuading cultivators to turn from one crop to another. If the knowledge these departments have gained were fully applied by all the cultivators of India, an agricultural revolution would follow. It is due to them that even now so much relatively has been achieved.

Inflation in Palestine

[FROM OUR JERUSALEM CORRESPONDENT]

October 19th.

DURING the two anxious months that elapsed between Rommel's capture of Tobruk and his failure to overcome British resistance at El Alamein, Palestine's currency in circulation rose by almost 30 per cent, and the banks experienced another run, the fourth in three years of war. These periodical crises in the credit system have been aggravated by the absence of a central bank, which would offer rediscount facilities, and they are the chief reason for the high liquidity which the local banks have to maintain. But the intensity of these crises is diminishing. In August-September, 1939, deposits fell by about 30 per cent, and currency in circulation rose by two-thirds. A general bank holiday was proclaimed, in spite of which several institutions failed. The disasters of the summer of 1940 again brought a withdrawal of some 25 per cent of deposits, and money in circulation soared by a third. But the withdrawal of deposits after the conquest of Greece and Crete did not exceed 8 per cent, the rise in money in circulation was only about 15 per cent, and the effect was but to prolong for some months the period of credit contraction. This time again, though the absolute rise in the currency in circulation has been greater even than at the outbreak of war, the total of banking deposits did not materially change, and the results on credit policy were negligible.

This improvement is partly due to the increased confidence in the banking system, which has been able to withstand such serious shocks. Moreover, the weaker institutions have been eliminated, and the smaller ones, with a paid-up capital of less than £P25,000, have been deprived of the right to keep deposits for current account by an

ordinance dating back to 1938, but only gradually enforced. Out of 53 banking institutions registered in 1938, and 77 in 1936, there are now only 25 remaining, of which four are big "foreign" banks operating in Palestine. Two of the local banks are Arab, and the rest are Jewish, as well as almost all the highly developed 85 co-operative credit societies. But not more than about 12 per cent of total deposits are entrusted to local banks, and another 5 per cent to the credit societies. The remainder is almost equally divided between the "foreign" banks, among them Barclays Bank (DC and O), which acts as bankers to the Government and the military authorities, and the Anglo-Palestine Bank, which is included with the "foreign" banks chiefly for historical reasons. The latter has come to be regarded as something like a central bank for the Jewish financial sector, and it keeps between 40 and 50 per cent of its resources in gilt-edged securities as an emergency reserve.

It must also be borne in mind, however, that banking deposits have not risen to the same extent as currency in circulation. They amounted to £P20 millions in July, 1939, and over £P24 millions in July this year, but the total of notes and coin in circulation rose from slightly over £P5 millions in normal times to about £P21 millions now. Obviously, the fluctuations in banking deposits cannot be of the same importance as when the latter were three or four times as great as the money in circulation. On the other side must be put the fact that the general price level has more than doubled, the physical output of the country is on the increase, and the circulation inflated by the presence of troops, while about 40 per cent of the circulation is presumably being hoarded either from panic or by the fellahin, who are not yet used to banking facilities. Contrary to previous experience, it is, therefore, the money in circulation which is at present likely to influence the accumulation of deposits.

Decline in Bank Loans

The same applies to credit. Total outstanding advances and bills (of banks and co-operative societies) were £P13.8 millions in July, 1939, and £P11 millions in July this year, notwithstanding the rise in the turnover of money. In fact, the banks are complaining about the continuous decline in the demand for loans. Wholesale trade is much reduced, and to a great extent taken over by Government agencies. Building and military orders are also financed from Government resources. Industry and agriculture, which in pre-war times were encumbered with debt, are now able, not only to meet their current needs, but also to invest new capital in extensions. It should be added that trade in general has been put on a cash basis, and that credit for private needs, which in pre-war times had been a substantial item, has since been much curtailed.

There has long been much talk about inflation, but until recently the import of capital was to a great extent neutralised by the relatively great import of goods—the value of imports in the first half of 1942 was £P11 millions, against £P5 millions in the first half of 1941, and £P8 millions in the same period of 1939—by the repayment of former indebtedness, and to some extent by increased taxation. But these factors no longer suffice, and liquid capital is accumulating at the rate of about £P1.5 millions a month. The rate of interest is on the downward trend, security prices have almost reached their pre-war level, and there is a rush to the real estate market, where prices are still rising. Moreover, this tendency has coincided with a new rise in commodity prices, following the shortage of most agricultural products.

The need to arrest this impact of money on a market where the supply of goods for civilians is diminishing has been stressed by many quarters, and Government policy has been criticised for being too liberal. But the chief difficulty seems to lie in the problem of coping with the rural population, which has considerable influence on local economy, on the supply as well as on the demand side.

Production in the Congo

[BY A CORRESPONDENT]

January 12th

At a recent Press Conference in London, M. A. De Vleeschauwer, the Belgian Minister for the Colonies, who has just returned from an official visit to the Belgian Congo, quoted for the first time some figures on current production in the colony. He stated, *inter alia*, that the present copper

output is at a rate of 160,000 metric tons per annum, and could be raised to 190,000 metric tons if additional supplies of equipment were available. Tin production has now reached 21,000 tons per annum, and, on the basis of present schedules, is to be raised to 35,000 tons by 1945. The Congo rubber output is at present running at an annual rate of 6,000 to 7,000 tons, and it is hoped to raise this total to between 15,000 and 20,000 tons before 1945. In palm oil, 80,000 tons per annum are now being produced, and here also production is to be further increased, although in agricultural production a number of unknown quantities—climatic conditions, possible pests, etc.—enter the picture. M. De Vleeschauwer added that in a number of other commodities, such as industrial diamonds, cobalt, copal, textile fibres and cocoa, production has reached capacity levels, but he quoted no definite figures.

Nevertheless, the above data are clear indications that the raw materials of the Congo are being developed to the utmost in order to meet Allied war needs. For copper, the present rate of production exceeds the past record figure of 1937 by some 10,000 tons. For tin, current production is more than twice as large as the 9,663 tons supplied in 1939—the record figure for the pre-war period. For rubber, the annual production in the past ten years had never exceeded 1,300 tons, so that current production is something like five times as great, and for palm oil, current production is about one-fifth in excess of the pre-war record reached in 1937. These remarkable increases deserve particular praise, as the German occupation of Belgium has completely disorganised the normal trade position of the colony and has, in particular, deprived Congo producers of their main source of equipment and skilled labour. As regards white labour, the Congo Administration has taken a number of steps in recent months to prevent any adverse effects on current production. In important cases, technicians have been transferred to other places of employment, especially in the mineral industries. The position regarding supplies of equipment is far more difficult. Here the Belgian colony looks to Great Britain and the United States for more help. Since all supplies of strategic materials produced in the Belgian Congo go into the United Nations' pool, and since the Congo has proved by its current pro-

Puts vital information at your fingertips

Shannoblic folders never slip under or ride up because they hang on a metal frame. The hangers carry the weight. They are easily removed and replaced. Large, angled, celluloid tabs, adjustable to one of five positions, allow flexibility of indexing and give immediate identification of folders. Shannoblic Suspension Filing will fit YOUR filing cabinets and desk drawers. Let us send you details.

Or the Shannoblic Desk Top Unit, a rigid all-metal frame with 20 Shannoblic Suspension Folders, is ideal for use on war-time emergency desk tables or as an extra desk top filing drawer. Price complete, 37/7 quarto, 42/7 foolscap, including Purchase Tax. Post free in Great Britain only.

To comply with Paper Control Order 48, please send 1d. postage stamp for leaflet.

duction that it is both anxious and able to utilise its available resources to the full, it is to be hoped that the required equipment will be forthcoming.

Although the contribution of the Belgian Congo to the Allied war effort is mainly one of supplies, it is not confined to this. M. De Vleeschauwer mentioned that, despite the

shortage of manpower, a Belgian Congo army took a successful part in the Abyssinian campaign. This army is now under the command of the British Forces in West Africa. Since the latest changes in French West Africa, it has been freed for other operations and expects to be used in more active campaigns on the African continent.

Russia at War

The Urals in 1942

LAST year was one of enormous expansion in the industries of the Urals. Towards the end of the year, the Soviet press published a number of reports which gave some glimpse of the scope of the work performed. It would appear that the bulk of the heavy armament industries has been concentrated in this area. In 1942, the output of the Urals' machine tool and metal manufacturing industries accounted for not less than 70 per cent of the total industrial output of the Urals. The corresponding figure for 1941 was only slightly over 40 per cent. A year ago, the Urals were primarily a metal extraction area; now engineering and metal working have become the foremost industries—they account for more than two-thirds of the whole output.

This change in the composition of the Urals' metal industries has undoubtedly been a remarkable achievement. Under normal conditions, no such change could possibly have been effected within one year. But the increase of metal manufacturing and engineering from 40 to 70 per cent is explained by the fact that the Urals have absorbed by far the largest proportion of the evacuated engineering plants. In the light of recent reports, it seems that a considerably smaller proportion has gone beyond the Urals, to Siberia. The reports have mentioned among the plants transferred to the Urals the iron and steel works of Mariupol and Kerch, and the machine building factories of Kharkov and Rostov, besides other plants, such as the giant Kirov plant of Leningrad and factories from Kiev, Moscow and Dnepropetrovsk, the location of which was known previously. Given this massive scale of evacuation to the Urals, the increase from 40 to 70 per cent is not very surprising.

Iron and Steel

The expansion of the old-established iron and steel works also made headway in the past year. The director of the famous Magnitogorsk Iron and Steel Plant states:

Last year our giant was growing at a rate of which we never even dreamt in peace time. There is not a single workshop in this plant which has not been reinforced in the course of the past year with new installations of first-rate capacity and technical perfection. . . . As a result of a speedy construction and launching of new equipment, output in the second half of 1942 increased by 24 per cent, and output of rolled metal by 34 per cent. This increase alone constitutes a doubling of output of all Urals plants before the revolution.

The percentage figures are very impressive, though they are much below the optimistic monthly records of "socialist emulation." They are, however, too vague to allow any safe estimate of current production. The following table gives the figures for the Urals' output of iron and steel before the revolution and after the completion of the Second Five Year Plan.

THE URALS' PRODUCTION
In millions of tons (round figures)

	1913	1938
Iron ore	1.8	7.7
Pig iron	0.9	2.6
Steel	0.9	3.5

A calculation of current production based on this table and on the percentage of increase mentioned above would put current output at about 7 million tons of pig iron and steel and at 14 to 15 million tons of iron ore. But a calculation of this kind is, of course, open to several objections.

The production of arms and ammunition in the Urals is claimed to have been doubled or even trebled in 1942. The important Sverdlovsk centre in the Northern Urals is credited with having doubled output in the first six months, and with having repeated the achievement in the second half of the year. The question arises, how the gap between so high an increase in the production of arms and the

much lower increase in the output of iron was filled. At the New Year, the armament workers of the Urals pledged themselves to double the production of weapons and munitions again in the course of this year. (The press published this pledge in the form of a letter from the Urals workers to Stalin, signed by nearly one and a-half million persons.) Almost simultaneously, urgent appeals to intensify the collection of scrap iron appeared in the press, appeals which had been absent since last spring.

The output of non-ferrous metals has also been greatly increased. The Urals are rich in nickel and chrome, mined in the Orsk region, and in manganese and bauxite worked at Magnitogorsk; copper is abundant in the Degtyarki region. Even so, there have been great technological difficulties to overcome.

Contrary to pre-war ideas, it has proved quite possible and sound to smelt ferro-manganese from poor manganese ores in large blast furnaces fully using valuable gases. Our workers have fully mastered the method of smelting high-quality steel in large open-hearth furnaces for the production of the most perfect types of arms. Operating the same machines as before, we now roll over 25 brands of metal needed for defence purposes.

The Pace of Building

The construction of new industrial buildings has expanded by over 300 per cent during the past year. The shortage of building materials has been acute, as most of the Russian cement works were concentrated in the territories captured by the Germans. It is only natural that most of the new constructions should have been built in a make-shift manner to meet the most pressing requirements of the moment. The press has published many instances of an almost fantastic tempo in building. The speed in the mobilisation of building materials and of labour for urgent constructions has been facilitated by the very high degree of concentration in the building industry. The People's Commissariat for Building has allocated all building work to a few trusts, each of them responsible for a large industrial area. Two such trusts are known to operate in the Urals. One of them, the *Yoush-Ural-Tyazh-Stroi*, is responsible for all the heavy constructions in the Southern Urals. This trust is apparently "attached" to the non-ferrous and steel industries of the Orsk region. Another trust, the *Tepl-Stroi*, has been responsible for building in the central and probably also in the northern Urals. It was this trust which built the new giant Magnitogorsk furnace within five months (see *The Economist*, December 19, 1942, page 770), as well as another large furnace at Chusovaya opened only a few days ago.

Living Conditions

The Urals have become a "melting pot" for the masses of workers evacuated from the western provinces. The authorities do their utmost to encourage them to settle down in the Urals for good. "Ural-mindedness" is being fostered among the many Muscovites, Leningraders and Ukrainians whom the fortunes of the war have brought to Chelyabinsk, Magnitogorsk or Sverdlovsk.

Meanwhile, lack of housing and some food shortages have rather severely affected the workers in the Urals. Some towns have increased their population ten and fifteen fold; new works were frequently started literally in the open air with no housing accommodation in the neighbourhood. Towards the end of 1942, the position was easing. Newly erected workers' settlements could already absorb many of the evacuees and newcomers; but, naturally enough, there is still overcrowding in most places; and it will take time before more tolerable housing accommodation can be provided. The food position has forced every large-scale enterprise to care for its own "food-base." Most factories have developed their own farms. A report from one of the largest and most modern tank factories in the Urals gives some idea about the scope of this farming. The factory's farm has 4,500 acres of sown area, 1,000 cows and 1,600 pigs.

THE BUSINESS WORLD

Tax Reform Proposals

WITH the date of the next Budget only some three months off, it is not surprising that the FBI should have submitted to the Chancellor of the Exchequer another memorandum suggesting reforms in taxation. Its claims are based on the contention that industry must, for a time at least, be financed by retaining profits within businesses:

As the nation may have to face after the war a long period of high taxation, industry may no longer be able to rely on outside sources for finance.

On this somewhat flimsy assumption, the FBI makes a number of suggestions some of which are in themselves quite laudable. They deplore the high rate of EPT and the inability of the Government to reduce it; and they propose that the Board of Referees should be empowered to grant standards up to 8 per cent—or 10 per cent in director-controlled companies—where concerns have to work on a substituted standard, based on a percentage of profit. The existing maxima are 6 and 8 per cent, respectively, and there seems no reason in equity why the rates should not be increased to the maxima mentioned, which are those for new concerns and newly introduced capital. In a small way, it would introduce a greatly needed element of elasticity into EPT.

The main suggestions of the memorandum, however, are concerned with income tax. They are, briefly, two: that allocations to reserve should be taxed at less than the full rate, and that tax relief should be granted in respect of all assets used up in production or in trading. (Particular reference is made to freehold property, leasehold premises, cost of patents, trade marks, designs and the residual value of assets not replaced.) An article in *The Economist* on January 2nd showed what the Inland Revenue does allow for depreciation. The conclusion was reached that the system has many shortcomings; and it is hoped in a later article to sketch the outlines of a positive plan for encouraging the replacement of the physical capital of industry much more rapidly than has hitherto been usual in this country. Whether concessions could properly be extended

to the full list of imponderables suggested by the FBI is another matter. There are grave disadvantages, for instance, in the present system of patents, as two recent articles in *The Economist* (on January 16th and 23rd) have pointed out; and the same considerations apply, in some measure, to such rights as trade marks and designs, at least insofar as these exist to perpetuate the demand for existing goods, to the exclusion of improvements, by the same makers or others. The general principle of using the machinery of differential taxation to direct, stimulate or, if need be, retard the flow of new investment is admittedly desirable. Indeed, it is perhaps one of the best means to these ends, and for some industries at some times this policy might well be taken far beyond anything suggested by the FBI. But it is a policy which could only be applied, without a very large measure of Government control, to industries where a sufficient degree of competition exists to ensure that the benefits of new equipment were passed on to the consumer. It is the benefit to the community which ought to be the criterion whether a concession is permissible or not.

Coupled with this proposal for an extension of depreciation allowances, the claim of the FBI that

the retained profits of the business taxpayer should be granted some relief from taxation subject to necessary safeguards, seems in part to ask for the same thing twice over. The "safeguards" appear to refer, only to the need to make sure that the full rate of tax is paid if the profits retained are subsequently distributed. What is intended, presumably, is that allocations to reserves, beyond those already relieved of all tax, should bear less than the full rate. Insofar as these further allocations are intended only to cover the additional cost of maintaining the physical capital, there may be a strong case for a differential rate of tax. Indeed, under the scheme adumbrated above, allowance would be made for any disability which a company would suffer from a rise in the price of the goods it required, provided always that the indications were that the volume of physical capital of that particular industry should be maintained.

31st December, 1942.

But to suggest that all money retained for investment in the business should be granted a lower rate of tax would not serve the best interests of the country, either in the immediate post-war period or in the longer run.

There is a large and influential body of opinion which holds that *all* projects for the extension and replacement of capital should be subjected to the various sifting processes which went on in the pre-war capital market—and whose efficacy would be greatly improved by the publication of really informative accounts. Whether it is desirable to go as far as this or not, it is clearly most dangerous to grant to existing concerns, irrespective of the secular trend in the industry in which they operate and the shorter term needs of the post-war situation, a definite encouragement to expand. On the basis of the FBI's assumption, quoted above, it would mean that only existing concerns would have any disposable capital, clearly a most undesirable state of affairs. This is especially so in existing circumstances when such a measure would give to concerns who happen to be able to make a contribution

to the war effort an advantage over those who cannot—again irrespective of post-war needs and of their relative efficiency.

It is certain that the physical capital of the country must be run down by total war. It is virtually certain that, under a regime of 100 per cent EPT, even with a contingent refund of 20 per cent, less tax, cash resources will be far below the level required to effect replacement and adaptation, at the higher level of prices likely to prevail. It is, however, even more certain that for some considerable time it will be not cash, but priorities which must count. And the priorities must be allocated according to the dictates of the reconstruction programme. It seems that, as it is, there will be gross inequities arising from the differing degrees of liquidity between individual firms and, possibly, whole industries. But these might easily be adjusted in a sense quite opposite to the real requirements of the community—at least in the post-war reconstruction period—by a system of indiscriminate relief in taxation on allocations to reserve such as the FBI suggests.

Finance and Banking

Wider Credit Base

Although most of the clearing banks have been making up this week for their January returns and have, in consequence, been calling funds from the market, there has at all times been an adequate supply of credit. The position was eased by the fact that no TDR payments were expected from the banks this week, this being the first break in such payments since the first week of October, 1942. The current nominal maturities amounted to £15 millions. Treasury bill maturities should also have helped, being £10 millions in excess of new payments. A large part of the recent maturities of Treasury bills have, however, been in official hands, having been acquired by the special buyer before the turn of the year and, again, in the mid-January spasm of stringency. The maturity of these bills is in part reflected in the fall of £7,190,000 in Government securities revealed by the latest Bank return. The effect of this movement on the volume of bank cash has been more than made good by a combination of other influences. The most important is the continued clearing of vested India stock warrants, which is reflected in a further reduction of £6,744,000 in other accounts. In addition, the draining of public deposits has gone to new record lengths this week, the total of this item falling by £4,762,000 to the exceptionally low figure of £4,745,000. Further help has come from an end-month increase in other securities, while the return of £1,320,000 of notes from circulation has also contributed to the building up of bankers' balances to £175,857,000.

Bank Credit in 1942

The expansion of bank credit in 1942 showed a considerable diminution on the pace maintained in the previous year. The deposits of the eleven clearing banks rose by £299,466,000 last year, compared with £529,186,000 in 1941. This comparison must not be taken as evidence of a slackening of deficit financing and of other forces making for an inflation of credit. The main explanation of this seemingly favourable development is provided by the absorption into tax reserve certificates of funds which, in large part, would otherwise have remained on deposit at the banks in anticipation of tax payments. As the amount of tax reserve certificates outstanding increased by £453 millions over the year, it will be seen that the forces making for credit expansion lost little, if any, of their strength over that period. The expansion in deposits over 1942 is overstated in the composite balance sheets to the extent of £24,011,000, this being the amount by which cheques in course of collection and transit items at the end of 1942 exceeded the comparable figure at the end of 1941. The growth in bank credit last year derives from the banks' increased holdings of Treasury deposit receipts, investments and Treasury bills—in that order. TDRs are £137,500,000 higher at £895,500,000, while investments have risen by £121,591,000 and bills discounted by £26,437,000. The higher bill portfolio is a reflection of the increase in the issue of Treasury bills via the weekly tender which began last October and which, by the end of the year, had raised the "tender" issue by some £70 millions compared with the end of 1941. On this evidence, the banks do not appear

to have obtained more than a small proportion of the additional Treasury bills which were put into circulation for their special benefit. It must not, however, be forgotten that the banks' holding of commercial paper declined appreciably during the year, those banks which differentiate in their balance sheets between Treasury and other bills showing a reduction of about 50 per cent in the holding of the latter. It follows that the banks' Treasury bill holding rose by rather more than the indicated increase in the bill portfolio. Advances continue to fall, their total at the end of

(In £ millions)

the year being £33,924,000 lower than at the end of 1941. The factors responsible for this movement are those which have been at work ever since the early months of the war; in particular, the smoother operation of the system of progress payments to Government contractors by the various supply departments has made war industry less dependent than ever on bank credit. The cash position remains nicely adjusted to the figure required to underpin the required volume of deposits, and the cash ratio on December 31st last stood at 10.76 per cent, compared with 10.99 per cent a year previously.

Unifying American Sterling Accounts

Arrangements have been made to simplify the conditions governing sterling accounts held in this country for United States residents. Apart from special categories, to be noted later, these accounts have since July, 1940, consisted of three groups. In the first place, there are "registered" accounts. These are opened almost exclusively in the name of banks and represent sterling which is freely convertible into dollars at the official rate. Secondly, there are "sterling area accounts" opened in the name of individuals resident in the United States but having certain payments—usually of a regular periodic kind—to make in this country. Thirdly, there are the "old" or "free" accounts. These represent sterling of the pre-July, 1940, variety which is available for meeting obligations of at least that vintage and which can only be converted into dollars at the free sterling-dollar rate of exchange. As

from February 2nd next, these three categories of sterling accounts are to be merged, and all will rank as "registered" accounts. This is obviously a considerable gain to the holders of US sterling area and "old" accounts who hitherto have had no guarantee of convertibility of their sterling into dollars at the official rate. The free market rate for sterling in New York had recently been hovering around \$3.50, having fallen to that level in what had become an extremely narrow and at times almost nominal market. The disappearance of this market, and the "phony" rates which have at times been quoted in it, represent one of the advantages which this country should derive from the new arrangement. The new regulations leave unaffected the blocked sterling accounts maintained in the name of US residents and sterling accounts kept in the books of British traders for US holders. The blocked accounts represent the proceeds of liquidation of certain capital assets, and will continue to be available for re-investment in certain types of sterling securities. The sterling held here for American film companies will also be unaffected by the new arrangements.

Currency in Tripolitania

The monetary arrangements that have been introduced in Tripolitania following the British occupation of the capital were prepared well in advance. Not only was the eventuality for which they were elaborated long and confidently expected, but the precedents for all the technical details had already been worked out with the occupation of the Italian East African territories. The monetary circulation in Italian North Africa consists of Banco d'Italia lira notes and of small token coins. This lira currency will continue in circulation, though it is to be expected that there will be some stamping of the notes in order to differentiate them from those circulating in Italy itself. It should be noted that the Banco d'Italia note circulation has covered metropolitan and colonial Italy without any discrimination between the issues serving these various territories. The local currency in Tripolitania will be supplemented by British Military Authority notes which will serve the requirements of the occupying forces. These notes are similar to those taken by British troops into French North Africa. They are

sterling notes, and the rate of exchange fixed for them is 480 lire to the £. This is the parity fixed in other Italian colonial territories already occupied by the British. This rate of exchange compares with a figure of 68 lire to the £ quoted when Italy entered the war. The official rate had for many years given a highly flattering value to the lira, and in the black market in Italy the rates quoted for sterling and dollar in the immediate pre-war years had approached fairly near the conversion figure which has now been fixed in Italian colonial territories. The existing branches of Italian banks in Tripolitania will continue to serve their considerably diminished Italian clientèle, but it is evident that additional banking facilities will have to be provided to serve the needs of the occupying troops and authorities. Hitherto, Barclays Bank (DC and O) has followed closely on the heels of the armies which have overrun the Italian African Empire. It seems a fair guess to assume that it will be operating in Tripoli before long.

Anglo-International Bank Capital

It has been announced this week that shareholders in the Anglo-International Bank are to receive a capital repayment of 5s. for every share of £1 held. The nominal value of the shares will thus be reduced to 15s. each. There are 1,960,008 shares in issue, and the repayment will involve a sum of £490,002. The repayment was foreshadowed by the chairman of the bank in 1941, and represents a considerable step in the liquidation of this institution. The latest balance-sheet shows a holding of cash and British Government securities amounting to £669,033. As against this, there are liabilities of £142,411. These are for the most part owing to European customers which cannot be dealt with while the war continues and present regulations exist. It is, however, necessary to provide for their discharge in due course, and this explains why the proposed return of capital falls well short of the available resources. When the capital repayment is completed, and allowance is made for discharging liabilities to customers, there will remain some £50,000 in liquid assets. In addition, there are frozen assets of unknown value which are included in the balance-sheet at £739,105. Most of these represent claims on customers in Germany, and countries occupied by Germany, and are relics of the Standstill agreements.

Investment

Break-up Values

Although some of the indices of stock exchange values continue to show almost daily rises, there can be little question but that the last few days have seen a falling off in both activity and firmness over a considerable field. There are a number of exceptions. Home railway equities are enjoying a renewed upswing, while a number of international shares, mostly of companies domiciled in Canada, have shown further sharp advances, increasing the discrepancy between quotations in London and New York. These rises are mostly of a speculative character, in that they evidently discount a return to more normal powers over the distribution of gross earnings after the war. It is not possible, however, to say that they are unreasonable on that account. Another group of rises, of which the recent appreciation in some shipping shares is typical, is based on the re-emergence of the break-up value argument. This phenomenon was seen at its height in Continental Europe during the period of acute inflation. It was then fashionable to argue that, since the replacement value of assets was rising in a fantastic manner, equity shares should keep in step. There is a sound argument—in the absence of highly differential taxation—for supposing that equity shares will constitute a fairly efficient hedge against inflation, but it rests on the rising prices, not of the assets of the company, but of the goods which it will produce. Only if continued production can be assumed is the rise in equity shares justified. On any large scale, break-up values can never be realised. In a general way, it is earning power, and not asset value, which counts. Even if the assets are entirely in cash and Government securities, this contention remains, broadly speaking, true, for it will seldom be the intention of the directorate to distribute the assets. In the particular problem of the moment, it may be of great value to have command over a large volume of liquid resources when the war ends. It would, however, be even more valuable, one would sup-

pose, to have the certainty of receiving priority of allocation for the purposes one has in mind. Nor is the fact that the current cash value of liquid assets exceeds the market valuation of the share to which they are applicable, a certain assurance that share values should rise. Even if it is possible for the enterprise in question to enter an industry where the secular trend is upward, there is no guarantee that the knowledge and skill which have brought success in one industry can be employed with equal benefit in another, while there is great danger that those in charge will feel that they can achieve this difficult task.

Monopoly by Patent

The arrival in this country of a synopsis of the judgment in a recent case in an American Federal District Court makes possible a useful footnote to the articles on patents appearing in *The Economist* on January 16th and 23rd. This was a case brought by the Attorney-General against nine of the leading glass container manufacturers under the Sherman and Clayton Anti-Trust Laws. In his decision, Judge Frank L. Klobb stated that the principal defendant, with the co-operation of one or another of the associated concerns, had pursued a plan whereby,

through threats of litigation backed by the financial power it controlled, by litigation beyond the dreams of the average man, through the acquisition of patents and businesses of competing devices and firms at a great outlay of money, it has corralled within its possession and control an aggregation of all the patents that pertain to the gob feed process in the manufacture of glass—one of the two automatic processes whereby glass containers may be made.

He went on to say that this aggregation had been strengthened by acquiring patents for other devices; that patents were discarded or shelved, having been obtained solely with the object of eliminating competition, and that

the association was an unholy alliance designed by the parties to attain selfish objectives at the ultimate expense of the public. The result, he said, is that no one can engage in the manufacture of glass container ware without applying to the association, which has consistently refused licences to new enterprises. The net result is a complete domination of the industry, so that prices to the consumer may be raised beyond all reason. The judge gave instructions, which if carried out would break up the ring, but the case will be taken to the Supreme Court, whose decision will be awaited with interest. This is the effect of the patent law in the American background. It is possible to point to a number of differences in law between America and this country, and, if one only read the laws, it would be possible to suppose that such things could not happen here. This is a delusion. Against a background of laws and policies which makes it possible for industrial groups to combine to extract a higher profit per unit from the consumer, the patent laws afford no protection, especially where there is no power vested in Government to bar practices which lead to monopoly. There is every reason to suppose that development in this country has been, and continues to be, parallel to that in the USA. But the British public is seldom treated to a case of this magnitude, because of the tacit agreement among manufacturers. When some unfortunate, who sees his business threatened with eclipse, wishes to protest, he is seldom able to face the huge expenditure and delay which such an action involves. Direct anti-trust legislation is not the most hopeful method of attack. It is necessary to abolish all privilege, or at least to reduce it to dimensions when it serves the organisation of plenty.

Protecting the Shareholder

More than once in recent months, when commenting on company reconstruction schemes, *The Economist* has suggested the need for some permanent machinery for advising the investor. While admitting the efforts of private individuals to assist the shareholder, no one who has studied these efforts can deny that the advice is not always good, however well-intentioned; that a great deal of time and energy is wasted through a lack of appreciation of the technical problems involved, and that the committees appointed commonly do not carry great weight, with either shareholders or company directorates. It is evident that, without some extensive organisation, people of the requisite standing and experience will not take up the cudgels on behalf of the unfortunate. The need for some such protection will, however, grow, if the ownership of industry is to remain in private hands, and it seems reasonable that the institutions principally concerned should get together to provide it. The Stock Exchanges, as providing the market, the Institutes of Company Secretaries and of Chartered Accountants, and the Association of Incorporated Accountants, are all interested to the extent that the good repute of joint stock finance redounds to their own credit, while the Board of Trade has a general responsibility for seeing that the law is not defeated. If there should ever again be a closely knit and enduring group of issuing houses, such as the merchant banking concerns which were responsible for issues prior to 1914, that, too, could play its part—indeed, insofar as these houses are still interested, they may do so even now. It seems a feasible plan, given a sufficiency of public spirit, that each of these concerns should enlist a small panel of people of good standing who would be prepared to serve on a committee which would "vet" and pass an opinion on any reconstruction scheme which was drawn up. The committee selected to deal with any particular scheme would be able to draw on the knowledge and experience of the institutions in question, and might secure the assistance of the investment trust and insurance associations. If, despite this, they found that the information did not exist on which to base a conclusion, the shareholder would be well advised to reject the scheme, leaving the company the alternatives of ac-

cepting the status quo or supplying the information. The finance could be provided by a levy on the funds of the company—this would only need a short bill—and the necessary secretarial services could be provided, at a reasonable fee, by the Stock Exchange, London, which would in most cases have reasonably complete records. Coupled with technical reforms which it is within the power of the Stock Exchange to make effective over a period, and with a more enlightened criticism in the Press, this should quickly establish a body of practice which would render the labour of most advisory committees very light.

Whitehall Electric Scheme

Whitehall Electric Investments, a subsidiary of Whitehall Securities Corporation, has large interests in electric power companies situated in this country, in Spain and in Greece as well as indirect interests in the Far East. Its capital consists of £2,500,000 7½ per cent cumulative preference shares, on which the dividend is six months in arrears, and twice as much ordinary capital held by Whitehall Securities, on which the last dividend was 3 per cent for 1932-33. Whitehall Electric recently sold a Spanish interest, and, being unable to find suitable means of re-investing the money, proposes the following scheme. Holders of preference capital are to be repaid half in cash. There is no redemption clause, and, despite the poor shape in which the company finds itself, holders are entitled to some compensation for abandoning a right to 7½ per cent for the life of the company. Far from offering any such inducement, the directors, who in practice hold the equity, suggest a cut to 6 per cent in the interest on the remaining moiety of the capital, offering in exchange 1s. in cash and 8s. in ordinary shares for every £1 of preference capital held after the repayment. That is to say, they get rid of a liability of some £75,000 net per annum in exchange for a transfer of 10 per cent of the equity. The earnings on the whole of this equity over the past decade have been of the order of £500,000. It is disturbing to find that, in the special circumstances, the associations of the investment trusts and insurance companies have decided to accept the scheme. It should certainly not be accepted by the private investor. Granted that, in the changed circumstances, there may not, for some years, be enough earnings to cover the full preference dividend on the existing capital, there is no doubt that they will cover half of it. The equity holders will be well out of their bad bargain if they are allowed to repay half the preference at the cost of giving up a slice of the equity and continuing to pay the full dividend on the remaining preference.

Foreign Investment and the Future

By the end of 1941, the war had already assumed world proportions. There was in 1942, as the Report of the Council of Foreign Bondholders points out, only one further default, that of Siam, and for this the occupation of the country by Japan was, of course, solely responsible. The resumption of a modified service on the external debt of Paraguay and the agreement, in principle, of terms for the resumption of its debt service by Colombia, are functions mainly of an increase in the foreign exchange resources of these two countries. The Council points out that, while the revenue position of certain Latin American Governments has been prejudiced by the reduction in imports, the increased purchases made by the United States and Great Britain have greatly enlarged the exchange resources available for honouring external debt obligations. Outside Latin America and Siam, there has been no change in the foreign debt position in 1942. Looking to the future, the Council raises the issue of post-war debt service and its influence on the balance of payments. It seems perhaps a little unduly defeatist to assume that British export markets, in South America and elsewhere, must be sensibly diminished as a result of the war. But it is true that, if the volume of exports does fail to recover even to the pre-war level, the relative importance of capital investment as an element in this country's invisible exports will increase. It is too early yet to estimate the potential capacity of the belligerent and occupied countries for meeting service on their external debt, and it is highly probable that readjustment of the burden will have to be undertaken in each individual case. The most important consideration is that reconstruction loans, when they are made, should be based on patently productive enterprise and issued at rates realistically adjusted to capacity to pay.

Company Notes

Tobacco Earnings

The latest results of two large tobacco companies, Imperial Tobacco and the United Tobacco Companies (South) provide an interesting contrast. The former, which operates inside Great Britain, has, according to its preliminary statement, maintained its usual 15 per cent, tax free, ordinary dividend, and repeated the tax free 2½ per cent bonus, which last year was reduced from 5 per cent. After repeating the allocation of £500,000 to general reserve, the disclosed figure for the carry forward is some £35,000 higher at approximately £1,701,000. In the absence of any other allocations, earnings for the equity total some £7,108,000, equivalent to 18.9 per cent, tax free, the same cover as was earned a year ago. It can be estimated that the net trading profit is only some £11,000 less than the £7,978,479 disclosed in the previous year. It is highly regrettable that the company does not differentiate the sources of its income, or disclose its tax liability. The United Tobacco Company, which operates in South Africa, has failed to halt the decline in earnings which commenced in 1939, the latest fall from £1,067,225 to £851,398 contrasting with the minor reductions of the two previous years. The dividend is consequently cut from 36½ to 28½, both free of South African income-tax, covered by earnings of 36.1 and 29.4 per cent respectively. By omitting the £35,000 transfer to employees pension fund, the carry forward is £30,000 higher at £474,204. It is likely that the larger part of the fall is attributable to increased taxation, since the balance-sheet suggests an expansion of the company's activity. Stocks are some £180,000 higher at £2,439,006, and cash and debtors share equally a rise of some £56,000, the latter now totalling £688,607. A new item is the £250,000 of 3½ per cent Notes, which have probably financed the increased stocks. Possibly similar expansion accounts for the fact that net loans from subsidiaries are some £180,000 lower at £502,766. Creditors, including taxation, are almost £365,000 higher at £1,202,963, the latter factor, doubtless, accounting for the larger part of the rise. It is possible that the South African company is merely repeating the experience of the British companies in the first years of war, and it is not improbable that current conditions in the Union will enable the company to stabilise earnings during the current year, unless taxation is increased. The 10s. ordinary shares of United Tobacco at 82s. 6d. ex dividend yield £3 8s. 8d. free of South African tax, while a price of 146s. 10½d. for Imps. ordinary to yield £2 8s. 4d., also tax free, reflects considerable confidence in both companies.

Further Woolworth Setback

For the second year in succession, the net profits of Woolworths, before tax, show a marked recession, although in the latest period, the drop of £704,937 is less than half that of a year ago. For the year to December 31, 1942, the preliminary statement shows net earnings of £5,699,822 against £6,404,759. There is a saving in tax liability of only £261,370, reducing the charge to £3,295,836, so that the greater part of the setback is passed on to equity earnings, which amount to £2,143,986 against £2,587,554, representing 57.1 against 69 per cent. The allocation to staff funds is unchanged at £110,000. Thus, the total payment on ordinary stock could have been maintained at the previous year's total of 55 per cent., including a 5 per cent bonus, at the cost of some reduction in the transfer to reserve. The management has, however, prudently decided to maintain the allocation of £250,000 to freehold and leasehold reserve. Consequently, the bonus, reduced from 15 to 5 per cent in 1941, is eliminated in the latest period, and stockholders receive an ordinary dividend of 50 per cent. The carry forward, as a result of this cut, is raised from £7,057,795 to £7,076,781. In a sense, the further decline in net profits is less remarkable than the deceleration in the rate of that fall. It still remains uncertain how much of the previous year's setback was due to the provision of EPT on the peak earnings of 1940. But in so far as the reversal of the upward trend was due simply to a deterioration in trading conditions, there can have been little improvement last year. There has almost certainly been a further fall in turnover and an increase in staffing difficulties. To some extent, these may have been compensated by expansion in the scope of the store's activity outside the 3d. and 6d. price range. Clearly, the concern has not, and will not, be able to maintain gross

profits in war conditions, but the decline so far appears to have been minimised. The 5s. ordinary stock, at 58s., yields £4 7s. 4d. per cent.

Bowater-Lloyd Results

The accounts of the Bowater-Lloyd group of paper mills for the year to September 30th last show a general, though modest, recession in profits, for which the further restrictions on the output of newsprint must be held responsible. The results of the parent, *Bowater's Paper Mills*, also a manufacturing concern, are typical. Disclosed profits declined from £196,870 to £192,758. Tax required £50,000, as in the previous year, and other charges remained approximately constant. War damage, which absorbed £11,193 against £24,077, was, as in the case of all related companies except *Bowaters and Lloyds Sales Company*, again charged to contingencies reserve. Thus, earnings for dividends are slightly lower at £63,517. Following the policy of conserving resources, no payment is made on cumulative preference arrears. In the latest year, the surplus is added to the carry forward, raising it to £108,486 instead of being transferred to dividend reserve. This experience and policy is closely followed by the other two United Kingdom operating companies, *Bowater's Mersey Paper Mills* and *Edward Lloyd, Limited*, which announce total profits of £113,861 against £115,299 and of £303,864 against £310,842, respectively. In neither case is there any dividend payment. *Edward Lloyd Investment*, the holding concern controlling *Edward Lloyd, Limited*, received no revenue and incurred no expenses, being now relieved of all administrative costs, so that the undistributed balance remains unchanged at £101,746. Dividends are again paid on equity shares by *Bowaters and Lloyds Sales*, the distributing company. With a decline in income from £92,451 to £90,347, there is, however, no bonus on ordinary capital, which receives 20 against 22½ per cent, narrowly covered by current earnings. The Newfoundland operating company, *Bowater's Newfoundland Pulp and Paper Mills*, the whole of whose preference capital has now been acquired by the group, is expected to have earned lower profits in the year to December 31, 1942, owing to the pegging of the price for newsprint in the USA and the rise of material and labour costs in Newfoundland. In 1941 total receipts rose from \$2,983,000 to \$3,032,000.

Distribution Policy

The latest profit and loss accounts of the Bowater-Lloyd group make it plain that, despite the further setback to gross receipts, the directors have been successful in husbanding liquid resources. In every case liquid assets have increased, despite war damage payments and debenture redemption. It is in line with this policy that the management should announce that the relative merits of schemes for funding arrears of preference capital are being considered. The arrears to latest dividend dates amount to £442,000 gross for *Bowater's Paper Mills*, to £96,250 for *Bowater's Mersey Paper Mills* and to £486,500 for *Edward Lloyd, Limited*. The balance sheet position of all the companies appears to be satisfactory. *Bowater's Paper Mills* show a rise in net liquid assets from £305,988 to £330,033. Total reserves, including dividend reserve, stand at £1,226,470, while net loans to subsidiaries stand at £191,252 against £138,753. Clearly, the group will have to take steps to deal with the accumulating total of preference arrears before it can prove an attractive investment to the market. The pre-war results of the group were far from satisfactory, but the preference holders ought not to be asked to accept a scheme based on wartime depression. There is, thus, some reason to believe that a funding arrangement is premature. The directors themselves point out that the Government regulations of December 27, 1942, tighten still further the restrictions on the manufacture of newsprint, although they hope to make good by a wider profit margin. The acquisition of the preference capital of the Newfoundland associate, bringing control of substantially greater supplies of raw material is welcome, but not immediately relevant. Sales in the United States may be stimulated, but the position of the British manufacturing companies cannot be greatly affected. It is, of course, encouraging that the "B" debenture stock of the Newfoundland company has been converted from 5½ to 3½ per cent. The position of the group, whose wartime course has been steered with considerable skill, remains uncertain, especially as paper pulp may not have a high priority among post-war exports. Further, it is doubtful whether the trough of current production has yet been touched.

ROBSON, MORROW & UNDERWOOD are seeking two outstanding men, a Chartered Accountant and an Engineer with a University degree; both with wide commercial experience, who could be trained as INDUSTRIAL CONSULTANTS for work of National Importance; four figure salary and exceptional post-war prospects. Full particulars to ROBSON, MORROW & UNDERWOOD, INDUSTRIAL CONSULTANTS, Victoria Station House, Victoria Street, London, S.W.1.

Shipping and the War

The impact of war on shipping concerns is strikingly revealed by the report of the Alexander Shipping Company for the year ended March 31st last. Net profit, including income from investments, is practically halved at £31,806, against £60,161 earned last year. The allocations to maintenance and investment reserves, which a year ago required £15,000 in all, are not repeated on the ground that the existing reserves are adequate. Consequently, after meeting the preference dividend, £23,706, equal to 8.3 per cent on the ordinary capital, is available to cover a payment reduced to 7½ per cent against the 12½ per cent paid, and slightly underearned, in 1940-41. The shareholders are over-compensated for the reduced dividend by the distribution of a cash bonus of 5 per cent, not subject to tax, requiring some £15,000 out of realised capital profits. In his statement, the chairman, Mr C. E. Alexander, complains that the Government hire terms for tramp steamers are inadequate for the provision of depreciation and full interest payments. He hopes, however, that representations now being made by the Chamber of Shipping to the Ministry concerned will not be without effect. The balance sheet serves only to complete the dismal picture. The book value of the fleet has been reduced by a third to £199,470, while there is a jump in the holding of Government securities of £260,000 to £324,954, reflecting insurance payments. The latter, contends the chairman, are insufficient to provide replacements for lost ships owing to the rise in building costs. Further, in the absence of adequate financial incentive, the board has kept to the decision, taken last year, to defer replacements indefinitely. The reduced business of the smaller fleet is revealed by a fall in debtors and voyage accounts of some £150,000 to £122,385, while a smaller, yet proportionate, reduction has been effected in sundry creditors to £96,508. Cash has risen some £179,000 to £516,848 and there is corresponding improvement in

the liquid position of the company, surplus assets totalling some £854,000 against £486,148. As sinkings continue, and since ships are not to be replaced, revenue and dividends must inevitably decline. It is to be hoped that after the war the company will be able to rebuild and so regain its River Plate trade. In view of the admitted inadequacy of compensation payments for this purpose, the distribution of capital profits is to be deprecated. The 10s. ordinary shares at 23s. 6d. nominal yield £3 4s. per cent on the dividend from earnings only.

Dalgety Profits

In view of the spread of the war to the Pacific during the greater part of the year, the profits of Dalgety in the twelve months ending June 30th last, as disclosed by the preliminary statement, do not appear to be unsatisfactory. There is a decline in net earnings from £157,915 to £138,895, so that, with a transfer of £15,000 to staff funds as in the previous year, equity earnings are reduced from £117,915 to £98,895, representing 6.8 against 7.9 per cent. The ordinary dividend, less tax at 6s., is reduced from 7 to 6 per cent and the surplus of £8,895 is added to the carry forward, bringing it to £143,654. In the absence of the full accounts, it is difficult to say how far the setback is due to higher costs and labour shortage, to bad crop conditions, or simply to the impact of the war. The net figures are lower than in either of the two previous years, but still above earnings for 1938-39, when only 5 per cent was paid on ordinary capital. Although estimates of the 1941-42 wheat crop and of the clip were generally good, the latter was expected to be below the 1940-41 level. It is probable, however, that the disturbance to transport occasioned by the Japanese entry into the war has been the most important influence. The £20 ordinary shares (£5 paid) at 107s. 6d. ex dividend yield £5 11s. 8d. per cent, less tax at 6s.

Industry and Trade

Water Power in Scotland

The Hydro-electric Development (Scotland) Bill has now been presented to the House of Commons. It embodies the main recommendations contained in the Report of the Cooper Committee (described in *The Economist* of December 26th). A North of Scotland Hydro-electric Board is to be established, with five members; four of these, including the chairman and vice-chairman, are to be appointed by the Secretary of State for Scotland and the Minister of Fuel and Power, acting jointly, and the fifth is to be a member of, and appointed by, the Central Electricity Board. Loans raised by the Board up to the amount of £30 million will be guaranteed by the Treasury. The Board is empowered to generate electricity from water power in its area, to distribute electricity in the district, outside the areas of supply of existing authorised undertakings, and to sell electricity to existing undertakers, large power users, and the Central Electricity Board. It is postulated that in the preparation and construction of works, regard should be had to the natural beauty of the Highlands and the avoidance of injury to fisheries; to this end, amenities and fisheries committees are to be appointed. The new Board is to collaborate fully with the Central Electricity Board, by means of a joint technical committee, and it is also to collaborate in carrying out measures for economic development and social improvement in its area. Considerable controversy has arisen about the proposed legislation—notably in the *New Statesman*. It has been described as "Fascist" on the ground that it is "private enterprise masquerading as a public board," and that it is the same Glen Affric pill which Parliament refused to swallow, with a sugar coating of public control. Surely the crux of the matter lies in the choice by the Government of persons to serve both on the Board itself and on its amenities committee, who can be relied upon to safeguard the interests of the consumers and the preservation of the countryside. From an economic point of view the test will be whether electricity can be supplied more efficiently and more economically by this means than by others. The sting of the present Bill is, of course, in the tail. Its sponsors do not claim that hydro-electricity can by itself solve the problem of economic and social development in the Highlands. But provided the safeguards are applied—and Parliament must be vigilant in this respect—and viewed as part of a wider development programme, which must be centrally planned and carefully controlled, the proposal to generate electricity in the Highlands could be a step in the direction of revitalising an area which was tending to become not only depopulated, but derelict.

Supplies of Household Goods

In view of the necessarily drastic cut in the supply of household goods—pottery, glassware, kettles, cutlery, polishes, blankets, sheets, and so on—the problem of ensuring their equitable distribution has become one of urgency. It has been recognised in *The Economist* that a household goods ration, analogous to the clothes rationing scheme, which, in spite of its deficiencies, has operated successfully, undoubtedly has very attractive possibilities. Unfortunately, however, the administrative difficulties of such a scheme are likely to be greater than in clothes rationing, in spite of the fact—indeed, in part at least, because of it—that the value of the annual retail turnover is nearly twenty times as great in clothing as in essential household goods exclusive of furniture. Exclusive of carpets, furniture, and certain other items, the retail value of new supplies of essential household goods—insofar as it can be estimated from the latest census of production returns, adjusted for changes in output and prices—probably does not exceed £25 millions a year, equivalent to about 10s. per head. The new supplies of some of the articles are so small that it would be difficult to operate a points rationing scheme. Moreover, owing to the appreciable variation in the stocks of goods held by individual households, such a scheme would not necessarily ensure supplies to those who need them most urgently. To include household goods in the clothes rationing scheme would merely enable those with adequate stocks and the necessary money to buy more clothes. In short, there seems to be no facile solution to the problem at this stage. But these difficulties cannot excuse inaction. Some means must

be found to divert supplies to those who need them most; in particular, the claims of new, growing or under-equipped households and of the bombed must be met first. So far as the more durable articles are concerned, a priority system seems to offer the best solution. This method has already been adopted for furniture; it might conceivably be extended to a number of other articles, though its application is hardly practicable in the case of goods, such as polishes, or articles, like pottery and glassware, which have to be replaced more frequently. The aggregate value of the supplies of this residue, however, is comparatively small, and the labour and materials involved in slight variations in output is insignificant; moreover, the wartime designs of pottery and glassware, for example, probably act as a deterrent to anything but essential replacements. Nevertheless, even in this category, experiments to ensure distribution according to needs may yield results.

Road Haulage Scheme

Much of the work preparatory to the introduction of the new road haulage scheme announced by Lord Leathers, Minister of War Transport, last November has now been completed. Briefly, the plan, which was described in *The Economist* on November 7th, envisages the transfer of as much traffic as possible from road to rail; the concentration of the remaining road traffic on the fewest possible vehicles; and the maintenance of the reserve of laid-up vehicles in serviceable condition, available for immediate use in case of need. At first, the scheme is to be applied to long-distance traffic; but its extension to shorter distance traffic is envisaged. It is understood that between 70 and 80 road haulage firms have been provisionally chosen by the Ministry to become "controlled undertakings" under the scheme; remuneration will be on the basis of net profits during two selected accounting years between 1935-1938, with adjustments for subsequent changes in the capital employed. As soon as the necessary financial and other arrangements with the selected firms are completed, road haulage units will be set up at the main traffic centres, each based on one of the controlled undertakings. A unit will eventually consist of some 50 or more lorries and will be under a controller who will normally be appointed from the staff of the controlled undertaking. The hiring of vehicles not owned by "controlled undertakings" will follow the setting up of units. The terms and conditions of hire have been worked out. The regional transport commissioners will consider applications from hauliers, advise about the eligibility and suitability of vehicles, and arrange the grouping of the selected vehicles into road haulage units in collaboration with the divisional road haulage officers.

The Coal Bonus Scheme

The machinery regulating the payment of additional wages in the coal mining industry under the output bonus scheme is producing some curious paradoxes. For example, the average weekly national output in the four weeks ended December 26th last was the smallest since the scheme was inaugurated last September. It averaged only 3,880,100 tons, against a weekly average figure of 4,126,500 tons in the preceding four weeks and the standard national output under the scheme of 4,161,800 tons. Yet twelve districts, employing nearly half of the total number engaged, qualified for bonus payments, and the weekly amount of the additional wages to be distributed is the largest so far authorised. The explanation is to be found in the conditions governing the administration of the scheme, and particularly in the discretionary authority given to the Minister of Fuel and Power. The Minister, when deciding whether or not a district has qualified for additional payments, must have regard not only for the district's statutory returns of output, but also for what the miners might have produced if employment had not been interrupted or work impeded by recognised holidays or by "abnormal occurrences of a temporary nature." The most important of the provisions for "loading" actual output in this way is the following:

If and whenever in any district an occurrence takes place which is, in the opinion of the Minister of Fuel and Power,

abnormal in the course of the industry, outside the control of the workers, and calculated substantially to lower output for a limited time, he may at his discretion, and in so far as he may consider it just to do so from time to time, direct that the actual output of the district during the period or periods in which the effect of the occurrence is, in his opinion, operative shall be deemed for the purposes of this scheme to include such additional number of tons as he considers to have been lost during that period or those periods by reason of the occurrence.

The Minister is also given discretionary power to call for the intervention of a reviewing authority, consisting in each district of an independent person and three assessors to help him in the discharge of this task. It is almost exclusively through the exercise of this discretion that bonus payments in twelve districts will be payable during the period of four weeks ended February 6th next. Except in one or two of the smaller areas, actual outputs fell short of the standard figure; in the larger coalfields the shortages ranged up to 5 per cent and even 7 per cent; but outputs were raised into the qualifying sphere by the addition of the national outputs. The procedure is likely to be amended in one or two important directions. One source of trouble has been the absence of an agreed formula for the allocation of national outputs in respect of losses through abnormal occurrences outside the control of the workers, and a recommendation on a pit stoppage basis has been made to the Ministry by the Joint Consultative Committee of the industry in the following terms:

Where a pit stops winding coal before half the time of a shift has elapsed the output for the day should be "loaded" so as to bring it up to the output that would have been obtained if the pit had continued winding for the normal length of that shift; any other losses of output to be disregarded.

A request is also being made that the arrangement by which colliery owners are allowed to recover only two-thirds of the cost of the output bonus from the Coal Charges Order Fund should be modified so as to admit the recovery of the whole of the cost from the pool.

Miners' Welfare

The chairman of the Miners' Welfare Commission, Sir Frederick Sykes, recently announced that a long-term scheme is being worked out with the object of improving conditions in the mining industry generally and raising the status of the miners. The Commission, in the 21 years of its existence, has done valuable work. It has established canteens, pithead baths, clubrooms and provided facilities for miners' recreation and leisure; in architecture and design it has set a standard which industry generally might well emulate. It has also encouraged schemes for rehabilitation, accident prevention and education in both technical and general subjects. Some £21 millions, most of which has been raised from an output levy on every ton of saleable coal produced, has been spent on these purposes between 1921 and 1941. Its main work since the war has been in connection with the provision of colliery canteens; the bath building programme has temporarily been suspended. Sir Frederick gave some recent figures: By the end of 1941, 650 collieries had canteens, more than a third of which provided only packed lunches, but by the end of 1942 canteens were operating at 843 out of some 1,028 collieries employing more than 50 workers, and others are in course of preparation. This record is satisfactory, but there would seem to be room for development in the direction of improving feeding facilities in small collieries and in providing full meals. Many collieries, though nominally providing canteens, still serve only snacks or pies and tea. At the present time 207 canteens are serving full meals (as compared with 40 at the end of 1941) and a total of 483 is aimed at, which would cover 59 per cent of the industry. It is alleged that this would meet the requirements of the industry, and there is evidence that only a small proportion (some 30 per cent) take full meals where these are provided. But in view of the importance of supplying proper nourishment for men engaged on such heavy work as mining, it is to be hoped that those responsible and the miners, through their pit committees and canteen committees, will see that meals, adequate both in quantity and quality, are provided and that the men are encouraged to make full use of the service. It is all too common to hear of miners' families going without their rations because they have given them up to their menfolk. The provision of canteens is, however, only one of the measures that will not only raise production now but

contribute towards the future well-being of the industry. Increasing attention is, rightly, being paid to-day to miners' welfare, health and safety, and Sir Frederick Sykes hit the nail squarely on the head when he said:

The nation has no right to ask the miner to work harder and harder still, unless it takes steps to make sure that the conditions of his work are as good as possible.

Sunday Work in Factories

Mr Bevin has upheld the action of the Factory Inspector who prosecuted an East Anglian firm for employing women on a Sunday as well as on other days of the week. The firm were clothing manufacturers, working on Service contracts, and they had apparently already been warned about non-compliance with the law, and had employed women on two previous Sundays. It was stated in defence that a breakdown in machinery had necessitated the Sunday work in order to overcome a bottleneck in production, but the excuse was not considered valid, and the firm was fined a total sum of £9. Although few details in this particular case have been given, the Minister's attitude was probably justified. There may be occasions when overtime and Sunday work are necessary in the national interest, when there are particular rush jobs to be completed, or in periods of emergency such as after Dunkirk, but as a general rule it is desirable that hours should be limited, and the day of rest observed; otherwise there is a danger that overtime and Sunday work may become a method of overcoming difficulties caused by inefficient management. It has become a truism that overlong hours defeat their own object by reducing instead of increasing output, and the strain tells on the physique, especially of women who are new to industry. There is also a direct correlation between hours and absenteeism. The Chief Factory Inspector's report for 1941 gave some examples of how output has actually been increased and absenteeism reduced when hours were reduced. In one factory, for instance, where a full six-day week was worked, absenteeism became so acute that it was decided to introduce a rota system whereby the women worked for 5½ days instead of six; casual absenteeism was practically eliminated. In some firms the difficulties have been met by introducing supplementary or part-time workers for a particular day or half-day. Such methods should be tried out before hours are increased or Sunday work is introduced.

Cotton Wages

At a recent delegate conference of the Cardroom Operatives' Amalgamation, which includes ring-spinners, it was decided to abrogate the agreement with the employers which provides for wages to be linked with the Ministry of Labour's cost of living index. This agreement was signed towards the end of 1939, and since then the workpeople have obtained wage advances of 22½ per cent and 12½ per cent, making an increase of 35 per cent in wages since the beginning of the war. A few weeks ago the Master Spinners' Federation granted a further war bonus of 5s. a week for adults and 3s. a week for juveniles. Joint conferences are now taking place between the trades union officials and the employers about the revision of the present method of payment, and reconstruction proposals.

Soft Drink Standards

Wartime standards have been laid down for the manufacture of soft drinks and will be embodied in a Ministry of Food Order to operate from February 1st. The standards were worked out by the Soft Drinks Industry (Wartime) Association and the Minister of Food has approved them. The best use of available materials is made by the standards and shipping space is saved by the substitution of saccharin for sugar. Some 73 tons of saccharin will be used to save 40,000 tons of sugar in a year and the industry has been allocated only 10,000 tons of sugar. The standards apply to unconcentrated soft drinks such as lemonade, ginger beer and soda water, and to concentrated soft drinks—squashes, fruit juice cordials and flavoured cordials. The minimum quantities of citric acid and natural strength juice are fixed for each ten gallons of the finished beverage; and the sugar and saccharin contents are fixed quantities. This step completes the changes in the wartime structure of the soft drinks industry, the output of which has been concentrated under a scheme involving profit sharing and the abolition of brand names and labels.

COMPANY MEETINGS

WILLIAMS DEACON'S BANK, LIMITED

SATISFACTORY RESULTS—STRONG LIQUID POSITION

CRITICISMS OF BANKING SYSTEM ANSWERED

MR. J. P. DEWHURST'S REVIEW

In view of existing conditions and in place of the usual annual address, the following statement has been circulated by Mr J. P. Dewhurst, chairman of Williams Deacon's Bank, Limited, to the shareholders of the bank in advance of the annual general meeting held on the 28th instant.

From the balance-sheet and statements of affairs in your hands you will note that the main feature, so striking in the last two years, has been the increase in our current, deposit and other accounts, and this in spite of the fact that tax reserve certificates which, judged by the present figure outstanding, have fully proved their convenience for the payment of taxation in advance, have now been on tap for a full twelve months.

The figure of the bank's deposits now appears at £70,400,000, an increase of £8,000,000, or 13 per cent, in excess of last year, and reflects the growing pace in Government war-time expenditure.

EXTREME LIQUIDITY OF BANK'S RESOURCES

Turning to the other side of the sheet, and taking the first five items of the bank's most liquid form of assets, we find that our cash, balances with other banks, money at call, bills discounted, and Treasury deposit receipts, constitute a total of £38,048,000, which is equal to 54 per cent. of our deposits, while the increase of £4,000,000 in our Treasury deposit receipts, £3,000,000 in investments and half a million pounds in Treasury bills, practically balances the increase in our deposits, and is a measure of the additional assistance we have been able to afford to Government finance.

Advances show a decrease of £338,000, an experience I imagine common to most banks at this time.

The figure at which our bank premises stand in our books is also down by £35,000, as with little or no expenditure possible in that direction the account benefits by the full amount allocated out of the year's profits.

I feel that the balance-sheet figures I have outlined are a clear evidence of the extreme liquidity of the bank's resources, and this will stand us in good stead in the testing times that may well lie ahead of us.

PROFIT AND LOSS ACCOUNT

Turning now to the figures of profit and loss, our net profit, after making the usual provisions, appears at £189,057 3s. 11d., as compared with £189,169 19s., or an increase of £4,887. This profit, with the balance of £85,406 1s. 3d. brought forward from last year, gives us a total of £274,463 5s. 2d. now to be dealt with.

After transferring £30,000 to bank premises account, we are in a position to pay a dividend at the rate of 12½ per cent. on both our "A" and "B" shares, and carry forward to next year's account £127,275 15s. 2d., as against £85,406 1s. 3d. brought in.

These results, I submit, are eminently satisfactory, and give ample evidence of the continued progress of the bank's business during a further twelve months of war-time conditions.

CRITICISMS OF BANKING SYSTEM ANSWERED

During the past year the banking system of this country has been under fire from certain quarters, and their criticisms would appear to rest on the two main contentions that banking has become a monopoly and that the issue of credit should be transferred to the State.

These, and other points, have been so ably dealt with by others that, meantime, I need here only repeat that there is no

such thing as a banking monopoly in this country. For the last 25 years no amalgamation of banks has been allowed except with Government sanction, and while it is true that, in order to meet the exigencies of war-time conditions, the banks have aspired to a measure of common action in one or two directions, it is nevertheless the case that they remain independent and competitive.

BANKS AND NEW CREDIT

The second point that the issue of new credit should be transferred to the State is apparently based on the idea that the banks create credit out of nothing and that, therefore, this "costless credit" should become a State monopoly. This argument is based on the fact that the total of bank deposits has risen by over 1,000 million pounds since the beginning of the war, but this increase in deposits arises primarily from Government borrowings from the banks as the result of expenditure in connection with the war effort. The fact therefore emerges that it is the State itself that has created the credit and that the banks are merely concerned with its distribution. And while, owing to the different influences and conditions which have prevailed during the two periods, the figures cannot be regarded as comparable without certain qualifications it is nevertheless of interest to note that at the end of 1917 the deposits of the joint stock banks and private banks in England had risen by 69 per cent. over the 1913 figures, whereas during this war the increase of deposits shown by their present-day representatives—the clearing banks—over an almost similar period of war-time conditions is 57 per cent.

CONFIDENCE OF COMMUNITY IN PRESENT SYSTEM

So far as these particular points go, it would appear that the critics of our present banking system would require a more accurate basis for their arguments if they are to justify any radical changes in a system which has certainly achieved the distinction that over the years—in peace and in war—it has retained in fullest degree the unbounded confidence of the vast community which it serves.

RELEASE OF MANPOWER BY BANKS

During the past year a committee under the chairmanship of Lord Kennet was appointed to investigate the possibilities of a further release of man-power from bank staffs. Needless to say, all relevant information was freely placed at the disposal of the Committee by the clearing banks, who are now willingly doing all they can to fall into line with the recommendations contained in the report which has been issued by the Committee.

One of the results of this will be that by March of this year we shall have to face a reduction to 85 per cent. of our pre-war staff (male and female), which will mean that only 44 per cent. of the male members of the pre-war staff will then be retained.

Economies in staff have already been effected by the closing of branches and further moves in this direction will have to be considered by the board.

In other directions, too, the bank's services to the public may have to be cut down, though nowadays these are so many, and so varied, that they have probably become part of the necessities of life in the eyes of the public.

All I can say is that so far the staff (permanent and temporary alike) have, in spite of their Civil Defence duties, risen nobly to the occasion, and the work of the

bank has been carried on with the minimum of inconvenience to our customers.

Up to date 493 members of the staff and 26 messengers are serving with H.M. Forces and a further 44 of the staff are due to go shortly.

As regards casualties, I much regret to have to report 1 killed, 8 missing, of whom 3 must be presumed killed, and 3 prisoners of war. To their relations and friends we take this opportunity of offering our sincerest sympathy.

TRIBUTE TO THE STAFF

In conclusion, I should like on behalf of the board to convey to the general manager, Mr Thomson, the assistant general managers and the officers and staff of the bank, our best thanks for their services and to assure them of our keen appreciation of the way in which the work of the bank has been conducted under the prevailing conditions of the past year.

The report and accounts were unanimously adopted.

NATIONAL DISCOUNT COMPANY, LIMITED

DISTRIBUTION MAINTAINED

The annual general meeting of the National Discount Company Limited, was held at 35, Cornhill, E.C., on the 22nd instant.

The following is an extract from the statement by the chairman, Sir Sigismund F. Mendl, K.B.E., circulated with the report and accounts:—

There has been no change during the past year in the Government's cheap money policy and although the return from bills discounted has been extremely small there have been more opportunities for operations in the short-bond market of which we have taken advantage.

The volume of business has been considerable and your company has taken its part in helping the Government with its war finance. The total of the balance-sheet shows an increase of more than £12 million over the previous year's figures, and now amounts to nearly £70 million. This increase has for the greater part taken place in deposits, which now stand at over £62 million, showing that your company has shared in the expansion which has occurred in the banking structure.

The reserve fund has been increased by £100,000 and now stands at £1,400,000. Bills rediscounted have remained at the same figure of £4 million, which I think is a very gratifying result in view of the continued contraction of commercial paper. On the assets side of the balance-sheet, cash at bankers shows a small decrease. Investments are very slightly down at just under £15 million, their actual value being considerably greater than that shown in the balance-sheet.

PROFIT AND DIVIDEND

After making provision for rebate and taxation and providing for all contingencies, our gross profit stands at £245,805. The amount brought forward from last year was £237,101, making a total of £482,906. After deducting current expenses and transferring £100,000 to the reserve fund and £10,000 to the pension fund trustees, there is available for appropriation the sum of £319,532.

Interim dividends were paid in July amounting to £42,300, and it will be proposed at the forthcoming meeting to pay a dividend of 2s. 6d., less tax on the "A" shares, making 10 per cent. for the year, and 7s. 6d., less tax, on the "B" shares, making 26 per cent. for the year. An interim dividend of 5s. 6d. per share on the "B" shares was paid last July, and the 7s. 6d. now recommended as the final dividend makes the dividend 13s. per share. While this is in effect the same cash distribution as has been paid since 1935, your directors have now felt themselves justified in converting the 2s. per share bonus, which has been distributed yearly since 1929, into a substantive part of the final dividend for 1942.

The report was adopted.

TURNER AND NEWALL, LIMITED

NEW USES FOR ASBESTOS

DEMAND FOR PRODUCTS

SIR SAMUEL TURNER'S ADDRESS

The annual general meeting of Turner and Newall, Limited, was held on Friday, the 22nd instant, in Manchester, Sir Samuel Turner, the chairman of the company, presiding.

The secretary, Mr. John L. Collins, read the notice convening the meeting and the report of the auditors, Messrs. Deloitte, Plender, Griffiths and Co.

The chairman dealt with the accounts at some length as usual and then stated that he would give a survey of the trading aspects of the company's various activities, though such survey must be necessarily much abridged as a result of present conditions. Accordingly, Sir Samuel Turner first referred to the mining companies in South Africa and Canada and mentioned the fact that they are all operating on a maximum capacity basis; he also referred to the new method of milling raw asbestos which represents a substantial advance in technique.

MANUFACTURING COMPANIES IN U.K.

Dealing with the manufacturing companies situated in the United Kingdom, the Asbestos Textile Companies were first referred to, namely Turner Brothers Asbestos Company, Limited, J. W. Roberts, Limited and Ferodo, Limited, all of whom had been fully occupied during the year, their various products being of the same vital importance in time of war as under peace conditions. With regard to the Asbestos-cement portion of the company's business, Sir Samuel Turner said that Turner's Asbestos Cement Company, Limited, have again demonstrated their adaptability to war-time conditions and have contributed largely to the solution of many problems created by the short supply of certain types of building material, mentioning in particular the fact that this company is supplying extremely large numbers of curved asbestos-cement huts in which there is no structural steel whatever and scarcely 5 per cent. of the timber normally included in wooden framed buildings.

The Washington Chemical Company, Limited, and the Western Chemical Company (Paisley), Limited, had during the year been busily engaged upon production both of their standard range of magnesia chemical products and upon those specially developed to meet the exceptional demands of the present day, this having meant inter alia the intensification of research activity in many directions and with a considerable measure of success. Newalls Insulation Company, Limited, had also been fully occupied during the year on a wide range of insulation contract work, including many important Government contracts on land and on board ship.

MANUFACTURING COMPANIES ABROAD

After referring to the company's export trade and the fact that the increased demand for the company's various products for work of national importance at home had meant that rather less of the company's materials had been available for overseas markets, the chairman referred to the manufacturing companies situated abroad, namely Keasbey and Mattison Company, Ferodo and Asbestos Incorporated and Asbestos Cement, Limited, and the substantial progress made by them during the year, and then continued as follows:

PROGRESS OF GROUP'S PENSION SCHEME

The pension scheme of the group has now completed its sixth year and is making

very satisfactory progress. As regards the Robert Turner fund, your directors again recommend the contribution of £10,000 to Turner and Newall Welfare Trust, Limited, for account of the trustees of this fund, which is being built up to provide means for dealing with exceptional cases not covered by the pension scheme itself.

During the past year further expenditure has been incurred in connection with air-raid precautions, amounting to £45,535. This is mainly a continuation of the policy of providing additional shelters in close proximity to the actual places in which work is carried on, but it also includes other passive defence measures and fire-watching costs.

I am glad to be able to tell you that, during the year under review, no significant damage has been caused by enemy action to any of your company's factories.

THE DIVIDEND

The final dividend recommended by the board makes, with the interim already paid, a total distribution of 12½ per cent. for the year on the Ordinary Stock, a figure which is identical with that of the previous year. Under conditions in which costs tend always upwards and—as sales are largely for war purposes—selling prices do not by any means always respond, I feel sure that stockholders will agree that the dividend is a satisfactory one. Taxation naturally continues to absorb the lion's share of what would otherwise be available profit, but of this, under conditions of war, I am sure no one would wish to complain.

THE FUTURE

Under the conditions which at present prevail, it is clearly impossible for me to make any specific forecast as to the future, save in respect of the period which lies immediately ahead. I can only say at the moment that, during the now current year, it is anticipated that demand for your company's various products is likely to be fully maintained, with the exception of the building materials range. So far as these are concerned, the position is not clear, as it depends entirely on Government policy as to whether the building trade is to be allowed to retain the necessary labour to enable it to carry on its operations on a reasonable scale. Whatever such scale may ultimately prove to be, we expect to get our full share of available orders, and in the other sections of our operations, as already indicated, we expect to continue in the fullest possible activity.

POST-WAR PROSPECTS

With regard to the more distant period, I am confident that the post-war future remains as bright as ever, and given a return in due course to normal trading, accompanied by substantial relief from taxation, our forward programme, which only awaits the end of hostilities, will be immediately put into operation.

In conclusion may I once more on behalf of the board and on your behalf, express to the officials and employees of our various undertakings, both at home and abroad, our appreciation of their continued efforts under the difficult conditions of war, and our confidence that such efforts will be fully maintained both during the war and subsequently?

The usual resolutions were then passed approving and adopting the directors' report, the accounts for the year to September 30, 1942, and the balance-sheet as at that date, and authorising the payment of

the ordinary dividend of 8½ per cent., making 12½ per cent. for the year, subject to income-tax, following which Messrs W. W. P. Shepherd, H. Hanson, R. G. Soot-hill and G. Wilson, the retiring directors, were re-elected as directors of the company and Messrs Deloitte, Plender, Griffiths and Co., chartered accountants, were re-appointed as auditors for the current year.

OROVILLE DREDGING COMPANY, LIMITED

DIVIDEND OF 25 PER CENT.

The thirty-first ordinary general meeting of the Oroville Dredging Company, Limited, was held, on the 26th instant, in London, Mr Frederick W. Baker, the chairman, presiding.

The following is an extract from the statement by the chairman, circulated with the report and accounts: Dividends received from the company's holding of shares in Bulolo Gold Dredging, Limited, and Pato Consolidated Gold Dredging, Limited, amount to £28,750. Other credits amount to £4,865. From the total credits of £33,615, after debiting all charges in London, including income-tax, the balance to the credit of profit and loss account for the period is £13,687. Adding the credit balance from the previous year and deducting the dividends paid, a balance of £118,331 is carried forward at September 30, 1942. The directors have decided to recommend a final dividend of 6d. per share (12½ per cent.), less income-tax, making, with the interim dividend of 6d. per share, 25 per cent. for the year. Out of a total income received by this company and its subsidiary Pato Mines (Colombia), Limited, amounting to £84,678, £52,231 has had to be provided for taxation purposes.

Operations at Bulolo continued normally until the invasion of New Guinea was imminent. I am given to understand that particulars of the operations for the financial year to May 31, 1942, will not be available until early in the new year, and that only information released by the Australian Government can be published.

OPERATIONS IN COLOMBIA

Operations on our interests in Colombia, both at Pato Consolidated Gold Dredging, Limited, and Asnazu Gold Dredging, Limited, are continuing very satisfactorily. The question of getting supplies is increasingly difficult, and in order to relieve this situation, it has become necessary to close down two of the dredges, though it is hoped that the effect of this will be largely offset by the handling of higher-grade ground.

The report was unanimously adopted. The Chairman said: Definite information is now in our hands indicating that the Colombian income-tax will be increased, as a result of recent legislation, to the extent of 85 per cent., 50 per cent. of which is returnable by the Colombian Government in the form of Colombian National Economic Defence Bonds, which, we gather, may bear interest at the rate of 4 per cent. per annum, though we have not yet any information as to when these Bonds will be redeemable. This increase of taxation will apply to all in Colombia liable to income-tax until the Government has secured a total of 60,000,000 pesos, which it expects to realise over a period of two years, when, we understand, 50 per cent. of the 85 per cent. will be abolished. In addition to this increase in taxation we will have to subscribe for a period of two years for Colombian National Defence Bonds to the extent of 20 per cent. of our gross output.

Unless we have to face conditions which we cannot at present foresee, we can expect to secure from our holding in Pato Consolidated dividends at the same rate as paid over the past year, namely, 30 per cent., so that, based upon these earnings, our company should be in a position to pay a dividend of at least 12½ per cent.

LIEBIG'S EXTRACT OF MEAT COMPANY, LIMITED

RECORD RESULTS

The seventy-eighth ordinary general meeting of Liebig's Extract of Meat Company, Limited, was held, on the 19th instant, in London, Mr Kenneth M. Carlisle (chairman and managing director) presiding.

The following are extracts from the chairman's statement circulated with the report and accounts:—

The balance of profit, at £213,000, is practically the same as that for last year, and so long as taxation continues at the present high level there is small prospect that any marked improvement on this figure can be shown. The volume of our trade and the results have exceeded all previous bests but, after making provision for the claims of the Revenue authorities, the amount remaining available for distribution in the form of a tax-free dividend is strictly limited, since the canons of sound finance cannot be lightly set aside, and regard must be had to the eventual demands of deferred repairs and obsolescence. Your directors propose, therefore, that the final dividend shall be 6s., free of income tax (making with the interim dividend a total of 8s., free of income tax) per unit of ordinary stock.

Our overseas factories have been engaged to the limit of cattle available in the production of canned meats, those in South America for account of the Ministry of Food, while the output of our African plants has been earmarked for the requirements of the Union and Middle East military authorities. A considerable rise in the price of cattle in Argentina, which occurred after the contract price for the supply of corned beef had been arranged between the two Governments, made it impossible to conduct factory operations in our region except at a loss, but the ranching section of our business, on the other hand, reaped the benefit of the enhanced values of live-stock.

The problem of maintaining adequate supplies of fuel and packing materials, as well as of factory spares and replacements, has been a constant source of anxiety, but thus far we have been able to comply with our contracts and carry through without serious stoppage. Plants have been maintained in as high a state of repair and efficiency as possible commensurate with the circumstances.

FARMING CONDITIONS

Conditions affecting farming were variable, as must almost inevitably be the case when the wide areas over which our estancias are situated, embracing Argentina, Uruguay and Paraguay, are considered; but, on the whole, with the exception of Uruguay, where good crops were harvested and calving and mortality returns were about normal, the very severe winter experienced in South America took its toll of the herds and flocks. Higher livestock values, however, and the disposal of the wool clip at satisfactory prices more than offset the disappointing physical results.

The trade in our proprietary lines in this country, embracing the well-known brands Oxo, Lemco, Fray Bentos, Beefex, etc., is conducted under the aegis of our associated company, Oxo, Limited, who also operate the factories in this country, and I am pleased to report that once again a most successful year's trading has been achieved.

These factories have been engaged to capacity and their output has been very large, but even so the demand for their products has been far from satisfied, and we have to continue to ask our many good friends and customers to exercise their kindly patience and indulgence until such time as the supply position from overseas can be improved.

The report and accounts were unanimously adopted.

ORIENT STEAM NAVIGATION COMPANY, LIMITED

SHIPS FULLY EMPLOYED

The forty-third ordinary general meeting of this company was held, on the 22nd instant, in London, Mr I. C. Geddes presiding.

The following is an extract from the statement circulated with the report and accounts:—Throughout the year under review your ships have been under requisition and fully and gallantly employed on Government service.

The working profit is down by £61,874 when compared with last year. You must be prepared to see further shrinkages in future accounts, for as ships are lost there will be a fall in the amount of profit we can retain free of excess profits tax. In this year's account it has been necessary to make provision not only for income-tax but also for E.P.T., although the precise liability is not yet known. We have also set aside £100,000 for transfer to general reserve; this account will then stand at the substantial figure of £2,000,000.

Investments, including tax reserve certificates, show an increase of £678,556 during the year. There is a corresponding increase in income from investments.

In 1936 you authorised the company to take power to invest in or operate air transport; and we made investments accordingly. If through the development of the air it seems desirable and opportunity offers to increase our interest in this new form of transport we shall do so. We hope it will be decided by the United Nations after the war that, as travel by air will be a great and increasing factor in world transport, it is to the interest of all nations and all traders that travel by air should be self-supporting. Competition in air transport based on subsidies on a large scale can only breed international jealousy and create a situation where subsidy would also be necessary for ships.

The report was adopted.

RADIO RENTALS, LIMITED

RECORD OF PROGRESS

The annual meeting of Radio Rentals, Limited, was held, on the 26th instant, in London, Mr H. F. Hunt (the chairman) presiding.

The following are extracts from the speech by the chairman circulated with the report and accounts.—The item radio sets in the balance-sheet is, of course, one of the most important and the figure of £197,548 shows a decrease of some £20,000 on last year's figure.

Subject to approval of the proposed final dividend, there will remain a balance of £32,303 to be carried forward. The amount of depreciation written off sets is £104,874, against £88,000 last year.

The provision for war damage premiums and contributions is down to £1,690, approximately half the figure in the previous year. Last year I referred to the penalising effect of this form of insurance and agreement has now been reached with the Board of Trade exempting a large number of our sets from compulsory insurance, which was only reasonable, in view of the fact that in the majority of cases we should not have been able to make a claim. The full benefit of this is not borne in these accounts. Provision of taxation is on the same basis as last year and constitutes a considerable increase.

The demand for our service is, of course, far beyond anything with which we can cope, and the supply of new sets is at present limited. Nevertheless, we have managed still further to increase the number of our subscribers.

With regard to our subsidiary company, I can say that satisfactory profits are being earned.

Nearly five months of our present year's trading have passed, and I know you will be pleased to hear that the business of your company is continuing to progress satisfactorily.

The report was unanimously adopted.

BARCLAYS BANK, LIMITED

ANNUAL MEETING OF STOCKHOLDERS

The forty-eighth ordinary general meeting of Barclays Bank, Limited, was held, on the 22nd instant, at the head office of the bank, 54, Lombard Street, London, E.C. 3. Mr Edwin Fisher (the chairman) presided.

Mr P. J. Diboll (the secretary) read the formal notice convening the meeting and the report of the auditors.

With the concurrence of the stockholders present, the report and accounts and also the statement by the chairman, which had been previously circulated, were taken as read.

The chairman moved: "That the report of the directors produced, together with the annexed statement of the company's accounts as at December 31, 1942, duly audited, be received approved and adopted, and that a final dividend of 5 per cent., making 10 cent. for the year on the 'A' stock and a final dividend of 7 per cent., making 14 per cent. for the year, on the 'B' and 'C' stock respectively less income-tax in each case, be declared, payable on the 8th proximo, to the stockholders registered in the books of the company on December 31st last."

Sir William M. Goodenough, Bt. (deputy chairman), seconded the motion which was carried.

The retiring directors were re-elected and the auditors, Messrs Price, Waterhouse and Co. and Messrs Kemp, Chatteris and Co., were re-appointed for the ensuing year.

A vote of thanks to the staff and a vote of thanks to the chairman for presiding at the meeting were unanimously accorded and the proceedings terminated.

MARTINS BANK, LIMITED

ANNUAL GENERAL MEETING

The 112th annual general meeting of Martins Bank, Limited, was held at the head office, Liverpool, on Tuesday, the 26th instant, Mr F. A. Bates, the chairman, presiding.

The chairman stated that the remarks which he would have normally made at this meeting had been issued in the form of a statement along with the report and accounts. He had nothing to add and he formally proposed the adoption of the report and accounts together with the declaration of a final dividend of 7½ per cent., making 15 per cent. for the year.

Mr A. Harold Bibby, one of the deputy chairmen, seconded, and the motion was carried unanimously.

Mr D. A. Sutcliffe proposed the re-election of directors. In thanking the chairman for his admirable survey and the directors for the very satisfactory results shown in the accounts, he said the bank was particularly fortunate in being so ably directed in these difficult times.

Mr W. G. Yates having seconded, the motion was adopted.

On the proposal of Mr J. R. Hobhouse, seconded by Mr John Wormald, the auditors were reappointed.

MIDLAND BANK, LIMITED

ANNUAL MEETING OF SHAREHOLDERS

The ordinary general meeting of shareholders of the Midland Bank, Limited, was held on January 28th at the Head Office, Poultry, London, E.C.2.

The Right Hon. R. McKenna (chairman) presided and, after referring to his statement circulated with the annual report and reproduced in these columns on January 23rd, moved the adoption of the report and audited statement of accounts. The motion was seconded by Mr S. Christopherson (deputy chairman) and carried.

The following resolution was then moved by the chairman, seconded by Mr. Christopherson, and carried:

"That this meeting desires to express its

sympathy with the relatives of those members of the staff who, whilst serving in H.M. Forces, have lost their lives or been posted as missing or become prisoners, and of the civilian members of the staff who have lost their lives by enemy action, and records with deep regret the loss the bank has sustained."

Further resolutions were carried, authorising the payment on February 1st of a dividend of 8 per cent actual less income tax, for the half-year to December 31st last; re-electing Mr Stanley Christopherson and Sir Alexander Roger, K.C.I.E., as directors; and reappointing Messrs

Whinney, Smith and Whinney as auditors for the ensuing year.

LLOYDS BANK, LIMITED

ANNUAL GENERAL MEETING

The eighty-fifth ordinary general meeting of this bank was held, on the 29th instant, at the head office, 71 Lombard Street, London.

The notice convening the meeting and the auditors' report having been read, the chairman, the Rt. Hon. Lord Wardington,

said that he assumed that the report and accounts which had been circulated would be taken as read as usual and that, as his address to members had also been circulated, he did not propose to take up the time of the meeting by reading it.

The report and accounts were adopted and the usual business transacted.

A resolution of sympathy with the relatives of those members of the staff who have lost their lives in the war was passed.

The proceedings ended with votes of thanks to the chairman and directors and to the staff.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

ALTHOUGH the undertone in the stock markets remains quietly firm, there was little response in quotations to the persistently favourable war reports or the news of the Casablanca conference. Turnover declined still further, but scattered equities continue to advance. The gilt edged market was quiet, occasional losses in long and medium dated issues contrasting with the steady tone of short term loans. A similar lack of interest prevailed in the foreign bond market, although there was a minor improvement in Brazilian stocks and some marking up of French Railway bonds. The recent improvement in home rail stocks continued in anticipation of the dividend payments, though at a much reduced rate. Among equities, Southern deferred was prominent. Preference and senior stocks showed little change. Argentine rail stocks derived some stimulus from the renewed request for higher tariffs, but small initial improvements were not generally maintained. Elsewhere, Canadian Pacific ordinary displayed some weakness in mid-week.

Scattered gains and losses reflected the current uncertainty in a quiet, but firm, industrial market. Movements in the brewery section were mixed and generally without significance, although Guinness improved steadily. Imps rallied after some earlier weakness on the maintenance of the dividend. Other tobacco issues were quiet, with the exception of Tobacco Securities deferred, which weakened on the reduced payment. Motor and aircraft shares fluctuated within narrow limits, but heavy industrial stocks attracted considerable support. Dorman Long was outstanding with an advance of 1s. 6d. on the prospect of a dividend, and useful gains were registered for Thos. W. Ward and Whitehead Iron. A minor rally in mid-week brought improvements for several shipping issues. P. & O. deferred was prominent with a gain of 1s. 9d., while Anchor Line also enjoyed support. Among stores shares,

Woolworth remained virtually unchanged on the reduced distribution. Textile shares were buoyant, but changes were without significance, except for a gain of 10d. for Courtalds. Chief interest centred on the international issues, of which International Nickel was outstanding with a net gain of 5½ points, while Brazilian Traction advanced 1½. Elsewhere, Gaumont British was bought, but a fall of 2s. 6d. for Wall Paper deferred followed on the recent advance in this share. Bowater Paper weakened on the report.

Activity in the kaffir market was at a particularly low ebb. Rand mining shares were neglected and quotations tended to lower levels. De Beers deferred was outstanding in a firm diamond section, advancing ½ on shortage of stock. Tea issues were supported, several issues being marked up 6d. to 1s., but the rubber market was practically without change. Interest in the oil market flagged, leading issues fluctuating narrowly and without trend. The news from Casablanca, however, encouraged a little speculative support, Anglo-Iranian rising ½, with minor improvements for other issues.

New York

THE excellent war news and the promise of things to come from the Casablanca meeting gave rise to the highest level of activity witnessed on Wall Street since the New Year. Despite fairly persistent profit-taking, investment demand forced prices steadily upward, many high-class industrial equities attaining peak levels for the past year or more. Profit taking in mid-week reduced quotations two points or more.

Salmon Distribution.—The Minister of Food has made the Salmon (Distribution) Order, controlling from February 5, 1943, the distribution of salmon other than smoked or canned salmon. The Order provides that every wholesaler shall offer his supplies to the same customers as in 1940, and in the same proportion to each customer as in that year, with certain exceptions.

Wool Waste.—The Minister of Supply has issued two new Orders affecting the control of wool. They are the Control of Wool Wastes (No. 2) Order, 1943 (S.R. and O. No. 99), and the Control of Wool Rags (No. 2) Order, 1943 (S.R. and O. No. 100). The effect of the first is to bring within the licensing provisions of the Control of Wool Wastes (No. 1) Order, 1941, certain woollen wastes and to subject them to maximum prices. By the joint operation of the two Orders, hosiery clips

and overlocks are removed from the definition of "wool rag," and are made subject to the provisions of the Control of Wool Wastes Orders. The new Orders came into operation on January 26th.

Nuts and Bolts.—The purpose of the Control of Bolts, Nuts, Screws, Washers and Rivets (No. 1) Order, 1943 (S.R. and O. No. 41), and the Control of Iron and Steel (No. 28) Order, 1943 (S.R. and O. No. 40), which came into force on January 25th, and have been issued by the Ministry of Supply, is to fix maximum prices for most sizes of bolts, nuts, screws, screw studs, washers and rivets, of whatever metal they are made, and to bring them all within the scope of the Iron and Steel Distribution Scheme.

Rayon Goods Export.—After some delay, the Cotton Board have issued allocations

for the production and export of rayon piece goods for the three months ending March 31st next. In the interests of efficiency and economy of production, no allocations below 1,000 square yards are available. The small quantities to which merchants are entitled have been added to quotas for other markets, and the total allocations have not been reduced. In the case of South Africa and Northern and Southern Rhodesia, export licence applications must be accompanied, as usual, by essentially certificates bearing a priority rating. It is pointed out to allocation holders that export licences will only be recommended against certificates of this kind, in accordance with the usual procedure.

Onions.—The Ministry of Food desires to place contracts with growers for dry bulb onions. The price offered is the same as (Continued on page 163)

Finance

GOVERNMENT RETURNS

For the week ended Jan. 23, 1943, total ordinary revenue was £95,423,000, against ordinary expenditure of £122,030,000, and issues to sinking funds of £120,000. Thus, including sinking fund allocations of £9,716,904, the deficit accrued since April 1st is £2,410,581,000, against £2,071,396,000 for the corresponding period a year ago.

On behalf of the Board,
S. F. MENDEL, CHARLES D. SELIGMAN, Directors.

W. SHEPHERD, Secretary.

We report that we have obtained all the information and explanations which we have required. We have examined the Securities representing Investments of the Company in hand, those held against Loans, and all Bills discounted in hand. We have also proved the Cash Balances, and verified the Securities and Bills in the hands of Depositors. In our opinion the Balance Sheet is properly drawn up so as to exhibit a true and correct view of the state of the Company's affairs according to the best of our information, and the explanations given to us, and as shown by the Books of the Company.

J. FREDERICK'S PLACE, LONDON, E.C.2. 11th January, 1943.

Let the People Work

THE Chancellor of the Exchequer did well on Tuesday to begin his survey of future economic policy with two warnings: that the war is not over; and that, after the war, the world will be worse, not better off. The recent rise in war expenditure is an index to the added strain that will grow as this year's offensives assume major proportions. The call for still more men and women in the Services and in war industry, and the pressing need for still more thrift in the use of shipping space and import capacity tell the same story in physical terms. After the war, there will be much leeway to be made up before headway can be made. There will be the vast task of re-mobilising the nation's resources of labour and capital in the new pattern of industry and trade which the changed conditions of the post-war world will demand; and, for a time, the structural unemployment that will arise from any failure to carry out this readjustment may bulk much more largely than the cyclical unemployment arising from periodic depressions to which so much attention is rightly being paid in current analyses. Britain's losses in overseas income and trade connections are hard facts. As Professor Macgregor has put it, "We are not going to have a better social and economic order, or to be in a measurable time better off, because of this war."

The point is that we shall not be better off *because of* the war. We can nevertheless be better off *after* the war

if a new understanding and a new energy can be discovered, if the errors of the past can be avoided and if full use can be made of our capacity. As the problems of war have been overcome, so can those of peace. There is no excuse for pessimism. War wastes or destroys to-day's output, not to-morrow's. The power to produce will remain, the labour, the land, the capital and the skill. The needs of war have been met by the full use of the nation's resources of men and machines, and by the achievement of a high level of productivity in war manufacture; and reconstruction and progress after the war will depend on precisely the same two factors—full employment and efficiency.

Full employment means more than work for all who are willing to work. It embraces efficiency. It means the fullest and most productive employment for capital as well as labour, for plant as well as workers. The idleness or under-employment of material resources subtracts from a nation's real income at least as much as the unemployment of its workpeople. It is estimated that, if unemployment had been eliminated in the inter-war period, the increase in national output might have been something like 10 to 15 per cent per annum, plus the yield on any extra investment undertaken as a result of the high level of national income. But it is possible that the restrictive practices due to monopoly and quasi-monopoly in

industry and distribution, coupled with the rigid policies of organised labour, caused an even larger subtraction from the real national income during the same period. The withholding of capacity and the organisation of scarcity had become chronic, both at home and abroad, before the war. It is a matter of history that these practices and the mentality which they bred very nearly lost the war for this country during its early stages. It is certain that, if they return, they will lose the peace.

The goal of economic policy must be the utmost efficiency, technical and economic, translated into the utmost output for consumption. The need for Britain, in search of this goal, is the utmost adaptability; and every rigidity in industrial, commercial or political life which holds back the power to produce and impedes adjustment is a deadly enemy. The task is not simply to employ all the nation's resources, which is the crude form of the doctrine of full employment, but to employ them to the best purpose.

There will be no sharp break between war and peace. In the armistice period, as Sir Kingsley Wood pointed out on Tuesday, the conditions of shortage and scarcity which produced the wartime controls will remain—and with them, in large measure, the controls themselves. The danger of inflation, if the volume of purchasing power is allowed to outrun the still restricted supply of goods, will be greater than during the war. When the process of remobilisation, transfer, re-equipment, rebuilding and restocking has been completed, under a conscious control designed to put first things first, and avoid the disorderly boom and slump which followed the last war, there is no reason why there should not be “hopeful possibilities not only of restoring but also of raising our standards of living.” But, if the lessons of the last twenty-five years have been learnt, the aims of policy will not alter. They will be the Maximum Output of goods and services and a National Minimum of the necessities of life, in both financial and physical terms, for every willing citizen. This will involve the maintenance of high investment and steady consumption. It will necessitate ways and means of giving priority in the use of resources to essential investment, at home and abroad, and to essential consumption. Capital is the limiting factor in production; there is no automatic abundance just round the corner. Whatever methods of control and supervision are utilised, they will entail the assumption of responsibility by the state, on behalf of the community, for ensuring, first, that the total of investment, private and public, is kept sufficiently large and sufficiently regular to maintain employment; secondly, that consumption, too, is kept high and regular by the redistribution of incomes implied by minimum wage standards and the Beveridge principle; and, thirdly, that a sufficiently large and sufficiently cheap supply of the necessities of life is made available to the public by the translation of the utility principle of war economy into peace terms.

All this is familiar ground. But the discussion which surrounds it is too often unreal. The issue is not Planning versus *Laissez-faire*. The task in each item of economic policy will be to find the method best fitted to achieve the end sought. Occasionally, perhaps, it may be state ownership. More often, it will be state control or supervision. Over a vast field of activity, it will be free enterprise, with only the rules and limiting conditions laid down by the state. Nor is the issue, as some current discussion would seem to suggest, Domestic Expansion versus International Trade. Full employment, in the complete sense of the term, always looks two ways, at home and abroad. It is obvious, for instance, that this country cannot, except as a purely statistical proposition, simply substitute domestic investment for its lost or dwindled overseas assets. The physical need for foodstuffs and raw materials from abroad, a need which will be increased if high employment and consumption are secured, makes imperative the necessity of importing and exporting in return, on the largest possible scale. Similarly, it is evident that, if the United States were to pursue at one and the same time a policy of high domestic investment and the Open Door policy which Britain pursued when the British national income was the highest in the world, there would

be brought into being a power house for world prosperity such as has never been seen. The issue is Restriction versus Plenty. Monopoly, autarky, bilateralism, protection and international agreements to restrain output, all are aspects of precisely the same danger. All result in the reduction of real income just as effectively as the actual idleness of manpower; and the aim of economic policy by and among the nations, if full employment in the real sense is to be sought, must be to extirpate this, too. On Wednesday, Mr Dalton stated right principles: “expansion rather than restriction; expansion, but not inflation; stability of prices, but not stagnation; order, but not rigidity.” But the extent to which the President of the Board of Trade is apparently relying on trade associations to produce his plans for him is definitely alarming. And his reference to the wheat agreement as “a forerunner and a symbol” is, for all the relative virtues of that scheme, hardly less disturbing.

It is most certainly true that domestic and international policies have clashed and conflicted in the past. National deflation to balance international payments or to restore arbitrary exchange rates has left a trail of idle men and idle resources. National inflation to restore international trade has bred economic war and world restriction. But it is not only in the realm of theory that the most fruitful basis for international trade is the utmost expansion in each separate country, or that a necessary condition for the most productive expansion at home is the most abundant exchange with other countries. The requirement is that the policies pursued by the separate countries should be worked out in concert and in tune. This requirement is probably the most pressing of all for the post-war world.

On Tuesday, Sir Kingsley Wood showed himself alive to this need. High among the Five Propositions which he outlined was “an international exchange mechanism to avoid competitive exchange depreciation.” He envisaged a system of international agreement which would render blocked currency balances and bilateral clearings unnecessary; provide an orderly method of determining currency values; eliminate speculative movements of short-term capital; and subject governments tempted to move too far towards deflation to the check of consultation with other governments (the technical implications and the difficulties are discussed in a note on page 172). This and the other four Propositions put forward by the Chancellor perhaps merit the comment “So Far So Good.” He asked for a policy of expansion to maintain employment; the reduction of unnecessary barriers to the flow of goods from country to country; the prevention of disastrous swings in the prices of raw materials and primary products; and the international production of investments for world development. Into these aspirations can perhaps be read the outline of a programme to apply the principles of high investment and steady consumption in both the national and international spheres. But it is only an outline. These are the right questions; what is now needed is the right answers. The task is to translate these Five Propositions into Five Policies—with always in mind that the objective is the highest possible output of goods and services for human consumption and enjoyment, and that the major crime against mankind is restriction.

The issue is between the Particularism, industrial, local, social or national, that restricts and the Communalism that seeks to serve the need of all. The problem is not to find work to do; but to take off the brakes. Professor Hutt in a recent book (“Plan for Reconstruction” by W. H. Hutt, Kegan Paul, 320 pages, 18s.) has stated it graphically:—

The blind *laissez-faire* which has given arbitrary power to trusts and trade unions; the muddled *laissez-faire* which, through fear of cheapness, has forbidden the right to work and employ and so prompted the weakenings of the essence of all economic security: this stupid *laissez-faire* must be replaced by the *laissez-faire* of the economists’ vision, a system under which the state operates through consciously planned institutions to protect the right of every man to produce, and to co-operate to produce, any demanded thing . . . *laissez travailler, laissez créer*.

Let the people work.

Japan Digs In

THE fighting round Australia has flared up again. To the north-west, new enemy concentrations are centred on Borneo. Off the Solomons, the Japanese are making a new and heavy bid for control. Papua and Guadalcanal were setbacks for Japan, but not in themselves decisive actions. The tips of two tentacles were clipped off, nothing more. Australia still stands in danger, and Mr. Curtin has marked the beginning of what may be a new phase in the fighting by putting his view on record that

Time is now fighting on the side of Japan. The reflagging of the Pacific theatre to a holding war means that Japan is buying cheaply the time she needs to exploit the resources she has acquired and to prepare for an onslaught which the United Nations will find it costly to out-fight.

General Tojo agrees with Mr Curtin. He recently called reconstruction in Greater East Asia the “key to Japanese victory in the war.” If the whole area conquered by Japan from the frontiers of India across to the Amur River and southwards to the shores of Australia were functioning as an orderly and productive hinterland to the Japanese war effort, the weight behind the Japanese blow would indeed be overwhelming. But can it be organised in such a manner? However long the lull in armed combat, can the Japanese, already strained by a total war economy, provide the capital, the equipment and the personnel for a major task of reconstruction?

The first necessity for working on such an ambitious scale is energy and unity at the centre in the concerting of plans. The war has brought this unity to Japan. The old paralysing differences in policy between the army and navy, the military extremists, the business world, and the Diet have disappeared. The military authorities are firmly in control. The chauvinists, Suetsugu, Hashimoto, Nakano (the last under duress), have dissolved their patriotic societies; and most of these leaders are now co-operating in the new Taisei Yokusan Seijikai, alongside their old enemies, the “liberal” business men of the Zaibatsu (the industrial financial oligarchy). The Seijikai appears to be a sort of association or official grouping within the Diet to take the place of the old parties and co-operate closely with the Government. The Taisei Yokusankai (Imperial Rule Association) does not seem to have fulfilled its function of providing a single totalitarian party. It still carries on its propaganda and organisational work in the country, but seems to be little more than a branch of the bureaucracy. The new association is the army-dominated Government’s instrument for controlling the Diet. Another example of reconciliation and consolidation was the number of army and naval officers

who for the first time stood for election in the new Diet in April, 1942. Hitherto they had held aloof from the civilian and bourgeois life of politics. The most marked characteristic of the re-elected Diet is the decline of the mildly Leftist groups, the return of all the chauvinist (military fascist) candidates and the great increase in nationalist fervour among ex-party men and business representatives. The Diet reflects the absolute unity of opinion in Japan and the acceptance of complete military domination.

Backed by this enthusiastically subservient legislature, General Tojo has pushed forward with the Government’s plans for the consolidation of victory. The political structure is not complete, but the broad outlines are there. In September, the functions of the Japanese Foreign Ministry were very much diminished. All the various departments and bureaux dealing with the conquered territories—the Kwangtung Bureau, the Manchuria Affairs Board, the China Affairs Board, the South Seas Board, the Foreign Ministry’s own East Asia and South Seas Bureaux—were brought together in a new Greater East Asia Ministry. All embassies and legations are subordinate to it. The Foreign Ministry’s task is reduced to “routine instructions of a purely diplomatic nature.” The Ministry began to function with Kazuo Aoki as Minister on November 1st. Under him and his four assistant directors are the General Affairs Bureau (covering all questions of industry, economics or “culture”), the Manchurian Affairs, China Affairs and Southern Affairs Bureaux. This reorganisation means a great simplification in the administration of the conquered territories and a considerable saving in trained administrators—one of Japan’s narrowest bottlenecks. It is the lynch-pin of a much larger reorganisation covering all the newly conquered territories.

Nanyo—the South Seas area—is now organised into five administrative divisions, all save Borneo under the commanding officer who conducted the invasion. The still very provisional character of the system is marked by the fact that this officer is entrusted with the defence of this area against Allied counter-attacks—which the Japanese clearly expect. These divisions have been designed in part to cut across the earlier frontiers. Siam and Indo-China are not part of the scheme, for they have a special status, “friendly occupied territory.” Burma is retained as one unit, probably because the Japanese claim to be on the point of giving them “the self-government refused them by Britain”; the reason for maintaining Philippine unity is probably also a bait for its nationalists. But Malaya and Sumatra are one unit. Borneo is united into one area planned to “remove the former tariff

Wartime Service

● In view of the absence of staff on War duties it has become necessary as a temporary measure to close certain of the Society's Branch Offices.

● Arrangements have been made to ensure that the Society's policyholders and annuitants will receive the best possible wartime service.

Head Office: 163/4, STRAND, LONDON, W.C.2. Telephone: TEMple Bar 0381
(temporarily transferred from 20, Lincoln's Inn Fields)

barriers between the different provinces and other obstacles to unification." The rest of the Netherlands East Indies makes up the fifth administrative area.

Japanese policy towards the native populations is still somewhat vague. The White Race has been finally driven out; now it is Asia for the Asiatics and Self-Government within the framework of Co-Prosperity—so much is obvious and clear. But there is still little sign of detailed policy for dealing with the great variety of races and cultural standards found within the new empire. A school for training Malayan administrators has been set up—everywhere the Japanese are short of officials. It is not certain whether the other races of Malaya, especially the Chinese, are to be admitted. The Chinese present a special problem. The millions scattered through the South Seas could be an invaluable pillar of the new regime. They are the only coherent group corresponding to a middle class. They can provide the badly needed doctors, engineers, merchants, technicians. They own a good deal of the property, especially in Malaya. The Japanese are in two minds. On the one hand, they are crushing vigorously all pro-Chungking elements, and fleeing the merchant communities with taxes and "voluntary contributions." On the other, they are trying to bribe potential quislings with offers of British and American property and have a special training school at Nanking for Chinese propagandists who go out to the South Seas and preach the Wang Ching-wei regime. It is too early to know the outcome of this equivocal treatment.

This, roughly, is the administrative framework within which economic reconstruction is to be carried out. The ideal form of this reconstruction has been described over and over again by Japanese writers and speakers in the last eight years. It is another "new order"—the concentration of predominant industrial power in Japan and the building up of Greater East Asia as a closed supply area for Japanese industry. Already, in this first year, plans are developing on these lines. There is a Five-Year Plan for the Philippines. Japan now has a glut of sugar and the Philippines are to be diverted from sugar to cotton, which is one of the new empire's chief shortages. By 1946, it is hoped to have 9.1 million acres under cotton. The sugar refining industry will be dismantled and the machinery devoted to other purposes, such as distilling alcohol. The islands, which used to import thousands of tons of rice and grain from the United States, are to be made self-sufficient in foodstuffs. Sugar production will be concentrated in Java; jute, another shortage, in Indo-China. In Borneo, there is to be intensive development of oil, gold, quicksilver and timber. To finance and guide these ventures, a Bank for the Development of the Southern Areas has been set up under the Bank of Japan with a capital of 100 million yen.

West India?

LAST week, there was a brief debate in the House of Lords on the West Indies. The sole speakers were Lord Faringdon, who asked the Government for a statement of policy in regard to constitutional progress and reform in the West Indies, and the Duke of Devonshire, newly appointed Parliamentary Under-Secretary of State for the Colonies, who replied. It must be said at once that this reply turned the clock back several years. It showed not the slightest sign that a new spirit and vigour is stirring in the Colonial Office, or that that Department realises the dangerous situation in the West Indies. It was the old temporising what-is-all-this-fuss-about? sort of speech that one had hoped had gone with Singapore.

I can only hope [said Lord Faringdon after he had listened to this speech] that British subjects in the West Indies may find the Government reply more comforting than I did.

It will be a vain hope. It is as well to remember that the West Indies have been the scene of general economic distress—for many people acute misery—and of political

The programme of building-up a supply area for Japanese industry involves a number of contradictions which the Japanese show little sign of resolving. The Government is determined to maintain its programme of self-sufficiency in food in Japan, partly for security reasons and partly to keep a large peasantry—the "vital stock"—in being. This strictly limits the amount of extra industrialisation; it also penalises the producers of food surpluses in the new supply area—Siam and Burma and Indo-China. Yet, without further industrialisation, the Japanese cannot possibly maintain their war effort and organise the new empire. All the plans require equipment, machinery and expert control. In the past, Britain, the United States and Holland provided these. They even sent these to Japan who, up to the war, was a large importer of manufactured products. All this has gone. Japan is the only industrial system left to make good the deficit. Japanese industry cannot meet the need. For months now, Siam has been pressing for manufactured goods in return for raw materials. The Japanese have paid in blocked yen only. Lack of tools has held up the work of repairing damaged installations. There is an acute shortage of oil engineers—a new institute has just been opened in Japan to train them *en masse*.

Lack of shipping is, if anything, more serious than the lack of capital and technicians. The new empire is an empire of islands. Nearly everything must be water-borne. The Japanese probably began the war with about 6 million gross tons of merchant ships. Even allowing them the most generous margin for ships captured from the Allies and for a wartime increase in shipbuilding capacity, and giving them the benefit of the doubt in the wholesale sinkings of recent months, it is unlikely that they have more than their original figure now—and probably much less. Yet to exploit the South Seas thoroughly, something in the order of 17 million tons would be necessary. When the Siamese trade delegation returned from Tokyo this summer, they complained that every agreement had been made dependent upon a shipping clause "if shipping is available." This is true of the whole area.

The Japanese are not, as Mr Curtin suggests, settling down to a vast exploitation of their new empire. The process of development is as much a drain on their war effort as a support to it. This does not mean that the blows they will strike will not be formidable or that they have by any means shot their bolt. They may not be consolidating their empire; but they are not fighting much either, and reserves of military equipment are accumulating. Japan is a military menace whether or not Nan Yo is developing according to plan. Mr Curtin is right to remind the Allies how entrenched Japan's position is becoming and how undisturbed its military force.

discontent for a long time. The war has not caused their difficulties; it has only intensified them, chiefly by the shortage of shipping, which has cut them off from their markets and sources of supply. To the poverty, disease, squalor and illiteracy of pre-war days has thus been added a shortage of food and other necessary consumption goods. It is therefore small wonder that the people of Jamaica, for instance, are unconvinced by arguments that they are not fitted for the responsibilities of government. Has the Imperial Government and their own government, they might argue in return, shown itself capable of dealing with Jamaica's problems? The argument that good government is preferable to self-government and bread to the vote, a dangerous argument at any time, loses all validity when the governing power fails to provide the bread.

It is quite true that the Colonial Office and the colonial governments have been making really serious efforts to improve the situation. In Barbados, 35 per cent of the acreage owned by the sugar estates must be planted with food crops. Rice production is being expanded in British

Guiana, for export to the Caribbean as well as for domestic consumption, and rice is to be grown in Trinidad. The Jamaica banana growers have been given financial assistance to switch over to the production of food crops, and prices of such crops are guaranteed. Half of Antigua's food requirements are supplied from local production.

Unfortunately, the efforts of those in authority to cope with the problems are frequently masked by the complacency with which they discuss the problems in public. There has been no sense of urgency in the replies given to parliamentary questions. At a press conference given last December, Sir Frank Stockdale, Comptroller-General of Development and Welfare in the West Indies, admitted a protein deficiency in the people's diet, but actually gave the impression that there was no general food shortage. The interview given last September by Sir Arthur Richards, Governor of Jamaica, to an American correspondent has already received some publicity, but it is worth recalling. After the economic problems had been reviewed as though they were a thing of the past, the Governor was then asked whether Jamaica could be compared with India.

He flicked off his cigar ash and snapped back: "There is no comparison. The conditions are so different. It is yet to be proved that the people even want self-government. Only a small minority group, which is extremely vocal, expresses such views. The great majority of the Jamaicans do not want self-government and do not think themselves capable of coping with all the problems of to-day, including finance, overseas markets and land reforms, just to mention a few of them."

And now comes the Duke of Devonshire's speech with its implied assumption that there is no need for anxiety; everything will turn out all right in the end.

In striking contrast to these official assurances, reports from the West Indies present a very different picture. "Shall We Starve in Silence?" was a headline in a Trinidad newspaper last August. There are persistent complaints of bad distribution, and pleas for some form of rationing. Last summer, there was a considerable increase in lawlessness in Jamaica, and the shops were raided for rice which was alleged to have been held up by shopkeepers for their most-favoured customers. From the same island come complaints of the high price of clothes and of a serious shortage of kerosene, on which the people are dependent for lighting. Jamaica, too, was the scene of extraordinary action by the Governor last summer, when he refused to accept the legality of the Railway Employees' Union and then, after the latter instituted court proceedings, declared it illegal under the defence regulations. At the same time, four arrests were made of persons who were either officials of the union or else associated with the People's National Party. Before the end of the year, the legality of the union was restored, but these men are still detained—it is said for subversion, not for their union or political activities, but the circumstances are very disturbing.

Above all, there is the problem that seems endemic to the West Indies—labour trouble. Little was heard in this country of the riots in the Bahamas last June, but in the words of a local paper it was "the biggest and most disastrous riot in the history of the colony." The evidence given before the Commission of Inquiry into the riots has now become available, and is very revealing. The immediate cause of the riots seems to have been the low wage, 4s. a day, paid for work on an American project at Nassau. This was considered to be merely a relief payment, and the workers thought that advantage was being taken of the prevailing unemployment to fix as low a wage as possible, though the cost of living had risen well above the pre-war level. But the evidence also reveals the unsound economic position of the whole colony and the dissatisfaction with the old reactionary constitution, which, like that of Bermuda and Barbados, means that any reforms have to have the consent of the oligarchy composing the House of Assembly—only one-sixth of the population in the Bahamas has the right to vote, and the property qualification for membership of the House of Assembly is £200. The result is that labour legislation

in the Bahamas is virtually non-existent—with the corollary that the colony cannot be granted funds under the Colonial Development and Welfare Act for projects involving labour.

There is here an inextricable relationship between constitutional reform and economic progress. But even in other parts of the Caribbean, where there is not this mockery of a constitution, the need for more self-government is no less urgent—President Roosevelt himself stated last summer that this was a precondition if the whole of the Caribbean area were to be brought into an economic and social team of benefit to the world at large. In contrast to the President's declaration, the attitude of the Colonial Office is, to say the least, half-hearted. It is two years since a new constitution was proposed for Jamaica. That it has not yet come into force is not the fault of the Colonial Office, for the proposals were turned down by the Jamaican Legislative Council. This rejection was, very properly, in view of the unrepresentative composition of the Council, not accepted by the Colonial Office, but it has done little to secure universal suffrage for the island—one of the main reforms of the proposed constitution—although an agreement has meanwhile been reached between the elected members of the Council and the leaders of the People's National Party and of another party on the constitution wanted. More may be going on behind the scenes: the Governor of Jamaica is in England for consultation at the present time, the secretary of the National Association of Local Government Officers has gone out to reorganise local government in the island, and at last, it seems, a census, an indispensable prelude to franchise reform, is being taken. But the delay has not improved the relations between the Jamaicans and the Imperial and local government and, taken in conjunction with the Governor's ill-chosen words and the victimisation of members of the PNP, may well lead to demands being put forward which cannot justifiably be granted.

Elsewhere in the Caribbean the position is not so potentially dangerous as in Jamaica. But the Duke of Devonshire's own words about the progress of the Franchise Commissions in British Guiana and Trinidad are hardly encouraging. In Trinidad, the Franchise Committee

has been in being since the early summer of 1941, but as it is not an official body it is impossible to put a definite limit on its proceedings.

The same drawback, the Duke went on to say, applies to the work of the British Guiana Commission, and he added, as though it was quite a natural rate of progress, the Commission is at the moment contemplating a visit to the interior before submitting its report.

Even if doubts had not already been felt about the membership of these two Commissions, which ought surely to have been official, the Duke of Devonshire's progress report on their work would alone make one despair.

Possibly the evidence from the West Indies is misleading. The picture may not in reality be so black as it appears. On the other hand, it is quite certain that it is not nearly so bright as official statements would have us believe. It is to be hoped, therefore, that members of the House of Lords, and of the House of Commons, will press for a much franker account of the actual economic and political situation than they have yet secured. They should press, too, for a statement of policy. There are not in the West Indies the communal problems which have for so long held up self-government in India. Nor, however, are there the social customs and traditions which impede development in, say, Africa. The Caribbean, in fact, is an area which is ripe for the energetic pursuit of the New Imperialism outlined so eloquently by Mr Morrison a few weeks ago. "Political enlightenment and humane integrity," matched by "constructive social and economic policies," could make the Caribbean a model of colonial administration. But, if they are lacking, the Governor of Jamaica's statement that there is no comparison with India may well be proved wrong; there will be another running sore in British imperialism; and the archaic name given to the West India Royal Commission will have been justified.

The Luxury of Saving

EVERY week, the National Savings Committee publishes a figure of the amount saved through purchases of National Savings Certificates and Defence Bonds and through increased balances in the Post Office and Trustee Savings Banks. The weekly figure is in the neighbourhood of £10,000,000. It is variously interpreted. In the House of Lords, on September 30th last year, Lord Gainford quoted the figure as showing "that there has been a margin of profit over and above what is necessary for maintaining the standard of living and the ability of the people to buy what they can either in the way of clothes or food." Mr Kalecki, on the other hand, concludes in an article in the Bulletin of the Oxford Institute of Statistics for October 31, 1942, "that a major part of 'small' savings is to be accounted for either by transfers from other investments or by the current savings of large savers. This is not only due to the savings campaign, which makes people think that it is particularly patriotic to invest as much as possible in small savings at the expense of other types of investment, but to the very advantageous terms which small savings offer to an investor." Lord Kindersley described the January increases in savings as reflecting the satisfaction of the people with the war situation. "We are," he said, "keeping in step with Russia and the Eighth Army by our savings."

Hitherto, attention to the savings campaign has concentrated on whether or not it was adequately helping to fill the inflationary gap. The present value of saving, as a means of reducing unnecessary consumption, has obscured the future value of saving, as a means of providing the wage-earner with something to fall back on after the war. It is, therefore, very important to decide whether small savings are at all equally spread over the wage-earning population, or whether they are highly concentrated in certain parts of it. If the latter, then the main social effect of war savings will be to consolidate a section of the wage-earners as a special property-owning class, the class of the rentier proletarians.

Data on saving by wage-earners are scarce, but an inquiry has been made by Mr Charles Madge, under the auspices of the National Institute of Economic and Social Research, which will shortly be published as an "Occasional Paper" by the Cambridge University Press. Details were collected in Leeds during 1942 about the saving and spending of a random sample of 1,304 wage-earning families. In this article, use is made of the results shown by 715 families where saving and spending added up to the income for each family, within a small margin, and which may therefore be considered substantially accurate.

The figures show a remarkable tendency for National Saving to be concentrated among a few families. Of wage-

earning families, that is, excluding those who derive their income from pensions, 44 per cent were not contributing at all to National Saving, while 30 per cent saved more than 2s. 6d. a week, and their saving made up 90 per cent of all National Saving by wage-earning families. It was similarly shown that 18 per cent of families saved more than 5s. per week and contributed 76 per cent of total National Saving; 9 per cent saved more than 10s. a week, contributing 56 per cent of total saving; and 3 per cent saved more than 25s. a week, contributing 31 per cent of total saving. A small number of families clearly contributes a phenomenal amount of the total saving. In the future, this small group of families, if it keeps on saving at the present rate, will have a tidy sum put by at the end of the war. But for the great majority of wage-earning families there will be little or nothing.

If the small group of high-saving families is examined in more detail, it is possible to make some cautious generalisations. As a rule they are families which, when they have paid rent and rates, income tax, state insurance, travelling expenses and the cost of food, fuel and clothing, have still got an "excess income" of £2 10s. or more. On an average, and subject to variations in the membership of different families, this means that heavy saving will tend to begin with a gross family income of more than £6 10s. a week. It should, however, be stated that not all the heavy savers have so much as £2 10s. in "excess income," nor are all those who have £2 10s. in "excess income" heavy savers. There is another variant—the individual's or family's propensity to save. Those with high "excess incomes" who are not saving appreciably tend to be spending the money on furniture instead. It also appears that high savers spend less on food, alcohol and tobacco than low savers, though both groups spend the same amount on clothes. This suggests that there is still a marginal or "luxury" element in food spending, to which saving may be the alternative.

The Leeds inquiry shows that in saving other than National Saving—for instance, industrial assurance, super-annuation schemes, and so on—there is a correlation between thrift and social grade: skilled manual workers save more than unskilled, and black-coated workers save more than manual workers, irrespective of their income levels. This correlation does not appear to exist in National Saving. Moreover, the proportion of income saved by insurance methods decreases with rising income, so that, in terms of Engel's Law, insurance saving behaves like a "necessity." National Saving, on the other hand, forms an increasing proportion of income as income rises—in other words, it behaves like a "luxury."

Among wage-earners, in fact, National Saving is still a new habit and, in their eyes, a luxury one. It is not clearly related to social grade or even to income at the lower income levels. In practice, the heavily saving families are most typically the childless families, especially those where the wife is working as well as the husband. Under such conditions, the joint earnings of husband and wife commonly raise the family income to the level at which, as has been said, National Saving may be expected to occur on a large scale. It is such families, presumably, which will also be getting substantial "post-war credits" refunded to them. One great advantage of the "post-war credit" is that it provides a large number of wage-earners with a small capital sum, irrespective of their propensity to save. The voluntary saving campaign has not the same advantage. It is not claimed that this Leeds survey is necessarily typical of the rest of the country. But the results are certainly suggestive. It is also of interest that similar results have been observed in Germany, where (according to Dr Singer in an article in the *Economic Journal* of December, 1942): "Budget enquiries have led to the startling conclusion, much discussed in the journals, that savings come mainly from the middle classes, and that workers save very little."

NOTES OF THE WEEK

War and Distribution

The war of production has become a war of distribution. This is well illustrated by the conferences and conversations which have taken place in Africa, Turkey and Brazil recently. For obvious reasons, not much is known about what was actually said at these meetings; but it is obvious that their one common theme was the problem of supplies. It is not only a question of the deployment of war material. In last week's *Economist*, the serious food position in India was discussed. On another page this week, the food shortage in North Africa is examined. In the Middle East, food supplies are the basis of every political consideration. As the war intensifies, production, both industrial and agricultural, grows, but shortage spreads. The offensives which were worked out in detail at Casablanca depend entirely upon the movement of supplies and transport. The urgent requirements of Turkey, which Mr Churchill discussed at Ankara, are supplies of war equipment and civilian necessities. The three threats to world supplies are distance, shipping space and the U-boat campaign. In Brazil, President Roosevelt no doubt discussed the defence of the vital supply line which runs northward along the long Brazilian coast. The crucial fact which emerges in this, the preliminary phase of the most intensive fighting of the war, is that concentration on world war means world shortages—however high world output may be. Everything is scarce in total war. The urgent need to check the successes of enemy submarines is underlined by the double necessity to bring Allied war output to the decisive theatres in time and, simultaneously, to feed and nourish all friends and allies. The call to cut down every surplus in the consumption of Britain and the United States is underlined equally. And there is a warning for the post-war period. The U-boat menace will then have been ended. But distance and shipping space will remain limiting factors. In order that the promise to supply a world ravaged by war may be matched by performance, it will be necessary to maintain, for no short time, the most stringent restrictions on every kind of otiose consumption, whether of food or materials.

Demmed Elusive

The attempt to keep up with Mr Churchill's peregrinations seems to be causing the *Wilhelmstrasse* something of a headache. The official spokesman was reduced to speechlessness by the news that on January 30th and 31st, when the Nazi bosses were engaged in anniversary celebrations, the British Prime Minister, accompanied by an imposing diplomatic and military suite, put up his caravan for two days in a Turkish railway train at Adana. Apparently, it was not until February 2nd that Papen, who as German Ambassador in Ankara might be expected to be closely in touch with developments, had an interview with the Turkish Foreign Minister, M. Numan Menemencioğlu. The flying visit is an illuminating commentary on the military defeats which Germany has suffered in Russia and North Africa. The content of the discussions between President İnönü and Mr Churchill is only very partially revealed by the official statement. Obviously, the supply of material aid—under Lend-Lease and under the terms of the Treaty of Mutual Assistance of 1939—must have bulked very large. Only in recent months has the equipment, whose supply was originally pledged by France and Britain and later by Britain and the United States, arrived in reasonably large quantities. Even in the military crisis last summer, when a German army was rapidly advancing on the Caucasus, supplies of modern weapons, of tanks, guns and aircraft, cannot have been adequate. It is only now that "general defensive security" is becoming a reality rather than a heroic aspiration. It is almost more important that Mr Churchill and President İnönü reached agreement on post-war problems. Last December, the Turkish press showed some anxiety lest Mr Eden's statement on the rôle to be played after the war by the four great military powers among the United Nations would in some way prejudice the independence of small states. There was some doubt whether, even in the Allied post-war world, the voices of the smaller nations would be heard effectively. In spite of the renewed friendship with Russia, there was

inevitably increased fear in Turkey for the integrity of the Dardanelles. The future course of the war was certainly discussed at Adana; perhaps the possibility of joint action in new areas was raised. But more important was the satisfactory resolution of those supply difficulties which have hitherto rendered Turkish neutrality so vulnerable and of those misunderstandings which have tended to obscure post-war policy.

The Eastern Mediterranean

The Prime Minister's visits to Turkey and Cyprus have brought the eastern Mediterranean and its military potentialities into the limelight. The press has been warned against reading too much into the communiqué on Mr Churchill's journey to Turkey. But some of the military and political elements of the situation are clear enough. First, there is the obvious fact that the Allied armies in the Middle East (Iran, Iraq and Palestine) have been set free by the conclusion of the Libyan campaign. They may either be used against the Japanese in Asia, or they may add to Allied strength in storming the European fortress. The priority which the European theatre of the war is being given in Allied war schemes seems to leave little doubt which way the decision has been taken. After the clearing of the eastern Mediterranean from the enemy, the feeling in Turkey is one of supreme relief. The nightmare of German conquest has faded; and the time of neutral timidity has gone. Turkey's self-confidence can only be strengthened by the knowledge that whatever the dangers ahead, a new Allied force is ready to cause an additional drain on the overstretched armies of the enemy. The chapter of defence has been closed in the eastern Mediterranean, too. And Cyprus, which was a defensive outpost for two and a-half years, may now be the potential stepping stone for an Allied offensive. It was there that the Prime Minister spoke of "the light breaking in the sky which will herald a day when Greece will be delivered." The Axis commands have now the unpleasant task of guessing what is going to be the next Allied move. But whatever guess they make, and whatever decision they take, the result can only be a further dispersal and stretching of their manpower and weapons.

Air Power

Whatever the state and amount of the air equipment now vouchsafed to serve the Navy, and the Mercantile Marine, it is plain that these needs have been only ill-served in the past. The appointment of a new Fifth Sea Lord to take responsibility for the equipment of the Fleet Air Arm was an admission of criticisms which had long been made. In last week's Lords debate, when blame for earlier shortcomings was thrown by various speakers upon the Admiralty, the Air Ministry, the Ministry of Aircraft Production, the aircraft industry and the Cabinet, one thing was clear, even in the apologia of the Government spokesmen—the planes supplied for sea purposes have been inadequate in both quality and quantity. Nor can it be said that this is excused by the priority of more urgent requirements. There has never been any more urgent requirement than the protection of British shipping. Miracles have been done with insufficient material. Now, when shipping is more crucial than ever, it is to be hoped that there will be no more deficiencies either in equipment or in organisation. Especially, it is to be hoped that the old inter-Service controversies will be allowed to die down, and that the use

FULL EMPLOYMENT

The recent articles and letters in *The Economist* on the ways and means of securing Full Employment after the war have been reprinted as a pamphlet. Copies are now available (price 6d.); and applications should be made to *The Economist*, Brettenham House, Lancaster Place, London, W.C.2. (Tel. Temple Bar 3316.)

of air power at sea will from now on be applied according to the doctrines, and under the command, of the kind of combined strategy which alone is likely to be effective in modern warfare. The demand last weekend of a meeting of merchant seamen for more aircraft protection for convoys was apposite. It is a demand that the whole nation may echo.

The Rainy Season

No appreciable progress has yet been made in Tunisia. The military experts agree that the rainy season makes a big push impossible just now. If this is really the case, large-scale campaigning will not start for some weeks. The enemy is gaining valuable time. It looks as if Allied action was too slow or too slight to prevent a junction between von Arnim's and Rommel's armies. In the Pont du Fahs region, the Germans have gained some ground, and in the south they seem to have established a fairly strong defence line from the Faid pass down to Maknassi. Rommel is still able to use the coastal corridor between Tripolitania and Tunisia. A point which deserves attention is the reported appearance of the heaviest German tanks in the fighting. There is some discrepancy in the reports, but several speak of 62-ton tanks armed with 88 mm. guns—a type of tank not used in Africa before. It needs a very detailed knowledge of the local terrain to explain why the rain, which so impedes the Allies, has not prevented the enemy from using such heavy tanks on muddy ground. The suggestion that the Allied forces in Tunisia are not yet adequately equipped to meet a heavily armed, though numerically weaker, enemy may be right; and the position may well change altogether when the manpower and the equipment of the Eighth Army is thrown into the scales. The layman has to suspend judgment until the sun or Montgomery clears the rainy skies.

Clearing the Air

So far the only concrete result of the meeting between General Giraud and General de Gaulle at Casablanca is that the two movements are to exchange missions. This liaison is better than no contact at all, but, by itself, it is obviously very unsatisfactory. M. Massigli, the most recent arrival from France and a distinguished diplomat, has testified to the fact that in France de Gaulle and Giraud are both synonymous with resistance and as such are linked in men's minds. That belief must be made a fact. It can at least be said of the Casablanca meeting and the various pronouncements which have followed it that the psychological atmosphere has been improved. General Giraud's generous tribute to de Gaulle and the greatness and rightness of his stand for the last two years will not only help Fighting French opinion. It will do something to silence a lot of unworthy and damaging chatter in the United States about the running of Fighting France by the English for their own—presumably sinister—ends. Similarly, General Eisenhower's statement on the complete unity of British and American officials in North Africa and Mr Eden's plea to the Commons that the North African arrangements should be given a fair trial should put an end to the artificially exaggerated resentment felt by Americans over British criticisms of North African policy. A thinning of the psychological clouds over the French situation will let in more daylight on the crucial problem—fighting the Germans. The fight will obviously go better if Britain and America, de Gaulle and Giraud are at one in their policy and arrangements. The resources of resurgent France are still so small that they must be pooled, just as, with the arrival of General Leclerc's army from Chad, they are being co-ordinated on the Tunisian front. General Giraud has stated his views on unity—anyone may join who wishes to fight the enemy. The criterion is sound and, if applied to the followers of both Generals, could be the basis of fusion on a sound and representative basis. General de Gaulle's movement is, on this criterion, too narrow. Many excellent men—one need only think of Admiral Muselier—who wish to fight the Germans, are excluded. General Giraud's movement is too wide. It is difficult to be convinced by the General's defence of the time-server, Peyrouton; and the military position is too delicate to leave men in places of trust whose loyalties can suffer a pendulum swing with every change in the fortunes of war. If the leaders feel unwilling to take these steps,

America and Britain, from whom come all the military supplies and on whom will fall the political consequences, must with all possible respect make this point of view prevail.

Old and New Battles

On the Russian front, old battles are being brought to a victorious end and the ground is perhaps being prepared for the opening of new ones. The epic of Stalingrad has found its epilogue in the surrender of Marshal Paulus with twenty-three other German generals and the remnants of their armies. The dramatic scene of the surrender—as reported by Soviet sources—has no precedent in the history of this war, at least since the French capitulation at Compiègne. The battle of the Caucasus, too, has run its course. The Maikop oil fields are back in Russian hands, without having contributed a drop of fuel to the petrol tanks of the Panzer divisions. If the German drive to the Caucasus was really actuated by the thirst for petrol, then the oil balance of the campaign must now show a very heavy deficit which may severely affect German mobility in future operations. The reconquest of the western Kuban valley, with Krasnodar and Novorossisk, can now be taken as certain. The enveloped German force there is probably much smaller in size than was von Paulus' force at Stalingrad; it has consisted mainly of Alpine divisions picked for the special task of crossing the Caucasus mountains. Further to the north, about half-way between Rostov and Voronezh, the Russians have pushed forward from Svatovo towards the Donetz. Here, the shifting front line has again taken the shape of a wide bulge, based on Rostov in the south and on the Donetz in the north; inside that bulge lies the famous coal basin, the recapture of which may ease the strain on Russia's fuel resources, just as the recapture of the Caucasus and the Don region before the spring sowing may better the food position in the second half of this year. Still further to the north, east of Kursk and Kharkov, the Russians have intensified their activity during the past week. And the possibility of a resumption of an offensive towards Kharkov cannot be ruled out; this time the Russians may have more success than they had during Timoshenko's offensive in May last year.

Aid for Russia

Lord Beaverbrook has apparently decided that the Second Front should be opened in Russia itself, in the form of much larger direct assistance to the First Front. "We must send supplies to our Russian friends and support the Red Army in a daring offensive of our own," he told the House of Lords on Wednesday. He recognised that supplies had already been sent on a considerable scale by this country—nearly 3,000 tanks up to the end of last year (according to Lord Portal, who replied) and nearly 2,500 aircraft. His point was that these totals are very small beside the masses of metal and equipment which are being used by both sides on the Russian front. Britain's actual commitments to the Soviet Union, he admitted, have been fulfilled; but the necessities of the war, he argued, now demand more. Germany is being beaten in Russia; the "soft belly" of the Axis is there, softened by Russian blows. It would be interesting to know the views of Premier Stalin on Lord Beaverbrook's plea. Plainly the Russians would like as much direct aid as can possibly be sent. But it seems no less sure that they want a Second Front elsewhere in Europe with the utmost speed; and Lord Portal's contention that the African offensive, which is the prelude to an attack on Europe, necessarily limited the scope of extra shipments to Russia was pertinent. Moreover, transport difficulties and dangers themselves set a limit to the cargoes that can successfully be shipped to the Soviets. On the other hand, it is unmistakably true that no effort must be spared to increase the weight behind Russia's killing blows; and the earliest practicable opportunity must be taken to join forces with the advancing Russians in the north or in the south.

Money and the Exchanges

Sir Kingsley Wood's reference to post-war monetary policy were notable for one exclusion: not once was the word "gold" mentioned. In the view of the Chancellor,

the basic objective to which monetary and economic policy must be subordinated is "active employment for our people." He expressed the hope that, by maintaining essential controls during the post-war period of shortages, it will be possible for the price level in this country to settle down "at a figure not far different from what it is at present." If that objective is to be achieved, it will call for tremendous technical operations designed to mop up and fund the pent-up volume of purchasing power that will be liberated in the early post-war years. It was in his references to the international exchange mechanism that the Chancellor was most explicit and informative. He visualised the creation of an international monetary authority which would provide orderly and agreed methods of determining the value of international currency units and which would eliminate the danger of each nation, by unilateral action, seeking to restore its competitive position by exchange depreciation. The mechanism would not be blemished by blocked balances or bilateral clearings. It would

free the international monetary system from those arbitrary, unpredictable and undesirable influences that operated in the past as the result of large-scale, unco-ordinated speculate movements of short-term capital.

The mechanism thus envisaged is obviously of the multi-lateral clearing type, operated by central authorities in each participating country, and subject to the control of an international authority whose decisions would clearly have to be backed by sanctions of some form if they were to be effective. That authority would have to exercise the control over international investment which Sir Kingsley Wood envisaged as part of the post-war financial mechanism. These are the lines along which the great minds at the Treasury are working. They conjure up a system of financial controls into which the former pattern of the international banking system may not find it easy to dovetail. It will take ingenuity and patience to reconcile the control of exchanges that will be required to prevent "undesirable" movements of short-term capital and the control of overseas investment with that freedom of enterprise and initiative which Sir Kingsley Wood regards as essential to the functioning of a "very large part" of our industry.

Hopes and Promises

The speeches and Hitler's proclamation on the tenth anniversary of the Nazi regime all struck a common note. A parallel was drawn between the position of the Nazi party shortly before January 30, 1933, and the position of Germany now. Then the Nazi party had suffered a big reverse; now Germany, fighting the same enemies in a world war, has suffered a serious setback. All the speakers argue that, as they won through in 1933, so will they triumph this time. The prolonged German resistance at Stalingrad has given the Nazis the chance to add more to their stock of legends, and it has served as a symbol of Germany's selfless fight against Bolshevism for the sake of European culture. Gone is the proud claim of Goebbels that the war is being fought by Germany for the vast economic resources of the Soviet Union. Instead, Germany appears once more as the saviour of the world against the Bolshevik terror. Britain, Goering said, should be fighting on Germany's side in this fight; and the Bolshevik bogey is being used in an attempt to lessen the ardour of Britain and the United States in their fight against the Nazis. But not even Goering, Goebbels and Hitler can hope that this sinister leaven will work with any rapidity in the Allied ranks. The one thing Germany must do, whatever may happen later, is to make a successful stand against Russian arms. There is no doubt that the Nazi leaders do think that a last great effort by the entire German people will enable them to get through the coming year. Germany is on the defensive. But one tradition in Germany is very strong; a mere defensive is impossible and tantamount to defeat. They must attack while they defend. And it is for this purpose, for attack as well as for the vast task of defence that has been forced upon them now, that the Germans are being asked by every means of propaganda for their last ounce of strength. Goebbels has used all his oratorical skill to point out that the common people of Germany will have the satisfaction now of seeing well-to-do people and, particularly, the idle rich ruthlessly compelled to do war work. This is no mere demagoguery. It is a necessity. This is the basis of the Nazis' last great effort. They are determined to continue the war; and the hopeless resistance at Stalingrad shows the power the regime still has over its soldiers. The fact that Hitler made no appearance on January 30th is being used to present him again as the

undaunted leader. Outside Germany, Hitler is already revealed as a supreme blunderer. Inside Germany, he is still displayed as the man who will save Germany, Europe, and the world from Bolshevism.

The Civil Service

The Government has gone a little way towards meeting the criticisms and recommendations put forward by the Select Committee on National Expenditure about the organisation and control of the Civil Service. But Sir Kingsley Wood's statement will not do much to satisfy the more impatient critics of the Government machine. He announced in the debate in the House of Commons last week that an investigation is being undertaken into the recruitment, training and retirement of civil servants, and that the proposals of the Select Committee for a Staff College will be given careful consideration. On the question of Treasury control, the Chancellor agreed that some official of a higher status should undertake responsibility for organisation and methods of work, but he would not concede that a third Joint Secretary should be appointed to deal with establishment matters. The issue of the relationship between the Treasury and Government departments remains where it was. The debate, which is apparently the first on the subject of the civil service to be held in the House of Commons since the war, was on the whole valuable and constructive. Tributes were paid on all sides to the wartime performance of the 700,000 civil servants now employed. The criticisms directed against civil servants are now familiar; they are slow, unwilling to take decisions and ready to "pass the buck." But these criticisms, which are not wholly unjustified, are due primarily to the present system of recruitment and organisation, to the peculiar methods of promotion in the service and to the relatively low standards of remuneration. The defects, no less than the peculiar virtues, of the civil service have been shown up in wartime, when initiative and imagination are qualities which rank as high as integrity and devotion to duty. An enquiry into the recruitment and training of civil servants would not solve the immediate problem of improving wartime efficiency; but it could, nevertheless, be directed to ensure a wider opportunity of entry into the service and the utilisation of qualifications that will be essential in the problems which the Government will have to face in the post-war years. The reform of the Foreign Service has set the pace for its larger colleague.

Consider the Mosquito

Few raids can have given the British people more human satisfaction than the raid by Mosquito bombers on Berlin which sent Goering to his cellar and delayed his January 30th speech by a full hour. Goering is the Nazi leader most closely connected with the savage raids on Britain and with a shape and character most apt for deflation. The Mosquitoes' repeat visit in the afternoon to disturb Goebbels rounded off—with only one plane lost—a joyous occasion. The performance of the new Mosquitoes should

INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

give the British people more solid grounds for satisfaction than even this superbly executed cocking of a snook. At a time when gloomy critics talk of the decline of British enterprise and of Britain's un-competitive position in the post-war world, it is no bad thing to consider what British designers have evolved and British workers executed under the stimulus of war. The output of the war factories, man for man, still leads the world—in itself a tribute to the technical skill of managers and workpeople. The argument from design—the design of the Spitfire, of the Lancaster, now of the Mosquito—is even more encouraging. It must have taken imagination and daring to conceive a Mosquito—built all in wood, with a top speed of perhaps 430 miles per hour, and 2,000 horse-power engines, carrying a bomb-load of 2,000 lb., yet, when the bomb-load has been dropped, outpacing the fastest fighter. These wooden aircraft are not built just for cocking snooks, as the Germans know well by now. In a series of day raids they have executed notable destruction on plants and factories in Europe. They prefaced the trip to Berlin by a devastating raid on the Diesel works at Copenhagen.

More Womanpower

The German attempt to find women for war work by added compulsion is discussed on page 182. Britain's mobilisation of womanpower has been virtually complete for some time. The only reservoir left is the small number of married women without children who have no jobs other than their own domestic duties. Mr Bevin now intends to call on these. It should be noted that he has always had power under Regulation 58A to direct anyone to do any work, but in practice he has not used his powers to direct women to part-time work. The result has been that women with homes to run have been exempt from war work because their domestic duties have been considered a valid reason why they should not undertake full-time work outside their homes. Many of them are already, of course, doing part-time work in the Women's Voluntary Services, the Red Cross, in wartime nurseries, and so on. But there are others who are not, and, in any case, Mr Bevin's new application of his powers should ensure that the part-time work done by women with home ties is really worth while. Women with children under 14 living with them will be exempt. The other new measures announced by Mr Bevin last week are the amendment of the Employment of Women (Control of Engagement) Order, to include women from 18 to 40 years of age instead of 30 as at present, and a new Order requiring compulsory notification to an employment exchange when a man or woman leaves employment. These two measures are to ensure that the Ministry of Labour keeps track of all men and women when they change their employment. The first means that women up to 40, except those with children under 14, can only obtain employment and be engaged through an employment exchange, with the exception of certain specified employments. As a result of the other measure, all employers will have to notify an exchange when any of their workers up to pensionable age (65 and 60 for men and women respectively), whether full-time or part-time, leave their employment. Thus, though the new measures will not secure any large new supplies of man-

power for war work, they will, or should, ensure that every man and woman is doing a job which the Ministry of Labour considers to be necessary in the national interest.

Catering Wages Bill

Mr Bevin's eagerly awaited Catering Wages Bill has now been presented to Parliament. The Bill proposes to establish a Statutory Commission, which will be empowered to examine the arrangements for regulating the remuneration and conditions of employment in the catering trades; to report where these are adequate or can be made adequate; and to make proposals for the establishment of Wages Boards where the arrangements are inadequate or non-existent. The Commission is to consist of not more than seven persons, and will include independent members and people qualified to represent the views of employers and workpeople who are not themselves directly connected with the trade. The workers covered by the Bill are all those employed in an undertaking engaged in the supply of food or drink for immediate consumption, or providing lodging accommodation. If the Minister of Labour decides, on the basis of the Commission's report, to establish a Wages Board, he will issue an Order accordingly. The Wages Boards will be composed of not more than three independent persons with representatives in equal numbers of the employers and workers. They may submit to the Minister proposals for fixing rates of remuneration, either generally or for any particular work, fixing the intervals for meals or rest, and holiday arrangements. The Wages Boards may make recommendations in connection with health and welfare facilities and on "any matter affecting the efficiency or development" of the section of the industry with which it is concerned. It will be free to deal with the question of tips. These proposals seem modest enough, and it is difficult to see why, in themselves, they should have given rise to such intense opposition. Judged by the text of his Bill, Mr Bevin does not suggest imposing immediate regulation on the whole of the trade; and, presumably, if the conditions of employment are shown to be already satisfactory in any branch, there will be no occasion to introduce wages board machinery. The Minister may be assumed to have Cabinet backing for his Bill; and it may still be that not all the 200 Conservative MPs who originally expressed their determination to oppose the Bill will be prepared to carry their opposition into the voting lobby.

Town and Country Planning

The Archbishop of Canterbury, at a Conference on "Planning for Living" held at Canterbury last week-end, issued a salutary warning that the term "planning" might become "a smoke screen behind which designs, either based on abstract theory or prompted by selfish interests, are promoted." It is clear that the Town and Country Planning Association are thinking along concrete and socially desirable lines. Mr F. J. Osborn, the Secretary of the Association, described a scheme for decentralisation which would prevent the conglomeration of population in large cities and encourage the settlement of industry and

people in small or medium-sized towns. Many existing towns could be developed and some 40 or 50 new towns could be built under a system of satellite towns, each with an independent social life but linked economically to the parent cities. A city the size of London might have 10 or 12 such towns, Birmingham three or four, Manchester and Liverpool two or three, Bristol and Southampton one or two, and so on. Unless something on these lines is planned, there is a real danger that country towns, which have progressively declined in recent years, may sink into permanent economic depression. Contrary to some agriculturalists, Mr Osborn thinks that whatever national policy to develop agriculture is adopted, the numbers engaged in farming will certainly not increase after the war, and are more likely to decline with the introduction of large-scale and mechanised farming, so that the *raison d'être* of most country towns—the marketing of agricultural produce—may shrink. Such a scheme might revitalise these towns and give them prestige and a new social and cultural life. It might arrest the drift of population to the large industrial centres, without artificial and costly stimulants, where the recommendations of the Scott report might only intensify the division between town and country by creating artificial barriers and by isolating country dwellers from the impact of industry. There is no reason why factory life should not be carried on in healthy surroundings, and with a well-developed transport system the old arguments of the advantages of placing firms near their markets and the centres of commerce have lost much of their validity.

Child Casualties

The country was naturally shocked when it read of the bombing of the LCC school at Lewisham, when 42 children lost their lives. Similar feelings were aroused by the bombing of the boys' school at Petworth last summer. Yet 1,315 children were killed on the roads in 1942, and the country does not shed a tear. Partly, of course, this confusion of sentiment is due to the fact that road accidents do not as a rule affect more than one or two children at a time; an accident to a charabanc carrying 30 children on a pleasure trip would perhaps stir the national emotions as strongly as did the bombing of Lewisham. There is, too, the feeling that bombing is deliberate. Whether the German pilot knew he was bombing a school or not, he knew he would kill someone by his bombs, just as an RAF pilot knows he will kill people, including children, when he bombs Germany. But it is surely wrong to allow this factor to dominate the emotions too strongly. War is deliberate killing, and a nation which goes to war must accept the killing of children as one of war's inevitable horrors. But the killing of children on the roads need not happen. It is the result of negligence, sometimes criminal negligence, but more often pure carelessness, and the nation's conscience should be moved far more deeply than its emotions are by children's deaths in air-raids. Since the beginning of the blitz in September, 1940, about 5,500 children have been killed in air-raids. From the beginning of 1940 to the end of last year, nearly 4,000 have been killed on the roads. Although total road deaths in 1942, at 6,926, were 2,243 fewer than in 1941—an improvement probably entirely due to the reduction in vehicles on the roads—children's deaths, at 1,315, were only 147 fewer, and were actually 138 more than in 1940. It is easy to explain these casualties to children by the preoccupation of their parents with work and their consequent inability to supervise their children. But to explain is not to excuse the parents themselves; the local authorities for not providing playgrounds where children enjoy playing; the police and the magistrates for not enforcing the traffic laws and for letting careless motorists off too lightly; and the band of motorists themselves. What is wanted is the full awakening on the part of all concerned—which means the whole country—to the needless, senseless tragedy taking place on Britain's roads, not every now and again, but day by day and hour by hour.

War Damage

The main object of the War Damage (Amendment) Bill, introduced in the House of Commons last week, is to alter the formula for determining whether a bombed building should be classified as a total loss, qualifying for a "value" payment, or whether it is worth restoration, qualifying for a "cost of works" payment. The War

Damage Act of 1941, as amended by the First Schedule to the War Damage (Amendment) Act, 1942, provided for three tests, namely, an estimate of the cost of making good the damage; an estimate of what the property would be worth in the market if and when the damage is made good; and an estimate of what the site would be worth in the market for redevelopment. No difficulties have arisen in determining which of the two varieties of payment are applicable in the case of slightly damaged buildings. But when houses have suffered severe damage it has been difficult to apply the formula, for it is almost impossible at this stage to forecast the course of building costs and the market price of buildings. As a result, the work of the War Damage Commission has been held up and owners of severely damaged buildings had no means of knowing whether they would ultimately qualify for a cost of works or a value payment. In view of the difficulty of applying the original formula, the Government has decided to substitute for it estimates based on prices and values at the end of March, 1939. Thus, in future the test will be whether or no a building would have been worth restoring at the pre-war level of building costs and values. The new Bill, in fact, removes an anomaly in existing legislation and its provisions should enable the War Damage Commission to reach an earlier decision about the classification of severely damaged buildings.

Shorter Notes

During November one person, a British subject of enemy origin, was detained under Regulation 18B. At the end of the same month, 491 persons were detained under the regulation, of whom 74 are cases in which the recommendation of the Advisory Committee that they should be released has not been accepted.

In *The Economist* of January 23rd, in a note on the Roumanian war losses, on page 102, it was erroneously stated that some 500,000 Roumanians had been killed. This is, in fact, the estimated figure for all losses—killed, wounded and missing. Taking the official German figures issued for the first fifteen weeks of the war as an average, it is possible to estimate that 113,655 men have been killed, 430,950 wounded, and 85,000 are missing. This total of casualties is a little over the 500,000 mark, and is probably substantially correct.

Total income of the Unemployment Fund last year was £78,476,000, and the expenditure on benefit, cost of administration, etc., was £6,656,000. The income on the agricultural account was £1,593,000 and the expenditure £355,000.

More than a century's accumulated business experience and conservative progress form the background of the comprehensive service which the Westminster Bank is able to place at its customers' disposal.

The Bank's vast resources, its constant touch with current affairs and its extensive system of branch offices in England and Wales and agents elsewhere, combine to enable it to offer a wide range of facilities, details of which will gladly be given on request by the manager of any branch.

AMERICAN SURVEY

Why Renegotiation? (From Our New York Correspondent)

THE United States had been immersed in the Second World War only a few weeks when two news stories served to focus the attention of the nation and Congress on the need for effective anti-profiteering legislation. In the first of these stories the ghost of World War I walked again. It was the story of a decision handed down by the Supreme Court on February 16th last year in a suit instituted twenty years ago by the United States Government to recover from the Bethlehem Shipbuilding Corporation what it termed "unconscionable" profits made by that concern on shipbuilding contracts in 1917 and 1918. The Court in a six-man decision found for the company four-to-two; but the public was perhaps more interested in the statement of the Court from which the finding largely flowed, namely, that the profits of 22 per cent made on the contracts involved were not "grossly in excess" of others of that period. "If profits earned under Government contracts in general (in the World War I period) are taken as the standard of comparison," said Justice Black in his review of the case, "the 22 per cent claimed here is overshadowed in too many instances for it to be regarded as extraordinary." And in concluding the Justice marked out the boundaries for a controversy which was to find Congress split into at least three major groups over war profits policy in the ensuing months. He said:

To meet this recurrent evil [profiteering] Congress has at times taken various measures. It has authorised price-fixing. It has placed a fixed limit on profits, or has recaptured high profits through taxation. It has expressly reserved for the Government the right to cancel contracts after they have been made. Pursuant to Congressional authority the Government has requisitioned existing facilities or itself built and operated new ones to provide needed war materials. It may be that one, or some, or all of these measures should be utilised more comprehensively, or that still other measures must be devised.

Congress was shortly to be presented with evidence that profiteering had not passed into history with World War I. A Senate committee, checking the war contract performance of industry, brought to light in March a case which, though in no sense representative, invited nationwide attention to the fact that excess profits taxes alone are not a specific for the evil of profiteering. This was the almost fanciful story of a comparatively small mid-west concern engaged in the manufacture of self-starters for airplane motors. The company, testimony revealed, paid out bonuses in 1941 amounting to \$949,000, thereby, according to counsel for the investigating committee, reducing its Federal tax liability from \$906,000 to \$172,000. The secretary to the president, who had received an annual salary of \$4,448 before the war contracts began to roll in, was paid \$39,000 in 1941. The assistant controller, who had been a \$2,300 Government employee in the pre-war days, received a \$10,000 bonus before he had been with the company two months. Six hundred and fifty thousand dollars was distributed during the year among the employees in the plant, who worked day and night to the morale-sustaining strains of phonograph recordings (of which the company boasted a library of 10,000), and who received free lunches, free dental care, free medical care and hospitalisation in maternity cases, a monthly bonus of a \$50 war bond per person and at Christmas time a cash bonus, a turkey and an 18-jewel wrist-watch.

Stirred by this and other less spectacular examples of waste in connection with war contracts, Congress decided to implement its tax programme with more direct control over production costs and profits. In the House, a Bill was passed setting a statutory ceiling on such profits of 6 per cent of costs before taxes. For a time it appeared that the Senate would follow suit. The Appropriations Committee sent to that body a proposal for, not one, but a series of, ceilings ranging from 10 per cent in the case

of small contracts to as low as 2 per cent on the largest. But the Senate, not convinced when it came to the test, voted down the recommendations of its committee, electing, instead, to strengthen the provisions of the Second War Powers Act. The central feature of the new measure, which was attached to the Sixth Supplemental National Defence Appropriations Act of 1942 and became law in the last week of last April, was the mandatory inclusion in all war contracts of renegotiation clauses.

The Revision of Contracts

Renegotiation is carried out by Price Readjustment Boards of the War Department, the Navy Department and the Maritime Commission. It sometimes originates with the contractor, but ordinarily the Government takes the initiative: (1) the Government may wish to make a new contract; (2) increased volume of production may suggest the need for a revision of cost estimates; or (3) some question may have arisen as to the contractor's performance or prices.

The point which is constantly emphasised by the renegotiation authorities is that what they are primarily interested in is not, as many persons believe, the recapture of excessive past profits, but the achievement of minimum costs on future war goods production. The Act, it is true, operates retroactively, and in consequence renegotiation does frequently result in a contractor's having to return some of his past (excessive) profits; but this, it is stressed, is an incidental effect rather than a major purpose.

The renegotiation statute has been, and still is, the subject of a good deal of criticism. Not a little of it has arisen from uncertainties and omissions in the original Act, many of which have been cleared up in a group of liberalising amendments passed as part of the Revenue Act of October 22nd last. Among the more important of these amendments are the following: (1) renegotiation is now authorised on an over-all basis, rather than contract-by-contract, thus not only simplifying enforcement, but enabling the contractor to offset contracts on which he has taken a loss with contracts yielding him better than normal profits; (2) credits are specifically allowed to contractors for any excess profits taxes paid on excessive profits found under renegotiation; (3) the fear has been dispelled that contracts might be subjected to repeated renegotiation until three years after the war by establishing definite time limits for renegotiation; (4) the Secretary of any Department is authorised to make "final agreements" with contractors after renegotiation, providing that contracts may not be reopened, except on evidence of fraud, malfeasance or wilful misstatement of fact; and (5) certain contracts are specifically exempted from the requirements of renegotiation.

Some of the criticisms advanced must be accepted as having a certain amount of validity. It is charged, for example, that the statute permits the Government to revise its bargains at the expense of the contractor; that it provides no standard by which the fairness of profits may be determined; that it leaves the contractor uncertain about his profits and his financial position, and that it penalises the efficient producers. The more open-minded advocates of renegotiation admit that there is some substance in these complaints.

What are the unusual conditions which may be said to justify the granting of such sweeping discretionary control over war costs and profits? In wartime, materials of all kinds are required in unprecedented amounts and with a minimum of delay. Companies find themselves called upon to produce articles in the manufacture of which they have had no previous experience. Many of the articles are new, and the quantities required and the rate of delivery must frequently be revised in the light of experience and the demands of the war effort. Finally, shortages of material,

priorities and allocation interfere with its movement. Under such circumstances, original contract prices can represent at best little more than intelligent guesswork. The resulting profits often greatly exceed those originally contemplated. These profits are in no sense assumed by the Government to represent evidence of "profiteering" on the part of the contractor; on the contrary, they are regarded, to use the phrase of one official, merely as "an index of the uncertainty regarding ultimate costs that existed at the time the original contract was made."

Why cannot the same result be achieved through the excess profits tax or through a flat ceiling on profits? As to the first of these alternatives, the case of the company cited at the beginning of this article, which dissipated its earnings in bonuses and other extravagances, should supply all the answer that is required. When a large proportion of profits is taken by the EPT there is little incentive to keep costs down and hence to prevent inflation. As to a flat ceiling on profits, that is much too arbitrary. It is obvious that while 2 per cent might represent a satisfactory profit for a simple operation, such as stamping out blanks, 10 per cent might be far too small for a company engaged in a complex operation requiring a large investment in plant facility, labour and time.

The only practical remaining method is cost and price control. In normal times, competition, in theory at least, performs this function. But in wartime, when all production facilities must be utilised and when competition is automatically suspended, other means must be substituted. In the field of civilian goods and services control is exercised through the Office of Price Administration and the Economic Stabilisation Board; but it is clear that such control over the materials of war must present insurmountable problems.

Not even its friends contend that renegotiation is the perfect answer to the problem of controlling war production costs. They do contend, however, and with much force, that this technique must be compared, not with perfection, but with the alternatives that have been thus far put forward to attain the same objectives. Much, obviously, depends upon how renegotiation is carried out in practice. Because of the flexibility which it allows it is difficult to obtain uniformity of administration. Inevitably some contractors

are able to drive a better bargain than others. But this applies with equal validity to the original negotiation of contracts. In some instances this seeming favouritism is, moreover, a result of conscious policy; for the renegotiation boards are under general instructions to allow a larger rate of profit to efficient contractors who have reduced costs than to those that are less efficient. This, incidentally, is the answer of those in charge of renegotiation to accusations that it tends to penalise efficiency, and that it is nothing more nor less than a return to the discredited "cost-plus" system of the first world war.

American Notes

The New Isolationism

One obstacle to a concerted policy between Britain, America, Giraud and de Gaulle over North Africa is the existence of divergent points of view on each side of the Atlantic. The United States was not in the fight at the time of the French collapse, and Americans did not come to think of Vichy as a personal betrayal. Hence a much greater tenderness for "men of Vichy" and a greater readiness to distinguish between *attentistes* and traitors. President Roosevelt has stated his full support for the North African arrangements, including Peyrouton, as a matter of immediate military necessity and Mr Eden has confirmed Britain's concurrence, presumably on this temporary basis. But the problem is not solved because it can be shelved for the moment. It will remain a serious problem in North Africa itself; and the same question will arise, whatever point is chosen for the re-invasion of Europe. It is essential that the British and Americans should have both a joint and a progressive policy. It is a truism to say that the hopes of a post-war international order depend upon American participation in the working of that order. Such a break with isolationism depends, in its turn, upon the grouping of political forces inside the United States. The Democratic party, on the whole, supports active participation. If the Liberal wing of the Republican party—men of the Stassen or Willkie stamp—support an internationalist solution, there is hope of American participation. But the present trend of Liberal opinion is away from

FILING Cabinets placed one on top of another solved the problem of shortage of floor space at these offices of a leading National Newspaper.

Europe—an ugly and distracting area—and, to some extent, away from “imperialist Britain.” Russia and China hold pride of place as partners in world order. It is the Liberals who are attacking the North African arrangements now. The paradox is that their indignation is meat for the isolationists. The *Washington Star* went on record that:

The spite of European political intrigues which we have had since we entered North Africa has been enough to cure some of the inveterate interventionists in European affairs. Our Army and diplomatic officers, who enjoyed the full confidence of the people of this country and of their Commander-in-Chief, have been criticised. If the Russians feel that they could bring peace to a continent that has been at war for centuries so much the better for all concerned.

Recent developments have shown that we can deal with Russians in a friendly manner even more successfully than we can with others of our close friends and associates. One thing appears certain: we shall have no major disputes with Moscow over economic zones of influence or the air routes of the world.

If the isolationists can catch the Liberals by preaching the virtues of Russia, the infamies of Britain and the moral turpitude of Europe, the hopes of securing co-operation from America are slight. It is all the more urgent that the line taken in Europe by Britain and America should be mutually agreed and morally uncompromised.

Pinpricks

The withdrawal of the nomination of Mr Flynn as Minister to Australia is the first of a series of small defeats for the President which appear to be inevitable during the coming session. It appears to have been the opposition of some of the Southern Democratic Senators which forced the issue. Faced by their hostility, Mr Flynn asked the President for permission to withdraw his name, and the President consented. It is only rarely that a diplomatic nomination is refused confirmation by the Senate, and when it is remembered that Mr Flynn was until lately the Chairman of the National Democratic Committee, the breach of party discipline appears complete. This is the first time in the new Congress that the often-propheesied coalition between the Republicans and the Southern Democrats has become evident. It would be a mistake to read too deep a meaning into this rebuff. Although the nomination was never so bad as the President's critics made out, it was, nevertheless, a bad slip of political judgment at a delicate moment. The conservative wing of the Democrats will probably continue to coalesce with the Republicans on a number of domestic issues although on the major purposes of winning the war it is not likely to desert the President. On the cards are Congress inquiries into the Federal Communications Commission, war contracts, and Government payrolls. Already Congress is demanding a repeal of the \$25,000 a year salary limit imposed by executive fiat last year. Where the connection between Administration policy and the winning of the war is direct and unmistakable, neither the Southern Democrats nor the Republicans are likely to waver. Mr Flynn's defeat is no great loss, but it is a reminder of Congress' determination to be independent, and of the wisdom of conserving the President's energies and prestige for the larger issues of domestic policy on which the vigorous prosecution of the war depends.

Britain's Lend-Lease

The explosive charge that was to blow Lend-Lease sky high is turning out a damp squib and even a boomerang. What the investigation of the Senate Committee has accomplished is to give the Administration a platform from which to tell the story of Britain's contribution to the common pool. Major Spugelberg, recorder of the Army's purchasing board in the European theatre, has testified that since last June only \$1,000,000 has been spent

on purchases from British commercial sources; the major part of American requirements come from Britain as reciprocal aid; one example he cited was of the RAF stripping itself of radio equipment of a certain kind in order to turn it over to the Americans. The details of British assistance must make it plain that, in its absence, the American offensive in Africa, and air operations from the British Isles would have been greatly delayed and hampered. The Ministry of Food has arranged for American rations in this country. The Ministry of War Transport has provided shipping and met repair and harbour charges. The Service and Supply Ministries have provided materials, personnel, and the fruits of experience, in substantial quantities and almost infinite variety. The Admiralty, for example, provides fuel and maintenance and repair facilities for American ships, but of even greater value has been the sharing of information and technical knowledge on such matters as anti-submarine warfare and the development of weapons. Designs and specifications of all kinds are freely shared. Living accommodation, hospitalisation and transport have been made available, as well as anti-aircraft equipment, including radio-location; aircraft, including a number of Spitfires; anti-tank equipment; and a multitude of stores. The provision of camps alone runs to many millions of pounds. Experienced RAF officers continue to be sent to the US to act as instructors; 4,514 balloons have been shipped to provide barrages for exposed American cities. The Ministry of Supply early in 1942 shipped 12 complete shell-producing plants taken out of British munitions works. From all accounts, the vindication of Lend-Lease has been complete. Even Senator Butler, who “dreaded to think what was going on behind the scenes” of Lend-Lease, has been mollified. The sorest point, though relatively of minor consequence except to those unable to buy butter, or margarine, or meat, has been the shipment of food to Britain and Russia. On this Mr Wickard has had some enlightening things to say. Shipments of butter to Russia have been less than 1 per cent of the total supply. Of the food sent to Britain, nearly one-tenth went direct to armed forces outside the British Isles; and of the remainder, quite a lot was destined for the Services in Britain. His point that in December Lend-Lease shipments to Russia were for the first time larger than shipments to all British and colonial destinations should help to dispel the prevalent belief that Britain is the chief beneficiary under Lend-Lease.

Stabilisation Endangered?

There are signs that the wage and price controls are again in danger. Increasing dissatisfaction with the wage policy laid down in the “little steel” formula is being expressed by the leaders of the CIO and by John L. Lewis; and even the AFL has confessed it would not object to the end of the formula. Justification is to be found in the cost of living which is continuing to rise gradually. Already 21 per cent above January, 1941, the cost of living registered an increase of half of 1 per cent in the week ended December 26th, the largest increase in any week since price stabilisation came into effect last May. Advances in food prices, particularly meat, were responsible. And if the farm bloc can manage it, this is only a foretaste of what is to come. Undeterred by their defeat last autumn, the lobbyists have descended upon Washington again, hopeful that the new Congress will prove more amenable. Their programme is to revise the calculation of parity upward; to kill off the New Deal farm agencies designed to aid the smaller farmers; and to gain recognition for agriculture as a war industry, for as the head of the Farm Bureau is reported to have said: “By God, if this is a war industry, you've got to give us a price.” The fight between labour and agriculture for a larger share of the diminishing civilian cake, the recurring theme of the domestic front, is exacerbated by the rivalry between the union leaders. It looks as though another strong lead from the President would become necessary. Unfortunately it is far from certain that this Congress will accept it.

Shorter Note

The seventh monthly report of the War Production Board shows that in December output of munitions was 14 per cent above November and was the greatest on record. Aircraft production increased 20 per cent, and 5,489 planes were delivered to the Services and the Allies. The Maritime Commission delivered 108 merchant ships totalling 1,167,000 deadweight tons. Tank output has reached its peak, with a decline scheduled for 1943.

THE WORLD OVERSEAS

North Africa's Food

(By a Correspondent)

THE food position in North Africa appears in the light of recent reports to be rather tense. Old shortages have remained and grown more acute, and new ones have appeared. A glance at the French papers published in North Africa is enough to show that black markets have spread extensively; the papers publish lists of penalties imposed upon speculators in food and other goods. And the food bottle-necks are the subject of the few speeches by local businessmen and administrators which appear in the strongly censored press.

There have apparently been various types of shortages. Some of them are of a permanent character; others can be explained by the economic drain to which North Africa had been subjected before the Allied landings, and still others have been artificially created by abuses and speculation. The shortages of sugar, tea, coffee, textiles, shoes, soap, agricultural machinery and fuel (petrol and coal) belong to the first category. All these goods used to be imported to Algeria and Morocco from France. At the time of the Allied landings, most of the consignments for 1942 were not yet delivered to North Africa. This can be seen from the official announcement of the Vichy Ministry of Food, which has stated that the supplies of sugar, textiles and coal available to French consumers will now be greater than before owing to the non-delivery of those goods to North Africa. The same is true of soap, which used to be imported from Marseilles. A part of the soap consumed in Algeria and Morocco used to be supplied by Tunisian factories, but contact with the latter has now been cut off.

Shipments to France

The reported shortage of bread is due to entirely different reasons. In cereals (as well as in livestock), Algeria and Morocco are surplus countries. Wheat used to be the second biggest item, next to phosphates, in Moroccan exports. Algerian grain exports amounted to nearly one million quintals in 1938, and they rose to about 1,800,000 quintals in 1941. The export surpluses used to vary from year to year, according to the weather and the harvests. The harvest in 1942 was rather poor. There was a prolonged drought which reduced the year's crops. Even so, North Africa might have secured a reasonable degree of self-sufficiency in cereals had it not been for the exceptionally heavy shipments to France during 1942. Exports of wheat exceeded the quota fixed by Vichy; it had been agreed that Vichy would avail itself of this surplus in order to tide over the *soudure*—the difficult gap between two crops—after which North Africa would receive in return a considerable amount of wheat from the French crops. This, however, did not materialise. That this is the real reason for the present bread shortage in North Africa has been confirmed by various sources. In Vichy, M. Bonnafous stated that France had received great quantities of North African grain which helped the country to meet the demand during the *soudure*, and in Algiers the same point was stressed by M. Pauze, the head of the General Delegation for Economy in the High Commissariat.

Similarly, large shipments of oats, barley and maize went to France, although the deliveries of these cereals did not come up to Vichy's expectations. The same is partly true of vegetables. In November, 1942, Vichy complained that it had not received about 290,000 quintals of dried vegetables and vegetable seeds expected from North Africa, but this was only a small part of the quota which had already been shipped to France before the Allied landings. The following items of the annual quotas were not delivered to France by the beginning of November last:—250,000 quintals of dates, 100,000 quintals of dried figs, 37,000 quintals of almonds and 35,000 tons of salted and dried fish.

Similarly, only 700,000 out of a total quota of 5.5 million hectolitres of Algerian wines were shipped to France. These figures, however, were exceptions to the rule. In all the more essential foodstuffs, Algeria and Morocco were very severely drained. The immediate effect of the cutting off of North Africa on the food position in France itself appears therefore to be slighter than it might be inferred from abstract statistical computations, and certainly slighter than anti-Allied propaganda would make the French public believe. What matters in the short run is not the statistical summary of North Africa's normal production or of its capacity to export, but the fact that the bulk of the year's agricultural produce was already exported before November, 1942. The shortages of basic foodstuffs have, unlike those in textiles, sugar and fuel, not been due to the economic structure of the countries concerned. They have been of a more temporary character. They are the legacy of the Vichy period. Yet they are bound to last for a number of months, at least up to the new harvests, unless substantial Allied imports relieve the strain in the meantime.

Mismanagement and Abuses

The position has been further aggravated by obvious mismanagement and plain abuses. The rationing system has been strained and compromised by the privileges

NORANDA MINES LIMITED

DIVIDEND NOTICE

Notice is hereby given that an interim dividend of One Dollar (\$1.00) per share, payable in Canadian funds, has been declared by the Directors of Noranda Mines Limited, payable March 15, 1943, to shareholders of record at the close of business, February 20, 1943.

By Order of the Board,
Toronto, J. R. BRADFELD, Secretary.
January 29, 1943.

accorded to the supporters of Vichy. Members of the *Légion des Combattants* and of the *SOL* still receive special "bons," which entitle them to buy abnormally high rations of all kinds of foodstuffs. Apart from its political taste, such a malpractice is bound to disrupt rationing and to turn into ridicule all the official exhortations against hoarding and speculation.

The food position has probably also been affected by the financial factor. The new exchange rate of the franc has given rise to some criticism which has been voiced by the French General Delegate for Economy, M. Pauze. It seems doubtful whether the exchange rate itself ought to be blamed, as the difference between the rate of £1:175 fr. in 1940 and the first new rate of £1:300 fr. is certainly smaller than the decline in the franc's purchasing power that has taken place in the meantime. And this week's cut to £1:200 fr. (discussed on page 185) leaves the franc overvalued rather than undervalued. But the fact remains that currency is expanding, while the amount of goods available is shrinking. The new budget of the High Commissariat will not ease the position. Expenditure in 1943 for French Africa (excluding the areas under General de Gaulle) has been put at 8.5 milliard francs, of which 7.3 milliards will be spent for war purposes. True, there ought to be quite a sufficient "cover" for the North African franc (some gold reserves as well as French assets frozen in Allied countries). But under war conditions it is not the "cover" but a sound system of controls which prevents inflationary developments.

Political Uncertainty

The general background of these inflationary symptoms as well as of the hoarding and speculation is, of course, the feeling of political uncertainty. The vicissitudes of the *affaire Darlan* were hardly conducive to reassuring the local population about the stability of the new set-up. And some tension is bound to prevail as long as the Tunisian campaign is not brought to a successful conclusion. Meanwhile, the crisis can be partly mitigated by Allied supplies. A beginning has already been made with the shipment of some tens of thousands of tons of food to North Africa and with the distribution of some petrol between local farmers. But the scope of Allied relief is necessarily limited by the amount of shipping space free for non-military cargoes. Stricter rationing measures and a more energetic struggle against abuses and black markets are probably necessary, at least until conditions allow a more generous flow of Allied supplies. A step in this direction was made by the census of all grain stocks taken during the last weeks of 1942.

Eire's Financial Position

[FROM OUR DUBLIN CORRESPONDENT]

January 14th

THE first nine months of the current financial year have yielded satisfactory results when allowance is made for the profound shock administered by the war to the Irish economic system. Although the country has succeeded in remaining neutral, considerable expense on military and civil defence became inevitable. On the other hand, some sources of revenue—for example, customs duties—necessarily declined. Although a substantial deficit is disclosed, the figures of revenue and expenditure show an improvement on last year's returns:—

	April-Dec., 1941	April-Dec., 1942
Revenue.....	23,424,230	25,231,449
Expenditure.....	28,492,665	29,399,597
Deficit.....	5,068,435	4,168,148

The following table shows the changes that took place in the leading categories of revenue. The third column shows the estimated revenue under each head for the whole of the current year:—

	April-Dec., 1941	April-Dec., 1942	Estimate for year 1942-3
Customs.....	£000	£000	£000
Excise.....	8,647	8,428	10,265
Motor vehicle duties.....	5,432	5,670	7,360
Death Duties.....	493	308	600
Stamps.....	942	952	1,330
Income Tax and Surtax..	397	376	463
Corporation Profits Tax..	3,498	4,409	9,226
	322	1,127	2,570

Practically every type of tax yielded an increased return. The exceptions in the case of customs and motor duties reflect the reduction of imports and the restriction on private motoring. It appears as if the estimate for the whole year will be safely realised. Income tax and motor duties are mostly collected in the last quarter of the financial year. The balance in the Exchequer was reduced from £2,394,375 on April 1st to £203,767 on December 31st. The remainder of the deficit was financed by ways and means advances of £1,700,000 and other borrowing of £500,000. Savings certificates were issued to the amount of £325,000 in excess of those paid off. Assuming that the revenue exhibits the buoyancy expected in the present quarter, outstanding ways and means advances should be repaid and the year should end without any further addition to the floating debt.

It is plain, however, that new borrowing will be necessary in the coming year. There is no reason to hope for any reduction in expenditure until the war situation is much clearer. Revenue has probably approached, if it has not already exceeded, the limit of its capacity to expand. It is generally agreed that any increase in the rates of direct taxation would produce disappointing results, and increases in indirect taxation are hardly feasible. The question that will confront the Minister, in framing his Budget for next year, will, therefore, be, not whether borrowing is necessary, but how much will need to be borrowed and at what rate. Judged by the yield on existing Government securities, the credit of the country is very sound. The yield per cent on the outstanding issues of Irish Government loans is, when allowance is made for redemption, almost identical with that obtainable on British stocks of similar maturity. For example, the yield on the 4½ per cent Third National Loan (1950-70) is £2 7s. 9d. per cent. It is not too much to expect that a fairly long loan could be successfully floated at slightly under 3 per cent. There is much to be said in favour of borrowing a considerable sum while the conditions are as favourable as at present. Large idle bank balances have accumulated, and alternative outlets for the investment of current savings are few and scanty. When the emergency ends there will be a demand for capital in many directions, and the market will, almost certainly, move against borrowers. The Government is preparing large plans of capital expenditure for the post-war period and might be well advised to complete its borrowing while conditions remain favourable.

The question is sometimes asked whether the Irish Government should not be able to borrow at a rate substantially lower than that suggested. Attention is called to the terms on which the British Government is borrowing part of its war expenditure in the short loan market. What is not fully realised is that such borrowing depends upon the Government's possessing complete control of the capital market, and that, even in these conditions, the problem of funding this short-term debt will have to be faced sooner or later. In estimating the lowest rate at which the Irish Government could hope to obtain accommodation, attention must be paid to the alternative openings available to Irish investors. So long as it is possible to obtain anything in the neighbourhood of 3 per cent on British gilt-edged securities of reasonably long maturity, any lower rate would not appear to be feasible for Irish Government loans. The suggestion that the banks could provide large amounts at rates approximating to the rates charged on short loans in Great Britain to-day ignores the fact that there is no money market in Dublin. Moreover, the great majority of the deposits in the Irish banks are savings deposits on which interest has to be paid. If the banks are to carry on at a profit, it is necessary that their assets should yield a return bearing some reasonable relation to their liabilities.

Germany's Health

[BY A CORRESPONDENT]

THE statistical black-out makes it impossible to give a clear picture of health conditions in German Europe; but it becomes clear from the scanty reports available that disease is taking a heavy toll, particularly of the civilian population of the eastern territories. In Warsaw hospitals alone, according to one report, 50 persons die every day from typhus; and infantile mortality has grown sevenfold in certain districts of Finland. The fight against malaria in the Balkans is endangered by a grave shortage of quinine. Numerous cases of scurvy occur all over Europe.

Germany itself is probably in a better position than most of the subjugated countries, as far as the health of its population is concerned; no great increase in infantile

mortality has taken place, according to official statements, and the police authorities claim to have prevented a widespread typhus epidemic within the Reich proper. But even in Germany, where the statistical records are less inadequate than in the occupied countries, the people's health has been affected by war conditions. For instance, the combined figure for diphtheria and scarlet fever cases within the territory of the Old Reich increased by 68 per cent between 1938 and 1941, and again by 64 per cent between the first half of 1941 and the first half of 1942. The number of new tuberculosis cases increased by 27 per cent between 1939 and 1941, and by another 8 per cent between the first half of 1941 and the first half of 1942. The number of dysentery cases doubled in the first two years of the war. Moreover, the medical authorities admit that a "slight increase" has taken place in the number of cases of venereal disease, and that dental conditions have greatly deteriorated. The *Klinische Wochenschrift* recently wrote that the army of sufferers from stomach trouble has increased during the war, owing to overwork, anxiety, irregular ways of living, and to the unhealthy diet.

The Nazis claim that the number of sufferers from some of these illnesses is still considerably smaller than during the first Great War. But this may be said to be due to the spectacular improvement in health conditions during the period of the Weimar Republic. The advent of Nazism in 1933, with its subsequent turmoil in the general living conditions of the people, completely reversed this trend, and a rapid deterioration of health conditions had taken place long before the outbreak of war. Consequently, the number of cases of scarlet fever, diphtheria, and various other illnesses in 1938 was again larger than in 1913, although this was not true, for instance, of tuberculosis. Neurosis, which has been on the increase ever since the last war, has now apparently reached a new peak.

A more general indication of health conditions in Germany is provided by the frequent queues in front of chemists' shops; according to Goebbels' paper, *Das Reich*, there has been an increase of nearly 150 per cent in the turnover of chemists' shops, owing mainly to the increasing demand for medical preparations, particularly anodynes and sleeping drugs. The paper asserts that these turnovers would be still larger if all the customers could get what they ask for; the case of one typical Berlin chemist's shop is featured where only one-third of the customers can be served.

An unscrupulous, and completely hypocritical, propaganda campaign is being waged against what is called the drug mania. The Reich Health Leader, Dr Conti, for instance, has pointed out in a speech in Finland that he believes in "natural cures," that is, fresh air and healthy food, rather than in strong medicines. The same Dr Conti has just issued an order, according to which special food should from now on be prescribed to patients only in very exceptional circumstances. It is, for instance, considered as "senseless" to provide extra food to persons suffering from malignant tumours; and patients who smoke while they are ill should on no condition receive extra food.

It was already a special feature of German health insurance statistics between 1933 and 1938 that an increase in the number of deaths and visits to the doctor was not accompanied by any appreciable change in the number of working days lost through illnesses. At present, workers are exhorted not to stay away from work except in unavoidable circumstances. About 60 per cent of all sufferers from pulmonary tuberculosis and 80 to 90 per cent of those suffering from arrested tuberculosis are gainfully occupied. The German *Tuberkuloseblatt* admits that "this valuable source of labour must not be wasted," but the paper disapproves of the fact that many patients are employed "under very unsuitable conditions."

Among other reasons for the deterioration of health conditions is the growing shortage of the medical personnel, which is due partly to the pre-war policy of the Nazis, but mainly to special war conditions. Less than one doctor is, on the average, available for every 10,000 of the civilian population, and there is also a great shortage of trained nurses. Hardly less damaging is, in the long run, the moral decline of the German medical profession—or, at least, of its official representatives. The key positions of the German health organisations have been taken over by doctors belonging to the SS, to whom the achievement of a "high biological standard" is their foremost professional duty: they are resolved, in fact, only to save "valuable" lives. Former Communists and other "anti-social" persons, who are suffering from tuberculosis, are detained in special wards but do not receive any treatment; their recovery is not considered to be in the national interest.

HEALTH AND FOOD RATIONS

WHICH FOODS

GIVE US

ENERGY?

Everybody knows that the man who does hard manual work and the child who is never still for a moment need more energy-producing foods than the man who sits all day in an office. Yet even the sedentary worker needs a diet of which half at least consists of carbohydrates, the energy-givers.

Obviously, then, the carbohydrates are important, especially for children. Fortunately they are cheap and so varied that any shortage in one group can be made up by substituting others in good supply.

Starch and sugars are the main carbohydrates. Starch is the chief constituent of flours and cereals. Potatoes, and the pulses such as peas and beans, are also rich in starch. Sugars are, of course, a problem to-day and it is best to save the syrup, honey, jam or chocolate for the children.

Fats are the other energy-makers. They give a reserve of energy while carbohydrates give quick energy. Fats are provided by lard, suet, dripping, butter, margarine and fat meat. Don't overlook the herring either; whether you eat him as bloater, kipper, or fresh herring, he's fine food for energy.

This is one of a series of announcements issued in support of the Government's food policy by the makers of

Germany at War

Replacing Losses

THE German press is unanimous in declaring that the new phase of war economy introduced by Speer in the spring of last year created an entirely new situation marked, for the first time, by total planning and complete concentration of industries for war production. This is not the first time that the Germans have announced that at last a total war economy has been organised, a fact which betrays some confusion about the meaning of total war. At the beginning of the war, the plan was to introduce complete rationing immediately, to close down civilian industries to an absolute minimum, and to concentrate industrial resources for war production. The full plan was not carried out. Until the autumn of 1941, Germany's economy was a mixture of planning and pre-war restriction. Before and after the outbreak of war, arms production grew in part because of continued territorial expansion.

During 1942, under the strain of the war in Russia, Speer (industry), Sauckel (labour), and Backe (agriculture) set out to apply the full plan. Its main feature was the ruthless closing-down of factories in all sectors of the economy in order to concentrate resources for war production in the most efficient plants. The war production programme was supplemented by a single production programme for civilian commodities; the independence of separate factories and concerns was practically abolished; patents, production methods and secret processes had to be exchanged between factories on the orders of Speer's controlling engineers.

The keynote was concentration, and the process is still not completed. Speer's ideal is the one-purpose factory—that is, the concentration of the manufacture of a single article, formerly produced in a number of factories owned by different concerns, into a single factory. The obstacles to this largely come from the relics of the former "free" market conditions. Compulsory standardisation and rationalisation were the methods used to achieve the greatest possible concentration.

All these changes were forced upon the German war economy by the growing demand of the *Wehrmacht* for man-power. During 1942, however, it was still possible to import workers from occupied countries; official sources stated that the total number of foreign civilians employed in Germany rose from 2,138,000 in February, 1942, to 3,500,000 on October 1, 1942. In the last quarter of 1942, the import of civilian workers continued at the same rate.

Even so, for this year's sowing in the spring an additional 500,000 workers have been called for, because of the calling-up of more men for the army. If Germany's military losses are to be replaced in order to bring the effective strength of the *Wehrmacht* in the spring and summer of this year up to anything like the level of 1942, many hundreds of thousands of men will have to leave industry and agriculture. The occupied countries can hardly yield any more labour. The area for recruiting slave labour in Russia is being steadily narrowed. The satellite countries, Italy, Hungary and Roumania, cannot at the same time supply man-power for their depleted armies as well as for German industry.

The last resort must therefore be to Germany's own people. The new law compelling every man from 16 to 65, and every woman from 17 to 45, to "contribute by work and exertion to the war" is mainly a political gesture. Compulsory labour was actually decreed as long ago as June, 1938. The new law extends compulsion to more age groups; and its intention is not so much to bring in fresh workers as to compel the transfer of men and women of all age groups from their present occupation to work at other jobs in other places. According to the census of 1939, the total number of men and women covered by the new law amounted in Greater Germany (not including the incorporated provinces of Poland) to

43,716,000, of whom 32,435,000 were gainfully occupied. In theory, 11,281,000 men and women were available at the beginning of the war who could be brought into employment, i.e., 2,944,000 men and 8,337,000 women. Of the women, 7,177,000 were married. Among this reserve, there are a great number of persons unfit for work; and, since the outbreak of war, the great bulk of the available women have already been recruited for war work.

Concentration in the full sense is being applied now to labour. The question is whether the required transfers are practically possible. The rationalisation of working processes has been carried very far, and the attempt to organise single-purpose factories makes it possible to replace called-up workers without great difficulty where no special skill is required. The majority of armament works have great experience in training new workers in a very short time. The fact that an additional 500,000 workers are needed for agriculture suggests that the *Wehrmacht* has lately been recruiting mainly agricultural workers and peasants. This implies that skilled workers in industry are still reserved, and that, in the first place, women will be directed to work in agriculture. But an equally large number of workers will be needed to replace called-up industrial workers. Where are these to come from? Retail shops and the small businesses of independent artisans have been combed out repeatedly since 1938. The fresh concentration which began in the spring of 1942 has combed through civilian industries without very great results. The workers set free in the cigarette and tobacco, textile, clothing and shoe industries can be numbered in tens of thousands only. The railways, civil service, hospitals, kindergartens and similar establishments have all needed more labour because of the war. Retail business, however, has been steadily declining, and the small shops may still, in spite of the earlier combing-out, be the greatest single source of additional labour.

Retail shops will probably be closed down in great numbers. In short, the distributive and catering sector of the economy is the most likely source for fresh labour. Mass feeding in communal kitchens on a much bigger scale than hitherto will be unavoidable. Success depends on the degree of mobility the German war economy has achieved. There is no doubt that mobility and the organisation of "shock-work" has been the outstanding feature of Germany's economic organisation ever since rearmament began before the war, and it is possible that, by these means, direct war production may be maintained during the winter—careful preparations were made during the autumn to assemble the necessary raw material and fuel.

1918—1943

The present situation is not directly comparable with 1918. But Germany is in a position similar to 1918. The index of production remained almost unchanged in 1917 and 1918; probably it has again been stationary since the end of 1941. The rate of losses in men and material is probably about the same as in 1917-18, and there is every reason to believe that individual output per worker is steadily declining. In October, 1918, output per man-shift in the coal mines in the Ruhr area had fallen by 28 per cent compared with 1913. The decline may be smaller this time so far. Yet even the German papers cannot hide the fact that individual efficiency has been falling off for a long time now. At the end of 1917, actual production still showed a tendency to rise. But now, as then, the reserves of man-power for the *Wehrmacht* are growing perilously small if war output is to be maintained. For every 100 men conscripted in 1916, only 46 were conscripted in 1917 and 28 in 1918. Germany is even worse off in this war. The total number of men born in the years between 1921 and 1925 is smaller with each year. The 1925 class is only 87 per cent of the 1920 class. It can thus be said, almost with certainty, that the losses which the German army has suffered in the summer of 1942 and during this winter's battles cannot be replaced. The 1925 class, which is already in military training and will be available for service at the front in the spring, is totally insufficient; and the withdrawal of equivalent numbers of men from war industries will make it impossible to maintain war production at the present level. This dilemma cannot be solved by organisation or by the pretence of a transition, at last, to really total war. Germany's industrial and military power is on the decline, and no political or economic decree can restore the *Wehrmacht* to the strength necessary for defence against continued offensives.

THE BUSINESS WORLD

Gas Shares

THE buying of industrial ordinary shares for "recovery" (which is basically part of the general movement into equities which seems characteristic of the later years of every war in every country) has now passed into its third—and last—stage. After the fall of France in June, 1940, everything was "cheap," and investors had only to shut their eyes and thrust a pin anywhere in the Stock Exchange List. During the second phase, greater selectivity was necessary; but it was still possible for purchasers to choose stocks whose post-war position seemed well assured and which, meanwhile, were making sufficient profits in wartime to earn their keep handsomely. For companies whose shares came into this category, EPT, paradoxically, provided a species of profits cushion, since a deficiency in standard earnings in any year could be re-couped out of taxation paid in earlier years. But the time when investors could have their bread buttered, as it were, on both sides, has now passed. The only "recovery" stock left on the market's shelves consists for the most part of shares in industries where "recovery" has its literal meaning of future revival from present malaise. Buyers of such securities must accept the conditions which normally fall to the lot of the speculative long-term investor, and take a moderate income return now—or none at all—in anticipation of benefits, by way of increased income and capital, to come.

Gas shares are, perhaps, the most typical of all examples in this group. The obvious vulnerability of gas-making plants to air attack is largely responsible for the official precaution which has resulted in non-publication of annual accounts. Stockholders, consequently, must draw what conclusions they can from a comparison of current dividends with those paid before the war. In this respect, experience has been very mixed, as the following table shows:—

ORDINARY DIVIDENDS

Company (Calendar Years)	1938	1939	1940	1941
Gas Light and Coke	5%	5%	3.95%	4%
S. Metropolitan	5½	5½	4	4
Commercial	5	4	1½	—
S. Suburban	6	6	3½	5
Wandsworth	7	6½	3½	4 (a)
Liverpool	6	6	6	6 (b)
Newcastle	5½	5½	5½	5½ (c)
Sheffield	6½	6½	6½	6½

(a) For 1942, 5 per cent.

(b) Interim for 1942 reduced from 3 per cent. to 2½ per cent.

(c) For 1942, 6.9 per cent.

Broadly, the provincial gas companies have maintained their pre-war rates of dividend fairly well, even in cities which have had their share of enemy bombing. In London, experience has been less favourable. Although the Wandsworth company is paying a higher dividend for 1942 than 1941, the largest of the Metropolitan concerns—Gas Light and Coke, South Metropolitan and the related Commercial company—have paid no dividends on their ordinary and (non-cumulative) preference stocks later than 1940. So far, therefore, as investors are interested in "recovery" in its strict sense, the London companies offer the most fruitful field of investigation. So far as the industry's post-war prospects generally are the relevant factor, special interest attaches to the provincial companies' stocks.

Although market prices of leading gas company stocks have risen like everything else on the Stock Exchange recently, they are still appreciably below the pre-war level, and yields, even on stocks which have maintained dividends throughout the war, are higher. This is clearly brought out by the table given in the opposite column. The average yield on the dividend-paying stocks in this table is above rather than below 5 per cent, against a current figure for industrial equities as a whole (according to the

Actuaries' index) of 4.29 per cent. Before the war, the differential was the other way; for at the end of 1938 this index computed the yield on representative gas shares at 5.27 per cent, and on industrials generally at 6.13 per cent.

The industry's wartime handicaps have been due less to enemy projectiles (with a few exceptions) than to the changed distribution of population and industrial demand,

STOCK PRICES AND YIELDS

Company	1936-39		1940-42		Present Price	Yield at Present Price
	Highest	Lowest	Highest	Lowest		
Gas Light and Coke—Ord. £1	28/7½	13/6	18/3	9/6	17/6	[Nil]
4% Cons. Pref. Stk.	110½	69	81½	49	86	[Nil]
S. Metrop.—Ord. Stk.	136	53	77½	29	75½	[Nil]
6% Pref. Stk.	152	85	92	65	94	[Nil]
Commercial—Ord. Stk.	105	48	60½	25	65	[Nil]
S. Suburban—Ord. Stk.	136	65	87½	54	91	3.29
Wandsworth—Cons. Stk.	164	85	88	55	104	4.81
Liverpool—Ord. Stk.	138	95	110½	89	104	5.77
Newcastle—Ord. £1	28/6	18/-	20/4	14/6	21/-	6.57
Sheffield—Cons. Stk.	149	115	130	107½	130	5.00

to rising costs and labour shortages. The physical difficulties have tended rather to ease as the war has progressed; but operational conditions have been, if anything, intensified. Coal supplies have fallen off in quantity and quality, and though a reduction in the calorific values of gas made has helped to conserve coal supplies, it has not fully compensated for troubles due to the use of types of coal for which existing plants were never intended. Women have replaced some men, but there are limits to labour dilution and substitution. Some of the industry's spokesmen

have complained that authorised increases in gas prices have barely offset higher operating costs. The governor and managing director of Gas Light and Coke has gone so far as to say that, in London, the industry is subsidising the cost of living—though how far that is true of the rest of the country is a moot point. On the whole, it is probably true to say that the net position of the industry has not worsened during the last year, and that in some areas, including London, it has slightly improved. The present trend of dividends is, on the whole, upward.

With the return of peace, many of the gas industry's wartime difficulties will be removed—but perhaps not wholly and certainly not immediately. Over a period, costs, presumably, will tend to fall, and labour will be released to the industry. The extent and distribution of the peacetime demand for gas, however, is bound to be a function of two factors which are difficult to estimate at the moment. The first is the extent to which Government policy will determine the location, character and activity of British industry as a whole. "Planning," if it is widely applied, may have a good deal to say on such questions as whether the old trades should go back to the old places; what should be done with the new factories which have sprung up on unexpected sites during the war; whether industry should have a permanently wider spread, geographically; and how far policies like the maintenance of full employment will demand differentiation in the encouragement given to various industries, in the conditions of this country's post-war environment.

The second vital, but unpredictable, factor will be the relations of gas with its competitor, the electricity industry. Up to the war, the gas industry had given on the whole a good account of itself in the struggle with its vigorous and rapidly growing competitor. On a long view of the future, the scales may appear to be somewhat weighted against the older industry; but there are factors on the other side which investors should not underestimate. For one thing, if the Ministry of Fuel and Power is continued as a permanent peacetime department, it is unlikely that it will

be prepared to allow competition to go to extreme lengths, between two forms of power production which can both claim to be making efficient use of indigenous natural resources. At the moment, competition is limited by gentlemen's agreement; but, in the national interest, any "regulation" after the war must come from a higher source than the industries themselves. Under any conditions, however, the gas industry has a considerable field for increased economies and higher earnings in the reorganisation of its operations on a wider regional basis. Before the war, four-fifths of the total undertakings in England and Wales supplied only one-eighth of the total gas made. And on the production and selling side, gas-making is linked, through its "residuals," to some of the newest and most progressive trades in the country—chemicals (industrial and pharmaceutical), dye-stuffs and—not least important—plastics. Before the war, receipts from this side of the industry were considerable; in the last complete pre-war year, Gas Light drew 21 per cent of its total gross revenue, and South Metropolitan 20 per cent, from the sale of residuals and by-products.

Clearly, conditions outside the industry's own control will determine whether this side of its activity is destined to have greatly increased—perhaps decisive—importance over the next twenty to fifty years. Much may then turn on the industry's adaptability, and the brains and financial resources which it is able to attract, as an industry at once "old" and "new." That, however, is looking some way ahead. Balancing the more immediate pros and cons, it would seem that, while the ordinary stocks of gas companies which are paying regular dividends may still have a limited distance to go, in order to catch up with equities in general, in a market which is still rising, the dividendless London stocks have the larger "recovery" element. But they are unlikely to regain all their former status until post-war conditions have become sufficiently "normal," and the medium-term outlook, at least, sufficiently clear, to bring back to the market the conservative type of investor to whom gas stocks formerly made a strong appeal.

Finance and Banking

More Notes in Circulation

The post-Christmas return of notes from the public was halted over the past week, the active circulation over the seven days to last Wednesday showing an increase of £3,225,000 to £911,285,000. The seasonal reflux from the year-end peak has this year amounted to over £15 millions, as against a comparable figure of about £11 millions a year ago. The latest recovery in the circulation must be interpreted in terms of end-of-month requirements, and the downward trend of notes may reassert itself for the next few weeks. One factor which will affect the note situation this year will be the influx or efflux of armed forces to or from this country. On present indications, this promises to work in favour of a reduction in the Bank of England circulation and of a corresponding increase in the issue of Allied military authority notes. The credit basis was appreciably reduced this week, the Bank return showing a fall of £36,345,000 to £139,512,000 in bankers' deposits. This last figure is at present about sufficient to ensure adequate supplies of credit in the short loan market at other than making-up periods. During the past few days supplies of short loan funds have been no more than adequate, and borrowers have been hard put to it to balance their books without having recourse to special assistance. The position is still being eased by an excess of Treasury maturities over payments, though a considerable part of the current maturities are in official hands. These maturities are partly responsible for the fall of £25,110,000 in the Government securities of the Bank of England, though an additional explanation is probably provided by the repayment of ways and means advances, which were shown to be outstanding to the amount of £24 millions at the end of last week. This reduction in the Bank's security holding, together with the rise in the circulation and an increase of £3,396,000 in public deposits, are the principal factors contributing to the contraction of bank cash over the past week.

Dollar-Sterling Free Rate

With the virtual unification of sterling accounts held for United States residents, the free market for sterling in

New York has almost disappeared. There is, however, one somewhat disguised form in which such a market remains. It is as an ancillary to the New York Stock Exchange market in such sterling securities as War Loan, British-American Tobacco, Imperial Tobacco, Distillers and other important industrial shares. The prices quoted for these on the New York curb exchange are about half the London prices if the corresponding quotations are converted at the official rate of \$4.03 to the £. On this evidence, therefore, the "free" rate would be about \$2 to the £. This, however, is not a representative figure and only measures a conversion ratio in which there are many factors apart from the exchange rate. Owing to the exchange control, it is impossible to arbitrage directly between London and New York in these securities. But it is possible for American operators who have access to both markets to switch within the group of these securities and profit by the differential which may exist in the disparities between their sterling and dollar prices. War Loan, for example, has, owing to the exemption from tax, been quoted at a smaller discount than the industrial shares, and, as a result, American brokerage houses have made profits by buying industrial shares in New York, selling them in London, and reinvesting the sterling proceeds in War Loan, which was then resold in New York. As long as the operations necessitate no applications for dollars to the control, they are apparently authorised and have yielded the interests concerned appreciable profits.

Floating Debt in January

The total floating debt in January fell by £2,000,000, the smallest net monthly change for some years past. Within this relative stability there were considerable movements in individual items. Ways and means advances by public departments rose by over £70 millions to £231,695,000, while those from the Bank of England fell from their inflated end-of-year total of £67,750,000 to £24 millions. Treasury bills have undergone a seasonal decline, the total

drop of £42,380,000 being helped by the reduction of bills issued through the weekly tender over the month. The exact separation of the January fall in bills as between tap and tender bills cannot be made, as the December 31st statement did not fall on the last working day of the week. The comparison with the November statement, which allows such exact comparison to be made, shows a fall of £20 millions in tender bills, but a rise of £65,805,000 in bills issued through the tap. The net increase in Treasury deposit receipts last month was £14 millions, the gross amount raised being £158 millions and redemptions £144 millions. Of the latter total, £39 millions was paid off before maturity to cover subscriptions to new Government issues. Of the other debt items, tax reserve certificates again provide the most interesting changes. The redemptions of these certificates, at £24,730,848, are the largest recorded in any month since their issue began. On the other hand, the new certificates taken up last month amounted to as much as £48,650,000 and the persistent increase in their total outstanding thus continues, the latest figure being £469,933,400.

Financing Expenditure

The following table summarises the Exchequer returns to date (January 30th), and shows the respective shares of revenue and borrowing in meeting expenditure:—

£000		£000	
Total ordinary expenditure...	4,592,332	Total ordinary revenue.....	2,144,271
New Sinking Funds.....	9,912	Loans raised:—	
Loans repaid:—		3% Def. Bonds (net).....	90,420

North African Franc Revalued

The North African franc, for which exchange rates of 300 to the £ and 75 to the \$ were fixed after the Allied occupation, has this week been appreciated by 33½ per cent. The new rates, which became operative on February 2nd, are 200 francs to the £ and 50 francs to the \$. The original decision to fix the rates for the North African franc at a level other than that quoted for other colonial francs, and the retreat which has now been made from it, provide further evidence of the flat-footedness which has characterised other aspects of the preparations for this Allied campaign. The rates originally fixed, though unfortunate in that they differentiated between franc and franc, could to some extent be justified in terms of the undoubted deterioration which had occurred in the French franc position since the Armistice, and by the value commanded by that currency in such open markets as Lisbon and Tangiers. The decision could have been made thoroughly acceptable to the territories concerned, and to their local population, by paying current sterling and dollar prices for their exports, and giving them the whole benefit of the comparatively "generous" exchange rate. These rates, however, were strongly objected to by the local authorities, and their protests found a ready amplifier in the various organs of Axis propaganda. Germany has become so expert in the arts of indirect looting by depreciating the currency of her satellites that her propagandists were unlikely to miss this occasion of returning accusations so often made against them. The considerable retreat from the original decision should at least serve to quieten this campaign of misrepresentation. If exporters from North Africa continue to be paid the same prices in terms of francs for their produce, they are unlikely to grumble at the new rates. Some interests, however, are bound to be adversely affected. The troops in North Africa, now paid in sterling and dollars, will find the cost of goods and services for which they must pay francs, raised by half. A substantial volume of sterling and dollar military authority notes will have found their way into hoards and in general local circulation. The unfortunate holders of these notes will stand a considerable loss, and will bear the Allies a grievance. This correction of the North

African position still leaves differential rates for the de Gaulle and Giraud francs. It is difficult to avoid the impression that the decision to go back from 300 to 200 francs to the £ and yet refuse the small additional margin which would have brought the North African francs to 176½, and thus to parity with the other colonial francs, springs from the political venom which poisons the whole North African scene.

Year-End Window-Dressing

The material required to measure the extent of the clearing banks' window-dressing over the turn of the year is made available with the publication of the Bank of England Statistical Summary for December. It suggests that the extent of that window-dressing was a record for all times. The composite year-end balance-sheets showed a cash holding of £390 millions, and a ratio to deposits of 10.8 per cent. The Wednesday figures of bankers' balances (reduced by 5 per cent to allow for non-clearing bank items) averaged £152 millions during the month, while the banks' till money averaged £147 millions on the Wednesdays of December. The "true" cash position for December may thus be taken as £299 millions, or £91 millions less than the window-dressed figure for December 31st. The cash ratio obtained by comparing this "true" figure with the end-of-year deposits total would be 8.2 per cent, showing a disparity of as much as 24.1 per cent with the published cash ratio. For December, 1941, the comparable disparity was only 22.7 per cent, the published ratio being 11 per cent and the "true" ratio 8.5 per cent.

The Bank of England Statistical Summary, in its presentation of the clearing bank figures, classifies deposits into current accounts and deposit and other accounts. The aggregate total rose over the year from £3,329 millions to £3,629 millions. Of this increase of £300 millions, no less than £261 millions was accounted for by current accounts, and only £39 millions by deposit and other accounts. This indication tallies with the bankers' clearings evidence of an increase in the velocity of circulation of credit.

Voice of the North

Investment

Postwar Framework

There is scarcely a paragraph of Sir Kingsley Wood's review in the debate on economic policy which is not of some interest to the investor. From their point of view, it is heartening that he included courageous investment as one of the prime factors in producing the prosperity and security which all desire. The three points which may have most immediate influence in determining investment policy are those relating to the control of new capital issues, the high priority for exports and the view that some reduction in taxation will be an essential part of any scheme—coupled with the hope of maintaining the general level of prices somewhere about the present figure. It must be stressed that nothing in the Chancellor's speech is more than an aspiration or, at best, an objective. No policy was even sketched for obtaining the ends in view. It is, however, at least reassuring to find that the aims are largely what one hoped to find them. It is, perhaps, rather discouraging to find that the Chancellor still talks in terms of controlling issues of capital, and in a different section of his speech of stimulating capital equipment by credit or other financial measures. There should be a single scheme for controlling the acquisition of new, and maintaining the existence of old, physical capital. It is extremely doubtful whether the pre-war practice of "vetting" individual applications ought to be the instrument for implementing Government policy in this matter, although it might render service as a protection to the investor. Even on the basis that prices of essentials are likely to be stabilised by grants for some time to come, it is interesting to learn that the Chancellor sees hopes of the general price level settling down at about its present level. This is in line with his general contention that there is at present little or no inflation. The exposition seems to suggest a rather rigid limitation of profit margins for some time to come. In the context of anything approaching full employment at current wage rates, it also

suggests a very substantial recovery in the normal demand for goods.

The most definite pointer is, perhaps, that provided by the high priority for exports. *The Economist* has always maintained that this will be essential. It provides definite encouragement to invest in post-war export industries whatever those may be. There is, fortunately, no indication that the stimulus is to be applied in such a way as to preserve the pre-war set-up. The Chancellor talks of assistance in raising capital, of the need for research, for better financial statistics and improved capital equipment, but not of subsidies and other incentives to the maintenance of the status quo. This is all to the good so far as it goes. What is now required is that these generalisations should be translated into a coherent series of measures which shall give the utmost freedom of enterprise, compatible with execution of the central plan, and the greatest opportunity for all to contribute to the plan and to criticise its operation.

Milestone for Equities

Now that full figures are available, it is possible to see that the month of January not only lived up to the reputation established in the three preceding years, but far exceeded it, at least in equities. As will be seen from the chart of the indices of *The Financial News*, the rise in the equity line is a good deal sharper than a year ago. The absolute rise in the figure is, in fact, five times as great as 3.5 points to a new high, since mid-January, 1938, of 97.2. Meanwhile, *The Actuaries' Investment Index*, after the virtual stability of December, resumed its upward course almost the old rate. Despite the opening burst of buying the rise in trustee stocks does not seem to have been a great last month as it was a year before, but that in industrial debentures and preference shares is greater. The

FIXED INTEREST AND EQUITY SECURITY
MOVEMENTS (July 1, 1935=100)
Financial News Indices of 20 fixed-interest securities
(converted to new base) and 30 ordinary shares

general effect is a further closing up in yield margins, both within the equity group itself, and between the various main groups named. The fall in equity yields has been far greater than that in any other section, and the movement passes an important milestone during the month. *The Actuaries' index* gives the yield on industrial preferences as 4.31 per cent, and that on industrial equities as 4.29. Thus, for the first time since April, 1937, the yield on the latter is below that on the former. For some years prior to the date mentioned, the equity yield was consistently below that of preference capital, and not uncommonly lower than that of debentures, although in this period it was always at least ½ point higher than the return on 2½ per cent Consols. The yield basis is, thus, approaching that ruling during a period of reasonable trade activity, when, however, unemployment fluctuated between some such figures as two and one and a-half millions. It was also a time when the long-term

outlook was becoming increasingly obscure. Bearing in mind the fact that, over a considerable part of the industrial field, some increase in distributions ought to be possible within a comparatively short time of the end of hostilities, it cannot be said that the existing yield structure is unduly distorted in favour of equities.

Further Closing of Margins

Throughout the whole equity section of *The Actuaries' index*, the only item in the value figures which fails to show a rise is shipping shares. The persistence of falling yields is not quite so uniform, for increased coal and cotton dividends caused rises in both these. In the fixed interest categories, the only exception to the general rise is a drop from 128.6 to 125.3 in investment trust debentures. This is probably due to some technical consideration. Despite the attention attracted to home railway ordinary shares, this index shows greater proportionate improvements in iron and steel, building material, electrical manufacturing and gas stocks, and at least as large a rise in oil shares. As a result of these adjustments, gas stocks now yield appreciably under 3 per cent, while the only yields materially above the average of 4.29, in the industrial list, are those on aircraft, coal, home railway, iron and steel and brewery shares. The range of yields, which was from 10.23 for aircraft to 2.90 for cotton a year ago, is now from 7.57

for the former to 2.92 for gas stocks. The average divergence of the fifteen sub-groups from the main yield index is now 0.88 points, against 1.13 one year, and 1.693 points two years ago. Rather over half the reduction in divergence is due to the general fall in yields and the remainder to a general assimilation of one yield to another. Outside the industrial list, the most important move in equities is a recovery in insurance shares. The rise is, however, less than a quarter of the fall produced in the few preceding weeks by the recommendations of the Beveridge Report. As has been pointed out before, the experience of recent years offers no guidance to the next step in equities. All that can be said is that they have been very firm; that a fair amount of vesting money goes into this form of security, and that there is no military reverse in sight such as occasioned relapses last year and in 1941.

Background for Kaffirs

Recent movements in the prices of Rand gold-mining shares appear to be based mainly on considerations arising out of the approaching budget. In recent years, it has been the practice of Union governments to impose heavier and heavier taxation on South Africa's principal industry. But it was not until last year that this practice, coupled with rising costs and limitation of supplies of labour and materials, resulted in an appreciable decline in distributable profits, and a fall in actual output. It is now rather over ten years since the Rand was given, not only an extended lease of life, but an unexpected expansion, by the raising of the official price of gold. Even without the ill-effects of total war that stimulus would now be wearing thin. The third interim report of the Union Industrial and Agricultural Requirements Commission, now over a year old, reported, *inter alia*, on the position of the gold mines. The

Government engineer then estimated that the amount of millable ore would fall from 64.5 million tons in 1940 to 54.4 millions ten years later, and would be reduced thereafter so rapidly that it would be only 26.3 millions in 1955 and 9.1 millions in another decade. These figures are admitted to be less favourable than other estimates, made for the Union Corporation, which, to the outsider at least, appear to take a rather more realistic view of the prospects of development of existing mines and of improvement in the facilities for development in depth. None the less, the best that seems possible, on the basis of the figures then presented, is that an almost immediate decline can only be avoided by an appreciable sacrifice in the life of the mines, and that no measures can defer a rapid falling off much beyond 1950. These calculations assume a continuance of the existing price-cost relationship. The period would be lengthened by a rise in the price of gold, by an improvement in mining technique, or by a fall in general prices. In point of fact, the whole trend of world opinion is toward financial policies which make for higher prices. Is there any reason to suppose that the post-war parity between the

Union and the USA will give a higher price than the present to gold? It is against this background that the Union has to decide its taxation policy. There is no longer any useful purpose in maximising gold output, if to do so interferes with the war effort. It is probably in the interests of the Union, provided no fall in the price of gold is anticipated, to discourage attempts to maintain production by any process of skimming the cream in these times of difficulty. The Commission recommended an investigation to discover the best means of maintaining a stable production for the longest possible period. At the present time there are more alternatives to gold mining open to the Union than has ever been the case before. It would appear not unreasonable to suppose that a policy aimed at economising gold extraction for the time being, insofar as this can be done without disturbing the finances of the country, might well prove suitable.

A Study in Conversions

Announcements of two important conversion operations have been made in the past week. The first, and the larger, concerns the Associated British Picture Corporation. Full details are not yet available, but it is proposed to redeem at 103½ the outstanding £3,055,542 5 per cent First Mortgage debenture, and replace it by £3,000,000 of 4½ per cent debenture stock. Owing to the high premium on redemption, the net saving on gross interest charges will be a mere £10,000, equivalent to only ½ per cent on the equity of £2,000,000, assuming the new stock is issued at par, or some £11,280 if issued at 101. Under the circumstances, it may be suggested that the operation might well be postponed until a longer experience of prosperity has thoroughly established the cinema industry, when slightly more favourable rates may be obtainable. The other scheme is put forward by Debenhams, Ltd., who propose to redeem £2,694,114 5 per cent First Mortgage debentures at 102 on September 1st next, by the issue of £2,000,000 4 per cent stock at 101½, repayment of unconverted stock being made from the company's accumulated funds. A sinking fund of 1 per cent per annum is to be applied in the purchase of stock at a net price not exceeding 102½, or in repayment of drawn stock. Drawings will commence July, 1944, to the extent that stock is unobtainable in the market. The final redemption date is September 1, 1978, with the right to redeem the whole, but not part, at any time between 1953-68, subject to six months' notice, at 103, and thereafter at 102½. The small group of equity holders benefit from an annual saving on interest of £19,220, plus the amount by which 5 per cent on £694,114 exceeds what is now earned on that sum. This appears to represent at least 4 per cent on the ordinary shares.

Company Notes

BAT Liquidity

The full accounts of the British American Tobacco Company provide no information as to profits additional to that contained in the preliminary statement, discussed in *The Economist* of January 23rd last. The balance-sheet, however, is slightly more informative. In addition to the temporary loss of income from the American subsidiary, the report discloses that, of investments in and advances to subsidiaries valued at £27,026,450, some £10,080,000 are now under enemy control. It would be interesting to know what provision has been made for the rehabilitation of these properties after the war. A further clue to the sharp fall in net profits is indicated by the new holding of £5,000,000 Tax Reserve Certificates, while sundry creditors, including taxation, have risen some £3,596,000 to almost £12,780,000. The parent's financial relations with its subsidiary and associate companies have undergone a startling

change, last year's net credit balance on loan and current account of nearly £4,500,000 has been altered to a net debit of some £23,000. The change, doubtless, arises partly in connection with the loss of the Far Eastern interests. It is likely that this has also provided the means of financing a 50 per cent. expansion in tobacco stocks from some £4,800,000 to over £7,250,000, and an addition of some £685,000 to the previous year's holding of £3,053,125 of British Government securities. Although both cash and debtors are slightly lower, the liquid position of the company has improved considerably, net surplus assets totalling some £11,800,000, against £7,520,000, excluding inter-company items. The belief that the company is well equipped for the future is apparently shared by the market, which values the £1 ordinary shares at 101s. to yield only £1 19s. 10d. tax free.

R. A. Lister Accounts

In the year to September 30th last, R. A. Lister, the important manufacturers of agricultural machinery, show a jump in profits after depreciation, tax and contingencies, from £131,517 to £163,940. In view of a reduction in the total provision for staff funds from £17,807 to £9,050, and assuming that the transfer of £30,000 against nil to stock contingencies should not be treated as a free reserve, there is a rise in equity earnings from £70,605 to £82,007, representing 23.4 against 20.2 per cent. There is no increase in the ordinary payment, which remains at 16 per cent. General reserve receives £25,000, against £15,000, and the carry forward is raised from £70,468 to £71,475. The reason for the improvement would appear to be the substantial increase in the official and unofficial demand for agricultural implements, coupled with a certain cost-saving rationalisation of type. The company's balance-sheet shows declines in debtors, creditors and in net loans to subsidiaries, which stand at £135,285, against £153,585. But these are offset by a rise in stock from £727,107 to £805,601. Further, the summary of assets and liabilities of the group shows an increase in both creditors and all current assets. The subsidiaries have, however, distributed almost to the hilt and the surplus shows a rise only from £413,276 to £445,310, with a slightly smaller rise in net liquid assets. In the balance-sheet of the parent, the liquid position is even stronger than before, surplus liquid assets standing at £1,380,741, against £1,241,374, while the total of general reserve and carry forward is up from £829,703 to £855,710. The concern should be assured of a further successful year in the current period. The £1 ordinary shares, at 74s. 6d. ex dividend, yield £4 5s. 11d. per cent.

Boot and Shoe Results

The results of the five boot and shoe manufacturers and distributors, which are analysed below, show a surprising capacity to maintain turnover. The only two concerns which disclose a profits figure struck before all taxation, *Bignells* and *Lotus*, earned a higher revenue than in either of the two previous years. In the case of *Bignells*, the rise in tax liability from £25,020 to £33,420 is sufficiently moderate to permit an increase in the rate earned on equity capital and in the ordinary distribution from 6 to 8 per cent. *Lotus*' tax liability was more than £78,000 higher at £235,000. Thus, there is a decline in the earned rate and a 2 per cent cut in dividend to 8 per cent. *Stead and Simpson*, with a decline in tax provision of £1,500, show a marked rise in equity earnings from 5.7 to 10.2 per cent, thus covering the ordinary dividend for the first time since 1939. The income tax provision of *William Timpson* is constant, and the decline in disclosed profits shown after EPT may in this case be due to lower turnover or the operation of cost factors. The 15 per cent ordinary dividend is still handsomely covered. In the case of *L. and J. Weber and Phillips*, the decision to raise the ordinary payment from 9 to 10 per cent is not supported by any substantial improvement in net income. The chairmen refer to the operating difficulties, the shortage of labour and materials and the effects of rationing. It is clear, however, that the saving in cost which followed the introduction of the utility shoes and the demands of the forces have made it possible for the industry to continue to produce on a profitable basis. Balance sheets show a general fall in stocks and increase in cash or Government securities. This is particularly marked

(Continued on page 192)

Industry and Trade

The Industrial Prospect

The note of optimism about the post-war prospect of British industry struck by Sir Kingsley Wood and Mr Dalton in the House of Commons this week was refreshing. There will be no lack of opportunity. The war has acted as a tremendous stimulus to technical progress; in so far as this will bring higher productivity in peace, it will provide some compensation for physical destruction during the war. The war, said Sir Kingsley Wood, has released in all industrial countries a high potential of invention and development over a much shorter period than would ordinarily occur. There are important technical changes at work, such as the chemistry of oil, the development of plastics, the increasing use of light alloys and the processing of foodstuffs. The importance of developments in the chemistry of oil has been frequently emphasised by *The Economist*; the prospect of expansion in the use of plastics was underlined by Dr H. Barron last week-end in his address to the conference arranged by the Association of Scientific Workers. But the future does not merely lie with new industries; there is still great scope for some of the older industries by the introduction of new methods. Coal is an important example. But, as Sir Kingsley Wood rightly pointed out, the opportunities will have to be seized if Britain is to maintain its position, as it can, in the industrial world. Some of the conditions which will have to be fulfilled to this end are discussed on page 165.

The Locomen Think Again

Mr Bevin, to whom the Associated Society of Locomotive Engineers and Firemen had submitted their case for a reconsideration of the recent wages award of the Railway Staff National Tribunal, rightly expressed the view that it would be

contrary to the spirit and intention of the Conditions of Employment and National Arbitration Order and to the policy which he has consistently followed in support of agreed joint machinery if, for the purposes of the Order, the Minister were to regard as a trade dispute the wages claim which had been the subject of decision by an independent arbitration tribunal, which claim had been referred to them for final decision by agreement of the parties concerned.

Had Mr Bevin given way to the demand of the ASLE and F, the national conciliation machinery, which has hitherto worked smoothly, would have been prejudiced.

He would have created a precedent whose consequences might well have been unfortunate, especially as the Locomen's demand for a review of the Staff Tribunal's decision was accompanied by a threat to strike. The executive committee of the ASLE and F, wisely, has withdrawn its threat to hold up essential transport by a strike. Another delegate conference has been convened for February 17th, when it may be decided to initiate a new wages claim. It is a pity that the ASLE and F did not take this course in the first place.

Shipowners and Builders

The announcement that shipowners and shipbuilders intend to form a joint committee "for examining mutual post-war problems" is important in its implications. Among the problems to be examined jointly are the spreading of shipbuilding orders and the regulation of prices as a means to even out fluctuations in production and employment; special attention is to be given to research. The move is a reflection of the interdependence of the producers and the operators of ships. The centre of gravity is rapidly shifting to the United States, which is now the leading shipbuilder, and on the way to becoming the leading shipowner. After the last war, during which the United States also expanded its shipbuilding capacity in order to fill the gaps made by the U-boat, Great Britain recovered its predominance in building, and maintained its lead as an owner of ships, largely by sheer skill and efficiency, and by its far-flung trade. The two industries will only prosper after the war by the methods of initiative and enterprise that have stood them in good stead in the past. To hold their own, British shipowners must not only run their ships efficiently, but they must be able to buy them at least as cheaply as other shipowners; and it is to be hoped that British shipbuilders will be able to supply ships on such terms. Any arrangements that owners can make with builders to facilitate that task can only be welcomed.

Labour Relations

The number of working days lost through trade disputes, as recorded in the *Ministry of Labour Gazette* for January, rose from 1,080,000 in 1941 to 1,530,000 in

THE WOOL (& ALLIED) TEXTILE EMPLOYERS' ORGANISATION require in Bradford the services of a first class Secretary with knowledge of general commercial and labour problems. Apply in writing stating age, experience and salary required to Chairman, Lloyds Bank Chambers, Bradford.

1942, the highest figure since 1937. True, the loss of time was only a tiny fraction of the number of days worked, and it was still well below the lowest figure for the last war; but in war every working day counts. During the last war the number of working days lost ranged from 2,450,000 in 1914 to 5,900,000 in 1918. It would have been interesting if the Ministry of Labour had made an estimate of the time lost through absenteeism. More than one-half of the number of working days lost occurred in the coal-mining industry during the first half of the year. The increase in miners' wage rates in June was followed by a marked reduction in disputes. The average level of full-time weekly wage rates, inclusive of agriculture, rose by about 5 per cent during the year; but as was shown in an article on "Workers' Incomes" in *The Economist* on January 16th, actual weekly earnings rose appreciably faster, partly a reflection of an increase in productivity. The official cost of living index remained almost unchanged throughout the past year; the rise in the prices of fuel and light and of miscellaneous non-food items was offset by the reduction in the price of clothing.

Cheaper Clothing

An interesting feature of the movement of retail prices during the past year has been the reduction in the average level of prices of working-class clothing and clothing materials. Between January and August the Ministry of Labour's index of clothing prices rose slightly (by 1.25 per cent), but during the remainder of the year it fell by 8.6 per cent. The reduction in prices can be attributed chiefly to increasing sales of utility goods, which, on the average, are cheaper than non-utility goods of corresponding quality, and to the removal of the purchase tax from utility goods dispatched to retailers after August 3rd. The prices of non-utility goods, which had risen during the first seven months of the year, were also made subject to stricter control in order to stem the advance. The Board of Trade's success in bringing down the prices of clothing by the utility scheme shows what can be done by a determined effort to reduce the prices of goods which are consumed in large quantities.

Planning of Science

The present war has been described as an engineers' war; it might equally be described as a scientists' war. How to harness the nation's scientific knowledge and experience to the war effort and to achieve maximum co-ordination of scientific effort were the dominant themes at the conference organised by the Association of Scientific Workers this week-end. Sir Stafford Cripps gave an impressive review of the numbers of scientific bodies and committees which are advising the Government in one way or another; but he did not altogether convince his audience that the actual central direction of the scientific war was as effective or as integrated as it might be. His picture of what was described by one speaker as an "unwieldy set-up" only seemed to confirm the demand which has been put forward by the Association, and has been supported by Professor A. V. Hill and others, for the creation of a Central Scientific and Technical Board, which would be in direct contact with the War Cabinet, and would thus be in a position to assist in relating the country's scientific potential to war strategy and requirements. Such a Board, it is suggested, would have executive powers to initiate programmes of work, direct personnel and collect technical data. Considerable progress has been made in the past year, both centrally and locally, in developing and utilising scientific research for the benefit of war production. In particular, close relations have been established between the RAF and scientists through Operational Research Sections which analyse the practical working of radiolocation devices. But there would seem to be room for improved co-ordination in the industrial field. There was some evidence of a sense of frustration—many speakers complained about the misuse of scientific manpower, and instances were given of qualified scientists working on projects not immediately related to the war, but designed to secure their firms' competitive ascendancy in the post-war market. The reluctance of some firms to pool technical knowledge and trade secrets was alleged, while the difficulties encountered in securing representation of scientific and technical staffs on joint production committees was a recurrent criticism. In general, the conference indicated the growing desire on the part of scientists, especially the younger scientists, to use their skill for the benefit of the community as a whole, both during the war and

after it, and to eschew purely academic research—an abnegation which, however, might prove a dangerous delusion, from the community's own point of view.

Ideal Homes?

The new concept of social medicine—the idea that a person's health can only really be studied in relation to his family and environment—is bearing fruit. The Central Housing Advisory Committee of the Ministry of Health asked the Royal College of Physicians for its views on the design of houses from the point of view of health, and the latter's Committee on Social and Preventive Medicine has drawn up a memorandum. The memorandum describes in detail the sort of housing estate and the design of houses which are necessary if good health is not to be affected by living conditions, and the picture outlined leaves most of Britain's pre-war housing schemes far behind. The doctors state that the standards of floor space and areas of rooms laid down by the Ministry of Health before the war were inadequate, and they regard the idea that children need less air space than adults as a "pernicious doctrine." They condemn, too, the reconditioning of unfit property, which was carried out under the Housing Acts as an alternative to the demolition of slum property. They also urge the provision of specially designed homes for the aged poor—becoming more and more necessary as England's population gets older—where they can live comfortably, not in isolated colonies, but among the community of which they are still a part. The problem of the incorrigible slum-maker is also dealt with, and the provision of communal amenities for the whole estate, such as children's playgrounds, cheap wholesome meals on the lines of British Restaurants, and health centres, is urged. Inside the house, the doctors look for proper sanitation, hot and cold water laid on, efficient cookers, facilities for food storage, airing cupboards and labour-saving devices generally. Before the war, many of these proposals would have been regarded as attainable only by persons of middle and higher incomes, as luxuries belonging to ideal homes. The doctors, however, regard them as necessary for health and as essentials for housing schemes for the poor. It is true that in drawing up their memorandum they have specifically excluded economic and financial factors, such as rent. But if, in the interests of health, the standards laid down by the doctors are necessary, it is surely the Government's duty to see that they are achieved—and available at rents which can be paid.

Cotton Yarn Margins

Ever since the operatives in the spinning branch of the cotton industry secured an advance in wages early in January it has been taken for granted that the profit margin of spinners would be increased to meet the additional labour costs. At the beginning of this week there were issued Control of the Cotton Industry (No. 40) Order, dealing with American type and Egyptian type single yarns, No. 41 Order covering doubling margins and No. 42 Order dealing with waste yarns. It was pointed out that the margin increases provided for in the No. 40 and No. 42 Orders arose mainly from the recent agreements to increase wages in the spinning industry and to grant an additional week's holiday with pay. In No. 40 Order provision has been made for a revision in the waste allowance for Egyptian type yarns, but the increase in the spinning margins of these yarns is greater than that which applies to American type yarns. The changes in doubling margins provided in No. 41 Order take account not only of the wages increase, but also of the results of an investigation of doubling costs by a committee of accountants which advise the Cotton Controller on the effect of the controlled prices. Instead of granting a percentage increase in margins, the authorities have decided to issue completely new schedules. The prices of raw cotton have been reduced by 1d. per lb. in order to prevent the changes in margins leading to an increase in the general level of yarn and cloth prices. Abroad the trend of raw cotton prices has been upwards. According to No. 40 Order, the figure to which American type yarn spinners add controlled margins to arrive at the prescribed price of yarn is reduced from 8.90d. to 7.80d. per lb. The combined effect of these changes has been to reduce the price of certain types of yarn. As a result there may have to be a revision of cloth prices to bring everything into line. It is reported that prices for manufactured cotton goods in Great Britain are now appreciably lower than in certain other manufacturing countries, that in India, for example, cotton cloth is now being sold at about 80 per cent above Lancashire prices.

COMPANY MEETINGS

DALGETY AND COMPANY, LIMITED

BUSINESS WELL MAINTAINED

The adjourned fifty-eighth annual general meeting of Dalgety and Company, Limited, was held, on the 4th instant, in London, Major-General Sir John H. Davidson, K.C.M.G. (the chairman), presiding.

The following are extracts from the chairman's statement, circulated with the report and accounts:—

The business of the company has been remarkably well maintained during the past year, in spite of many difficulties, but indications point to a contraction in earning-power in several directions, due primarily to difficulties of shipping, restrictions of imports and to rationing, and we must be prepared to see some falling-off in our results next year.

BURDEN OF TAXATION

In addition, the heavy taxation levied both in this country and overseas constitutes a grievous burden. To give you some idea of the weight of this burden, the combined United Kingdom and Overseas taxation for 1939 was £82,000, for 1940 £221,000, for 1941 £260,000, and for the year under review £366,000.

With regard to wool, it is satisfactory to be able to report appreciable increases in both the Australian and New Zealand clips, that of the Dominion again establishing a record. Appraisements under the Government Purchase Scheme proceeded reasonably smoothly throughout the season. Production in the Commonwealth was estimated at 3,656,013 bales, an increase of 44,090 bales on that of the previous season. Practically the whole of the wool was disposed of, the gross realisations being £A63,127,615. Reports indicate that prospects generally are favourable for another good clip during the present season, though other factors may set a limit to these increases in production.

New Zealand again experienced a satisfactory season, the clip amounting to 985,812 bales, an increase of 37,649 bales compared with 1940-41. The proceeds of shorn and slippe wool together amounted to £NZ18,172,748. Seasonal news is favourable and it is expected that this year's clip will be well up to last season's figures.

One of the most important happenings during the period under review was the decision of the British Government to increase by 15 per cent. the price to be paid for Australian and New Zealand wools, the new prices taking effect in the season now in progress. This will not only be of advantage to the company, but of immense benefit to its great wool-growing clientele.

CONTROL OF WOOL CLIPS

I have referred above to the considerable increases which have taken place in the Australian and New Zealand clips and, whilst no one can regard them as other than excellent in themselves, under war conditions they bring in their train added handling and other difficulties which are becoming especially acute in Australia. So much are these now making themselves felt that the Federal Government is taking matters in hand and has adopted proposals which include measures to conserve labour and transport, and even have in view the reduction of flocks.

The 1941-42 Australian wheat crop was 164,920,000 bushels, and the estimate for the 1942-43 crop is 145 million bushels.

Turning to the accounts, we have considered it prudent to conserve our resources somewhat, and while recommending the payment of a final dividend of 3 per cent. (making 6 per cent. for the year), to increase our carry forward by approximately £9,000.

The report and accounts were unanimously adopted.

THE NATIONAL BANK, LIMITED

ANNUAL GENERAL MEETING

The one hundred and eighth annual general meeting of the proprietors of the National Bank was held, on the 28th ultimo, at the head office, 13 Old Broad Street, London, E.C.

The chairman, Mr. Michael J. Cooke, presided, and the secretary read the formal notice convening the meeting and the report of the auditors.

The report and accounts, which had been previously circulated, were—with the approval of the proprietors present—taken as read, and the chairman reviewed the figures of the balance-sheet and referred to the payment of the dividend at the rate of 10% per annum and the transfer of £10,000 to both the reserve and the premises accounts, which left £41,788 carried forward.

The chairman moved:—"That the report and balance-sheet to December 31, 1942, be adopted by the meeting and entered on the minutes." Sir Thomas F. Molony, Bt., P.C., seconded the motion, which was carried unanimously.

The retiring directors were re-elected and the auditors, Messrs Peat, Marwick, Mitchell and Company and Messrs Stokes Bros. and Pim, were reappointed for the ensuing year.

THE NATIONAL BUILDING SOCIETY

ANNUAL GENERAL MEETING OF MEMBERS

The ninety-third annual general meeting of members of the National Building Society was held at National House, Moor-gate, on the 29th ultimo, under the chairmanship of Mr Stanley C. Ramsey, F.R.I.B.A. His speech referred to the policy of the society as one of prudent retrenchment, the effect being to strengthen its position and to ensure a full measure of liquidity. Thus reserves, at over £2½ millions, stood at the highest level ever recorded.

Over £1 million was received in fresh share investment during the year, though this inflow was counterbalanced by the repayment of special deposits. The aggregate of shares and deposits stood at £28½ millions. Fresh business had not been sought, and only mortgages conforming to the highest standards had been accepted. Meanwhile, mortgage repayments and interest had risen, the revenue from that source being nearly £3½ millions.

A STRONG POSITION

A large inward flow of funds had thus helped to conserve the strong and liquid position of the society. Well over £1 million had been invested, mainly in Government funds, the total of investments outside the society rising to exceed £2,100,000, while cash at bankers was more than £600,000.

Income-tax and National Defence Contribution absorbed £469,000, and he noted that this was a load of 1½ per cent. on the aggregate of share and deposit capital in the hands of the society. The rate allowed on share investments remained at 2½ per cent. free of tax, which was equivalent to the favourable return of 5 per cent. where the full standard rate of tax had to be borne, while on deposits the rate offered was 2½ per cent.

During the past year most of the war damaged houses had been repaired. Members had benefited from the provisions of the War Damage Act of 1941, which also provided an additional safeguard for the

THE OUTLOOK

The chairman observed that the need for fresh building and re-building would be pressing when peace was restored. It could only be done by the co-operative effort of a great many people; by the house builders, by the architects, by local authorities and the Government, and last, but not least, by the building societies, who provided the vital link between builders and house owners. Private enterprise was part of Britain's inheritance, but it must be in furtherance of the national interest. It was the little ships that helped to bring about the epic of Dunkirk.

A people roused to arms, he believed, was now roused to the need for reconstruction in peace, and the great stirring in ideas would clearly lead to practical and constructive reform.

The speech was received with acclamation, and the report and accounts passed.

BIGNELLS, LIMITED

SATISFACTORY RESULTS

The sixth annual general meeting of Bignells, Limited, was held, on the 29th ultimo, at Rushden, Mr Arthur J. Bignell (chairman and managing director) presiding.

The following is an extract from the statement of the chairman circulated with the report and accounts for the year ended November 28, 1942:—

The accounts show a net profit of £12,613 (as compared with £10,727 last year), subject to income tax, but after making provision for directors' fees, depreciation, war damage insurance, and estimated liability for excess profits tax. The trading profit amounted to £46,108, which, after charging directors' fees, depreciation, war damage insurance, and estimated liability for excess profits tax, resulted in a net profit of £12,613. After providing for income tax, the final and the interim dividends of 3 per cent. on the ordinary shares paid on January 31 and on July 20, 1942, respectively, the half-yearly dividends on the 6 per cent. preference shares paid March 25 and September 29, 1942, there remains a balance available of £9,746.

The directors recommend that a final dividend of 5 per cent., less income tax, be paid on the ordinary shares, making, with the interim dividend already paid, 8 per cent. for the year ended November 28, 1942. The final dividend will absorb £1,875. The directors also recommend that the sum of £1,055 be applied in reduction of goodwill, leaving a balance of £6,815 to be carried forward. Taking into consideration difficult trading conditions and control of labour and action, your board feel justified in expressing satisfaction with the results as shown by the accounts.

The report was adopted.

Dalgely Report

The full accounts of Dalgely for the year to June 30th last show an increase in the disclosed total from £1,162,520 to £1,253,523, a more substantial improvement than could have been deduced from the preliminary statement discussed in *The Economist* of January 30th. The modest decline in equity earnings of some £9,000 to £98,895 is due to the jump in tax liability from £259,967 to £366,203, which more than eliminated the rise in profits, and to the increase of some £9,000 in exchange loss to £131,640. The directors make no reference to the outbreak of the Pacific war, which must presumably have been the most important influence restraining the rise in earnings. Crop conditions were generally better than in recent years, being satisfactory for most of the period throughout Australia, and in East Africa exceptionally good, although poor in New Zealand. In the current season, the concern will benefit from a 15 per cent increase in the British Government price for wool. It is, however, estimated that both the wheat and barley crops will be lower. This contraction is suggested by the balance decline of nearly £700,000 to £5,102,120 in the total of advances on land, stations, stock, etc. There is a corresponding rise in cash holdings, from £1,165,245 to £1,869,642, while Government securities are up from £212,614 to £278,044. Debtors and creditors are also higher, although the rise in the latter is probably due in the main to the inclusion of tax reserve. The current year is, of course, the first in which the impact of the military disturbances in the Pacific will be felt for the whole period, and it is possible that there may be a further reduction in dividend below the 6 per cent paid for 1941-42. The £20 ordinary shares (£5 paid) at 105s. ex dividend yield £5 14s. 3d. per cent less tax at 6s.

RECORDS and STATISTICS

STOCK EXCHANGES
London

Note: all dealings are for cash

ALTHOUGH business in the markets has suffered a further small contraction, the undertone throughout practically all sections remains firm, small gains for selected issues generally exceeding losses. Present indications favour a period of minor activity with a tendency for prices to react. Meanwhile, the gilt-edged market remains quietly firm, gains for several irredeemable and long-dated stocks at the reopening probably reflecting the initial investment of some of the South African vesting moneys shortly to be disbursed. In the foreign bond market, Chinese issues were marked down 2 points and more, while Japanese bonds, too, tended to lower levels. Among South American stocks, Chilean bonds weakened as interest declined, and several Brazilian loans suffered small losses. The recent interest displayed in rail stocks was absent from the home rail market at the reopening, quotations in consequence declining. Actual losses were insignificant and restricted to the junior and marginal preference stocks. Several Argentine junior rail stocks fluctuated narrowly in the foreign rail market, where the largest movement was a loss of 1½ points for the United of Havana 1906 debenture. Elsewhere, Canadian Pacific ordinary lost ½.

Selective buying provided several features in the industrial market, but prices generally fluctuated within narrow limits. Brewery shares enjoyed several scattered improvements, while tobacco issues were quietly firm on the recent results. A majority of motor and aircraft shares enjoyed small gains. Leyland, De Havilland and Rover, with advances ranging from 6d. to 1s. 3d., overshadowed smaller losses for other issues. Interest in the heavy industrial group was not quite as marked as of late, but among shares to advance, Bolsover, Dorman Long and South Durham were prominent. Losses of a few pence, however, were scattered throughout the group. Shipping shares turned dull in midweek, P. and O. deferred losing 9d. with smaller losses for Furness Withy, Union Castle and

others. Textile shares fluctuated erratically, although net changes were generally slight. Lister and Co. was an exception, rising 1s. 10d. on the higher dividend, but Courtaulds failed to hold the larger part of an earlier advance. Stores shares remained steady to firm, most movements being restricted to few pence. Small advances were scattered throughout the miscellaneous section. Wall Paper deferred, James Finlay and Turner & Newall all enjoying useful gains. Elsewhere, Brazilian Traction and International Nickel suffered a reaction after last week's sharp advance, falling ½ and ½ respectively.

Cape buying, in a market short of stock, occasioned widespread advances among *kaffir* issues. Main demand centred on Far West Rand shares, Blyvoors rising 1s. 9d. and West Wit Areas ½, among several other improvements, ranging from ½ to 1s. Chubwa and East Assam were prominent among several shares to advance in a slightly irregular tea market, but rubber shares were devoid of interest. Oil shares were neglected, prices weakening slightly. In particular, Burmah lost ½ and both Anglo-Iranian and Shell eased ½.

New York

PERSISTENT investment buying, occasioned by the war news and partly as an inflation hedge, continued to raise quotations on Wall Street during the past week. Turnover was considerable, daily dealings' totals on several occasions exceeding a million, and profit-taking, on the belief that some technical correction was due, was easily absorbed. Nevertheless, many leading issues failed to participate in the rise.

The Wheel Turns

IT is small wonder that the chief feature of Nazi propaganda is the note of fatalism. For the second time in a generation the Germans have fought their way through triumphs to disaster. For the second time, the wheel is turning full circle against them. For the second time, after successes that laid prone a continent and shook the whole world, they are reeling back to where they started from. Mr Churchill's journey, from Casablanca to Ankara and back via Cyprus, Cairo, Tripoli and Algiers, is symbolical of a new phase. Germany is being beaten by Soviet Russia, and the need of the hour is for Britain and the United States to bring the full weight of their immense strength to bear against the enemy while the Russian advance proceeds. Until last autumn, the biggest pitfall for the Allies was over-optimism and complacency. Now, although the enemy is still powerful and vicious, the danger is over-caution and too high an insurance against the risks which are inseparable from war. The price of victory will be high; but it will not grow less by waiting.

The military possibilities of what is happening on the Russian front are immense, even in the soberest view. The Russians have still much ground to regain; but their pace of advance is not slackening. The Germans may well find themselves, after two years of fighting, back

where they began with something like half their effectiveness gone, with their stocks of material gravely wasted away and with no chance of staging a recovery against the steadily gathering armour of the Allies. Moreover, something is happening already within the German ranks. As yet, it does not seem to be a crisis of morale; nor has a crisis of leadership yet appeared. It rather seems to be a crisis of leadership—perhaps the most menacing crisis of all in a totalitarian regime. Whatever may be the truth of health of Hitler, one thing seems sure. He has given the German people no direct personal guidance or inspiration at all during their greatest trial. And the estimates made by Hitler's allies and satellites of Germany's plight are plainly taking shape; each in its own way, they are moving towards the exit, seeking re-insurance against Axis collapse.

Caught by their own ambitions in the inexorable repetition of what befell Imperial Germany, the Nazis themselves seem to see only one way out. They can fight to the last; but they cannot shoot their way out. They are relying again, for the last and most crucial time, upon dividing their foes by politics. Both at home and abroad, their plea is the same. Germany is sacrificing itself to save the world from Bolshevist domination; and

COMMODITY AND INDUSTRY NEWS

Temperature Measurement (B.S.1041).—The British Standards Institution has published a comprehensive code for temperature measurement which is the first of its kind published in any country; it has involved several years of investigation by a strong committee of scientists, instrument makers and engineers. The code covers the whole range of industrial thermometry starting with the International Temperature Scale, based mainly on the work of the National Physical Laboratory, and going through mercury thermometers, thermocouples, resistance thermometers and radiation pyrometers of all kinds. A very valuable section deals with the sources of error, and there are also several sections covering special problems of thermometry such as the measurement of the temperature of glasses and liquids and the surfaces and interiors of solids. The code is stated to be of a provisional character issued for war purposes, and it will be subject to revision. It has been in use in a number of laboratories and works for some time past on an experimental basis.

Toys and Cutlery.—The quotas for toys and indoor games and for cutlery have been fixed for the six months from February 1st to July 31st. The quota for toys and indoor games is 7½ per cent of the value of supplies during the standard period. In the case of cutlery the quota is 10 per cent, with special provision for razors and razor blades, under which only a proportion of their value count towards the quota. The standard period in both cases is the twelve months ending May 31, 1940.

Canned Vegetables.—The Ministry of Food announces that, in view of the ample supply of fresh green vegetables, the Order prohibiting the sale by retail of canned vegetables which it had proposed to revoke on February 7th will remain in force until further notice. This means that the public will not be able to buy canned vegetables for the time being. The quantity of canned vegetables, when released, will be considerably less than that available a year ago.

Auction and Tender Sales.—The Board of Trade, after consultation with the Central Price Regulation Committee, have made the Sales by Auction and Tender (Control) Order (S.R. and O. 1943, No. 58) replacing the Sales by Auction (Control) Order (S.R. and O. 816) made in May, 1942. The new Order comes into force on March 15th and in addition to bringing sales by tender under control, cancels the general licence granted by the chairman of the Central Price Regulation Committee to three associations of auctioneers enabling their members to hold auctions under certain conditions and instead requires application to be made to the Local Price Regulation Committee for a special licence for auctioning certain price-controlled goods. Previously any person selling their property by auction had to declare before a Justice of the Peace or a Commissioner for Oaths

that the goods being auctioned were their own personal property. Under the new Order a similar declaration is required, but is made on a simply worded form and does not have to be declared before a Justice of the Peace or a Commissioner for Oaths. In future all traders wishing to sell goods by tender must apply for a licence to the Local Price Regulation Committee.

Laundry Services.—The Board of Trade's Central Advisory Committee on Laundry Services met on January 26th to consider the means to be employed for the laundry industry to contribute its quota to the general release of workers from less essential industries to direct war work. The plan adopted entails, at any rate as a first step, a review of the labour position on a regional basis, and from the results of these regional investigations the Directorate of Laundry Services will obtain information on which to base their plan for the imposition of such restrictions on civilian laundry as may be found necessary. The Regional Controllers of Factory and Storage Premises, who are also Regional Directors of Laundry Services, have been appointed Regional Directors of Dyeing and Cleaning Services.

Flower Growers.—In order to assist the smaller flower growers to meet the expense of converting their land to food production, the Government have decided, as a special measure, in view of the exceptional conditions, to make a payment at the rate of £20 an acre in respect of land freed from flower crops (including flower bulbs) since June 4, 1942, and subsequently planted to a food crop. The payment will be made only in respect of holdings where there were not more than 10 acres under flowers prior to the war and on which the growing of flowers for sale comprised the major part of the business of the holding.

even so, the terror from the East may be too strong—a warning as well as an admission. It is the old tactic which split all opposition in the past. But this time it is a losing game. Whatever the fears of this or that clique, it is plain to the people and leaders of both Britain and the United States that Russia's victory will be their own victory, too.

It is still folly to paint the future in rosy hues. The biggest and the most costly battles are still ahead. The U-boat attacks may reach a perilous peak in the spring. In Tunisia, as Mr Churchill has publicly stated, the struggle will be hard and bitter. But Germany is definitely losing the war. While the German retreat all along the Russian front continues, while Germans are slain or captured daily in their tens of thousands, while mastery of the air comes more and more into Allied hands, the fact that Germany is being hastened towards total defeat is unmistakable. There is only one question for Britain and the United States. What can be done to transform the blows struck by Russia into the *coup de grâce*? For many long and weary months, the problem was to mobilise for war, to muster men and marshal materials, to work out and to apply a common long term plan. Now, it is the short term that counts. The hour for action struck last November, when the landings in Africa followed the victory of Egypt—and the surging turn of the tide came in Russia. The time was due for a great acceleration, for a One-Year Plan to win the war in Europe at speed. Now, nearly four months later, when the mounting successes of the Russians have opened still new and even startling vistas, the tempo is still too slow. Too much of British and American strength is still beating the air. Aid to Russia, even at its agreed maximum, is not large in comparison with the masses of material on the eastern front. The bombing of Germany, for all the effort gathered in recent weeks, is a long-term plan; offensive in Africa has become long-term too. It is a Nine-Months Plan for victory that is needed.

Reconstruction Priorities

One main contention of the critics of the Beveridge plan is that "We cannot afford it." What does this mean? How far is it true? Broadly, the answer is that it is a matter of choice. We can afford it if we want to do it.

In money terms, the plan proposes extra burdens (over and above the present cost of the social services which it is designed to rationalise and extend) upon three groups—the taxpayers and the two partners in industry, employers and workpeople. In 1945, according to the tentative figures used by Sir William Beveridge to measure the effects of his proposals, an extra £86 millions will have to be paid from the national exchequer and local rates, an extra £125 millions by insured persons and an extra £54 millions by employers. It is doubtful whether these figures could be reduced. They have been worked out to supply benefits which will give a bare living, and they assume a rise of only 25 per cent over 1938 prices.

The increased contribution of public authorities is due entirely to the estimated cost of children's allowances (£113 millions). Without this, there would actually be a reduction in the public charge. By 1965, it is true, a further £164 millions a year will have to be found. But that increase, due to old age pensions, will be wholly the consequence of the ageing in Britain's population, and not of the Beveridge plan as such; it is a cost that will have to be incurred, in one form or another, in any case. The immediate question is the increased cost in 1945, or whatever post-war year is taken as the starting point. The extra £86 millions is plainly not a heavy burden. It is about one-ninth of normal pre-war, pre-armament budget expenditure. It is less than 2 per cent of total expenditure in the current wartime financial year. It is less than 1½ per cent of what the national income is likely to be in the post-war period. It is less than 4 per cent of the present total yield of direct and indirect tax-

Perhaps this plan was made at Casablanca; Mr Churchill said on Thursday that it had—to unfold remorselessly during the next nine months. Admittedly it is not possible, even with the greatest military opportunity in history at hand, to prepare and mount great new offensives from zero in a few weeks or even months. But it is possible, and indeed imperative, to speed up, press on, divert and deliver the offensives already planned. Audacity is the twin of speed. A double programme is needed: to assail the enemy in combined operations in Europe—ready to take risks that could not have been contemplated a year or six months ago before the disintegration of German strength had begun; and, at home, to undertake the greatest degree of austerity and effort yet contemplated. Flushed with the success of his missions, the Prime Minister has told the Commons that this country may be able to get on in food and imports in the coming months on pretty much the same lines as hitherto. With more reflection, the organiser of victory may be more grim and less gay, for now is surely the time for short-term measures: for living on capital as never before to save ships and labour and material; for making up a genuinely Spartan victory diet from food stocks and meat on the hoof; and for screwing up urgent output by the same emergency means that were adopted in the days of danger after Dunkirk.

All these decisions may have been made. All that the ordinary man can see, and say, is that they must be made—and made for to-morrow, not the day after. This is no time to plan thousand bomber raids in 1944 or anti-U-boat campaigns six or twelve months hence. This is no time to talk of an American army of 7½ millions to fight in 1945 or 1946. The day of the long-term defensive has gone. The short term of victorious attack has arrived. The wheel has turned once more against the enemy, and the chance must not be missed—on pain of betraying all the blood and tears and toil that have gone before.

tion. Plainly it need not compromise the financial position in any appreciable way.

This is not to say that there will be money to burn when peace comes. Post-war defence costs will certainly be much higher than before the war; with standing forces of, say, three-quarters of a million men, they may amount to at least £500 millions. And other commitments, for service of the debt and the existing cost of social services, may bring the total up to £1,300 millions, or about two-thirds more than normal pre-war peace-time expenditure. The present yield of taxation exceeds £2,400 millions. Of this, EPT will presumably be removed as soon as possible after the war, which would reduce tax revenue at present levels (allowing for an increase in the yield of income tax, owing to the disappearance of EPT) to somewhere about £2,000 millions. All these estimates are highly speculative; obviously much depends on the duration of the war. But it seems reasonable to suppose that the difference between the yield of taxation at its present level and commitments already known may be of the order of £600 millions. Out of this, the critics say, all reconstruction expenditure, on education, housing, health and public works, in addition to social security, must come—as well as the margin for the reduction of taxation which must be made. This is true. There is a limit to the charges that can be imposed. But it is surely a disingenuous and primitive notion to suppose that the large expenses of a capital nature involved in reconstruction must necessarily either be carried on the annual budget or financed out of taxation. If the Government is to employ both its power to spend and its power to tax as positive instruments of economic policy, there is need for a capital budget not borne on yearly tax revenue. And Government spending, on defence as well as works, can maintain employment, expand the national income and increase the yield of

taxes. These comparisons with the pre-war position overlook the fact that, at present prices, the national income after the war, provided employment can be maintained, is likely to be at least 40 per cent higher than it was—and capable, as the result of positive policy, efficiency and adaptability, of further expansion. It will be possible, if there is faith and competence, to maintain a much higher budget than in the past with much lower rates of taxation than at present, to meet much higher public commitments and still to leave a high margin of private incomes for private spending. The coat must, indeed, be cut according to the cloth. But, by right means, the cloth can be greatly expanded.

The real point is how much is likely to be needed for all the reconstruction items added together. The burden of the Beveridge supplement will be small. What the total burden of other charges will be is not known. What is needed before a complete picture can be drawn of the post-war financial position is an educational budget, a housing budget, an agricultural budget and a health budget drawn up on the same lines as the social security budget in the Beveridge Report. It is often argued that what we can do in wartime by way of public spending, we can do in peacetime. It is only a partial answer to say that the reason why public expenditure can absorb the greater part of the national income in wartime is that both industrial maintenance and civilian consumption are kept on short commons, while capital is drawn upon. This state of affairs arises chiefly from the fact that what the state spends in wartime is mostly spent on unproductive purposes, on the provision of material and equipment to be destroyed. State expenditure in peacetime on social security, housing, agriculture and investment would be more productive in its consequences; it could be used directly to raise the level both of industrial equipment and civilian consumption. The important points that emerge from the comparison between wartime and peacetime finance, are, first, that, if an abnormally high proportion of the national income is spent on "investment" purposes, current consumption must be correspondingly restricted; and, secondly, that the significant characteristic of wartime finance is a system of priorities by which the nation's resources are distributed in order of need and urgency. We can do in peacetime what we do in wartime provided that a similar system of priorities is imposed, so that resources are allocated first to essential investment and essential consumption; and provided that the means by which the national income is distributed do not act as a deterrent to the efficiency, adaptability and enterprise of economic life, upon which the size of the national income, the total output of goods and services, itself depends. It is probable that, after the war, when the transition period of shortages, dislocation and inflationary dangers has passed, taxation, while considerably lower than during wartime, will be appreciably

higher than it was in the middle thirties; and it will be enormously important that the methods of collecting taxes should be so revised and modified that enterprise is not penalised and both investment and technical progress are encouraged.

More often than not, however, the critics mean, not that the state cannot afford the Beveridge plan, but that industry cannot afford it. This, too, is a doubtful proposition. The addition of £54 millions to the contributions of employers, compared with their payments to the existing schemes, will represent not more than 2 per cent. of their labour costs. The contribution of the other partner in industry, the insured persons, will rise by £125 millions. But it should be remembered, first, that the number of persons insured will be very much increased by the Beveridge plan; and, secondly, that they will receive in return more and better benefits. The increase on contributions which employees make to existing schemes will be 2s. 5d. a week, which is about 2 per cent of the present average wage; and Sir William Beveridge in his Report pointed out that, if the voluntary payments which workers normally make to secure benefits such as burial expenses and extra medical treatment (which are to be granted automatically in the new plan) are added in, the insured worker will pay appreciably less and not more than before—and be better served. There may perhaps be a case for suggesting that the lowest-paid workers who, under the existing system can only make these extra voluntary payments by denying themselves of many necessities, will be hard hit by the extra compulsory 2s. 5d. a week. Indeed, there are a number of arguments for suggesting that the distribution of cost between the state, industry and insured persons might be adjusted; but there is no case at all for saying that the total burden cannot be borne—provided the charges levied for other purposes do not, together with the cost of social security, add up to too onerous a total burden. It is a question of priorities.

Actually, the problem is not a financial one at all. It is a physical one. Can the resources, the goods and services be made available to ensure a national minimum of consumption for every individual and every family whatever may befall them? And the answer is that, if priority is given to this object in the distribution of the real national income, it can be done, provided the measures adopted to achieve it do not, by their effect upon national economic life, reduce the national income available for distribution. There is no reason to suppose from the measures recommended by Sir William Beveridge, or from the sums involved, that these consequences are likely; indeed, the Beveridge plan is more likely to have the contrary effect of helping to maintain the national income at a high level by keeping consumption high through good years and bad.

What we can afford in total, in terms of goods and services, depends on the size of the national income,

£12,500,000 damage to the War Effort last year from ordinary fires.

Half the fires in the country are caused by matches and cigarette ends.

MOST FIRES ARE CAUSED BY "CAREFUL" PEOPLE.

DON'T JUST BE CAREFUL—TAKE EXTRA CARE

Issued as part of the Fire Offices Committee's Campaign against fire wastage.

which itself depends upon what we do with it, upon the way in which it is distributed and used. The prime needs are a rate of investment large enough and regular enough to maintain high employment; the highest possible level of productivity and technical efficiency in manufacture and distribution; and the utmost possible enterprise and adaptability. Manufacturing and export costs can be reduced infinitely more after the war by an increase in efficiency and a decrease in restrictive practices than they can possibly be increased, even in money terms, by the Beveridge and other plans. The fact that British steel before the war cost half as much again as foreign steel is immeasurably more significant than a rise of 2 per cent or so in money costs because of the added social security charge—a rise which in any case will be compensated, to the advantage of Britain's terms of trade with the outside world, by the lower rate of exchange which must in any case be fixed for the pound in the post-war period. If the national income is to be maintained and expanded, trade associations and trade unions must play a positive part in securing this efficiency, in increas-

ing the speed and skill with which resources can be transferred and applied to the purposes which will be most productive in post-war conditions. This will call for an assault upon monopoly and quasi-monopoly; and, equally, for some revision of the craft practices in trade unionism which impede the movement of labour from one occupation to another in accordance with the needs of adjustment.

These are the conditions of "affording" reconstruction plans. If the provision of a physical minimum, by means of the most efficient possible use of resources, is made the foundation of policy, then the task of providing a financial minimum in terms of the Beveridge and other plans is correspondingly easier. The important question at the moment is to know what these other plans will be, what they are estimated to cost and in what order of priority they are regarded by the Government. Then it will be possible to say much more specifically what can be afforded. For the moment, of the Beveridge plan, all that can be said is that its cost can, and should, be met.

Catering Conflict

THE Catering Wages Bill has been given its second reading in the House of Commons. The heated debate and the unexpectedly big opposition vote indicate that the Bill may have a rough passage through its Committee stages. The fact that 116 Members were found to vote against a measure which had unanimous Cabinet backing is a testimony to the energy and persistence of the organisers of the opposition.

Proposals for the regulation of catering wages have always given rise to opposition. In 1924 the Labour Government tried to pass a Bill and again in 1929 Miss Bondfield sought to establish a Trade Board for the industry. On both occasions, the Labour Government fell from power before it could carry its proposals through. In 1930, the General Council of the Trades Union Congress reported

Never have employers fought more strenuously than in the present case.

So many "objections" were raised to the Minister's Draft Special Order that it was decided to appoint a special Commission of Inquiry. Sir Arthur Colefax, who reported in February, 1931, was mainly concerned with legalities, and expressly stated that the expediency of applying the Trade Boards Act to the trade was "a matter solely for the Minister of Labour" to determine.

Mr Bevin's scheme has met with as much opposition as did Miss Bondfield's twelve years ago, though not all branches of the trade are hostile. Some industrial caterers, most local authorities and institutions and some individual employers, such as the Express Dairy Company, are in favour of his Bill. The character and extent of the opposition within the trade itself can best be gauged from the composition of the Liaison Committee which was set up in August, 1942, to conduct the campaign against the Government's plan. It includes representatives of the Hotels and Restaurants Association; Residential Hotels and Trust Houses; the Retail Liquor trade; the Light Refreshments trade; the Eel and Pie traders; the Coffee Stall keepers; and the Milk Bars Association.

Sir Douglas Hacking, the leader of the intransigents, based his attack on political grounds. He argued that the Bill was of a controversial nature and could not be held to relate in any way to the prosecution of the war. Mr Eden backed Mr Bevin in denying this. But the main objections were that it would impose "control for control's sake"—the Bill was called a "monster of bureaucratic autocracy"—since the statutory Commission, whose members would all be "the Minister's own nominees" (an innuendo which appears to be an inexcusable, ungrounded and unprecedented attack on Ministerial integrity and impartiality) would have power to make recommendations not only about wages and conditions, but

also on matters relating to the efficiency of the trade. This is regarded as the "thin end of the wedge." The *Daily Telegraph* has pointed out that there is nothing to prevent Mr Bevin from "casting his eye along a whole row of other industries" and applying similar arbitrary measures wherever he feels disposed. The catering interests have stated that they have no objection in principle to an investigation into the conditions of their employees; but they say that Mr Bevin, by establishing a Commission before he establishes wages regulation machinery, is putting the cart before the horse. It is Mr Bevin, far more than his Bill, that they are hunting.

On the face of it, it is very difficult to see why the Bill should have evoked so much protest—apart from these illegitimate personal reasons. The proposed Commission, after all, is not an executive body; it will only make recommendations to the Minister if it finds the existing arrangements inadequate. If the conditions are satisfactory, well and good. If not, it is as well that there should be legal machinery to bring about improvements. Mr Bevin's speech, like the Bill itself, was extremely reasonable and moderate.

The caterers have denied that there is any need for legislation or regulation. If the employees were dissatisfied, it is argued, they would either walk out or get themselves organised in trade unions; and the catering trade is too diversified and too individualistic to make it desirable or practicable to apply the Trade Boards Act to it. These are their arguments. Admittedly, catering with its different sized units and varying types of service, ranging from the one-man coffee stall or corner café to the multiple tearoom or West End hotel, presents a far from composite picture. There is no geographical unity; an immense diversity of catering units may be found within the same town or even in the same street. The seasonal element bulks very large in catering. Boarding-houses and restaurants in seaside resorts may be faced with a big influx of visitors for two or three months at the height of the summer holidays; they have to increase their staffs to cope with the expanded business, and lay them off during the dead season. Then the variety of components which enter into the workers' total remuneration makes it difficult to arrive at any wage structure for the trade as a whole. Lodging or meals may be found, and it is difficult to assess their cash value; allowances in kind—uniform, laundry, beer—may or may not be provided. Then there is the question of tips. Mr Bevin's hatred of these haphazard *douceurs* is probably shared by many employers and employees. In most establishments a system operates whereby tips are pooled, generally according to a graduated scale, but this may not cover the kitchen staffs.

But these problems should not make it impossible to regulate wages in the various sections of the trade. The retail trade has many different sized units, and the element of personal service bulks large; yet collective agreements have been made for distributive workers. A Wages Board was established in the road haulage industry in 1938—the Act was described by Miss Sells in her book on Trade Boards as "the application of a system of Trade Boards to the special conditions of a large and heterogeneous industry." Dock labour has been casual; the seasonal element is present in agriculture; yet in both these industries wages and conditions have been statutorily regulated.

It has been suggested, unpardonably, that Mr Bevin's object in promoting the Bill is to increase the power of his own union. A representative of the brewery trade has said that "the introduction of the trade union element in relation to the vital services rendered to the public at licensed houses was to be strongly deprecated." Catering workers are probably the least organised section of the working-class, and they are not covered by any trade union agreements. In 1929 the proportion of organised workers was less than 5 per cent; today it may be slightly higher, owing to the development of industrial catering, but it is certainly not more than 10 per cent for the trade as a whole. The chief reasons for the failure of the unions to build up any organisation in the past have been the casual and seasonal nature of employment and the weak bargaining power of catering employees, their fear of victimisation, and the large amount of foreign and refugee labour employed. But it is not at all certain that the mere establishment of a Wages Board would result in increased union membership. Some years ago the TUC appointed a committee to investigate the working of the Trade Boards Acts, and out of 22 unions giving evidence, half reported that the establishment of a Board in their industry had either resulted in a loss of membership or proved an obstacle to organisation. On the other hand, there was unanimous agreement that the Trade Boards had been instrumental in maintaining wage rates and improving the conditions of labour. On this evidence, the unions cannot be accused of acting from purely organisational motives in supporting the Bill.

It is regrettable that there is so little up-to-date information available about the catering trade—a fact which Mr Bevin has admitted in the House of Commons. The latest detailed investigation was that initiated by Miss Bondfield. This enquiry revealed a tremendous divergence of standards in different branches of the trade and different categories of employees; but it did show that some workers in some branches were definitely underpaid and overworked. Though Sir Arthur Colefax reported that there was no evidence of the "prevalence" of bad con-

ditions, the Minister of Labour took the view that it was not necessary to show that *all* waitresses and kitchen-hands were badly paid, but that *some* were, in order to justify the establishment of wages machinery. It may be argued that the 1929 enquiry is scarcely relevant to the present issue, since it was undertaken at a time of growing economic depression and mounting unemployment. Conditions have undoubtedly improved in general since that date, but there is evidence that at busy times employees in hotels and restaurants were working long hours with little or no breaks, hurried meals and inadequate rest-rooms; and living conditions were frequently said to be unhealthy, in badly ventilated attics or basements. And there is no system of inspection to enforce decent standards. Since the war, of course, the bargaining power of the workers has increased immeasurably and has forced up the general level of wages. Immediately before the war, barmen in London public houses were earning about 25s. to 35s. a week, excluding board and lodging, for about a 60-hour week. With the present shortage of labour they can now earn between £3 5s. and £4. Waiting and kitchen staffs in the larger hotels have secured considerable increases on their pre-war earnings. Voluntary agreements regulating wages and hours have been made in certain sections of the trade and cover canteen staffs in industrial establishments, British restaurants and hostels.

But the fact that catering workers have been able to secure advances in wartime does not remove the necessity for regulating the level of wages in the future. The Minister of Labour is thinking in terms of a great expansion of the catering trades, which he believes may employ a million or more workers. It is hoped that the development of civil aviation will bring tourists to Britain. If a stable level of employment and higher standard of social security are aimed at, and holidays with pay become general, it may be assumed that the business of providing accommodation, food and drink will become increasingly important. About 100,000 cooks are now being trained in the army and for them, as well as for the many catering workers who have been mobilised, it is desirable to guarantee a return to secure wages and decent conditions. The principle of a national minimum is now becoming generally accepted and to have one section of industry standing out for unregulated, individual wages bargains, which may or may not be consistent with that minimum, would undermine all attempts to establish a national wages foundation. Collective bargaining is by far the best means of determining labour's terms of employment, and if it is not backed by legally enforceable contracts, the whole structure will be full of gaps and loopholes. It should surely not be necessary in 1943 to fight over again the 1909 battle for the establishment of a minimum wage principle.

The Quality of Mercy

THE amount of misery caused by this war is beyond the limits of imagination. Even if people wished to see it clearly, they could not do so. And they do not wish to because pity which cannot lead to action is quite unbearable. There is, however, this consolation, that the only way to end the suffering is to win the war, and the effort for victory is thus, without hypocrisy, the most genuine effort of compassion and relief.

Yet from time to time the horror rises to some extreme pitch, and no amount of insistence on working for victory can really satisfy the pity in men. Two such cases are before the British people now. They represent the ultimate pitch of barbarity, one passive, one active. In Belgium—and in other occupied but less accessible countries—the Germans' policy of letting all but the active adult working population starve has resulted in famine. The death rate among mothers and infants is mounting steadily. The children who survive are stunted and maimed. The tuberculosis rate is 60 per cent higher than in 1940. In scientific terms, children who need 2,725 calories a day are getting 886. The danger facing the

European nations is quite simply that, when relief comes, it will come too late for this lost generation.

The other case is more horrible, so horrible that only the most certain evidence has compelled the belief that such callous atrocities are possible. The Nazis are making good Hitler's promise to exterminate the Jews. Since July last the ghettos in Poland have been emptied, and Jews have been deported from enemy-occupied country to the east. The journey of these unhappy men, women and children is designed to guarantee that few of them survive. They are packed in cattle-trucks so closely that the dead have no room to fall to the stinking lime-strewn floor. At their destination the slaughter camps await, where all—young and old, mothers and children, the sick, the infirm—all, in a word, whose strength cannot be exploited for the German war effort, are massacred by mass methods of destruction. Of the six million Jews of Europe, over two millions are gone already. Thousands more are being herded across Europe to their death. The mind falters before such horrors. It is not enough to win the war in six months, in a year, in two years. Can

nothing be done now, before the slaughter has wiped out the last remaining Jew?

These are the two cases which confront the conscience of the British Government and of the British people. What can be done? Winning the war remains the overriding aim, and where there is contradiction between the waging of effective warfare and the relief of Hitler's victims, relief must give way. In the war strategy of 1943, there are two extremely vulnerable points: shipping and supplies. Shipping losses alone can still cripple the great offensive of the Western Powers. Food shortages are spreading round the world and in many areas for which the Allies are already responsible there is danger of famine. Yet without sustenance and transport nothing can be done on a big scale to help the children or the Jews. The truth—the unhappy truth—is that there can be no effort commensurate with the degree of pity and anger aroused in this country. There can be no mass feeding of Europe's starving masses. Millions of Jews cannot be evacuated.

There comes a point at which a flow of rhetoric gives an impression of activity at home and hypocrisy abroad. Fortunately, there are some steps which, without interfering with the effectiveness of the war effort, can be taken. It is on these that public opinion must be focused in order to speed governmental action. In the case of the children, the existence of neutral Swedish shipping, and the readiness of the Swedes to devote this shipping to the transportation of vitamins and powdered milk to Belgium, meet the shipping difficulty—to some extent. These ships are not being diverted from the Allied war effort, and the amount of food proposed—it might be more nearly described as medicine—2,000 tons a month, is negligible. Moreover, the Belgian Government would finance the operation. Apparently, it waits only on the issue of navicerts. The argument against such action—that it is the thin end of the wedge of feeding all Europe—is perfectly sound. It has been stated by *The Economist*. But it does not take into account the limiting factor of Swedish shipping. No Allied ships can be diverted from the war effort. That is axiomatic. Even if the British people and the Allied armies reduced their ration, as they very well could, the shipping saved would of necessity be devoted to the battlefronts. Thus, when all the shipping that Sweden—or any other neutral country—can devote to relief is under commission, the limit of assistance has been reached.

The problem of removing Europe's Jews from the reach of their assassins is again a transport problem. There can be no mass exodus, but the sincerity of the British Government's intentions will be tested by the speed, vigour and generosity with which it deals with the trickle who can escape. It is good news that after negotiations through the Protecting Power with the Bulgarian Government, and directly with the Turkish and Iraq authorities, the Palestine Government are admitting 4,000 Jewish children, accompanied by 500 adults, from Bulgaria, 270 children and later 500 children, from Roumania and Hungary. As transport becomes

available, the immigration quota up to March, 1944, which amounts to some 29,000 visas, is to be filled, mainly by children. This is something, and the House of Commons received the assurance that the Government is not limiting its attempts to Palestine only. Over 100,000 refugees of all nationalities have already been admitted into Britain, the Middle East and East Africa. Yet clearly this is not enough. Planned emigration, thousands at a time, is possible only round the Eastern Mediterranean, where there is a land bridge out of Europe. But what of the individual Jews and the small groups who succeed in escaping elsewhere?

One of the proudest achievements of political freedom was the right of asylum. It was a commonplace a century ago that the politically persecuted, if they escaped, had the right to shelter and protection. That right has gone, even in the free world. Those who escape today have no guarantee of assistance, no certainty of visas, in some cases no guarantee even that they will not be returned in ignominy to their persecutors. Here the United States and Britain share a heavy responsibility. They have not been over generous. By insisting on financial guarantees, they have rescued the wealthy or the canny, rather than the hardworking. By complicating the procedures, they have tended to exclude the straightforward citizen and received the wire-puller. Now, so late in the day, the time has come to say that any Jew, who escapes to any neutral country, will be received in Britain or America. Arrangements could be made with the neutral Governments for the temporary maintenance of the refugees. Lisbon could be made a port of call for ships possibly returning with some shipping space from North Africa. It is not enough to divert the trouble away to the East. The Western world must be prepared to restore the right of asylum where necessary at its own immediate expense. It might even be possible to ask the German Government through the Protecting Power or the Vatican to permit a specified number of Jews, especially children, to make their way to the Spanish frontier and arrange with the Spanish and Portuguese authorities for transit, maintenance and their ultimate despatch from Lisbon to Britain or America. The number must be limited by shipping and supplies, but if only fifty, a hundred, two hundred, people were rescued in this way, so many human souls would have been saved from anguish and so many bodies from torture and death.

The only thing which would be absolutely inexcusable in this terrible dilemma of relief would be to use the exigencies of war as an excuse to avoid any kind of assistance compatible with the waging of a successful war. No one denies that the dilemma exists and that the shipping and food shortages are limiting factors. All the more reason then to pursue the policies which are practicable with all the vigour and compassion the working of a larger scheme would have required. The quantity of Britain's mercy at this time is cruelly constrained. Its quality need have no limits.

NOTES OF THE WEEK

The German Retreat

With the capture of Kursk and Byelgorod by the Russians, the campaign has entered a new and decisive stage. The battle of the Ukraine is now in full swing, while the fighting in the Caucasus and around Rostov is nearing its finale. The terrain into which the Russian armies are now infiltrating has been held by the Germans since the end of 1941. It was supposed to have been formidably fortified and made impregnable. Yet the speed with which Kursk and Byelgorod were taken suggests that some grave deterioration has taken place on the German side. The approaches to Kursk were only slightly defended. The reason for this must have been a growing shortage of operational reserves, which are needed on too many sectors of the front at the same time. From the detailed reports of the fighting, it may also be that the

German armies are more and more handicapped by inadequate armament—whereas the Russians have thrown in very massive reserves of arms and munitions. It is, of course, possible that Kursk was deliberately evacuated and given up by the Germans, and that only the garrison was left to fight a rearguard action. If so, then the strategical conduct of the campaign shows a picture of utter inconsistency and confusion. If the German Command decided upon a general withdrawal in order to shorten the line, and fall back to a more defensible front, they ought first to have withdrawn in the extreme south, from the dangerous pocket between Dnepropetrovsk and Rostov. Kursk was hardly a place from which a withdrawal had become strategically desirable. The fighting for Rostov and for the Donetz drags on, although the German position there is obviously untenable. In fact, the German retreat has so far been carried out according to no coherent plan.

The pace and the direction of the retreat have been dictated by the strength and speed of the Russian thrusts. The initiative is firmly in Russian hands all along the front, and alternating pockets and bulges leave the Germans little chance of easy extrication or planned withdrawal.

Three Days and After

Legends and superstitions play a central part in Nazi propaganda. From the outset, the myth of racial superiority was translated into the barbaric fact of anti-Jewish persecution; and all the earlier victories of German arms were put down to German invincibility. Thus, it was not possible to explain the disaster at Stalingrad to the German people in rational terms. The only way out was to create a new legend. The destroyed 6th Army became in this handling a Victorious Army. On the second day of last week's mourning, the German people were given a graphic account of the 6th Army's triumphant progress since 1939; and on the third day, there was a great parade of Germany's mighty achievements in industry, science and culture. The ordinary German was left with the impression that the whole of this great German army, officers and soldiers alike, had fallen like the Nibelungs after an incredibly heroic resistance. As long as the Nazi regime lasts, this legend will remain, like the legend of the "Langemarck volunteers" of 1914 and the "unbeaten" army which came back in 1918. All this is true to type. But it may be a boomerang. The fact that a major military disaster has befallen German arms in the east cannot have entirely escaped the notice of the German people. There may be other catastrophes to follow Stalingrad, and a new legend cannot be made every week. The German people know that the Russians are advancing, just as they know that labour mobilisation has already been carried to the highest possible pitch; the new decrees closing down shops, and so on, will have only a slender yield. They too are part of a legend, the legend of the "people's community" which the Nazis have brought into being, the community in which, at this crisis, the leisured and the idle must be forced to work and fight. But facts will tell. The German people have still to hear Hitler in person on what is happening to their eastern armies. They have still to know where he is and what he intends to do. And, while they wait, there is a note of fatalism and despair in the speeches of their other leaders which must be somewhat frightening. Dr Ley has toured East Prussia. It was stated that the people there expressed their inescapable determination to fight. Thus, Dr Ley prepared the German people for a Russian invasion of the Reich.

Reshuffle in Italy

"Heads I win, tails you lose." The Italians are in a desperate situation, and any political move made under the pressure of such a catastrophe, interpreted in whatever direction, makes not the slightest difference to the fate of the Duce's regime. Its days are numbered. The Cabinet changes are a last desperate effort to manoeuvre for position and probably represent not a coherent policy, but a series of expedients. The dismissal of Ciano, Bottai and Grandi, all great names in the Party, is chiefly for internal consumption. The Duce needs scapegoats and the suggestion of new beginnings and new men is apparent in the wholesale reshuffle in the Cabinet. The recent dismissal of the Chief of Staff, General Cavallero, was not sufficient to meet a crisis in which military, political and economic conditions are all deteriorating. The names of the dismissed and of the new men suggest a tightening of discipline. Moderates like Thaon de Reval are sacked. Tried men who have worked unsensationally at their jobs like Host Venturi and Riccardi have gone. Although all generalisations may be misleading, it seems that Mussolini has dismissed on the one hand anyone big enough to be useful as a scapegoat, on the other any who might prove timid, disillusioned or cynical enough to give up. If it is anything, the new Ministry is a Government of National Concentration with the Duce adding yet another vital office—the Foreign Office—to those of Minister of War, the Navy, the Air Force, the Interior and Commander-in-Chief which he already holds. This interpretation fits in with the trend inside the Fascist Party in recent months. The discipline has been tightened up and all "slackers, cynics, grumblers and defeatists" have been purged.

Just as Hitler in the crisis which has been growing ever since December, 1941, took over unique control first of the army, then of civilian life, and thus attempted to rally the people by a personal identification of the government with his mystic leadership, so probably the Duce, in rather a less emotional and teutonic way, is attempting the same metamorphosis. Even so, with Rosso sent out to Ankara and Ciano to the Vatican, he may still have one ear on the ground for whispers of peace.

Towards Unity

General Giraud's new ordering of French Africa is at least an improvement on Admiral Darlan's. There is to be no more harking back to Pétain's authority. General Giraud is to be "French Civil and Military Commander-in-Chief," and he will be assisted by an advisory war committee in place of the old Imperial Council. On the economic side, he will have the assistance of an economic council representing all French African territories (save those controlled by Fighting France). Delegates to this council are to be nominated by the Governors. In his relations with the Allies, the General will be assisted by a Delegate General. The new administration is to work in a more liberal spirit. Jewish property will be restored, and—three months after the entry of American and British troops into North Africa—Jewish children are to be permitted to return to school. The release of prisoners will be carried forward, and such astonishing anomalies as the continued existence of Laval's *Service d'Ordre Légionnaire* will cease. All this obviously represents a step forward in meeting the Allies' wishes—and the needs of the military and political situation. It is less obvious whether it will speed up the process of fusion between Fighting France and the North African authorities. As General de Gaulle pointed out at his press conference, the changes were made without consultation, even though General Catroux, the Fighting French Commissioner for Syria, was about to arrive in Algiers for joint talks. The situation is that two centralised authorities exist to control and direct the French Empire and the efforts of independent Frenchmen living outside France. Neither authority is anything like ideal from the point of view of Frenchmen or their Allies. It is not so much that the committees are "unrepresentative" in the sense of not being democratically elected; in the circumstances, they could not be. The shortcomings lie in the character and temper of the two movements. General de Gaulle has weakened his position by excluding a number of his ablest collaborators, General Giraud by failing to exclude some of his most compromised. General de Gaulle has allowed a suspicion to grow that his movement has strong personalist tendencies, and that he himself is not without ultimate political ambition. General Giraud has largely admitted his incapacity to deal single-handed with the problems of North Africa by his repeated assertion that he is no politician and only a simple soldier. Given two authorities, neither ideal, there should be no question of abolishing either in favour of the other, but

of fusing their better elements in a new unity. There is need for a centre of administration both in London and North Africa. Let there be an exchange of personnel, a process of "mixing up" carried down through both administrations. No mere "liaison" would be an effective step towards fusion. Let the independent Frenchmen in Britain and America be brought, both in Africa and London, into positions of trust. This broadening of both branches would have a liberalising effect, for it is the authoritarian tendencies of both movements that have held many honest men aloof.

Aid from Canada

The financing of Canadian war supplies to the Allied nations has been placed on a new footing by the establishment of a War Supplies Allocation Board, announced this week by Mr J. L. Hsley, the Finance Minister. The Board, which is being endowed with an initial appropriation of \$1,000 millions, will have a task roughly equivalent to that of the United States Lend Lease Administration. It will provide for the distribution and finance of Canadian supplies of war materials—in the widest definition—to the United Nations. These materials are to be supplied without cash or credit. The new arrangement is explained by the exhaustion of the \$1,000 millions free gift which Canada made to the United Kingdom early in 1942. This gift, in its turn, followed the virtual exhaustion of Britain's Canadian dollar resources (and of gold and securities convertible into Canadian currency) and a period during which British purchases from Canada were paid for in sterling and accumulated here in the form of credits, which in January, 1942, were converted into a loan free of interest. The new arrangements for financing the supply of war materials from Canada to this country will only operate when available resources of Canadian dollars are not sufficient to meet debts. These resources are to be somewhat increased in the immediate future in two ways. First, the Canadian Government is to take over the ownership of United Kingdom interests in Canadian war plants, which amount to about \$200 millions and represent direct British Government investments in Canadian munitions concerns made since the beginning of the war. Secondly, Canadian Government expenditure in the sterling area is to expand considerably as a result of the formation of additional Canadian RAF squadrons, which will incorporate most of the Canadian personnel now in the RAF and hitherto paid by the British Government. The new arrangements ensure that the flow of Canadian supplies to this country and to the other United Nations will not be hampered by financial considerations. In so far as they involve no creation of monetary or "real" debt, they go as far as generosity can.

War in the Air?

A Note on page 208 discusses American views on the future of civil aviation. There is uneasiness on both sides of the Atlantic. Some Americans allege that by supplying aircraft under Lend-Lease they are giving the key to Britain; at least as many Englishmen allege that by handing over Empire routes to United States lines they are selling their birthright. Few opinions on the subject are so riddled with nonsense as those expressed in Mrs. Claire Luce's recent plea for "sovereignty of the skies." Fantastically, she speaks of the squeezing out of American shipping by the "heavily subsidised" lines of other "low labour scale" countries, and voices the fear that the same may happen in the air. It is high time that the British and American Governments ended this sordid wrangling by stating exactly what is happening and making plain their future policy. They have to choose between "sovereignty of the skies" and "freedom of the air"; and there is no doubt which choice will best serve both world peace and the efficiency and cheapness of world transport. In this discussion, British and American Imperialism look equally ugly.

Service Overseas

Both Houses of the South African Parliament have approved General Smuts's motion that South African soldiers be allowed to form volunteer units for service overseas. In the House of Assembly the motion was passed by 75 votes to 49, thus giving a majority in the Government's favour of 26, compared with 19 when a vote on the war issue as a whole was taken two years ago. But if General Smuts's

position has thus been strengthened by his motion, the very reverse is true of Mr Curtin in Australia. When he decided to amend the Militia Bill to enable Australian conscripts to be sent to serve in the Pacific area outside Australia itself, he was applauded for having taken a courageous step which would lift the conduct of the war outside party issues. But the Bill which is now before the Commonwealth Parliament defines the area to which the militia can be sent so narrowly that it excludes parts of Java, Borneo and the Solomons and the whole of the Malay, the Philippines and New Zealand. Thus Mr Curtin has apparently given way to the isolationists in his own party, though the inter-State Labour Conference had approved his proposal to send the militia outside Australia by 24 votes to 12, and his explanation for the narrow definition of the south-west Pacific—that *inter alia* it had to be based on Australia's available manpower—reads unconvincingly. It may be true, as he claimed, that the present strategy of holding Japan until Germany is beaten means that Australian action must be primarily defensive. But that the main body of Australian soldiers is needed in or near Australia now should not be allowed to determine future military plans, which must inevitably be hampered by the knowledge that the use of Australian manpower is still limited—even against Japan. Mr Curtin has not lost his political position in Australia by his timidity, because the Opposition has shown itself equally weak in condemning but not opposing the Bill. But he may have lost some weight in the counsels of the United Nations, whom he has been ready to blame for sending their soldiers overseas to fight Germany instead of to the Pacific area to fight Japan.

Peace Aims

It is right for publicists and experts to point continually to the folly of seeking old ways in a new world. There was no return to 1914 after 1918; there will be no return to 1939 after 1945—whenever it is. The world will be changed, and the greatest need of all will be adjustment. Nevertheless, neither the journalist nor the economist should overlook the human facts. The first and foremost fact is that practically every ordinary man or woman who is in the Services or in the war factories wants, above all, to go back home—and by home is meant something very like the old familiar home life of 1939, riddled, no doubt, of its disadvantages and insecurities, but still the old familiar place and way of life. Indeed, whatever war and peace aims the various governments may have, this is precisely what millions of ordinary men and women are fighting for. The second fact is that certain groups in the community are making their way back to 1939, under cover, not because they regard the pre-war world as a whole as desirable, but because their own position in the pre-war world was relatively strong and well entrenched. The trade unions, quite openly and above board, have their Restoration of Pre-war Practices Act; the trade associations are getting their trade practices restored in a different way, by consultation and private treaty with the appropriate Minister or Ministry, by getting on with the job of making certain that, even if it is no better, the post-war world will be no worse—for them. The implications of these facts are plain enough. First, the starting point for every plan must be the ordinary life of ordinary people, and their ordinary wants and needs—the wants and needs of Tom Snooks and his family, as Lord Nathan would say; the rule of the expert, who knows nothing and cares less about ordinary people, is less tolerable even than the rule of the good fellow who is an ignoramus. Secondly, all post-war planning should be done in the open. As Sir George Schuster argued in last week's debate on economic policy, the principle should be Let the People Know. Let them know, let them decide. Only in this way can it be made sure that the real issues are known, and that the solutions are not being worked out behind closed doors by vested interests. Let the Government say openly what its schedule of priorities in reconstruction is, what it proposes to do and why; then the people can tell whether these questions have been rightly answered, whether what they want to have and to do has been taken into account, or whether the harpies have been at work again, closing this or that avenue to a homely but abundant life.

The Upper House

It should not have been left to Lord Beaverbrook to say what a notable contribution the House of Lords has made to the discussion of war problems and policy. Mead-

ing for the discussion on the Ministry of Aircraft Production to be held in public session, Lord Beaverbrook underlined the national importance of the peers' debate. The present House of Commons, he pointed out, is no longer representative; it has prolonged its own life by statute; and it has "co-opted nearly 100 Members without consultation with the electorate." The House of Lords, on the other hand, he contended, "has to-day a far greater influence and power than it has exercised at any time in the past 30 years." This is perfectly true; as a deliberative body, the Upper House has never been more worthy. This does not mean, however, as Lord Beaverbrook seemed to suggest, that the balance of political power has shifted upstairs. He said that the further continuance of the life of the House of Commons was dependent on the assent of the House of Lords. Formally, this is true; but, actually, if the Government decided that the life of the Commons should be extended further, the House of Lords, itself inspired in matters of party decision by precisely the same political pressures which control the Commons, would agree. It is as a deliberative body, not as a political force, or as the maker of policy, that the House of Lords has come to excel; and it has done this by the admirable way in which it has employed its resources. Only those people who know, by profession, experience or close study, about the topics to be debated, normally take part. The process is vaguely similar to that by which only the law lords came to sit in judgment when the House of Lords acts as a court of justice. The debating ring is kept clear for the peers who have something of value to say; and the process has been very notably assisted in recent years by the quality of the new peers created, very few of them merely as political jobs, and very many of them men of high distinction and ability, not least in matters of government and the Services. All this gives not the slightest excuse, in itself, for the existence of a hereditary Upper House. It is because, by and large, the hereditary principle is only a sleeping partner in the actual proceedings of the House of Lords that these excellent results have been achieved.

The Colonial Service

It was, perhaps, natural that, after the proposed reforms in the recruitment of the Foreign Service had been announced, suggestions that there should be equally far-reaching reforms in the Colonial Service should be renewed. Lord Trenchard returned to the attack in a debate in the House of Lords this week, when he asked whether the Government had come to any decision on the question of the recruitment of the Colonial Civil Service, the establishment of a Colonial Staff College, the creation of a Colonial Advisory Board and the grouping of colonies together. The Duke of Devonshire, in reply, was not able to state more than that all these matters are under active consideration. There are certainly colonial matters on which the need for a statement of policy is more urgent. To a large extent, the right machinery will be forged as new policies are put into effect. Thus, the full implementation of the Colonial Development and Welfare Act will demand a more technical and specialist Service, and, unlike the Foreign Service, the whole Colonial Service must, gradually but eventually, wither away as one by one colonies come to administer, and finally govern, themselves. But policies can nevertheless be held back if the machinery is faulty and cumbersome, and there is consequently an obligation on the Government to see that the Colonial Service is staffed by men with progressive ideas and courage, and that their initiative and critical outlook are not stifled by higher authority. This need for the right staffing, at the Colonial Office itself, in the Governments and Secretariats of the different colonies and in the administrative and technical services, is discussed in detail in *Downing Street and the Colonies*, a report submitted to the Fabian Colonial Bureau and published by George Allen & Unwin (2s. net). Not all will agree that the examination system, abolished altogether when the Colonial Service was unified in 1932, is the right method of recruitment, as the report urges. It may be more democratic than the present system which favours unduly young men from Oxford and Cambridge, but modern methods of selection, as, for instance, are applied at present to the selection of officers for the army, will probably be found to have far greater value in determining and finding the right sort of person; it is worth noting that this system will be adopted for recruitment to the Foreign Service to a maximum of 25 per cent of the candidates. But the report's main recommendations will be endorsed by all who look for new life and vigour in Downing Street and the Colonies themselves.

Reculer pour mieux Sauter?

After some six months of fierce fighting, the Japanese have abandoned Guadalcanal in the Solomons. The spectacular landing made by United States forces early last August—their first exercise in combined operations—has succeeded. Japanese Imperial headquarters have admitted the total withdrawal of their forces with the exception of a few isolated remnants. There has been no large scale Japanese attempt at reinforcement since the middle of last November, and the forces which remained were outnumbered and outmanœuvred. This Guadalcanal victory is the complement of the Australian victory in Papua. Both tips

of the pincers, with which Japan, in the early summer, attempted to encircle Australia, have been bitten off; the threatening arc has been curtailed and an immediate and pressing danger removed. Moreover, the campaigns for Guadalcanal and Papua have cost the enemy heavy losses in all fighting services, and have demonstrated that the Greater East Asian power is not invincible. These two campaigns may prove to have been the turning point in the Far Eastern war. But to suggest that the turning point has unmistakably been reached would be to read too much into the latest successes.

Young Workers

The claims of industry and education are too often regarded as opposed. There are those who hold that, however desirable it may be to extend the period of compulsory education, the country "cannot afford it," because the withdrawal of a large part of juvenile labour would add materially to industrial costs. There are others who hold that one of the chief reasons for raising the school-leaving age is to keep adolescents as long as possible from entering industrial employment. It is the great merit of Nuffield College's Statement on Industry and Education (Oxford University Press, 1s. net), that it shows how false this opposition is. Since Britain's standard of living depends on the efficiency of British industry, it is industry that will continue to employ the vast majority of the new supplies of labour that appear year by year. The idea that there is something derogatory in manual occupations as against non-

manual must be eradicated—possibly the war, which has emphasised the importance of skill in the Army and especially the RAF, will have helped—but it follows that the young worker taking up manual employment must have an education equal in status and in quality to the education given to a grammar school boy—the more intelligent and adaptable he is, the greater will be his efficiency and the lower industrial costs. Nuffield College insists that the education of the great majority of industrial recruits—those leaving school at the statutory age, which it urges should be 15 immediately after the war, with a further rise to 16 as soon as is practicable—should not be “narrowly vocational . . . but should be such as to provide a wide instruction in mathematics and basic science” and also in general and social subjects, and should include “the speaking and writing of good and exact English.” The same non-vocational character should apply to the curriculum of day continuation schools, which, the Statement recommends, should be rapidly extended to enable young persons, leaving school at the statutory age, to spend half their time between education and employment. Vocational training, on the other hand, should take place in industry itself. Nor does Nuffield College consider that recruits to industry from secondary schools and higher technical schools should have specialised; from them again, the main requirements of industry are “the broadest possible development of general intelligence and initiative, together with a sound basis of general scientific and mathematical knowledge.” It further urges the right of industry “to claim a higher proportion of the best men from the Universities than it has been getting in the past,” and that technical colleges should become the nuclei of People’s Colleges, taking an active part in adult education as well as training students for vocations, which would give higher technical education the cultural quality it now lacks. Most of all these recommendations are not new. They have been urged by educational reformers, official and unofficial, for years. But that they should have been restated with such clarity and precision, at the very moment when the future of British industry, and its need for efficiency and enterprise if it is to compete in post-war world markets, are being widely discussed, gives them greater force. What is now wanted is the long-promised Education Bill to make them realities.

Of Usury

The frequency with which the argument against the taking of interest on borrowed money is advanced suggests that the true intention of the medieval laws against usury is still not generally appreciated, after eight hundred years of discussion and experience. Whatever the origins of the law against usury, it developed in its pure form in Western Europe during the period of some two hundred and fifty years following the middle of the eighth century, when the complete success of the Mussulman invasions closed the Western Mediterranean to commerce, save that of an occasional non-Christian trader on a flying visit to one of the few larger centres of population. With this fundamental change money, which had been used as the active vehicle of trade—and to some extent of local industry—became in fact barren, inert and, apparently, dead for all time. In these circumstances, its sole function was to act as a store of value against misfortune, or the demands of quite exceptional developments. It could be used only for consumption, not for the production, or transport, of goods at a profit. It was consequently a great service to the community that those with idle money should be enjoined to lend it to those in want, and that the lender should be forbidden to take interest, since the debtor was, by definition, already in trouble. The law against usury was, in fact, a rudimentary attempt to secure a more reasonable distribution of current resources. So soon as commerce started again, all this was changed. If a man was to use money to gain 15 per cent there could be no possible objection to his paying five. Indeed, some such payment was necessary to ensure a sense of responsibility in the merchant. The change was, in fact, quickly realised by leaders of opinion, although the general problem remained to plague the public and the law courts, even, it would seem, until the present day. It was very early recognised that, if the lender shared in the risks of the enterprise he was financing, he was entitled to demand interest. Even when interest was still forbidden on a loan used to acquire fixed capital, the owner of the money might acquire the capital goods himself and hire them for money. Shortly after 1260, Aleyde de Brabant decided to ignore the death-bed wishes of her husband that all usurers should be expelled from his country on the advice of no less a theologian than St. Thomas Aquinas, while

even earlier experts in canon law were busy whittling down the absolute prohibition. Had these and subsequent experts been prepared to search, they might have found the key to the problem in the Mosaic law. Framed for an agricultural community, at a similar stage of organisation to that of tenth century Western Europe, this had none the less taken cognisance of the existence of traders. The law laid down that no interest should be taken from fellow Jews, who would normally require it for relief, not trading, but that it might be taken from foreign traders. It does not make it clear that they were charged interest as traders and not as foreigners, but this distinction is implicit in the further injunction that loans must be made, free of interest, to a gentile in distress, as to a Jew. Thus, the essential difference between a loan for consumption goods and a loan of money to be used to breed more money, appears to have been realised in the Palestine of the Old Testament. It is a pity that it should still be necessary to labour the distinction between moneylending and investment in twentieth-century Britain.

The Just Price

The Archbishop of Canterbury’s address to members of the Bank Officers’ Guild was, in the main, an unexceptionable definition of the place of religion, of personal qualities and personal relations in the life and progress of the community. But from this followed a dissertation on the vice of usury; a condemnation of the law of supply and demand which apparently should make way again for the concept of the “just price”; an attack on commercial advertising “which has taught Goebbels most of his secrets”; a condemnation of the project for a world bank because “it would make for power without responsibility,” there being no world Government; and finally, a denunciation of the demand for greater mobility of labour because this “involves treating labour as an instrument of production” and is therefore immoral. Among this astonishing array of criminals none wears a more guileless, innocent look than the law of supply and demand. It is difficult to see how its guidance could be disregarded even by the price-fixing authority of a wholly communistic regime. The pitfalls of the law of the just price can best be illustrated by the Archbishop’s own example. As an illustration of his argument, he extolled the action of his tailor, who at the beginning of the war refused to raise the prices of his suits until his pre-war stock of cloth was exhausted. That, apparently, was obeying the law of the just price. But does the Archbishop realise that by accepting suits at this price he was in fact robbing his tailor of part of his capital? Let us assume that the tailor’s capital, invested for the most part in his stock-in-trade, was sufficient to maintain 500 bales of cloth. When these were exhausted by the process of selling suits at pre-war prices, and the tailor found himself obliged to restock in a market in which prices had risen by, say, 50 per cent, he would only be able to buy 333 bales. The transactions which led to this impoverishment of the tailor may have appeared most laudable to the Archbishop, but the price at which they were made was hardly a “just” one for the tailor.

Shorter Note

Mr Bevin has announced that, in view of the pressure of work in his Department and the need for economies in the use of staff, he has decided that the unemployment statistics should in future only be published at quarterly intervals instead of every month. The decision is not of great importance, since the number of unemployed has now fallen to such a low level and consists mainly of people changing jobs; but the reason given for it is unconvincing and it is in any case a most undesirable precedent. The need is always for as much official information as can be released without danger as possible, and it is imperative that as soon as the war is over, and the process of securing full employment has begun, the old custom of publishing unemployment statistics monthly should be restored.

The LCC has accepted the report of its Education Committee recommending that there should be no collaboration between the Council, as local education authority, and the Fleming Committee, which is to report on the best means of associating the public schools with the general educational system of the country. A motion to refer the report back was defeated by 43 votes to 24.

AMERICAN SURVEY

United States Steel

(By a Correspondent)

UNLIKE this country, the United States has still a considerable reserve of untapped manpower. But in order to translate this reserve into war potential, increased supplies of materials are required. Materials means first of all steel. Steel production in the United States has risen by leaps and bounds. When war broke out in Europe in 1939 the country’s output of steel ingots reached 52.80 million net tons of 2,000 lb. By 1941, it had risen to 82.93 million tons; in 1942 it advanced to 86.00 millions, and by the end of last year it was already running at an annual rate of 89 million tons. Yet, since the middle of last year, steel has been one of the most critical shortages. This year US requirements will be well above those of 1942. As something like 90 per cent of US steel is being delivered on priority ratings of “A-1-a” or higher, it is not possible to transfer further sizeable quantities from non-munitions to munitions. The introduction of the new Controlled Materials Plan will only improve the control over the flow of steel to the most urgent purposes; it will not create sizeable additional supplies of steel for the armament industry. An extension of steel-producing capacity is required to meet mounting demand.

Increasing Capacity

The productive capacity of the US steel industry has not been stationary. At the end of 1939, it was 81 million net tons of ingots. By the end of 1941, it amounted to 88 million tons. The latest War Production Board estimates of capacity at the end of 1942 are as high as 93 million tons. The advance in actual steel output between 1939 and 1941 was greatly eased by the fact that productive capacity far exceeded the current rate of production. But since last spring increases in output have been directly dependent on the provision of new productive facilities. It is true that, even last year, production of steel remained well below the capacity figure; but this was mainly due to the fact that the alloying of steel, one of the most vital parts of the steel production programme, has absorbed an increasing proportion of steel-making capacity—especially open-hearth capacity. The monthly output of alloy steels in the United States, which averaged 270,000 tons in 1939, reached 736,000 tons in January, 1942, and jumped to 1,130,000 tons last December. Because tonnage capacity is lost when steel furnaces produce alloy steel instead of carbon steel, the difference between the output and capacity figures in 1942 does not mean that there is still a surplus of capacity.

Nevertheless, the next twelve months will see a further considerable increase in the United States steel output. As Mr Donald Nelson recently announced, the rise in capacity last year was only part of a wider expansion plan, which is to be completed by the middle of this year. It provides for the following detailed programme:—

PRODUCTIVE CAPACITY OF U.S. STEEL INDUSTRY
(Annual Rate in Net Tons)

	January, 1942	December, 1942	Mid- 1943*
Open hearth	77,702,000	78,895,000	84,241,000
Bessemer	6,721,000	6,721,000	6,721,000
Electric	3,402,000	4,666,000	6,153,000
Total	87,825,000	90,282,000	97,115,000

* Goal of Present Schedule.

In order to reach the goal of over 97 million tons by the middle of this year, expansion in the next few months will have to be over five times the average rate of expansion in 1942. As Mr Hiland G. Batcheller, director of the Steel Division of WPB and chairman of the recently formed Combined Steel Committee, pointed out in his New Year message to the US steel industry, “most of the groundwork was already laid in 1942.” The additional capacity to be brought into operation within the first six months of 1943 exceeds the total production of Japan.

The Flow of Materials

At this stage the planning of an adequate and regular flow of raw materials for the utilisation of the increased capacity requires an even greater effort than the completion of the extension programme. Here also the goals have been set months ago. They provide for the following increases in supplies of the various raw materials:—

RAW MATERIAL SUPPLIES OF U.S. STEEL INDUSTRY

(Annual Rate in Net Tons)

	January, 1942	December, 1942	Mid- 1943*
Iron Ore	118,583,000	121,391,000	133,949,000
Coke	71,559,000	73,068,000	80,440,000
Limestone	29,300,000	30,780,000	34,716,000
Pig Iron	57,879,000	60,759,000	68,716,000
Re-circulating Scrap	24,602,000	25,047,000	27,192,000
Purchased Scrap	19,866,000	17,575,000	14,386,000

* Goal of Present Plan.

The whole of the increased iron ore requirements under the new programme are, for the first time, to be exclusively supplied from domestic sources. The bulk of the increase will be provided by the Lake region, which is scheduled to produce 112,109,000 tons per annum by the middle of next year, against 104,621,000 tons by December last. The problem involved in moving this ore was discussed in an article in *The Economist* on January 23rd (page 104). The shipping problem will be somewhat eased by the completion of a transport development plan, approved by the WPB last August, which will be completed before the beginning of the new shipping season.

The bulk of the additional coke requirements will be produced in the steel industry’s own by-product coke ovens, of which 17 new ones are to start operation before next July. Limestone supplies appear to be offering least difficulty. An intensive effort is required to increase the blast furnace capacity from 64,440,000 tons at the end of last year to 70,418,000 tons by next June. Improvements in equipment, the rehabilitation of old furnaces and enlargements of furnaces at present in operation, will not provide more than about one-sixth of this increased capacity. The remainder is to be provided by new furnaces, of which a substantial number are already nearing completion. The fulfilment of the blast-furnace programme is especially significant, since the ratio of pig iron in steel must in future be materially increased owing to the shortage of scrap. But recirculating scrap supplies will be automatically increased as a result of the larger production of finished steel products. The scheduled increase from this source, however, will not be large enough to counterbalance the decline in old scrap supplies.

The foundations for this steel expansion programme were laid before Mr Lyttelton’s visit to Washington in December

BANK OF MONTREAL

The Bank undertakes general banking business and with its numerous branches offers special facilities in Canada, Newfoundland and the United States.

last and before the appointment of the Combined Steel Committee. It is the basis of this year's Allied war production plans. Although it is impossible at this stage to judge the precise trend of steel requirements in the more distant future, it can be anticipated that next year the demand for steel will rise at a far slower rate than this year, which, according to present plans, is to be the peak year of Allied war production.

American Notes

Manpower Manœuvres

The President's Order on the 48-hour week appears to be a partial answer to current Congressional ferment over the manpower position. At present, a number of Committees of Congress are investigating manpower. That which is receiving most attention is the Senate sub-committee inspired by the shortage of agricultural labour. It is the spearhead of a group in Congress determined it possible to force the Administration to reduce the size of the Armed Forces in order to provide more labour for agriculture and essential civilian jobs. Ex-President Hoover has predicted "an extremely grave shortage of food, metals, and oil," unless 1,000,000 workers are transferred to farms, factories, and mines, either from the Army or unessential civilian work; and he is said to have stressed to the Committee, on the basis of his experience in the last war, the need for immense reserves of food for relief when the fighting is over. The growing scarcity of labour, particularly in the west, has contributed to the triumph of Lend-Lease, for the Isolationists argue now that more Lend-Lease means that the Forces will need fewer recruits, thus freeing men for civilian war work. So far, however, there are no signs that the Army—or the President—is willing to reduce the estimate of an army of 7,500,000 by early 1944. Dissatisfaction with the Government's approach to the distribution of manpower—both with its substance and the use of executive decrees—is also evident in the introduction of Republican Bills into both Houses of Congress this week, providing for general compulsory service for men between 18 and 65, and women between 18 and 50. "Orderly and effective mobilisation of manpower" is the avowed intention of the Bills. Their chance of passing is said to be remote, but it is difficult not to agree that the steps taken so far by the Administration, perhaps for sound political reasons, have been piecemeal and partial. The "work or fight" Order of the Manpower Commission, which provides that men over 38 engaged in a long list of unessential occupations must transfer to war work by April 1st or be drafted for the Services, is an indiscriminating tool, which will produce many hardships, and cannot guarantee an efficient redistribution of labour. To compel hiring in war production areas to be done through the US Employment Service may end some pirating; but it does not reach the more fundamental problem of bringing war work to the pools of unemployed in cities like New York, which used to specialise in consumption goods. The Order establishing a 48-hour minimum working week makes it possible to require an increase in working time in areas of labour shortage, though overtime will still be paid above 40 hours. It will be put into effect in 32 areas at once, to release workers from industries operating a low work week for war work. Presumably, however, the manpower position will have to get worse before any determined effort is made to face the inherent difficulties.

Civil Aviation

The future of commercial aviation is one of the many topics of debate in the United States which provides a testing-ground for the strength of the forces of nationalism and internationalism. Recently there has been a sharp clash of ideas between those who want America to realise its "manifest destiny" by domination in the air, and those who are eager to bring about a pooling with other nations as soon as possible. The agitation to set up a permanent Congressional Committee on Civil Aviation is intended to forestall the agreement between the United States and Britain which the White House is rumoured to be planning. Various Congressmen and editorial writers have talked of air supremacy as sea power was talked of in Admiral Mahan's day. Representative Nichols said a fortnight ago:

The country that is ranked first with fast cargo-carrying planes will dominate the post-war world.

The allocation of production which provides that in the United States almost a third of the planes produced are transport types, and the experience and facilities gained as a result of the vast expansion of the US Air Transport Command create advantages which it will be hard to resist exploiting. For some time past, the aircraft industry has been spending substantial sums on advertising to the nation the glittering future of American civil aviation. The most recent text of American Airlines reads: "Attain the most powerful position in the air and automatically we become the greatest power for peace." Commercial interests plus national prestige make a persuasive combination. The Isolationists have even found a grievance in the transfer of transport planes to Britain for war purposes. They argue these planes will be used in commercial rivalry after the war. At the other extreme, Mr Wallace has proposed in a recent magazine article the creation of a United Nations air network, using internationalised airports and heavily subsidised to provide cheap passenger and freight rates. Mr Wallace, too, is struck by the parallel with sea power:

Freedom of the air means to the world of the future what the freedom of the sea meant to the world of the past. Boldness should be the guiding principle in planning a world-wide airport construction programme.

The Administration is said to be working on a more modest plan for proclaiming the freedom of the air. Under this, the idea that national sovereignty exists in the air above each country would be scrapped, and there would be some form of international control of airways and access to bases. The early conclusion of this agreement is devoutly to be hoped for. The temptation to stake out American predominance in the air is strong, and as Mr Willkie said recently, "You can never get more out of the peace than you can get when the war is still going on."

If the Shoe Pinches

The surprise rationing of shoes by Mr. Byrnes, the Director of Economic Stabilisation, is proof of a welcome advance in rationing technique. Except for Mayor LaGuardia's Puckish hint to avoid unnecessary walking, which sent New Yorkers hurrying to the equivalent of Petticoat Lane to stock up before the freeze went into effect, there seems to have been no forewarning, although the supply situation has made it likely for some time that restrictions on civilian purchases would be necessary. The maximum number of civilian shoes that manufacturers can produce this year from their quota of hides is, according to an estimate by *Business Week*, 315 million pairs. A ration of three pairs a year per person works out above this figure; but there are substantial stocks to fall back on—more than 200 million pairs, the result of record production during the last 20 months. On average, the ration will produce no great hardships, for it only reduces civilian purchases from 3.7 pairs a year to 3, and bedroom slippers and infants' shoes are exempt. What is most interesting, in addition to the decision to forgo the advance notice of rationing which has done so much to create shortage in other commodities, is the imposition of a flat ration which takes no account of regional or occupational needs. It is unlikely that the barefoot black boy in Georgia will take up his ration, whereas in some occupations and regions the limitation may produce real difficulties. These refinements may, of course, come later; and an overall clothing ration would make for more flexibility. What is a matter for congratulation is the victory of those who have been urging for months that rationing should be put into effect before severe shortages developed and stocks of the commodity were so depleted as to cause bitterness and alarm at the size of the ration. This latest step of the Office of Economic Stabilisation carries with it a promise that in future shortages will be taken in hand before they become serious, and that the guarantee of "fair shares" on ration books will mean more than it has in the past.

Shorter Note

The deletion by Congress of the appropriation for the National Resources Planning Board is a blow to the extension of social security and post-war reconstruction. It was the social security plan developed by this Board that President Roosevelt promised to send to Congress for their consideration. The Board has been opposed by conservatives as being too radical.

THE WORLD OVERSEAS

No Change in Newfoundland

(By a Correspondent)

DURING his visit to Newfoundland last September, Mr. Attlee found the island enjoying its most prosperous year since 1932, when the country was forced to appeal to Britain for financial aid. The Royal Commission, sent out that year, recommended the suspension of Newfoundland's Dominion status, and the appointment of six commissioners, who were to run the country through the Governor without responsibility to anyone but the Secretary of State for the Dominions. Despite its retrograde nature, this step was welcomed at the time by most of the islanders, who hoped and expected that the new government would introduce fundamental changes in the country's economy. By 1939, however, Newfoundland's position was even more serious than it had been six years earlier, and the British Government had to make a grant-in-aid of nearly \$5 millions—about one-third of the total expenditure.

The chief cause of this depression was the parlous state of Newfoundland's fishing industry. The Royal Commission of 1933 had insisted that "the cod-fishing industry had been and must continue to be the mainstay of the island," and the Government acted on that assumption. But, in 1939, over 30,000 fishermen, roughly half the working population, were dividing less than \$5 millions between themselves, compared with \$12 millions in 1929, while the companies in the paper and mining industries were paying almost \$10 millions in wages to their 10,000 employees. The average gross return to a fisherman for his season's work was under \$150, which very often meant that he was in debt over the winter or else, with his family, had to go on Government relief. As many as 80,000, out of a total population of 300,000, were on relief in 1939.

The war has brought a sudden change. In the year ended June, 1942, for the first time for ten years, Newfoundland balanced its budget without the help of a grant-in-aid. There was, in fact, a surplus of \$7 millions, revenue, at \$23 millions, being double the 1938-39 figure. Even the fishing industry is enjoying a boom, and the decrease in the number of fishermen, combined with a jump in exports to over \$10 millions, has meant that average earnings have been higher than at any other time in the last fifteen years. Newfoundland still has a public debt of almost \$100 millions, but the social services are already being extended, and compulsory free education for all children between the ages of 7 and 14 was introduced last year.

Apart from the fishing industry, this sudden change in Newfoundland's fortunes can be attributed almost entirely to one factor—the construction of US and British military bases on the island. In the case of the United States alone, the expenditure is over \$32 millions, and more than 20,000 Newfoundlanders have found employment at the bases. The high wages paid by the base contractors, averaging \$100 per month, has led to a great increase in the purchasing power of the population, and this, together with the local purchases of the firms themselves, has meant a big jump in imports. The latest figures (for 1941) are \$35½ millions—of which Canada supplied 50 per cent, the United States 35 per cent, and Britain 10 per cent—an increase of \$7 millions on the previous year. This jump in imports is reflected in the country's balance-sheet, for Newfoundland depends on customs receipts for over two-thirds of its revenue. The 1942 surplus of \$7 millions is, therefore, ultimately due to the vast expenditure on the military bases. Obviously, the present prosperity is unsoundly based.

The island's exports, which for 1941 totalled \$36½ millions, are high for a poor country, working out at \$120 per head compared with \$90 in Trinidad, one of the most prosperous of the West Indian colonies. But almost \$25 millions are accounted for by the products of the two paper and two mining companies, which control all the chief sources of production in Newfoundland. These companies are financed by foreign capital, with the result that, apart from wages paid, the country receives little return from the exploitation of its resources. The Royal Commission of

1932, commenting on this, stated that the terms originally offered by the Government to attract foreign investors were much too generous. The companies' exports and imports are more or less free from duty; royalties are negligible; and, consequently, the expenses of Government must be met very largely by a system of high tariffs. This in turn leads to a rise in the cost of living, which is estimated to be at least 30 per cent above that prevailing in Canada, and while the employees of the mining and paper firms might be able to demand and obtain higher wages, the 35,000 fishermen and their families had no alternative, before the war, but to hope that fish prices would rise and to accept Government relief until they did.

Primitive Technique

Newfoundlanders themselves are the first to agree that there is little hope of the prosperity in the fishing industry lasting after the war. Not only will the present inflated prices fall, but Spain, Portugal, Britain and other markets will almost certainly decline when peacetime competition returns. In the past, the Newfoundland fishermen's primitive technique has been a serious handicap in the face of the rationalised production methods and subsidised export trade of countries such as Iceland and Norway. The press complains that, in contrast to the modern technique of other fishermen, the Newfoundlanders' methods are "little different from those of our forefathers 450 years ago." The attempts made by the Commission of Government since 1933 to revive the fishing industry have not been very successful. In the first few years, help was mainly given through the provision of equipment to specially chosen fishermen, and the building of bait depots and cold storage plants along the coast. These methods failed, and a Fishery Commission was appointed to investigate the industry. Its report in 1937 led to no drastic changes in the Government's fishing policy, nor did it lead to any improvement in the conditions of the fishermen. Another report in 1938, made by Mr J. H. Gorvin, at present one of Sir Frederick Leith-Ross's advisers on post-war relief problems, offered limited prospects of a revival, but only a small start had been made to implement his recommendations when the war broke out. About this time, the General Seafoods Company decided not to continue with a proposal to set up a centralised fish-processing plant on the island, which caused much disappointment in the fishing industry, especially as the present refrigerating companies in Newfoundland have very limited resources. But even should the Government thoroughly reform the processing and marketing of fishery products, it is unlikely that the industry will ever again provide a livelihood for 35,000 fishermen and their families.

Unfortunately, expansion within the existing paper and mining industries cannot be expected. The possibility of a third paper mill in the area known as the Gander Valley disappeared in 1937 when the Government negotiated an agreement with the Bowater-Lloyd interests, which conceded a long-term right to export unmanufactured wood from this region. The vast majority of Newfoundlanders protested vigorously, and, as a result of this and other incidents, a certain hostility has grown up among the people against the companies "exploiting" their resources. On the whole, the labour conditions of the permanent employees of the four alien firms are good; but the position of the part-time "loggers" employed by the paper mills is most unsatisfactory, and requires revision. Arrangements might be made whereby the firms are responsible for the clearing of forest areas, and the settling of the loggers and other seasonal workers on the cleared lands. It is only fair to add that the profits so far taken out of the country cannot be compared with those taken from other colonial areas.

The undeveloped resources of Newfoundland have been listed several times in official and unofficial reports on the country's future economy. The water power of the rivers, the coalfields left untouched, the possibilities of a tourist industry—these and many other suggestions have been made in the last ten years. Each of them requires individual investigation, and some would almost certainly offer sufficient hope of success to justify Government action. But the most likely direction in which immediate progress might be made is in the development of Newfoundland's agriculture.

After his visit in 1938, Mr Gorvin produced an excellent report recommending a vigorous land policy run on co-operative lines. In 1939, he was appointed to the post of Commissioner in the Newfoundland Government, and there seemed every chance that a wide recovery programme would be started on the basis of his recommendations. But the war intervened, Mr Gorvin resigned about a year later, and the various reconstruction plans were postponed. Since then, many of the small farmers have drifted to the defence projects, or have slackened their food production because fishing is bringing in adequate returns. The result is shown in the statement of the *Journal of Commerce* that "1941 was one of the worst years on record for Newfoundland agriculture." This decline cannot be a wartime necessity, for some of the West Indian colonies have increased local food production considerably since 1939. Nor can there be any question of Newfoundland's agricultural opportunities—live-stock, poultry and pig-keeping, dairy produce, sheep raising and fruit-growing are all commercial propositions. But the Government seems to be content to live for the day, and as a consequence is beginning to lose the confidence of the people. A local paper, the *Evening Telegram*, summed up the position in these words recently:

The tendency, becoming more pronounced year after year, to take the public less and less into its confidence regarding public matters under discussion . . . has given rise to a feeling of apathy towards Commission Government.

A return to some form of democratic government cannot alone save the country from another disaster; there must be a more realistic outlook towards the island's economic position, and an immediate start on a vigorous policy of land cultivation. In 1933, the Dominions Office took on the responsibility for the Government of Newfoundland, and over \$20 millions has been provided by the British Exchequer in order to provide some sort of security for the people of the island. Mr Attlee is doubtless aware that no real security exists behind the façade of a budget surplus; it is to be hoped that he will be able to introduce, even in wartime, some of the changes which will be necessary if Newfoundland is ever again to live as an independent, self-supporting country.

WATCH AND WARD

A Plea for Rational Planning,
By JEAN H. TRESFON.

Eagerness for reform may lead to such a measure of control as to deprive Britons of much of their traditional freedom. The author refuses to be stampeded and discusses possibilities of reconstruction safeguarding the liberty and enterprise of ordinary people.

Eire's Majority

[FROM OUR DUBLIN CORRESPONDENT]

It is twenty-one years since the ratification of the Anglo-Irish Treaty, which brought the Irish Free State into being. The coming of age of Eire has passed without celebration and almost without notice. The absence of any public remembrance of the anniversaries of the Treaty and its ratification suggests that the events are not regarded with unanimous satisfaction. The fact of the matter is that the Treaty settlement has never been accepted with universal enthusiasm. The exclusion of six counties marred the arrangement from the beginning. The split over the acceptance of the Treaty, and the Civil War which rent the country from top to bottom, were an inauspicious opening of a new chapter in Irish history. Moreover, the period since the Treaty has been full of disturbances at home and abroad. The Civil War had not finished for many years when the world agricultural depression struck the principal Irish industry. To make things worse, the depression was followed by the Economic War between Great Britain and Ireland, which completely dislocated the export trade for several years. The Economic War was settled in 1938, the year of Munich. In the following year, Europe burst into war, and the last three years have been a period of quite abnormal difficulty. The last two decades have scarcely been favourable to the success of an experiment in self-government.

Nevertheless, the most disgruntled critic of the Treaty could scarcely pronounce the last twenty years to have been a failure. The reality of the autonomy conferred by the Treaty has been amply demonstrated. The Irish leaders at the Imperial Conferences took an active part in determining the new constitutional relations between the various parts of the British Commonwealth of Nations. The Statute of Westminster could scarcely have been so comprehensive had it not been for the activities of certain Irish Ministers. The new Constitution, passed in 1937, was a formal recognition of the realities which had developed in the course of years. The outbreak of war afforded the acid test of Irish self-government. The successful maintenance of neutrality for over three years has demonstrated to the Irish people and the outside world that the status obtained by the Treaty and the subsequent constitutional developments enabled Ireland freely to decide its own fate in the overwhelming issue of peace or war. The sovereignty of Eire has been established beyond question.

When the question is asked whether the best possible use has been made of that sovereignty opinions must necessarily differ. On the credit side, it must be admitted that both Irish governments since the Treaty have maintained law and order in spite of considerable opposition and difficulty. The tradition of armed resistance to the Government has not been easily extirpated, but the challenge of the lawless element has been met with courage and decision. The suggestion that religious intolerance would be experienced in a self-governing Ireland has happily been proved incorrect. On the other hand, the course of political development has scarcely been ideally satisfactory. The division on the Treaty has tended to stereotype the issues between the leading parties on controversies that are now dead. The two leading parties who will contest the coming election date back to the split following the Treaty. There has been a lack of recruitment of new blood into politics. Irish democracy has proved to be sterile in the production of young politicians. Very few young people of ability have adopted political careers, and some of those who have done so have found themselves in the wilderness of independence. It must be admitted, however, that this is the fault of the people rather than the politicians. The utmost liberty of expression of opinion, consistent with the interests of a censorship in wartime, has been maintained, and political discussion has not been muzzled in any way. Irish politics have remained essentially democratic during a period when democracies have perished in many other countries.

[About 250 words have been deleted here by the Irish Censor.—EDITOR.]

From the economic standpoint, the period of self-government has fallen into two parts. During the first ten years emphasis was placed on the export trade of agricultural products, while a policy of mild industrial protection was pursued. The largest concrete achievement of the first Irish Government was the electrification of the Shannon, which has rendered the country to a great extent independent of

imports of coal during the war. Since 1932, self-sufficiency in agriculture and in industry has been the order of the day. The world agricultural depression and the adoption of protection in Great Britain would have necessitated some modification of Irish policy even if there had not been a change of Government. The accession to power of a party which was frankly protectionist, together with the interruption to the export trade resulting from the economic war, caused these modifications to take place at a pace more rapid than desirable. The new protective policy has undoubtedly given considerable employment in the protected industries. But employment in some of the older exporting industries has been reduced, and the volume of employment in agriculture has not been maintained. The stream of emigration, which is the most wasteful element in Irish economic life, has continued throughout the whole period of self-government; so long as this stream continues to flow the economic condition of the country cannot be regarded as satisfactory. It is probably correct to state that Eire is sounder financially than economically. In spite of sound monetary and financial conditions, the population has continued to decline and the national income has obstinately refused to expand.

Canada's Minerals

[BY A CORRESPONDENT]

THE Dominion Bureau of Statistics at Ottawa has issued a summary of Canada's mineral production during the past year. Since 1940, these summaries have been confined to the value of production, but as the great majority of mineral prices have been stabilised around their latest pre-war levels, these data still give a rough guide to the size of the output. According to this assumption, Canada's mineral production is still rising, after having increased, almost without interruption, in the last eight years of peace, to reach a total of \$470,179,000 in 1939. In 1942, the value of the Dominion's total mineral output amounted to the record figure of \$564,200,000. This is only \$4,000,000 more than in 1941, but it should be remembered that the production of gold, normally by far the largest single item in Canada's mineral production, declined last year by some \$20 millions, owing to the compulsory closing of a number of gold mines to secure labour for base metal production.

The increased production of strategic metals has, in fact, largely offset the decline in gold production, and the total value of the metals, including gold, produced in Canada last year, at \$392,763,000, was only slightly below the total for 1941. The chief increases took place in nickel, aluminium, copper, lead and zinc, but there were also a number of other features in Canada's metal production. In 1942, the Dominion produced, for the first time in its history, metallic magnesium from domestic dolomite. According to the *Northern Miner*, Canada's leading mining journal, Canada's magnesium output has now reached a level adequate, not only for domestic needs, but also for exports. Moreover, the production of steel alloy metals was greatly stimulated last year. Canada has always been an important producer of cobalt, but, in 1942, there were important new developments in its output of manganese, molybdenum, chromium and tungsten. Mercury production has now reached a considerable size, and Canadian exports are playing an important part in filling Allied requirements of this metal, which, until the outbreak of war, was a virtual monopoly of Italy and Spain. In platinum, the Dominion now accounts for close on three-fifths of world production. As Canadian platinum is almost entirely recovered from the copper-nickel ore of the Sudbury basin in Ontario, the output of this precious metal, which has important uses in war industry, is closely linked up with copper and nickel production. The rise in production of fuels to \$90,306,000, an increase of \$6,000,000 on the year, also deserves attention. This increase is due to higher production of both coal and crude oil.

In 1943, another increase in Canada's mineral production can safely be expected, although the shortage of miners in the base metal industries may require a further cut in gold production. In the middle of last year, the Canadian Government initiated a thorough survey of its mineral deposits as a preliminary to intensive development. This survey has recently been concluded. Apart from this general production campaign, the International Nickel Company of Canada has just announced that its \$35 millions development scheme, initiated in 1940, has now reached a stage at which an increase in its nickel producing capacity of 50 million lb. over the 1940 output has become effective. The Consolidated Mining and Smelting Company of Canada, Canada's leading producer of lead, zinc, mercury and tin, also extended its capacity considerably last year.

Gas contributes to our daily lives in many ways. Gas helps to win the Battle for Fuel by providing half a ton of coke from every ton of coal used in the gas works. Gas-making releases other priceless by-products, from which a thousand and one familiar articles are produced—from the tar for our roads and the flavourings for our foods to explosives, plastics and the homely aspirin tablet.

But for the Gas Industry, the land would never bear such bumper crops. Among the most important by-products of gas-making are agricultural fertilisers, 80,000 tons of which are produced every year by the Gas Industry.

Just now gas and its precious by-products are needed most for war purposes. Do YOUR bit in the Battle for Fuel by burning less gas.

HOW TO SAVE GAS

Russia at War

The Taste of Victory

RUSSIA has followed the advance of the Red Army in a spirit of jubilation and triumph. The "holiday in the Russian street," promised by Stalin in his last anniversary speech, has now come, after a long sequence of setbacks and disappointments. Last summer's losses have been almost completely made good; and the people are looking forward now to the liberation of the Ukraine. The press speaks of Kharkov and Kiev as of the next objectives; and the secretary of the Ukrainian party organisation, Khrushchev, was one of the main speakers at the first mass meetings in Stalingrad after the last shots had been fired over the city's ruins.

The man in the street probably thinks, not only about the military aspects of the offensive, but also about its economic consequences. The Red Army has liberated some of Russia's wealthiest agricultural areas, the vast granaries of the Don and of the Caucasus. Radio and press explain in detail the economic importance of every recaptured town and district; and each of these explanations sounds like a promise of immediate relief from hardship and starvation. Peasant families return to the recaptured villages from beyond the Caucasus mountains; and they bring back to their homes the cattle which were evacuated last autumn. Soviet and party organisations resume their work; and their first pre-occupation is to make preparations for the spring sowing. The railways in the recaptured areas are being hurriedly repaired and their gauge is being widened by railwaymen and technicians from the north. The rebuilding of towns and villages will be no easy matter, as the damage has been very extensive. But the authorities are resolved to let no time slip. The decrees on labour mobilisation enable them to conscript whatever labour is available; and the population is eager to get the repairs and restorations done. This may account for some of the achievements claimed by the press. It is said, for instance, that some of the regained oil-fields have already started to yield oil—although the Germans were unable to get any oil out of them during the three months of occupation.

Jubilation and Confidence

The mood of jubilation is most strikingly reflected in the homage paid to the Red Army and in the honours bestowed upon its commanders. Almost every communiqué now mentions the names of generals and colonels whose troops stormed a town or reduced an enemy "hedgehog." The names of the new marshals and generals are being given the widest publicity—a completely new feature in Russia. The grey colour of anonymity which has hung over Russian life, at least since the purges, seems to have been dissipated. A new inspiring military legend has come into being. Not a day passes without awards and medals being given to brave commanders. Ceremonies of investiture again take place within the old walls of the Kremlin. The number of divisions and corps renamed as Guards grows from day to day. On the eve of the twenty-fifth anniversary of the Red Army, all Russian officers have been ordered to sew on epaulettes which since 1917 have been forbidden and regarded as symbols of Tsarism.

As the Red Army advances so grows the feeling of self-confidence and national pride.

The Russian people [says Alexei Tolstoy, the former emigré who has reconciled himself with the new régime and is now one of its chief spokesmen] have not been spoilt by good fortune. For a thousand years our history has been the story of a stern fight for our mother earth. Sometimes life was so hard that the Russian soil itself seemed to have gone barren.

All through their history the Russian people have shown the same marvellous power of resistance which they are showing today. It astonished the world only because the world knew us so little—though, in truth, our own knowledge of ourselves was by no means complete. . . . We must aim at being the most efficient people in the world. We have everything to make this possible. The war has revealed an immense productive capacity in our land.

The Russian armies have been able to inflict these scathing defeats on the Germans before the Allies came to

their aid by a Second Front in Europe. The Second Front has hardly been mentioned recently in press or radio. The harder the Red Army can push the retreating *Wehrmacht*, the stronger may grow the confidence in its ability to achieve a strategic denouement single-handed.

This is certainly not the official attitude. In an article summing up the battle of Stalingrad, the party paper, *Pravda* has recently recalled Stalin's words: "I express the conviction that the joint military operations of the armed forces of the USA, Great Britain and the USSR in the near future will bring about a victory over our common enemy." And the paper speaks of the enemy's forces as being "broken down but not defeated" and mentions the "many difficulties that still lie ahead."

New and Old Ideas

The war has undoubtedly produced new shades in ideology. One may, perhaps, pick out two trends: one that does not depart from the party line as it had crystallised in the pre-war period and which is represented by Yaroslavsky, Shcherbakov and other party spokesmen; and one that might be regarded as the "neo-nationalist" trend, and which has been reflected in the whole set of recent military reforms. It would be too much to speak of any clear cut division. The two trends mingle and merge with each other; and the unity of party and army is personified by Stalin himself, whose rôle as Commander-in-Chief and maker of strategy is stressed. The difference between the two trends is rather a matter of emphasis. In the army, the war medals of Suvorov and Kutuzov have been ranked above the orders of Lenin and of the Red Banner; in connection with reforms in army discipline, the "Army Regulations" of Peter the Great have been recalled as the guiding principles of the soldier's conduct. The development of these shades in ideology deserves some attention. It may bear upon Russia's attitude towards the problems of post-war co-operation with the Allied nations.

It was against this background of a country which has got the first taste of victory and which hails its young and "dynamic" generals that Stalin, in his latest Order of the Day, called the Red Army to "rout the German invaders and to expel them from the boundaries of our motherland." Stalin has thus, in fact, re-defined the war in terms of a defensive national struggle. This re-definition of Russia's war aims has been further elaborated by so authoritative a spokesman as Zaslavsky. The occasion was provided by the *Washington Star* in which a generous-hearted writer presents the USSR with Bulgaria, Czechia and an outlet to the Mediterranean through Yugoslavia after the war. In its irresistible generosity the newspaper hints at Moscow's influence extending through Iran to the Persian Gulf. Ridiculing the "foolish good intentions" of the American paper, Zaslavsky warns over-zealous "friends" against helping German propaganda by attributing any such expansionist ambitions to Soviet Russia and by sharing out the alleged spheres of influence. He then goes on to quote the *Washington Star* as presenting Russia with Bessarabia.

What kept him [the writer] from presenting the USA with a big gift in the form of California or Alaska? There are still amazing people to be found who are ready to present the Soviet Union with half of its own territory such as the Baltic States. These people pretend not to know that the Constitution of the USSR has consolidated the ties of these republics with all the other republics of our Union.

What is significant in Zaslavsky's comment is the omission of Eastern Poland, although the reference to the Constitution could be applied to that country, too. Russia claims—by and large—its 1941 frontiers. It claims, according to Stalin's words, no hegemony over the Slavonic peoples. This seems to be the Soviet reply to Dr Goebbel's Bolshevik bogey. And it is at the same time a reply to the offer made in the *Washington Star* that Russia "should bring peace to the continent" and also, perhaps, to the suggestion that "we (Americans) can deal with Russians in a friendly manner even more successfully than we can with others of our close friends and associates." The Russians do not, so far, seem to have snatched at the bait put out by some American isolationists.

THE BUSINESS WORLD

Postwar Shipping

SHIPPING is Britain's biggest export industry in peace and the key to its strength in war. The question of its future transcends the sectional interests of the shipping industry. The end of the war will find the British mercantile marine in a serious plight; its size may have shrunk by as much as half; and many of the surviving ships may be worn out or obsolete. The reconstruction of the fleet will be an essential and urgent postwar task, and must be given a high degree of priority in the re-equipment of British industries. As in the past, its prosperity will be a function of its efficiency, but it will be intimately affected by the international setting, that is, by the course of world trade and by the shipping and shipbuilding policies adopted by other seafaring nations. The views of the shipowners on these problems, embodied in the Report issued this week under the fitting title of "Freedom and Efficiency" by the General Council of British Shipping, representing the Chamber of Shipping and the Liverpool Steam Ship Owners' Association, merit the closest consideration.

This country must not be afraid to say to its Allies that a strong British mercantile marine is just as necessary to it as its Navy, Army and Air Force. Not only must this be said, but the country must be prepared to defend it in argument, and to require that the Peace Settlement should include effective guarantees against a renewal of the race in subsidies which marked the pre-war period.

The Council refrains from defining how large a merchant fleet Britain should aim at after the war. This is not the time for preparing a complete blueprint of the size and composition of Britain's postwar shipping tonnage. But it may not be out of place, even now, to redefine the principles which might guide postwar policy. It may, for instance, be reasonable, on economic and strategic grounds, to accept, as a rough yard-stick, that the Empire's ocean-going tonnage should be roughly equivalent to the capacity required for carrying inter-imperial trade and one-half of the trade between the Empire and other countries. (In practice, this does not mean, and should not mean, that all inter-imperial trade and half the trade between the Empire and other countries should be reserved for Empire vessels; it may very often be more profitable to employ foreign tonnage in Empire trade and British tonnage in the trade between foreign countries.) This, in fact, was the position before the war. A "fact-finding" inquiry carried out jointly by the Chamber of Shipping and the Liverpool Steam Ship Owners' Association before the war showed that in 1936 the Empire's sea-going steam and motor tonnage represented 36.7 per cent of the world's total and carried 40.2 per cent of the world's sea-borne trade. Britain's tonnage, excluding vessels of under 2,000 gross tons, amounted to 15,084,000 gross and the Dominions' to 1,934,000 gross. In the same year, inter-imperial trade and half the trade between the Empire and other countries accounted for 19.4 per cent and 18.7 per cent respectively of the total value of the world's sea-borne trade, or, together, for some 37 per cent, almost exactly equivalent to the Empire's proportion of the world's sea-going shipping tonnage. The size and distribution of world trade may be different after the war—they are changing continuously even in peacetime—and the Dominions, especially Canada, may wish to own a larger tonnage. On the other hand, it may be advisable for Britain to hold a strategic reserve of shipping tonnage. On the whole, it seems reasonable to conclude, tentatively, that, if the former proportions of trade are likely to be restored, Britain's merchant fleet may have to be raised to about its pre-war level.

To suggest a minimum tonnage as the aim of post-war reconstruction is not to advocate paying subsidies for this purpose. The shipowners themselves are opposed to subsidies and, not unnaturally but rightly, against Government restrictions on the employment of ships, that is the creation of preserves. In fact, one of the most encouraging features of the Report is its insistence on the "fullest application of the policy of non-discrimination which underlies the

Atlantic Charter," a reflection of the confidence of shipowners in their ability to regain their position after the war by enterprise and efficiency. They do, however, call for international collaboration "to ensure satisfactory service and to maintain freight markets at a reasonable level"; and they invite the Governments of shipowning countries to secure compliance with agreements. The prosperity of the mercantile marine, they say, is essential to the improvement of the conditions of its personnel. The shipowners' dislike of subsidies and restrictions is only exceeded by their dislike of nationalisation, which, they hold, would be disastrous in shipping, which is highly individualistic and "essentially competitive." Moreover,

it is fearful to contemplate a situation where a normal incident of commercial competition will become an act of state with diplomatic reverberations.

While the Report stresses the need for "sufficient financial strength to build the best and most competitive ships," and indicates that the resources at the disposal of shipowners may not be adequate to restore the merchant fleet to its pre-war tonnage, it is admitted that these reserves may nevertheless go a long way if shipbuilding costs can be kept under control. To this end the industry has already established contact with shipbuilders. The shipowners hope that a marked rise in prices after the war may be avoided by the spreading of orders and that arrangements can be made to reduce the violent fluctuations in the demand for new tonnage after the initial replacement programme has been completed. It is suggested that this policy might involve a continuance of some licensing system "under the control of the industry," an ambiguous and dubious suggestion; but no reference is made to orders placed with British shipbuilders by various shipowners.

Shipowners attach considerable importance to the rôle of air transport after the war, and their report urges the Government to give careful thought to the effect of its air subsidy policy on shipping. Given large enough financial support to aviation, the fast passenger ship "will necessarily tend to disappear." It is tentatively suggested that collaboration between air and sea is "obviously" preferable to competition; and it is understood that a report on this subject will be issued shortly by the General Council of British Shipping. They approve of competition in their own industry, but deprecate it with their outside rivals—a human but illogical attitude.

The post-war shipping problem, however, is not merely a British problem; it is a world problem. There may be a deficiency of tonnage immediately after the war, and British shipowners recognise the need for the temporary maintenance of wartime control. Insofar as this is a deficiency of tonnage, it could be made good rapidly in the United States. Indeed, if mass-production is continued at the present rate for very long, after the cessation of hostilities, a shortage might soon be followed by an actual glut that might cause a slump in prices. The most serious shortage is likely to be in other categories, such as passenger ships and in vessels

Paid by The Prudential

Last year The Prudential paid Death Claims on nearly 500,000 policies for a total of over £10,000,000.

One in three of the persons who have lost their lives in air raids on this country were insured with The Prudential.

THE PRUDENTIAL ASSURANCE COMPANY LTD.
HOLBORN BARS, LONDON, E.C.1

specialising in the transport of meat and fruit; this can only be made good gradually. The enormous expansion of America's building capacity does not necessarily mean that the centre of gravity in shipbuilding has shifted permanently to the other side of the Atlantic. There will be no market for the millions of tons of standardised vessels

that are now being produced in order to make good the ravages of the U-boats; and, in the absence of discrimination, there is no reason to believe that British shipbuilders will be unable to launch the kind of ships that will be needed at competitive prices or that British shipowners will be unable to hold their own in competition.

Finance and Banking

Tax Transfers

The short loan position this week has been dominated by the heavy transfers of tax money which the banks were making towards the close of the week. Anticipation of this substantial movement of funds kept the banks out of the market for bills, and the discount houses, in order to finance the Treasury bills they were taking up earlier this week, were forced to seek the assistance of the official buyer. Current Treasury bill maturities were again £10 millions in excess of the payments for new bills, but, on the other hand, the banks' TDR payments, amounting to £20 millions, were £5,000,000 in excess of the nominal maturities. Towards the middle of the week, however, the credit position eased appreciably, and with a gradual revival of the banks' purchases of bills from the market no further recourse to the special buyer was needed. The special operations reported earlier in the week probably bear some responsibility for the rise of £5,775,000 in Government securities shown in the latest Bank return. Public deposits remain substantially unchanged at £8,035,000. The expansionist effect of the increase in Government securities has been neutralised to the extent of £2,694,000 by a further expansion in the note circulation, which thus appears to have returned to the secular upward trend after the seasonal contraction of January. Bankers' deposits have thus expanded by £3,078,000, and at £142,590,000 stand at a level which, in the present situation, should spell reasonable ease in the money market.

Fall in Bank Investments

The clearing bank aggregate returns for January reveal the customary contraction of bank credit following the year-end inflation reflected to the full in the previous statements. The total of deposits has fallen by £52,005,000 to £3,576,616,000. The whole of this decline is, however, fictitious, as the total of cheques in course of collection and

this moment, it seems to invite the interpretation that some banks have been selling gilt-edged in order to reinvest the proceeds during the coming Wings for Victory week, and thus ensure the "success" of that venture. The true explanation may not be so fantastic, but it provides an equally significant commentary on the banks' participation in the coming London week. The fall in investments was probably due to the fact that some banks held Indian securities vested under the Treasury order which was completed early in January. In the normal course, the proceeds of the repayments would have been reinvested immediately. Such reinvestment is probably being postponed until it can help to swell subscriptions towards the target figure of £150 millions. Last month's fall in advances amounts to £14,074,000, and gains in significance from the fact that normally advances were inclined to rise in the early weeks of the year as a result of facilities granted by the banks to meet their customers' tax payments. The fact that tax payments and the exceptionally heavy subscriptions to tax reserve certificates have been made without appreciable recourse to bank credit is further indication of the increasing liquidity of industry. The banks' holding of bills discounted remained virtually unchanged last month, but short loans rose by £3,593,000, reflecting the larger portfolios maintained by the market as a result of the banks' diffidence in buying bills during the period of heavy tax collections.

Expenditure in Canada

The new arrangements for financing Canadian supplies to the United Kingdom and other United Nations (dealt with in a note on page 204) should have a perceptible effect on the Exchequer returns and on the contemplated budget expenditure for the coming year. Hitherto, the outlay on war materials obtained from Canada has figured in full in the published totals of British Government expenditure. That was true of the period of cash purchases, which lasted as long as there were available supplies of gold and British held Canadian securities wherewith to acquire Canadian dollars. It remained true of the subsequent period when Canada took sterling for its supplies of war materials and allowed that sterling to accumulate here mostly in the form of Treasury bills. It was still true of the third phase in British-Canadian wartime financial relations, when supplies were financed by the \$1,000 millions free gift which was to last until the close of the current financial year. That sum has been exhausted some weeks earlier than was anticipated, but until the end of March it should be possible to finance the UK balance of indebtedness to Canada by using the \$200 millions placed at the disposal of this country by the Canadian Government on taking over the ownership of British Government investments in Canadian war plants. Thereafter, however, all supplies provided by Canada under the new Mutual Aid agreement will be kept outside the Exchequer returns in the same way as Lend-Lease supplies from the United States. It should be noted that the new agreement will only operate from the point at which Britain's immediately available resources of Canadian dollars are insufficient to meet its current debts to the Dominion. Those resources will be appreciably swollen by the decision of the Canadian Government to meet the whole expenditure on its rapidly expanding air force in the sterling area. The net effect of this particular decision on the Exchequer returns should be comparatively small. The UK expenditure figure already included the cost of the Canadian personnel in the RAF which is now being shouldered by the Canadian Government, but on the other hand the British expenditure in Canada met out of the dollars thus made available will also figure in the returns.

items in transit fell by no less than £61,395,000 over the same period. The level of true deposits thus rose by more than £9,000,000 over the period covered by the last two returns. The main expansionist force was again provided by Treasury deposit receipts, which rose by £39,500,000, a movement that rather more than neutralised the customary post-balance-sheet reduction in cash and appreciable declines in investments and advances. The fall in investments amounts to £8,049,000, and is perhaps the most interesting movement revealed by the return. It is the largest decline in this item since the outbreak of the war, and, coming at

Investment

Coming Railway Payments

Stock markets have been running true to form, since the opening of the new month, and the indices for both equities and fixed interest securities already show minor falls from the January peaks. In the case of the latter, the decline began before the end of last month, but, even so, the fall to date is less than 0.22 per cent. Much more important, from the market's own point of view, is the fact that activity has fallen back, virtually to the December level. Almost the only section to show any resilience, in either prices or turnover, is that of railway stocks, where there have been fresh minor adjustments to the impending dividend announcements, of which the first appeared this week too late for inclusion. Home railway stocks have benefited more than any other section from the process of levelling down yields which has been a feature of recent months. This is, perhaps, natural, but the excitement concerning the actual dividends and earnings is difficult to excuse. Whatever the actual results may be, it is probable that they can have little reference to peacetime conditions, and it is clear that very little allowance ought to be made for existing results in any post-war settlement of stockholders' rights which may occur. It is plain that existing transport arrangements have little or no reference to the most economic form of carriage in normal times. Shortages of petrol and rubber and of labour for the maintenance of roads; the complete ban on new construction; the devotion of the motor industry to Service orders; and a number of other factors all tend to make the existing distribution of traffic between the railways and other forms of transport different from the ideal. Further, although the maintenance of full employment would be a bull point for railways, as for all forms of activity, there is no guarantee that the proportion between different types of traffic coming forward after the war will, for any extended period, be similar to that now existing. There is a very strong and growing tendency to speak, not of the railway problem, but of the transport problem of post-war years. If this means that there is to be a central plan to make the best use of all possible transport resources, that is a very desirable objective, however difficult to attain. But if, as seems to be suggested, the plan is to make the best use of existing transport resources, that is to say, to stabilise the *status quo*, the country will be saddled with a system which will, in all probability, be neither cheap nor well adapted to modern requirements. While wishing to reach a just assessment of the rights of railway stockholders, those in authority ought to take cognisance of the fact that the capital structure was built up on the assumption that the lines possessed a perpetual monopoly, which does not, in fact, exist. It ought not to be restored merely to benefit the stockholder or the existing railway servants.

No Canadian Pacific Dividend

There will be considerable disappointment among investors, who had bid up the value of Canadian Pacific common to 17½ last year, at the news that once again there is to be no dividend on this class of capital. The absentee capitalist is always liable to feel that it is easy for the board of a company to be ultra-conservative when it is at his expense, but there is no reason to see an element of such calculation in the decision of the directors not to make any distribution out of the very ample profits now assumed to be available. Actually, nothing beyond the net earnings of the railways has so far been disclosed, and it is not improbable that net receipts from steamships and hotels, two of the main ancillary businesses, will have declined. However this may be, there is no excuse for the optimism recently felt by certain investors, who have based their hopes solely on the railway figures. At last year's annual meeting, Mr D. C. Coleman gave a number of reasons why the common dividend had been passed. He said that the increased profits were derived almost entirely from wartime traffic which had no relevance to the conditions of peace; that provision had to be made for maturities which were very heavy over a period of years; and that there was no means of knowing how far competition from road and water transport would affect net earnings after the war. The implication was plainly that war profit was in part a wind-fall; that the company would have many uses for such additional resources, and that they intended to retain them. Mr Coleman argued that this policy was, ultimately, more beneficial to holders of the equity than to pay them dividends. That is a question of fact, based largely on the future decisions of a board of unknown composition. The conservation of resources is only beneficial to equity holders if there is a reasonable assurance that such a policy will, in the not too distant future, ensure them a steady return on their investment. If that time is not likely to come, it would be fairer to state frankly that the profits are being retained for the benefit of the preference capital, whose dividend might otherwise be placed in jeopardy.

Actually, in their statement announcing the passing of the dividend, the board are rather more explicit this year than last. They point out that, although during the past three years the funded debt of the company has been substantially reduced, fixed charges are still high. And they give as an indication of policy the ruling that no common dividends shall be paid until these charges are brought to something like their former level. The last common stock dividend was paid out of the profits of 1931. Fixed charges for that year were \$22 millions odd, against some

BAY HALL TRUST LIMITED.

Summary of the Directors' Report for year ended 31st December, 1942, and of the accompanying Statement by the Chairman, Sir Charles Hambro, K.B.E., M.C.

DIRECTORS' REPORT:

The gross revenue amounted to £110,861. After charging Debenture Interest, Directors' Fees, Management and General Expenses amounting to £30,897, the net profit is £79,964. Adding £75,945 brought forward, the total available for appropriation is £155,909 and a dividend of 6½ per cent. is recommended which will absorb £65,897 and leave £90,012 to be carried forward.

A belated application from a Debenture holder to convert into fully-paid Ordinary shares was granted. Accordingly, in January, 1942, the Issued Ordinary capital was increased by £625 to £1,013,800 and the amount of outstanding Debentures decreased by £1,250 to £772,400.

At market prices on December 31st, 1942 (or where no market price existed at valuations by the Directors at that date amounting to £305,011), the Share and Debenture Holdings and British Government Securities had an aggregate value of £2,140,884, as compared with their book cost of £1,962,974.

CHAIRMAN'S STATEMENT:

The net profit of £79,964 compares with £70,514 for 1941; the increase of £9,450 is due to the effects of income tax. The allowance for Dominion Relief amounts to 3s. 9d. in the pound, so that the net income tax to be deducted on the 6½ per cent. dividend now recommended will be at the rate of 6s. 3d., and the dividend is, therefore, equivalent to about 8.9 per cent. less tax at the standard rate of 10s. 0d. At the end of 1942, the value of our investments showed an indicated appreciation of £177,910 over book cost. Over 98 per cent. of the investments, including British Government Securities, taken at the valuations at December 31st last, are situated in United Kingdom, South Africa, and other parts of the British Commonwealth. Similarly measured, but excluding British Government Securities, about 93 per cent. of the investments are in Ordinary stocks and shares and the balance in fixed interest bearing securities.

Copies of the full Report and Accounts can be obtained on application at the office of the Company, Princes House, 95, Gresham Street, E.C.2.

\$19,166,000 for 1930. In 1933, they were already \$24,229,000 and in 1940 appear to have reached a peak of \$25,380,715. They fell by over a million dollars in 1941 and last year's figure is not yet available. There is a substantial gulf to be spanned, but it is to be noted that the gap between the 1930 and 1941 figures of \$5,380,000 odd is only a little more than 1½ per cent on the common stock. This seems to indicate that, with net earnings at current levels, dividends are likely to be modest, even when resumed. The common stock holders have now been without any payment for eleven years. The \$25 shares touched 17½ last year, the highest since the temporary peak of 18 in 1937. Prior to the announcement, they had relapsed to 15½ and they are now at 14½, which is still more than three times the lowest level of 1940. Considerable optimism about the post-war industrial activity of Canada seems to be justified. It is more doubtful whether this will mean prosperity for Canada's railways, and still less certain that the equity stock holder will reap much benefit.

Richard Thomas Developments

The news that the consortium, headed by the Bank of England, which holds the prior lien debentures of Richard Thomas, has consented to a reduction in the rate of interest from 4½ to 4 per cent is satisfactory to the equity holders so far as it goes. The saving, added to that resulting from the further repayments, at the rate of some £270,000 per annum, amounts to something of the order of ½ per cent on the ordinary capital. What the market would like to see is, however, the total disappearance of the remaining £3,355,000 of prior lien debentures and with it the present system of control. Rightly or wrongly, it has always been assumed that the banking consortium has run the company in the interests of the tinplate industry rather than in those of the shareholders, and it is only natural that this should be resented by the proprietors, even now that they are receiving a modest return on their capital. Incidentally, the disappearance of the prior charge would bring with it the automatic reduction in the rate on the £6,800,000 mortgage debentures from 4½ to 4 per cent. As the amount of this is twice that of the prior lien stock, the relief would be proportionately greater. At the end of March last, the parent company had net liquid assets of some £3,500,000 and the group of £5,000,000 odd. It may be recalled that the company lost its independence because the finance raised was not sufficient to complete the programme. There is no clear indication as yet that the accumulation of reserves has been sufficient to render the group fully independent of the money then put into it, but a more rapid repayment of the prior lien stock would seem possible. Richard Thomas is likely to prove a test case as to the intentions of those in authority towards the independence of British industry. It is possible to make out a very strong case in favour of the original policy. If Britain is to achieve a higher standard of living after the destruction caused by the war, it can only be by an energy and adaptability, of both capital and labour, on a scale far above pre-war levels. Whatever the faults of the scheme, Richard Thomas set out to equip one section of industry with the most modern plant available. Instead of rewarding that energy and initiative, the country has penalised it, at least to the extent of placing the group under official tutelage.

Gas Dividends Resumed

The experience of suburban and most provincial gas companies, outlined in an article in *The Economist* of last week, had prepared shareholders in the London companies for some improvement in their lot. Thus, there was no surprise when the Gas Light and Coke and South Metropolitan companies announced, in addition to full preference payments for the whole of last year, a resumption of dividends at the rate of 1 per cent on the ordinary capital of both concerns. In the case of the former, this decision entails resumption on the 3½ per cent maximum stock with a payment of 1½ per cent. Compared with this, it might be thought disappointing that the Commercial Gas Company should be unable to resume payment on any class of share capital. Conditions in eastern London, where its main business lies, are, however, evidently less favourable than those prevailing elsewhere. Both Gas Light and Coke and South Metropolitan had postponed consideration of preference dividends until the end of the year, a clear indication that the possibility of payment depended largely on the activities of the Luftwaffe. In practice, these have proved less damaging than might have been expected, and it is the general diffi-

culty of obtaining supplies of suitable coal and labour, coupled with the inadequate margin between costs and selling prices, which is the main cause of continuing depression in the London section of the industry. Last spring, the chairman of the former of these concerns went so far as to say that, even after the increases recently granted, the gas companies were subsidising the cost of living. Apparently, however, the absence of heavy bombing, the grant of some relief in prices, and the return of population, have had some effect, although in the absence of accounts it is impossible to say how much. The latest previous payment of Gas Light was 2½ per cent for 1940, comparing with 5.6 per cent pre-war, while for South Metropolitan the corresponding figures are 2 and 5½ per cent, respectively. The price of £1 stock units of the former was virtually unchanged on the news at 17s. 6d., while the quotation for the latter moved only fractionally to 76½.

Company Notes

Woolworth Accounts

The setback to trading profits of F. W. Woolworth in 1942 from £6,872,720 to £6,093,640 is greater than that suggested by the decline in the net figure discussed in a note on the preliminary statement in *The Economist* of January 30, 1943. The relatively small drop in published net profits is due to a reduction in war damage contribution from £105,988 to £28,383. The balance sheet shows no great change in the financial position. There is a fall in cash holdings of some £2,000,000 to £4,862,981 and in Government securities of rather more than this amount to £1,408,863 which have financed the acquisition of £4,000,000 of tax reserve certificates. Creditors, including tax, are more than £600,000 lower at £5,579,169, but there is a small rise in debtors. The decline from £4,910,589 to £4,797,191 in stocks, of which a greater proportion than in the previous year is subject to purchase tax, certainly understates the reduction in volume. Net liquid assets are very slightly higher at £9,831,063 against £9,517,963. The chairman, Mr W. L. Stephenson, points out that the fall in profits is due, both to the reduction in supplies and to the reduction in selling space—for which presumably enemy action is responsible. There is no doubt that the labour shortage is also acute. Mr Stephenson states that a number of branches are entirely managed by women and that only 15 per cent of the pre-war female staff remains with the company. In the circumstances, the decline in profits appears to be inevitable. It is a matter for congratulation that the management has met the position with a determination to continue to build up liquid resources. The reduction of equity payments has been by no means drastic and the concern remains in a position to undertake the necessary work of reconstruction when the war is over. The 5s. ordinary stock at 57s. 9d. ex dividend yields £4 6s. 6d. per cent.

English Electric Profits

The rise in net profits of *English Electric* in 1942 from £362,604 to £407,560, struck after tax and depreciation, reflects the acquisition of D. Napier. The directors state that the net figure includes the 7½ per cent dividend receivable from D. Napier in respect of 1942; that is to say, at least, £16,380 net. The new *English Electric* ordinary capital, which is now increased from £1,922,513 to £2,317,182, was offered in exchange for the D. Napier ordinary capital under the terms of the arrangement of November 30th last, but ranked for dividend as from January 1, 1942. The directors announce the distribution of 10 per cent on the increased ordinary capital of *English Electric*, requiring £231,718 gross against £192,251. This means, as anticipated, a return to Napier shareholders who accepted the offer of 8 against the 7½ per cent previously received. After meeting the preference dividend, equity earnings are up from £288,774 to £333,730, representing 18.8 per cent on the increased capital against 20.0 per cent on the old capital. There is no information in the preliminary statement about the allocation of the surplus, but it is clear that the concern would be able to repeat the £100,000 transfer to free reserves allocated in the three previous years without depleting the carry forward. Last year, the acquisition of the D. Napier interests had, of course, no influence on the earning capacity of *English Electric*. In the current period, D. Napier output should be substantially increased, but it is far from clear how the earnings of that company, or of *English Electric*, permissible under EPT legislation will be affected. The £1 ordinary stock of *English Electric*, at 47s. 6d. ex dividend, yields £4 4s. 2d. per cent.

Thomas Tilling Record Profits

In the year to December 31, 1942, *Thomas Tilling*, the important road transport holding concern, earned record profits, struck after war damage, depreciation and tax, of £557,208 against £546,464. Equity earnings amount to £518,892 against £507,996, representing 15.2 against 14.7 per cent, so that it is possible to place £100,000 to general reserve, and to raise the carry forward from £167,305 to £174,197 after repeating the customary 10 per cent payment on ordinary capital. The disclosed profits for the year include no payment from the newly formed subsidiary, *Tilling Motor Services*—one of the two successor companies under the recent reconstruction to the former subsidiary, *Tilling and British Automobile Traction*. *Thomas Tilling* has, however, received a final dividend from *Tilling and BAT* in respect of 1941, and a payment in lieu of the 1942 interim. The reconstruction is reflected in the balance-sheet by the disappearance of holdings in associated concerns of £2,114,777, and their replacement by a holding in *Tilling Motor Services* of £1,998,414 at par. In order to list this holding at par, it has been necessary to transfer an unspecified sum, apparently £26,543, from general reserve. There is a decline in net loans from subsidiaries from £696,110 to £619,041, and a rise in the total of reserve and surplus from £1,767,896 to £1,848,246. Otherwise, the balance-sheet shows little change. The chairman, Sir J. Frederick Heaton, points out that the structure of the group would preclude a consolidated statement from being as informative as it would be in the majority of cases. It remains true, however, that such a balance-sheet would still provide stockholders with more information than they receive from the existing accounts. The directors are optimistic regarding the benefits of the reconstruction, and it is possible that, with the greater operating efficiency which can now be secured, there may be a further advance in profits. The chairman again draws attention to the extent to which vehicles have been successfully adapted to the use of producer gas. Even under present conditions, all-in costs do not greatly exceed those of running on diesel oil, and there is no difficulty in maintaining previous timetables. Sir Frederick pointed out that the profitability of producer gas after the war depends on the relative prices of coal and liquid fuel. The development of the use of producer gas offers an important potential market for home produced coal, if it can be marketed at a competitive price. The £1 ordinary stock, at 54s. 3d., yields £3 14s. 5d. per cent.

Linen Thread Progress

Profits of *Linen Thread* for the year to September 30th rose by nearly £6,000 to £254,366. Depreciation received £5,276, against £5,526, and war damage required the negligible sum of £176, against some £2,000, so that the decline in equity earnings is due solely to the provision of £18,494, against nil, for reserve against war losses. The total of this fund is now raised to £200,000 and is stated by the directors fully to cover investments in subsidiaries now in enemy occupied territory. The decline in equity earnings from £120,001 to £109,420, representing 7.3 against 8.5 per cent, is not so sharp as to endanger the cover for the 6 per cent dividend, distributed throughout the last decade, and the surplus raises the carry forward from £210,256 to £220,676. The cause of the rise in profits is not immediately clear. As the concern's main business is that of a holding and finance company, the balance-sheet throws little light on trading conditions. A switch of some £225,000 from net advances into holdings in subsidiaries suggests that a permanent expansion is envisaged. Stocks of the parent show a modest recovery from £70,966 to £95,184, which may reflect better home production and some relief from supply difficulties. The stock position is, however, still very low. Net liquid assets show a very moderate rise to £1,548,000, debtors, investments and creditors all being appreciably lower. There is also a transfer of £500,000 from cash to tax reserve certificates, a feature which appears in balance-sheets with increasing frequency. There is a substantial official demand for the products of the group on both sides of the Atlantic, so that a fair turn-over seems assured. A regular demand also exists for any normal production permitted by lack of supplies of material and labour. The £1 ordinary stock, at 28s. 9d. ex dividend, yields £4 3s. 6d. per cent.

Steady Investment Trust Earnings

The first batch of investment trust results for 1942 show no startling change from the profits earned in the

previous year. There are individual fluctuations, but the average result shows that income has been steadily maintained and that expenses are not in general higher. The results of seven leading trusts are analysed in the following table. Of these, four showed an increase in total disclosed profits, the most substantial improvement being realised by *Scottish American Investment Trust*. Of the three trusts which show a decline in income there is no case where the setback exceeds £3,000, and in one case, that of *Debuture Corporation*, the reduction in tax liability is sufficient to offset the fall in profits. Thus, equity earnings are actually higher at 11.7 against 11.1 per cent. In each case, equity dividends are the same as those paid in the previous year, although no restoration is contemplated by the two trusts, *Great Northern Investment Trust* and *London Stockholders*, which reduced their payments in

† After tax on dividends, except for *London Stockholders*, *Omnium* and *River Plate* in 1940 and 1941.
N.D.—Not disclosed. † Undisclosed appreciation. § Adjusted for income tax in carry forward. * £1 stock.

1941. The stability of earnings is accompanied by an apparent improvement in the market value of investments. The three trusts which provide an estimated valuation of investments all show a substantial further improvement last year, and in two of the three cases, *Great Northern* and *Scottish American*, there is a change from depreciation to appreciation in terms of balance-sheet valuation. In the circumstances, it is highly unfortunate that the remaining trusts still withhold this vital information from stockholders. In only one case, that of *Omnium*, whose directors state that depreciation exceeds the total of reserve and carry forward at £82,053, is a serious disparity probable. One further illuminating symptom is provided by this group of accounts. In at least two cases there is a switch to majority holdings of equity shares. There is no evidence to show whether investment trusts in general are shifting the balance of their holdings in favour of equities. But such a policy would be consistent with the struggle of managements to maintain monetary income in the face of higher taxation, and real income in the event of any future measure of inflation.

Industry and Trade

Coal Supplies

During the six four-weekly periods to January 23rd for which figures are available, the production of coal was only once above the level of the corresponding period in the previous year. The returns for the four weeks ended January 23rd again compare unfavourably with the figures for the preceding year; the average weekly output of saleable coal was 3,813,400 tons, against 3,824,800 tons in 1942. Only three districts—South Derbyshire, Leicestershire and Somerset—qualified for the bonus, compared with twelve in the four weeks ended December 26th. Even the Ministry of Fuel and Power, in its purely factual monthly statement, describes the January results as disappointing, especially as output a year ago was hampered by unfavourable weather. The lag in output has been attributed to the poor start made in many districts after the Christmas holidays, and to a seasonal increase in absenteeism caused by sickness. In spite of the unsatisfactory response to the call for higher output during the past six months, there has been no serious shortage of coal so far this winter. In fact, it is understood that stocks are no smaller than a year ago. If, as was forecast last summer, the volume of industrial consumption has increased, the explanation must be sought, at least in part, in a reduction in non-industrial consumption. The "save fuel" campaign, in other words, has not been ineffective. In January, for example, the consumption of coal for the manufacture of gas and electricity was actually slightly below the previous year's figures, despite the reported expansion in industrial demand. The mild weather in January has no doubt eased the position—indeed, the effects of severe, instead of mild, weather in the winter months on distribution and consumption might have been disastrous. After the song and dance last summer about rationing and reorganisation, we have, by the grace of God, muddled through surprisingly well so far. One small factor which has been of some assistance has been the growing contribution to coal supplies from opencast mining, which is not included in the returns of the output of saleable coal. No figures have been issued, however, showing the change, if any, in exports and in the quantity of coal shipped for the use of steamers. The fact that a serious shortage has so far been avoided is, of course, no ground for complacency—though there are signs of this at the Ministry. In particular, the technical reorganisation of the industry, so loudly trumpeted by the Government early last summer, should be begun in earnest, in order to secure an increase in output per miner later this year—when another, and perhaps much less benign, winter is due and the manpower shortage may be still more serious.

Industrial Research

It has been estimated that whereas the Soviet budget for science represents one per cent of the national income, America's is only three-tenths and Britain's one-tenth of one per cent. These proportions were quoted by Mr P. Dunsheath, chief of the research department of Henley's Telegraph Works, during his recent lecture on industrial research before the Royal Society of Arts. The importance of research as a means of ensuring economic progress and increased productivity is very great. By far the greatest contribution is made by industry in its own laboratories; the best of these are well staffed and equipped. Some industries already spend very large sums each year; the electrical industry, for example, is estimated to spend at the rate of £1,000,000 a year. Not unexpectedly, progress has been most marked in the larger concerns. The Government, through the Department of Scientific and Industrial Research, has initiated research on a national scale; the universities have made many important contributions. But, while substantial progress has undoubtedly been made during the past twenty-five years, the funds and intelligence at present devoted to industrial research are far from adequate, and there is probably not enough contact between the various research organisations. Mr Dunsheath suggested the establishment of a co-ordinating secretariat to—

maintain a comprehensive and accessible record of all researches in progress and completed, so as to bridge the gap between discovery and application, and shorten the present long period which elapses between the birth of knowledge and its availability for use.

Mr Dunsheath's suggestion is a sound one. But apart from the need for such a central organisation, the actual resources devoted to research might with advantage be increased if Britain is to remain in the forefront of industrial nations after the war.

Campaign against Fire Losses

The estimated cost of fires arising from ordinary causes (i.e., excluding outbreaks due to enemy action) amounted in 1942 to £12,470,000, compared with £10,252,800 in 1941 and £8,780,800 in 1938, the last pre-war year. These figures are arrived at on the basis of fires in Great Britain and Eire involving a direct loss of £1,000 or more, and adding 60 per cent to cover the large number of smaller fires; no allowance is made for consequential loss. The total for 1942 is less alarming than appeared likely at the end of June, when losses were running at nearly twice the level of the previous year, but the figures give no grounds for complacency. In pursuance of the policy announced in October, the Fire Offices' Committee, the association of insurance companies transacting fire insurance on tariff lines, has now launched its countrywide publicity campaign for the reduction of fire waste. The first step in this campaign has been the preparation of a handbook with the caption, "Fire—Hitler's Ally," now being distributed to works managers. The introduction to the handbook by Mr Hinshelwood, the chairman of the Committee, emphasises that the monetary loss by fire represents only a part of the true loss to the country from this cause. Stocks and machinery, if replaceable, have to be renewed at the risk of men's lives and of shipping; a factory burnt out means the loss of its productive capacity, maybe for many months; houses and other buildings that have to be restored or replaced involve the diversion of labour and materials from other essential work; in fact, any fire helps the enemy in his purpose and hinders us in ours. Fire insurance companies will give technical advice on measures for preventing and limiting fires, but it is the individual who, by the exercise of vigilant care, can do most to remove this drag from the national war effort. The handbook details features for managerial attention and reproduces in colour a series of posters, full-sized copies of which may be obtained by works managers from their insurance companies. Small informal committees of insurance branch managers have been formed in all important towns, and every branch office and principal agency will be a centre for the dissemination of fire prevention information.

Industrial Caterers

The Minister of Labour's refusal to apply the Essential Work Order to canteen workers employed by industrial caterers seems a little puzzling. The application for scheduling canteen staffs in essential war factories is not a one-sided demand but has been made by the Joint Industrial Council which was set up in January, 1942, and consists of the National Society of Caterers to Industry, on the one hand, and the National Union of General and Municipal Workers and the National Union of Distributive and Allied Workers on the other. In a letter to the Joint Industrial Council, Mr Bevin expressed the view that "final responsibility for canteen staff ought to rest with the principal employer in the factory," and suggested that the solution lay "in an agreement over a wide area of industry with the principal employers as to the conditions, including wages, to operate in canteens." In reply to a question in Parliament on November 19th, he said that there were "no regulated conditions, no rates for the job." But there is, in fact, an agreement on wages and hours in regard to canteens operated by industrial caterers. An agreement was reached in July, laying down minimum rates of wages for factory canteen workers and a working week of 48 hours (the details were reported in *The Economist* of August 8th), between the Caterers to Industry and the NUG & MW and NUDAW, the Transport and General Workers' Union not being a party to the agreement. As from January 18,

1943, the rates have been increased by from 3s. to 5s. a week, according to the type of work. The National Society of Caterers to Industry covers the majority of "outside" catering employers; it employs some 20,000 workers and is said to serve about 2½ million hot meals a day. According to the latest available figures, 44½ million meals per week are served in all industrial canteens, so that it can be seen that industrial caterers occupy a place of considerable importance. Whether it is desirable or more efficient for a firm to employ outside caterers or to manage its own canteen is an entirely different matter. Industrial canteens are properly regarded as vital to the war effort, and the difficulty of obtaining and retaining staff has probably hindered their development. Where canteens are operated by factory committees and by a manager appointed by the firm itself, the workers in the establishment, including canteen staffs, are automatically scheduled if the factory is engaged on essential work. Mr Bevin, in his speech during the catering debate, showed that he is looking at the matter from the catering trade as a whole, but to apply the Essential Work Order now to staffs employed by outside caterers in scheduled factories would not necessarily prejudice either the long-term measures or the interim arrangements he forecast for improving the wages and conditions of the employees.

Dearer Newsprint

On February 8th the price of newsprint was increased by 30s. per ton, the reason given by the Ministry of Supply being an increase in costs. This raises the "controlled" price for standard weight newsprint to £32 5s. 0d. per ton and the "equalised" price to £31 12s. 6d. per ton (for the sake of uniformity the prices of imported and home-produced newsprint have been "equalised"). A record of changes in prices since February, 1940, is given in the table below:—

Date of Change	Controlled Price*		Equalised Price		Extra Chargeable for Lightweight Paper†
	£	s. d.	£	s. d.	£ s. d.
Feb. 29, 1940	21	10 0	...	...	...
May 27, 1940	22	11 6	22	10 0	...
July 1, 1940	24	0 0	24	0 0	...
Oct. 26, 1940	28	10 0	26	0 0	...
Jan. 1, 1942	28	15 0	26	0 0	...
April 13, 1942	30	0 0	28	0 0	...
Aug. 1, 1942	30	0 0	29	0 0	1 13 0
Oct. 1, 1942	30	15 0	30	2 6	1 17 6
Feb. 8, 1943	32	5 0	31	12 6	1 17 6

* Basic control price for standard weight newsprint, 14½ lbs. demy.
† 14 lbs. demy.

The increased price will be spread over no less than 38,000 newspapers of four pages each, the number produced per ton of newsprint. It would add about £60 a day to the paper bill of a four-page daily with a circulation of 1,500,000 copies.

Farm Workers' Conditions

Two important steps in the direction of improving agricultural workers' conditions have recently been announced. In the first place, the Central Agricultural Wages Board has agreed that farm workers shall have four days paid holiday a year and four statutory holidays. Secondly, the Ministry of Health is introducing a scheme for building 3,000 cottages. Work is to start in April, and it is hoped that most of the houses will be completed by the harvest time. The construction and management of the houses will be the responsibility of the rural district councils, which will select the sites in co-operation with the County War Agricultural Committees. A model plan for three-bedroomed houses, with living-room and parlour, has been produced by the Ministry's Central Housing Advisory Committee, and it is understood that wherever practicable water and electricity will be provided, and if this is not immediately possible, it could be done in the post-war period. The rents of the new houses will work out at about 12s. to 13s. 6d. a week, including rates, for houses with parlours; those without parlours will be slightly cheaper.

Though the standard of accommodation offered will be better than that in most rural areas at present, these rents are considerably higher than the present level of farm workers' rents—in most villages cottages are rented at from 3s. to 5s. a week—and a labourer who is earning no more than the statutory minimum wage and has a family to support may be unable to afford one of the new houses, if the minimum wage remains at its present level. Nevertheless, the decision to provide farm workers with holidays and with better houses will be generally welcomed, as an indication of the Government's desire to improve the life and conditions of agricultural workers. They also show that it is not necessary to wait until the war is over to initiate measures of essential reform.

Gas and Electricity

In January, for the first time since the launching of the "save fuel" campaign last summer, the quantity of coal consumed in the production of gas and electricity showed a reduction from the figures for the corresponding month a year earlier. Recent changes in the consumption of coal are given below:—

TREND OF COAL CONSUMPTION IN THE MANUFACTURE OF GAS AND ELECTRICITY

(Percentage increase over corresponding month of previous year)

	Gas %	Electricity %
1942—April	11.0	12.0
May	9.3	10.4
June	8.6	9.7
July	6.5	7.2
August	5.3	6.6
September	3.0	5.6
October	1.3	5.0
November	1.8	4.1

1943—January	0.8	5.4

As industrial consumption of both gas and electricity is stated to be well above the level of a year ago, their use for non-industrial purposes has no doubt shown a decline. It is equally reasonable to assume, however, that the mild weather, especially in January, has been an important factor in the reduction of fuel consumption for heating purposes.

Potash Supply Changes

The Allied potash supply position is far better than it was during the last war, when this valuable fertiliser was almost unobtainable. Until 1919, Germany had a monopoly of supplies. The United States, Russia, Palestine and Spain have become important producers, and some other countries are developing their potash production. Among the newly developed deposits, the Russian mines in the Urals are probably the most important; while those in Palestine (the Dead Sea) are perhaps the cheapest to exploit. In Spain output (chiefly in Catalonia) had been adversely affected by the civil war, but production has been resumed on a substantial scale. The United States, a decade ago, was the world's largest potash importing country, but has now become an exporter of these fertilisers. The foundations of the United States potash industry were laid during the last war. From an output under 5,000 short tons of crude potash salts, with a K₂O content of under 2,000 tons in 1915, United States production, which is largely concentrated in California, Maryland, New Mexico and Utah, rose to a pre-war record of 534,945 short tons containing 316,951 tons K₂O in 1938. Since then, according to statistics published by the U.S. Bureau of Mines, another steep rise has taken place, bringing the 1941 output to no less than 986,458 short tons of crude salts with a K₂O content of 524,875 tons. Already in 1940 the United States produced more potash than it needed, and since then has had a regular export surplus. This year another increase in United States production is expected, so that Allied supplies of this vital material are not unsatisfactory. The rise of the extra-German potash production is not only of vital significance for the Allies during this war, but it will also prove of great benefit to international agriculture in future, as it will prevent the German cartel from dictating world supplies and prices.

COMPANY MEETINGS

GENERAL MORTGAGE BANK
OF PALESTINE, LIMITED

INCREASED PROFITS

MR. S. HOOFIEN'S REVIEW

The twenty-first annual general meeting of the General Mortgage Bank of Palestine, Limited, was held, on the 7th instant, at the bank's offices at Tel-Aviv.

Mr S. Hoofien, M.B.E. (the chairman), in putting the directors' report and accounts for the year 1942 before the meeting, said that results had again been very satisfactory. Although there was little, if any, new business through the virtual absence of all private building, the balance of profit was somewhat in excess of last year, in spite of considerably increased provision for income tax, and larger expenditure owing to cost-of-living allowances.

Arrears were again lower than in the previous year. All arrears of interest were put to reserve and did not appear in the profit and loss account.

The liquidity generally prevailing in the country had favoured punctual payment of rents, especially as only tenants taking care not to get into arrears enjoyed the protection of the Rents Restriction Ordinance.

No damage of any importance had been caused to borrowers' property through enemy action.

ACCUMULATION OF FUNDS

During the second half of the year the accumulation of funds in the bank's hands had encouraged the directors to offer loans in replacement of private mortgage loans which had matured, but advantage was not taken of this offer in sufficient measure to counterbalance the continuing accumulation of funds. The directors did not regret this strengthening of the bank's cash position, as it would enable them to enter the field armed with sufficient means as soon as circumstances were again favourable to an active lending policy. Against such loss of

earnings as this temporary redundancy of liquid means involved, amply sufficient provision was available.

The chairman then dwelt on the various methods which the bank applied to strengthen its position so as to enable it to play, in the post-war period, the part incumbent on it, particularly in view of the fact that the bank enjoyed a virtual monopoly in its field.

There had been the usual liberal allocation to the contingencies fund, and after making provision for arrears of interest and income tax liability, it had been found possible to add a further £15,000 to the reserve fund, which now stood at £130,000. It was proposed to pay a final dividend of 4½ per cent. on the ordinary shares and 3½ per cent. on the preference shares, thus bringing up the total dividends to 7½ per cent. and 6½ per cent. respectively.

The report and accounts were unanimously adopted.

F. W. WOOLWORTH AND
COMPANY, LIMITED

A GRATIFYING RESULT

The thirty-fourth annual general meeting of F. W. Woolworth and Company, Limited, will be held, on the 19th instant, in London, and the following are extracts from the statement by the chairman, Mr W. L. Stephenson, circulated to the stockholders with the report and accounts for the year ended December 31, 1942:—

Our company has operated under greatly increased difficulties. The further restrictions on the manufacture of consumer goods, and the increasing and proper demands on both labour and materials for war purposes, has quite naturally had its direct effect upon your business, as well as on all other distributive trades.

The net profit for the year's operations at £5,699,822 is £704,937 lower than in the previous year, and this is directly caused by reduced supplies of merchandise and continued reduction in selling space. After consideration of all the factors which have influenced the past year's trading, we can

feel very gratified with the result obtained. The cash bonus of 3d. per unit has been omitted, with the result that we have been able to maintain our balance carried forward and have added to it the small amount of £18,986.

The financial stability of your company is of first consideration with your directors. Your directors' policy has been to add to the liquid reserves of the company, and in these very difficult times it is heartening to know that we shall have this accumulation of reserves available for post-war purposes.

Your company will need its carefully built-up reserves to re-create its distributive depots on the most modern lines, and to collaborate to the fullest extent with manufacturers in the production of newer and better goods, and to provide an improved service to your millions of customers.

WANDSWORTH AND
DISTRICT GAS COMPANY

The annual meeting of the Wandsworth and District Gas Company was held, on the 9th instant, on the company's premises at Wandsworth.

Mr Frank H. Jones, M.Inst.C.E. (chairman and managing director), said that it was a matter of regret to the directors to find in May last that it had become necessary to increase the price of gas by 1.5d. per therm. That had been done after the Ministry of Fuel and Power had considered all the working details of the company and agreed that such an increase was fully justified. Their gas, in price, still compared favourably with the rest of London, and provided a fuel that was economic and indispensable to the consumer, whether domestic or industrial. Moreover, its by-products were invaluable to the nation both in peace and in war.

In conclusion, after paying a tribute to the loyalty, skill and application of their staff in these very difficult times, he said that proprietors would have noticed with pleasure that it was recommended that the dividend on the ordinary stock should be increased as compared with that paid for the previous year.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

The decline in turnover in the markets continues, the number of markings having now fallen to the level at the end of last November. In the absence of selling, however, quotations have fluctuated narrowly, with small losses predominant in many sections. The gilt edged market attracted little interest, and in the absence of support, a general easing of quotations, ranging from ½ to 1, was registered on Tuesday. Chinese bonds rallied after last week's setback, and elsewhere in the foreign bond market Chilean stocks were quietly firm. Both Brazilian and Japanese loans were easy, while the 7 per cent German Potash bonds lost a point at the reopening. With the approach of the dividend announcements, buyers were attracted to LMS and GW ordinary issues, but apart from point gains for these, activity in the market was light, other movements being without significance. Further appreciation of the Argentine companies' expenses occasioned a general decline in all classes of stock, losses ranging from ½ to 2 points. A sharp fall of 1½ for the Canadian Pacific equity reflected the market's disappointment at the passing of the dividend.

Despite the prevailing dullness in some sections of the industrial market, the

undertone remains fairly steady, while occasional improvements reflect the continuance of selective buying. Thus, a sharp rise of 2s. for Courage overshadowed everything else in the brewery section, but there was little of note in tobacco shares. Rather less interest than of late was displayed in the motor and aircraft section, most issues fluctuating narrowly. Lambert Bros. was outstanding in the heavy industrial group, the equity rising 2s. on steady support. The textile section displayed weakness in the earlier part of the week, but later a slightly steadier tone became apparent, although earlier small losses were not recovered. Shipping shares were idle. Some selling of Brazilian Traction led to a total decline of ½, but International Nickel, in contrast, were firm on the dividend. Miscellaneous issues followed the general tendency. Thus, while Ransome and Marles were firm, Turner and Newall and Murex, among many others, fell back, the former losing 1s. 6d.

Light Cape support in the kaffir market exerted a negligible influence on quotations, both developing and dividend-paying mine issues moving within narrow limits. Activity in the rubber and tea market was at a minimum, and with the further falling off in support scattered losses were registered in both markets. In common with other sections, oil shares were little bought, although occasional support sufficed to keep prices steady. VOC were unchanged on the publication of the Petroleum Bill's proposals to control prospecting.

New York

ANTICIPATION of a technical correction to the continued upward trend, coupled with some uncertainty regarding the position in the Solomon Islands, occasioned some irregularity on Wall Street. Although light selling and continuous profit-taking were fairly well absorbed, intermittent support was insufficient to prevent widespread declines. Early this week, however, a stronger tendency was evident, and this was justified by more definite news from the Pacific.

GOVERNMENT RETURNS

For the week ended Feb. 6, 1943, total ordinary revenue was £104,998,000, against ordinary expenditure of £111,045,000, and issues to sinking funds of £910,000. Thus, including sinking fund allocations of £10,821,904, the deficit accrued since April 1st is £2,464,929,000, against £2,351,386,000 for the corresponding period a year ago.

Wigan Coal and Iron Company.—At an extraordinary general meeting on January 31st, the special resolutions for the reduction of the company's capital, and the distribution of the shares of Lancashire Steel Corporation in satisfaction of such reduction, were passed unanimously.

COMMODITY AND INDUSTRY NEWS

Utility Fabric Exhibition.—An exhibition of cotton and rayon utility fabrics is to be held at the Cotton Board's Colour, Design and Style Centre, 19 York Street, Manchester, from February 15th. All the fabrics covered by the cotton and rayon utility schedules will be represented, and the display will provide a comprehensive review of current utility production since it includes samples from the ranges of all leading manufacturers of cotton and rayon utility cloths. It is expected that over 2,000 samples of plain, printed and coloured woven materials for men, women and children's wear will be on show.

Mica Control.—The Minister of Supply has made a Direction under the Control of Mica (No. 2) Order, 1942, authorising the acquisition and disposal, without licence, of small quantities of prepared mica or of built-up mica (micanite and the like) subject to the conditions that the aggregate quantity acquired by any one person from all sources under this Direction must not exceed £5 in value in a period of one calendar month, and processors who make disposals under the Direction must make a monthly return to the Ministry of Supply in the form set out in the appendix to the Direction. The Direction came into force on February 4th.

Price-Regulation.—The Board of Trade, after consultation with the Central Price-Regulation Committee, have made the Prices of Goods (Price-Regulated Goods) Order (S. R. and O., 1943, No. 118), amending the Prices of Goods (Price-Regulated Goods) Order, 1942, No. 794, and adding to the list of goods price-regulated under the Goods and Services (Price Control) Act, 1941, spectacles, lognettes, pince-nez and spy glasses, and

frames and lenses therefor and component parts thereof; and paint and distemper. In future all traders (manufacturers, wholesalers and retailers) dealing in these articles may only increase their prices beyond those ruling on August 21, 1939, by the amount representing the actual increase in the costs of their business, and traders must be prepared to justify any such increase. The inclusion of these articles in the list of price-regulated goods makes them subject also to the Restriction of Resale Order (S. R. and O., 1942, No. 958) and the Price-Controlled Goods (Invoices) Order (S. R. and O., 1941, No. 1388).

Food Delivery Rationalisation.—The rationalisation of retail deliveries of food other than bread and milk, has resulted in the laying-up of 34,000 vehicles. Petrol has been saved at the rate of 25 million gallons a year, representing a saving of 36 per cent of the petrol normally used for the delivery of groceries.

The Parting of the Ways

THE Government has not been even remotely in danger of actual defeat this week, in spite of the fierce gale that blew up so suddenly against its friendly but evasive and non-committal statement on social security. But it has been confronted with the prospect of two serious, and significant, reverses: a hostile vote by the bulk of Labour members, many Liberals and some of the younger and more vigorous Conservatives; and even, it was rumoured, the resignation of certain Labour Ministers. At the time of writing, it is not known what success behind-the-scenes bargaining has had in holding the wings of the Commons together. Mr Morrison and Mr Eden may have saved the day. The Government may have been persuaded, after all, to do what it should have done from the start—to say outright what it means to do, to specify its intentions, to give some definite assurance of action and some hint of the vision, the courage, the imagination and the "practical idealism" whose absence from the speeches of Sir John Anderson and Sir Kingsley Wood so outraged Parliament and a large part of the public.

But whatever has happened the crisis is by no means over. The origins of this week's storm are far wider and far deeper than mere party passion or the Beveridge Report itself. There come moments in the affairs of every

nation when the deep doubts and problems which have frustrated social and political advance for many years come up, inexorably, for solution and decision. In 1939, the totalitarian challenge was accepted; Britain went to war, with no notion yet of how or why, but with the sound instinct to resist the wrong. In 1940, Britain did not waver when left alone. Now, the third and perhaps the greatest climacteric is near. On the decisions of these days depends the destiny of Britain. It is the crisis, not only of the war, but of twentieth century freedom and it can be the privilege and duty of this country, above others, to resolve it. Since the bugles sang truce twenty-five years ago, democracy has walked in the shadows. In country after country, it has gone down to defeat before the claims of other systems. Where it has remained, it has stayed on uncertain, ineffective, disillusioned, embittered and sceptical. It has seen the right ends of social policy—security, work and strength—meretriciously pursued in other lands by wrong and ruthless methods. It has seen two aims enshrined above all else in national aspirations—employment for every individual and armed strength in battle—and it has witnessed the apparent conquest of these spheres by alien and unfree means. It has learnt to recognise the truth of Monsieur Reynaud's warning that, at every great moment of decision, free and representative

governments lack "lucidity and daring." It became an open question whether "government of the people by the people for the people" would perish from the earth.

Democracy was saved by Britain in 1940. The charter of free and representative government was rescued from annihilation by the RAF and the British people. The first step towards salvation was taken. Now the moment of proof has arrived. Can free men and free institutions meet and beat the despots on their own ground of efficiency—war and peace? It is a moment of hope. The greatest of all experiments in soulless dictatorship is staggering towards defeat. The Russian armies and the Russian people have flung back the Nazi invaders and destroyed for ever the momentum of totalitarian aggression. In the rear of the retreating Germans, slaughtered and shattered because of the failures of their boasted leaders, the people of an entire continent are asking what alternative to "fascist efficiency" the future affords.

What answer has freedom to give? The Nazis have little doubt about the answer. In their greatest extremity, they still trade upon the inability of democracy to solve the problems that must be solved if the peoples of the world are to choose responsibility in place of dictatorship, liberty in place of regimentation, peaceful accord instead of militarism. They know that they rose to power because of the failure of their democratic opponents to furnish answers to the problems of social security, economic prosperity and national safety. They still hope that the armed might of the United Nations will be neutralised by the democratic weaknesses of Britain and the United States. They know that the dread of Communism is still alive in free countries, as it was in the Germany they captured, because it threatens property as well as individuality. They rely upon the free peoples to undo themselves.

This is the greatest challenge of all, a challenge which has been implicit since Mussolini marched on Rome and Hitler sidled into power in Hindenburg's shadow. The answer can no longer be delayed. If the challenge is refused, if the free peoples of Britain and the United States cannot contribute their full share to the dénouement which the ruthless Russian advance has made possible, if they cannot in their own countries make good the pledges of security and prosperity which the fascists have made their stock in trade, a new era of political chaos may be in sight, with democracy condemned by its own shortcomings, and with despotism enshrined, despite the crass failures of Nazi Germany, as the way out of human affliction. The stake the democracies have claimed, through the Atlantic Charter and other statements, in the future settlement of the world, still has no point of departure, no fulcrum.

The Parliament and the people of Britain have to make their choice with much already in the favour of freedom. British democracy withstood the worst blows of a vastly superior enemy two years ago. Without that resistance Nazi Germany would have won before either Soviet Russia or the United States could move. This country and its institutions have little cause to be ashamed of the way in which they have stood the test of total war. But this is only a foundation. It is the task of Mr Churchill's Government and the people's representatives in Parliament to set in place the superstructure; to show that free men are as apt in attack as they have proved themselves in defence, and to demonstrate that the poverty and insecurity of economic life, which the totalitarians claim so glibly to have solved by their war making, can be rooted out by the democratic methods which regard the goods and services available to the free choice of ordinary men and women as the be-all and end-all of economic effort and organisation. The sweeping Beveridge plan for social security has laid bare some of the basic issues upon which the future of freedom depends. On every occasion when the democracies have been called upon to make crucial decisions, they have delayed, they have temporised, they have bargained. Their policies have been too late and too little. Is this to be so again? If it is, then the floodgates are open. It was because of the timorous and lukewarm approach of their democratic leaders that the Nazis, poor in ability and rough and ruthless in their methods, were

admitted to power. If the same timorousness and lukewarmness are shown in Britain to-day towards the military opportunities which so plainly present themselves or towards the social opportunities of the Beveridge plan, then the way will be prepared for totalitarian creeds from both Left and Right, with the fascists the final victors. The hour has come, or is near, when Britain must make the choice which in country after country of Europe was made to the destruction of freedom.

There is no need for fatalism. Britain has done already in war what no other democracy has succeeded in doing. At Casablanca, it may be, the boldness that has been displayed in defence was worked out in dramatic detail for attack, with the same readiness to risk everything in men and material that has brought victory to the Russians. At home, the challenge is no less apparent; it was the *leitmotiv* of the Beveridge debate. The statement of policy, made on Tuesday by Sir John Anderson, spoke with two voices. To some it seemed an acceptance of the plan, to others a denial. It was an excellent example, voiced by an honest parliamentarian and a sound administrator, of the muffled and fumbling manner which democratic politics have too often bred. He accepted all the basic assumptions upon which Sir William Beveridge founded his plan: the maintenance of employment, children's allowances and a comprehensive medical service. He accepted in principle the proposal for a universal scheme of social insurance against unemployment, sickness and disability. He agreed, on behalf of the Government, to the supersession of the approved societies as the carriers of social insurance, a method of administration which more than anything else has cabined and confined British social services in the past generation. But he hedged the Government's acceptance of the plan with so many reservations and conditions that very little that is specific was left by way of pledge. The approved societies may go, except as agents; there will be children's allowances, at the rate of 5s. a week instead of 8s. For the rest, time will tell. There is to be no Ministry of Social Security, only a nebulous nucleus. The basic provision for old age, worked out in detail in the Beveridge plan, is to be superseded by a strict insurance scheme, with contributions paying for benefits. The proposal to free workmen's compensation from the defects both in cash and in kind which ruin the present system is shelved. Everything is made conditional upon future financial prospects and is "subject to further review."

This is neither lucidity nor daring; it is not a spring-board, but a feather bed. For all its fair words, the Government lacks the courage either to accept or refuse the Beveridge plan. Few less lucid or less daring speeches have been made than Sir John Anderson's—except, of course, Sir Kingsley Wood's. It is true that these outlines of a programme, if filled in aright, can add up to a programme for social security; it is equally true that, qualified and watered down, they can add up to a refusal. This week's revolt was a movement of fear, fear that the plan may go by default in its detailed working out.

The Government must say Yes or No. They cannot sit on the fence. If it is nonsense, as it is, for Mr Greenwood to say that pounds, shillings and pence are meaningless symbols, it is madness for the Government to refuse to state how much it is prepared to spend on social security as a first charge upon both the national budget and the national income. Is the prevention of want to be a first charge in any event? That is the question that is being evaded. The total amount that can be spent is strictly limited; it must be related to other commitments, both old and new. There is a serious financial problem involved. But the arrangement of priorities must precede the making of the final budget. To make the future a gigantic pigeon-hole for social and economic plans is to risk the same fate that has befallen democracy elsewhere. Before the spring, British parliamentary government has the chance to prove, in battle abroad and in policy at home, that the free people of this country are as capable of facing with faith both the terror without and the terror within—to the discomfiture of the totalitarian rivals that crowd upon them.

Finlandia

THE Finnish presidential election passed off under a veil of unparalleled obscurity. Up to the last, it remained uncertain whether Marshal Mannerheim would stand, and one vote was in fact cast for him by a member of the Agrarian Party, in spite of his refusal to be adopted as a candidate. M. Risto Ryti, the first president of Finland to be elected to a second term, was returned with an overwhelming majority by the three hundred members of the electoral college. There were twenty-four abstentions and the three remaining candidates, who included the first president of independent Finland, M. Stahlberg, polled only six votes between them. Once Marshal Mannerheim had declined to stand and M. Ryti had received the formal support of the Prime Minister, M. Tanner, and the Social Democratic Party, the result was a foregone conclusion. Yet the size of M. Ryti's majority was less inevitable and must be regarded as an endorsement of official policy by an overwhelming majority of electors. In no Axis country, and in no other satellite state, could an election held to-day in similar circumstances be regarded as anything but a farce. In Finland, the result must be considered to be to some extent representative, in spite of the curious failure to advertise the names of the candidates until extremely late in the day, and the less surprising failure to canvass any alternative policy. It is unlikely that the actively pro-German caucus, which certainly exists, would interfere overtly with the electoral machine. Indeed, Marshal Mannerheim, the only alternative candidate who could seriously have challenged the re-election of M. Ryti, would have represented no more than a change of personality. His policy has been consistently identified with that of the Ryti-Tanner Government—prosecution of the war and collaboration, within limits, with Germany.

Probably the election results have understated the strength of the opposition. M. Ryti's policy enjoys general though faint-hearted support. His mandate, if the election was really conducted in a democratic manner, has been strongly renewed. Yet there has been, since the end of last November, a significant change of tone in the Finnish press, and of emphasis in Finnish politics. The burning question—the possibility of concluding a separate peace with Russia—has been discussed openly, even in the press. At the same time, the two corollaries, the possibility of attaining deeper understanding with the United States and closer co-operation with Sweden, have been widely discussed, too. At the end of November, 1942, the general tone of the Finnish press ceased, for the first time since the start of the Russian war, to be anti-Swedish and began to stress the advantages of closer

Scandinavian co-operation. The possibility of pushing co-operation to the extent of actual federation, and also though implicitly, of extricating Finland from participation in the war, was discussed in two books published last autumn. The first, "We Will Not Be Choked," by a writer claiming to be a soldier at the front, raises the basic problem of Finnish foreign policy—that Finland has two security problems, represented on the one hand by Russia, and on the other hand by Germany. The writer is unable to decide whether the Russian aim is to acquire a strategic frontier or whether it is to annihilate Finland. He is also unable to decide whether the Finnish Government genuinely believed that the presence of Germans in Finland would guarantee security. He feels German pressure to be as grave a danger as Russian enmity. The second book, "A United Scandinavia—the Necessity of To-morrow," is written by a member of the Finnish Diet, who also held the post of leader writer on the paper, *Arbetsblad*, from which he has been dismissed. The author explicitly advocates the creation of a Nordic Federal Government with a joint defence force. His book, which has appeared to many Finnish patriots to sketch a means of release from the dilemma of pro-Russian or pro-German dependence, has also tended to crystallise the discussion of war aims and of the conditions on which peace could be attained.

The renewal of pro-Scandinavian sympathy and the feverish debates on foreign policy to which these books have given rise emphasise a dissatisfaction with official policy which has undoubtedly been growing ever since it became plain, in the winter of 1941-42, that Germany could not win a blitzkrieg in Russia. Now that the siege of Leningrad has been raised and it is obvious that Germany will not even win a war of attrition, competent opinion in Finland has come to fear that alliance with Germany was a grave error. The maintenance of support for M. Ryti and M. Tanner seems to be due solely to an inability to devise any practical method of escape. This mood is reflected in the press by renewed affirmation that Finland is a special case, that the country is primarily fighting its own war and that the alliance with Germany is in the nature of a coincidence. *Suomen Sosialidemokraatti*, a paper which has contrived to maintain a more or less oppositional standpoint, urged last December that Finland still regards the present war solely as a continuation of the Winter War. There is an attempt to prove that Finnish policy is, as certain Swedish observers have suggested, an armoured version of Swedish neutrality. Coupled with this dominant theme is a powerful and growing defeatism. A Finnish journalist

wrote in *Ajan Suunta*, on the twenty-fifth anniversary of Finnish independence.

Now, while we celebrate Independence Day, I feel certain that those who have fallen and do not see the proof of the immaturity of Finnish independence are the happiest. They are spared seeing how vain was their sacrifice.

The presidential election was held at a real crisis in the history of the Finnish state, at a time when a nation which has just celebrated a quarter of a century of independence faces the distinct possibility of a total loss of sovereignty. Walter Lippman's recent article in the *New York Herald Tribune*, declaring that the Allies cannot develop such military strength that they can afford to support an anti-Russian diplomacy in the east, has created widespread depression among a people which increasingly realises that it has backed the losing horse.

The situation has been more realistically, and more accurately, summed up by a Swedish writer, Alva Myrdal, who has pointed out that, as things are to-day, Finland's fate will in fact be decided by Russia, but that the sympathetic intervention of Great Britain and the United States might prove a decisive factor. In the circumstances, what should Finland do? If it is assumed, as seems probable, that there is a small but influential anti-war group in Finland, and that this group remains a minority only because there is a general disbelief in its ability to come to terms with the Soviets, is there a basis for negotiation? The Russian attitude is not clear. There is a *prima facie* case for supposing that the Soviet Union is more interested in the acquisition of a secure frontier than in the absorption of the Finnish nation. A recent article by S. Zaslavsky, a Soviet journalist who is close to the Foreign Office, definitely suggests that Russia is concerned to recover, in the main, its 1941 frontiers. But if Stalin is in fact not anxious to incorporate Finland in the Soviet Union, it can hardly be supposed that he would be content with frontiers less advantageous than the frontiers of 1941, including the Hangö base. For the Finns, by a catastrophic error of judgment, have unhappily proved the Russian thesis that their territory does constitute a springboard for German attack. It would have been better in the long run to have suffered the martyrdom of Greece and Norway and to have gone down in support of those principles of democracy which most Finnish patriots still proclaim, and to have won thereby the confidence of Russia and of the world.

To-day, the optimists in Finland base their hopes on the Atlantic Charter. Invoking the recognition of national sovereignty contained in the Allied declaration, against

which they are in fact fighting, they cherish the belief that the western democracies, and in particular the United States, with which Finland is not at war, will plead the cause of Finnish independence at the conference table. They have perhaps not fully realised that, whatever extenuating circumstances can be pleaded, and there are many, the Red Army has reason to know that Finland has been Germany's most effective European ally. On the northern sector of the front, the conspicuous lack of success which has attended the arms of the German commander, Colonel General Dietl, has been masked only by the exploits of the Finns. However much the world may acknowledge that Finland is fighting, not for Germany, not even for Eastern Karelia and Greater Finland, but for the 1939 frontiers, the time has come when the Finns cannot advocate their "special case" without breaking with Germany. Indeed, the break has been delayed over long. The case for Finland would be clearer and more impressive if peace had been made when the pre-Winter War frontiers were recovered in the autumn of 1941. The decision to take the line of least resistance since then, to acquiesce in the *fait accompli* of partial German occupation and dependence on German food supplies, has already almost completely undermined the support which Allied sympathisers could give to this least disagreeable enemy. Each day's delay in making the break aggravates the weakness of the Finns' position, and makes it more likely that they must bear the full consequences of their own decision to make war.

In reply, the Finnish Government may plead that dependence on Germany for foodstuffs, for grain and sugar, is almost complete. Economic subjection has gone very far in the past two years. This aspect of the problem is discussed in detail in an article on page 238. It would be difficult for Britain and America, so long as they do not control the north coast of Norway, to supply the deficiency. It would be difficult for Russia and virtually impossible for Sweden to do so. But there is no agreement among competent observers that the supply of Finland from other than enemy sources is completely impossible. As the price of Finland's withdrawal from the war, it might not prove exorbitant. In any case, from the Finnish standpoint, defeatism on this issue must imply disaster in the long run. A reversal of policy may be difficult, but its maintenance will be catastrophic. Words alone will not drive home the claim to be different from all other satellites, to be in the Axis, but not of it; it needs to be reinforced by decisive action. It has been placed in grave doubt by the result of the presidential election.

The Nursing Profession

THE shortage of nurses is one of the most serious limiting factors on the expansion of the health services, to which Sir John Anderson committed the Government on Tuesday. In fact, in many places the shortage prevents them from being adequately maintained at their present level. Nor is the shortage the result of the war, although the present state of the labour market may have intensified it. The Athlone Committee, appointed in November, 1937, to inquire into the shortage, found that the intake of probationers was maintained; it was the demand for nurses that had grown. There was then an apparent shortage on establishment in the London County Council's general hospitals of 355 nurses, but that the real position was more serious since the Council, owing to the difficulty of obtaining staff nurses, released fourth year probationers for staff nurse duties. There was in fact a shortage of 611 staff nurses and an excess of 296 first year probationers. On March 31, 1938, the Committee was informed, 151 out of 621 authorised posts for female nurses in Surrey County Council hospitals were unfilled despite repeated advertisements, and the *Nursing Times* carried 17,119

advertisements for nurses in 1937, compared with 6,429 in 1934. Since the war, the Medical Research Council's committee on tuberculosis has reported that on June 30, 1942, an immediate enrolment of 1,200 nurses was needed for sanatoria and for TB beds in emergency hospitals in England and Wales; and, on February 4th this year, replying to a parliamentary question about the shortage of hospital accommodation for maternity cases, the Minister of Health stated that more maternity beds will be provided in the near future "if staff can be found."

In sum, the country's hospitals, it was stated last week, need 10,000 nurses, and the Minister of Labour has set up a National Advisory Council to advise him on how they can be found. Viewed against the vast number of women who have been called up or directed into war work, this number does not seem large. But women cannot be compelled to become nurses, any more than they can be compelled to become teachers or members of any other profession. The Minister of Labour must rely on voluntary recruitment, on appeals and advertisements, to obtain the ten thousand. But before he can launch a recruiting campaign, he must be sure that the conditions

of work and the pay of nurses are on a par with those of other professions. Since the Athlone Committee reported, in December, 1938, salaries have considerably improved, and national scales have now been recommended in the first report of the Nurses' Salaries Committee, which has been sitting since November, 1941, under the chairmanship of Lord Rushcliffe.

The following table shows the salaries recommended by the Rushcliffe Committee for female hospital nurses—its proposals for other nurses will be made shortly:

Category of Nurse	Starting Annual Salary	Annual Increase	Maximum Salary	Emoluments	Total Maximum Salary and Emoluments
Probationer	£ 40	5 10*	60-70*	75	135-145*
Staff Nurse	100	5	140	90	230
Ward Sister	130	10	180-200†	100	280-300†
Qualified Sister Tutor	230	10	280	120	400
Qualified Senior Sister Tutor	260	15	350	120	470
Assistant Matrons	275-400	15	400	150	550
Matrons	450-700	30	700	200	900

* £5 increase at end of first year and second year, and £10 at end of third year, but before State Registration; another £10 after State Registration if under a four-years' contract. † An additional service increment of £20 to be given after 10 years' service as Ward Sister. ‡ In hospitals approved for the training of nurses, with 500 beds and over.

The table is condensed from the Rushcliffe Committee's recommendations for all hospital nurses, and refers to those in general hospitals, children's hospitals and fever hospitals. In TB institutions, the salaries of the lower grades are slightly higher. Matrons and assistant matrons in hospitals with less than 500 beds have lower salaries, as do those in non-training hospitals. Scales have also been fixed for night staff, home sisters, housekeeping sisters, departmental sisters, and "assistant nurses," i.e., those not on the State Register.

The Rushcliffe Committee considered it necessary to put a valuation on a nurse's emoluments, that is, her board and lodging, laundry, uniform and so on, in order to make superannuation payments and benefits more standardised. At present, some local authorities estimate the value of emoluments as the amount a nurse would have to pay if she provided them herself, others as the actual cost to the hospital, while for non-resident staff the actual cash payment made to the nurse is taken into account for superannuation purposes. In voluntary hospitals, the value of emoluments is fixed by the Federated Superannuation Scheme. The Rushcliffe Committee recommends that a nurse who is required to live out should have the whole cost of her accommodation provided by the hospital authority, though for superannuation purposes the fixed emoluments of resident nurses would be taken; but that a nurse who lives out by her own wish should receive a cash allowance, which would be equal to the valuation placed on the emoluments of a resident nurse, subject to a deduction for services provided by the hospital, such as meals when on duty and laundry. Thus the contributions paid by resident and non-resident nurses in the same grade and the pension benefits received would be the same.

As can be seen from the table, the Rushcliffe Committee's scales, which have been commended by the Minister of Health to local authorities and voluntary hospitals, will put the nursing profession on a financial par with the teaching profession. The matron in charge of a big hospital will receive a maximum salary little, if anything, below the salary of a headmistress of a secondary school. The salaries and emoluments of sister tutors will compare favourably with those of assistant mistresses who do not normally receive a living allowance. Those of staff nurses and probationers will be on a par with the salaries of junior certificated teachers. In fact, a staff nurse in her first year, after four years' salaried training, will be receiving as much as a newly qualified doctor receives for a "house" job after a much longer training which he has had to finance himself.

But, though the new scale of salaries may be regarded as fully adequate and, in fact, generous, they cannot be considered apart from the conditions of service which, though frequently exaggerated, are in many hospitals such as, in the words of the Athlone Committee, "would not be tolerated in most occupations open to educated women." The most frequent complaint is the long hours worked, and it is worth noting that, though a reduction to 96 hours a fortnight, was urged by the Athlone Com-

mittee, the same recommendation has had to be made by the Rushcliffe Committee four years later. The trouble is that the long hours, besides being an effect of the shortage of nurses, are also a cause of it. If an additional 10,000 nurses are recruited, the 96-hour fortnight, subject, of course, to emergency demands, could probably be brought into national operation. But the fact that it cannot be guaranteed is likely to act as a deterrent to new recruits.

Long hours are not the only condition of service complained of. In some hospitals, the discipline imposed is often irksome and unnecessary. The Athlone Committee was told of late leave being cancelled because a probationer was three minutes late for breakfast; of a hospital which includes among its rules the following: "Nurses and probationers must give obedience and submission to their sisters, not answering again under apparent provocation"; and of one large hospital, "in one of our largest cities," where "probationers and nurses are still liable to have their chests of drawers and cupboards inspected at any moment without warning." Possibly the position has improved considerably since it reported—the LCC had already introduced new rules which were regarded by the Athlone Committee as "an example of enlightened reform"—but unless it is generally known that other hospital authorities have followed suit, the bad name that hospital discipline has incurred is likely to stick. It is significant that, even now, when other forms of national service impose considerable discipline, few women have opted for nursing when they were called up.

There are other complaints: poor accommodation, bad food, inadequate notice of time off and an excessive amount of non-nursing duties. This last grievance was very largely being remedied before the war, but now the shortage of domestic staff in hospitals is probably as serious as the shortage of nurses. The result is that the latter, particularly probationers, have to do a considerable amount of domestic work, which intensifies the shortage of nurses and is another deterrent to recruitment. Probably, the Ministry of Labour would find its task of finding nurses far lighter if it relieved the shortage of domestic staff.

But, above all these deterrents, there is the severe practical one known as "the gap." Most hospitals will not take probationers until they are 18 years old. Except in fever hospitals or children's hospitals, it is undesirable that the age should be reduced; but few secondary school girls are willing to wait until then, or can afford to, and for elementary school girls the gap is longer. For a variety of reasons, including the closing of the gap, the General Nursing Council divided the preliminary state examination into two, shortly before the war. The first part can now be taken at the age of 17½, after a full year's course in a secondary school or after a two years' course in an evening institute. In normal times, if suitable teachers of the required subjects can be found, this should encourage a larger recruitment from secondary schools. Ideally, they ought to provide all would-be nurses, but, at the time the Athlone Committee reported, they were only providing, in the case of most hospitals, 50 per cent or less.

Thus, in spite of the new salary scales, the Ministry of Labour's task will not be easy. It should be realised that 10,000 additional nurses means 12,500 probationers, since at least 20 per cent of the latter do not survive the first year—though this wastage may be reduced as more are recruited with a higher educational standard. But, whatever the actual number wanted, it is to be hoped that the recruiting campaign will be conducted realistically. As the Medical Research Council's committee on tuberculosis stated, emphasis is too often laid on the sacrifices demanded, instead of on the fact that nursing is an interesting and, in the future at least, a well paid and well regulated profession. The shadow of Florence Nightingale has lain too long upon it. Nor should the campaign stress too exclusively the importance of nursing as a national service—though it is undoubtedly true. Patriotism is not enough; if nursing is made an attractive profession, as now seems likely, the recruiting campaign should concentrate on pointing it out.

Food and Politics

ALL the politics of the country to-day are bread, carrots, potatoes, beans and radishes." This statement appears in the Syrian newspaper *Echos de Syrie*; and, although the list is rather lavish for the meagre diet of most Middle Easterners, the fact is indisputable. Food is the principal concern of all the people living between the Bosphorus and the Hindu Kush. The Middle East covers countries whose economic tradition is one of scarcity. In times of normal harvest, there is enough to go round, even at the very low level of consumption of the great mass of the people. The area is usually self-supporting. But if any major disturbance intervenes—a bad harvest, civil war, the threat of invasion, then the narrow margin of sufficiency disappears, the poorest starve and the middle class resort to the black market which merchants and land owners, great and small, immediately provide. The hoarder, the profiteer, the regrater and forestaller are dominant types in the economic history of the East. This war, which has disturbed far less precarious economies, has created conditions of shortage throughout the Middle East. In some areas, for example, parts of Persia, shortage has developed into something close on famine. These difficulties are due in the first place to a bad harvest in 1941. Lack of transport has aggravated the initial shortage. The uncertainties of war encouraged hoarding, even before there were any definite signs of stringency. Axis propaganda is busy in each country fomenting the sense of insecurity and blaming the Allies for it; and unhappily it is in the interests of speculators and hoarders to magnify the Axis rumours and, by creating sudden movements of violent demand, to force up prices still further. A contributory cause in countries occupied by Allied armies is the high rate of employment and the good wages earned by thousands of casual workers; their new prosperity increases the pressure on shrinking food supplies.

The result is a cost of living rocketing up, a rising currency circulation, sinking confidence in the currency itself, and an undercurrent of political suspicion and unrest. Between August, 1939, and July, 1942, the cost of living in Egypt rose 130 per cent—unofficial estimates put it much higher. Palestine's cost of living has gone up by nearly 100 per cent in the same period. In Turkey the rise may well be twice as great as the estimated 107 per cent, because of black market dealings. In Persia, where the economic crisis is most serious, some observers put the rise at about 500 per cent. The circulation figures tell the same story. Since June, 1939, the currency circulation has more than doubled in Iraq, quadrupled in Palestine and trebled in Syria, Turkey and Egypt. In Persia, it has trebled since early 1940.

In Britain, a very intricate system of controls keeps inflationary tendencies in check and ensures a fair distribution of supplies. The supplies and prices of basic foodstuffs are controlled by the Government. These foods are distributed through an elaborate rationing system. A great army of civil servants works with probity and industry to control Government purchasing and distribution. The mounting head of income is drained off through stringent taxation and a big and constant drive for voluntary savings. Finally, there are severe penalties for those who infringe the food regulations, and these penalties are enforced. To work at all, the control requires the honest co-operation of millions of people, not least of the consumers themselves. The only solution of the food crisis in the Middle East would be the introduction of similar measures; and the attempt to introduce them into economies which for generations have been geared to scarcity, black markets, hoarding and the devil-take-the-hindmost, is the whole story of politics in the Middle East for the last eighteen months.

The problem is at once most difficult and most urgent in Persia—most difficult because the shortages are severer there than anywhere else, most urgent because good relations between the Allies and the Persians now and after the war are at stake. Persia is normally self-sufficient; yet, during the course of 1942, there were conditions approaching famine in Laristan, Khuzistan, Fars, Jahrum and Bushire. The reasons for this were complex. The Allied occupation upset the peasants, who began to hoard. The tribes, taking advantage of the confusion, returned to brigandage and pillage. This discouraged potential sellers still further. Transport was very much taken up by the passage of supplies to Russia. Added to all this was the Government's inability to ration, to check and punish hoarding, to drain off by savings and taxation the extra money which thousands of Persians were earning with the armies of occupation.

This is the background of the food and currency controversy between the Persian and British Government. In May, 1942, a currency agreement was reached fixing the exchange rate at 129 rials to the £. The Persian Government were to provide the armies of occupation with the currency they needed, and the British Government would cover the issue in London, 40 per cent of it in gold and 60 per cent in sterling. But each time the British have requested a fresh issue of currency, the Persian Government and the Majlis have resisted, on the grounds that it would only increase inflation and that no more money could be issued until more food reached the country—to which the British could only reply that the food was there but hoarded. This wrangle has been settled for the time being by the agreement of December 4th, in which the Persian Government agreed to introduce rationing, and to enforce fair distribution; transport was to be placed under a joint Anglo-American-Persian Committee; and, given the fulfilment of these two conditions, the Allies agreed to ship in more grain.

Egypt and Turkey are having similar difficulties with their grain producers and merchants. The Nahas Ministry, guided and advised by the Middle Eastern Supply Centre, has at least taken active steps to meet the shortages. The area under cotton has been cut down drastically and grain grown instead. Supplies of flour are satisfactory, or would be, were it not for hoarding. Bread, oil and textiles are the three weak spots. In September, severe penalties were introduced for the adulteration of bread. In the same month, all supplies of cotton seed and cotton seed oil disappeared from the market when the dealers tried to compel the Government to raise the fixed price—the fixed price of cotton had just been raised to cover costs of production. Sugar and kerosene were rationed but the system worked badly—the staff of the Egyptian Ministry of Supply is neither large nor trustworthy enough for the task of supervision; but now that kerosene rationing has been abandoned, the situation is even worse. Cheap textiles are desperately short, and the Government has introduced the experiment, both for oil and clothing, of buying up a percentage of the supply and selling it at low prices to the poor. The main difficulty is probably lack of co-operation from an ignorant and undisciplined people. When this summer King Farouk gave an example to the landlords of selling his wheat to the Government at the fixed price, none of the large landowners followed suit—the Regent of Iraq incidentally gave the same example with the same result. On the side of the buyers, the Minister of Commerce summed up the difficulty not only for Egypt but for the entire Middle East: "The . . . public is responsible for the increase in prices by its eagerness to purchase from those who disregard the law."

In Turkey, Governmental policy has changed several

times in recent months. When the Sarajoglu Cabinet came in in July, the Government was committed to a policy of buying up and distributing the whole wheat harvest. This scheme was first modified, then abandoned completely. Prices were left to find their own level in the hopes that this would tempt the hoarders to release their stores. Municipalities were left to look after their local hoarders. The result was not satisfactory. Hoarding continued, not only in foodstuffs but in vital household needs such as olive oil. Even the price of textiles and fuel, which are controlled, rose nearly 100 per cent. In November, new measures were announced. To the poorest tenth of the population, the Government would distribute food at special low prices. All products of state factories—which in Turkey cover a wide range of goods—would be sold only at controlled prices. At the same time, a drastic capital levy was introduced to drain off the hoarders' accumulations. The effects of this tax are only now beginning to be felt. Its intake should be £T500 million, four-fifths from Istanbul. The first arrests of defaulters have taken place, with the penalty of confiscation and penal servitude.

In Iraq and Syria, the supply situation appears to have been slightly better, for both have produced a sizeable food surplus. Moreover, in Syria, family ration cards have been introduced, while in Iraq, the Government has taken over the whole wheat harvest, apart from the peasants' immediate needs for food and next year's sowing. Even so there are signs of the same problem. The British Legation and the Iraqi Government are compelled at regular three-monthly intervals to scotch Axis rumours, backed by local black marketeers, that the presence of British troops is causing, or is likely to cause, a shortage. In Syria, the political crisis of July which saw the resignation of the Ahmad Dauq Ministry in Lebanon and the taking over of the Cereals Office by the Prime Minister, concerned food supplies only. The former President of the Cereals Office, Fariz al Khuri, resigned, declaring that the obstruction of the large landowners and greed of the merchants made his work impossible. Ahmad Dauq then visited Damascus to discuss Lebanon's food supplies—the Lebanese depend upon the Syrian surplus—and promptly

resigned. It was at this point that the Prime Minister, taking over the Cereals Office, introduced coupon rationing, set on foot a new search for hoarded supplies, made the cultivators in a village collectively responsible for deliveries, and the municipalities responsible for distribution. Satisfactory arrangements were also reached with the Lebanon. Since that time, the situation has improved.

The troubles of the Middle Eastern Governments in dealing with shortages, hoarding, profiteering and the like are only in appearance "internal" to each country. In reality the Great Powers are involved; and each state is involved with its neighbour. The neighbouring states depend upon each other to meet the crisis, for the deficiency areas of the Middle East can be most quickly assisted by the neighbouring surplus areas, not by expensive shipments from overseas. Turkey needs Egyptian rice; Palestine needs Egyptian eggs; Lebanon needs Syrian grain; Iraq and Syria can help to supply Persia. The great obstacle to the development of this system of mutual aid is the political divisions of the area. Natural irrigation areas run straight across political frontiers. Transport is undeveloped, and is anything but regionally conceived. Moreover, political suspicion and economic nationalism disturb the possibilities of exchange. "Not an egg must leave Egypt until the price of wheat has been lowered at home" was a typical and not unnatural press comment on the Egyptian transaction with Palestine.

The Allies are implicated because they are there. They are the hourly butts of Axis propaganda. In some states they have mandatory responsibility. They are bound to the area by alliances—Britain is especially involved in Middle Eastern politics. To meet their responsibilities, they have already evolved a very remarkable and successful piece of international economic machinery, the Middle Eastern Supply Centre, which has now for nearly two years been attempting to assist the Middle Eastern states with all their bewildering problems of supply. But scarcity and shortage and dislocation existed before the war. They will exist after it, to darken men's minds and poison international relations, unless some of the lessons of this war are learnt and some of its experiments embodied in more permanent machinery.

NOTES OF THE WEEK

The Russian Blitzkrieg

The past week has been the most crucial one in the history of this war—since the French collapse in June, 1940. The whole southern front of the Germans is crumbling. The spectre of a Napoleonic defeat has appeared before Hitler with an amazing suddenness. A week or so ago, it still looked as if the Russians were scoring brilliant successes in a campaign for limited objectives; they were recapturing the Caucasus and driving into the Donetz basin. The Germans were apparently still resolved to defend the ground they held as well as they could. Then the sudden capture of Kursk wholly changed the position. Their old line in the eastern Ukraine was broken at one of its most important points. The break-through at Kursk may well appear in a historical perspective as the Sedan of the east. The events which followed can, in a sense, be compared to the collapse of the Maginot line. Within a few days the Russians regained Shakhty, Voroshilovgrad, and nearly the whole of the Donetz basin. From Bielgorod and Kursk they enveloped Kharkov by overwhelming, top-speed moves, in which their superiority in the field proved itself to an extent altogether unsuspected by the German High Command. It was in the days which followed the capture of Kursk that the Germans made the first hints at a deep withdrawal all along the southern front. Rostov was apparently to be given up; but the German divisions there were to fight a long and stubborn delaying battle to enable the main forces to disengage themselves from the traps and pockets inside the Donetz bend. But the city's defenders were taken by surprise by the Russian crossing of the unfrozen stretch of the Don to the south-west. The "gateway to the Caucasus" was probably stormed and taken by the Russians too early to allow for an orderly German retreat from the Donetz

basin. Then, two days after the fall of Rostov, Kharkov, too, fell. Whether the evacuation of Kharkov was also part of the German plan of retreat seems to be less certain. They may have hoped to keep the city even after the fall of Rostov, as they did last year. Whatever the truth, they surely intended to fight at least a long delaying action. Kharkov was defended by picked SS troops, and by at least two tank divisions. Yet here, too, General Golikov's soldiers overcame the defence by a feat of Blitzkrieg which matches all German precedents. With the loss of Kharkov, the Germans have virtually forfeited the whole of the eastern Ukraine, with its enormous agricultural and industrial wealth, and with its well-developed rail network.

The Next Stage

The next stage of the campaign depends on a variety of factors which it is still difficult to assess. During the whole Russian campaign, the shape of the railways (rather than the shape of the rivers) dominated the course of the fighting. After the loss of their east Ukrainian communications, the Germans have to rely for supplies on the western Ukrainian rail network of which Kiev is the centre. In a straight line, about 280 miles lie between Kharkov and Kiev. The distance between Stalingrad and Kharkov is 400 miles. If the speed of the Russian advance is maintained (and it has been on the increase recently), the fighting may well shift, not to the Dnieper, but beyond. The question is whether the Russian communications and supply services will allow the offensive to sweep forward at the same rate as hitherto. The Russians are very confident about

this, and the fact is that the offensive has so far gathered, and not lost, momentum as it has advanced. Another incalculable factor is the weather. The spring thaw may impede movement, though this year's mild winter ought to produce a correspondingly "mild" thaw. The fact that the Russians have won the battle for the railways in the eastern Ukraine makes them less dependent on the weather than are the Germans. This is one of the cumulative advantages of the offensive. Another one is that the fighting on the southern front is bound to react upon the position in the centre and in the north. A deep Russian advance into the western Ukraine would force the Germans to shorten the front by retreats on the other sectors. Orel, Rzhev, Vyazma and some other hedgehogs would become untenable. The outlook from the German point of view may become almost catastrophic. Its foreboding has been clear in General Dittmar's recent comments. His only hope now is that the Germans during their retreat will enjoy the advantages of space, as the Russians did before. The important difference is that the Russians were retreating in their own territory, whereas the Germans have to withdraw through space filled with enemies. "Space" is not a military or political blank submitting passively to the manoeuvres of enterprising commanders. This has already been illustrated by the speed with which the present Russian offensive has overcome towns numbering hundreds of thousands or even a million of inhabitants, though the Russians themselves during their retreat were able to hold out in these towns for much longer. Another advantage of the offensive is that, as the Russians advance, the guerrillas, who have so far not been very prominent, will come again into play. Yet the problem of space exists nevertheless; and who will benefit by it—the Russians or the Germans—depends on the size of the Russian reserves and on the degree of the German exhaustion. Russian superiority, it should not be forgotten, is relative; its margin is determined by the rate of losses inflicted on the Germans.

Wartime Politics

It is an old trick of the Nazis to accuse their opponents of having committed this or that devilry when they in fact propose to commit it themselves. It is a politicians' trick; the Nazis are first and foremost politicians. A version of the same trick has lately been seen in this country. Certain Tory circles have accused their political opponents of having broken a non-existent political truce. This they have done not because they really wish all lips to remain sealed on controversial questions, but because they think the time ripe to express their own views on these questions with the utmost vigour and acerbity. Thus they prepare the way for their own partisan pleas, by accusing the other side of making their own pleas illegitimately. These pleas should certainly be stated. It is all to the good that the fundamental issues which surround, say, the Beveridge Report, should be stated frankly and strongly by all parties. Only by this means can the forgotten man in modern politics, the citizen, be given the grounds on which to make his choice and decision. The electoral truce, due to war conditions, has meant that he is only seldom stimulated to agreement or opposition by speeches on the hustings. On the wireless there is a disdain of the issues that count, not because of the war, but because of the peculiar technical monopoly and state connection enjoyed by the BBC. Every opportunity therefore for showing the dividing lines of opinion about the future of policy should be taken, in the press and elsewhere. It is a good thing, for the Left even more than for the Right, that the Conservatives have made their démarche against the Catering Bill; the electorate now knows where they stand. It will be a bad thing if all the crucial differences which underlie the parties' estimation of the Beveridge Report are hidden by a conventional and formal agreement.

This is why it was a surprising act for Mr Greenwood, apparently without consulting the rank and file of the Parliamentary Labour Party, to associate himself with a Commons motion, not accepting the Beveridge Report as such, but simply welcoming it as indicating the lines on which future policy might proceed. Coupled with him in this motion was Sir Arnold Gridley. It is nonsense to suppose that Mr Greenwood and Sir Arnold Gridley could ever contemplate working in double harness; and, in the debate, although Sir Arnold spoke in favour of a Ministry

of Security, extended insurance and children's allowances, his insistence on their costliness meant that, in effect, he opposed the plan while Mr Greenwood supported it. At first sight, the motion which they both supported seemed simply a formal act, to permit of the widest possible discussion in this week's debate. Closer inquiry, however, showed that it was not agreed by the parties concerned; that the Parliamentary Labour Party was from the first restive about Mr Greenwood's action; and, to their great credit, that the Liberals refused to associate themselves with this non-committal motion, preferring to put down a motion of their own explicitly supporting the Beveridge Report—as, indeed, the Labour Party, in view of the pronouncement of the National Council of Labour, should themselves have done. Since then, the issues have been crystallised by the Labour demand for a much more specific statement of Government policy. It was never more important in the whole history of British democracy that the issues which divide group from group and party from party should be stated. It is an immense step forward, and an essential condition of progress that there should be so wide a degree of agreement about the aims to be pursued. But there is nothing to be gained, and much to be lost, by concealing the disagreements that exist about the means to be pursued. The citizen has been disfranchised and set aside for so long that the least he is entitled to is a clear knowledge of the different views which are held by his would-be political leaders about the shape of government to come.

Ordeal In India

Once again, Mr Gandhi is fasting, not this time "unto death," but for 21 days. His object appears to be twofold: to pin responsibility for his imprisonment and the recent disorders upon the Government of India; and to secure his unconditional release. It is hard to see how this perilous experiment can prove anything but Mr Gandhi's own admitted resolution and endurance. An attempt has been made by various Indian politicians, apparently under the inspiration of Mr Rajagopalachari, to use the occasion to bring together members of the warring groups to discuss a settlement. Actually, this experiment was doomed to fail from the start. The view of the Moslem League, inevitably, is, first, that if Mr Gandhi chooses to starve, it is his own business; and, secondly, that if his object is to secure an Indian settlement which rules out Moslem claims his venture is irresponsible in the extreme. Nor has the reaction of non-Congress Hindus been more favourable. To the Hindu Mahasabha, Mr Gandhi's fast is irrelevant to the Indian problem. In fact, of course, it is not irrelevant. It is a deliberate attempt by Mr Gandhi to blackmail the Government into accepting the Congress claims. Mr Gandhi knows very well that the mere fact of his fasting, and its dangers to him personally, must have considerable effects upon Indian sentiment and opinion. Three members of the Executive Council have resigned. The Viceroy has acted with caution and wisdom. He has offered to release Mr Gandhi during the duration of his fast, though, if he cannot be unconditionally released, the Mahatma prefers to remain in his present comfortable setting. The Viceroy has also permitted Mr Gandhi to see visitors. He has done everything in his power to prove the obvious—that is, that this fast is Mr Gandhi's concern alone, and that none of its possible consequences can lie at the door of the Government of India. While it is obvious that the playing of Mr Gandhi's last card cannot in the least advance the solution of the Indian problem, it is enormously important that the curtain of secrecy which has overlaid Indian events for far too long should now be raised. It is plain that the terrorist campaign, which followed the Congress resolution and Mr Gandhi's arrest, a campaign deliberately planned and not in any sense merely the consequence of the arrest, has failed. That is why Mr Gandhi has played his last card. Nevertheless, the problem remains, and it will be impossible for any person in this country to arrive at a final judgment about the rights and wrongs, and possible next lines of action, until, first, what has been happening in India is made generally known; and, secondly, the proof which the Government of India claims to have about the precise inspiration of the recent terrorism is published in its entirety.

The Tunisian Puzzle

The week has brought some unpleasant developments in Tunisia. The Germans have attacked two American positions, Sbeitla, the central Tunisian railway junction,

and Gafsa, an important road junction in the south. In the north, the first attack was repulsed. The Germans were pushed back to the Faid pass; and both sides are said to have suffered heavy losses in tanks, on the American side heavy enough to delay an immediate Allied counter-offensive. On Wednesday the onslaught was resumed; and Sbeitla has again been threatened. In the south, Gafsa has been evacuated by the Americans, and the Axis forces are still advancing. The German attacks are probably intended as a diversion to forestall the overdue Allied offensive. Incidentally, they have done away with the weather argument, which was used to explain the lull in Tunisia. Even if the Germans are taking advantage of the fact that the ground has been drying out, the Allied spokesmen who forecast that the rainy season would last until the end of March ought perhaps to take a few supplementary lessons in meteorology. The other puzzling point bears upon the American losses. Von Arnim is said to have lost "at least 20 of his tanks." If the Allied losses are in any reasonable proportion to that figure, it is somewhat difficult to understand why the knocking out of some twenty or even thirty Allied tanks should delay the campaign. It is now possible to get some picture of the enemy's general strategy. The fall of Gafsa has removed a threat to Rommel's positions behind the Mareth line. He has been assigned the task of pinning down Montgomery's forces in front of it—its defences have been considerably strengthened during the last three months. Von Arnim is apparently still mustering fresh forces for a diversion on a larger scale than this week's attack. The twin push towards Sbeitla and beyond Gafsa was, in all probability, a preliminary to this. Beyond the Mareth line the Eighth Army has occupied Ben Gardane, and is approaching the enemy's positions. General Montgomery may succeed in breaking the line by a concentrated attack on the El Agheila pattern, or he may perhaps try to turn the Mareth line. In any case, the course of the Tunisian campaign will be decisively influenced by what the Desert Army is able to achieve.

From Eight to Five

The Government has at last accepted the principle of universal children's allowances, but it is adopting a rate of 5s. a week instead of the 8s. proposed by Sir William Beveridge. According to Sir John Anderson, it was decided, before the publication of the report, that "by far the best and most effective measure . . . is the fullest development of the various child welfare services, which bring the benefits directly to the children." It is quite true that in many cases the provision of such services in kind is of greater value to a child than the money paid to his parents, which might easily be lost in general housekeeping expenditure. But there are serious drawbacks. In the first place, the principle abrogates parental responsibility instead of encouraging a greater sense of responsibility towards children. Secondly, it is almost impossible to be certain that the provision of such services is uniformly good throughout the country. Thirdly, it is almost as difficult to ensure that parents take advantage of such services as it is to ensure that the cash allowance is spent directly on their children. Sir John Anderson gave figures showing the number of children for whom school dinners were being provided, which he hopes will reach 2,000,000 before long. But this does not mean that all these children actually have dinner at school; it has, for instance, been reported that many LCC school-children do not take advantage of the meals provided. Sir John Anderson admitted the problem of school holidays. There is the case of the under fives as well. Possibly, the Government intends to continue after the war the provision of day nurseries and so on; he stated that the Government sees no difficulty in providing services equivalent to 2s. 6d. per head of the taxpayers, against the 1s. assumed by Sir William Beveridge as the cost of school meals. But such services will tend to destroy family life instead of encouraging it—which is the prime object of children's allowances. They are, or should be, relief measures when family life breaks down, as in wartime, or falls below the accepted standard. Thus they should continue, and should be expanded, but in addition to adequate cash allowances, not instead of them. After all, the Truck Acts are only a hundred years old. There is a further point. Sir William Beveridge's 8s. was an average rate, but he proposed that the actual payment should be graduated according to the age of the child. The Government has not made it clear whether it accepts the principle of graduation or not.

Insurance and Assurance

In the course of his statement on the Beveridge plan for social security on Tuesday, Sir John Anderson, Lord President of the Council, informed the House of Commons that the Government had decided to accept Sir William Beveridge's suggestion that the approved society system should be terminated, not because it had failed, but because there was no longer a place for it under changed conditions. This is a vastly important step forward; it attacks the administrative defect which has most of all restrained and restricted the practical benefits of British social insurance. One of the defects of the approved societies singled out for comment by Sir John is that the system is essentially one of unequal benefits for equal contributions, "however much the inequalities resulting from careful management or favourable sickness experience may be smoothed out by a measure of pooling of surpluses." The Government has not allowed itself to be deflected from the logical—and right—course by the protests of some of the groups of approved societies, one of whom, the National Federation of Employees' Approved Societies, has suggested in a memorandum that to abolish them altogether would, in their view, be a "serious blow to our democratic way of life, for the preservation of which millions of insured persons are to-day ready to make if need be the supreme sacrifice." Sir John did not say how the machinery of the societies is to be fitted into the general scheme of social insurance, but pointed out that the Government would gladly consider any scheme by which they could continue to act as agents in the administration of the national scheme in some such manner as Sir William Beveridge had tentatively suggested. The Lord President, further, announced that the Government had agreed to Sir William's proposal that death grants should be one of the benefits under the unified system of social insurance. The amount of the benefit, and the transitional arrangements needed to overcome the technical problems arising from the existing volume of voluntary insurance, are still under consideration. Finally, Sir John, not unexpectedly, announced that the Government does not propose to adopt Sir William's suggestion that the business of industrial assurance should be converted into a public service. In other words, the Government has not yet faced the dilemma arising from the divorce of death benefit and health insurance from the industrial life offices.

Australian Beveridge

The Australian Government has stolen a march on the British Government by introducing a social security plan for Australia. Last week, Mr. Chifley, the Commonwealth Treasurer, announced the creation of a national welfare fund of £A30 millions. From this will be paid an increase in the maternity grant, from a flat sum of £A5 to £A6 where there are one or two children and £A7 10s. where there are three or more, together with an allowance of 25s. a week for eight weeks, making £A15 for the first child and

£17 10s. for the third and subsequent children. Other benefits include a funeral benefit not exceeding £15 for old age pensioners, an increase of 20 per cent in the standard war pension and allowances of 15s. a week for dependent wives and 5s. for unwedded children and invalid pensioners. But Australia is beginning where Great Britain is ending, as national schemes for unemployment and sickness benefits have still to be introduced. The most interesting feature of the Australian plan is, in fact, the method that has been chosen for financing it. Unlike Sir William Beveridge's proposals, social security in Australia is, apparently, to be financed out of taxation instead of contributions. Thus, the national welfare fund is to be set up and fed by a transfer of £30 millions a year from national revenue, or of one-fourth of the receipts from personal income tax, whichever is the lower. This naturally involves a considerable increase in the scope of income tax, which will reach incomes down to £104 a year, against a present exemption limit of £156, although persons paying tax on the lowest incomes will be mainly those without dependants. Mr Chifley has thus done what contributed to Mr Fadden's fall from office some eighteen months ago.

North Africa Command

The appointment of General Eisenhower as Commander-in-Chief in North Africa, and the grouping under him of Britain's best fighting men in positions of "immediate tactical control," is a very happy dovetailing of the Allied commands. General Alexander is Deputy-Commander-in-Chief; Air Chief Marshal Tedder as Air Commander-in-Chief, Mediterranean, will be responsible to General Eisenhower for all air operations; and Admiral of the Fleet Sir Andrew Cunningham fills the same position with regard to operations on sea. The prestige, authority, enthusiasm, determination, and organising ability of General Eisenhower will be invaluable in fusing all the various elements, American, British and French, in a fighting unity—he alone can do it where the French are concerned—and at the same time, he has to advise and assist him men who know the difficulties and possibilities of Mediterranean fighting through years of hard experience. The general arrangement could not be better. Time and the fighting will prove its day-to-day working. Here the chief need is for faultless co-operation, technically between the three arms of the Services, and nationally, between the three peoples. It may be that some of the delays and disappointments in Tunisia have been due to some lack of integration on the Allied side. The most urgent problems are concerned with air cover and the degree of fusion between the different Allied air forces. The position is apparently that three separate Commands have been organised under Air Chief Marshal Tedder: the Malta Command, under Air Vice Marshal Park, the Western Desert Command, under Air Chief Marshal Sholto Douglas, and the North West Africa Command, under General Spaatz, who is also Air Marshal Tedder's Deputy for Air Operations. At the next stage of the hierarchy, Air Vice-Marshal Conyngham is in control of air support for the First and Eighth Armies—fighters and fighter bombers; and his opposite number is General Doolittle, who commands the United States 12th Army Air Force. This seems a satisfactory arrangement from the standpoint of fusion on a national basis. Strategic and tactical unity has still to be proved in the field.

Rats on the Run

In German Europe the signs of disintegration are too marked now to be dismissed as wish fulfilment. They are, after all, the obvious reaction to disaster of the quisling mind. Hitler's difficulty is that, having built up his rule upon the most cynical and opportunist elements in Europe, his only chance of maintaining their "loyalty" was to maintain his success. Now the day of reckoning is at hand, and all through the occupied continent the men of the underground are drawing up the balance-sheet in jubilation and rising confidence, the quislings in desperation and fear. The new attitude has a hundred forms, but all amount to resistance to the previously overwhelming control of Germany. The differences are only of degree. In some cases, for example, the Hungarian and Roumanian authorities, resistance is apparent in a stiffened attitude towards the Nazis' demands for more manpower to go and work or die at the front. In the case of Finland, and possibly Hungary, there are rumours, if nothing more, of attempted initiatives for a separate peace. Even the quislings most committed to

collaboration—a Doriot in France or a Pavelitch in Croatia—seem to be casting around for ways to break their ill-omened link with Nazism, and achieve some new ideological purity. The Nazis' resources for meeting this crisis of confidence are not, of course, exhausted. In every occupied country the tide of terrorism is rising, against "liberals," intellectuals, Jews. Behind many of the uneasy satellite governments stand desperate men who, having nothing but the certainty of violent death before them in the hour of Hitler's defeat, are prepared to play the card of terrorism to the last losing trick—the Kvaterniks in Croatia, Mihailov in Bulgaria, Horea Sima in Roumania. Yet a new terror can at the most only postpone the hour of collapse. Terrorism is almost as hungry for manpower as the front itself. Men must search the houses, seize the victims, guard the prisons and man the machine guns. Nor is this new terror directed against the cowed and the beaten. The counter-terror is at work from mass work by guerillas in Poland, Yugoslavia and Greece, to individual assassinations, always of the worst quislings, a General Lukoff in Bulgaria, a Seffardt and a Reydon in Holland. Manpower is doubly short, quisling manpower threatened by the unseen assassins, Axis manpower to intensify the terror to check the counter-terror. There is no escaping the vicious circle. Hitler's defeats are losing him active quisling supporters by the thousand just when his defeats makes him most dependent upon quisling support.

The Conditions of Exporting

Mr Morrison's provincial progress goes on. In a speech at Nottingham, last week, he rounded off the survey of future economic policy which has rendered him outstanding among Cabinet Ministers. His main theme was post-war exports. Exports would be more necessary than ever because of the decline in overseas income from investments and from shipping and financial services. It will be impossible to maintain, let alone to increase, the standard of living without more exports. Mr Morrison stated one true and crucial point. There is no fixed and set amount of world trade to be divided between the nations. The expansion of British exports need not mean the cutting of other countries' sales by a corresponding amount. It will only mean this if world trade is restrained and restricted by tariffs and quotas. If world trade is expanded in the interests of all by the freest possible restoration of commerce and investment, there will be enough trade and to spare. But whatever trade there is will not fall automatically into the lap of British exporters. It will have to be worked for and won. Britain will need to sell, not what it wishes to sell, but what its customers wish to buy. Here in a nutshell is the problem of adaptability and adjustment which is fundamental to the solution of all Britain's economic and social problems. Without this mobility of resources to seize the opportunities of the future, there will indeed be stagnation and decay; with it, there are bright vistas.

Retribution or Rescue?

Lord Vansittart's Motion in the Lords
That, in view of the systematic atrocities committed both by the Gestapo and the German Army, remedies should be proposed before systematic extermination has gone beyond repair,

led to a debate not on specific remedies, but on the old, old topic of Germans, Good or Bad. Lord Vansittart's concrete proposal did not amount to more than a plea that all British propaganda to Germany should be concentrated on retribution. "Tell them the remedy is in their own hands and that it is not a very difficult one"—merely to overthrow an entire totalitarian regime after ten savage years of absolute power!—"but tell them, too, that retribution is not class conscious and will not recoil before numbers, however great, if really guilty." These numbers include the Gestapo and the German Army, which Lord Vansittart later interpreted widely to include all Germans: "I think that the German Army is the German People." The suggestion is thus that the horrifying atrocities committed in Europe can be checked and the victims helped—that is Lord Vansittart's chief point—by concentrating all German broadcasts on one theme only—the common guilt and common punishment of the German people. The Bishop of Chichester replied to uphold the innocence of some sections in Germany, pointing out, very properly, that the Gestapo had tortured Germans before other peoples, and its existence and activity between 1933 and 1939 were

proof of the degree of resistance to Hitlerism. But Lord Vansittart's point was help for the victims, and the real answer to his proposed method was not made in the Lords' debate at all. It appears in a moving pamphlet *Let My People Go* by Mr Gollancz, who is as anxious as Lord Vansittart to save Hitler's victims. Lord Vansittart rather passed over the problem of rescue. "Of course, what I am proposing does not exclude . . . the extension of asylum, which I should very greatly welcome; but that is only a palliative . . . you cannot transport and lodge whole peoples." Mr Gollancz insists that to concentrate on retribution can divert energy and action from rescue.

Does not the insistence on retribution [he writes] fulfil a positive function: in the unconscious or semi-conscious, it is often an excuse for doing nothing . . . The proclamation of vengeance will bring back no single Jew from his nameless grave . . . will it prevent a single murder? If you tell them [the SS Squads] that they will be shot after the war, will they forthwith revolt against their masters and be shot at once? . . . It is imperative that the German people should learn what is happening. But everything depends on how. *Crude broadcasts, based on retribution, could only have the result of producing . . . a determination to support the Government until what is called "final victory," lest worse should befall.*

Firewatching and Production

A contretemps has arisen between the Trades Union Congress and Mr Herbert Morrison. The TUC alleges that "a good deal of manpower is wasted on tedious routine fireguard duties, especially during daylight periods," and that, after working long hours during the week, workers in essential war factories have to put in too much extra time in firewatching or attending Home Guard parades. The General Council have therefore asked the Home Secretary to relax the firewatching regulations, and the War Office to excuse from attendance at Home Guard parades men who have reached a reasonable degree of proficiency, and for whom refresher courses could be arranged. Mr Morrison has gone some of the way to meet the TUC's demands; he has replied that he cannot abolish fire prevention duties in daylight hours altogether, but he is prepared to issue an Order legalising the informal arrangements for relaxation during the daytime, which have been adopted in some areas. Whether this concession will satisfy the TUC remains to be seen. The War Office reply has not yet been given, but it seems unlikely that they will agree to any dispensation, since they do not consider that refresher courses fulfil the same object as regular parades. While it is undoubtedly necessary to maintain the fire prevention arrangements in a state of preparedness, and to keep the Home Guard in efficient working order, there is a strong case, in the interests of production, for minimising the additional burdens which war workers are called upon to undertake. It seems likely that both absenteeism, which is always highest at week-ends, and timekeeping would be improved if week-end firewatching and Home Guard duties were lessened. Many complaints on this score have been made, especially from mining districts. No doubt some people will be found to accuse the workers and the miners of "slacking," and trying to evade National Service. But in this matter, a sense of proportion is necessary, as also a sense of priorities. If excessive firewatching and Home Guard duties are definitely proved to be hindering production, by causing fatigue and bad timekeeping, then it would be wise, while the immediate dangers of fire bomb attack and invasion are, to say the least, remoter than they were, to relax the stringency of the arrangements and concentrate on output—so long as this can be done without impairing the efficiency of the national fire prevention scheme and of the Home Guard.

The Nuffield Foundation

Lord Nuffield has no heirs of his own to whom he can leave his vast fortune. Consequently, he has created them. He is handing over to trustees his shareholdings in the Nuffield Organisation, to the value of £10,000,000, as a capital fund, the income from which will be used to assist the following:—medical research and teaching; the organisation and development of medical and health services; scientific research and teaching in the interests of trade and industry; the pursuit of social studies; and the care and comfort of aged persons. Normally, the Trust's activities will be confined to the United Kingdom, but in certain cases it will be extended to the Empire, and Empire students will be able to benefit from scholarships and assist-

ance in regard to the first and third items specified. There will doubtless be many who will disapprove of this gift, from the extremists, who regard all fortunes derived from private enterprise as ill-gotten, to others, who consider that objects such as are to be assisted from the Trust should be the responsibility of the state and should not be left to private charity. Others again will think that though a large fortune is justifiable, on the owner's death it, or the larger part of it, should revert to the state in the form of estate duties and become part of the national revenue. Lord Nuffield, they will argue, has arrogated to himself the right to decide priorities in national expenditure, a right which should belong to the elected representatives of the people. There is, perhaps, some force in this argument. On the other hand, there can be no doubt that, even in a completely socialised community, there will still be some individuals who will not fit into the plan. Private benefactions cannot take the place of a national system of education, of a national health service and of a national scheme for old age pensions. But in helping an old person, who for one reason or another is still in want in spite of a generous state pension, in encouraging and financing research into a new drug whose importance has still to be established, and in providing another year's study to a scholar who has come to an end of his state grant, they will continue to fulfil a very genuine need. They cannot, and must not, replace state action, but they can prevent the machinery of state from grinding the faces of the enterprising and deserving. Lord Nuffield has earned the nation's deep thanks.

Shorter Notes

In a Shorter Note on page 206 of *The Economist*, last week, it was stated that the LCC had accepted the recommendation of its Education Committee that there should be no collaboration between the Council and the Fleming Committee. The LCC's decision would have been made much clearer if reference had been made to a Note discussing it more fully in the issues of January 30th, page 142. What the LCC is opposing is not collaboration with the Fleming Committee itself, but the sort of collaboration between the public schools and state-aided schools envisaged in the Committee's terms of reference.

The following table gives the number of civilian casualties in air-raids since September, 1939:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept., 1939-Aug., 1940.	1,494	1,980	3,474
Sept.-Dec., 1940.....	22,282	28,522	50,804
Total, 1941.....	20,863	21,839	42,702
1942:—			
January to June....	1,838	1,922	3,760
July.....	411	871	1,282
August.....	403	509	912
September.....	207	238	445
October.....	229	370	599
November.....	24	38	62
December.....	109	201	310
1943:—			
January.....	328	507	835
Totals to date....	48,188	56,997	105,185

Of those killed in January, 107 were men, 145 were women, and 76 were children under 16.

AMERICAN SURVEY

All American?

Congressional views about the post-war settlement are boiling up. The great battle between "globaloney" and "isolationism" tends to obscure the quieter and more reasonable voices. Pre-eminent this week is the idea that the United States should negotiate now for air bases all over the world in return for its contribution under Lend-Lease. The scheme was first put forward by Senator Tydings, who is bitterly anti-Roosevelt, and who prefaced it by charges that reverse Lend-Lease amounted only to a "trickle." But it has been given some official sanction by Colonel Knox's statement that the United States needs air bases in the Pacific after the war; and Representative Vinson, chairman of the House Naval Affairs Committee, has announced the formation of a committee to investigate the possibility of securing additional bases through Lend-Lease machinery. A number of Congressmen already have announced their support, and it has been commended by *Time*, the Luce news magazine, and the Scripps Howard press. This is one more aspect of the movement for an "All-American" peace settlement which would include American leadership in the air, the maintenance of large armed forces after the war, and the limitation of thorough-going co-operation to Canada, which to the isolationists bears the least taint of Europe of any foreign country. The sudden stir of interest in post-war problems has produced two suggestions on machinery by which the views of Congress could be made effective. One is that of Senator Gillette and Representative Baldwin: an "American Charter" should be drawn up specifying what contributions and concessions the United States was prepared to make at the Peace Conference, in order to avoid a repetition of the failure in 1919 of Congress to follow

through President Wilson's peace proposals, and to serve notice on foreign countries that it is Congress that must be reckoned with in any enduring settlement. Another is Senator George's resolution which would create a special committee to study post-war problems. Meanwhile the members of the Administration are trying to substitute a more solid and reasonable foundation for the discussion in place of the many loose and inaccurate generalisations now current, of which the speech of the Representative from Connecticut contained the maximum number. Colonel Knox and Mr Welles pointed out last week the dangers of a spirit of narrow nationalist rivalry after the war. Mr Berle, who is a member of the Government Committee on commercial flying, testifying before the House Foreign Affairs Committee, disowned the idea that the United States should demand permanent possession of foreign bases as a price of continuing Lend-Lease; and pointed out that the acquisition of aviation rights abroad necessarily raised the question of what concessions the United States was prepared to make concerning access to its own airports. So far the voice of Liberal and non-official America has been hard to hear above the clamour; but it is noteworthy that Mr Lippmann, the well-known commentator, is urging the conclusion of written agreements with Britain providing for the sharing of Atlantic bases after the war, and the maintenance of the armed strength of both countries at a stated level.

The Task Ahead

Mr Byrnes' speech last week marks his public emergence as Mr Roosevelt's chief lieutenant on the domestic front. Mr Henderson has gone; but from this able and persuasive speech it appears that Mr Roosevelt has found a man capable of carrying on the fight against inflation with more tact and more powers than Mr Henderson possessed. The cashiering of Mr Henderson was engineered largely by his enemies among Congressional pressure groups, but it is beyond doubt that they took advantage of a public revulsion against wartime regimentations. Mr Byrnes set himself the task of making them more palatable and of explaining their necessity. After dismissing impatiently the suggestion that the American people are not ready to meet the requirements of total war, Mr Byrnes pointed out the imperative needs of 1943: the demand for even greater war production; the enlistment of additional millions; the requirements of the coming invasion of Europe, with its inevitable casualty lists. After stressing the urgency of continuing to supply Russia and China, and Britain, he stated flatly:—

We must face the fact that there is no way we can hope to improve or even sustain the customary standards of living during the coming war year. . . . We must all prepare to adopt for the duration a spartan standard of living and take patriotic pride in it. . . . Our task is to see that the present balance (between the various producers and workers) does not change for the worse and that those on the lower rungs of the economic ladder are not ground down below the margin of subsistence.

Pointing out the unprecedentedly favourable position both of labour and the farmer, Mr Byrnes stressed the very real dangers of inflation, and stated that in consequence he had requested the National War Labour Board to make no increases in wages without consulting him; and the Price Administrator not to approve raising the ceiling without consultation.

It is my purpose to exercise all the powers granted by law to prevent any further increase in the basic essential cost of living.

The limited use of price and wage incentives to increase production is not ruled out, Mr Byrnes said; and this was his defence of the increased wage bill which would result from the institution of the 48-hour week in certain centres of labour shortage. Mr Byrnes' reading of his field of command is wide; he touched on rationing, price control, taxation, and manpower policy. On all he struck a firm but sympathetic note:

No man hates regimentation more than I do. But I would be less than honest if I told you that the stresses and strains

on our civilian economy could be met without a high degree of regimentation of our civilian as well as our military life. With proper spirit and understanding among our people that regimentation may be largely self-regimentation. But whatever you call it each one of us will have to play his part in our team.

This is the theme that was once Mr Henderson's. Whether Mr Byrnes will be more successful in inducing Congress to make it its own only time will tell, but the prospects are not unduly good.

Eternal Triangle

The battle over the synthetic rubber programme is reported to be ended, with the decision—said to be Mr Byrnes'—that priorities should be granted to permit this year 43.6 per cent of the original Baruch programme. But as Mr Forrestal, Under Secretary of the Navy, said in answer to a question at a committee hearing, "You can never make these things stick when men are making their cases so strongly." The cases were indeed made strongly, both for the Services and, particularly so by the Rubber Administrator, Mr Jeffers, for the civilian consumer. Mr Jeffers monopolised the headlines, with his blasts against "Army and Navy expeditors" and "loafers" who obstructed war production; with his charge that the Army and Navy "say you can take the country off rubber, and I say you can't," and his accusation that it was impossible to get any firm decision from the WPB. He gained startled attention for the fact that not one ounce of synthetic rubber has been produced under the Government programme. Only one butadiene plant is on the verge of operations; and the Government polymerization plants are not ready either. The root of the trouble is the need for certain manufactured parts, namely valves and other machinery items, by the high-octane gasoline and naval escort vessel programmes as well as the synthetic rubber programme. Mr Jeffers demanded priorities to permit 65 per cent of the Baruch recommendations. This was opposed by the Services, who took their case from WPB to the White House. Mr Byrnes' compromise will allow the building of manufacturing plant capacity sufficient to produce 425,000 tons of synthetic rubber this year. It is considered a partial victory for Mr Jeffers, whose roars rose even above the campaign to impress on the public the dangers of the

U-boat. What is noteworthy about this particular example of the triangular pull is the replacement of Mr Nelson by Mr Byrnes as arbiter; and the evidence it provides of the persistence—in civilian as well as Service circles—of the belief in Service control, even of the civilian economy. At one point in the Committee hearings, Representative Maas of Minnesota suggested that final decisions on military and semi-military programmes such as synthetic rubber should be made by the joint chiefs of staff, with civilians acting only in an advisory capacity. Mr Forrestal's answer was "You're stating my case." It is this kind of thinking which is behind the reappearance in the Senate of the bill for an Office of Civilian Mobilisation, which, while leaving the direct control of war production to the Services, would assure over-all civilian supervision and authority.

Shorter Notes

Further information on shoe rationing shows that a number of safeguards are included to protect the consumer. Manufacturers will be prevented from increasing the production of higher-priced shoes, and special certificates will be obtainable at ration boards for those who can show need for extra pairs. Many frills and non-essential models will be eliminated, and the early development of standardised "utility" shoes at reasonable prices is expected.

An inquiry has been ordered by Senator Truman's War Investigating Committee into Aircraft Construction at Willow Run and at the Curtiss Wright plant at Columbia, Ohio. Senator Truman said that "There has been so little production at either plant as to amount virtually to none."

The points in President Roosevelt's speech last week which have been particularly welcomed in the United States are his promise that the United States is not working toward a Vichyite post-war France, and his assurance that the war in the Pacific is being given its full share of attention.

THE WORLD OVERSEAS

Canadian Altruism

(From Our Ottawa Correspondent)

January 18th

IN 1941, Canada's position with respect to its balance of international payments was simplicity itself. The problem was twofold—to finance extraordinary imports from the United States and extraordinary exports to the United Kingdom. The exhaustion of the United Kingdom Financing Act account, the so-called billion dollar gift to Britain, during December, 1942, served to recall the circumstances of its origin as well as the future. The simplicity of financial relations in 1941 is clouded by political considerations in 1943. The problem is still that of financing heavy war shipments to the sterling area, while maintaining heavy imports from the United States essential to the continuance of many lines of Canadian war production. But changes in the war have brought changes in the strategy of supply for Canada, as a surplus munitions producer. Not merely aid to Britain, but aid to the United Nations, is the theme of the 1943 problem.

Canada takes no part in the allocation of its war exports which, in practice, find their way to virtually all fronts. The deliveries of Canadian war production have exceeded \$3,000 millions in value. Recently, Mr Howe, the Minister of Munitions and Supply, said that 30 per cent of Canadian munitions went to Canadian forces at home and abroad, about 50 per cent to Britain, British combat areas and

Russia, and 20 per cent to the United States, China, Australia, and the Pacific theatres of war.

The portion going to Britain has been subject to allocation by the Munitions Assignment Board in London. Likewise, the portion going to the United States and the Far East has been largely subject to allocation by the Munitions Assignment Board in Washington. Anomalies have crept in. Canada has supplied more than \$100 millions worth of munitions, including tanks, to Russia, but these have been financed under the United Kingdom Financing Act, and, in effect, Canada has made a gift of them to the United Kingdom, which in turn arranged to let Russia have them. Since the Act was passed, Canada has established separate diplomatic relations with Russia. In a comparable way, Canadian war materials obtained by the United States under the Hyde Park Agreement have been allocated to China, and recently Canada has entered into diplomatic relations with China. From the Canadian point of view, the machinery of international financial relations has been behind the development of diplomatic relations.

The circumstances which led the Canadian Government early in 1942 to make a gift out of Canadian production of \$1,000 millions have been clarified by a recent official report on the Canadian balance of international payments to the end of 1941. The Canadian account in sterling for current

	<u>\$673,169,484.32</u>

United States Government obligations and other securities carried at \$108,018,866.82 in the above statement are pledged to secure United States Government deposits of \$99,619,388.43 and other public and trust deposits and for other purposes required by law.

Member of the Federal Deposit Insurance Corporation

expenditures, that is, trade, tourist, interest and dividends, freight and shipping, etc., was as follows:—

	(Millions of dollars) Credits	Debits
1939	\$ 571	\$ 245
1940	636	239
1941	1,095	560
	2,100	894

In three years, therefore, Canada accumulated a credit balance in sterling of \$1,206 millions. By adding capital investment made by the British Government in Canadian war plants and the expansion of air training facilities, this total was brought to \$1,770 millions. Down to December, 1942, when \$1,000 millions in Canadian funds was being used under the UK Financing Act, the total deficiency of the sterling area in Canadian dollars was \$2,770 millions. The methods by which this deficiency has been made up include the following:—

	(Millions)
UK sale of gold to Canada	84
Private repatriation (gifts, etc.)	250
Official repatriations	126
Interest-free loan to the UK	694
UK Financing Act (gift)	700
	1,000

The conditions which were met by the UK Financing Act are not expected to recur. A European offensive in 1943, bringing the Canadian First Army into action from its British bases, would mean a sharp rise in Canadian army expenditures in Great Britain. This is counted on to reverse the trend that has created a huge British deficit of Canadian dollars.

Canada's balance of payments with the United States showed a growing deficit of US dollars in the first three years of the war.

In these three years, Canada's debit balance was \$720 millions. The Hyde Park Agreement of April, 1941, was designed to correct this growing deficit of US dollars, and, under its terms, the United States agreed to charge to its British Lend-Lease account all components of Canadian production, originated in the United States and

destined for Britain. In addition, the United States undertook to increase its purchases of Canadian war production. Recently Mr. Hsley reported that Canadian war imports from the USA were now paid for to a large extent by Canadian sales to the USA. The Hyde Park Agreement has, therefore, solved the problem of Canada's deficit of US dollars, and it is expected to continue.

	(Million dollars) Credits	Debits
1939	\$ 775	\$ 864
1940	827	1,128
1941	1,042	1,372
	2,644	3,364

No Complaints

It should be made clear that no fault is found in Canada with these arrangements, by which Canadian surplus munitions find their way into pools of war supplies under the allocational control of London and Washington. It is recognised that, in practice, the authority to assign supplies must be centralised, and so far no machinery has existed outside the London and Washington assignment boards. Nor is there much demand that Canada should assume a more direct responsibility over the final disposition of its surplus. The sale by the United Kingdom of Canadian funds to other United Nations serves to secure wider distribution of Canadian munitions to fronts that need them. The distribution by American Lend-Lease of supplies purchased in Canada by the US Government serves the same purpose.

Finland's Trade Dilemma

[BY A CORRESPONDENT]

FINLAND has been cut off from over 60 per cent of its foreign markets and has lost, according to German accounts, as much as 40 per cent of its merchant fleet. Foreign trade was at its lowest during 1940 and the first half of 1941 and is still very considerably below the pre-war level, in spite of increasing imports of German goods since July, 1941. This fall in trade, however, is concealed by the enormous rise in the prices of imported goods and by the smaller, but still considerable, increase in the price of exports; the official wholesale price index rose by 130 per cent for imported goods and by 79 per cent for home-produced articles, between August, 1939, and March, 1942. Finland's trade balance shows a large import surplus, partly owing to this divergence in prices and partly because Germany has to sustain its ally by sending more goods than it receives from this limited source. The last available trade returns for the eleven months ended November, 1942, which, however, do not include munitions, showed imports at 9,260 million Finmarks, and exports at only 4,559 millions, compared with 8,607 millions and 8,398 millions respectively during 1938. A rough calculation seems to indicate that the volume of exports has been reduced by about two-thirds, while that of imports may have been halved, between 1938 and 1942.

Germany's trade with Finland has risen before and during the war, both absolutely and, still more, in comparison with other countries; its share in Finland's civilian imports and exports increased from 20 to 70 per cent, and from 14.8 to 58 per cent, respectively, between 1938 and 1942. Most of Finland's remaining trade is carried on with Germany's European satellites. Its trade with Sweden, on the other hand, seems to be on the decline since goods to the value of only 330 million Finmarks were imported from that country during the first six months of 1942, compared with 580 millions during the same period of 1941; exports in both periods were at the low level of 100 million Finmarks. It has also been reported that a large proportion of the Finnish trade is carried in German ships.

The Finnish Prime Minister has described the imports from Axis sources as a means "of avoiding the most extreme hardships through the help of friendly states." The provision of the Finnish population with food, fuel and other goods is still inadequate; and the rationing of sugar, textiles and cigarettes has been tightened in recent months. But the breakdown in the national food supply, which appeared imminent last winter, has so far been avoided; the fat ration was increased somewhat in November, when the weekly ration of bread and other cereal products was raised from 5 lb to nearly 6 lb per week. To the Finns, it is unpleasantly true that the maintenance of their bread supply during 1942 was only possible by an

"3 per cent —and more!"

Why "and more"?

Because, in addition to the attractive rate of interest, 3% Defence Bonds have other big advantages.

Such as?

3% Defence Bonds never fluctuate in value, which means you can always get what you paid for them.

Any other points?

Yes. They are repayable after 10 years with a bonus of 1/- for each £5 invested; interest is paid half-yearly and Income Tax is not deducted from it at source.

How and where do I buy them?

In units of £5 through any Bank, Stockbroker, Post Office or Trustee Savings Bank or by instalments with 6d., 2/6 or 5/- National Savings Stamps.

And if I have to cash them before the 10 years are completed?

You can cash them on six months' notice, or in case of private emergency, you can apply to the Savings Bank at which your bonds are registered for repayment of the purchase price, subject to a deduction equal to six months' interest.

Any limit to holdings?

Yes, they're so good that no one may hold, or have an interest in, more than £1,000 worth.

3% DEFENCE BONDS

Issued by the National Savings Committee

HEALTH AND FOOD RATIONS

THE MINERALS WE NEED FROM OUR MEALS

Most people know that iron is a good tonic; but how many know that the body needs at least twelve minerals—including such surprising things as zinc, copper and magnesium—to keep it healthy?

There is no need to worry, however, for a normal diet of natural food supplies all the minerals necessary. The only ones of which you are at all likely to run short are calcium and iron, and occasionally phosphorus.

Children in particular need a generous supply of calcium; rickets is the result of an insufficiency of this mineral. Phosphorus, too, is important since the two go into partnership to build bones and teeth. Both these minerals are obtained from milk, cheese, sardines. Calcium is present as well in cabbage and watercress; phosphorus, in cereals, fish and eggs.

Lack of iron results in anaemia and is most important in the diet of children, especially growing girls. Get your iron supply from liver, National Wheatmeal bread, dried fruits and vegetables, particularly peas and beans.

This is one of a series of announcements issued in support of the Government's food policy by the makers of

CROOKES'

HALIBUT LIVER OIL

THE PASSAGE OF THE YEARS

HERE you see the latest model Singer as it stood in front of the coach house, newly delivered from the works, on a Spring morning in 1904.

As a matter of fact, this particular model was subsequently driven around the Yorkshire Wolds by its owner-driver for three exciting years; and it would appear that the impression it made upon him was considerable. For during the next thirty years this motorist owned seven more cars—and they were all Singers.

Now, what is it about the Singer? Perhaps the fact that this particular motorist was himself a qualified Automobile Engineer may provide you with a clue.

SINGER

Manufacturers of Automobiles for nearly half a century
SINGER MOTORS LIMITED • COVENTRY AND BIRMINGHAM

increase in foreign grain deliveries by about 90 per cent (measured by value) over the 1941 level. In Finland itself, only 425,000 tons of grains were harvested during 1942—about the same disappointing amount as in 1941, when the weather was much worse—the poor result being due to the growing labour shortage.

The Finnish trade deficit has produced a large clearing debt to Germany and other Continental countries. But while the export trade is small in itself, it consists of valuable national resources, including copper and nickel. In 1941, Finland produced 18,000 tons of copper and exported 15,000 tons; and the Government organised a big copper salvage campaign to meet the country's own requirements of 5-7,000 tons a year. During the first ten months of 1942, the export of the two items, copper and ores, was about 30 per cent larger than in the same period of 1941, although this may be partly due to an increase in price. By far the most important item in Finland's export trade is timber and timber products, and the fall in the total export figures has been very largely due to the drop in timber exports. The home supply of firewood and other timber is inadequate owing to the labour shortage, as well as to the difficulties of inland transport and, possibly, to the lack of co-operation from the forestry owners. But the German-Finnish trade talks, which took place in Berlin at the end of 1942, seem to have resulted in an agreement for the export of more timber than hitherto, including the delivery of 500,000 cubic metres of pit props during 1943; the supply of local timber to the Wehrmacht units stationed in Finland has also been increased in recent months. The Finnish Government has accordingly tried to entice the forestry owners to a greater effort, by granting them higher prices and by similar concessions. Felling activities are now mainly confined to the most suitably located areas, which has largely solved the transport problem, although at the risk of permanent damage to the forests concerned. The most serious problem, however, is that of labour; a compulsory labour service was introduced in January for all men between 19 and 65, but even this measure will hardly bring forward the necessary number. The only means of providing forestry workers will probably be to release men from agricultural duties; this, in its turn, will result in a still greater dependency of the Finns on German food supplies.

Shortages in Palestine

[FROM OUR JERUSALEM CORRESPONDENT]

November 30, 1942

SINCE the beginning of 1942 an apparent change for the worse has taken place in the food situation of Palestine's urban population. In the last six months, retail prices have risen, according to Government indices, by 17 per cent in the Arab markets and by 13 per cent in the Jewish ones, and in September they were 60 and 63 per cent respectively higher than in September, 1941, and 171 and 145 per cent respectively above the average of 1937. These figures do not, however, tell the whole story, for they are partly based on maximum prices fixed by local authorities for bread, meat, fish, eggs, poultry and so on, although these prices are not strictly adhered to. Nor do the indices reflect the deterioration in the quality of many commodities. Palestine standard flour now contains 15 per cent of barley and 15 per cent of millet, and wheat flour is only issued upon production of a medical certificate; only unrefined sugar is in use and so on. Moreover, many staple articles of local diet are actually off the market—for instance, rice, potatoes and groats—or are sold in limited quantities—for instance, bread (300 grs. per person daily—100 grs. = 3½ oz. approximately), sugar (600 grs. per person monthly), eggs (1 egg per person weekly), butter, milk and many other foods, while meat purchases are limited to four days a week. At the same time, black markets in all kinds of food continue to flourish.

These trends, typical of wartime conditions, have not as yet been sufficiently countered by Government measures.

A full rationing scheme, as envisaged at first, was never put into practice, the sugar ration being the sole survivor of it. The attempts to put a brake on soaring wholesale prices, by centralising the imports in the hands of Government agencies, did not have the desired effect, and is now being partly replaced by a system of public tenders, through which Government stocks are offered for sale and import licences are granted, on condition that the retail prices are fixed in advance. No use has been made of the consumers' co-operative societies, now embracing about a tenth of total urban population, to make the control of trade more effective. The purchase of local cereal crops by a Government agency has proved a failure, as in most districts the yield has been grossly under-assessed, the balance being kept by the peasants for their own consumption or sold to Syria and to local speculators, while the Government was forced to allocate shipping space again for wheat imports from Canada. The shortage of grain and of imported fodder has caused a reduction in local poultry stocks, and little has been done to encourage potato and vegetable growing. On November 1st a point system was introduced, comprising bread, flour, macaroni, meat, fish, poultry, butter, fats and oils, eggs, cheese, sugar, jam, cocoa, tea and coffee, as well as meals consumed in establishments, but up to now its effects have been negligible. This is small wonder, as the scheme covers neither the rural areas nor most of the Arab cities, and is confined in practice to the Jewish urban sector. Moreover, it does not imply any guarantee of the availability of the goods included—with the exception of sugar. But the chief reason is that only a few families can afford to buy at current prices even the limited quantities they are entitled to under the scheme.

Under these circumstances, a rise of wages has become inevitable, the more so as the local wage-level had been previously depressed by the prolonged stagnation during the disturbances and the first year of the war. According to an agreement reached early this year, allowances are given up to 80 per cent of the war increase in the Jewish Agency's cost-of-living index, but only on the first £P8.5 of salary. No exact figures are available about the wage increases in Arab industry; but, in the Jewish sector, the present allowance is at the rate of 85 per cent. A few firms are granting more, but many industries and most commercial undertakings, banks, services and so on are making the cost-of-living allowance at the rate of about 60 per cent. During recent months many strikes have broken out, the employees demanding an increase in basic wages, apart from the cost-of-living allowances. A Commission has been appointed by the Government to inquire into the subsistence level of the unskilled worker at the present time, and to make recommendations on the method of determining the standard wage of workers and the computation of the scale of cost-of-living allowances; but simultaneously it was announced that no orders will be placed with any manufacturer granting a wage increase without authorisation by the War Supply Board.

As another step to counter further price increases, additional taxation has recently been announced in an address given by the Financial Secretary. The proceeds of these taxes are to be devoted chiefly to maintaining the present price of bread by allowing the Government to subsidise flour to the extent of £P1.5 million during the current fiscal year.

THE BUSINESS WORLD

Profits under Restraint

WHEN the last quarterly review of profits appeared, in *The Economist* on November 21, 1942, there were some who argued from a few increases in equity dividends and the general rise in ordinary share prices, that an appreciable increase in equity earnings and dividends was just around the corner, if not already in sight. That view was challenged here at the time, and the latest computations—for the last quarter of 1942—show that industrial earnings are as tightly under restraint now as they have been for the past 2½ years. EPT is still the great leveller; it is lopping off surplus earnings, stabilising dividends, and leaving stolid profits figures for quarterly comment in these articles.

Gross profits for 565 companies whose reports appeared last quarter showed a decline of 2 per cent compared with their previous year's total—a movement opposite to the increase shown by the third quarter's companies, and equally negligible in extent. An increase of 2½ per cent in gross profits, before standard income tax is deducted, is the wartime reward of these companies to date:—

TABLE I

565 FOURTH QUARTER COMPANIES' GROSS PROFITS—
NEW BASIS (IN £'000)

(All figures gross)

	Year 3 Preceding (1939)		Year 2 Preceding (1940)		Year 1 Preceding (1941)		Latest Year (1942)	
All interest	6,204	11.3	6,214	10.7	6,181	10.7	5,970	10.2
Preference divs.	12,739	22.5	12,674	21.7	12,637	22.1	12,836	22.9
Equity divs.	27,011	49.9	27,501	47.2	26,164	45.7	25,067	44.6
Sub-total	45,954	83.7	46,389	79.6	44,982	78.5	43,873	78.1
Free reserves and net carry forward	8,023	14.6	10,653	18.2	8,394	14.6	10,892	19.4
Other savings*	923	1.7	1,252	2.2	3,988	6.9	1,394	2.5
Profits before tax, after E.P.T.	54,900	100	58,294	100	57,364	100	56,159	100
Per cent of Year 3 preceding	100.0		106.0		104.5		102.3	
Rate of tax applied in grossing up	7/-		8/6		10/-		10/-	

* Redemption funds, deferred repairs, etc. (grossed up at corresponding rates of tax.)

The quarterly groups tend to have their own characteristics. Preference capital appears to get an unusually high share of fourth quarter gross profits—nearly 23 per cent, compared with 18½ per cent for the third quarter group and only 16½ per cent in the first quarter. This high proportion is due mainly to the large amount of Lever and Unilever preference capital; it is not evidence of a sudden change in distribution policy (which might at first sight be inferred from Table V).

No accounting innocent abroad is so naïve as to suppose that published reserve allocations even begin to tell the full story of the actual provisions. Limited though they are, however, the free reserve allocations for the year 1942 are of some interest. Including the sum of £12,034,000 set aside for the fourth quarter, the year's total amounts to £50,564,000. For the notional year "1939," the same companies put by £37,927,000. If this were all, one could not regard a £12½ million annual increase in reserves as sufficient either in relation to wartime exhaustion of assets or post-war re-equipment programmes. But if specific reserves and hidden allocations (deducted before profits are struck) have increased in like proportion, the post-war situation should be more comfortably handled, without including any prospective benefit from the 20 per cent EPT offset which has been promised, in general terms, by the Chancellor.

Table II gives the first—necessarily incomplete—impression of how companies fared in their financial years which ended during 1942.

TABLE II

GROSS PROFITS, BEFORE TAX, BY FINANCIAL YEARS

(In £'000)

Accounting Date Falling in	No. of Cos.	1938	1939	1940	1941	1942

3rd Quarter	360 345 210	42,880	40,900	42,636	38,457	24,442
4th Quarter	964 873 45	156,236	162,927	154,538	149,957	5,246
Whole Year	2,282 2,176* 986*	306,467	307,295	300,832	288,361	116,487

* Incomplete results.

Certain companies, included in earlier tables have been excluded owing to the delay in issue of their reports.

We have, as yet, less than half the eventual 1942 sample; for what it is worth, it shows an increase in gross profits of less than 3 per cent, whereas the almost complete sample covering the two years 1940-41 showed a 3 per cent fall. Complete results in 1942 may well show a less than compensating improvement. In any case, profit fluctuations are so limited in extent and random in direction that industry's gross earnings are to all intents and purposes fixed—and half is then deducted for standard income tax. These results are expressed in index number form in Table III, at the foot of the article.

The past year shows a slightly improved tendency, at first sight. In fact, the behaviour of the index since 1940 is astonishingly stable. The average deviation in the past eleven quarters, compared with the 1938 level, is -0.8 per cent. In terms of reported profits (from which substantial deductions for income tax have been made at increased rates since 1939) the fall, as revealed in the index number in Table IV, is naturally steep. These figures—they might be called the profits of the financial headlines, accepted alike by the average shareholder and the average financial commentator—averaged 93.1 per cent of the 1935-36 level for reports published last quarter, compared with 129.3 for the first quarter of 1939.

Table V, showing the distribution of profits and return on capital, has now been recalculated on the new basis for the whole of 1942. Apart from the fact that the distributions of the fourth quarter continue to be distorted by the high Unilever preference capital, the new figures are rather more uniform than the old. There appears to be a tendency to

**FOR ALL
INSURANCE
NEEDS**

LIVERPOOL **LONDON**
North John St. Lombard St.

maintain distributions at the cost of reduced allocation to reserves.

TABLE III
INDEX OF GROSS PROFITS, BY ACCOUNTING PERIODS
(Four Quarters ended December, 1938 = 100)

	1st Quarter	2nd Quarter	3rd Quarter	4th Quarter
1939.....	98.1	96	97.4	98.1
1940.....	101.2	99.7	102.6	99.5
1941.....	96.7	98.8	95.9	97.0
1942.....	100	98.7*	101.9*	

TABLE IV

INDEX OF NET REPORTED PROFITS, BY PUBLICATION DATE
(Revised Geometric Basis)
(Four Quarters ended June, 1936 = 100)

	1st Quarter	2nd Quarter	3rd Quarter	4th Quarter
1939.....	129.5	125.7	124.4	121.6
1940.....	129.7	129.8	116.8	115.1
1941.....	112.9	103.7	101.0	98.6
1942.....	96.5	91.4	95.4	95.1

Of 569 fourth quarter companies in 1942, 241 disclosed allocations to depreciation of £4,772,145 against £4,758,015 in 1941. This represented 13.0 per cent of disclosed profits, on the old basis, against 13.6 per cent for the same concerns in 1941.

The industrial group figures in Table VI must be left largely to tell their own story. They show, as in recent quarters, that the consumption goods groups are faring well—with the important qualification that the food group shows a sharp reverse, partly explained by tighter rationing. The heavy industry figures are rather equivocal—it is in these groups that internal reserve policy plays a large part. Finally, the cataclysm in rubber profits has been made good

—in this quarter at least—by the rebound in oil earnings. It is not an exciting record, all told, but an efficient EPT must inevitably leave a dull record of residual profits. It is likely to do so for some time yet.

THE ECONOMIST NEW PROFITS SERIES.

The notes below may assist readers to follow the improvements in our profits figures.

The new figures are presented throughout on a gross basis and represent the closest estimate that can be made of industrial profits, before deducting any charge for standard income tax.

The gross profits are shown (a) under periods in which they were published and (b) under the periods in which they were earned.

(a) A four-year comparison of gross profits of companies whose accounts were published in the latest quarter of this year is given in Table I.

(b) A five-year linked comparison of gross profits arranged by accounting periods is given in Table II., and this is expressed as a quarterly geometric index number of gross profits (four quarters 1938 = 100) in Table III.

The *Economist* index of net reported profits (i.e., net profits taken from the companies' accounts without adjustment for taxation) has been converted from an arithmetic to a geometric basis (July, 1935, to June, 1936 = 100) and is given in Table IV.

The figures of Table V. have been calculated on the new gross profits of Table I., less interest, for the whole of 1942, comparable figures on the old basis being given for the first two quarters. The companies given in Table VI. have been partially regrouped. The net profits are still given on the old basis, that is as reported by the companies, but gross profits are on the new basis of Table I.

Finance and Banking

"Wings for Victory" Bills

There has been an unusually large turnover of funds in the money market this week. Apart from the high rate of revenue transfer, now running at peak level, the payments on vested South African securities involved a distribution of £42 millions at the beginning of the week. Dividends on Government securities due on February 15th amounted to £17 millions, gross. In order to cover its prospective deficit for the week, the Treasury called upon the banks to pay £50 millions in Treasury deposit receipts this week, this being all fresh money as there were no TDRs falling due. As against this, the current Treasury bill maturities exceeded payments for new bills by £10 millions. In addition to these various factors, the February making up has already begun to make its effect felt. When the announcement of this week's TDR payments was made, the market was inclined to expect the development of stringent credit conditions. In effect, the position has been well managed by the authorities, and though the clearing of South African repayment warrants has, as usual, proved somewhat sluggish, this factor has been balanced by the fact that most of the current TDR and Treasury bills payments have been concentrated towards the end of the week. The banks have, therefore, shown some interest in bills. It is noteworthy that demand has been specially keen for bills maturing during the week March 6th to 13th, during which the banks will be feeling the strain of the London "Wings for Victory" week. They are evidently making ample preparations for this ordeal. The Bank return shows the effect of Government borrowing at the Bank, and of the special help given to the market towards the end of last week, in a rise of £9,990,000 in Government securities. The counterpart of this is seen in increases of £6,885,000 in bankers' deposits, of £3,355,000 in other accounts and of £932,000 in the note circulation.

Tax Certificates and Bank Loans

Soon after the first issue of tax reserve certificates, the Chancellor of the Exchequer pointed out in the House of Commons "that it is entirely contrary to the wishes of the Government that subscriptions to these certificates should be financed with borrowed money." That injunction has, no doubt, been obeyed in the letter. No bank would make a loan specifically intended to finance a customer's purchase of tax reserve certificates. But where such a purchase is but one of many calls on a company's liquid resources, the actual purpose for which bank loans are being incurred cannot readily be ascertained. Available cash will be used in the purchase of certificates, and bank facilities used to finance work in progress which, but for the purchase of certificates, would have been financed by the company's own resources. The temptation to have recourse to some such device is particularly great where the firm concerned is liable to EPT. Not only is the 1 per cent return on the tax reserve certificates free from all taxes, including EPT, but the amount of the bank loan will, in the normal course, be included in the capital employed in the business, and will thus rank in arriving at the company's EPT standard. The bank will, for its part, give an equal welcome to the opportunity of stemming the persistent fall in its loans and advances. The recently published reports and accounts of three large companies, Woolworths, British American Tobacco and Imperial Tobacco, show that each of these undertakings has over its last financial year acquired a substantial amount of tax reserve certificates, and it is interesting to see from the balance-sheet changes how these purchases have been financed. In the case of Woolworths, the total of certificates acquired up to the end of 1942 was £4,000,000. This new item in the balance-sheet was balanced by a reduction of £2,000,000 in cash and of £2,200,000 in gilt-edged investments. In this case, the purchase of certificates has been made as to one-half by utilising cash which would otherwise have repaid with the company's bankers in anticipation of tax payments. The remaining half was financed by sales of other securities, suggesting that the tax free interest on the certificates was decidedly attractive to this company. The British American Tobacco balance-sheet shows a holding of £5,000,000 in tax reserve certificates, which is balanced by an increase of £4,600,000 in current

liabilities. The Imperial Tobacco balance-sheet is most significant of all, contrasting a £7,000,000 acquisition of tax reserve certificates with the appearance of a £7,500,000 bank overdraft. This juxtaposition does not provide evidence that a bank loan has been granted for the purpose of taking up certificates; indeed, the chairman of the company has pointed out that the emergence of this bank loan must be viewed in the light of the substantial increase in the value of the company's manufactured stocks. But it is difficult to escape the conclusion that if no certificates had been taken up, it would have been unnecessary for the company to borrow from its bankers on this scale.

Trustee Savings Bank Deposits

The Trustee Savings Banks Association reports an increase of £60,923,499 in the funds of the Trustee Savings Banks for the year ended November 20, 1942. The total funds of the Trustee Savings Banks at the end of this period were £446,508,957, and changes in the composition of these items and in the geographical distributions of the total were as follows:—

	1941 £	1942 £
Cash balances due to depositors:		
Ordinary Department.....	214,769,942	264,577,260
Special Investment Department.....	108,578,686	113,918,096
Government Stock held for depositors.....	50,547,899	55,266,498
Total Balances.....	373,896,527	433,761,854
Combined Surplus Funds.....	11,688,931	12,747,103
Total Funds.....	385,585,458	446,508,957
England and Wales.....	234,052,558	273,305,428
Scotland.....	133,978,471	152,033,296
Northern Ireland.....	17,554,429	21,170,233
	385,585,458	446,508,957

The expansion in the Trustee Savings Banks funds was relatively much steeper than the corresponding movement in clearing bank deposits. This is largely explained by the slowing down in the expansion of bank deposits caused by the issue of tax reserve certificates—a factor which would not have affected the growth of Savings Banks deposits.

Hire Purchase Restrictions

The already restricted scope of hire purchase business is being further narrowed by a Board of Trade order which prohibits the hire purchase of price-controlled goods with the exception of furniture, perambulators and motor cycles. The prohibition comes into effect on March 1st next. The new order also defines some of the conditions to which authorised hire purchase transactions will have to conform. The monthly instalments must be not fewer than six and not more than twelve. The new order makes it compulsory for traders to sell perambulators on hire purchase terms if they have done so before and if such facilities are required by their customers. It is further stipulated that in such cases the purchaser must deposit £2 or 12½ per cent of the price, whichever is the greater, and that 20 per cent interest may be charged on the balance. To the uninstructed this figure of the permissible rate of interest will probably come as a surprising revelation of the charges that have normally been made for this type of accommodation. The considerable reduction in the volume of hire purchase finance since the outbreak of the war has affected the discount market to which a large part of the hire purchase paper created in this country made its way. For the most part, the paper which reached the market was in the form of the promissory notes given by the purchaser, endorsed by the agents and retailers through whom the sale was arranged, and also endorsed by one of the hire purchase finance houses. It was on the strength of this last endorsement that the paper commanded the relatively fine rates at which it was taken by the market. There have, of late, been rumours in the discount market that the largest of these specialist houses, the United Dominions Trust, is endeavouring to acquire an interest in one of the discount firms. If true, it would provide an interesting illustration of horizontal combination in this sphere of financial enterprise.

THE SOCIAL FRAMEWORK

offices listed in the accompanying table—and may be considered remarkable if the continuous pressure of National Service claims on staff, and the steady call-up of potential policyholders are borne in mind. Rising public confidence

in the war situation has possibly been a stimulating factor. The volume of new business written in 1942 is about two-thirds of that for 1938, the last pre-war year, but a distinction must be noted between the experience of the so-called industrial-cum-ordinary offices, with writings in the region of 85 per cent of the pre-war level, and the remaining offices, with a comparable ratio of under 60 per cent. The reason for the relatively high activity of the former group is the maintenance of large staffs for the purpose of door-to-door collection of premiums on industrial policies—staffs which in the course of this work are able to solicit new ordinary assurances as well as industrial ones—and the high earnings among the sections of the community for which these offices primarily cater. Cutting across this broad classification of the offices into two groups, there have also been wide fluctuations in the activity of individual offices; one or two are actually transacting more business than before the war, and others have receded to a quarter or less of their pre-war totals. These variations are chiefly due to the differences in policy which have previously been noted. A few offices have set out to encourage new business by offering to cover civilian war risks without extra charge, and by appealing to patriotic sentiment through the issue of policies in which the sum assured is expressed in savings bonds in lieu of cash; others have been content to accept such business as reached them without a sales effort. Companies specialising in group policies are keeping their new business at high levels.

Eire's Central Bank

The new Central Bank began its operations on February 1st, on which date the Currency Commission ceased to exist. The President, acting on the advice of the Executive Council, has appointed Dr Joseph Brennan as the first governor of the bank. He was chairman of the Currency Commission for 15 years, and was chairman of the Banking Commission which recommended the establishment of the Central Bank. The Minister for Finance has nominated the other eight directors. Three of these were chosen from a panel of six bank directors prepared by the banks. Three others were selected to represent agricultural, industrial and labour interests respectively. The remaining directors are Mr J. J. MacElligott, secretary of the Department of Finance, and Professor T. A. Smiddy, late Irish Minister at Washington.

Investment

Railway Results

There was some evidence at the beginning of the week that the investor was taking a renewed interest in equities, but the sole section which received any tangible results was that for those railway stocks which at present occupy the position of equities. There was a general rise in prices, accompanied by an expansion in business to by far the best recorded under the present system. The number of bargains received was, at 1,400, nearly double that in gilt-edged, instead of half as great, as is the more normal experience. Business fell away substantially next day, and the tone was easier, but even the more conservative elements were prepared to revise their estimates upward on the basis of the good LMS results. The only particulars so far available are the net income, dividends and allocations of three of the main line companies, and of LPTB. The relevant figures are set out in full in the table at the bottom of this page. The results of the Great Western remain to be

received, but so far the only company to show a considerable improvement is the LMS. That of the LNER is distinctly moderate, while the Southern is reduced and that of the LPTB, rather unexpectedly, slightly increased. All the companies have been more generous in their distributions than was the case a year ago. The managements appear to be doing their best to establish a precedent for high payments. In the absence of fuller figures, it may be assumed that the outstanding result of LMS is due to receipts from Irish railways and that the relatively good results of the northern lines as against the southern arises from the partial concentration of industry in the former and the closing of much of the latter to holiday traffic. The reduction in Transport "C" dividend a year ago was due to technical considerations, but this year the increased payment is more than fully earned. The market eased on the news of the main-line results, but subsequently recovered part of the fall.

Two-Way Proxies

Although there is no sign as yet of any movement to provide direct advice for the shareholder, as suggested in *The Economist* on January 30th, the Committee for General Purposes of the Stock Exchange has not neglected the question of improving his position. On Monday last, they passed resolutions to the effect that circulars sent to shareholders should be unambiguous and couched in simple language, setting out the proposals in such a way that reference to other documents is unnecessary; that, where the statutory notice is one week, every effort should be made to double the time, and that proxies should be drawn in such a form as to make it possible to vote against, as well as for, the resolution. This last question of the "two-way" proxy has been raised repeatedly, but had received little official support until now. The three requirements together go a long way towards easing the path of the shareholder, but it still remains to give him the best advice and an organisation. Good as the changes are in themselves, the most important point is that they have secured the approval of such bodies as the Chartered and Incorporated Accountants and the Institute of Secretaries—the latter dissociating themselves from the proposal for two-way proxies—the London Chamber of Commerce and the Associations of Investment Trusts and Insurance Companies. This is a big step forward in co-operation, and should make more certain the acceptance of the proposals by the general body of companies. The Committee will take steps to see that compliance with the new provisions is a prerequisite for obtaining either a quotation or permission to deal, but only by co-operation can the concerns, whose securities are already granted these privileges, be brought within their ambit. It is to be supposed, however, that these provisions, like those concerning the announcement of dividends, will be generally accepted. The Committee has made a notable advance by securing so large a measure of co-operation, it is believed for the first time.

Unit Trust Accounts

Municipal and General Securities are to be congratulated on being the first of any group controlling unit trusts to present any form of accounts. The Anderson Committee recommended such action in 1936 and the Prevention of Fraud (Investments) Act of 1939 prescribes the audit and circulation of the manager's accounts, but without stipulating their form. This Act is in abeyance owing to the war. The accounts presented cover the bulk results for the nine unit trusts controlled from April 1, 1931, to June 30, 1942, those for the closing six months being in an improved form. Henceforth, manager's accounts for each trust are to be submitted separately each year. The managers understand that they will in no circumstances be asked to publish figures which would give an indication of the growth of the movement and no absolute figures are given. The items for each period are expressed as percentages of total turnover, but of turnover in the particular activity under consideration. In consequence, it is impossible to obtain total charges by adding together the various percentages given—except within strict limits. An explicit warning against this should be incorporated in the statement. While it is reasonably certain that the statement will be found lacking in intelligibility, it does in fact provide a fairly accurate answer to a number of the charges levied against these institutions and, if generally adopted, would go a long way towards revealing abuses, if and when such exist, and allaying unjustified suspicions. Further, Municipal and General Securities, who have plainly put in a great deal of work, advance it only as a first attempt made with a view to providing an opportunity for criticism and improvement. Further suggestions have, in fact, already been made and are under consideration. Among others, there is being investigated the possibility of providing a fair approximation of the actual cost to the purchaser of taking up new units, either on the formation of the trust or later. This involves a complicated calculation, but it should not be impossible to reach a reasonably satisfactory basis. Another piece of information which would be of interest to, although it is not strictly the concern of, the unit holder would be to show, by percentages, how total revenue is made up and how it is spent.

The actual statements of Municipal and General cover nine pages, so that it is obviously impossible to summarise them. They do, however, make clear a number of points. The three main sources of revenue to the managers are the

net portion of the preliminary charge on the issue of new sub-units and profits on the re-sale and liquidation of sub-units. The first of these, based on the value of new sub-units issued at issue price, has varied from 2.498 per cent for the nine months to December 31, 1933, to 1.540 for 1937, there being no issues last year. The second, based on the sale of repurchased sub-units, ranges from 3.348 in 1938 to 0.541 per cent two years later. The third, based on cash received from trustees, proceeds of sale of underlying securities and value of securities transferred to holding account, was non-existent in the early years, started to be productive in 1935, dropped to a minimum of 1.200 per cent in 1938 and rose to a maximum of 2.477 per cent in 1940. In the first half of 1942 it again fell to 0.339 per cent. The only other item which is commonly as high even as one per mille is the annual participation, the management charge, which averages around 0.3 per cent of the monthly valuation of the trusts. Considerable details are given as to the methods of calculating the various figures, and the whole must be recommended as a valuable beginning. It is a great pity that absolute figures cannot be used, but the essential is to obtain an agreed minimum of information which shall have the force of law. With some of the additions suggested, the accounts now offered would, if generally adopted, go a considerable way to provide what is necessary. To economise paper, these accounts are not being generally circulated, but those interested can obtain them on application to the managers.

Concentration on the Gold Coast

It has long been apparent that, with the institution of full Lease-Lend, the need for the maintenance of gold output as a factor in the war effort of the British Empire had passed. Canada had already cut down production, Australia was moving in the same direction even before the war came to her doorstep and South Africa made some cut last year. In the circumstances, it seemed more than probable that the much-canvassed further restriction of Gold Coast output would soon become a fact. None the less, the news that the Colonial Office is putting through a measure of concentration, similar to that applied to non-essential industries at home, came as something of a shock to the investor. Actually, the market both for the concerns which are to remain in operation—these are for the most part the market leaders—and those to be placed on care and maintenance is rather poor, with prices at a considerably lower level. A part of the fall results from the general uncertainty, for the announcement gives no key to the degree of contraction, while the vagaries of EPT further complicate the assessment of any estimate of the final result. If one is to take a long term view, it is conceivable that a concern with a very poor EPT standard might benefit from being closed down now, provided this potential benefit is not discounted in the care and maintenance provision. But the whole outlook for gold mining is less certain than it appeared to be even on the outbreak of war. It is by no means clear that any long term policy, even for West Africa, ought to be read into this decision to economise essential war materials. At the same time, the application of concentration to an industry which offers such widely differing returns as does gold mining is a new departure and raises a number of points of principle. It is to be hoped that details of the scheme will be made public in due course.

Intangible Assets

The proper treatment of such imponderables as goodwill, patents and other monopoly rights in company balance-sheets has for long been a matter of dispute. In many cases, no such item occurs, while, when the ownership has changed

Most fires are caused by
CAREFUL PEOPLE

DON'T JUST BE CAREFUL—
TAKE EXTRA CARE

Issued as part of the Fire Offices Committee's
campaign against fire wastage.

hand, there is almost always a substantial balance-sheet item, usually an omnibus item, covering these intangible assets. This matter is almost the central thesis of a brochure written by Mr P. D. Leake, entitled *Balance-Sheet Values* (Gee and Co., Es.), of which a new edition has recently appeared. Mr Leake puts forward two desiderata; that all such values should be banished from the industrial balance-sheet, and that there should be no counterpart to them in the fixed share capital of a company. It is much easier to agree with the second suggestion than with the first. If both were adopted, it would mean that the shareholder had only the going-concern values of tangible assets, with the corresponding liabilities, on which to base his judgment. This is certainly infinitely superior to a valuation of fixed assets which contains an element of allowance for earning power. But is it enough? Surely it would be very much better to insist that monopoly rights should be stated in the balance-sheet at cost, and that additions to them, and amounts written off, should be fully disclosed. Presumably, where goodwill had also been bought, this item should equally be stated separately. The shareholder would then have all the information available, for it is almost impossible to place a money value on goodwill until it has changed hands, and equally difficult to assess the value of a monopoly right, arising from the exertions of the company itself, and not purchased. Pending the disappearance of such monopoly rights, some such practice as this appears to be the most helpful. The ban on issuing capital against such intangibles is a different matter. If this were insisted upon, the reserve of the company would consist, at the moment of formation, of the balance-sheet value of intangibles. Mr Leake suggests, *inter alia*, a register of wasting assets and the fixing of the obligation on every company to state the surplus or deficit on its fixed share capital. This would, presumably, mean that the reserves and carry forward of a company at any time would consist of two elements, the surplus or deficit on fixed assets, and the net liquid assets. If intangibles were included, as it seems they should, there would be a third element, their written down value. The general adoption of such practice would considerably simplify the understanding of accounts, and the correlation of results. It would also bring the balance-sheet a long step nearer to expressing the true and correct view of the state of the company's affairs to which all auditors' certificates refer.

Company Notes

Bolsover Colliery

The full accounts of Bolsover Colliery for the year to December last show a drop in total income from £1,099,638 to £801,933, the lowest level since 1938. The directors state that the setback is due to the rise in costs. There is, however, an improvement in equity earnings from £306,718 to £347,151, representing 25.9 against 22.9 per cent, for which the drop in tax liability, from £691,000 to £375,000, and the redemption of debentures are responsible. The saving in taxation is due partly to the fall in profits and partly to the fact that in 1941 an exceptional retrospective provision was made to cover the 1940 liability, increased by the rise in the standard rate. Thus, the management is able to repeat the total ordinary payment of 15 per cent, and the transfer of £50,000 to general reserve; to raise the transfer to development reserve from £60,000 to £82,651; and to increase the carry forward from £136,121 to £150,029. The balance-sheet shows a number of swollen liquid items. The chairman, Mr N. B. Brooks, points out that the rise in debtors from £519,723 to £543,428 is due to the latest advance in the price of coal, and that the jump in creditors from £1,080,393 to £1,310,016 is mainly a function of tax liability outstanding. The £400,000 of newly acquired tax reserve certificates have been liquidated in settlement of tax claims since the date of the accounts. The redemption during the year of £400,000 6 per cent debentures has freed the debenture redemption fund of £141,389 for general application. This sum is now added to development reserve which, with the latest transfer from profits, is brought up to £500,000. Mr Brooks states that output again exceeded that of any pre-war year. The return of men from the forces, however, did no more than maintain the total number of the company's employees, and there is no doubt that labour supply remains a critical factor. On the question of the ultimate organisation of the industry, Mr Brooks understandably stresses the importance of arriving at a permanent settlement with the minimum of delay. The £1 ordinary stock, at 52s. ex dividend, yields £5 15s. 3d. per cent.

English Electric Assets

The sole addition to the information contained in the preliminary statement of English Electric concerning profit allocations to be extracted from the full accounts for last year is that general reserve again receives the usual £100,000, permitting an increase in carry forward from £51,018 to £53,030. The rise in profit, apart from the Napier dividends, suggests a considerable expansion in capital employed, but there is little indication of this in the accounts. Fixed assets are higher by £54,253, after providing depreciation of £100,000. Total liquid assets are £209,000 higher on the year, while the net figure is down by some £93,000. There is a substantial transfer from debtors to stock-in-trade, and the bank overdraft is reduced by almost £1,500,000 against a slightly smaller rise in creditors. The principal changes of interest are those associated with the Napier acquisition. Almost 90 per cent of the capital has been acquired, and this is taken in at par, namely £493,495. This already constitutes a considerable undisclosed reserve. The English Electric shares, issued in exchange, amount to only £394,669 at par. There is no addition to published reserves on account of the difference, which is some £98,000 after allowing for purchases of fractions in cash. There is thus a further hidden reserve of this amount. Since, however, the company's fixed assets are already so written down that it is earning some 25 per cent, after taxation and all charges, other than a nominal depreciation, on them, such minor concealments hardly matter.

Imperial Tobacco Assets

As was suggested in a note on the preliminary statement in *The Economist* of January 30th last, profits of Imperial Tobacco, after depreciation and tax, are some £11,000 lower at £7,970,338 against £7,981,241. The allocation of profits is analysed in the following table, which shows that the concern is able to maintain the 17½ per cent tax free ordinary dividend, to repeat the transfer of £500,000 to general reserve and to raise the carry forward from £1,666,436 to £1,701,032. Despite the increased tobacco duty, the group is still able to sell its full quota of supplies. The rise in the balance sheet value of assets of £20,000,000 to £117,125,374—which took place exclusively among liquid assets—reflects mainly financial factors. Thus, as Lord Dulverton points out, the rise in stocks from £28,527,715 to £43,869,197 is due in part to an increase in holdings of manufactured goods, but mainly to the inflation of values caused by the rise in duty. This factor also explains the jump of some £7,640,000 to £29,976,761 in debtors, while that of £10,725,000 to

	Years ending October 31,

*After tax and depreciation. †Tax free. ‡Gross.			

£41,089,490 in creditors is due to the time lag in collecting taxation from profits. On first inspection, the balance sheet suggests that the acquisition of £7,000,000 of tax reserve certificates has been financed directly by the new bank loan of £7,500,000, and the position is discussed in some detail in a finance note on page 243. The net result of the various adjustments of liquid items is a rise in excess liquid assets of £1,864,826 to £33,486,324. Net loans from associates and subsidiaries have risen from £20,582 to £1,170,614. The financial position remains sound and the profit earning prospects of the group are as good as could be expected in present circumstances. It is unlikely that they would be seriously impaired by a further rise in the tobacco duty. The £1 ordinary shares at 148s. 7½d. ex dividend, yield £2 7s. 2d. per cent tax free.

Lampport and Holt

The preliminary statement of Lampport and Holt reports a fall in net profits for the year to December 31st last from £174,474 to £101,929. The company is repeating the 6 per cent ordinary dividend, paid in the three previous years, and covered in 1940-41 by equity earnings of 16.7 per cent. It would not be possible to repeat the 1941 transfer of £100,000 to depreciation of fleet without trenching on the carry forward, and it appears highly probable that there is a substantial cut in this provision. Indeed, the decline in net profits, which from inspection of the previous year's balance sheet would appear to be the direct result of loss of fleet, diminishes the inducement to allocate a heavy depreciation charge. At December 31, 1941, the company's statement showed ship and wharf properties reduced by £100,000 to only £439,510, while tonnage replacement reserve stood at £1,180,256 against £261,356 a year earlier. In addition, holdings of Government securities had risen from £100,000 to £274,804 and cash holdings from £841,654 to £1,792,532. There was also £394,600 available on Government tonnage replacement account. These figures suggest a considerable reduction in the total available tonnage and, in the circumstances, it is surprising that the drop in net profits is not more marked. At the present level, the ordinary payment is not in any danger. The resources available for rebuilding after, or during, the war are, however, almost certainly inadequate. On this point, the latest balance sheet should provide information of exceptional interest. The 6s. 8d. ordinary stock at 10s. 9d. yields no more than £3 15s. 10d. per cent, a level which implies market confidence in the management's ability to succeed in the post-war world.

Lister and Company Results

After the heavy fall in trading profit registered in the previous year, the 1941-42 results of Lister and Company for year ended November 30th last can be considered satisfactory. The latest trading profits of £216,521 compare with £144,814, to which level they were reduced last year from £347,459 earned in 1940. The larger part of the increase is absorbed by taxation, the company's liability having risen from £98,304 to £153,275. Equity earnings after meeting the preference payments total £37,753 against only £20,580, equivalent to 5.3 against 2.9 per cent. The ordinary dividend is raised from 2.5 to 4 per cent, double that paid in 1940, while in the preceding 7 years no payment at all had been made. The carry forward is increased some £9,250 to £22,744. In his statement the chairman, Mr W. H. Watson, states that operating difficulties have increased.

The growing shortage of labour has been met by concentration of various departments, but despite the reduced machinery activity a reasonable level of output has been maintained. Production has been concentrated on bulk goods and, in the case of yarns, on coarser counts, on which the profit margin is much lower than on the higher quality products. A new sponge rubber substitute called "Resilitex" has been developed, a purely textile product made on existing plant, and the demand appears to be highly satisfactory, although the real test must come after the war in more competitive markets. A rise of some £110,000 in cash to £289,413 and a new holding of £150,000 in Tax Reserve Certificates is accounted for by almost equal falls in debtors and stocks, the latter item now standing at £907,484. Creditors are slightly higher at £457,650, but the liquid position of the company is practically unaltered, net surplus assets totalling some £1,061,000 against £1,068,387. Provided that further labour reductions are not too severe, it is likely that the company will be able to maintain the latest results, having by now fully adapted itself to the new conditions. The £1 ordinary shares, which rose sharply on the increased dividend, now stand at 15s. 3d. and yield £5 7s. 7d.

British Tin Investment

In 1942, British Tin Investment was for the first time thrown back upon an income drawn solely from the small minority of its investments held outside enemy occupied territory. Thus, gross income has dropped from £301,431 to £27,042, and even with a fall in taxation from £28,474 to £3,435, there is only £17,230 against £256,370 available for the ordinary capital, representing some 1 against 14.4 per cent. There is, of course, no dividend, and the whole surplus is added to the carry forward, which is raised from £78,992 to £96,222. There is no prospect of any recovery from this low ebb of revenue until Japan is evicted from the conquered territories. The liquid position, although unsatisfactory, has improved. There is, of course, a marked recession in all liquid items, but the surplus of liquid assets is raised from £2,294 to £29,487, while advances to a subsidiary are down from £152,297 to £125,996. The directors state that investments quoted in London, which represent 87½ per cent of all holdings, show an appreciation of some 19 per cent at the date of the balance sheet compared with end December, 1941. There is still a substantial depreciation against the balance sheet valuation of £2,656,597, which cannot be eliminated under present conditions. The 10s. shares stand at 9s. 3d., which suggests a strong faith in recovery prospects.

Industry and Trade

Progress of Concentration

In a review of the progress of industrial concentration at a press conference last Monday Mr Dalton pointed out that some 250,000 workers had been released and 137 million square feet of factory space made available for other purposes; concentration had been carried out in 52 industries and was still in progress in nine others. Among the industries at present undergoing a process of concentration, clothing is the most important. Clothing concentration is being carried out on a regional basis, with Leeds and Manchester the main areas. In Leeds about 1,000,000 square yards of factory space have already been released, but little progress has as yet been made in Manchester, and less in London. The present programme of industrial concentration is nearing completion; the additional labour and factory space likely to be released is probably small. The 250,000 workers released by the closing down of factories do not, however, include the workers in factories which switched, partly or wholly, to other work. As this number is unknown, the total number of workers released by the present concentration programme is nearing completion does not mean that the work will soon come to an end. There may be need for frequent adjustments in the light of changes in the war production programme. Indeed, the process must be one of continuous adaptation.

Estate Agents to the Government

In creating the Control of Factory and Storage Premises as a department of the Board of Trade in April, 1941, the Government has set up its own estate agents for factories and storage premises. Originally, the purpose of the Control was chiefly to act as a clearing house for the re-allocation of factory and storage capacity released by the concentration of industry scheme. But its scope has been steadily extended. For example, it also draws on factories engaged mainly on non-essential work, or on work which could be done by other firms whose factories are not required for other purposes. By the Location of Industry (Restriction) Order, 1941, as amended by the Order of 1942, it was given control over the movement of industry, in that the transfer of existing businesses to other premises and a change in the type of work carried on in a factory was prohibited except by licence. In fact, an organisation has been set up—the Controller-General and his staff are assisted by twelve regional controllers—which is in a position, within the limits of available accommodation, to provide Government departments and their contractors with the production and storage capacity they require for war purposes in the most suitable buildings as quickly as possible. While its activities are limited to existing premises, no new construction project is sanctioned without previous reference to the Control's "books." There can be no doubt that the

Control has economised resources by avoiding unnecessary construction and, simultaneously, has been instrumental in speeding up the expansion and dispersal of production and storage. Since its creation, premises have been found and handed over for essential purposes at the rate of five to six million square feet a month. The Control should be able to play a useful part during the change-over from war to peace production after the war.

Combined Copper Committee

Last week it was announced that the Governments of the United States, Great Britain and Canada have set up a Combined Copper Committee. Mr H. O. King, jun., chief of the Copper Branch of the US War Production Board, has been appointed chairman of the new Committee. Its other members represent the three participating Governments as well as the Combined Production and Resources Board and the Combined Raw Materials Board. Both in its composition and its tasks the new Committee is analogous to the Combined Steel Committee appointed last December. It is merely a fact-finding and advisory body on matters which are not the direct concern of the Combined Raw Materials and Production and Resources Boards. In a review of copper supplies in *The Economist* on August 15, 1942, it was pointed out that the Axis countries were using their copper far more economically than the United Nations. In spite of the fact that world production is at a record level, and that the United Nations control something like nine-tenths of world supplies of this vital material, copper has become one of their scarcest materials. One of the main tasks of the new Committee will therefore be to study ways and means of increasing the efficiency in copper consumption and to make recommendations to secure the translation of the results of this study into practice. Similarly, the Committee is to consider the possibilities of increasing the copper supplies of the United Nations. But the decisions will lie with the Combined Raw Materials and Production and Resources Boards.

Coal Trade Profits

Colliery companies in Great Britain have now been informed by the Ministry of Fuel and Power of the price allowances to be given them out of the national pool under the new centralised financial arrangements. By these arrangements each coalfield is given a datum credit balance, and under the procedure adopted for the administration of the scheme each undertaking is authorised to deduct from the 5s. levy now payable by it into the pool such price allowances as the Ministry, acting through an Advisory Council on which the owners and workers, as well as the Ministry, are represented, may determine from time to time. The allowances vary according to the financial needs of each district, and although usually the allowances authorised apply uniformly to all collieries and to all classes of coal, exceptional differential arrangements apply in South Wales and Scotland. The district uniform allowances range from 1d. per ton in Somerset to 4s. 4d. per ton in Cumberland; among the principal coalfields they range from 7d. in Northumberland to 1s. 7d. in Yorkshire; while the differential allowances include 2s. 2d. per ton to certain collieries in Lanarkshire compared with 8d. per ton for other Scottish collieries; 3s. per ton on South Wales washed and graded bituminous coals and 6s. 5d. per ton on South Wales anthracite coals. In the aggregate these allowances, which apply to the first three months of the year, ensure approximately a national credit balance equal to that in 1938, but they are subject to review at the end of each three months. Their effect will be to raise the level of credit balances in the exporting districts, principally South Wales, Durham, Northumberland, and some Yorkshire collieries, at the expense of the normally most profitable of the collieries dependent mainly or exclusively on the inland trade.

Rise in Unemployment

The numbers registered at employment exchanges as unemployed on January 18th are the last ones to be given monthly. In future, unfortunately, they will only be published quarterly, and the next return will relate to April 12th.

The numbers unemployed on January 18th were 99,017—a rise of 13,193 since December 14th. About 6,000 of the rise is due to boys and girls leaving school in December; the increase in the numbers of men and women wholly unemployed was 1,977 and 3,598 respectively. The increases affected every region except two. The classified figures, with those for December 14, 1942, are given in the accompanying table. From February 22nd the Control of Engagement Order is to be extended to include women up to the age of 41, and from that date, with certain exceptions, they must obtain new employment through a labour exchange. Two new industries have lately had Essential Work Orders.

REGISTERED UNEMPLOYMENT IN GREAT BRITAIN			
	Wholly Unemployed	Temporarily Stopped	Persons Normally in Casual Employment
Dec. 14, 1942			
Men	46,078	1,147	2,695
Boys	7,128	1	4
Women	22,337	817	159
Girls	6,400	58	—
Total	81,943	2,023	2,858
Jan., 1943			
Men	48,055	1,283	2,083
Boys	10,279	8	1
Women	25,935	1,674	110
Girls	9,439	149	1
Total	93,708	3,114	2,195

applied to them: stoneware and boot and shoes manufacture. Discussions between the Minister of Labour and the industrial catering trade on the subject of an Essential Works Order, asked for by the trade, were adjourned last Monday. The WRNS expects to increase its numbers by 20,000 this year. The Women's Land Army is now in a position to recruit 1,000 members a week. The LCC is asking for 900 nurses so that hospital beds can be put to full use. Mobilisation has now reached the stage where it is necessary to direct part-time workers into less essential work in order to continue to provide service to civilians.

Utility Cottons and Rayons

The first comprehensive display of cotton and rayon utility fabrics is on show in Manchester, and contains more than 2,000 samples, contributed by over 350 manufacturers. This represents an average range for each manufacturer of less than six "lines" and the samples cover cloths suitable for all clothing purposes. All the fabrics conform to the Board of Trade's quality specifications and price schedules. The number of specifications in the Utility schedule on which the 2,000 samples are based is about 160. The manufacturers are left free in the matter of design and the numbers of different designs they may produce from each basic specification. In contrast, pottery manufacturers are limited by the Board to a maximum number of different designs of each article they may produce. The cotton and rayon manufacturers do not appear to have been unduly lavish in fixing the numbers of "lines" to be produced, and it can be assumed that economy of labour is of paramount importance in weaving. The materials themselves are attractive, the designs simple, and colour is sufficient. Fears that "utility" would produce dullness and uniformity are proved by the exhibition to have been unjustified. The cotton fabrics will retail from about 1s. 4d. to 3s. a yard, and the rayons will range from 2s. to 6s. a yard. The productive capacity of the cotton trade is being heavily taxed and more orders than usual have been placed this month. Demands for the Forces are met first, but utility production is otherwise given high priority. Utility cloth of all kinds now amounts to 80 per cent of production for civilian use and according to a statement by the President of the Board of Trade, the limit has been reached; for technical reasons, utility specifications cannot cover all productions.

December Shopping

There was a rise of about 14 per cent in the average value of daily retail sales in December, 1942, compared with the average of the previous twelve months. The index

for all sales (1937 = 100), published in the *Board of Trade Journal* on February 6th, was 123 for December, compared with 106 for November and an average of 108 for the year to November, 1942. Rises were recorded in all departments except household goods, where the index, at 81, was the same as the average for December, 1941, to November, 1942, though there was a rise of 12 in the index from

PERCENTAGE CHANGES IN AVERAGE DAILY VALUE OF RETAIL SALES FROM PRECEDING YEAR

	Food and Perishables	Non-Food Merchandise	Total
Feb.-Dec., 1940	+2.4	+5.1	+3.6
" 1941	-1.6	-6.9	-3.8
" 1942	+3.6	+1.3	+2.6

November. The general rise compares with a normal peacetime rise of 28 per cent for the Christmas shopping month. On the whole, there was a decline of 1.9 per cent in the volume of sales between December, 1941, and December, 1942. The non-food decline was 2.8, and the food and perishables, 1.2 per cent. The accompanying table shows the percentage changes in the average value of retail sales from the preceding period, for February to December, 1940, 1941 and 1942.

Safety in Mines

There is a real danger that the drive for increased output in coal mines may lead to an increase in accidents, owing to the shortage of materials, especially timber, the use of inexperienced men at the coal face and, possibly, a relaxation of safety precautions. The accident rate has increased considerably since the war—997 people were killed in mines and quarries in 1941 as compared with 887 in 1939—and over half of these deaths were caused by falls of ground. It is, therefore, satisfactory to learn that the Safety in Mines Research Board is carrying on its work, in spite of the difficulties of wartime. The Board's 1941 report which has just been published, shows that research has been conducted over a very wide field—coal dust explosions and methods for the reduction and collection of coal dust; the preparation of more dispersible stone dust; firedamp explosions; falls of ground; the use of concrete pit props and the strengthening of timber props; the metallurgical examination of haulage; wire ropes; and protective clothing are all engaging the attention of the Board at the present time. The Board also co-operated with the Pulmonary Diseases Committee of the Medical Research Council which published an extremely valuable report on the incidence of these diseases among South Wales miners last year. It is a pity that the war should have made it difficult for the Board to carry on its arrangements for giving "safety instruction" to miners, since it is during wartime that the risks are highest and the need for constant vigilance greater.

Agricultural Research

A great deal of interest has lately been expressed in the question of the co-ordination of scientific research at all levels of production. The report of the Agricultural Research Council provides a timely and useful survey of how agricultural research is organised and co-ordinated. The Council itself is one of three Government bodies established under the Lord President of the Council "to promote and co-ordinate scientific research on all problems that affect the life and activities of the nation as a whole." It works in close contact with the other two organisations within the group, the Department of Scientific and Industrial Research and the Medical Research Council, and assists the Ministry of Agriculture and the Scottish Agricultural Department in making the knowledge and experience gained from research available to the practical farmer. The Council also keeps in close touch with the Universities and Agricultural Colleges and provides special grants to stimulate the development of research and to train young scientists. The Council is responsible for the organisation of a number of Research Institutes; others come under the control of the Ministry of Agriculture, but the great majority are independent establishments, financed by Government grants and working under the general co-ordination of the Agricultural Research Council. The Rothamsted Experimental Station, the East Malling Re-

search Station, and the various research stations and institutes at Cambridge come under this category. The Council's Report gives details of the research programme that is being carried out in various subjects, such as soil fertilisers, crop physiology and husbandry, plant breeding and genetics, grassland management, animal nutrition, dairying, storage and processing, pest control and forest products. One practical example of the value of research work was mentioned at the recent conference of the Association of Scientific Workers. To combat the wireworm pest, estimated to have caused a loss of 250,000 tons of food in each of the three years of war, a national wireworm survey was instituted under the auspices of the Agricultural Research Council. This is a subject which had previously been grossly neglected, but as a result of the survey improved methods of reducing the dangers of the pest have been devised.

The great majority of agriculturalists are, rightly, engaged on research into the urgent problems created by the war, when the need for attaining maximum productivity from the soil and eradicating pests and diseases in crops and animals is vital, but it is satisfactory to learn that post-war questions are not being neglected. The Agricultural Economics Research Institute at Oxford, under the direction of Dr C. S. Orwin, after a preliminary study, has found that farm and field boundaries all over the country were devised fully a century ago, that no material additions have been made to buildings and permanent equipment since about 1880 and that, on the other hand, there has been a complete revolution in the sciences of plant and animal production, in facilities for the mechanical cultivation of the land and in the conditions of agricultural employment. From these facts the Institute concludes that a national survey is desirable to ascertain to what extent these antiquated farming units are meeting the needs and opportunities of modern farm practice, and how far they offer scope for the trained farm manager, the employment of modern farming machinery and the specialisation of agricultural labour. Such a survey should also show whether the physical and social conditions of rural life are adequate and whether any changes are necessary in the present system of land tenure. The Institute is planning to undertake a sample survey in a specific area and the results will be awaited with interest. Clearly these subjects are vitally important, if British agriculture is to take the place in the post-war organisation of the country as an efficient and economic branch of industry.

Furniture Industry Compensation Fund

The utility furniture scheme involves the closing down of some furniture manufacturers, who are to be compensated from a central fund. Working manufacturers will pay into the fund 75 per cent of the difference remaining after receiving their estimated costs, plus 6 per cent of the maximum price. Closed firms will receive payments for care and maintenance of closed works and shops, and a division of profits. Those eligible to participate are "furniture manufacturers as defined in the Domestic Furniture Orders, who have worked upon timber supplied through the Timber Supplies Committee," who drew timber on quota after October 31, 1941, and were manufacturing domestic furniture on October 1, 1942. The scheme has been worked out by elected representatives of the furniture trade under an independent chairman nominated by the Board of Trade. An association is being formed to which both designated and closed firms will belong. The accountancy period is to be six months, and a review of the financial basis of the fund is provided for after six months, with a subsequent annual review. Manufacturers' costs, as declared by the Board of Trade, will be reviewed after six months, and they may be reviewed on the demand of any interested party.

GOVERNMENT OF SOUTHERN RHODESIA FOUR AND A HALF PER CENT. INSCRIBED STOCK, 1958-68. CITY OF JOHANNESBURG

FIVE PER CENT. INSCRIBED STOCK, 1950-60.

NOTICE IS HEREBY GIVEN that in order to prepare the dividends due 1st April next the BALANCES of the several accounts in the above-mentioned Stocks will be STRUCK on the night of the 1st March, and that on and after the 2nd March the Stocks will be transferable ex-dividend.

For Barclays Bank (Dominion, Colonial and Overseas).

COMPANY MEETINGS

BRITISH-AMERICAN TOBACCO
COMPANY, LIMITED

RESULTS NOT UNSATISFACTORY

SIR H. CUNLIFFE-OWEN'S REVIEW

The fortieth annual general meeting of British-American Tobacco Company, Limited, was held, on the 15th instant, at Townsend House, Greycoat Place, Westminster, S.W. Sir Hugo Cunliffe-Owen, Bart., the chairman, presided.

The chairman, in the course of his speech, said: Referring now to the balance-sheet, you will notice that certain items show very substantial changes as compared with the previous year and I propose to confine my remarks to these items. Taking the asset side of the balance-sheet, loans and current accounts with subsidiary companies (less provision for doubtful accounts) shows a reduction of £3,473,810, as compared with the same item in last year's balance-sheet.

To some extent this reduction is due to the capitalisation of part of the amounts owing by subsidiary companies which is, of course, reflected in an increase in shares and bonds in subsidiary companies. It is also partly due to the fact that during the year under review your directors have thought it advisable to set up out of income an amount sufficient to cover the whole of the sums—fortunately not large—still due from companies now in enemy or enemy-occupied territories. For the most part, however, the reduction in loans and current accounts with subsidiary companies is due to repayments by subsidiary companies of moneys advanced.

STOCKS OF LEAF

Stocks of leaf, manufactured goods and materials at cost or under shows a substantial increase of £2,415,119 as compared with the corresponding figure in last year's balance-sheet. This is very largely due to the increased value of leaf tobacco.

You will have noticed a new item on the balance-sheet this year—"Tax Reserve Certificates"—which your company held to the value of £5,000,000 at the end of the financial year. In considering this item, I want you also to look at an account on the opposite side of the balance-sheet, "Creditors, including provision for taxation and contingencies," which has increased during the year by £3,596,944.

It has been your company's policy since the outbreak of war to place any surplus funds at the disposal of H.M. Government, with a view to assisting in the prosecution of the war. In addition to the purchase of War Loans, this has been accomplished during the past few years by paying part of your company's tax liability in advance of due dates.

During the year under review, the same policy has been followed, but instead of actually paying taxes in advance, your company has purchased Tax Reserve Certificates, which can be used for the payment of taxes due at any time within two years from the date of their purchase. This will explain the substantial purchase of Tax Reserve Certificates during the year, and, for the most part also, the large increase in "Creditors, including provision for taxation."

PROFIT AND LOSS ACCOUNT

This brings me to the profit and loss account, from which you will have noticed that the net profit for the year, after making provision for taxation and contingencies, amounts to £3,065,348, representing a reduction of £1,022,216 as compared with the previous year.

Last year we carried forward a balance of £2,338,157. To this must be added the profits as previously mentioned (£3,065,348), less the dividend on the 5 per cent. preference stock of £225,000, on the 6 per cent.

preference stock of £360,000, and the three interim dividends paid during the year on the ordinary stock, amounting to £1,979,813, leaving a disposable balance of £2,838,692, out of which the directors recommend the distribution on March 31st next of a final dividend (free of U.K. income-tax) on the issued ordinary stock of 4d. per £1 of stock, amounting to £395,963, leaving £2,442,729 to be carried forward. During the year under review only one dividend was received from China, and an amount equivalent to the net dividend after tax was set up as a reserve against your company's substantial investment in China.

During the year under review, increased taxation has been imposed on the earnings of many of your company's subsidiary and associated companies in various parts of the world, which has naturally affected the net earnings of those companies and their dividend policy. Taking all the foregoing into account, I do not think you will consider the results unsatisfactory.

SUBSIDIARY COMPANIES

I think you would like me to say something with regard to our subsidiary company in the U.S.A., in connection with whose financial arrangement with Reconstruction Finance Corporation I made reference at the meeting last year.

In addition to increased taxation, our subsidiary company in the U.S.A. is also feeling the effects of high leaf prices, to which I have already referred; nevertheless, I am glad to be able to tell you that the first of the notes which matured in May, 1942, was duly redeemed, and I have every hope that our subsidiary company in the U.S.A. will be in a position to redeem on the due date the second note, which matures in May, 1943.

Your company, and its subsidiary and associated companies in many parts of the world, had to contend with very considerable difficulties in connection with the supply of leaf and other materials. Though these difficulties do not get any less, I hope that your company will still be able to deal with them successfully.

THE OUTLOOK

Under present abnormal conditions I do not believe you will expect me to express an opinion as to what lies ahead of us; but in the absence of some major catastrophe, I am hopeful that at this time next year your directors will be able to put before you a balance-sheet no less favourable than that now under review. I am not pessimistic about the future. We all of us live in confident anticipation of complete victory, not only in Europe but in the East. When that happens, great prospects of world recovery are evident, but we must remember that there will be many difficulties to be overcome and problems to solve for a considerable period of time.

I now beg formally to move the adoption of the report and balance-sheet for the year ended September 30, 1942, including the payment on March 31st next of a final dividend (free of United Kingdom income-tax) on the issued Ordinary stock of fourpence per £1 of stock.

I may also mention that the directors have declared for the year 1942-43 an interim dividend of tenpence per £1 of stock (free of United Kingdom income-tax) also payable on March 31st next, so that the ordinary stockholders will receive on that date 1s. 2d. per £1 of stock.

Mr M. L. Whishaw seconded the resolution, which was carried unanimously.

BARROW, HEPBURN AND
GALE, LIMITED

FURTHER STEADY PROGRESS

The annual general meeting of Barrow, Hepburn and Gale, Limited, will be held on the 25th inst. at Winchester House, Old Broad Street, London.

The following are extracts from the statement of Mr G. W. Odey, the chairman and managing director, circulated with the report and accounts:—"The accounts disclose that the steady progress of the company in recent years has continued during the past year. Production and turnover have been maintained at practically the levels reached in 1941, which, in view of the increased demands of the Services upon our labour supply, is no mean achievement. Whatever the future may hold, the company can look back on its war effort during 1942 with pride and satisfaction."

LARGE TAXATION RESERVE

Once again it has been necessary to make a large reserve for taxation. As far as E.P.T. is concerned, your company has since the war began incurred a total liability of approximately a million and a half, and of this liability over a million has already been discharged in hard cash. It will be seen that our resources are equal to this obligation, but it is only because we have pursued a most conservative policy with regard to dividends and by a continuance of our policy of ploughing back some portion of our profits into the business.

Turning to the accounts of the parent company, the profits, after making reserve for taxation, were £66,878, compared with £70,293 for 1941, but after allowing for the reduction in the War Damage Contribution and the amount of £10,000 written off the buildings of subsidiary companies, the net profit carried to the balance-sheet is £48,320, which represents a small increase on the net profit for 1941.

The 6 per cent. dividend on the preference and ordinary shares, after payment of tax, absorbs £37,500 and leaves us with a carry-forward of £100,080. The steady increase in our carry-forward of recent years has thus been well maintained, and at our present rate we have approaching three years' dividend in hand which, after the past vicissitudes of the company, must be a very reassuring position for the ordinary shareholder.

The outlook for 1943 with regard to both supplies of raw material and labour is not good, and there is little doubt that our turnover and profits in the coming year will suffer a diminution. At the same time, having regard to our relatively low profit standard, the possibility of our profits falling below our standard would appear to be a most unlikely contingency.

POST-WAR POSSIBILITIES

With regard to the post-war position, I feel that we can look forward with justifiable optimism. Our productions which are vitally needed for war are, with the exception of our equipment department, equally needed for peace, and even in our equipment department our change-over from war to peace production has already been planned and will be speedily accomplished.

The demand for leather, both in this country and on the Continent, will be considerable; in fact, for two or three years after the war the demand will probably be overwhelming. Europe, we know at the present time, is starved of leather. Provided that the necessary raw materials are imported, and suitable financial arrangements can be made, the tanning industry in this country, with the improvement in its organisation, will be well able both to replenish civilian stocks in this country and also to contribute to Europe's needs. In spite of difficulties affecting labour and limitations in the choice of tanning materials available, the quality of leather has been fully maintained at pre-war standard.

WHITEHALL ELECTRIC
INVESTMENTS, LIMITED

An extraordinary general meeting and class meetings of the stockholders of this company were held on the 17th instant, in London.

The Hon. Clive Pearson, the chairman of the company, who presided, said that in the autumn of last year it had been considered wise in the world conditions ruling to take advantage of an opportunity to sell the company's property in Spain. In the judgment of the board, the prospect was unfavourable for the employment of those resources in suitable investments in electrical utility undertakings, and the company consequently had more capital than it required for its business. In the circumstances it was thought proper to propose to the stockholders a partial repayment of their capital.

The scheme submitted sought to be just as between stockholders, and in his opinion would, if adopted, strengthen the position of the company itself. The board had no hesitation in expressing their belief that the scheme was satisfactory to the company and fair to the two classes of stockholders.

In its essence the scheme might be said to be:—

1. The repayment of 10s. of each £1 preference stock held.
2. The payment on March 31st of the dividend for six months to that date at the full rate of 7½ per cent. per annum and the payment of all arrears of dividend amounting to 3½ per cent.
3. The reduction from 7½ per cent. to 6 per cent. in the rate of the cumulative dividend on the remaining 10s. of preference stock.

4. The payment in cash by Whitehall Securities of 1s. in respect of each £1 of remaining preference stock.
5. The transfer free of cost by Whitehall Securities of £2 of ordinary stock in respect of each £5 of remaining preference stock.

A few comments might be helpful on the proposed transfer to the preference stockholders of £2 of ordinary stock in respect of each £5 of remaining preference stock. The ordinary stock had a balance-sheet value at the time of speaking of rather over 6s. per £1 of stock without attaching a value to the Athens investment, and there was applicable to the ordinary stock a current income of approaching 1 per cent. It was his belief that they might look to those figures showing an improvement in the years ahead. To such an extent as they might be reasonably optimistic as to future earnings, the scheme, which involved a reduction in the preference dividend, might appear as unnecessary. It was, however, clearly impossible to say when and by how much their income from Athens would be resumed, and it was exceedingly difficult to assess in time and amount the hoped-for improvement from their investment in American and Foreign Power.

Without the scheme, taking it as a whole, there was the disability that, pending a substantial improvement in the company's earnings, the preference dividend would not be earned, and the position of the stockholders and of the company would be unsatisfactory. What the scheme did was to utilise cash in the repayment of 10s. of each £1 of preference stock, reduce the rate of dividend upon the outstanding 10s., bringing dividend requirements within the company's earning capacity, and there was left the prospect that the dividend reduction might be made good by a dividend arising from the ordinary stock, which was to be transferred free of cost, and there was, not as a prospect, but as a certainty, the increased total value of what a stockholder received in comparison with what he previously held. The old preference stock had a value which could only be reckoned at below par, whereas the cash and value receivable could not be assessed at less than 22s. or 23s.

The resolutions were duly carried at all the meetings.

TEMPERANCE PERMANENT
BUILDING SOCIETY

STRONG FINANCIAL POSITION

The board of directors have pleasure in submitting the eighty-ninth annual report and statement of accounts covering a period during which war conditions have continued to curtail the normal activities of the society.

Shares and Deposits.—Despite the fact that no active steps have been taken to secure the inflow of new capital, the combined share and deposit receipts for the year under review exceeded the total for the preceding year by £70,019. Moreover, withdrawals from share and deposit accounts showed the considerable decline of £147,813 as compared with the previous year's low total—a fact which affords unmistakable evidence of the confidence of both classes of investor. The amount standing to the credit of shareholders and depositors at the end of the year was £5,025,675—an increase of £80,936 compared with the corresponding total for 1941.

Interest Rates.—While the rates of interest payable to existing shareholders have been maintained, the necessity for restricting new investments led the directors to reduce the interest yield to new share investors to 2½ per cent. and to depositors to 2 per cent., all interest continuing to be paid net and free of liability to income tax.

Mortgages.—During recent months there has been evidence of a growing demand for mortgage facilities, the effect of which is reflected in an increase of £127,153 in the year's advances. The directors continue to exercise the greatest care in the selection of properties, ample security remaining their primary consideration.

It is gratifying to report that notwithstanding the continuance of war conditions borrowers' repayments have been well maintained. The policy of granting sympathetic consideration to borrowing members suffering financial hardship has met with warm appreciation. It is none the less noteworthy that, despite the continuance of conditions beyond the control of the society, there should be some decrease in the number of cases to be included in the statutory schedules.

Assets.—The total assets now amount to £6,228,735, representing an increase during the year of £118,516.

War Damage.—The society's scheme for financing repairs to mortgaged properties, which have been subject to air raid damage, has proved of welcome assistance to borrowing members.

Taxation.—The heavy burden of income tax, national defence contribution and liability for indemnities under the War Damage Act, remains a substantial charge upon the society's funds—a total of no less than £95,388 being required to defray these obligations.

Profit and Loss Account.—The balance of profit for the year, after making due provision for all ascertained liabilities, including income tax, national defence contribution and interest due to shareholders and depositors, amounted to £33,498, to which has to be added the balance of £27,465 brought forward from last year's account, a total of £60,963.

This amount has been appropriated as follows:—

Addition to general reserve fund	£10,000
Addition to contingency fund	£27,826
Balance carried forward	£23,137

In addition to the above-mentioned allocation, a further sum of £2,377, arising from the recovery of amounts written off in previous years, has been transferred to the contingency fund from account No. 3.

Reserves and Liquidity.—The combined total of the general reserve fund, contingency fund and balance of profit carried

forward now amounts to £1,098,137, representing 21.85 per cent. of the aggregate share and deposit capital. In this respect the society continues to occupy the premier position among large building societies.

As cash and investments now total £786,128, the balance-sheet discloses a substantial degree of liquidity. During the year investments in Government securities totalled £350,000.

Board of Directors.—The directors report with deep regret the death on September 10, 1942, of Mr G. Bradshaw Walker.

Mr Seymour J. Price, F.C.I.B., has accepted an invitation to fill the vacant directorship.

Management and Personnel.—Mr A. W. Betts, F.C.I.S., general manager and secretary, having served the society for upwards of 37 years, retired on June 30, 1942, and was succeeded by Mr Ronald Bell, formerly assistant secretary-manager.

Despite the grave inconvenience occasioned by the calling up of trained personnel, the services offered by the society to its members and to the general public have been efficiently maintained. The directors record their deep appreciation of the services thus rendered by the general manager and secretary, the principal assistants and all members of the staff.

Conclusion.—Despite the increasing difficulties and strain of wartime conditions, the results of the year's activities add materially to the confidence of your directors in the capacity of the society to emerge from the war period with its exceptional financial strength and its essential organisation maintained, ready to play its part in the work of post-war reconstruction.

JUTE INDUSTRIES,
LIMITEDMR J. ERNEST COX'S
STATEMENT

The 22nd annual general meeting of shareholders of Jute Industries, Limited, will be held in the board room of the Association of Jute Spinners and Manufacturers, 5, Cowgate, Dundee, on Tuesday, the 23rd inst.

The following is the statement by the chairman (Mr J. Ernest Cox), which was circulated with the report and accounts:—

Trading profit, interest, dividends, and transfer fees exceed the previous year's figure by £14,033.

The usual sum of £50,000 has been transferred to reserve for depreciation and obsolescence, and £11,946 17s. 6d. has been provided to meet the liability for war damage contributions for the ensuing three years.

Under the heading of "Liabilities" in the balance-sheet, a sum has been included to cover deferred repairs.

After meeting the dividend of 4 per cent., less income-tax, on the preference shares, there remains, with the amount brought forward from the last accounts, a sum of £43,621. Your directors have thought it prudent, in the uncertainty of the times, to transfer £10,000 to contingent fund, leaving £33,621 to be carried forward.

Negotiations are still proceeding with a view to fixing our capital and profit standard for excess profits tax purposes. We are advised that the provisions made against this liability, as well as for income-tax and national defence contribution, are sufficient.

During the year £20,000 2½ per cent. National War Bonds have been sold.

Concentration of the industry has been arranged, and certain of our productive units have been closed. A compensation scheme has also been agreed to, under which we shall be called upon to make contributions based on profits, against which we shall receive payment for the units no longer producing.

The business of the meeting, to be held in Dundee, will be purely formal.

BOOKER BROTHERS, McCONNELL AND COMPANY, LIMITED

A GOOD RESULT

The annual general meeting of Booker Brothers, McConnell and Company, Limited, was held, on the 17th instant, in London, Sir Alfred Sherlock (chairman and managing director) presiding.

The following is an extract from the chairman's address circulated with the report and accounts: The net profits this year, after providing for taxation, are £18,000 better than the previous year. This extraordinarily good result is not due

to any increase in the earnings of our sugar-producing subsidiaries, but to much higher departmental trading profits arising from the extra spending power of the people in the Colony due to increased wages. The turnover of our Demerara branch was a record, but it is now impossible to secure replacements and maintain stocks. The profits of the estates during 1941 were much the same as in the previous year, but it is expected that the 1942 results will be a little less. In 1943 I am afraid the estates will not do much more than clear expenses. The outlook for the next year or two is therefore not bright, and we may find we are unable to continue the same rate of dividend and bonuses.

Turning to the balance sheet, the principal change is that Bookers Demerara Sugar

Estates, Limited, our main subsidiary, are now debtors instead of creditors. Sundry creditors have risen by £263,907, but on the other hand investments have risen by £100,000 and we have tax certificates for £90,000. Referring to the amalgamated balance sheet, the satisfactory feature is that reserves and surplus now amount to £943,000.

I would like to express our thanks to the Ministry of Food, Sugar Division, and to the Ministry of War Transport, Liner Division, for their consistently helpful and sympathetic attitude. I would also mention that we have found the Colonial Office most helpful and co-operative.

The report was unanimously adopted, and the proceedings terminated with a vote of thanks to the chairman, directors and staff, especially those in Demerara.

RECORDS and STATISTICS

STOCK EXCHANGES London

Note: all dealings are for cash

ALTHOUGH the markings record suggests that turnover in the markets has recovered slightly after the recent steady contraction, the expansion is mainly due to the burst of activity in the home rail market caused by the increased LMS equity payment. In practically all other sections, business has shown little change, prices remaining generally steady. There was little indication in the gilt-edged market that any considerable amount of the South African vesting money now being distributed was being invested in Government securities. The most likely explanation is the fact that the institutions have already effected the transfer, while much of the current money available is going into the tap issues. On balance, some of the long and irredeemable issues were slightly lower this week, although several of the short-dated stocks registered a few minor improvements. Insurance shares, however, were firmer on the Government's statement on the Beveridge Plan. The volume of business in the foreign bond market was insufficient to affect prices, with the exception of an occasional gain for Brazilian bonds. Following on the raising of the LMS ordinary dividend, the home rail market displayed considerable activity. Bargains marked on the first two days of the current week exceeded 1,400 and 1,000, but apart from a rise of a point for Southern deferred, advances were nowhere considerable. Already on Tuesday, some hesitancy became apparent as the market speculated whether the remaining companies would follow the example of the LMS board, and the following day profit-taking reduced prices among junior stocks. In the foreign rail market, Argentine rail stocks enjoyed scattered gains on occasional support, but a point advance for BAGS 4 per cent debenture was the largest movement recorded. Canadian Pacific ordinary fluctuated erratically with intermittent support.

shares were firm in the opening dealings. Smaller gains for several leading issues, notably John Summers, Stewarts and Lloyds deferred and Bolsover Colliery, were registered. Shipping shares were distinctly dull, and the initial setbacks, occasioned by the Lamport and Holt statement, for several leading issues were nowhere recovered this week. Despite several losses, the textile group was generally firm. Listers continued to advance on the recently increased distribution, while Patons and Baldwins and Tootal Broadhurst were firm. Several stores shares improved slightly at the reopening, while international issues were dull.

A general lack of incentive, coupled with revived fears of increased Union taxation, led to rather dull conditions in the kaffir market. Losses were widespread, ranging from $\frac{1}{2}$ to $\frac{1}{4}$. East Geduld and Union Corporation were among those to lose the latter amount, while Blyvoors and West Wit Areas lost 6d. and 7½d. respectively. West African mining shares were marked down on the concentration scheme. The rubber and tea markets were dull, business falling to a minimum. In the latter section Doars fell 1s., but New Dimbula rose the same amount. Continued absence of interest in the oil market led to several minor losses for leading issues. Mexican Eagles weakened on moderate selling early this week, but later recovered.

New York

Despite minor fluctuations throughout the various sections of the industrial market, prices in general remained quietly steady. An exception was the brewery group, which suffered an all-round reduction in quotations, ranging from 3d. to 1s. Tobacco shares, however, were firm, Imps improving $\frac{1}{2}$ on the annual report. Earlier gains for numerous issues in the motor and aircraft section were not always fully held, but the majority of net changes were for the better, although De Havilland after an initial gain of $\frac{1}{2}$ closed with a net loss of a few pence. An advance of 2s. for Lambert Bros. was the outstanding feature of the heavy industrial group, where Lancashire Steel Corporation "A" ordinary

OPTIMISTIC reading of the war news, together with ample funds, constituted the main influences on Wall Street during the past week. Despite some slackening in activity at the end of the previous week owing to the holiday, the reopening witnessed the largest turnover recorded for over 13 months. Large blocks of low-priced utility stocks were dealt in, and gains up to two points for numerous issues were recorded. Many were reduced the following day as support declined, but selling pressure was at no time great, although dealings again exceeded a million.

Total share dealings: Feb. 11, 1,409,000; Feb. 13*, 749,000; Feb. 15, 1,836,000; Feb. 16, 1,182,000; Feb. 17, 1,097,000.

Shorter Comments

Minerals Separation.—Total income in year ended December 31st last £88,235 (£116,957). Net profit £68,982 (£98,829). Income from royalties £61,004 (£78,551). Ordinary dividend reduced to 25 per cent from 40 per cent. Carry forward £118,695 (£104,662). Reserve remains at £350,000.

Pacific Gas and Electric (Sooes).—Consolidated gross operating income in year to September 30, 1942, \$124,546 (\$112,446). Net operating \$48,226 (\$43,746). Net income \$21,599 (\$21,680). Earnings available for common stock \$2.12 (\$2.20) per share.

GOVERNMENT RETURNS

For the week ended Feb. 13, 1943, total ordinary revenue was £83,028,000, against ordinary expenditure of £106,465,000, and issues to sinking funds of £65,000. Thus, including sinking fund allocations of £10,886,904, the deficit accrued since April 1st is £2,488,431,000, against £2,378,076,000 for the corresponding period a year ago.

COMMODITY AND INDUSTRY NEWS

Food Prosecutions.—Lives in December, 1942, there were 2,735 prosecutions under the Food Control Act, of which 2,538, or a percentage of 92.8, were successful. The total number of prosecutions during 1942 was 33,311, of which 31,397, representing a percentage of 92.8, were successful. These figures compare with a total of 29,329 prosecutions undertaken in 1941, with 27,475, or 93.7 per cent, successful.

Rubber Tyres.—The Salvage Recordal Board of the Ministry of Supply has begun the requisitioning of rubber tyres from laid-up vehicles in districts of London and Berkshire. Compensation will be paid to owners, and unusable tyres will go to salvage.

Standard Specifications.—The British Standards Institution has recently issued specifications for non-ferrous metals for armaments and vehicles, soft solders economising in the use of tin, and a specification for war emergency code of practice relating to the use of radio valves in equipment.

Cattle "Panel" Scheme.—Nearly 5,000 farmers now have their herds under the National "Panel" Scheme. Approximately 200,000 dairy cows are regularly examined by veterinary surgeons for mastitis, contagious abortion, sterility and Johne's disease. Loss of milk through these diseases amounts to 50 million gallons a year.

For Trading.—The Retail Fur Trade Association has published *Fur Trading* with the subtitle of "Guide to war legislation for fur manufacturers and traders." The handbook, which costs 5s., and runs to 60 pages, contains a full index, and covers all aspects of war-time legislation affecting fur traders. It sets out the minimum wage rates payable under the Joint Industrial Council for the Retail Drapery Trades agreement, and gives a useful ready reckoner for calculating maximum retail selling prices.

Building Wage Increase.—The National Council for the Building Industry has agreed upon an increase in basic wage of one penny per hour for craftsmen, three-farthings per hour for labourers, and begin on April 2nd. This brings the rate to a standard rate of 22½ per cent above the pre-war level. The application of the Building Operatives' Federation was an increase of 3d. per hour, and they asked that labourers' wages should be on the basis of 80 per cent of craftsmen's rates.

Coal Output.—During the four weeks ended January 23rd the output of coal was 3,813,400 tons, compared with 3,880,100 tons in the previous period. Only three districts qualified for output bonuses, compared with 12 in December. The percentage of targets reached by each district is shown in the following table:—

PERCENTAGES OF DISTRICT TARGETS REACHED*

During Four Weeks Ended

	Dec. 26th 1942	Jan. 23rd 1943
Northumberland	101.0	95.0
Cumberland	96.3	92.6
Durham	101.6	96.5
South Yorkshire	99.3	92.6
West Yorkshire	96.2	90.3
North Derbyshire	101.2	96.3
Nottinghamshire	103.2	98.1
South Derbyshire	106.2	102.3
Leicestershire	105.1	103.5
Lancashire and Cheshire	102.4	97.9

Warwickshire	99.7	91.8
S. Wales and Monmouthshire	99.9	93.6
Forest of Dean	99.3	96.1
Bristol	90.4	93.4
Somerset	107.2	104.5
Pile and Clackmannan	103.3	95.5
Lothians	103.2	98.6
Lanarkshire	98.6	95.5
Ayrshire	98.1	91.9
Kent	99.3	88.4

* Percentages based on output, adjusted for tonnage lost through holidays and circumstances beyond the industry's control. † Still under review.

Rayon Utility Cloths.—A new system has been established for dealing with the production and distribution of rayon utility cloths, and it is to operate for the four months ending August 1st. Merchants will be allowed to buy the styles they want from manufacturers with whom they have traded in the past. Production will continue to be planned by the Cotton Control in co-operation with producers of yarn and manufacturers of cloth. The chief alteration is that each allocation will be a bulk one instead of one for specific goods as before. The scheme places responsibility on members of the trade, which they have welcomed; it is calculated to provide more scope for enterprise and initiative.

The Debate Continues

THE House of Lords has taken a new high place during wartime in the deliberations of the nation. This week, Lord Nathan's motion afforded a chance to the Government to undo in the Upper House the ill effects of what its spokesmen said about the Beveridge Plan last week in the Commons. Lord Nathan epitomised the Commons debate in a phrase: "The Government is no safer from reproach in its Morrison shelter than in its Anderson shelter." By emphasising the points on which the Government agrees with the Beveridge proposals, instead of laying the same stress as Sir John Anderson and Sir Kingsley Wood upon the conditional and provisional nature of that agreement, the Home Secretary scored a political success; the landslide was arrested. But 119 Members voiced their protest against the Government's faint words by a hostile vote; the question "Has the Government accepted the Beveridge Plan?" remained unanswered.

The question came up for answer again in the Lords this week, and it was impatiently brushed aside by Lord Simon. It had been put plainly enough in the Commons debate by Mr Quintin Hogg in the most significant of the speeches made. He quoted Sir William Beveridge:

Reconstruction of social insurance and allied services to ensure security of income for all risks is a general aim on which all reasonable men would agree . . . if a plan

for freedom from want, so far as social security can give it, is to be ready when the war ends, it must be prepared during the war. . . . If His Majesty's Government accept the main recommendations of the Report, it is suggested that the first step would be to submit to Parliament resolutions approving the introduction of a scheme of social insurance and allied services, in accordance with the principles named, and approving the constitution of a Ministry of Social Security.

The Government did none of these things last week, and it was this which caused Mr Hogg, speaking as an avowed Conservative, to describe their attitude as "a major political blunder."

The question of whether or not we recover after the war depends in the main . . . upon our ability to continue the community spirit, new in time of peace, but not unfamiliar on the battlefield or in time of war.

The Beveridge Plan is a scheme, as Mr Hogg pointed out, for the abolition of want by the redistribution of wealth. It is not an assault upon that wealth, "because so long as you redistribute what is there, you cannot destroy the economic resources of the country." The Government has not yet said whether it will regard the prevention of want, by financial and physical means, as a first charge upon the nation's wealth, of the same order of urgency as the defence of the realm. Indeed, its spokesmen, Lord Simon even more than those in the

Commons, have suggested otherwise. They have nervously rejected the subsistence basis for benefits; they have professed themselves incapable of entering into "final commitments." They have failed to recognise that the comprehensiveness of the Beveridge Plan is its essence; that it cannot be approached piecemeal paragraph by paragraph, accepted here (in principle) and rejected there—however much modification and revision its details may, admittedly, require; that, to quote Mr. Hogg again

The Beveridge scheme, by introducing the principles of comprehensiveness and an equal rate of contribution, ensures to that extent that the wealth of the country should be redistributed as to put the burden equally upon the whole community.

Mr Hogg was content to accept all the implications of this central idea which the Government has ignored.

I have always been a believer in private property and private enterprise, but so long as there remain people who cannot have enough to eat, the possession of private property is a humiliation and not an opportunity.

The speaker was in tune with the high opportunity provided by the Beveridge Report to round off and consummate a generation of social policy, and with the deepset hopes and aspirations that the scheme has roused among millions of fighters and workers—both at home and abroad. The Government has spurned the second chance afforded by the Lords' debate. It still declines to accept, even if it has not rejected, the central idea of security. It has announced neither the way nor the means to achieve the prevention of want. Only if this central idea is accepted, if a programme to apply it by stages is begun at once, and if the administrative instrument to work out and effect that programme is fashioned now, can the Government claim to have accepted the Beveridge Plan in any true sense. It is for this reason that the institution of a Minister of Social Security, to build up by degrees both a policy and a Ministry to apply it, has come to be regarded, soundly, as the test of governmental good faith; and no statistical claims about the Government having accepted 70 or 80 per cent of the plan—in principle—can shake the validity of this test.

The issue is strangely simple. Is the prevention of want, by security of income for all risks and for all individuals and families, accepted as a *sine qua non*, regardless of what else may have to be sacrificed to ensure it? In wartime, willy-nilly, the principle of a National

Minimum for all citizens, in terms both of money and goods, is accepted and applied. Is this principle to be discarded in peacetime? It is nonsense to say, in absolute terms, that it cannot be afforded. If it can be afforded in wartime, when the stock of goods and services for civilian use and consumption are stringently restricted by the needs of war, how much more can it be afforded in the greater abundance of peacetime, when the lion's share of the nation's resources have no longer to be dissipated in shot and shell. It is, of course, true that, to afford it, some of the extras and luxuries of life will have to be set aside until the National Minimum is satisfied, just as in wartime all extra luxuries have to be set aside. First things must be provided first. But it is a matter of choice.

By all tests, it seems that the Government is prepared to accept almost all the Beveridge Plan—in principle—except this, which is the central idea. The notion, it seems, still lingers that voluntary thrift should be regarded, not as a means by which careful, hard-working and deserving citizens rise above subsistence level, but as one of the means that they should use actually to achieve subsistence. Burial costs, for instance, are to be a statutory benefit; but industrial assurance is to remain. The insurance agent is still to visit each working-class household with his insidious plea:

Look here, what is this £20 after death? What does it amount to? Why not have a little more and keep your other policies alive? Why not get some new ones for the children or a nice endowment?

The appeal of voluntary thrift should not be admitted until the National Minimum has been assured, in cash and in kind, by communal action. Then, rightly, upon a man's thrift, as well as his work, will depend his rating above or below his neighbours; that is the powerful and proper place of voluntary saving, to afford for men and their families the extra goods and services which their labours and their abstinence deserve—after want has been prevented.

Is the Government prepared to recognise the prevention of want—the effective rounding-off of the social services which are part of Britain's tradition—as a definite goal that can and will be achieved? Are, say, Sir Kingsley Wood or Mr. Bevin ready, for this purpose, to set aside, if necessary, some of the special interests for which they stand? That is the question, and no amount of debate or advocacy can diminish either its relevance or its urgency.

Towards a Full Alliance

WITH the Russian victories, a new phase has opened in the war. For the first time, the end of the struggle is, if distantly, in sight. After three years of hard and apparently endless fighting, men can begin to throw their minds forward to the day when peace will come. Peace—yes, but what kind of peace? To fight on to victory was an ideal great enough and simple enough to hold together half mankind in the coalition of the United Nations. But now that peace is looming up behind victory, where are the new ideals and principles?

It is in this half world of doubt and questioning that Goebbels is waging his new war of words. The strategy is two-fold: to dissolve the alliance between the three Great Powers, Russia, Britain and the United States; and to break down the unity of resisting Europe. At no time during this war has the Germans' propaganda arm been wielded so vigorously or so desperately, for it is their last weapon against certain defeat. It would be folly to ignore this threat, especially since the weapon they are using has proved effective in the past. The Bolshevik bogey helped Hitler to power. It helped him to break collective security. It helped him to smash France. It is true, as Mr Eden pointed out last Sunday, that the Allies know all about it by now; but this familiarity does not mean that no counter action is required. Nazi propaganda has never yet been worsted by being ignored.

There are already disturbing signs. The promising accord reached between the Russians and the Poles in 1941 has clouded over. The problem of divided resistance in Yugoslavia has appeared. Both are warning signals to the Allies to close their ranks.

The most urgent problems concern Russia, Britain and the United States. On the mutual understanding, trust and friendship of these three Great Powers the peaceful future of the world depends. It is useless to suppose that thoroughly cordial and confiding relations can be achieved before the opening of a Second Front. Most people, not sharing Lord Beaverbrook's apprehensions, assume that Britain and America are striking, and will strike, as hard as their difficult geography permits. But the fact remains that the disproportion of the British and American military effort is one of Goebbels' most effective propaganda points. To the Russians, he suggests the desire of "Anglo-Saxon plutocracy" to see Russia bleed alone; to the Europeans, he paints a picture of a devastated continent left to the mercy of the "hordes from the East."

The Second Front, the invasion of Europe, is the pre-condition of a closer and more concrete understanding between the Great Powers; but it is no more than that. The task of implementing the twenty-year Anglo-Soviet Treaty and of concerting with the United States an agreed line of policy is the next urgent step. The initiative ought

most certainly to come from the English-speaking Allies, for if the Russians are ever to become active partners in a functioning world order, they must be encouraged out of their radical distrust of the world outside Soviet Russia. Lend-lease and the Arctic convoys have started the work of breaking down this distrust. The Second Front will carry it on powerfully; but there must be some assurance that Russia's allies want co-operation and friendship beyond the immediate aim of defeating Hitler. The psychological importance of a twenty-year Treaty was very great; but it may be dissipated if it is not followed up. Mr Eden admitted in the House in December that so far no conversations had been held to amplify the agreement. Will the initiative be taken as soon as the opening of the Second Front creates a favourable point of departure?

Whatever the plans broached by Britain and the United States, they must be designed to prove their authors' sincerity in desiring to secure Russia as a partner. Any hint or suggestion that the Russians were being purposely excluded from the concerting of Anglo-American plans for the future would renew the old suspicions a hundredfold. So far no tripartite organisations exist, either in the military, economic or political field. The time is surely at hand for the Allies to establish some permanent and continuous liaison, possibly through a joint council. No amount of meeting between leaders in times of emergency can make up for the lack of a permanent organ for discussion and planning. The offer of such a council would also be a tangible symbol to the people of Russia that they are recognised in all aspects as the equal partners of the other Great Powers.

In the military sphere, the frequent proposal for a Supreme War Council is vitiated by the fact that the battles, separated by hundreds of miles, must be separately conducted. But the time is coming when the battles will merge and when the Allies can usefully discuss the extension of their wartime collaboration into a postwar framework for collective security. As Mr Morrison pointed out in his Guildhall speech:

Among the United Nations a special responsibility rests upon the Great Powers, particularly on Russia, the United States, China and ourselves, as wielders of what will be the overwhelming preponderance of armed might in the world. The sword of world justice and world sovereignty will be in the hands of these nations . . . [they] must see to it that in course of time they mobilise, behind the effective power they will wield, the free consent of all the free peoples of the world.

If agreement on such concrete issues as the disarmament of aggressor nations, the future of civil aviation or the possibility of joint bases could be reached, the generalities of the Atlantic Charter would begin to take on some meaning.

It is above all in the economic sphere that Britain and the United States can give concrete expression to their

desire for collaboration. The task of reconstruction before Russia is colossal. If help could be given in a politically acceptable form, the Russian people, who have suffered so much already, would be spared some hardship at least. It would be for the Soviet Government to determine the form the economic assistance should take—whether short or long-term credits—but the Allies have an opportunity here to carry over into peace the tangible effects of alliance, now represented by tanks and aircraft and food-stuffs and medical supplies.

This effort of friendship must be made, for it has yet to be proved that nations with such diverse ideologies can work together in a genuine partnership. Stalin believes that it is possible. In his memorable speech last November, he said:

It would be ridiculous to deny the existence of differences in the ideology and structures in the States which form the Anglo-Soviet-American coalition. But does this circumstance exclude the possibility of co-ordinated action by this coalition against the common enemy who threatens them with enslavement? Definitely it does not.

With good will and patience, Stalin's belief can be made fact; but, just as he does not deny the differences in ideology, so it would be useless to deny the problems which arise from those differences. They have to be met and it is far healthier for the successful prosecution of the war and for the peace settlement afterwards that they should be discussed in frankness and honesty now. Mr Morrison stated fairly the main issue when he said:

Solutions . . . must be sought by reasoned and moderate joint approaches to questions of difficulty and problems of change—approaches in which there is general readiness to sacrifice the old idea of unrestricted national sovereignty in the interest of common action.

What sort of Europe will emerge from the victory of Allied aims? A ruined bolshevised Europe, screams Goebbels, with property abolished, religion banished and western civilisation trampled underfoot. The Allies have already given their solemn though general answer in the Atlantic Charter, and probably no statesman has better outlined the general purposes of the Grand Alliance than Stalin himself:

The abolition of racial exclusiveness, the equality of nations and inviolability of their territories, the liberation of the enslaved nations and the restoration of their sovereign rights, the right of establishing whatever regime they like, economic assistance to the countries which have suffered and help to be given to them in achieving material welfare, the restoration of democratic liberty, and the destruction of the Hitlerite regime.

These are undoubtedly the peace aims not only of the Allies but of Europe's "little men," who have had their pastors murdered, their personal property confiscated, their trade unions abolished, their national identity stamped out. But it is time for the Allies to give more concrete expression to the manner in which they intend to keep faith with their own promises and

with Europe's oppressed, starved and decimated masses.

From Britain and America must come the guarantee that they do not intend to make a mockery of the peoples' resistance by restoring power and authority to those who have collaborated with Hitler. The tragedy of North Africa is that apparent military necessity dictated a course gravely compromising to the two Powers concerned—and to renaissance France. During the period of reconstruction, there will be pressure both in Britain and America to re-establish individual politicians or social groups who, on their record, should be debarred from all power and influence. Many of the industrialists, many of the large landowners have been pillars of Hitler's infamy. No desire to deal with people "who speak the same language" must be allowed to modify the democracies' attitude towards such men. A guarantee given now that the heavy industries through which the Germans have exercised continental control will not be restored to private ownership, but established as public corporations under international control might be a constructive contribution to the unity of Europe and incidentally a solution of the problem of a large quiescent class. The distribution of the land to the peasants in Hungary and Roumania might liquidate the influence of two other traitor groups. Active policies of this kind cannot of course be envisaged, except in the framework of a broader plan for the economic reconstruction of Europe. Here Britain and the United States, as the only two remaining nations with any surplus resources, must carry the responsibility. A guarantee that they are prepared to do so would allay much of the Goebbels-sown suspicion that Europe will be abandoned to quick occupation, or slow decay.

From the Russian angle, the guarantee most needed to stifle Nazi propaganda is that, in general terms, the Soviet Government will support and play a part in Europe's efforts to get itself into working order and, in particular, that the difficult frontier problems in Eastern Europe will be settled by agreement and not by unilateral action. The Poles are justifiably perturbed by the Soviet decision to treat as Soviet citizens all Poles now in Russia who have come from the territories assigned to the Soviets by the Russo-German Agreement of 1939. If this step means that without any attempt to reach agreement with the Polish Government or with their other Allies, the Russians intend simply to annex the lands they consider to be part

of the Soviet Union, then Goebbels' work is done for him. Stalin has expressly excluded this possibility in his Order of the Day to the Red Army:

It [the Red Army] has been created not to conquer other people's country but for the defence of the frontiers of the Soviet land. The Red Army always regarded with reverence the rights and independence of all nations.

But Russia's attitude to the whole frontier problem must be clarified now when the advance of the Red Army is bringing it to the anxious attention of Europe.

An agreed policy between the Allies would naturally not exclude the possibility of frontier changes; but it should lay down an orderly and acceptable procedure in accordance with the principles of freedom and independence already accepted by all the Allies in general terms. For example, no territory should change hands anywhere in Europe without a plebiscite conducted under impartial control. After any such plebiscite, those who voted in the minority should have the possibility of asylum in some other land where the rights they cherish are respected. If the people of Eastern Poland were to vote to remain with Poland, those who voted for the Soviet Union should be allowed, if they chose, to leave with compensation for their property. In the opposite event, the same right should be guaranteed to those who preferred to move into Poland. A similar procedure should be applied to the Baltic States.

These are admittedly difficult problems; but the less they are discussed in a spirit of confidence and understanding, the more insoluble they become, and the more potent in Goebbels' armoury. Neither the battle on land nor the war of words has yet been won. Stalin has warned the Allies of the tough struggle still to come, and in this tough struggle the confidence of the Allies in each other and of the enslaved peoples in them are factors of major military importance. It would be tragic indeed if all hopes of post-war understanding based on a common victory were defeated once again by "too little" and "too late"—too little discussion too late in the day. It is the enemies of Anglo-American-Soviet friendship who are throwing up the smoke screen of suspicion, obscuring every issue and keeping the problems back in a dark underworld of fear and doubt. It is the Allies' task to break through the difficulties by facing them and to build their alliance in the full light of day.

The Red Army

TWENTY-FIVE years ago, Russia, in the throes of a civil war, possessed no army. The fighting forces of the old order had ceased to exist. The new regime relied for its defence on some fifty thousand armed workers organised into Red Guards, and on a number of loose guerilla bands in the countryside. The military position of the new republic looked almost hopeless. The armies of the White generals were seizing vast territories; and about 200,000 former Tsarist officers joined their ranks. The German armies stood at the gates of Petrograd. Urging his followers to agree to the conclusion of the "shameful peace" of Brest Litovsk, Lenin stated on February 22nd, 1918:

We are now powerless. German imperialism has gripped us by the throat, and in the west I see no proletarian fists that will deliver us from the claws of German imperialism. Give me an army of a hundred thousand men—but it must be a strong, steadfast army—and I will not sign the peace treaty.

This was the starting point. The old military structure had been destroyed; the old discipline had been abolished. All that remained, after the revolution had achieved its work of destruction, was a seemingly amorphous mass. The critical point, familiar from the history of other revolutions, was reached when the disappearance of authority coincided with the pressing need to set up a new authority and a new discipline. The first step had to be made towards changing the chaos of anarchic decentralisation into a new centralised order.

Only in the process of that change could an army, by its nature the most centralised of institutions, be created. The transformation could only be achieved gradually; and all the stages of that evolution have been reflected in the composition and outlook of the Red Army.

On January 12th, 1918, the *Sovnarkom* issued a decree for "the creation of a socialist army, built up from below on the principles of election of officers and mutual comradeship discipline and respect." The decree betrays the dilemma with which the new rulers were confronted. The "election of officers" had been proclaimed as the principle of socialist democracy in the course of the Bolsheviks' struggle for power; it played an essential part in the disintegration of the old army. It could not easily be abandoned. There were no commanding cadres available to help in the task; it was hoped that they would emerge, by natural selection, from the rank and file.

On February 23rd, 1918, Trotsky, the new Commissar of War (who was to hold this office until 1925), was able to announce that the first detachments of the new army had come into existence. Only in a very limited sense can this date be regarded as the birthday of the Red Army. Conscription was not introduced; the new soldiers were volunteers. Not until June 12th was the mobilisation of several classes ordered. Even then, it was limited to the areas immediately threatened by the advance of the Whites; and it applied only to proletarian and semi-proletarian elements. A further extension of the conscription followed in October, 1919. Progress was hampered

by the antagonism between the socialist towns and the individualist peasantry. The official records mention nearly three million soldiers, mostly peasants, who deserted from the Red Army in 1919-1920—but fifty per cent of the deserters were induced to rejoin the ranks.

At every step, military necessities clashed with political considerations. The election of officers proved a suicidal fallacy in the field. A bold step was made to enlist the services of former Tsarist officers. Trotsky tried to build "the new structure with the old bricks." Within a few weeks he succeeded in recruiting forty thousand officers. Political control over the commanding cadres was maintained by the political commissars. Propaganda was supplemented by a tightening of discipline. The compromise between politics and military necessity met with violent opposition, headed by Voroshilov; but the compromise prevailed, and was maintained for more than two decades.

The victory of the Red Army in the civil war was due to the effectiveness of its political warfare rather than to its military efficiency. The civil war was fought with the most primitive weapons. At the peak of its strength, during the Polish-Soviet war in 1920, the Red Army possessed less than half a million obsolete rifles; and only one Russian soldier in five could be armed. The leaders of Soviet Russia knew that they owed their victory to an exceptional set of circumstances, social, political and military. They also knew that any future war would be fought very differently, and would demand a coherent and flexible military and technical organisation. On the morrow of the civil war, the principles of the new organisation and of the new strategy became the subject of the most thorough discussion.

The most startling feature of that discussion, in the early twenties, was its correct anticipation of the character of modern warfare. In his lectures on strategy Tukhachevsky preached the need to prepare for mechanised and armoured warfare. He forecast the "flying tank," and conceived the use of parachute troops. The participants in the discussion can claim rights of authorship to many of the devices used by the German *Wehrmacht* in 1939-40. The new strategy of lightning warfare was developed by Tukhachevsky—in connection with Utopian and Wellsian ideas of carrying the revolution into Europe "from without." But the chaff of revolutionary adventurism was gradually sifted from the sound strategic content. The one-sided offensive concept gave place to a more complex defensive-offensive attitude; and in the mid-twenties the Red Army was already mentally equipped for the battles which were to be fought fifteen years or so later.

What was lacking was material equipment. Russia did not possess the industrial capacity which is the basis for the modern strategy of total war. The glaring discrepancy between the new strategy and the old industrial poverty determined the outlook of the Red Army during the decade between 1924 and 1934. Against the opposition of Tukhachevsky, the Red Army was organised within the framework of the "militia system"; 74 per cent of the Red Army consisted of territorial units, the members of which used to undergo a short, two-monthly training in the barracks and six-weekly military courses every year. Less than a quarter of the Red Army's strength consisted of regular units. The political convenience of that system was beyond doubt. It gave the Red Army that peculiar democratic outlook, of which Jaurès in his *L'Armée Nouvelle* and other socialists somewhat naively dreamt in the quiet era before 1914. But the militia system, based on the attachment of fighting units to limited areas, was a liability from the point of view of a strategy of high mobility which envisaged deep sweeps by armoured columns. It was bound to be thrown overboard as soon as the material pre-requisite for that strategy was created.

The great reform was carried out in 1935. Stalin's Five Year Plans removed the discrepancy between strategy and economy. New and powerful industries sprang up which were able to give armour and wings to the ideas of the Command. What was now needed was a more coherent and a more centralised organisation. In 1935,

77 per cent of the Red Army was converted into regular units, and only 23 per cent remained militias. In subsequent years, the militias were fast disappearing. The Red Army assumed almost the outlook of a normal standing army in matters of military hierarchy and discipline. In the late 'thirties, the powers of the commanding cadres were to a large extent re-established along "orthodox" lines—although the process was not pushed to its final conclusions until 1942, when political commissars were at last abolished.

In 1939, a year after the completion of the second Five-Year Plan, Marshal Voroshilov was able to illustrate by certain figures the saturation of the Red Army with modern technique. The fire power of a Soviet division (raised from 13,000 to 18,000 men) was already about 30 per cent stronger than that of a German division. The fire power of the Soviet armoured forces increased by nearly 400 per cent between 1934 and 1939. The total carrying capacity of Soviet bombers increased from 2,000 to 6,000 tons of bombs. The commanding cadres were trained on a mass scale by a vast network of military schools headed by 14 military academies. By 1939 the Red Army was, in the light of these and similar figures, by far the strongest military force in the world—its intervention in the first phase of hostilities might have brought the war to a truly lightning conclusion.

Economy, strategy and organisation have given the Red Army its strength. The experience of the first Russo-Finnish war and the purge of the High Command created the impression of weakness. But the effects of the purge were limited and temporary. The Red Army has been able to draw on a vast reserve of young commanders, well trained and free from outmoded strategical and tactical notions. The explanation of the Finnish episode will perhaps be provided one day by historians with access to the archives of the Soviet High Command; what remains to be explained is the contrast between the initial Russian reverses and retreats in the war with Germany and the rolling sequence of its recent victories.

Stalin has explained the initial defeats by the fact that the Red Army was caught unawares by the German attack. From this, it would appear that Russia's reverses were due to political miscalculation rather than to military weakness. Whatever the truth, the factor of morale has almost certainly dominated over all the other factors—economy, strategy and organisation. In all its wars, Russia's morale has been at its highest when the invaders have swept deep into Russian territory. Charles XII was beaten at Poltava, Napoleon in Moscow, and Hitler at Stalingrad. The supreme danger has acted as an unflinching stimulus to the hidden and dormant forces of the nation. Once these forces are stirred nothing can surpass or equal the Russian people in stark heroism, in mute endurance and the genius for improvisation.

So far, the pattern of this war differs little from those of all the major wars fought by Russia. There is, however, one important source of strength which was absent before. The Russian people have availed themselves of the advantages of modern industrial technique; and, at the same time, it has remained the elementary peasant nation which has not lost contact with nature. It has assimilated much of the industrial skill of the west without losing its original vigour. Without this combination of such different traits many of the Russian recent feats in using the terrain of the fighting—such as their surprise attacks in blizzards or their crossing of unfrozen stretches of water in the winter—could hardly have been possible. It is this feature of the new Russian Army that will perhaps contribute most to its ultimate victory—its primitive vigour and gusto combined with modern equipment and up-to-date skill.

The Red Army can look back with pride. What was a "semi-armed rabble" in 1918-19 has grown into the force which is shattering the mighty German war machine. But the Red Army is not alone; it is one of the forces of the United Nations. It is still the one that bears the brunt of the battle. But as the war goes on ties between the Red Army and the armies of the other Allies will be forged on many fronts. Out of this comradeship of arms it is to be hoped that a new understanding will emerge.

NOTES OF THE WEEK

Death in the Scales

Mr Gandhi's last card may prove to be the ace of trumps and not just the knave. His life hangs in the balance, not as an exclusive effect of his 21 days' fast "to capacity," but as the consequences of a condition which was bound, sooner or later, to prove mortal. Death is the one gambit to which the politics neither of justice nor expediency have any answer; and the repercussions of the Mahatma's death, if it befalls, may indeed be incalculable. It is easy to say now, when his death seems in sight, that Mr Gandhi should have been released at an earlier stage. But this is to be wise after the event. The effects of his release upon the situation in India were quite definitely calculable. He made it plain to the Viceroy that he would open another campaign of civil disobedience to secure the aims, the prosecution of which led to the savage disorders of last year, to the brutal murder of civilians, officials and members of the fighting Services. However much he may have deprecated these terrible events on grounds of conscience, he refused the one condition which the Viceroy indicated to him, namely, to condemn this savage violence; and he made it impossible for the Government to release him, even though they did offer conditional release for the duration of his fast, which he refused. Mr Churchill made it plain in his telegram on Wednesday that there is still no alternative—though the Viceroy's continued refusal to make public the evidence he claims to have of Congress responsibility for the recent terrorism must arouse more than some misgiving. Mr Gandhi deliberately chose the harder and more perilous path, with the irresponsible, deep-seated courage and resolution which he has always shown. It was his intention to pin his death, should it happen, upon the Government of India. If he dies, he will have succeeded; and nothing that the Government could have done, in discharge of its minimum duties, could have avoided this, given his readiness to die in a cause which fits in no way into the calculations of ordinary mortals. Mr Gandhi is a great man. More than that, he is a consummate politician. Whether he has used his talents and his character to the best interests of his own people is much more doubtful—and, if he dies, it will be made more doubtful still by the manner of his dying.

The Party System

There is an opinion, recently expressed in a letter to *The Times* by Commander King-Hall, that the party system has completed its span of usefulness. In its way, this view is understandable. The argument is that the major objectives of future policy, peace, prosperity and social security can only be pursued by political agreement; that, though personalities and policies may change, Parliament should remain during the indefinite period of reconstruction ahead a Council of State, without any formal division between Government and Opposition. The notion is plausible; but, in effect, it threatens the same abnegation of parliamentary methods that heralded the disappearance of democracy in Germany and other European countries. There is indeed agreement about the aims to be pursued, about the need to guarantee peace and ensue it and the need to achieve full employment in each country and a full interchange of goods and services internationally. It is also true that the worst danger to the achievement of these aims is faction, whether it be the faction of parties or the faction of nations. If the old parliamentary dictum that the duty of an Opposition is to oppose is taken to mean that, right or wrong, the Opposition must resist the Government, then advance along these agreedly desired roads will be prevented. But there is infinitely more than faction in the traditional ways of British parliamentary democracy, which has provided this country, uniquely, with governments at once more strong and more popular than the governments of other countries, however democratic in form. The two pillars upon which British democracy rests are representation and responsibility; and neither can be guaranteed without the presence, confronting the Government, of an Opposition which is ready, not only to assist effectively in the making of policy, but also to oppose effectively, and capable always of providing the people with an alternative government, pledged to an alternative policy.

This issue is neither academic nor theoretical. From its ill solution arose the single party dictatorships of Germany and Italy. Indifference to its reality has bred among many the disposition to take the major matters of social and economic policy "out of politics," and to reserve them for some body of experts—a device which, so far from removing, say, social security or full employment from the pettiness, the distractions and the incompetence of competing pressure groups, might actually provide the most weighty of these groups with a fulcrum to exercise sovereign power.

The Parties Ponder

At the moment, the issue of Parliament's and the parties' future is smouldering beneath the surface of British politics. It is implicit in the revolt of Labour politicians against the emasculated Beveridge plan which has emerged from the agreed compromises of the present all-party Cabinet—compromises which, it is said, were welcomed, on some grounds, as eagerly by the Minister of Labour, as a trade unionist, as by the Tories. It has caused a section of the Liberal party, utterly loyal to solidarity in the war effort, to contemplate ending the present political truce, in the cause of clarifying the deep differences which exist among the groups into which this nation is divided about the apportionment of national wealth and the balance, between the classes, of social and economic power. The crucial question, in relation to the Beveridge scheme, of the trade unions' attitude to training for new work as a condition of unemployment benefit, after a period, has been left entirely unanswered so far. A cursory survey of what has happened since nearly 100 Labour Members, with Liberal support, voted against the Government in the Commons last week might suggest that the storm is blowing over. No Ministers, at the moment of writing, seem likely to resign, either from the Government or from their own political parties, despite the adverse vote; even the wrath of Mr Bevin has apparently been assuaged. But the origins of the tempest remain. Is it possible to make a policy in the future on the assumption that, because there is a broad agreement on ends, there is no disagreement about means? The answer, in the light of the utmost that the Cabinet has found it possible to do about the Beveridge Report, and in the light of all the democratic experience with which, as Mr Morrison pointed out in the City on Wednesday, this country is uniquely provided, must be in the negative. The first philosopher of British Parliamentarianism, Edmund Burke, while condemning faction root and branch, approved party. Nothing has happened in the last century and a half to upset the validity of his conclusions.

The Division

Including the tellers, the division on the Labour party's amendment at the end of the Beveridge debate resulted in 338 votes being cast for the Government and 121 against. Of these 121, 97 were Labour Members, 9 were Liberals, 10 were Independents, 3 were members of the ILP, one was an Independent Labour, and one was Mr Gallacher. Those who voted for the Government consisted of 275 Conservatives, 23 Labour Members, 21 Liberal Nationals, 7 Liberals, 4 National Labour Members, 3 Nationals, 4 Independents and one Independent Labour. There were in addition some abstentions, of whom the majority are thought to have been Labour. The division was thus a complete reversal of the one which took place on the second reading of the Catering Bill. Then, including the tellers, 118 Members voted against the Government, of whom the vast majority were Conservatives. Only one Member voted against the Government on both occasions, and he was Mr D. L. Lipson, Independent Conservative Member for Cheltenham. The result of these two divisions, it has been said, proves how "controversial" the Catering Bill is; the division on its second reading, it is pointed out, split the Conservative party, since many of its members voted for the Government though the opposition was almost entirely Conservative; the Beveridge division, on the other hand, was a clear-cut party vote, with the Conservatives for and the Labour party—except for its members in the

Government—against. Surely this argument is ingenuous. The catering vote showed, not that the Bill is controversial in the sense implied by Sir Stafford Cripps, when he spoke, on the occasion of the new session, of the need to avoid legislation "likely to arouse serious controversy between the political parties," but that there is controversy in the Conservative party itself on whether it stands for the people or for vested interests, or whether it is to go forward or go back. This internal split in the party was reaffirmed in the Beveridge debate. Mr Quintin Hogg and Conservatives like him probably ought to have had the courage of their convictions and voted against the Government, or at least abstained. But his speech (which is discussed in an article on page 257), and his public dissociation from the subtle Conservative attack on the Beveridge scheme, made in some of the speeches, show beyond doubt where the controversy lies.

Stalin Strikes the Balance

In his anniversary Order of the Day, Premier Stalin summed up the results of the three months' Russian offensive in a spirit of moderate and cautious optimism. Time (he said) is now working against Germany. The replacement of losses in enemy manpower could not be made at once, even if the necessary reserves were available. The German armies in the immediate future, will be labouring under an acute shortage of manpower. Stalin gave a figure of 9 million for German casualties (including 4 million killed) since June, 1941. It is not possible to say how this estimate has been arrived at. The detailed figures, given by Stalin, of the losses inflicted on the Germans during the three months of the Russian offensive are obviously more precise. These amount to "over 700,000 killed and 300,000 prisoners." It is certain that the rate of German casualties and losses in prisoners has been at its highest during the recent retreat; and whatever the arithmetical niceties, the problem itself has been posed by Stalin rightly. It is in the coming months, before such reserves as are available can be mustered, that the German war-machine will be most vulnerable. Yet, "it is first of all essential not to be carried away by one's victories." What has been achieved is only "a firm foundation for a victory." This warning was clearly meant for foreign as well as home consumption; and it is in this context that Stalin's reference to the "absence of a second front in Europe" should be read.

Test in Tunisia

The position in Tunisia is still in flux; thrusts and counter-thrusts succeed one another. The past week has given the enemy very important operational advantages. Sbeitla, where a week ago the enemy was said to have been halted, has in fact been lost by the Allies. The next grievous loss was the Kasserine pass. Von Arnim and Rommel used these vantage points for a series of attacks north and westwards. The attack upon Sbita, if it succeeded, threatened the Allied positions in the north of Tunisia; and the German advance in the centre and in the south created a decidedly awkward "bulge" in the Allied line in the north, vulnerable to an outflanking move. The thrust from Kasserine towards Tebessa, now halted, brought the war to the frontier of Algeria. The crucial question is the relative strength of the opposing armoured forces. It is difficult to square all the varying estimates of reserves and losses which have been computed in the thick of the battle. Both sides have thrown in some of their strongest tanks. The other vital issue is the Allies' loss of advanced airfields. The Allied aeroplanes have been pushed back to Algeria. This loss may be partly counterbalanced by the advance of the Eighth Army, which has captured a number of enemy airfields further east. General Montgomery's soldiers have moved from Ben-Gardane to Medenine and towards Mareth. Some reports suggest that the Mareth line possesses, like its Maginot prototype, the almost classical gap which makes the whole laboriously built defence belt valueless; if this is so, and if the Germans attempting to press on westward, who have been forced to retreat, have been pushed back to the Kasserine pass for good, the position may be retrieved quickly.

Second Front

A lot of nonsense is being talked about a Second Front; and it is not all being talked by the "ill-informed clamourers" to whom Lord Simon, with perhaps some justice, took exception in Tuesday's debate in the Lords. Some of it is coming from high official quarters. Lord Simon suggested, legalistically, that it is largely a question of definition—that the sea and air activities of British forces, which do undoubtedly engage a great deal of the enemy's strength, in themselves represent a Second Front. On the other side of the Atlantic, Mr Roosevelt has told the press that no two people would agree as to what was a Second Front. Surely, with all due respect, both the Lord Chancellor and the President are wrong. What the term Second Front has come to mean is perfectly plain. It means the invasion of Europe, and since the British and American Governments are explicitly and publicly pledged to such an invasion, even to "invasions," there is no difference of principle between them and their critics. What difference there is concerns the question of timing. Lord Beaverbrook's view is that it must be done now—regardless, it must be admitted, of his own earlier plea for the immediate sending of expeditions as well as supplies to the Russian front itself. The Government's view, apparently, is that it cannot be done until Tunisia has been cleared—which may or may not be a full statement of the decisions made at Casablanca. Obviously, this is in the last resort a matter for those who know the facts. But three evident points can be stated. First, Lord Beaverbrook is perfectly entitled to press for action, in view of the importance (recognised at Casablanca) of acting while the momentum of the Russian advance is still high—provided that he does not suggest, as he tended to, when pressing for a Second Front while he still had one foot in the Government, that he knows that it could be done at once and is only being held up by ineptitude of some sort. Secondly, in asking for action as soon as possible, Lord Beaverbrook does echo the heartfelt desire of a majority of the British people—as well as the Russian people, including Stalin. Thirdly, if Tunisia is the stumbling-block, then Allied strategy has suffered a very unfortunate, if only temporary, reverse in recent weeks.

Personalities in the Lords

Actually, Tuesday's debate in the Lords on the Second Front motion by Lord Beaverbrook was not on the Second Front at all, but on Lord Beaverbrook. The question hotly debated was whether Lord Beaverbrook should or should not have put down the motion; and the cutting edge of Lord Simon's reply for the Government was very much like a personal attack on the mover of the motion. Indeed, the Lords were hot under their noble collars throughout Tuesday. Their second debate was on the Fleet Air Arm—ostensibly. In fact, it was yet another repeat performance of the old acrimonious cross-talk act between sea peers, on the one hand, and air peers, on the other. Not a single one of the speeches, by Lord Chatfield, Lord Brabazon, Lord Trenchard or Lord Keyes, was of the slightest assistance either to the Fleet Air Arm in particular or to the cause of war strategy in general, for the reason that each and every one of the speakers was

*** Fires in War-time aid the enemy**
*** and most fires are caused by "careful" people, who are not careful enough.**
Don't just be careful — take EXTRA care.

Published as part of the Fire Watchers' Committee Campaign against Fire Wastage.

far more intent to advertise his own extreme belief, and to vilify his opponents, than to seek a genuine solution of the many problems of air power at sea. This generation-old controversy has become a lamentable farce, damaging to the national interest. It is to be hoped that these Air Marshals and Admirals, at rest in the Lords, do not represent the views and attitudes of the active commanders of the two Services. If they do, then all attempts at inter-Service co-operation and a genuine combination of command, planning and action must be futile. It is obstinately not realised by these peers, who on other occasions have contributed so much that is vital from their great and distinguished experience, that the issue is not one of the Air Ministry *v.* the Admiralty, or the RAF *v.* the Royal Navy; it is the Allies *v.* the Axis. The problem is to secure the fullest possible combined and integrated striking force against the enemy. The task is to give the greatest possible weight to both the decisive air weapon and the sea power upon which British strategy, especially in the next offensive phase of the war, must depend. It is to be hoped that in the Services themselves there are officers at all levels who do genuinely see all future operations as combined operations, without the atmosphere of clan warfare that so disfigured Tuesday's debate—a debate which might, in a different atmosphere, have been of real assistance to the brave men who have for so long had to fly obsolete or inadequate seaborne aircraft.

Progress Report —

It is just over three years since the Government's Statement of Policy on Colonial Development and Welfare was made; and the first report showing how the Colonial Development and Welfare Act has operated was published this week (Cmd. 6422). The Act was passed in July, 1940, but it was not until June, 1941, that the colonial governments were explicitly told that as full advantage of it should be taken as war conditions permitted. The report, therefore, though ostensibly covering the period July, 1940—October, 1942, really only deals with a period of fifteen to sixteen months, and it is a period which has seen a large part of the colonial empire lost to the enemy and serious and increasing shortages of men, materials and above all shipping. It is hardly surprising, therefore, that the maximum expenditure contemplated under the Act—£5 millions a year—has not been reached. The total actually spent by the end of October, or rather (an important qualification) the expenditure involved by the schemes that have been approved, is £2,032,399, plus £57,158 for research for which an additional £500,000 a year was granted under the Act. But the most serious misgiving that is aroused by the report is the apparent lack of any coherence in the formulation of schemes, except in the West Indies, and the apparent dilatoriness of some colonial governments in submitting applications. Kenya, for instance, does not appear in the list of colonies whose schemes have been approved. Nor does Uganda. Northern Rhodesia has apparently been content with a sum of £3,000 for locust control. Yet the problem of, for instance, soil erosion in Africa, and in Kenya in particular, is urgent. It may be that the colony is doing all that can be done out of its own resources, but it would seem that an inter-colonial and international treatment of this growing danger is needed, and for such a purpose the Colonial Development and Welfare Scheme would appear to present a great opportunity. The report, it is true, points out that at present colonial governments have little time or staff to prepare long-term schemes of development, and this is particularly true of Kenya, which is devoting its efforts to supplies for the Middle East. Even so, the fact that the schemes approved for the whole of Britain's colonial possessions in Africa involve an expenditure of less than £300,000 is disappointing.

— In the West Indies

The Caribbean, which under the Colonial Development and Welfare Act was to account for one-fifth of the maximum annual expenditure allowed, has, in fact, accounted for more than half—£1,187,055 up to the end of September, plus £15,670 for research. Together with the report on the operation of the Act as a whole, there has been published Sir Frank Stockdale's report on development and welfare in the West Indies (Colonial No. 184). It abundantly justifies the appointment of his organisation, which was recommended by the West India Royal Commission to work out long-term schemes of reform in collaboration with the local governments concerned, and, it is hoped,

will lead to the appointment of similar bodies in other groups of colonies. Development and welfare in the West Indies are not being undertaken haphazardly, by applications for money to construct a pilot sawmill here or a bridge there or a stock farm somewhere else, which, though no doubt urgently wanted, do not even skim the surface of the real problem of colonial development. In the West Indies, it is made clear from the detailed reports of Sir Frank Stockdale's advisers on medical, educational, social welfare and labour matters that the schemes are related to a general programme designed to raise the standard of living of the islanders. Here, again, the practical limitations that exist are made plain. The educational adviser, for instance, points out that in the Caribbean 17,580 teachers are properly necessary to provide for the education of all children aged 6-15, whereas

Apart from the very great deficiencies in buildings and equipment, there are, in all, approximately 8,500 teachers and pupil teachers employed in the area.

To provide enough elementary teachers at an average salary of £100 per annum would cost £2,000,000, against an expenditure in 1941 of £640,000. Even if the balance could be made available under the Act, it would take some time for the teachers to be trained. And, as the educational adviser pertinently remarks,

the West Indian countries cannot undertake permanent commitments involving permanent external aid without jeopardising their growth in self-responsibility.

The need to increase their wealth, to enable them to finance such expenditure themselves, is thus urgent. It is consequently a pity that there is no instance of a scheme being approved for the establishment of light industries. Industrialisation, besides helping to solve the labour problem, should raise the productivity of the islands, which, in Barbados in particular, is too low to maintain their increasing populations. The difficulty of obtaining the capital equipment in wartime is obvious, but it is to be hoped that the Stockdale organisation has the possibility in mind.

Third Attempt

It is, perhaps, more than a coincidence that Sir Frank Stockdale's report on the West Indies should have appeared on the same day as was published a despatch from the Colonial Secretary to the Governor of Jamaica (Cmd. 6427), making another attempt to solve the constitutional deadlock. Since January, 1942, when the second attempt at constitutional reform was made, the elected members of the Legislative Council and leaders of the People's National Party and of the Federation of Citizen's Associations have come to an agreement on the constitution they think Jamaica should have. In a memorandum to the Secretary of State, they asked for a bi-cameral Legislature and an Executive Committee which should be the principal instrument of policy, and which, upon the development of the ministerial system, should become a Council of Ministers. They also emphasised that the Governor should have no power of veto or certification. The constitution now proposed goes far towards meeting these demands. Colonel Stanley agrees to a bi-cameral Legislature, consisting of a House of Assembly of not less than 24 members, elected on a basis of universal adult suffrage, and of a nominated Legislative Council of 15 members. He also proposes an Executive Committee of 10 members presided over by the Governor, of whom 5 should be chosen by the House of Assembly—against the 7 asked for in the memorandum—the remaining 5 consisting of 3 officials and 2 unofficials, to be nominated. He also suggests that the Assembly should form five small committees to concentrate on general purposes, agriculture, education, social welfare and communications, and that the five chairmen of these committees should be appointed to the Executive Committee; but this is a suggestion and not a rigid part of the proposed constitution. Where, however, Colonel Stanley cannot accept the Jamaicans' requests is in the matter of the Governor's powers. But he proposes that the power of certification—that is, the power to give force of law to a measure which has been rejected by the Legislature—should be exercised with the advice of the Executive Committee and that any decision to use it must be reported to the Secretary of State, whose approval should normally first be obtained. A similar safeguard would apply to the power of veto. It is understandable that such powers should be disliked by a politically conscious people. On the other hand, the gap between efficient government and popular government, which exists in the older democra-

cies and is bound to be more serious in a country just achieving responsible government, can best be bridged in this sort of way.

Painful Progress

In some respects, the situation in North Africa is improving. The economic position is better, Allied supplies are arriving and getting distributed, and M. Peyrouton has undertaken to take steps to relieve the abject poverty of the Moslem inhabitants. There seems, too, to be better prospects of understanding between the North African administration and Fighting France. General Catroux, the Fighting French Commissioner for Syria, will be liaison officer between the two movements and will divide his time between Beirut and Algiers. Before leaving Algiers, he spoke feelingly of General Giraud's difficulties—"the problem of North Africa is the problem of the convalescence of a country"; approved the General's economic council; and let it be understood that he believed in the Administration's desire to pursue a liberal policy. Here the difficulty is the old one, that of maintaining a functioning administration while purging it of its quisling elements. Many of the General's genuine liberal intentions are being frustrated by the intransigence or even sabotage of men lower down in the hierarchy; this is particularly and painfully true of the crucial problem of political prisoners. The chief of police, Rigaud, is a fascist and has used his powers to imprison de Gaullistes, and other left wing supporters of the Allied cause. It is clear from General Bergeret's confused statement on political prisoners that the Administration is not fully informed of the situation and that its subordinates are throwing a smokescreen over some very dangerous and discreditable activities. The Inter-Allied Commission will be able to clear up matters in camps where Bergeret admitted conditions to be very bad. But not all the victims of Rigaud's police go to the camps. Who is to conduct a proper investigation of the prisons where de Gaullistes are alleged to be detained? There is only one solution, a genuine purge and reorganisation of the civilian administration.

Divided France

There is some danger that the establishment of liaison between General de Gaulle and General Giraud will be looked on as a final and sufficient arrangement. It is not. It will perhaps prevent some of the more blatant discrepancies in policy and action, but it leaves unsolved the chief problem—the restoration of unity among the resisting French. M. Peyrouton has issued an appeal for unity, saying:

Frenchmen are masters of their own destiny. If they unite themselves they will again make France a great nation. If, on the contrary, they keep on quarrelling . . . the resurrection of France will not be easy.

This is perfectly true; but M. Peyrouton is the last man to say it. In the same speech, he boasted that he had in the past been "harsh" with the Frge French, because it was necessary to preserve France's "peace of mind." To which purpose? one may ask. To make the policy of collaboration with Germany more effortless and secure? A unity which includes M. Peyrouton is no unity, for true unity must be based not on expediency but on principles. These principles are pre-eminently two: resistance to Germany; and loyalty to the Allied cause. By this definition Fighting France still excludes too many men, and General Giraud embraces too many. The Allies must not rest until their views on this point have prevailed; nor should they tolerate delay. To give only one example of the effects of procrastination, what will be the future of the French Navy if the units which are being repaired in the United States—including the battleship *Richelieu* and the cruiser *Montcalm*; the units over which the Allies are negotiating with Admiral Godefroy at Alexandria; the units whose fate is being considered at Martinique; the units at Dakar; and, finally, the Fighting French Navy—are all left under separate control and administration? Are the unhappy French people to be presented not only with two governments and two armies but with five navies? If so, may they not come to look on the Frenchmen who fought for them abroad as their worst enemies, as the people who most hindered "the resurrection of France"? It is hard to think of a common purpose more compelling than the defeat of Hitler. If that cannot bring Frenchmen together, what can?

Transference of Labour

Mr Lyttelton's recent statement that a big expansion in the labour force and a greater mobility of labour would be necessary in the 1943 programme of "production for attack" has made the public anxious to know how Mr Bevin proposes to meet the new demands. The Minister of Labour has already announced that he is preparing to direct married women without children into war work; and the Control of Engagement Order has been extended to women up to the age of 41. In Tuesday's debate in the House of Commons, Members were mainly concerned with the more human side of mobilisation, and raised such matters as billeting, transport, nurseries and canteens. Many cases were quoted of inadequate and insanitary billets and of excessive charges for accommodation; inefficiency and red tape in handling transfers were alleged; demands were made for extra food for heavy manual workers and for the extension of day nurseries and communal feeding; the Scottish and Irish MPs were up in arms against the alleged neglect of their respective nations and the wholesale transference of labour to England; and Mrs Tate pressed the Minister to call up women now living idle lives in hotels. Mr Bevin, who was in jocular mood, had an answer to most of the questions. He admitted that in dealing with such a vast problem there were bound to be individual cases of hardship and possibly departmental mistakes; but he claimed that, on the whole, transference was working smoothly and with a minimum degree of friction. In particular the capacity centres of the Ministry of Production and his own Outside Welfare Department had facilitated the work. He pointed out that most girls preferred living in billets to the hostels which had been provided, and that the chief responsibility for providing nurseries and British restaurants—the need for which he admitted—lay with local authorities. Most of these topics have been discussed in Parliament before, and their importance has often been stressed by the Select Committee on National Expenditure. The only new thing which emerged was Mr Bevin's statement that he is thinking of introducing a scheme for domestic helps, with proper status and regulated conditions, somewhat on the lines of the district nursing system. This would be a valuable measure—it is indeed long overdue.

Equal Compensation

The House of Commons Select Committee on equal compensation for civilian war injuries, which was appointed in December, has produced a workmanlike and unanimous report in a remarkably short space of time. The Committee concludes that the principle of equal compensation "not only has justice on its side, but could be adopted with little practical difficulty and at relatively little cost." Under the present scheme, applicants are divided into gainfully occupied and non-gainfully occupied persons; whether for injury allowances, pensions or treatment allowances, the rate of compensation for women is about two-thirds of that for men. The Committee recommends the abolition of the distinction between gainful and non-gainful occupation, which reacts unfairly on housewives, and the adoption of a flat rate for everybody, irrespective of sex or occupation. They suggest a flat rate of 35s. a week for men and women injured, but not in hospital, and an increase in the pension rate in the case of 100 per cent disability to 37s. 6d. for all men and women. They also recommend the termination of the anomaly that a married man in receipt of an injury allowance does not get a wife's allowance unless he is in hospital. These proposals are sensible and just; there will be few who will quarrel with the Committee's findings. The main argument against equal compensation advanced in the House of Commons debate last November (when 95 Members voted against the Government) was that earnings and compensation were indissolubly linked, and that, so long as differences existed in the rates of remuneration as between the sexes, there could not be equal rates of compensation. The Select Committee has knocked the bottom out of this argument by showing that there is no necessary connection between earnings and compensation. Remuneration is always related to work done and services rendered; compensation, on the other hand, is not necessarily related to the value of work previously performed. There are contingencies when it may be reasonable to relate compensation to lost earnings; but in no case is this reasonable until basic needs have been met at a flat rate. And, in any case, there is no pretence that compensation for civilian war injuries, to men or women, has, or is intended to have any specific relation to the earnings lost by incapacity.

AMERICAN SURVEY

Pressures on Prices

(From Our Washington Correspondent)

February 1, 1943

GRAPHICS on war strains and pressures are currently being supplied by the women's outer-wear garment industry in New York City. The decision on wage rates in the case of this industry, currently before the War Labour Board, may have a future importance comparable to the "little steel" formula of May, 1942, which placed a wage ceiling at 15 per cent above January 11, 1941, levels.

Any February is hectic enough along Seventh Avenue. That is when buyers come to town with spring orders; when new styles, materials, trimmings appear; when bargains are driven at the various standard price levels; when employment for members of the Dress Makers' Union (a part of the International Ladies' Garment Workers' Union) is at one of its two annual peaks. This February, additional items figure in the excited talk on the sunny sidewalk at lunch-hour. They cover pressures that start far back along the line. Among the buyers who come to town are many from war industry areas, where department stores have adopted new hours, staying open till 9 p.m. on at least one, and in many cases more than one, evening a week, to give shopping opportunities to factory women workers.

Ordinarily, the buyer who came to town with such a bulging order book would expect to be subject to extensive courtship upon arrival, including dinners, theatres, and a certain number of well-placed orchids. This year she anticipates that the expense account may be in a different column. The first story the buyer is likely to hear in the manufacturer's office is how impossible it is to do business under Maximum Price Regulation No. 287, issued by the Office of Price Administration, on December 12th. This order regulates manufacturers' margins, reducing those over 46 per cent and 22 per cent to add enough material, trimming or labour to the product to reduce the margin by 10 per cent; and permitting the retention of margins currently at 22 per cent or under. (The last is the important figure.) What can I give you on that margin and still stay in business? Answer me that one, says the manufacturer.

The industry is a small business industry. Net sales average 5-6 times reported net worth. In 1939, the industry sold \$1,112,241,000 worth of goods; this was done by 6,831 establishments with an average of under 34 wage-earners. The mortality rate of these firms is high—a New York survey covering some 1,000 businesses in 1937-39 found liquidations ranging from 17-23 per cent of the establishments. So the accounts of a firm whose line does not include the big sellers of a given season are very apt to change colour from black to red. (The chances of being lucky—or bright—enough to foresee the big sellers can be calculated from the fact that the 78,665,000 garments sold by dress manufacturers in 1939 were produced in 122,849 different styles.) OPA order No. 287 was issued some weeks after negotiations for upward revision of wages had been opened by the Dress Makers' Union with the five employers' associations that represent the manufacturers, jobbers and contractors of the industry. It became an important element in the employers' attitude. The workers halted manufacture on January 26th. Two days later, the War Labour Board took jurisdiction on condition that work should be resumed at once.

The Unions' Case

The union case was the extent to which living costs have recently risen. Bureau of Labour Statistics figures, on a 1935-39 = 100 base, show the index for New York City to have moved from 101.0 on January 1, 1941, to 119.3 on December 15, 1942. The 10 per cent wage increase negotiated in August, 1941, is, the union points out, insufficient to cover this 18.2 per cent change—and the union further contends that the proportions of income a worker spends for food, rent, etc., have been so distorted by the recent exaggerated rise in food prices that the BLS index no

longer represents the facts of family expenditure. And the union points to the current rush of business as evidence of the employers' capacity to adjust wages within the present price structure.

The employers questioned the legality of the stoppage in view of the union's current contract; so did the War Labour Board's wire, which said, "This strike is continuing in violation of labour's pledge to the President that there shall be no strikes for the duration of the war." The employers also declared that, while it is true that the cost of living has risen, they are unable to increase wages without an adjustment of the present OPA order freezing prices. The employers thus recommend that price ceilings should be raised; the workers, that the present wage stabilisation formula should be altered.

The union does not expect to maintain peacetime standards, but we claim that the "little steel" formula has outlived its usefulness. If prices are frozen, wages should be frozen, after equalisation has been made for price rises not yet adjusted.

The case occurs in a context of other events likely to affect its outcome. The manoeuvres of John L. Lewis in the coal strike, of which the major chapters remain to be written, have left Phillip Murray, of the Congress of Industrial Organisations, and William Green, of the American Federation of Labour, on the spot—as members of the War Labour Board they are sponsors of the "little steel" formula. Ever on the outlook for organisable discontent, Mr Lewis will undoubtedly make the wage issue his next bid for a comeback. With an eye to this bidding, R. J. Thomas, head of the United Auto Workers, CIO, and a member of the War Labour Board, has urged that the "little steel" formula should be discarded:

We need a realistic formula recognising an advance of at least 30 per cent in the cost of living since January 1, 1941, so that workers through their unions can commence to bargain for comparable increases in wages.

The "little steel" formula recognised that the rise in living costs over the country as a whole amounted to about 15 per cent between January, 1941, and May, 1942. Today their level is 19 per cent above that of January, 1941, with the main increase in food prices, which stand at about 36 per cent of the January, 1941, level. To stimulate additional production by growers of sweet potatoes, soya beans, grain sorghums, peanuts, dried beans and peas, flax, potatoes and truck crops, the Department of Agriculture has announced a programme of "incentive payments." The farm bloc in Congress is opposing such subsidies, affirming that the basic price levels of agricultural commodities should be raised instead.

American Notes

Change of Heart?

After a week of defeats for the Administration in the Committees of the House of Representatives, Congress appears inclined to stay its hand a little. Senator Taft has suggested that Congress ought not to be against a measure simply because the President is for it; and another Republican, Senator Aiken, has remonstrated "We can't just run wild." The implication is that the Senate may moderate somewhat the limitations the House has imposed, in one direction or another, on the authority of the executive and its agencies. These include, besides the well-publicised refusal of the Ways and Means Committee to permit the continuance of the order limiting salaries to \$25,000 a year after taxes and other fixed charges, the slashing of some appropriations and the deletion of others. Funds for the National Resources Planning Board were voted to be stopped entirely; appropriations for the Post Office, the Treasury, the Bureau of the Budget, and the Home Loan Bank Board were cut. Economy was not all. "Blank check

appropriations are out of the window" remarked a Democratic gentleman from Indiana. The salary of a negro employee of the Government was stopped because of his alleged Communism; resolutions were introduced to investigate WPB and OPA policies in regard to the concentration of industry, and even to create a committee to investigate "any action, rule, procedure, regulation, order or directive" taken by any agency. The manpower position is being investigated with a view to reassessing the needs of the Forces, and Mr McNutt got a far from friendly hearing for his "work or fight" order. A Bill to forbid the calling-up of fathers until all childless men are under arms has been passed in committee. Anti-labour Bills are re-appearing; and it is this twin drive on the unions and the manpower problem that has given rise to the rumour that Mr Winant may be recalled to head the Administration's efforts in this sphere. The farm bloc is pressing, for the third time, its demand that the cost of labour—including family help—should be included in computing parity, a provision which would raise the nation's food bill by perhaps as much as \$3,500 millions. There has been no actual cessation in this spate of inquiries, pruning and Congressional intervention. What is reported is a change in the temper on Capitol Hill. Any deep-seated change of heart on the part of the Opposition is improbable, but it is reassuring to see some signs of restraint so early in the life of the new Congress.

"Roar China"

The triumphal appearance of Madame Chiang Kai-shek before Congress brought to a focus a mass of floating sentiment about China. The romantic feeling for China is compounded of sympathy for the under-dog; memories of Pearl Buck's "The Good Earth," the film performance of Paul Muni, the Theatre Guild's famous production of "Roar China"; childhood recollections of returned missionaries, of whom there were many; and a vague belief that the National Revolution was something like 1776, and that Sun Yat-sen was an Oriental George Washington. Americans are proud of their record in China, too; the Open Door and the use of the Boxer indemnity to build schools are regarded as foundation stones of a good neighbour policy. The Chinese have put their case well and they have found devoted propagandists in many Americans. And inevitably, as hatred of the Japanese mounted, so has good will towards China. To say this is not to detract from Madame Chiang's personal ovation. Her eloquence, her charm, and her quick wit captivated Congress as well as the nation. One Senator acclaimed her fervently as "the greatest woman in the world." Undoubtedly her address strengthened the cause of the "Pacific school" in Washington; the response inside and outside Congress is a reminder, if any were needed, that this particular tension is as yet unresolved. As Dorothy Thompson pointed out, if emotion were running the war, the Japanese would enjoy an AAA priority in American strategy. As a consequence, the report of the Lend-Lease Administration on aid to China has been received somewhat coolly. It explained that what China needed after the fall of Burma—transport planes—was what America had least of, it stressed the swallowing up of American supplies in the Burma campaign; and pointed out that the training of Chinese pilots and the control of air gained as a result of the American Volunteer Group's operations could not be measured in money terms. There exists a strong feeling against accepting the difficulties of transport as a final limiting factor in aid to China. But at this stage in the war these emotional responses are not likely to upset the strategic applecart. The set-back in Tunisia has given the American public a very healthy longing to hit back, and a more realistic understanding of the difficulties that are likely to be encountered in subduing the Western wing of the Axis before concentration in the Pacific is possible.

Meatleggers

There are lurid stories from the United States of the revival of gangsterism. Now it is food—principally meat—that is the foundation of a new illegal traffic. How much truth there is in the story that Caponism is back again is hard to tell; but it is generally admitted that extensive black markets in food exist. Time quotes "harried Washington officials" as putting the figure as high as 20 per cent of the animals slaughtered for food; and American papers are carrying pictures of out-of-the-way barns being used as slaughter houses, and stories of cattle and sheep being stolen and slaughtered along country roads. Consumers are

willing to pay fantastic prices for meat, sometimes as much as \$2 a pound for beef. The Office of Price Administration has started a series of prosecutions against offenders, but in the meat traffic in particular enforcement is difficult. There is no bottleneck through which meat moves which can be policed easily, as there is in sugar or petrol, where the number of refineries is small. Honest traders have been squeezed by the fact that although their ceilings are fixed, there is no limit on the price of livestock, with the exception of hogs. The advantages of rationing, with its guarantee of fair shares, is easy to understand, but those of price fixing have been harder to sell to the public. The problem will be eased somewhat as rationing gets under way. Canned goods go on points next week, and meat rationing is expected to start on April 1st. In the meantime the Price Administrator is starting a vigorous campaign of education in the beauties of control. In a recent address, he pointed out that already consumers have been saved nearly \$6,000 million compared with what would have been spent had prices risen at the rate they did during the last war; the saving per family was \$140. One of the examples of the pressure on prices which he cited concerned butter. News of the extension of the ceiling price on butter failed to reach a given city in time. Overnight the price soared from 55 cents a pound to \$1.25. Examples of this kind are testimony to the value of price control, but they illustrate as well the enormous strain on ceilings imposed by the increase of purchasing power unaccompanied by adequate taxation and savings.

Shorter Note

The Office of Price Administration has announced the completion of a new system of "margin control" for prices. Under its provisions, prices will be fixed at the wholesaler's or packer's level, and profit percentages for different types of wholesalers and retailers will be established. This meets the difficulties of traders who were unable to keep up supplies because their ceilings were too low; and it has the advantage of substituting for an almost unending range of ceilings three or four levels, which will be easier for the housewife to police.

RECORDS COST MONEY, ARE YOU PAYING TO HIDE VITAL FACTS?

Shannon Visible Records give a panoramic view of Key facts—posting is many times faster than in books. A unique all-metal Suspension holds the cards securely yet gives maximum freedom of movement. Cards are instantly removable. Both sides are available for posting and Auxiliary Sheets provide additional information or increase the card life. Let us show you how Shannon Visible Records will help to increase your control and production.

To comply with Paper Control Order 48 please send 1d. postage stamp for booklet.

THE WORLD OVERSEAS

French Agriculture

(By a Correspondent)

RECENTLY, M. Bonnafous, Vichy's Food Minister, and M. Cathala, the Minister of Finance, made statements on the new agricultural programme. As usual, Vichy's "peasant lovers" present their programme, not merely as a set of emergency measures necessitated by the pressure of events; they also pretend to carry out a set of reforms which will lead the peasantry to a neo-physiocratic paradise. The whole agricultural policy of the Third Republic is portrayed as a sinister distortion of France's natural evolution; the prospect of an Allied victory as the loss of the physiocratic paradise; and the New Order as the only background against which a revival of French agriculture is possible.

The new programme, stripped of its embellishments, boils down to the "balkanisation" of French agriculture under German pressure. Its main feature is the expansion of oil-seed cultivation, to make good the loss of North African imports. According to M. Bonnafous, the present stock of fats in France amounts to 140,000 tons; if consumption is to be maintained at last year's level, the deficit in fat supplies amounts to nearly 160,000 tons. The reserve of industrial fats is 20,000 tons against a minimum demand of 54,000 tons. During the years of the armistice, the cultivation of oleaginous plants expanded only slightly. In 1941-42, the area under oil-seeds increased from 8,000 to 25,000 hectares. In the autumn of 1942, however, not less than 60,000 hectares were sown with oil-seeds. The new programme envisages a further increase up to 250,000 hectares in 1943. In a broadcast to the farmers, M. Bonnafous reminded them that if this programme is fulfilled, French agriculture will have regained the level of output which it had reached under the Second Empire, before the home cultivation of oil plants was replaced by imports from the colonies.

It is doubtful whether these historical reminiscences have any real meaning for the peasants or whether the ideal of going back to the agricultural standards of the Second Empire can find any serious response. The French peasant will probably think that the references to the Second Empire are not unconnected with the demands of the Third Reich. But M. Bonnafous has also offered the peasants some more tangible inducements. He has promised to fix the prices for oil-seeds at such a level as to make their cultivation two or three times as remunerative as that of wheat. Farmers will also receive 6 kilograms of oil per 100 kgs. for the first five quintals of seeds delivered, 5 kgs. for the fifth to the tenth quintal and 4 kgs. for every additional quintal. The whole programme has been very warmly welcomed by the German press.

M. Cathala, Minister of Finance, has taken the same line with regard to the cultivation of vegetables and fruit. He spoke recently of the decay of French vegetable and fruit growing in the inter-war period, and explained it by the competition of Californian, Canadian, South African, Indian and Malayan fruit and vegetable producers. Before 1939, France had to pay nearly 200 million francs to the USA, 22 millions to British India and 20 millions to South Africa for its imports.

Tomorrow [the Minister of Finance concluded] if the Anglo-Americans were to emerge victorious and were to force their agricultural produce on our markets again, as they did in 1931, for instance, our peasants would soon be going through hard times again. . . . Once we have created a European economic structure, we shall be able to do without those imports, and the millions we have been sending to foreign countries will benefit French farmers. Tomorrow our industrial capacity will perhaps be limited and, moreover, we no longer have any gold. Our gold will be our agricultural produce—our wheat, wine, fruit, our early vegetables.

In other words, the "pernicious" policy of the Third Republic resulted in an expansion of fruit and vegetable consumption at home; within the framework of the New Order, on the other hand, France would pay with fruit

and vegetables for the industrial goods it would have to import owing to its "limited industrial capacity."

The wheat position has also been discussed. The falling off of colonial imports of grain has not affected the position in the short run. The Ministry of Food does not yet contemplate any cut in the bread ration. But, in the longer run, the bread position is bound to become very critical. Last year, the import of one and a half million quintals of cereals from Africa covered home consumption before the harvest. No such supply will be available to bridge the next gap between the two harvests, in June and July. In addition, a part of the 1942 crop was milled very early, beginning in July, and the crop was substantially below normal. Smaller reserves of grain have, therefore, to meet the demand during fourteen months instead of twelve. M. Bonnafous has appealed to the Prefects, the Peasants Corporation and to the *Légion des Combattants* to start a crusade for the delivery of wheat, as "the very life of the nation is at stake." The prospect for the summer is indeed very gloomy; the towns of France are threatened with famine.

Black Markets for Meat

The position in meat is deteriorating. A faulty price policy led to a mass slaughter of cattle. The disparity between the prices for butcher's meat and the prices paid for cattle is so wide that the farmer does not find it worth his while to sell cattle at the fixed prices. Enormous masses of meat are being absorbed by the black markets. A section of the press excuses the farmer and blames the Government for the abnormal position. Thus, *Action Française* writes:—

The farmer can ask: "Why allow a suit to be sold at 2,000-2,500 fr. which cost 600 fr. in 1939; why authorise the butcher to sell veal for twice as much as in 1939, when we have to sell a live calf at a price slightly less than that which existed in the same period? Why allow a shoemaker to sell at 300 frs. and more a sole made of bad wood and a few thin straps of an ersatz material?"

This is, indeed, an eloquent comment on the new physiocracy. The problem of agricultural prices seems to have been the cause of some friction between the Minister of Agriculture and the Minister of Finance. The former has been inclined to raise prices; but the Minister of Finance has objected, on the ground that an increase in prices would upset the budget estimates. The divergence of views has led the former Minister of Agriculture, M. Caziot, to resign from his post in the official agricultural corporations. The screw of the price-stop on agricultural prices has hardly any effect when the tide of inflation is rising; its only results are that the channels of official distribution are getting emptier and emptier, and that the peasant seeks to make good his losses, caused by compulsory deliveries to the state, through illicit trading and bartering.

Primitive barter has, in fact, become the dominant form of trade, and it is widely practised within the countryside as well as between countryside and town. As the bargaining power of the peasants has been stronger than that of the general mass of the townspeople, the result has been a relative shift in the distribution of the national income in favour of the farmers. This does not mean that the actual income of the farming class has risen. On the contrary, it must have declined; but the total national income has decreased even more sharply; thus the smaller income of the peasants now forms a higher proportion of the total than before. The fact is not devoid of some political significance. It makes it possible to play off the town against the countryside and vice versa. While M. Bonnafous has been preaching physiocracy to provincial peasant audiences, German propaganda in Paris has been "explaining" to the workers and employees that they have been exploited by the peasants. One of the arguments is that while the tax on agricultural profits yields only 60 million francs, the tax on salaries produces 6 milliards.

Stabilisation in New Zealand

[FROM OUR CANTERBURY CORRESPONDENT]

December 18, 1942

ON December 15, 1942, the Prime Minister broadcast about the Government's new stabilisation plan. This consists of a big extension of the price-fixing measures previously adopted, combined with effective control over wages. Early in the war, efforts were made to prevent prices and costs rising. A Price Tribunal was established, house rents and most interest payments were controlled, and by September, 1940, the prices of 38 major commodities in common use were stabilised, in some cases with the aid of subsidies. Since then, price fixing has been extended and rationing applied to a considerable range of goods. But, while other costs have been controlled, wages have been relatively free. In August, 1940, the Arbitration Court raised award rates of wages by 5 per cent on account of the increasing cost of living. It rejected an application for a further rise in December, 1941, but granted an additional 5 per cent, on the first £5 per week only, in March, 1942. The wage index shows an average increase of 13.6 per cent since September, 1939, but this index is based on minimum award rates and does not reflect payments in excess of those rates, much less total earnings. No general changes in award rates have been made since last March, but adjustments for particular trades have generally been upward and, owing to the keen demand and short supply of labour in many industries, rates in excess of the minimum awards are widely paid. In addition, much overtime has been worked to meet war needs, and overtime rates increase both earnings and costs steeply after the standard 40-hour week has been worked. Women and youths are taking many men's jobs in occupations classed as essential. Large numbers are in the forces, and farmers, market gardeners and others, whose products are sold at fixed prices, are unable to compete with the attractions offered by rising wages elsewhere. Production and supplies for the military and for export have been well maintained, but rising costs and increasing Government expenditure have brought the danger of inflation nearer.

In September, 1940, a representative Economic Conference recommended the stabilisation of prices and costs, and a committee was appointed to continue investigations. The measures then adopted had considerable effect on prices and costs other than wages, but no effective limitation of wage increases was imposed. Now the committee has brought forward a wider plan which the Government proposes to put into effect. Its obvious aim is the freezing of further prices and costs, including wages. All wage rates, including overtime and piece rates, are to be fixed at the levels of November 15, 1942, and penalties are provided for breaches by either employers or employees. Adjustments will be made if the cost of living rises by 2½ per cent in the first place, and after that by further steps of 5 per cent. Prices are to be fixed for about 150 necessities entering into the cost of living, mainly locally produced goods. These cover rents and a wide range of groceries, dairy produce, meat, fruit and vegetables, fuel and light, clothing, footwear, drapery, furniture and miscellaneous articles. The aim is to keep these prices stable, and it is stated that unavoidable rises in some items will be offset by declines in others, so that the workers will have both fixed wages and fixed costs for their essential purchases. A new wage index number is to be computed showing changes in retail prices. This index is to be based on, and apparently confined to, the items covered in the scheme, and it will be used if necessary for any wage adjustments required. The freezing of wages at present levels, therefore, depends on the effective stabilisation of the prices that are to be fixed, and these prices will depend largely on wages. In these conditions, the prospects of stabilising both prices and wages should be good.

The plan adopted is probably the best that can be devised. But the basic difficulty was revealed by the Prime Minister, when he estimated the war increase in the national income at £NZ50 millions, and the war decline in the supply of consumers' goods at £NZ40 millions. In these conditions, even partial price stabilisation is difficult

to ensure, while complete stabilisation is probably impracticable. The extension of price fixing will increase the difficulties of effectively policing the price regulations; complete coverage of all prices is obviously impossible; and imported goods are in short supply, while import prices are rising steadily and are beyond local control. Some doubt must remain, too, whether effective means can be found to induce producers, including employees, to provide a sufficiency of the fixed price, and presumably low profit goods, when tempted by the superior attractions of other free price and higher profit goods. But such problems are not confined to New Zealand, and the scheme adopted represents an earnest attempt to cope with a problem that has worried every Government, and that appears to admit of no completely satisfactory solution.

Brazil as Ally

[FROM A CORRESPONDENT IN SAO PAULO]

December, 1942

THE three months' activities of Joao Alberto Lins e Barros, Economic Co-ordinator, has shown that the concentration of control over production, distribution and manpower is of vital importance in a sub-continent of vast size, containing such a wide variety of potential resources. Realising that the war effort demanded the maximum exploitation of a few, quickly available materials, the Co-ordinator, with the help of American advisers, set up a hierarchy of commodities, putting at the top rubber, vegetable oils and waxes, ores and industrial diamonds, and then coffee, cocoa, Brazil nuts and meat. Most of all these commodities are produced for export to the United Nations. Next come textiles, cotton, timber and fruit, which go to neighbouring South American countries and, to a certain extent, to European neutrals.

This obvious dethroning of Brazilian staples, such as coffee, was made possible by the Washington agreements, under which the United States promised to buy certain Brazilian products for the duration, irrespective of whether they could be shipped. Attention could thus be concentrated on stimulating the production of the important raw materials; and the removal of any immediate danger to Brazil by the Allied landings in North Africa stressed further the fact that at present the country's chief task in the strategy of the United Nations is the mobilisation of its material wealth.

The Co-ordinator's other function is the organisation of essential supplies for his own country. An American Engineering Commission, which has recently completed a two months' survey of the industrial possibilities of the Sao Paulo area, with a view to diminishing Brazil's dependence on certain imports, declared that the lack of high-grade coal deprived the country of an adequate basis for heavy industry. Brazil, the Commission went on, should take the opportunity of developing its industry on a light metal basis, thus anticipating the progress of technology, which tends more and more to substitute light materials for iron and steels. This opinion ran counter to the views of an increasing number of experts, who favour an extension of heavy industry, but although opinions are thus differing on how greater self-sufficiency can be achieved, the clash is largely academic, since neither project could be completed before the end of the war—even if begun at once.

It is noteworthy that there is complete agreement between the American advisers and Brazilian experts on the manufacture in Brazil of certain consumption goods which are no longer obtainable from Great Britain and the United States.

A serious, but old, obstacle is the poor communications, both inside the country and with the outside world. The Brazilian economy rapidly adapted itself to the fuel shortage resulting from the submarine campaign, and the programme for producing alcohol from sugar assures a minimum supply for industrial purposes. But the inter-state communications are suffering thereby, and, without railway or road connexions between north and south, trade must be carried on by coasters—with a reduced number of ships.

Fears have been expressed in the Rio press lest the restrictions on coffee consumption in the US, together with the campaign in American magazines in favour of the introduction of ersatz coffee, will permanently affect the taste of American consumers for pure coffee. But at the moment

these fears are groundless, for the US has agreed to purchase 90 per cent of the coming coffee crop, and since prices are four times above the pre-war level, the big reduction in the output in 1942-43 should be largely compensated.

The case of cotton is somewhat different, since it was not included in the Washington agreements. It is difficult to find an export market for this crop, but its by-products—linters and cottonseed oil—are profitably exported to the

US, and the Brazilian Government, with the help of US loans, has decreed a minimum price of 6d. per lb. for cotton fibre, which should maintain the area under cotton cultivation. In fact, so far from provoking discontent, the incorporation of Brazil into the economic framework of the United Nations has given its commercial relations a stability that has seldom been achieved in the last thirty years.

Germany at War

On the Defensive

IT seems at first incredible that the Nazi regime, which had been credited during its period of successes with thorough planning for each new move, should have been surprised by the Russian winter offensive. But the fact is plain enough. It can be demonstrated beyond doubt by a survey of the German press and radio during last autumn and the early winter—until January 11, 1943, when General Dittmar broadcast his "backs to the wall" commentary. The Nazis believed that the summer offensive had achieved at least the safe possession of the Donetz and Don territory and part of the Caucasus; and that Russia had been fatally weakened, while Germany had gained important sources of foodstuffs and raw materials. While the German armies were still advancing into the Caucasus, more eastern provinces of the Ukraine were put under civil administration. The confidence of the Germans in their ability to maintain these conquests was shown by the foundation of numerous new companies for the development of the Ukraine and the Caucasus; state concerns were set up for the generation of electricity and coalmining in the Donbas and for the cultivation of cotton, rubber plants, and tobacco; leading steel and manufacturing concerns established branches in all parts of occupied Russia; new trading undertakings appeared, and even firms to produce and distribute films. This went on right into December last year. Reports about autumn sowing were at the same time optimistic. This was not mere propaganda. It was based on the belief that rich colonies had been captured for good. The German armies could be supplied on the spot, with the coal of the Donbas for their railways, electric power for their factory repair shops for army equipment, and the oil of the Maikop area for their tanks and aeroplanes. All this activity was to go on far behind the fighting front during a relatively quiet winter. Now these hopes have been catastrophically shattered—everything has been swept away in a few weeks, with fearful losses. Seldom in history has foresight failed more completely.

The Strength of the Regime

What is the effect in Germany? The military, economic and political situation in the Reich and in the whole of German occupied country has changed. The sweeping successes of the Russians have brought the Germans, strong though they still are, to bay. The process of reducing Germany's conquests has begun. The Nazi regime is faced with the grim problem of finding a way out of its first real crisis.

Hitler and his party came into power by a very curious process of trial and error. Easy successes over disunited enemies at home and abroad were ascribed to the political and later the military genius of Hitler, who became convinced that he himself planned all the triumphs. Hitler and the Nazis had no clear plans or precise time tables. They moved from one easy success to another. Their one underlying idea was to build up the strongest possible military organisation and to keep it in semi-mobilisation; and the tremendous advantage of being able to move great armies at a moment's notice gave them the chance of conquering almost all Europe. The unexpected resistance of Britain induced them to attack Russia. Then, over-confidence in their own power and a complete misunderstanding of the Russian regime showed, after their initial successes, the relative weakness of the Nazi leaders, including their generals. The war against Russia was begun with all the old German generals in command.

The Stalingrad disaster uncovered the vulnerable spot of Hitler and all other Nazi leaders. They were strong and displayed foresight in economic and military affairs at periods where they could rely on real experts. Once they undertook the work of experts themselves they failed. The

power of the political, economic and military machinery of totalitarian Germany stands in glaring contrast to the poor quality of the Nazi leadership, who fortunately failed in using this instrument to its full advantage after the collapse of France. The great strength of the authoritarian regime at home is obvious. Stalingrad is probably the greatest disaster a German army ever suffered. Outside Germany it is clear for everybody to see that Hitler and his generals are responsible for this senseless sacrifice. Yet the authoritarian leaders can ask for more sacrifices without being swept away by the people. This is the real situation at the moment. The Nazi leaders, politicians, generals and administrators alike, are determined to prolong a war which can no longer be won.

The Stalingrad disaster was followed by a number of economic decrees ostensibly designed to bring the last reserves of manpower into war production. But, immediately before the decrees were issued, the German economic papers voiced the opinion that any further reduction in the number of retail shops would only cause difficulties in distribution; and they stated, also before the decrees, that independent artisans had already been fully mobilised. In fact, economic conditions in Germany had already been strained to such an extent that there are hardly any reserves left. The total volume of production is inevitably declining with every worker called up to replace the losses suffered in Russia.

The Nazis are convinced that production can be increased by a last great effort. The truth that pure defence is tantamount to defeat is known to every Nazi and felt instinctively by every German. Germany at war needs its conquests for food, raw materials and man-power. If the conquered territories are lost one by one, defeat becomes certain. Defence must, therefore, be offensive not only militarily but also politically. Still strong, though seriously wounded, the Nazis will strike out fiercely wherever they can. The whole territory from the present fronts in Russia to the German frontier is considered an area of defence in which a number of strong positions will be made the basis of a flexible defence, that is to say, of maintaining defence areas by offensive thrusts. This is the intention; and the hope is that Russia will exhaust its superiority in men and material in the present offensives.

This method of defence in the east, it is hoped, will leave the Germans enough forces for active operations in Tunisia and frustrate any landing in the west—provided the full use of the gathering Allied forces can be prevented. Two offensive means to prevent this full use, are, in Nazi opinion, available. The first is the U-boats; the second is the political offensive exploiting the Bolshevik bogey. The stories of Russian atrocities told at present on the German radio have a familiar ring; they are old stories from the Nazi archives. Behind them, however, is the belief that the people in Britain and America, as well as Europe, are afraid of Russia, and above all the conviction that Britain, peopled by a branch of the Nordic race, will finally come to terms with the Germans if they can contain Russia in the east.

The actual strength of Germany in terms of armies and economic means and especially the power of recuperation is the unknown factor. The territory available for flexible defence in the east is still large. But the value of the Balkan countries and the occupied countries in the west as an area of defence is doubtful once the Allied invasions begin. These things must be seen in combination with morale at the front and at home. Any army is seriously affected by a long retreat. The Nazi leaders have no choice; they must continue the fight; and as long as the SS and Nazi police remain intact there will be party terrorism (as Hitler's proclamation this week plainly promised) rather than surrender. Germany's material means, though enormously depleted, are still large. If the morale of the army and the whole Nazi party survive the coming spring, the final chapter of the war may still be protracted.

THE BUSINESS WORLD

Homework

THE increasing difficulty of obtaining unskilled or semi-skilled labour for war production has given rise to a new type of "outwork" or "homework." Not every industry can use homeworkers profitably, and for their successful employment two conditions have to be fulfilled. First, the articles—whether finished or semi-finished—is immaterial—must be reasonably small and light. Secondly, the manufacturing process must lend itself to sub-division into a number of operations, some of which are simple and can be carried out with hand tools. In general, the operations suitable for homework fall into two main classes: simple assemblies of parts requiring such tools as screw-drivers, spanners or pliers; and simple hand operations, such as scraping, insulating, sealing, filing, gauging and adjusting.

The next step is for the works to organise a homeworkers' department. This department has two main functions. The first is to act as a depot to which material and parts are diverted from their normal routes in the factory for parcelling in convenient quantities for distribution, and from which completed work is returned to store. The second function of the homeworkers' department is to deal with the homeworkers themselves, supply them with work, instruct and supervise them, receive and inspect their work and pay them for it, and deal with difficulties, either personally or by correspondence.

The arrangements made for the distribution and return of the work are of paramount importance in any homework scheme. On them depend, not merely the even flow of work in and out of the factory, but also the maintenance of the enthusiasm of the homeworkers. These arrangements vary considerably, but they may be classified into groups, the most important determining factor being the type of district in which the factory is situated. First, there is the sponsor system. Under this scheme responsible members of the works staff—foremen or charge-hands, act as sponsors and organise groups of six to ten people near their homes who are willing to undertake homework. The sponsors bring materials and parts from the works as required and leave them in the homeworkers' stores. The workers draw their materials from the store and return the completed assemblies to it; these are collected from time to time by the sponsor and delivered to the works. Another important function of the sponsor is to demonstrate to the homeworkers how the assembly should be carried out, and deal with any assembly difficulties which may arise.

A second type of scheme is one which involves the distribution and collection of work by a van sent out from the factory. This system can be adopted in an urban or suburban area, but needs careful organisation in order to avoid uneconomic journeys. The secret of success is to avoid taking on workers who are widely scattered.

In a third type of scheme, the workers themselves call at the factory to collect the work and receive instructions, and later to return the finished product. For this scheme to be worked successfully, there must be a fairly large number of women not engaged on war work within easy distance of the factory. The chief requirement is an efficient homeworkers' department, so that a steady stream of callers can be dealt with without confusion.

Outwork is only worth while if it taps a source of labour which would otherwise remain unused. If it uses labour that could be employed more continuously and more productively, it is wasteful and inefficient. Any scheme which relies on drawing homeworkers from the immediate neighbourhood of the factory requires careful organisation; otherwise regular part-time or even full-time workers will be attracted from the factory. Many of the most successful applications of the outwork principle are found in country districts, villages or small towns. The most suitable districts are those where transport facilities are not good enough to make it possible for workers to travel every day to a factory, or where there is a large proportion of immobile women for whom there is no work in their immediate neighbourhood. In such areas local depots are established from which the workers collect their work and to which they

return it after completion. These depots are generally within a ten-mile radius of the factory. One firm in a small country town, for example, found that in three of the four villages within an eight-mile radius, small engineering firms were willing to become agents for the distribution and reception of work in their immediate neighbourhood. Not infrequently the amount of part-time work that can be done from one of these centres is more than enough for a single firm; and in such cases firms combine to form a group centre which handles all the outwork for the firms belonging to the group. Sometimes the group has been organised by the Ministry of Production; in other cases it has been left in the hands of the firms concerned. Finally, some factories have found it best to have the work itself done at the local centre and not in the outworkers' homes. For this purpose a suitable building is made, in effect, into a small branch works manned by local workers working on a part-time basis. An interesting scheme for the employment of part-time women on hand finishing aircraft components has been developed in Surbiton. It started by a group of women meeting in a drawing-room, working for a Middlesex factory; a number of shops for hand assembly and non-machine processes are now being organised in the area. This method is somewhat different from homework proper, though the principle is the same; it offers the advantage that the work is done in one place, which is more economical and facilitates instruction and inspection, and makes possible the employment of a wider range of processes.

Which of these schemes is adopted depends on local conditions. In all of them good organisation and super-

Voice of the North

ASK TO SEE IT AT YOUR CLUB, LIBRARY OR NEWSAGENT

vision are essential. Initial instruction is of much greater importance in placing the work out than it is in a factory; and the greatest care has to be exercised at the factory to see that all parts which are sent away for home assembly are absolutely correct. The factory assembler will often tolerate occasional imperfections, as he has the tools at hand to put them right, but the homemaker has no such facility and has to reject the parts. There must be the closest liaison between supervisors and the inspection department, who have the final say as to whether or not the work is up to standard. Payment for work done is on a piecework basis, and is made in cash when the work is handed in.

Homeworkers are volunteers. There is no formal contract of engagement as employees, and they merely undertake verbally to do certain processes at prices based on Trade Union rates of pay for similar processes when performed in the factory. Whatever their legal status, they are in practice treated more as sub-contractors than employees, although National Health and Pensions Insurance contributions are paid by the factory. Firms who have been using homeworkers for some months say that the standard of work is as high as that done under factory conditions. Socially, all classes are represented as homeworkers. Most are women, and the utmost care has to be taken to avoid absorbing women who are wanted for factory work by the Ministry of Labour—which is the great danger of the homework system.

Finance and Banking

Abundance of Credit

Although most of the banks have been making up this week there has been no evidence of pressure in the credit situation. There has been some relief from the £10 millions excess of Treasury bill maturities over payments for new bills, while TDR payments of £20 millions for the past week compared with nominal maturities of £30 millions. The actual maturities were substantially below this figure, many banks having evidently encashed TDRs against customers' subscriptions to tax reserve certificates. Nevertheless, there was probably some outgoing of funds on TDR account this week. These floating debt factors, allied to the exceptionally heavy flow of Government expenditure, have helped to keep money in abundant supply in the market. This plethora of credit is reflected in the latest Bank return, which shows bankers' deposits at the exceptionally high level of £178,233,000, an increase of £28,758,000 on the week. The principal counterpart to this movement is an increase of £25,200,000 in the holding of Government securities. This suggests that in fixing the volume of its floating debt borrowing for the week, the Treasury erred on the short side and was thus compelled to borrow appreciably on ways and means advances from the Bank of England. Heavy revenue transfers were known to be due on Thursday, i.e. after the Bank return was made up, and this may have restored the position and reduced the level of bankers' deposits to more normal proportions, while allowing the Treasury to pay off ways and means advances. There was, however, no evidence of credit pressure on Thursday, and it is evident that the authorities, with the customary regard for the banks and the market which they evince in making-up weeks, planned to keep the cash basis ample to meet the calls of window-dressing. Another factor helping the credit position has been the further clearing of South African loan repayment warrants. This is reflected in a fall of £5,434,000 in other accounts. The circulation is now firmly anchored to its basic upward trend, and a further expansion of £2,536,000 was recorded over the past week.

India's Silver Sales

The Finance Member recently made a statement in the Indian Assembly, countering the suggestions that Indian Government silver had been made available to British consumers through British Treasury sales in the London market at less than the world price. He asserted that no sales of Indian silver had been made to the British Government since the beginning of the war at less than the sterling equivalent of the United States Treasury's official price for imported silver. He added that no sales of silver to the British Government had been made from India since last August, when the United States import price was raised

Outwork was started by a few enterprising companies, and, with the encouragement of the Ministry of Production and the supply Ministries, has spread rapidly. In the radio industry considerable use has been made of outworkers, as the production of radio equipment is so largely a matter of assembling more or less standard components. But almost any light mechanical assembly work can be done in workers' homes, and the assembly of quite delicate instruments has been successfully carried out. Unfortunately, no comprehensive statistics exist at present to enable a quantitative assessment of the importance of outwork in war production to be made. One small firm actually found that it could employ as many man-hours outside the factory as inside.

This work is, of course, essentially a war-time expedient for utilising a source of labour which it is normally not profitable to use, and it is improbable that peacetime conditions will require any extensive employment of homeworkers. It may, however, have a limited application after the war in two directions. There will, unfortunately, be a large number of disabled men and women who will be unable to undertake factory work, and to these homework would bring obvious benefits, psychological as well as financial. Secondly, schemes might well be evolved which would appeal to elderly people who are often fit and able to do simple tasks, and who would welcome the opportunity of home employment to bring them in a small addition to their incomes.

from 35 cents to 45 cents per fine ounce. The assurance does not carry one very far, since the sterling parity of the former 35 cents import price paid by the US Treasury was only 19½d., while the official sales in the London market have been made at prices consistently above this figure and, ever since the early days of the war, at 23½d. Up to May, 1941, these official sales were made direct by the Indian Government, while since then the Bank of England, acting for the British Treasury, has been the official seller operating at this constant ceiling. The burden of Indian criticism of these sales is that they were made, not at less than the US price, but under the price quoted for silver in Bombay and that the Indian Government was prepared to supply the London market while it was not prepared to sell in India. The answer to this criticism could have been readily made; it is that the official sales made in London go to satisfy strictly "vetted" essential industrial demands while silver sold in Bombay would have disappeared into hoards.

"Free" and Official Silver

It is interesting to note from the Finance Member's statement that no Indian Government silver has been sold to the British Treasury since last August. Yet, since that time, official sales of the metal in the London market have been of almost daily occurrence, and though the flow has been comparatively small, the total involved must be considerable. These sales, moreover, have continued to be made at the price of 23½d. per standard ounce. The new US Treasury price for imported silver gives a sterling equivalent of 25.65d. per standard ounce. A point must, sooner or later, be reached at which the official stocks held in this country are depleted, for not only are they being utilised to satisfy genuine industrial demand, but considerable amounts are being devoted to fresh coinage. There are two directions from which replenishment can be effected, India and the United States. If further purchases are to be made from India, it may be assumed from the Finance Member's speech that they will be made at a price not less than the American import price. In that event, it seems reasonable to expect the London quotation to be adjusted to a level which would at least cover the costs of purchasing the metal and shipping it to this country. The alternative source of supply is the Lend-Lease silver which the United States has promised to the United Nations. The experience of the market does not suggest that any of this silver has yet arrived. No American bars have been seen recently. Before American silver arrives and is used to satisfy essential industrial requirements, it would be desirable to extend the official control over the London silver market so as to cover dealings in unofficial, or "free," silver. The position as it exists at present is that brokers are expected to

scrutinise very closely the purposes for which they obtain official silver on behalf of their clients. Only urgent and essential war industrial needs qualify for official silver. Free silver, of which fair quantities occasionally come to the market, can be sold without restrictions, and it is quite possible that some of it finds its way into private hoards. It would be anomalous if such traffic were allowed to continue after American Lend-Lease silver is made available to satisfy industrial and coinage requirements.

British Banks in China

The Chinese Government has recently granted licences to two British banks, the Hongkong and Shanghai Banking Corporation and the Chartered Bank of India, Australia and China, to open offices in Chungking. Both banks had for some time past maintained a small personnel in the temporary capital, and negotiations with the Chinese authorities have been proceeding over some months to convert this representation into recognised branch offices. The necessary licences have now been granted and both offices are expected to open for business on March 1st. Since British extraterritorial rights in China have been relinquished, these offices will be subject to the Chinese Government's banking regulations and will depend upon Chinese courts for the settlement of any litigation with clients in that country. The experience gained in this respect will be of value in settling the problems that will arise when foreign banks are again in a position to open their offices in the former treaty ports. The establishment of branches in Chungking must be regarded as a preliminary to the re-entry of the banks concerned in the ports from which they were evicted by the Japanese. The amount of business available in Chungking will be negligible in comparison with what used to be handled by the offices in Shanghai, Tientsin, Hankow and Hongkong. In any case, the overhead expenses of the Chungking offices are calculated to deprive the establishments in that town of any profit-earning capacity. Chungking now has the unenviable reputation of being the most expensive capital in the world. Almost every office requisite has to be imported and arrives by air after a most devious journey. The cost of maintaining these offices is, thus, likely to exceed any immediate return they can bring to their respective banks. But as a harbinger of their eventual re-entry in the great Chinese ports, the coming opening of branches in Chungking is of the greatest significance.

Turnover and Prices Lower

The stock market presents few features of interest. Now that the peak of tax payments is passed, preparations for the Wings for Victory weeks are visible, and, if London is any guide to the general reaction, they are going to be even more costly in men and materials and produce an even more meaningless parade of figures than their predecessors. Their effect on the market has been to hold up investment, with the result that fixed interest stocks have ceased to advance, despite a great scarcity of stock outside the list of Government securities proper. In fact, the Funds, where the supply is adequate, have suffered a very minor reaction. The fall in equities has been rather over one per cent from the peak in about four weeks, and a disproportionate share of this is due to the decline in home railway stocks since a couple of days after the LMS announcement. The Great Western payment was fully up to expectations at 4½ per cent in all, but the ½ point increase was found almost entirely by putting less to reserve. The general reduction in contingency allocations is, presumably, a reflection of the smaller need to provide against war damage, and it is very largely out of such reductions that the increased distributions have been made and not from expansion in earnings outside the Government scheme. Since the whole transport system was working virtually to capacity throughout 1942, there would seem to be little room for any further increase in distributions. In view of the fact that most of the lines are over-capitalised by peacetime standards, and that all have from time to time been short of ready money for new construction, the extremely liberal distribution policy is to be deplored. It clearly rests on the belief that the Government will provide, and so places a potent weapon in the hands of those who maintain that transport should be state-owned. The two accounts so far

Irish Banks' Returns

The returns for the banks operating in Eire for the December quarter, published by the Currency Commission, are as follows:—

	(£000's)		Dec. Quarter, 1942		
	Dec. Quarter, 1941	Sept. Quarter, 1942	In Eire	Elsewhere	Total
Liabilities:—					
Capital, reserves, etc.	17,615	17,637	10,422	7,228	17,650
Notes in circulation	15,026	16,683	5,378	12,448	17,826
Current, deposit and other accounts	194,327	205,858	153,353	61,294	215,247
Other liabilities	7,964	8,521	6,278	1,954	8,232
Total	235,534	248,701	176,031	82,924	258,955
Assets:—					
Cash and Balances with London	31,702	32,078	10,891	25,327	36,218
Agents and other Banks	14,111	18,349	1,113	17,970	17,970
Money at call and short notice	4,451	4,113	3,586	394	5,980
Bills	67,515	64,585	47,294	19,871	67,165
Loans and advances	98,073	109,767	7,567	106,642	114,209
Investments: (a) Government	9,724	9,204	3,891	5,305	9,196
(b) Others	9,956	10,480	5,461	4,753	10,214
Other assets					
Total	235,534	248,701	78,691	180,264	258,955
Excess of Assets outside Eire over Liabilities outside Eire	83,753	93,794	...	...	97,339

The expansion of the banks' resources continues. The increase in the note issue is confined to Northern Ireland as the consolidated bank note issue in Eire is limited to a maximum of £6,000,000. The growth of deposits reflects rising prices for agricultural exports together with a lack of investment outlets. The steadiness of loans and advances is in striking contrast to experience in Great Britain. Another point of contrast is the small extent to which the Irish Government is in debt to the banks. The growing accumulation of net sterling assets emphasises the interest of Irish financial institutions in the maintenance of the value of sterling after the war.

Hire Purchase—A Correction

In *The Economist* last week, page 243, it was stated that the new Board of Trade order makes it compulsory for traders to sell perambulators on hire purchase terms if they have done so before and if such facilities are required by their customers. This was incorrect. They are under no obligation to do so.

Investment

available show virtually no increase in revenue outside the Government scheme. The rise of £340,000 in LMS revenue was within the plan, and is merely a reflection of the fact that the net credit for 1941 was lower than the mathematics of the scheme would have suggested. The fall in railway equities has gone hand in hand with a return to more normal dimensions in the number of bargains received in that section. This fall is mainly responsible for the fact that the total received is now once again the lowest since the period of stagnation experienced in December.

South African Budget

The direct interest of the British investor in the budget presented this week by Mr Hofmeyr is still largely concentrated on its effect on gold and diamond shares. There was some relief that the increase in the special contribution to be made by the former is only from 20 to 22½ per cent against the figure of 25 per cent which would have caused no surprise. There will, however, be some disappointment at the rise in contributions of the diamond companies of 6d. to 4s. 6d. for the ordinary and rs. to 3s. for the special contribution. For other companies, the normal rate is raised from 3s. 6d. to 4s., while EPT is put up to 15s. against 13s. 4d. Further, the tax on dividends paid to foreign shareholders is raised from 1s. to 1s. 6d. in the pound, to yield £480,000. One further indication is provided which is of substantial value to holders of gold shares, namely, that, on the basis of old taxes, revenue from the mines would fall by £2,200,000. This appears to mean that the fall in production of January will be representative of the general performance of the year. The curtailment of profit by rising costs and restriction of supplies is, thus, considerable. The

company taxes outlined, and the contributions from foreign shareholders, are together estimated to yield an increase of some £3,750,000 on the year, leaving £3,500,000, in very round figures, to be raised by customs and excise, £1,500,000 by increased taxes on incomes and private companies, and a deficit of £500,000 after bringing in some miscellaneous items of small amount. It is to be noted that duties of a penny a tot on spirits and 2d. on 50 cigarettes yield between them two-thirds as much as the increases in all the company taxes. Against this, there is no increase in the petrol duty. Mr Hofmeyr characterised his budget as drastic, and certainly some of the increases are impressive, as is the fact that virtually the whole of the increase appears to be financed by taxation and not by borrowing. The response of the British investor to the announcement was very slight but Cape buying put up prices for both gold and diamond shares. The effect of the increase in non-residents tax will presumably be to accelerate the repatriation of South African shares.

British Investments in Portugal

It is idle to pretend that the tentative proposals of Portugal to convert six foreign-owned public utility concerns into Portuguese companies came as a complete surprise, or that it can be hailed with anything but regret. No actual dispossession is under consideration, but the provision for the lodging of shares in Portugal before voting rights can be exercised will, if given effect, further restrict the appeal of these investments, and so, to some extent, diminish their value. The whole matter is still in its early stages, and only comment of the most general kind is possible. The two British-owned companies involved are Anglo-Portuguese Telephone and Lisbon Tramways. The price of the former fell 1s. 3d. to 23s. 9d. on the news, but the latter were steady at 30s. 9d. It is an inevitable result of the increasing inclination to place the control of public services, if not of all industry, in the hands of the state, rather than of private enterprise, that foreign ownership of such undertakings should be considered undesirable. The wisdom of the policy may be questioned, but, if the desire for it is strong, there appears to be no alternative but the transfer of control, if not of ownership. It is, perhaps, doubtful whether foreign owners would wish to retain their investment under such circumstances, and the most satisfactory, and possibly the only honest, method of procedure is to make a reasonable offer for the shares in those cases where control is to be assumed, either openly or by fixing costs and rates chargeable. It may be that Portugal is actuated only by a desire to control the country's public utility services, and has no antagonism to foreign capital as such. There appears, however, to be a growing dislike for foreign capital, at least in the Spanish and Portuguese republics of the Americas, and this is to be deplored. It is essential for the full development of the world's resources that there should be greatly increased movement across national frontiers of money and men, as well as of materials and manufactured goods. It is to be hoped that Portugal is not to join the ranks of those who hope to achieve prosperity by minimising foreign trade, for that is one effect of banning the entry of foreign capital.

U S Bank Profit Statements

While the balance-sheets of banks, both in this country and America, are reasonably informative, it has always been the case that British banking profits have been regarded as a matter for secrecy. All that the best banking profit and loss account provides in this country is a net figure after all tax, showing only published allocations, including the amount paid in dividends. In the USA, the position has, in many cases, been even less satisfactory, and it is, therefore, highly gratifying to learn, through the good offices of the Central Hanover Bank and Trust Company, that the American banks have been working towards a uniform type of earnings statement. The first of these, published by this bank, presumably in the agreed form, shows earnings under three headings: interest and discount on loans; interest and dividends on securities; and commissions and other fees. The total is some \$17½ millions, to which the first and the last of the three categories contributed, very roughly, a quarter each. Against this are charged expenses of \$11.2 millions, of which salaries called for \$5.7 millions, general expenses \$5.1 millions, and depreciation of property \$343,200. This is quite a fair amount of informa-

tion, and appears fairly straightforward. It leaves out, however, capital profits. These are included under reconciliation of capital, surplus and undivided profits as \$283,647 net profit on securities. A great deal turns upon the interpretation of the word "net," and an explanation would be welcome. The whole statement is, on any interpretation of this world, a great step forward, but it does not appear on the face of it, that the public is any nearer an estimate of true earnings before secret reserves.

Unit Trust Extension

The British Industrial Corporation, controlling the "Keystone" group of unit trusts, gives notice that the life of Gold Producers Deposit Receipts (First Series) Trust is about to expire. The life was ten years, and the first units formed would normally be liquidated, and the proceeds distributed, in about April next. Sub-unit holders who wish to do so are invited to extend their holdings for a further maximum period of ten years. As previously, the managers or trustees will have the right to bring the trust to an end at any time on giving six months' notice. Holders of sub-units have the right to realise their holdings at any time. In remuneration for their services, the managers will receive, half-yearly, one-half of one per cent on the current market cost price of investments in the trust. The fee was previously one per cent yearly. The problem which faces the holder in deciding whether to accept this offer of renewal is essentially the same as that with which he has been faced in deciding to retain his holding so far. The recent South African budget decisions will be a new factor of transient importance. The fundamental consideration is the place which gold is to occupy after the war. Despite the great rise in the price of gold over the decade, profit experience is not very encouraging. The first distribution of this trust was 7.67d. per sub-unit net in August, 1933, the highest 10.77d. in February, 1937, and the lowest 5.63d. this month. The corresponding gross figures are, first and lowest 10.23d., highest 15.9d. February, 1940, latest and lowest but one 11.26d. per sub-unit. It is impossible in the absence of accounts to give a considered opinion on the charge demanded for their services by the managers. It represents a considerable proportion of the total income, but is not necessarily unreasonable. The managers point to the yield of some 11 per cent on the sub-units—now priced at 16s. 6d. against an original issue price of 20s.—as being attractive. Even bearing in mind that, out of this return, a considerable part of the capital invested has to be amortised, the high level is surely an indication of the risk which is felt to attach to such an investment.

Company Notes

Lampert and Holt Accounts

The full accounts of Lampert and Holt for the year to December 31st last—the preliminary statement was discussed in *The Economist* on February 20th—show that total income declined from £184,452 to £111,748. As was to be expected, the transfer for depreciation of fleet is reduced, by £25,000 to £75,000, but despite this economy equity earnings are down from £74,474 to £26,929, providing very narrow cover for the 6 per cent dividend. The carry forward is £145 higher at £203,102. The reason for the setback is stated frankly by the chairman, Sir Philip Haldin—the continued loss of fleet by enemy action. Fixed assets before the latest depreciation are down from £439,510 to £277,285. Tonnage replacement reserve is up from £1,180,256 to £1,502,556, and GTR from £394,600 to £475,200. Debtors, freights under collection and balance on pending voyages have jumped from £316,601 to £897,112. Cash holdings are nearly stable at £1,735,873 against £1,792,532, while net liquid assets have risen from £1,842,720 to £2,416,194, a good index of the cost of shipping lost. Sir Philip Haldin provides a striking pointer to the dimensions of the post-war replacement problem by disclosing that the construction of two vessels, which in 1939-40 cost the company £175,000 each, to-day requires £300,000. He puts in a plea that the peace conference shall attempt to prevent the subsidising of national mercantile marines. This is, of course, a fundamental condition of the return of competitive conditions on the high seas. It is the logical alternative to a policy of nationalisation. The 6s. 8d. ordinary stock, at 10s. ex dividend, yields £4 per cent. The outlook for this year is improved by an increase in rates of hire.

The Harrods Group

The preliminary results of the Harrods group set a cheerful note at the opening of the stores dividend season. Harrods itself and the two main subsidiaries, D. H. Evans and Dickins and Jones, all announce increases in net profits which far outstrip the previous year's tentative recovery. Coupled with the results of Lewis's, Ltd., and Barkers, the first batch of figures certainly suggest that the recovery has been general. With net profits of £714,840 against £560,120, in the year to January 31st last, Harrods announce a 1 per cent rise in the ordinary dividend to 6 per cent. Tax reserve claims £275,000 against £120,000, but, in the absence of any transfer to staff pensions against £25,000, there is a rise in equity earnings from £115,120 to £139,839, representing 6.6 against 5.2 per cent. The whole of the surplus is passed on to the carry forward, which is raised from £206,268 to £213,196. Relatively, the recovery of the principal subsidiary, D. H. Evans, is equally satisfactory. Net profits over the same period amount to £134,498 against £94,355, after an allocation of £11,525 against nil for deferred repairs. Equity earnings may be estimated to have risen from £72,355 to £86,498, and the ordinary payment of 8 against 7 per cent is covered by 11.2 against 9.1 per cent. The smaller London interest, Dickins and Jones, which suffered more seriously than the other two concerns from the effects of wartime restrictions and blitz, is not yet back in the dividend lists. Net profits, however, are up from £41,374 to £78,907. This makes it possible, after providing £15,000 for taxes and £14,000 for writing down assets, to meet the year's preference dividend, to add £3,173 to reserve for such dividends and to increase the carry forward from £3,219 to £4,910. The parent is thus not in sight of a dividend on its investment. The Harrods £1 ordinary stock, at 46s. 6d. ex dividend, yields no more than £2 11s. 7d. per cent, a level which presupposes a very substantial further recovery in earnings.

The Kensington Stores

The preliminary statement of John Barker to January 31st last shows a rise in net profits from £253,748 to £345,056, a level which suggests that the pre-tax figure may have touched a new high. The Kensington group, which John Barker controls, have throughout the war enjoyed more profitable trading than the rest of the London department stores. The latest figures show that their recovery from the trough is at least as good as any realised elsewhere, even on the basis of net figures. After meeting preference dividends and repeating the customary transfer of £10,000 to staff funds, there is £288,881 against £197,573 for the equity, representing 42.2 against 25.7 per cent. Ordinary shares receive 10 per cent, as in each year since the normal pre-war rate of 15 per cent was reduced in 1940. Of the surplus of £178,248, £75,000 against £35,000 goes to general purposes reserve, £25,000, as before, to write off fixtures and fittings, and £50,000 against nil to write off properties. There is no allocation against £25,000 to modernisation reserve, so that the carry forward is raised from £207,264 to £235,512. The warning note struck by the chairman, Mr T. A. Bowen, in his statement last spring, that net profits must be seriously threatened by growing shortage of stock has not so far been justified. But until the war is won, this remains a very real danger, and the latest results should not be taken to suggest that an unlimited recovery is on foot. The £1 ordinary shares, at 56s. 9d., yield £3 11s. 9d. per cent, at which level they, in common with other department store shares, appear somewhat overvalued.

A Provincial Result

Lewis's, Ltd., which controls the important Midland and north country group of department stores, earned in the year to February 1st total profits—after tax, including EPT—of £802,452, against £793,743. There is little change in disclosed charges, depreciation of fixtures receiving £10,000 as before, so that there is £362,397, against £353,030, available for the deferred capital, representing 366.8, against 350.9 per cent. The management has wisely decided to repeat the 250 per cent deferred dividend, instead of restoring it to the customary pre-war level of 275 per cent. Of the surplus, £25,000, against £24,155, is transferred to general reserve, £30,000 to contingencies, against £60,000 to tax and contingencies, while the remainder is

devoted to raising the carry forward from £32,688 to £46,335. The £60,000 provided for tax or contingencies in the previous year was, as the chairman, Lieut-Colonel S. S. G. Cohen, points out, required for an additional EPT demand literally during the preparation of the accounts. The most striking change shown by the latest balance-sheet is the rise in stocks from £559,865 to £653,356, for which the inflation of values caused by the Purchase Tax is solely responsible. The decline in cash from £440,051 to £295,335 has financed the higher stock holdings and also part of the reduction in creditors from £366,455 to £220,457. There is little change in net loans from subsidiaries and associates at £414,942 against £419,915. Total reserves are actually slightly lower at £1,929,258 against £1,930,381. The chairman in his statement is able to report that all trading subsidiaries earned increased gross profits, but that since all suffer from poor EPT standards, there was little margin for providing depreciation and building up reserves, for which the management is forced to rely on the promised 20 per cent EPT refund. The chairman provided a detailed account of the history of retailing in the past year, and suggests that, in war conditions, the best solution for the problems of high prices and poor quality is to be found in the extended provision of utility goods. Of the Purchase Tax, he has no good word to say, characterising it as wholly inflationary, a tendency accentuated by the system of uplifts devised in an attempt to define "notional wholesale value." The deferred stock is all held by Lewis's Investment Trust, whose ordinary £1 stock, at 65s., yields £4 14s. 6d. per cent on the 15 per cent distribution.

Bovril Stability

The report of Bovril, Ltd., for 1942 shows that net profits are little changed at £310,109 against £299,215. The company's liability for income-tax and EPT is not disclosed, and it is impossible to deduce the actual trading results. It is clear, however, that there is a ready market for all the company can produce. Depreciation requires £21,542, some £1,700 more than last year, and, after meeting preference dividends, equity earnings total £131,286. Thus the cover for the 9 per cent equity dividend, to which level the payment was raised by one point in 1941, is equivalent to 17.3 per cent on the deferred capital, against 15.4 earned a year ago. After repeating the £30,000 allocation to reserve, it is possible to raise the carry forward £11,286 to £96,973. The most interesting feature of the balance sheet is the reduction by some £146,000 to £647,126 of investments in associated companies. The late Lord Luke explained that certain debentures have been redeemed, while other marketable securities were sold to take up tax reserve certificates. In direct contravention of the recommendations of the Council of the Institute, the extent of this holding is not disclosed, but deducted from the sundry creditors and tax provision item, which stands at £476,864. There can, therefore, be no valid comparison between that figure and last year's total of creditors and tax provision of £838,487. No mention is made this year of the Argentine subsidiary, whose losses were last year being borne by the company's EPT cushion. Stock is practically unchanged at £885,790, while cash is some £33,000 higher at £235,262. Debtors, however, have fallen sharply from £472,542 to £351,015. The call of 2s. per pre-preference share made last November yielded £50,000, and is shortly to be followed by another call, possibly of 4s. per share. In view of the fact that the company's net liquid assets total virtually £857,000 against £601,285, it would be interesting to learn how the additional finance is to be utilised. There can, however, be little doubt as to the company's ability to maintain its present earnings, certainly for the duration of the war, the chairman stating that retailers were receiving at least their pre-war quotas. The return on the £1 deferred shares, which at 34s. ex dividend yield £5 5s. 10d., discounts to some extent fears of renewed competition in the post-war period.

REFUGE ASSURANCE COMPANY LTD.

Chief Office: OXFORD STREET, MANCHESTER, 1

(1941 Accounts.)	

Kern Oil Difficulties

For the second time in succession, profits of Kern Oil declined in the year to May 31st last, on this occasion from £259,442 to £199,366. In the same period, consolidated earnings are down from £342,773 to £277,871. In the company's accounts, there is a substantial saving in depreciation, which receives only £90,467 against £135,598. The rise in tax provision from £64,442 to £82,004 is also alleviated by bringing in £32,750 over-provided in previous years. Thus, there is only a slight reduction in equity earnings, at £45,305 against £46,801, representing 10.1 against 10.5 per cent. The 6 per cent dividend, reduced from 8 per cent in the previous year, is repeated. General reserve receives nearly £7,000 less at £13,439, but there is a transfer of £10,000 against nil to Mexican reserve and the carry forward is reduced from £35,346 to £30,462. The information supplied by the directors does, however, suggest that operating conditions are more unfavourable than is indicated by the setback in profits. The Mexican company made a loss which is provided against by the specific allocation. There is no prospect that this company will do better until the political situation in that country has been clarified. There was some improvement in net results in Trinidad, but, in California, output was restricted and costs have risen. The chairman, Mr George W. Ivey, points out that the latest profits were only attained through the strictest economy, and issues a warning against assuming that the current dividend can necessarily be maintained. Expendi-

ture on the unsuccessful venture on Trinidad Northern Leases has now been written off by the transfer of £89,939 from general reserve. The total of this fund is restored to £100,000 by the latest allocation from profits, but shows a net fall of £76,641. The company's balance sheet reveals that net liquid assets of £87,791 have replaced a deficit of £13,740, while in the consolidated statement there is an increase in net liquid assets from £103,037 to £208,334. In both cases, the improvement is largely due to higher cash holdings. Advances by the company to its subsidiaries are some £10,000 lower at £84,633. No final settlement regarding the company's EPT liability has been arrived at, but the directors are confident that the existing provision is adequate. The most powerful influence on the course of profits is probably the future of crude oil prices in the United States. The 3s. 4d. stock, at 4s. 3d. ex dividend, yields 4 1/4s. 1d. per cent.

Gas Light and Coke Payment

Owing to a typographical error it was stated on page 216 of *The Economist* of February 13th that the resumed dividend on the 3 1/2 per cent maximum stock of the Gas Light and Coke Company was at the rate of 1 1/2 per cent. This figure should have been 1 1/4 per cent, that is five-fourths of the rate on the ordinary. We regret any inconvenience or confusion the error may have caused.

Industry and Trade

Industrial Location

Nothing is more irresponsible than to hold out hopes for the economic future that cannot be fulfilled. But excessive timidity and pessimism can be equally harmful. In his paper on Industrial Location, read before the Royal Society of Arts, on February 10th, Mr R. G. Glenday, economic adviser to the Federation of British Industries, rightly pointed out that the problem of industrial location must be viewed against a background of dynamic change, and not treated as a static problem "of siting an odd assortment of independent and separate factory pieces on a stationary industrial chessboard." There must be flexibility and adaptability if Britain is to make the best possible use of its resources in the future; especially as the war has temporarily reversed the trend of an absolute and relative growth of service industries, and a movement of population from north to south; it has actually led to an enormous expansion of some of the older and formerly stagnant industries. The primary reconstruction problem, in Mr Glenday's view, will not be so much one of choosing the regions in which new industries are to be established, as of selecting those in which over-expanded industries are to be contracted. In other words, the immediate need will be for adjusting Britain's economy to peacetime conditions. But Mr Glenday is very cautious, if not pessimistic, about the future:

So far as new industries are concerned it seems probable that in the absence of some new line of technological advance equivalent in range and penetration to the motor-car and electric power, we must look forward to a very slow rate of advance once the task of post-war restoration has been achieved.

This view is based on present population trends, and on the fact that in the past the successive waves of rapid expansion were generated by the upsurge of new industries, such as the railways, the motor industry, electricity and so on. Technical advance through mass production and mechanisation, Mr Glenday holds, will reduce the employment-absorbing capacity of the older industries, at least as fast as it will increase that of the newer industries. Mr Glenday does not heed his own warning against regarding industry as something "static." There is no justification for assuming that some new industry comparable in importance with those he mentions will not arise. But, far more important, he overlooks the enormous potential demand for the existing range of consumers' goods which could be made effective by rapid technical progress leading to sweeping reductions in the real costs of existing and established industries.

Chamber of Shipping

The annual reports of the Chamber of Shipping, which represent the views of a substantial body of British ship-

owners, are never devoid of interest. The latest report, published last week, expresses the anxiety of shipowners about the destruction of their capital assets; it "presents the gravest problem with which the industry is faced," especially as it has been unable to make adequate provision for replacement. The first step towards its rehabilitation has been the arrangement for transfer to private ownership after the cessation of hostilities—in his address to the shareholders of the Lamport and Holt Line Sir Philip Haldin, the chairman, strongly urges immediate transfer—of vessels built for the Government. The first allocation under the scheme covering vessels delivered to the Government up to September, 1941, has been almost completed. Deliveries made during the last quarter of 1941 are being mostly allocated to Allied Governments; the second allocation to British shipowners will be of vessels delivered from January to June, 1942. Secondly, last autumn agreement was reached on the conditions on which shipowners may obtain licences to build ships for their own account during the war. The principle governing such licences is that the vessels to be built must be of certain types prescribed by the Admiralty as most urgently required for the prosecution of the war and must conform to wartime specifications, which are "far below those required for peacetime trading." While the volume of merchant ship construction for both Government and private account is by no means negligible, it has so far been well below the rate of loss. The industry recognises that the elimination of Government control after the war must be a gradual process, but the report once again emphasises that, "under conditions of commercial competition, experience has shown that Governments have never been able to run the industry successfully."

Mr Geddes on Air Transport

The Chamber of Shipping's report expresses no views on the problem of air transport, but the gap has been filled by Mr I. C. Geddes, in his presidential address to the Chamber of Shipping on February 25th. The views of Mr Geddes are of special interest in that he is also deputy-chairman of British Overseas Airways Corporation. He pointed out that the balance between sea and air transport can only be found by trial and error; but that, in view of developments in design and operation the balance will not be a static one. Technically, air transport has an advantage over sea transport in that ships are built to last twenty years and aircraft only five. A fleet of aircraft can be modernised more quickly than a fleet of merchantmen. While agreeing that British policy must take account of the policy pursued by other countries, Mr Geddes rightly deprecates the artificial fostering of air transport. The aim of the British Government should be to secure international agreements on some basis on which the earnings of air transport would approxi-

mately cover costs, "the only way by which air and sea can eventually find their own level." Where air services can be maintained without subsidy, Mr Geddes observed, private enterprise should be encouraged to develop air transport in the same way as it developed the merchant marine.

Japan's Merchant Fleet

Japan, like Britain, depends on an adequate supply of ships for the massing of its full economic and striking power. Like Britain, Japan is probably short of shipping capacity, but there are no reliable estimates of the extent of its deficiency. According to Mr Tarashima, Minister of Transport, Japan's merchant fleet totalled 7,000,000 (presumably gross) tons at the outbreak of war and its size has not shrunk; this implies that sinkings have been offset by new construction and captures. He pointed out, further, that the shipbuilding programme was designed to raise the tonnage to 7,500,000 during the current year. Mr Tarashima's statistics about the prewar size of Japan's merchant fleet are somewhat higher than current estimates (he may have stretched his definition); but his statement that the total tonnage had been maintained may not be far from the truth because captures have been considerable. But in future Japan cannot rely on captures and its building capacity which, though enlarged by the conquest of territories with facilities for constructing small vessels, must be well below a million gross tons a year. By sinking their ships, the United Nations are hitting the Japanese at one of their most vulnerable spots, especially as a tonnage of some 7,000,000 can hardly be commensurate with their present needs.

Water Power in Scotland

The Hydro-Electric Development (Scotland) Bill, which, if passed, will empower a Board (four of its five members are to be appointed by the Government and one by the Central Electricity Board) to generate electricity from resources in its area, has given rise to a good deal of criticism. The case of those who argue that industrial development would spoil the natural beauty of the Highlands would be a strong one if spoliation were inevitable. Fortunately it is not; in fact, the Bill makes special provision to this end by providing for the appointment of an amenities committee. The exploitation of the water-power resources in Switzerland can hardly be said to have disfigured the countryside or adversely affected the tourist trade. Hitherto, moreover, the contemplation of the beauties of the Highlands has been virtually reserved for those with large purses; little encouragement to visit them has been given to the ordinary tourist with limited means. Another criticism which deserves careful consideration is that the Bill merely provides for the generation of electricity in the Highlands instead of for their economic development according to a regional plan. Dr Julian Huxley, for example, in a letter to *The Times* on February 22nd, suggested the appointment of a regional authority on the lines of the Tennessee Valley Authority in the United States, with the same "overall mandate of multi-purpose planning for the general development and welfare of the region." While a more comprehensive development scheme undoubtedly has attractive possibilities, the Committee on Hydro-electric Development in Scotland, which reported last December, asserted that a scheme for the generation of electricity in the Highlands would be justified on economic grounds.

We consider that, even if our proposals are viewed solely as a contribution to the national supply of electricity and without regard to the very important local and general advantages which will indirectly accrue to the Northern Area, our recommendations would be worthy of adoption in preference to the provision of an equivalent capacity of new steam plant.

It is the economic assumptions underlying the Bill—it passed to second reading in the House of Commons on Wednesday—and the merits of a more comprehensive development plan that deserve further examination.

Wage Claims

Two important wage claims, which involve two of the largest unions and the most vital to the war effort—engineering and rail transport—are pending, and are likely to be the subject of some contention in the near future. The withdrawal of the strike threat by the railway engine-

men, in the national interest, and in the light of the Minister of Labour's statement that in the circumstances their strike would be illegal, was generally hailed with relief. But the matter, which has cost a lot of time and tempers, does not rest there. The union's executive has been instructed to formulate a new wage claim for presentation to the Railway Tribunal, and, as a result of negotiations with the other railway unions, the National Union of Railwaymen and the Railway Clerks' Association, who were parties to the original award (which they accepted in spite of dissatisfaction with the amounts granted), a joint new claim for all grades is to be made. In presenting a united claim, the railway workers are following the example of the engineers. Previously the Amalgamated Engineering Union and the Foundry Workers' Union had acted in isolation, but last summer the 40 unions of the engineering trades put forward a collective claim. They asked for an increase of 11s. on the basic wage, for 33 1/3 per cent on the basic rate for plain-time workers and for the restoration of the pre-1931 conditions in regard to overtime, night shift and Sunday work. The claim, it was estimated, would cover about 1 1/2 million workers and would cost about £65 millions a year. The engineering employers made a counter-proposal and a joint sub-committee was set up to examine the offer. It is understood that the employers are unwilling to concede the restoration of the pre-1931 conditions. Last week the sub-committee's recommendations were turned down, and the conference of the 40 unions was adjourned to enable the representatives to consult with their executives. Presumably, if the normal negotiating machinery fails to produce a settlement, resort will be had to the National Arbitration Tribunal; if so, it is to be hoped that arbitration will prove more successful than it has done in the case of the railwaymen. By contrast with these difficulties, it is satisfactory to hear that the miners' union has accepted by a large majority the scheme for the establishment of a National Wages Board.

Allied Meat Purchases

The Combined Food Board was set up in Washington last June to pool Allied food resources. After three months, the Board announced a plan for the purchase by the British Ministry of Food of the whole tea surplus of India and Ceylon, at fixed prices. Provision was made for the sharing of available supplies between consuming countries. This was followed by a similar plan for the purchase of oils and fats, which are bought by the United States and Great Britain in different countries, on behalf of the pool. An agreement has now been concluded in Washington by which Great Britain will be the sole buyer of meat and meat products for the United Nations, including the United States, in Argentina, Brazil, Paraguay and Uruguay. The supplies thus bought will be allocated according to Combined Food Board recommendations, based on surveys of world meat supplies and wartime needs. Apart from the efficient use of shipping and allocation of supplies which can be achieved by the plan, the saving of tin is envisaged. Canned meats will be available only for military use, and will be conserved, as far as possible, for use in action. Canned meat of the bully beef variety has not been available for civilian consumption in this country for nearly a year and was last used to supplement fresh meat, which was particularly scarce at that time. The United States has stopped its importation for civilian use. The pooled buying of other vital commodities may be announced in the near future.

Produce Federation

Following a series of discussions last summer and autumn the majority of British commodity trade associations decided early this year to form a federation "for the consideration of post-war problems and all such current developments as are likely to affect the post-war position of the commodity trades." The new organisation was registered on February 4th, as a limited company known as the "British Federation of Commodity and Allied Trade Associations Ltd." The Federation is governed by a Council, consisting of one representative from each association. At its first meeting, held last Friday, Mr E. Mackenzie Hay, of the Rubber Trade Association of London, was elected Chairman, and Mr A. Chaine-Nickerson of the Liverpool Cotton Association, vice-chairman. They will remain in office until the first general meeting, which is to

(Continued on page 280)

COMPANY MEETINGS

SUN LIFE ASSURANCE SOCIETY

SATISFACTORY RESULTS

THE HON. SIR WILLIAM H. GOSCHEN'S STATEMENT

The annual general meeting of the Sun Life Assurance Society will be held at 63 Threadneedle Street, London, E.C. 2, on the 16th proximo.

The Hon. Sir William H. Goschen, K.B.E., chairman of the society, has issued a statement to shareholders, which will take the place of the address usually made at the meeting.

The statement is as follows:

CHANGES IN DIRECTORATE

Before dealing with the report and accounts for the year ended December 31st last, it is with the greatest regret that I refer to the recent death of General The Hon. Sir H. A. Lawrence, G.C.B., who had served on our board for over twenty years, during which time he took a keen and most helpful interest in all the affairs of the society. The directors feel their loss very deeply and he will long be remembered by us all not only because of our sincere appreciation of his services, but also on account of his outstanding charm of manner which endeared him to all with whom he came into personal contact.

I am pleased to report that Mr David J. Roberts has been elected to the board, and that his appointment as a director of the society will be submitted for confirmation at the approaching annual general meeting. I consider that we are indeed fortunate in securing the services of Mr Roberts and that his valuable financial knowledge will undoubtedly enable him to contribute materially to the welfare of the society.

FUNDS, INCOME AND OUTGO

During the year 1942 our total funds increased by nearly two-and-a-half million pounds to over £52,760,000.

In the life account the increase was £2,368,000. The premium income in that account was £5,296,000 as compared with £5,111,000 in 1941. Of the increase of £185,000 thus shown, nearly £160,000 was in respect of renewable premiums, the balance being due to a small increase in the amount of single premium business effected during the year.

The gross interest income was £1,890,000, which, although slightly larger than that of the previous year, was earned in respect of an appreciably larger fund; the net interest income of £1,472,000 shows an increase of about £36,000. The gross rate of interest earned was 4 3s. 6d. per cent. per annum, as against 4 4s. 11d. per cent. per annum for 1941. The fall is principally due to the support which the society has continued to give to current war loan issues, under which, as I mentioned last year, the rates of interest are lower than those earned upon most of our other investments. The extent of the fall is, however, somewhat less than that shown between 1940 and 1941.

As regards the outgo from the life account, death claims (which include war claims of just over £200,000) were £1,427,000, which is £193,000 less than those for 1941. Claims by maturity were £1,987,000. Surrenders by £238,000 were about three-quarters of those of the previous year, and less than one-half of those for the year 1940. This reduction is doubtless largely due, as I stated last year, to our policyholders' recognition of the value of life assurance in present conditions. I should, however, like to add that we have for many years past consistently endeavoured to dissuade policyholders from surrendering their assurances by placing before them alternatives, by way of loan, conversion to paid-up assurance, and other means, whereby they might continue to

enjoy the advantages of some, if not all, of the life assurance protection which they would otherwise have sacrificed.

Commission and expenses of management are together about £3,100 in excess of the previous year's total, but as a result of the growth of the renewable premium income the "commission and expenses" ratio again shows an appreciable reduction.

The item "war damage contributions" of £11,458 is somewhat less than one-half of that passed through the 1941 account, because in that year there were included not only the contribution which was due on July 1, 1941, but also that which was due on July 1, 1942, and had fully accrued on the previous January 1st.

The annuity, sinking fund and accidents accounts are, of course, of minor importance in comparison with the life account, and present no features upon which special comment would appear to be necessary.

NEW BUSINESS

The total life new business for the year was £9,376,000, and although this is only 43 per cent. of our pre-war figure it represents a satisfactory increase upon last year's total. The transaction of this amount of business is, I think, in itself a testimony that the public still appreciates the advantages of a "Sun" policy, and the service which the society can offer. This is especially so as our outdoor staff, being so depleted, is no longer able to bring the advantages of life assurance to the notice of the public to an extent even remotely comparable with that possible before the war. At the same time, the society is still able to offer facilities for the transaction of such business as is offered to us, and in doing so is, of course, directly furthering the cause of saving, upon which the financial security of the country so largely depends.

REVIEW OF ASSETS

It will be seen from the balance-sheet on December 31, 1942, that the total assets of the assurance funds then amounted to over £53,000,000. Of this sum nearly one-quarter is represented by mortgages and loans, which are well secured at the figures at which they appear. The item of £5,666,000 relating to mortgages on property within the United Kingdom largely consists of loans granted in connection with our house purchase scheme. This scheme continues to show results which are satisfactory to the society, and which are, in fact, considerably better than one might have anticipated at the outbreak of the war. Incidentally, I may mention that the society has continued to make new advances under this scheme ever since the outbreak of hostilities, although the extent of the new transactions is now, of course, much smaller than formerly. It is hoped, however, that after the war this business will regain its more normal proportions and that thereby the society will not only be provided with a suitable outlet for its increasing funds but will also have the satisfaction of assisting to some extent in the solution of the financial aspects of the housing problem.

The investments shown in the balance-sheet amount to nearly £38,000,000, of which almost one-half consists of British Government securities, the society having during the year increased its total subscription to current war loan issues by £3,500,000. The remaining investments consist principally of redeemable securities, which from their essential nature are free from the risk of serious depreciation.

The general improvement in the values of securities during the past year which has resulted from the pressure of money for

investment in a limited market has, however, brought its own problems with regard to the disposal of that portion of our funds which is available for general investment. Nevertheless, the society has maintained its practice of investing its available resources within the British Empire whilst at the same time taking any suitable opportunity of reducing its existing holdings of foreign securities. As a result of the continued pursuit of this policy, over 97 per cent. of our total assets are now invested within the Empire, and the market value of the assets as a whole exceeds their balance-sheet value by a considerable margin.

INTERIM BONUSES

In accordance with the recommendations made by the Actuary, the interim bonus regulations which are to apply to participating assurances during the current year have been decided by the directors.

The following regulations will accordingly apply during 1943 to assurances in respect of which bonuses are normally declared as reversionary additions to the sums assured.

If during the year 1943 an assurance should produce a claim for the sum assured by death or maturity, or should be surrendered, an interim bonus would be paid in respect of the premiums due and received since December 31, 1936. The rate of interim bonus will depend upon the rate of reversionary bonus declared for the years 1932 to 1936 and will be as follows:—

(a) For an assurance producing a claim: Three-fifths of such rate of reversionary bonus.

(b) For an assurance terminating by surrender: The surrender value of a reversionary bonus at three-fifths of such rate in respect of premiums due in the years 1937 to 1941, and at one-half of such rate in respect of premiums due subsequently.

For an assurance effected by single premium the interim bonus will be the same as for an assurance subject to annual premiums.

For an assurance effected by a limited number of premiums the interim bonus will be the same as for an assurance subject to premiums payable throughout the duration of the assurance.

As I indicated last year, similar regulations will be made from time to time up to the date of the next valuation, and in deciding upon the rates of interim bonus to be allowed, the board will endeavour to safeguard the interests of the policyholders whose assurances terminate, equally with those of the policyholders whose contracts are continued in force.

TRIBUTE TO STAFF

It has been my privilege for many years on the occasion of the annual general meeting to voice, on behalf of the shareholders, our appreciation of the services of the management and staff.

There is probably no business which is more dependent for its success on the skill and energy of its staff than life assurance, and I feel sure that the shareholders, after having read the report and seen the figures of the past year's working, will realise that our high standard and traditional repute for efficiency and ready service have been worthily upheld by our present much depleted staff. I offer them our congratulations and thanks.

Of the management perhaps I may be permitted to say that wartime conditions have added very considerably to their anxieties and burdens, but, in spite of that, they have set a fine example of leadership and have their reward in the excellence of the results.

I should like to add that we keep alive in our thoughts the well-being of those members of our staff who are serving their country, whether at home or abroad, and our sympathy goes out to those families who have suffered anxiety or sorrow.

IMPERIAL TOBACCO COMPANY (OF GREAT BRITAIN AND IRELAND), LIMITED

DIVIDEND MAINTAINED

LORD DULVERTON'S REVIEW

The annual general meeting of the Imperial Tobacco Company (of Great Britain and Ireland), Limited, was held, on the 23rd instant, at Bristol, Lord Dulverton (the chairman) presiding.

The following is the chairman's statement which was circulated with the report and accounts:—

BALANCE-SHEET

On the assets side all the variations of moment take place in the last section, the total of which is £86,258,223.

Stock-in-trade at £43,869,197 exceeds last year's figure by no less than £15,341,482. While it is true to say that the stock of unmanufactured leaf in bond at October 31, 1942, stood at a rather higher figure than a year before, the main cause of this enormous increase lies in our stocks of manufactured goods which have increased in both value and quantity for the two following reasons: Firstly, in April, 1942, the Chancellor of the Exchequer increased the rate of tobacco duty by ten shillings per pound, and this, of course, means that duty-paid stocks have a very much higher duty-paid value. Secondly, during the year, at the request of the Government, we built up our manufactured stocks to a level a good deal higher than normal. In brief, then, we are carrying a bigger manufactured stock on which a much higher rate of duty has been paid than at October 31, 1941. You will remember that the tobacco duty, which was 9s. 6d. per pound four years ago, is now 29s. 6d. per pound.

Debtors are also much more than last year, the increase being £7,641,559. This is almost entirely due to the advance in prices, caused by the large increase in duty to which I have referred. Government and other securities stand at £631,024 against last year's £9,815,049, a decrease of £9,184,025. At October 31, 1941, a large part of our investments under this heading were in the form of Treasury bills, which matured soon after that date. Subsequently in December, 1941, the Chancellor announced the issue of Tax Reserve Certificates. Your company at once took up a holding of £7,000,000, thus meeting the wishes of the Government by an immediate transfer to the Treasury of funds earmarked for the payment of tax liabilities. There still remains a further gap of £2,184,025 to be explained, and this I will leave, together with the reductions in cash at bankers and in hand and in loans to corporations, etc., until I touch on the bank loan appearing on the other side of the balance-sheet, merely noting at this stage that the sum total of these reductions comes to £2,891,317.

CAPITAL AND LIABILITIES

General reserve appears at £9,500,000, the increase of £500,000 representing a transfer from the profits of the year under review.

Profit and loss account £1,701,032 is the balance left after providing for proposed final dividends and bonus; I will deal with this item more fully later under its separate heading.

Creditors, provision for taxation, and other provisions amount to £41,089,490, an increase of £10,726,898. This is entirely due to the time-lag between the earning of profits and the handing over to the revenue of the taxation arising out of those profits, despite the fact that from time to time we have paid substantial sums on account of tax liabilities not yet assessed. Let me add that your board are satisfied that adequate provision has been made for all liability under this head-

ing up to the date at which the balance-sheet was struck.

Now I come to the bank loan. This appears at £7,500,000, and if you will add to this figure the reductions which I mentioned earlier in connection with certain assets—£2,891,317—you will find that our liquid resources, other than stock and debtors, have been depleted by £10,391,317. This of course is the inevitable consequence of the sterling increases in stocks and debtors, the reasons for which I have already given; and were it not for the time-lag between earning profits and paying taxes, to which I have also referred, this depletion would have been considerably greater.

Deposits by and current accounts with subsidiary companies have increased by £990,214, due much more to larger cash deposits by certain of our subsidiary companies than to increased balances on trading accounts.

PROFIT AND LOSS ACCOUNT

The net profit for the year, after providing for all charges, bonus to customers, income tax and other taxation, and depreciation of property, plant, etc., together with income from investments and loans, shows a figure of £7,970,338, a decrease of £10,903. An interim dividend on the ordinary stock at the rate of 7½ per cent., free of income tax, was paid last September, and it is now proposed, subject to your approval, to declare a final dividend of 7½ per cent. and a bonus of 2½ per cent., both free of income-tax, making a total distribution for the year of 17½ per cent., free of income tax.

The balance remaining to be carried forward is £1,701,032, which is about £34,000 more than the amount brought in at the commencement of the year.

The dividend is the same as last year, both gross and net, and I trust you will regard the maintenance of the rate as a thoroughly satisfactory achievement.

CURRENT TRADE AND FUTURE PROSPECTS

The outstanding event in the year under review was the unprecedented increase of 10s. per pound in the tobacco duty last April, to which I have already referred. Notwithstanding that, consumption has been well maintained; our factories are working to capacity, and we continue to manufacture and sell as much as our quota of raw material allows.

Another important event to which I should like to refer is the scheme adopted at the end of last year for economising transport in the distribution of cigarettes. This scheme was worked out by the leading manufacturers, and involves a very considerable exchange of manufacture. The difficulties of putting into force a scheme of this nature would be formidable in peace-time; obviously in these times such difficulties are magnified many times. However, it has been done, and a very substantial saving of transport effected, without imposing any hardship on the smoking public.

As regards the future there is little that one can say without venturing on the dangerous paths of prophecy, of which I have always tried to steer clear. The fact is that the popularity of our standard brands is today as great as ever. For our ability to supply them we are, however, in the hands of the Government. Provided that we are permitted to obtain supplies of our raw material, and to retain sufficient skilled staff and labour to manufacture and distribute our products, we shall continue to fulfil the requirements of the smoking public.

The report and accounts were unanimously adopted.

ENGLISH ELECTRIC COMPANY, LIMITED

INCREASED OUTPUT

The twenty-fourth annual general meeting of the English Electric Company, Limited, was held, on the 25th instant, in London.

Sir George H. Nelson (chairman and managing director), in the course of his speech, said that the increase of £394,669 in the issued ordinary stock resulted from the exchange of shares with the holders of ordinary shares in D. Napier and Son, Limited. Creditors and reserves were up by £1,381,000, which was largely due to additions to reserves for taxation, etc. The substantial reduction in bank overdraft arose from the fact that payment for work done had been accelerated. The general reserve had been increased by a further £100,000 and now stood at £800,000. The new item under investments, viz., 1,973,981 ordinary shares of 5s. each, fully paid, in D. Napier and Son, Limited, had been taken into the accounts on the very conservative basis of par value.

Notwithstanding a considerably increased output, the profit carried to the balance sheet was, due to the incidence of taxation, only £44,956 greater than in the previous year.

Holders of over 90 per cent. of the ordinary shares of D. Napier and Son, Limited, had accepted the offer to exchange their holdings for ordinary stock of the English Electric Company, and it had been decided to take the necessary steps under the Companies Act to acquire the remaining shares.

In conclusion he referred to the splendid manner in which the company's well-organised staff and works committees continued to function.

The report and accounts were adopted and a dividend of 10 per cent. was declared on the ordinary stock.

THE STERLING TRUST LIMITED

DIVIDEND MAINTAINED

The twenty-sixth ordinary general meeting of this Trust was held, on the 23rd instant, in London.

Mr R. S. Guinness, the chairman, who presided, in the course of his speech, said: Our accounts show a total shrinkage of some £6,400 only, and thus your directors are able to recommend a total dividend of 4½ per cent., the same rate as for the previous year.

After dealing with the Trust's investment policy in Argentine railways, the chairman continued:—Have British investors reaped their just reward? The answer is in the negative. Our investment, mainly in fixed-interest stocks, produced in our 1942 results barely 2½ per cent. You will ask the reason. By Government order the ratio of exchange for remittances of interest and dividends payable by Argentine railways in sterling is fixed at a rate of 16 pesos to the pound, which is over 15 per cent. below the rate of exchange the authorities have fixed for the purchase of sterling required by exporters. In other words, British investors suffer a penal tax estimated at a round million pounds yearly. In other South American countries receipts from transport and commercial undertakings show prospects of improvement. If sound politics and finance prevail after the war, the outlook in South America should be "set fair"; if so, our revenues will benefit accordingly.

The item investments is shown at £4,515,150. The depreciation is reduced to 11 per cent., as against 21 per cent. in 1941.

The report and accounts were unanimously adopted and the dividends recommended were approved.

(Company meetings continued at foot of page 280)

(Continued from page 277)

take place within three months. The troubles of the commodity trades have arisen, not merely from the general dislocation caused by the war, but from the difficulty of fitting them into the wartime arrangements of the Ministries of Food and Supply. In fact, their activities have been almost completely suspended. After the war, however, the commodity trades should again be able to perform an important service; formerly the British commodity markets played a more important part in the marketing of primary products than those of any other country. The new Federation should be of great value in facilitating the return to free commodity markets, and in preparing the reforms that will be necessary to fit them into the scheme of postwar trade.

Food Trades Call-Up

Women of all ages as well as some men under 35 engaged in the food distributive trades have hitherto been left in their work. It has at last been decided that this policy can no longer be justified and the Minister of

Food has announced that a limited withdrawal of labour will be made from this section of the distributive trades. The total number to be released for the Armed Forces and munitions is not expected to exceed eight per cent of those engaged. The grocery and provision trade is to be dealt with first and wholesalers and retailers are to make returns giving details of their staffs on March 1st. The release from small retail firms will be the responsibility of food offices, from wholesalers of the new wartime associations; multiple organisations and co-operative societies will be dealt with separately. Each group will be expected to release one person in twenty. Only men who were under 35 when they registered (these are very few) and women born in the years 1918 to 1923 will be considered for release in the first place, although older workers may be called upon, if necessary, to make up the quota. Due regard is to be paid to the individual circumstances of shops. Mr Bevin in taking powers to direct women into part-time work said that this was necessary in order that services vital to civilians, but not directly to the war effort, could be carried on. One service they could do is to serve in food shops, thus enabling an even greater release of mobile workers from the food trades than the present one envisages.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

WITH the subsiding of activity after the temporary improvement in turnover created by the anticipation of home rail dividend announcements, the volume of markings is again at a low level, Wednesday's total of 4,307 bargains being the smallest this year. Little interest was displayed in the Funds and with the exception of one or two minor recessions for long-dated and irredeemable stocks, the gilt-edged market was without any significant change. Chinese bonds fell back at the reopening of the foreign bond market, but among the South American issues, Brazilian stocks were firmer on rumours of an improved debt arrangement. After the final dividend announcements, fairly general profit-taking and some light selling in the home rail market steadily reduced quotations of the equity and marginal preference stocks. London Transport "C" stock suffered a loss of 1½ points net, due largely to the relatively low yield rather than dissatisfaction with the dividend.

COMPANY MEETINGS—continued

BOVRIL LIMITED

The forty-sixth annual general meeting of Bovril Limited will be held in London on the 2nd proximo. The following is an extract of a statement by the Lord Luke, K.B.E. (chairman), circulated with the report and accounts:—

Early in 1942 it was becoming evident that the public were buying Bovril in 16-oz. bottles instead of 2's, 4's, 8's, etc. This was obviously to the general disadvantage because there could not be such a wide distribution. The sales of this large size had so grown that they represented 20 per cent. of the whole output. In May your directors decided to discontinue the sale of the 16-oz. size to the ordinary public, keeping that size only for caterers and the Service canteens, etc. This had the effect of releasing more material for the production of smaller sizes, particularly the 4-oz., which seems to have caused considerable satisfaction, especially among those of small means who do not wish to hoard 16-oz. bottles. I indicated to you at the last meeting the steps we have taken to distribute Bovril on a quota system so as to get a fair and equitable distribution throughout the trade. During the year under review this system has operated with evident satisfaction to our customers.

In the foreign rail market, Argentine rail stocks, although neglected, remained quietly steady after their recent decline. Some enquiry for Leopoldina and Central Uruguay senior stocks failed to affect quotations to any extent.

Occasional selling, but primarily absence of support, led to some irregularity in the industrial market. Brewery shares suffered a general decline in prices, although actual losses were relatively insignificant. In a quiet tobacco group, Imps improved ½ on further consideration of the chairman's statement. Losses ranging from a few pence to 1s. 3d. were general in the motor and aircraft section. The largest losses were suffered by Albion Motors, Raleigh Cycle Holdings and J. Lucas. An exception to the trend was Rover, with a gain of 1s. Dorman Long were prominent in the heavy industrial section with a small advance on dividend prospects, but changes were generally downward. Shipping shares were distinctly dull on consideration of recent results, Cunard and P & O deferred losing 1s. and 2s., respectively, among smaller declines for other issues. Although very small losses in textiles were the rule, Courtaulds were a prominent exception, losing 9d. The recent spate of improved stores trading results had little effect on stores issues, Barker's and Harrods actually weakening on the higher earnings. Elsewhere, Portuguese utilities were marked down slightly on the Portuguese Government's suggestions for the control of the industries concerned.

Budget fears reduced activity in the kaffir market on Cape account to a minimum. Actual changes throughout the market were restricted, apart from an advance of 1s. 7½d. for African & European. Initial considerations of the Budget in mid-week occasioned a general improvement. Tea shares weakened on the Indian situation, losses occasionally exceeding ½. Rubber shares were neglected, but apart from a marking down of United Sua Betong by 2s. 3d., quotations were scarcely changed. In the absence of active enquiry, oil shares eased slightly. Thus, among leading issues, Anglo-Iranian and Burmah each lost ½, and Shell ½, early in the week, but later recovered, Shell advancing ½ on Wednesday.

New York

ALTHOUGH the initial reverses in Tunis led to some uncertainty and dullness on Wall Street, the volume of selling and profit taking was at no time sufficient to affect prices to any considerable extent. Immediately before the holiday, however, the market, under the influence of support for rail and steel issues, rallied strongly. Continued buying at the reopening on Tuesday raised the prices of several leading steel rubber and industrial stocks to their high levels in the past two years, although profit taking was at no time entirely absent.

GOVERNMENT RETURNS

For the week ended Feb. 20, 1943, total ordinary revenue was £78,186,000, against ordinary expenditure of £126,325,000, and issues to sinking funds of £20,000. Thus, including sinking fund allocations of £10,906,904, the deficit accrued since April 1st is £2,536,590,000 against £2,412,245,000 for the corresponding period a year ago.

COMMODITY AND INDUSTRY NEWS

Non-Wool Cloth Quota.—The present quota period for woven non-wool cloth ends on February 28th. Control over the production and supply of cloth is now exercised by other means, and the Board of Trade has decided not to retain quota restrictions after the present ones expire. Utility cloths are already quota free.

Printing Ink Concentration.—The Board of Trade is prepared to grant nucleus certificates to firms in the printing ink trade which inform the Board before March 22nd that they intend to carry out voluntary concentration arrangements as already put forward by the Concentration Committee of the industry, and approved by the Ministry of Labour and other Government Departments. Firms in the industry have, accordingly, received from the Committee a Board of Trade memorandum on the position, and this is to be considered by a full meeting of firms. The memorandum makes it clear that the nucleus arrangements must show a release of one-third of the labour employed in the participating firms, as returned in May, 1942, but that, thereafter, the labour of the firms in the nucleus scheme will be protected, whereas the labour of firms not participating in the scheme cannot be protected.

Canned Vegetables Control.—The Minister of Food has made the Vegetables and Vegetable Products (Canning, Bottling and Freezing) (Control and Maximum Prices) Order, 1943, which came into force on February 21st and replaces the 1942 Order, which is revoked. The only vegetables which were canned in any quantity during 1942 were fresh peas, broad beans and spinach. New prices have been fixed for these varieties, but the wholesale and retail prices of all others are the same as in the 1942 Order. No changes have been made in the terms and conditions of sale. Although the sale of canned vegetables other than baked beans and dried beans in brine by retail is still prohibited, distribution to wholesalers and retailers will continue in readiness for release to the public. Canned peas, canned beans in tomato sauce and canned tomatoes will continue to be on points, but no other varieties are being included in the points rationing scheme.

World Cotton Supply.—It is estimated by the New York Cotton Exchange Service that the total world supply of American cotton available for the present season is 23,765,000 bales, compared with 23,425,000 bales last season. World consumption is

tentatively estimated at 12,760,000 bales. Last season it was 12,210,000 bales. Thus the carry-over at the end of this season may be about eleven million bales, against 11,115,000 at July 31, 1942.

Export Control.—The Board of Trade have made the Export of Goods (Control) (No. 2) Order (SR and O 1943, No. 217), which comes into force on March 1st. Under the terms of this Order, export control is extended to cover artificial silk (rayon) staple fibre yarns, thread and cord.

Mr Speaker

ON Wednesday last week, the proceedings of the House of Commons were rudely interrupted by the death of the Speaker, Captain FitzRoy. Until the Commons presented Colonel Clifton Brown as their new choice to the King's Commissioners in the Upper House, the proceedings of the Lower House stood in abeyance. There has been some criticism of a state of affairs which permitted the business of Government to be interrupted at a crucial time by an ancient ritual.

Circumstances were indeed unusual. It is a century and a half since a Speaker died in harness. Captain FitzRoy's sudden and lamentable death, in the middle of a war in whose conduct his skill in the office he had occupied for nearly fifteen years was a powerful aid, was a blow that had not been anticipated. But it is nonsense to suggest that the war effort was in any way adversely affected by the dignified process which brought the Deputy Speaker and Chairman of Committees into the Speaker's Chair with the utmost dispatch. All that can be said is that the possible area of choice for a new Speaker was somewhat lessened by the suddenness and unexpectedness of the event. But Colonel Clifton Brown owes his election, not to the unusual circumstances in which it took place, but to his own record and qualities. The Speaker probably occupies a more important posi-

tion to-day than even his predecessors have done. From being first the creature of the Crown and then the creature of the Government, the Speaker has become the friend and protector of Members. His concern is, on the one hand, for the Commons as a body and, on the other, for Members as individuals, never for parties or the executive power. This role is doubly important when the checks and balances of normal parliamentary procedure on party lines have been removed by the overriding emergency, and when the Government is vested with vast war powers which Members can question or criticise, but not diminish.

The only dissentient voice that was raised in the Commons on Tuesday, when the new Speaker was chosen by acclamation, was in fact raised, not against Colonel Clifton Brown, but against a situation in which the deliberations of Parliament tend to be dominated by the regiment of Ministers, Secretaries and ex-Ministers who make up so large a part of the present House and regard their right to speak, and speak at length, as a prior charge upon Parliament's time. This had exercised the mind of Captain FitzRoy who pleaded on the occasion of his third election in 1931 for briefer speeches, especially from Members of Ministerial status. That the situation has since become worse, not better, is the almost inevitable

consequence of a wartime position in which immense and manifold acts are undertaken by the Government in the presence of a Parliament in which the party alignment and its cut and thrust have become for a time largely formal. Captain Cunningham-Reid, whose intervention was typically maladroit, can at least rest assured that the new Speaker, judged by the promise of his own earlier

work in the chair, and by the performance of his former chief, will do everything that lies in the power of a Speaker to temper the wind to the shorn lamb—and to preserve intact the respect for individual and minority opinions upon which the rehabilitation of the Parliamentary process after the war will depend. Mr Speaker has the future of Parliament, as well as its past and present, in his keeping.

Piecemeal Planning

THE White Paper on Training for the Building Industry was analysed in *The Economist* last week, when some attempt was made to work out its quantitative implications. Regarded by itself, the scheme commands admiration. It is a bold attempt to bring a measure of stability to a notoriously precarious industry and in doing so to pave the way for the most visible and tangible aspect of Reconstruction. Nevertheless, some of the elements of the plan require more extensive scrutiny in the context of major economic policy. While acknowledging the imaginative breadth of the plan and paying tribute to the vision of a rebuilt Britain that it conjures up, it is necessary to inquire more closely into the way in which this plan fits into the wider framework of policy for the post-war period. As was pointed out in *The Economist* last week, the programme must be related both to likely building needs and to other claims on the total resources available for investment and consumption. Is the claim that has been so precisely staked out for building a reasonable one in the schedule of reconstruction priorities? Or will its acceptance, as it has been set out, prejudice the necessary claims of other items on the national stock?

From this point of view, the policy sketched in the White Paper, after its quantitative implications have been measured, raises two major questions. The first relates to the magnitude of the programme. It was calculated last week that the target figure of 1,250,000 persons employed implies an annual production of about £600 millions, valued at present prices; and that, if this total is distributed between the different categories of building work in roughly the pre-war proportions, it will include from 440,000 to 500,000 new dwelling houses a year, compared with an average of about 200,000 a year in the inter-war year and the record figure of 370,000 in 1936/7. The plan calls, in short, for a rate of building, extending over ten years, very substantially higher than has ever before been experienced.

Will such a high rate of building be required? There is, of course, the air-raid damage to be made good. But the number of houses rendered uninhabitable—not all of them requiring complete rebuilding—is not more than about 250,000, which is only about half the planned annual output. Nor can there be expected to be as large a backlog as in the last war, when the population was still increasing and there had been very low building for several pre-war years. After the first year or two of the new peace, the industry will be back upon a peace-time basis. Will there, in such conditions, be a demand for 500,000 houses a year? A desire and a need there will certainly be; it will be impossible to say that houses are not wanted until every inhabitant of the country is adequately housed. But a desire can be converted into a demand in only two ways—either by people spontaneously spending the requisite portion of their incomes to secure it, or by the Government footing the bill.

There are some reasons for supposing that the spontaneous post-war demand for houses will, after a brief period of repairing the ravages of war, be smaller, not larger, than before the war. The enormous pre-war demand arose from the coincidence of a number of factors. In the first place, though the increase in the total population had almost ceased, the number of family units (i.e., in the main, married couples) was still increasing; this will not be true, or not true in nearly the same measure, after the war. These increasingly numerous

family units were in the 1930's enabled to afford new houses by an increase in their real incomes, due to the great fall in the cost of food. This also, through the double effects of an adverse change in the terms of trade and the machinations of the agrarian interest, is likely to be reversed. Thirdly, there was a great deal of building as a result of the flexibility of transport brought by the motor-car. This may or may not have reached its natural limit; but it is unlikely to be a more potent factor after the war than in the early 1930's, if only because of the restrictions which are likely to be imposed on building in rural areas.

The prospect is, then, for a smaller spontaneous demand for additional houses. There is, of course, the possibility of a spontaneous demand arising for the replacement of old houses by new. That is a possibility. But it has not arisen yet; up to the present, the demand has been for additional houses, not for replacement, as is proved by the small margin of value between an old house and a new. And any demand for replacement would be likely to be checked by a fall in the value of old houses. Anybody would prefer, other things being equal, to live in a new house than in an old house (except for "period residences"). But other things will not remain equal, and how many people will prefer to pay half as much again for a new house as for an old house with comparable accommodation?

If the rate of building is to be doubled while the spontaneous demand falls, the gap will have to be filled by a very much enlarged programme of Government-supported building. In itself, such a programme is, of course, highly desirable. Few prospects are more exciting than that of removing within a generation the blight of bricks that the nineteenth century (and part of the twentieth) spread across the country, and replacing it with homes fit for democrats. But, in effect, the Government's new plan gives this particular dream a first lien on the resources of the country. What the Government is in effect committing itself to (though it may not be aware of the fact) is that 500,000 houses a year shall take precedence over every other form of reconstruction. The question to be asked is not whether we should like to rebuild the entire country in 25 years, but whether we need houses at this rate so badly that we are prepared to put them ahead of everything else. The maintenance of this programme is likely to impose a very heavy burden on the Budget. Does it really express the wish of the people that, while no commitment is entered into on the Beveridge Plan, the available budgetary margin should be mortgaged for houses? Building at the rate of £600 millions a year would use up half or more of the gross national savings—that is, of savings and depreciation funds together. Do we really want to take so large a part of the national re-equipment in bricks and mortar, at the cost of all other forms? It has been estimated in the press that direct employment of 1,250,000 persons in the building trades means total direct and indirect employment of some 4,000,000. The calculation is probably somewhat exaggerated; but even if the right figure is 3,500,000, that is one-sixth of the total labour force. With all the other things that there are to be done, is it really right to put one man in six into building? When the time comes, of course, none of these things will be done. The commitment is one which cannot be honoured, and everyone concerned should be warned of the fact from the start.

The first major qualification that must be made to the welcome given to the plan is thus that it is too large. A ten-year plan for the building industry is an admirable and praiseworthy idea. But the figures are wrong; 900,000 builders might be much closer to what the country can support, and (when it becomes conscious of the priorities) will desire, than 1,250,000. The second major qualification relates to the flexibility of the programme. Building, it was pointed out in last week's article, is "one of the most important and flexible instruments for translating into practice any policy of full employment." The doubt is whether the use of this programme as a flexible instrument will not be inhibited by its very size. The ability to expand the subsidised portion of the building programme when depression threatens can indeed be one of the most powerful weapons in a Full Employment policy; slums and slumps can be removed by the same action. But how can employment in the building trades be expanded if it is already stabilised at the maximum? What should be one of the flexible elements is, in short, threatened with inflexibility. To avoid this, the employment target should be reduced to, say, 900,000, and this figure should be treated as an average. There is nothing to prevent, and everything to support, an offer of stabilised employment to the permanent garrison of the trade—say, to 700,000 workers; but, within the planned average employment of the industry, room must be left for a certain transient

portion, a floating population, if the general economic policy of the country is not to be fatally hampered.

The reason why this particular plan has been produced at this particular moment on this particular scale is to be found in the confluence of a band of enthusiastic planners at the Ministry of Works with the necessity to provide reassurances to the building trade unions in the matter of wartime dilution. Both motives are entirely proper—indeed, it is refreshing to find any instance in which forward-looking people are able to turn the ponderous wheels of the machinery of state even so far as to produce a White Paper. But when all these kind words have been said, it is still necessary to deplore the obvious fact—due, it should be said, not so much to any fault of the actual drafters of the plan, as to the ca'canny empiricism of their superiors in the hierarchy of government—that the planning has been done in isolation from other aspects of the economic problem and with wholly inadequate efforts to fit it into the general framework. It should be a well-known and bitterly learned truth, from the experience of wartime priorities, that if they are worked out separately and independently, the total claims will inevitably exceed the capacity and resources available. Planning for the future we must certainly have; but if the planning is to be as piecemeal as this, we shall end up by being more planned against than planning, and instead of priorities and a programme there will be frustration.

The Middle East—II

Supply Centre

IF the Governments of the Middle East had been compelled to deal unaided with their supply problems, there would certainly have been a famine in some areas last year. The influence of Britain, the United States, France and to a very much lesser extent, Russia, has been brought to bear again and again to ameliorate conditions, smooth out difficulties and encourage and guide the inexperienced efforts of the local administrations. This influence has not been exercised in a haphazard way through a variety of different agencies and missions. Since April, 1941, all questions of supply have come under the jurisdiction of the Middle Eastern Supply Centre at Cairo. Created under the pressure of wartime necessity, the Centre has developed in the course of its two years of existence into a vigorous and hopeful experiment in international economic co-operation. Turkey's dealings with the Centre are confined to various basic commodities—cereals, fertilisers and sugar—which are subject to world-wide pooling arrangements; but all the other Middle Eastern countries, as well as the Sudan,

Suadi-Arabia, Eritrea, British Somaliland and Ethiopia, carry on their foreign trade through the Centre.

Its organisation is simple. It is now a joint Anglo-American organisation, meeting under the presidency of Mr Casey, with Mr Winant, brother of the United States Ambassador to London, as Chairman of the Executive Committee and member of the Supply and Transportation Sub-Committee which deals with the Centre's local business. A Middle Eastern Supplies Committee, representing all the interests involved, gives advice and guidance from the London end. In the countries served by the Centre, contact is maintained through officials attached to the British or American diplomatic missions or, where they have been set up, through Joint Supply Committees; there are Anglo-American Supply Committees in Baghdad, Ankara and Teheran, a Joint Committee of British, Americans, French, Syrians and Lebanese for Syria and Lebanon, a number of Anglo-Egyptian Supply and Transport Committees in Egypt. Neither the Centre nor the Committees have executive

(temporarily transferred from 20, Lincoln's Inn Fields)

powers. They advise and co-ordinate. The Committees, in conjunction with their Governments, work out the country's requirements for each half year; and this list is sent to the MESC which, co-ordinating it with the requirements of other countries, sends the total supply list to London. Here it is the task of the Ministry of War Transport and the other Ministries and agencies concerned to allot supplies and transport facilities for as much of the requirements as can be met.

Two types of trade are covered. Private trade still accounts for much of the imports and exports; but since shipping space is limited, only a certain amount of private trade can be permitted, and essential goods have to be given priority. At the request of the MESC, the Middle Eastern Governments have either introduced or tightened up the system of granting import licences, and only those approved by the MESC are given shipping space. Certain commodities are too vital and in too short supply for the normal functioning of private trade. Cereals, sugar and fertilisers are bulky goods and require much shipping space. Other commodities—such as tea, quinine or oil seeds—are subject to world-wide pooling schemes under the Anglo-American Combined Boards. These supplies are handled by public agencies. The MESC makes up the requirement lists; and the shipping, storage and distribution of the pooled commodities is entrusted to the United Kingdom Commercial Corporation.

In the first year of its existence, the MESC averted the danger of famine by importing and guiding the distribution of some 600,000 tons of wheat to the Middle East. Now when better harvests have brought the region back to its old relative self-sufficiency, the activities of the MESC are a reassuring background for local government action in compelling hoarders to disgorge their supplies and encouraging the resumption of cross-frontier trading. The Governments have a hard time in these disturbed days to persuade their peoples that the export of surplus foodstuffs to deficiency areas is good policy. With the MESC behind them, they know that they will not be left with any inconvenient shortages themselves. This indirect contribution towards stability is probably one of the MESC's most important contributions to the return to orderly distribution in the Middle East.

Even if the work of the MESC were simply confined to this controlling and directing of supplies and transport, the organisation that has been built up could with profit be maintained after the war to integrate the economic life of the whole region for later years. Its fate would depend upon the shape of the peace settlement. If freedom from want becomes the goal of international collaboration, and the lessons of wartime administration are learnt, the MESC and its dependent Committees fit into the pattern of world-wide economic collaboration foreshadowed by Lend-Lease, the Combined Boards and Britain's experiments in rationing. The common factor in all these systems is the basing of priority upon need and the recognition that human resources can be broadly planned to ensure that needs are satisfied before luxuries and extras. Wartime experience has shown that the pre-war type of commodity control, designed primarily to maintain prices, if necessary by restricting output, could be displaced by the type of control now exercised by the Combined Boards. The basis of this control is an established programme of need. The Boards are responsible for expanding output up to the limit of the programme and distributing it on a priority basis. If such a system of world-wide commodity control were adopted after the war to plan production, not for war needs, but for increasing human consumption, the various national committees and their parent MESC might continue their work of estimating six-monthly lists of basic necessities—grain, sugar, oil—and of securing their acceptance at the general pool. In this way, the people of the Middle East might secure minimum standards of consumption at guaranteed low prices—a minimum "freedom from want," while consumption above the average could continue to be catered for through the ordinary channels of private trade.

Such a development does not follow inevitably from the work of the MESC. Its present hold upon the Middle

Eastern Governments springs from shortage—shortage of shipping and shortage of supplies. When in the post-war years these conditions are relaxed, unless there is some United Nations' Ten or Twenty Years Plan for raising up the submerged peoples through a guaranteed minimum diet or some such standard, much of the work of the MESC will inevitably lapse. However, the apportioning of supplies and allotting of shipping space has turned out to be only one part of a much wider and more varied field of action. To save shipping by reducing bulk imports, the various states have been encouraged to increase their own food supplies. Agricultural experts, British and American, have surveyed the Middle East at the invitation of the MESC, and many of their recommendations are already embodied in functioning schemes. It was at the instance of the MESC that Egypt reduced its cotton production by a third and, concentrating only on long staple cotton, turned the rest of the land over to food growing. In Persia, three agricultural development and irrigation schemes are under way, two managed by Persians, one under British management. Another scheme in the upper reaches of the Tigris would, if introduced, give Iraq and Persia new agricultural land and spare Baghdad the danger of annual flooding. Shortage of fertilisers and agricultural machinery are the chief obstacles to sound agriculture. The MESC has arranged for the import of both. In Syria a Tractor Board under joint Control has been established from which cultivators can hire out tractors at a low cost. As a *quid pro quo* the Syrian Government is being encouraged to demand control of a percentage of the increased output.

The MESC has arranged for a number of agricultural conferences for the pooling of information, and one factor which emerges clearly from its work is the shortage of trained personnel and the lack of any facilities for agricultural education among the peasants. Apart from the Jewish Research Institute in Palestine, there are few research and training stations directly in contact with the cultivators; and although the political record of Britain in Iraq is remarkable, there are few traces of any British attempt to set the Iraqis up with good economic and technical equipment. The MESC has opened up the need for a great programme of technical education and development which could obviously best be carried out jointly by the United Nations through a centre such as the MESC. At present, there are no Russian advisers at Cairo, although Russian agriculturalists and engineers have much valuable experience to contribute from work undertaken in areas with very similar climatic conditions. Only in the sphere of pest-prevention have the Russians been brought fully into a co-operative scheme. The anti-locust organisation established in May, 1942, by the MESC has Russian, Persian, British and Indian experts working at Teheran. Another branch is at work in Saudi Arabia. The sunn pest in Iraq, Turkey, and Persia is also a concern of the MESC, and in Baghdad the Arabs have called in the services of a Jewish expert from Palestine—a fact not without political significance.

The agricultural development programme of the MESC has been accompanied by plans for the encouragement of local industries. To reduce imports and spare shipping, the MESC has made possible the starting up or extension of a number of industrial ventures—a plant for crushing oil seeds in Iraq, canning plants in Egypt, superphosphates in Palestine and Egypt, a cotton mill plant in Persia, paper production in Egypt, window glass in Palestine. The Middle East demand for dry batteries can now be met from Palestine, and the region's needs in sodium sulphate are covered locally. The development schemes tend to be centred in Palestine and Egypt because there local capital and skill are available. If a wider scheme not dependent upon immediate wartime contingencies were envisaged, it would be essential to spread the advantages over the whole region. The work of the MESC in the industrial as in the agricultural sphere has brought to light the Middle East's need for more technical training, for wider education, for bigger capital investment than any one Government can afford, and here, even if the wider hopes of a peace settlement

based on the raising of living standards are not realised, it should be possible for the MESC to continue its work after the war and act as a centre for the planned development of agriculture and industry in the whole region.

A revised MESC, representing the United Nations, could provide the capital, the machinery, the experts, the advisers, the educationalists without which there can be no speedy raising of Middle Eastern living standards, no end to the recurring crises of want, little genuine political co-operation and little hope of the area being withdrawn finally from the struggle for predominant influence between the Great Powers. The machinery, the personnel, the administrative methods for such a transforma-

tion and expansion of the MESC exist. Co-operation between the great nations and between the local Governments is a fact. But it would be simply futile to suppose that the existence of the machinery in itself is enough to secure the survival of the experiment. Only if the United Nations are resolved on their policy, will they be able to take up the implements the war has forged for their use. The MESC is one of the most outstanding—and one of the most precarious. Its great economic and social achievements depend absolutely upon the political decisions of the peace settlement. It has no more permanence than the victors choose to give it. (The first article in this series appeared on February 20th)

NOTES OF THE WEEK

Stabilisation in the East?

The position on the Russian front has again taken a new turn. By their success in re-establishing their front on the Lower and Middle Dnepr, the Germans have reduced the Russian salient pointing from Slavyansk towards Stalino and Taganrog. The German counter-attack was carried out by a concentrated force of 25 divisions, which had, according to Russian sources, been shifted from Western Europe. Kharkov was threatened from the south. A threat from the west was soon added by the German advance to Valki. The German bid for Kharkov was then countered by a Russian withdrawal from their salient pointing towards Poltava. The Russians have been faced with the difficult task of re-grouping their westward array of forces so as to be able to meet the danger to their southern flank. A new

battle of Kharkov has been going on. Up to a point the possession of Kharkov will determine which side—the Germans or the Russians—will be able to mount a large scale offensive in the south later in the year. On the Moscow front, the Russians have followed up their victory at Rzhev by the capture of Gzhatsk; but the pace of their advance here, as well as on the Lake Ilmen sector, has slowed down—it has never been comparable to the tempo in the south. Before the thaw starts in the north, too, the Russians may still be able to regain Vyazma and Orel. Apart from these two key points—and Kharkov in the south—it is not improbable that the front in the east has become relatively stable; it may be that, apart from the fighting for these

pivotal towns, no very important changes will occur before the summer campaigning season. When the German Command strikes the balance of the winter campaign it cannot avoid putting all its immense losses in territory, material and manpower on the debit side. On the credit side, it will have only the shortening of the front to about half the length it was last November.

Time in Tunisia

On the Russian front, the Germans have won a little time to strengthen their defences and to prepare for the summer. In Tunisia, they have been playing for the same stake; and it is not yet definitely established with what success. Their thrust westward towards the Algerian frontier broke down, and was followed by a fairly deep retreat. But, if the statement (made at an early stage of the fighting) that Allied losses would cause a postponement of the final offensive was not merely a *ruse de guerre*, then the foray brought Rommel and Arnim at least part of the advantage they were seeking. They were less lucky in the attack from the Mareth line against the Eighth Army. General Montgomery's artillery took a heavy toll of the panzers; the loss of 50 tanks means a lot to a force which has only a few hundreds at its disposal. But in spite of this, the Mareth line still stands between General Montgomery and Rommel; and to break through it is a much harder task than to beat back a series of sallies from it. Judgment on the latest stage of the Tunisian campaign must depend on what is considered to have been the enemy's initial intention. If it was to make a large scale diversion and to carry the fighting into Algeria, then the enemy has suffered a signal defeat. If, however, it was merely to fight a delaying action to gain time for the completion of the new mobilisation in Germany and for the strengthening of the European fortress, then Rommel may not, perhaps, in spite of local reverses, be wholly dissatisfied with the results achieved so far. His delaying operations have not failed to delay the Allies.

Marshal Stalin

The "granting of the military rank of Marshal" to Premier Stalin surpasses in importance any ordinary military appointment. The act is not only a stressing of Stalin's leading role in the strategic conduct of the war. It is also an indication of a significant trend in Russia's internal policy—the growing prestige and social importance of the

Paid by The Prudential

Last year The Prudential paid Death Claims on nearly 500,000 policies for a total of over £10,000,000.

One in three of the persons who have lost their lives in air raids on this country was insured with The Prudential.

THE PRUDENTIAL ASSURANCE COMPANY LTD.
HOLBORN BARS, LONDON, E.C.1

new officers' corps. The army pays its tribute to its supreme commander. But, by sewing on the epaulettes of a Marshal, the leader at the same time pays his tribute to the army. The fact that Stalin did not assume any military rank earlier was due to the essentially "civilian" outlook of the party set-up; and Stalin has been, and still is, the leader of the party. Some time ago, no military position could rank on equal terms with the extra-constitutional and outwardly modest post of the First Secretary of the Central Committee. Stalin's military promotion has—according to Moscow correspondents—been welcomed in military circles with the words: "Now he is one of us"—words which seem to reflect the strength of the new *esprit de corps* that has developed in the course of the war. From the point of view of the new military hierarchy, the promotion can hardly be regarded as the final definition of Stalin's military status. The Commander-in-Chief has now become "the youngest marshal" in the brilliant pleiad of old and newly promoted marshals; and it will not be surprising if in the near future some new and special military title is created to suit Stalin's altogether exceptional position *vis-à-vis* the officers' corps. Stalin continues to embody the unity of army and party; and the care which is being taken to maintain a stable balance between the two has recently been stressed by the appointment of L. M. Kaganovich to the important post of Commissar for Railways. Kaganovich was Stalin's closest associate during the period of the inner-party strife. He was Commissar for Railways before 1939. In recent years he seemed to have disappeared from Stalin's immediate entourage. His appointment signifies a certain strengthening of the older, "orthodox" party element in the councils of the Kremlin.

Agenda for Peace

The peace aims of the ordinary man are not extravagant. He wants enough to live on, security in his job, freedom from the overshadowing threat of war—and a fair chance to "get on." Mr Sumner Welles recognised this in his recent speech when he said:

There is no disagreement anywhere as to what the United Nations want. They want full employment for their people at good wages and under good working conditions and the other physical and institutional arrangements that add up to freedom from want.

These "physical and institutional arrangements" are the stumbling blocks; and Mr Sumner Welles very sensibly asked for an immediate and concerted attack on the concrete problems of reconstruction.

If we do not make a start now, there is danger that we shall be brought together to make the peace with as many plans as there are governments.

Mr. Welles believes that if the problems are met in time, before habits of thinking have crystallised in each country, "common denominators" in economic policy can be discovered. The United States Government is ready to begin investigations now, in company with its Allies. Talks on the currency problem have begun. Mr William Batt has gone on record with his hope that the agencies behind Lend-Lease, such as the Combined Raw Materials and Production Board and the Combined Food Board, may continue to function with revised aims and techniques after the war as the instruments of a new kind of control, an expansive control geared to a programme of expanding world consumption. The growing points are there. But the most powerful among the United Nations have yet to prove that they know what they want to do with them. The predominance of America in the economic field lays a special duty on the Americans. The discussion at large during the last months in the United States, together with the talk of conditions for the renewal of Lend-Lease (which have not, in the event, been imposed), has not been wholly reassuring. Nor is there much evidence that the American people as a whole have grasped the essentials of a sound creditor position—willingness to accept goods and services in return for exported capital. In one sense, the future of prosperity of the world depends on the future height of the American tariff, as well as on the future courage of American investment overseas. As Mr Sumner Welles wrote recently in the *Atlantic Monthly*, if America does not mean to stimulate world trade "then other nations will have to plan and build for autarky."

The Political Foundation

International economic collaboration will not take place in a political vacuum. Concrete problems are good starting-points for reconstruction, but, as the plans take shape, they

have to be related to the political controls the victors are ready to create. Many people see that the United Nations could be the framework of a world-embracing federation or union of states; but few have gone so far as Mr Stassen, Governor of Minnesota, who, from among the ranks of the younger Republicans, is calling for "a definite continuing organisation of the world" with United Nations world police force, a bill of rights and a United Nations Court, international control of ports, and responsibility for increasing education and prosperity. He proposes an elected legislature with voting strength based on "the actual strength of the respective member nations" and an executive chosen from and responsible to this assembly. Mr Stassen's proposals are a challenge to more concrete thinking. Few people will deny the necessity of some kind of world council. The scheme he offers presents—as will any scheme—enormous practical difficulties. How can the balance between power and voting strength be worked out so that the smaller nations do not fear domination and the powerful nations secure recognition for their heavier responsibility? The voices which are being raised in this discussion are confused. The delicacy of tampering with national sovereignty was illustrated by the "sovereignty of the air" debate in Congress. A preference for national solutions is apparent in the anxiety of some circles in the United States to take over the American leased bases from the British or to acquire new bases in the Pacific. In Britain, the dominant tone in many recent debates has been "what we have we hold." Russia has given no indication of any readiness to join in world government. It is hard indeed to establish the frontiers between accomplishable world control and Cloud Cuckooland, so long as none of the leading powers gives any lead on the policy it is prepared to back.

The Russian Reaction

One difficulty in the way of formulating concrete peace plans is the attitude of the world to Russia and of Russia to the world. On Monday last Mr Wallace discussed this problem with his usual vigour and frankness. His thesis was:

The future well-being of the world depends upon the extent to which Marxism, as it is being progressively modified in Russia, and democracy, as we are adapting it to twentieth-century conditions, can live together in peace... unless the Western democracies and Russia come to a satisfactory understanding before the war ends, I very much fear that World War 3 will be inevitable.

There can be no question about the Vice-President's diagnosis. Failure to reach agreement with Russia means failure to reach agreement at all, because in the areas in which the seeds of war are most likely to be sown at the peace making—in Germany and in Japan—the attitude of Russia largely determines the attitude of the other Great Powers. If they can reach a co-operative solution there is hope of peace, not otherwise. What can be done to secure agreement? Contributions cannot be unilateral; that is why a Second Front must be the first concern of Britain and the United States, a necessity as well as an obligation. Nothing short of a full-scale offensive will completely banish Russian suspicions. But the contributions in good will and sympathy, too, cannot be unilateral. Admiral Standley, however undiplomatically, laid his finger on a difficulty, when he suggested, with what truth it is impossible to tell, that the Russians, in the spate of their tremendous victories and enormous sacrifices, are being allowed to believe that they were virtually fighting alone. To overcome the engrained suspicions—skilfully played up by Nazi propaganda—on both sides needs a very active effort of good will on the part of the Allied Governments—from the British and the Americans no dealing with quislings, no "sympathy with anti-Russian elements"; from the Russians, a truce to anti-capitalist propaganda. However, Mr Wallace issued the warning that the "Bolshevist bogey" is to a great extent a function of the democracies' own policy. If they tolerate mass unemployment, no Government, Russian or otherwise, will prevent the spread of totalitarian doctrines, to Right and Left.

Trusteeship

A week ago, Colonel Oliver Stanley, the latest Secretary of State for the Colonies, made a speech at Oxford. Like all recent official speeches on colonial policy, it was, in itself, unexceptionable. It dwelt only a short time on past achievements; on the establishment of the rule of law; on the creation of impartial justice and incorruptible administration; on the prevention of exploitation; and on the development of communications, health services, agricul-

tural research, education and welfare. The Minister admitted that, in the main, the conception of trusteeship in the past has been a negative one, a policy designed to safeguard the estate of the several colonies, to preserve it intact, and to see that the income from it is enjoyed by the colony itself. He pointed out that a new conception has been proclaimed, a conception of positive trusteeship by which the colonies and their inhabitants shall be assisted to grow in status and estate and to work out their own destiny for themselves in their own ways, with British aid. The vicious circle by which economic development in the colonies was restricted by the lack of social services and social services by the lack of economic development, was broken, in principle, by the Colonial Development and Welfare Act of 1940. All this is sound statement, and well worth stating to a sceptical outside world. Colonel Stanley was surely right when he said that it would be a surrender to abandon this responsible trusteeship in favour of some kind of international control which has not yet been even defined and which must depend for its appearance upon a degree of international collaboration, in detail as well as in principle, which has not yet come in sight, even for war purposes. But the title deeds of the British Empire are conditional; they must be bought and paid for time and again as long as they run. In the past, the title has been earned by actual achievement; it will have to be earned again in the future, not by the record of the past or the promises of the present, but by positive performance. Until the strains and distresses which are apparent in the West Indies and in Africa have been removed, the new colonial policy will remain a programme, not a fact; and until the machinery of investigation in the specific colonial problems has been vastly speeded by comparison with, say, the bodies that have been at work in British Guiana and Trinidad, the new pledges can hardly be taken at their face value. In wartime, there are obvious difficulties. Goods are scarce to meet the basic needs of the colonies. There is a shortage of shipping space and communications are difficult. The expert scientists that are needed to deal with disease and afflictions of the soil are not available in sufficient numbers. Nevertheless, there is still more than a suspicion that precept and practice are out of step. This country has a historic opportunity, in the implementation of the new Imperialism on the basis of positive trusteeship, to give a lead and set a model for the world. "What we have we hold" is no more than a half truth at best; "What we nourish and develop we hold" is the only sound and just slogan.

A Tragic Lesson

On March 3rd there was an ineffective but noisy raid on London, apparently in retaliation for the devastating attack on Berlin two nights earlier. The noise was due to the remarkable gun barrage which London now possesses. Damage and casualties were very slight. Yet, at one tube shelter, 173 people were killed (60 children) and a further 61 people were seriously injured. This happened in a district where no bomb dropped. It was, as the official statements have emphasised, an accident—and an accident quite without precedent even at the height of the bombing of London in 1940-41. The fact that this tragedy was due neither to panic nor to enemy action strongly underlines the need for the most searching inquiry. An inquiry is to be held, Mr Morrison has announced, but not, unfortunately, in public. Accidents like this should not happen, and those responsible should be made acutely aware of this. Not only did accidents of this kind not happen in 1940-41; it is permissible to suggest that they could not have happened, because the standard of vigilance and safety organisation was kept at all times and at all places at a peak. There could be no more melancholy proof than this accident of the perils of relaxing even the smallest precautions, even though the danger from the air has diminished and become infrequent. Human fallibility, on the part of crowds as well as officials, is unavoidable. But by a proper organisation of entrances, hand-rails, crash barriers, lighting and crowd control this tragedy could surely have been made impossible. Final judgment must await the findings of a full investigation. Every effort has been made to assist the injured survivors and the dependants of those who were killed; but nothing could justify the placing of obstacles in the way of their desire, which is shared by the general public, to know precisely why this dreadful accident was allowed to happen.

Wings for Victory

By Wednesday night, after five days of the Wings for Victory week in London, £102,617,440 had been subscribed

towards the target of £150 millions. This is a remarkable figure. To the extent to which it represents genuine saving and abstention from consumption, which may be appreciable—it represents a direct contribution for the war effort. On the other hand, the figure reached by the end of the week must inevitably wear the usual spurious air. That is to say, there was never much doubt that the target would be attained; and the greater part of it will be made up of large institutional savings which are not savings in any real sense, which would have been invested in Government securities in any case, and which have simply been deployed in this particular way at this particular time to swell the total. As the Chancellor of the Exchequer said when the London week opened, the primary objective of these campaigns is "saving by private individuals." But he also said, "Do not let us decry large subscriptions by institutions and business undertakings," the notion being presumably that these are the whales which, though neither here nor there in themselves, are used to catch the sprats that really count. This theory is excellent, with one important proviso. Possibly, many people are induced by the pageantry and the big numbers of special savings weeks to put aside a little more than usual themselves. But, there is an opposite tendency. Many other people may feel that their mite cannot possibly count beside the thousands and millions of the big savers. In that case, instead of assisting in the sprats' capture, the whales merely frighten them away. Every success must be wished to these Wings for Victory weeks; but there is still an urgent need for clearer thinking about their purpose. Confusion, for example, was revealed in the speeches of Sir Kingsley Wood and Mr Attlee, taken together. Both agreed that savings are needed now to assist the war effort by reducing civilian demand for resources, and, correspondingly, increasing the Government's. But, whereas Mr Attlee, referring to after the war, said that current savings are required to ensure a steady flow of purchasing power to maintain postwar employment, the Chancellor of the Exchequer declared, somewhat astonishingly, that these savings are needed to-day in order to assist in post-war reconstruction. The Chancellor is surely wrong again—unless he simply means, as he certainly did not say, that the withholding or blocking of the money claims represented by these savings after the war will facilitate reconstruction. The only saving that will aid post-war reconstruction will be that made while reconstruction is taking place, that which will actually free resources at the time for reconstruction tasks.

Soldier into Civilian

Lord Nathan has made welfare his province. During the war, he is concerned with welfare in the Army, with the multitude of problems, perplexities, difficulties and discomforts that inevitably confront the civilian turned soldier.

CAMBRIDGE STUDIES IN ECONOMIC HISTORY

THE THEORY AND PRACTICE OF CENTRAL BANKING, 1797-1913

By E. VICTOR MORGAN

Mr Morgan sets out to do in this book what in the writing of modern economic history has seldom been done; his study is both historical and theoretical: economic theory is an avowed part of his subject, but he treats the theories as historical facts and subjects them to historical analysis. At the same time his book is no mere history of economic doctrine; it pays an equal amount of attention to the banking policies, the monetary changes, and the movement of prices, which sometimes influenced theoretical discussion, were often themselves affected by contemporary doctrines and are, in any case, essential for our comprehension of the contemporary modes of economic thought.

Cambridge University Press

It is this experience that has caused him to turn to the no less perplexing problems that will face the soldier when he turns civilian again. Lord Nathan's proposal is that a Department of Welfare should be set up, in liaison with the Ministry of Labour or the Ministry of Social Security. Its justification is the certainty that when soldiers and war-workers come home again after a war which has dislocated their entire family life, there will be immense need for some authority charged with specific responsibility for answering the questions which these bewildered individuals will inevitably ask, and for placing them, as individuals, in touch with the agencies that can assist them in putting their lives and livelihoods together again. The need is not made smaller by the refusal of the Government, expressed in the House of Lords on Tuesday, to contemplate the creation of a new Ministry. Indeed, the need was recognised by Lord Snell, the Government spokesman; and, Ministry or no Ministry, it must be met, if a real danger of confusion and discontent after the war is to be avoided. The need for means to enable individuals to deal with their own particular and personal problems and anxieties is not new. It has been immensely increased by the dislocation of war, which has placed men, women and children all over the country in abnormal and unfriendly circumstances; and it will be further intensified when the dislocation of war is succeeded by the unscrambling process of the immediate post-war period. But it is a well-known and long-standing criticism of the social services that, perhaps of necessity, they cater for categories and not for individuals, for masses and not for persons, for the "average man" and not for the actual family. In a sense, all social welfare, at the point where it is applied, is concerned with special cases; and every body of enquiry that has investigated the working of this or that social service has been struck by the gap which exists between the administrative machinery that has been created and the actual needs and knowledge of the individuals affected. Whether there is to be a Ministry of Welfare or not, this gap must be closed, especially while the vast task of demobilisation is in train. There must be some agency on the spot from which the individual man and woman can find out where to go and what to do in order to pick up the threads of home and work again. The nuclei exist in the welfare organisations of the Services, in the Citizens' Advice Bureaux and in such *ad hoc* devices as the organisation set up in 1940 to furnish London's homeless with central clearing houses of guidance and aid. Sir William Beveridge has suggested the setting-up of local enquiry offices. The step from these beginnings to local welfare centres, in which all the strands of the social services, public and voluntary, can be brought together as they affect each actual individual who comes for help, is short and surely inevitable; and it should be done deliberately, as Lord Nathan asks.

The New Finnish Cabinet

The Cabinet crisis in Finland was solved last week by the choice of Professor Linkomies, a prominent Conservative, as Prime Minister. M Hakkila, the Social Democrat Speaker of the Diet, failed to form a Ministry when the Agrarian Party announced their refusal to collaborate. This appears to have caused some regret in the Third Reich, where Dr Schmidt had just announced at a Wilhelmstrasse press conference that M. Hakkila was renowned for his anti-Bolshevik convictions. Besides the appointment of M Linkomies, the most important feature of the new Cabinet is the replacement of the pro-German Foreign Minister, M Witting, by the Social Democrat M Ramsay, a Fenno-Swede known to have numerous personal connections with the western democracies. It may also be significant that M. Fagerholm, whose resignation was nearly engineered by pro-German sympathisers last December, remains in the Government, while the representative of the IKL—the local Nazi party—and Pastor Kukkonen, a protagonist of the Greater Finland policy, have been dropped. Axis sympathisers are attempting to draw comfort from the fact that Professor Linkomies is a pure Finn, reputed to favour the retention of Far Karelia. The formation of the new Cabinet occupied some two and a half weeks after the Presidential election. The Cabinet itself has emerged from a background of feverish negotiation and uncertainty and has as yet made no statement of policy, although in the meanwhile the President, M Ryti, has once more stressed the inevitability of Finland remaining in the war. The press of all nations has shown a tendency to tie itself in knots attempting to forecast the implications of the reshuffle, but it seems probable

that no crucial decision has yet been made; that the Finnish Government is not secretly pledged either to continue the war or to renounce it. Probably the slight shift to the side of democracy is a conscious attempt to foster understanding with the United States and this country as a measure of reinsurance. But there appears to have been some reaction in Finnish opinion since early February from the anxiety to break with the Axis. No doubt the check to the Russian advance and the setback in Tunisia are partly responsible. People argue that, after all, a German defeat may not be inevitable.

Manpower Reserve

Britain's manpower and womanpower are now highly mobilised, as Dr Goebbels himself has recently had occasion to remark. Little more can be expected in the way of tapping fresh sources of labour during 1943; and Mr Ince, Director-General of Manpower at the Ministry of Labour, pointed out in a speech last week-end that part-time women represent about the only reserve from which the places of men called up for the Services can be filled. Recent figures show that about a quarter of a million women are engaged on part-time work. An expansion to at least one million is hoped for. Part-time work has several advantages; it minimises the difficulties of shopping and domestic ties, and, if arrangements can be made between two women to work alternate shifts in the factory, and look after each other's children when off duty, it can be mutually beneficial. Many employers prefer to take on two part-time women to one full-time woman, since they arrive fresher at work, industrial fatigue is less, absenteeism is lower, and in many cases—so long as the continuity of the process is not broken up—their combined output is higher than that of a single woman. It is probable that schemes for outwork, either in workers' homes or in decentralised workshops, such as were described in *The Economist* on February 27th, will be developed—though not, it is to be hoped, at the expense of recruitment for factory work, which is in every respect more productive. The drive for part-time workers should not be made an excuse either for full-time recruitment or for not extending the number of day nurseries, and otherwise making it much easier than it is for married women to work full time in factories. Mr Ince, echoing earlier pronouncements by Mr Bevin and Mr Lyttelton, said that the chief task now is to make up for labour shortage by increasing labour's productivity, and in this connection he stressed the importance of training. Although the 26 Government training centres and 150 technical colleges have played an important part in training recruits for industry, the bulk of the training still has to be provided within the factories themselves. Many employers, either through shortage of skilled labour or through pressure of work, are still slow, after 3½ years of war, to provide the necessary facilities; and the question of training and up-grading women, and ensuring their employment on the jobs for which they have been trained, is one that calls for constant vigilance and control by the Ministry of Labour's staffs. Like labour, managerial staffs have been heavily diluted since the war.

Buoyant Revenue

Just over a month ago, the Chancellor of the Exchequer announced that expenditure in the financial year 1942-43 would exceed the Budget estimate by some 5 per cent. For a long time, it has been obvious that revenue, too, would exceed the estimate. It is likely to do so some three weeks before the end of the financial year on March 31st. Ordinary revenue between April 1, 1942, and March 6th this year amounted to £2,592 millions, compared with an estimate of £2,627 millions for the whole financial year—and compared with £1,902 millions in the period between April 1, 1941, and March 7, 1942. It is likely that the estimate will be exceeded in both direct and indirect taxation; but the most striking increase, and the most significant one, will be in the latter category. Customs and excise have already brought in £826 million, compared with an estimate of £805 millions, and excise alone has yielded £402 millions, compared with £367 millions estimated. About this, there is no occasion for unmixed congratulation. In part, at least, it is a sign that civilian consumption has exceeded expectations in spite of onerous rates of tax, and is a sign that a proportion of the purchasing power which should have gone entirely into genuine saving

has, in fact, been spent, that is, employed on the undesirable consumption of real resources—which it is above all needful to conserve against the inevitably austere requirements of the next phase of the war. The Chancellor of the Exchequer when he prepares his new Budget will have to decide what he wants most from his indirect taxes—revenue or the curtailment of physical consumption.

Engineers' Wages

As expected, the long-drawn-out negotiations about wages between the engineering employers and engineering unions have resulted in a "failure to agree." The Minister of Labour is being informed of the existence of a state of dispute in the industry, and the claim will be referred to the National Arbitration Tribunal. Last summer, the 40 engineering unions put forward a collective claim for an all-round increase of 11s. a week on the basic wage, for an increase of 33½ per cent on basic rates for plain time-workers, and for the restoration of the pre-1931 conditions of overtime, Sunday work and night shifts. The employers made a counter offer of an additional 6s. a week for all plain time workers, with a consequential variation of the earnings of lower paid piece-rate workers, and advocated a revised wage structure for the industry. They were unwilling to concede the restoration of the pre-1931 conditions. A joint sub-committee of the two sides was set up to examine the proposals, but no settlement was reached. The Tribunal is bound to offer the engineers an increase on their present rates—it can hardly offer less than the employers were prepared to concede—and the unions are bound to accept its award. There will be no strike, and the engineers know that they will not get the full increases originally asked for, which were pitched high in the first place and against the advice of the union leaders. The vital part played by engineering workers in the war effort is fully recognised, and it may well be that the claims of lower-paid workers, especially of women, deserve special consideration, and that there are anomalies which should be rectified. But an increase in wages in engineering will inevitably lead to further demands from other branches of industry, especially as the engineers are already the highest paid of all industrial workers.

The Railway Case

Railway chairmen these days have a tale to tell at the annual meetings of shareholders. Proudly they describe the vital rôle the railways are playing in wartime and about the mounting traffics efficiently carried. Before the war, said Sir Thomas Royden, of the LMS, on Friday, last week, passenger journeys represented some 20,000 million miles of travel and freight traffic 17,000 million ton miles; last year passenger traffic was up 10,000 million passenger miles and freight traffic by 7,000 million ton miles. Here is a measure of the intensity of Britain's war effort. To carry this greatly increased volume of traffic, augmented by the need to save rubber and petrol on the road, and by the limitations upon coastal shipping, the railway machine, pointed out Sir Ronald Matthews, of the LNER, in answer to "those few surviving critics of railway efficiency," has needed an expenditure equal to the cost of only a few hours of war. Steps have been taken to economise fuel; the pooling of wagons has been successful in reducing substantially the movement of empty wagons; permanent way, rolling stock and buildings have been maintained as well as possible in difficult conditions; large numbers of women have had to be trained to take the place of men called up. Sir Thomas Royden adroitly took the opportunity of putting in a plea for the stockholders by contrasting the magnificent services rendered by the railways with what he considers their meagre financial recognition by the Government.

Just when we might reasonably have expected to see some reward for our conservative policy, war broke out, the Government took over the railways and it was the community and not the stockholders who reaped the benefit. . . . As a final travesty of justice, the self-denial of the stockholders in the matter of dividends was actually quoted against them as an argument for cutting down the price paid by the Government for the use of the railways.

On Wednesday Sir Charles Hambro, of the Great Western, set this alongside Sir Thomas Royden's outburst:—

I must remind stockholders that the railway companies accepted the fixed annual payment of £43 millions as a wartime arrangement, because it was recognised that in time of war the national interest was paramount. . . . Another factor to be borne in mind is that our receipts during the past year arose mainly from war traffics carried under exceptional conditions. . . . As all cheap fares were abolished,

and the train services largely reduced, it is not surprising that there should have been a large increase in net earnings.

True, in terms of the nominal capital of the railways, the return seems meagre, less than 4 per cent; expressed as a percentage of the effective capital employed—the only real basis of comparison—it may show a different picture. Whatever the wartime service of the railways—and wartime service is only common duty—their stockholders could hardly expect to derive special gains from Britain's emergency, especially as, for the most part, they are not identical with the officials and operatives who are actually doing the job.

Freedom of Martinique

So the seamen were wrong who struck in New Orleans because the food they were shipping was designed for Admiral Robert. According to Mr Sumner Welles, no food has been sent to Martinique since last November. But the seamen were right in their suspicions of Admiral Robert. Even the cautious State Department admits that he has been "somewhat recalcitrant." As a means of counter-pressure, the island of Martinique has now been deprived of supplies for the last two months. Surely this, of all ways of dealing with recalcitrance, is the least satisfactory. Admiral Robert will be the last, not the first, to starve, and meanwhile his unhappy people, of whom a large percentage are in favour of resistance, must endure famine for the inglorious principles of Pétain's National Revolution. The time has come to end the farce of Robert's pretended sovereignty. The Vichy régime is at an end, leaving as its only legacy the total disappearance of any sort of French State. In this anarchic situation, there is only one safe basis of sovereignty, the old basis, the will of the people. Let the people of Martinique be given the chance given to the people of St. Pierre and Miquelon to say whether they will support the United Nations or not. The evidence suggests that a clear majority would do so. Robert and his Vichy naval officers may make a show of resistance if the Allies take over the island just as the British received stiff opposition in Madagascar. But who will doubt that the British policy was correct?

Spanish Scare

It was certainly time for the Germans to revive the bogey of a Nazi occupation of Spain. Now, as before, no certain answer can possibly be given about Germany's intentions towards Spain. Now, as before, the familiar pros and cons—Spain's lack of food against the benefits to be derived from nipping the Mediterranean at the Straits of Gibraltar—are doubtless as baffling to the Führer as they are to the world at large. There seems to be no doubt that fresh German pressure has been brought to bear on the Caudillo. Troop movements on the Pyrenees can easily be explained away as manoeuvres to attain closer frontier control; so can the German torpedoing of a Spanish vessel, the *Monte Igueldo*, on the ground that accidents will happen. Certainly, nothing can be deduced from the official visit to Spain of the Reich Student Leader. Even the seizure of the French post office in Tangier by the Spanish authorities last week is not unmistakable evidence of German control. The Latin American states, which follow Iberian affairs with peculiar attention and insight, do seem to incline to the view that the danger is genuine—in which case, Argentina might find *Hispanidad* a feeble prop to its neutrality. At the end of February, the Argentine *El Mundo* and the Brazilian *O Jornal* definitely affirmed that occupation was imminent. Yet it may be that the German pressure is essentially defensive, designed to caution a Government which has recently seen fit to send an envoy, Colonel Beigbeder, to Washington. In the circumstances, the question of Lend-Lease for Spain, and the indignation aroused in America by the despatch to that country of much needed oil supplies, has great importance. It would be no service to Spain to render it rich enough to attract the plunderer.

Shorter Note

Trade may now be resumed with French Somaliland, Réunion and the dependencies of Madagascar. Trade with the mainland of Madagascar has already been authorised.

AMERICAN SURVEY

Last Testament

Not long ago the House of Representatives refused to appropriate funds to continue the existence of the National Resources Planning Board, a signal example of how political considerations can be allowed to obscure a sense of national values. The NRPB has celebrated its death-warrant, and justified its claim to go on living, by the issue of a remarkable report on future economic policy. The report is more than a Beveridge plan; social security is only one part. In general, according to the first brief cables from Washington on Wednesday, it is a comprehensive plan for the transition from war to peace. Its first half is made up of proposals for the demobilisation of men and plant, and for their remobilisation for peace purposes and reconstruction; its second is concerned with provisions for old age, want, dependency, unemployment, sickness and accident. Stress is laid upon the retention and encouragement of private enterprise; but a basic assumption is that a policy of full employment should be pursued by the Government. Nationally, this report, which is based on three years' work (and calls for much more extended treatment than in this short Note), suggests a new chapter in the New Deal. It offers to the United States Government a bold and imaginative programme, built on practical lines—just when the British Government has decided that the Beveridge plan is probably too big to handle, except in penny numbers. Internationally, it outlines a policy by which, in combination with freer importing and courageous investment overseas, the United States can be the power house of world economic advance.

* * *

Action on Manpower?

Some further action on the manpower issue, which has provided the main subject of debate on the home front, appears imminent. A special committee of five has been instructed to prepare a report for the President on the best use of the nation's manpower resources. The five members of the Committee are Mr Baruch, Mr Byrnes, Admiral Leahy, Mr Hopkins and Judge Rosenman, long a close adviser of the President. A correspondent of the *New York Times* suggests that the size of the Army may again be under consideration, but Mr Stimson's statement this week that "it is impossible to reduce its size or interrupt its training" makes this appear unlikely. The concern of the new manpower committee is more likely to be with the estimates of the manpower shortages, and the location of the most critical sectors, in agriculture, certain industrial skills and medicine; and with the adoption of new controls for more orderly allocation. The deferment of essential farm workers has this week been made general, and it has been announced that industrial workers returning to agriculture will be exempt. But although Congress has no integrated programme for dealing with the issue, it has made clear its distrust of Mr McNutt, the Manpower Commissioner, by refusing to grant him the \$2,454,000 he requested for extending the work of the United States Employment Services, and unless the Administration produces a convincing plan—and a more popular Administrator—Congress will be encouraged to take over the reins. Presumably the Committee is also considering the pros and cons of industrial conscription. Mr McNutt and his Commission remain hostile to the Austin-Wadsworth Bill for the use of compulsion in allocating labour. Mr Stimson, on the other hand, has, with apparent reluctance, found reliance on the voluntary principle inadequate, and is supporting a National Service Bill. In this matter, Mr McNutt has the support of organised labour, which has set its face against compulsion.

* * *

Kitchen Crisis

The United States is now on points. The rationing of tinned and processed foods is more drastic than had been expected. Instead of the 25 per cent cut that had been cheerfully anticipated, under present points values only about 13 million cases of canned goods will be distributed monthly, instead of the 30 million cases consumed during 1941-42. Each purchaser will get only two to four average sized tins a month. Included in the ration of 48 points a month are peas, 16 points; tomatoes, 16; grapefruit juice,

23 points for 2 lbs.; soups, 6 points; and baby foods. The ration is something of a shock; but the picture of the American housewife desperately, but courageously, facing the future, with an idle tin-opener and foreign-looking piles of fresh fruits and vegetables, is far from fair. Tinned foods are used more in the United States than in other countries; but to suggest that they are a major part of American cooking does less than justice to the great culinary traditions of the South, of New England, and the Middle West. The reason for the food crisis lies, not in an inability to deal with fresh foods, and not so much in a real shortage, as in the threat—it is still only that—of a failure to achieve efficient and equitable distribution of supplies. There is some danger that dissatisfaction with the present methods of price control and rationing—and with enforcement of both—may lead to a lack of confidence which will stimulate black markets and lead to further shortages.

* * *

In the Lion's Den

Once more the efforts of Sir Walter Citrine and his delegation have failed to secure the participation of the American Federation of Labour in a labour organisation including representatives of Russian labour, or to persuade the AFL to sanction independent representation of the Congress of Industrial Organisations and the Railway Brotherhoods in such a body. The acrimony and public recrimination which have followed this new attempt make it difficult not to believe that it would have been better—for the time being, at least—to have let the project rest, as, indeed, Sir Walter was advised. The Federation has stubbornly refused to depart from its position that

any organic liaison with the Soviet trade unions is undesirable because . . . the Soviet unions are not free labour organisations, but the instrument of a state.

On the other side of the fence, salt has been poured into a re-opened wound. The CIO and the Railway Brotherhoods have been incensed by the refusal of the British Trades Union Congress to deal directly with them, instead of insisting that any such negotiations be conducted through the AFL. They consider it derogatory to their dignity. The position is that the AFL, with which the TUC feels it must treat as a consequence of its international affiliations and long relationship, will not co-operate; whereas the two other great American labour bodies, which are prepared to enter into an alliance of all United Nations' labour organisations, cannot be approached directly, because of the monopolistic attitude of the AFL and the self-denying ordinance of the TUC. In this lion's den of labour rivalry Sir Walter appears to have acted with more energy than discretion.

* * *

Ruml Legislation

The need for a pay-as-you-go plan for income taxes has been conceded in all quarters. What remains to be determined now is what form it shall take. Despite the popularity of Dr Ruml's provision for "forgiveness" of 1942 taxes, it is unlikely that his scheme will be accepted in its original form. At least four Bills embodying pay-as-you-go have been introduced. The compromises take two forms. One would provide for "forgiveness" in the lower tax brackets only. It is reported that discussions have been going on between tax legislators and the Treasury along this line; and one possibility is that "forgiveness" might be extended through the first surtax bracket, thus preventing the windfalls to taxpayers in the higher brackets, which constituted the main objection of the Treasury to the Ruml plan. The other issue is whether pay-as-you-go should go into effect at once or not; on this the feeling is that taxes as usual might be paid on March 15th, and that the other quarterly payments might combine 1943 tax liabilities with part of 1942's liabilities. The latter might then be spread over a period. A few Congressmen would like to pass legislation on the Ruml plan independently of the new revenue bill, but the Treasury has discouraged this, suspecting it would remove the main impetus from the drive for new tax legislation. Although there may be some delay in arriving at a compromise satisfactory both to the Treasury and Capitol Hill, the incorporation of the principles of pay-as-you-earn and of withholding tax at source in the American income-tax system appears likely.

THE WORLD OVERSEAS

"L'État Français"

(By a Correspondent)

"THINGS and actions are what they are, and the consequences of them will be what they will be: why then should we seek to be deceived?" It is a pity Bishop Butler's wisdom could not have been applied to recent discussions of the present and future political problems of France which have illustrated once again Britain's national talent for ignoring unpleasant facts and, if they cannot be ignored, asserting or assuming that they need not have unpleasant consequences.

One unpleasant fact, above all, has been ignored, and one unpleasant set of consequences minimised or wished out of existence. Yet the fact is indisputable and, one would have thought, sufficiently dramatic to win attention. The fact is the absence from the world at this moment of a French state. It is true that there exists a body which calls itself a French state and, indeed, calls itself that and nothing more. But the "French State," as an independent body, is as much a fiction as the sovereignty of the Sultan of Morocco or of the Emperor of Annam. The case might indeed be put a little more strongly than that. For the French conquerors, in Annam or Morocco, were taking over and exploiting the existing political organisation; the Germans in 1940 permitted the creation of a new political organisation for France which, in their then state of omnipotence, was the same thing as creating it. If Pétain had not existed, he would have had to be invented. People talk of Pétain "adopting the policy of an armistice." But the Marshal had in 1940 only "the freedom of choice" between resistance and non-resistance. The fact that the non-resistance chosen was given form by an armistice should not blind us to the fact that it was non-resistance that was chosen by the Marshal; the armistice was not negotiated. It was, like the "*Charte octroyée*" of Louis XVIII in 1814, given by Hitler for his own reasons and at his own good pleasure. Hitler could have behaved in France as he behaved in Poland—abolished the French state altogether. He could have completed his military victory and ruled all France directly. Why did he not do so? Because he thought Vichy would be a paying proposition. He may have been wrong, but the decision was made not by the impotent and despairing Marshal, but by the triumphant and, at that moment, apparently invincible Fuehrer.

Once the Germans had decided that it paid them to permit and encourage the creation of a "French state" they allowed it the harmless luxury of apparent sovereignty. It had to look like a semi-independent organisation as much and as long as was required by German policy. No doubt, direct interference varied. Dakar, Algiers and Martinique were given more rope than Vichy or Marseilles to do

the Indian rope trick, that is, to make German domination seem to disappear into the blue.

The political consequences have been grave and are still grave. All over the world, in Shanghai and Buenos Aires, in Stockholm and Ottawa, in Washington and Ankara, the German-sponsored "French state" has been the administrator of the diplomatic and other assets of the French Republic. It has been "France" for that large section of the world's population that does not bother to look behind fictions. The consequences have been serious for us and important for the Germans. It is true that our own action in supporting the de Gaulle movement—for all its grave faults and imperfections, which have not grown less—saved us from the worst consequences of the Vichy policy. Refusing to recognise the armistice, encouraging French disavowal of it, repeatedly asserting the British belief in a real France that was neither collaborationist nor *attentiste*, we were able to protest continually and effectually against the basic Vichy premise that it was possible to do a deal with Hitler. If there had been no continuing protest, Hitler would have gained even more by his "magnanimity" than he did. The spectacle of France either rushing to the side of the victor, or attempting to manoeuvre in the tiny field left to her by Hitler, would have been a moral triumph of great importance in the epoch when Hitler was selling the New Order, not only in Europe, but in America. To deny this is to affirm that we should be no worse off if King Haakon had remained in Norway to imitate Pétain or if Queen Wilhelmina had gone to Java to imitate Admiral Decoux and the other Vichy agents who surrendered Indo-China to Japan.

If Hitler, as some pretend, "made a mistake" the price is being paid not by Germany, but by France, now there is no generally recognised and functioning French political authority. The fiction of Vichy now pays hardly anybody. All of France is occupied and the situation only differs from the other occupied countries by the higher rank and the more generally representative character of the Vichy agents and apologists of German policy. Only in China has the Axis managed to find so plausible an imitation of a native government as it has in France. But Chungking and the Chinese Government give an answer to the Japanese claims that no French Government can now make to the German claims. To state this is to state a regrettable and tragic fact.

It is of the greatest importance for Europe—and for France—that there should be a strong and representative French Government and French state in existence as soon as possible after the invasion, or the German collapse. That Government should not be proscriptive in

temper or too self-righteous. But it is idle to expect that any French Government can begin to function that does not condemn at least the attitude of the unshakably loyal agents of Vichy like Admiral Robert at Martinique.

The eleven-hour cannot last forever; it will soon be *minuit passé*. And everybody who has any concern for the future of France and of Europe should begin all consideration of the French problem by accepting the fact that the Vichy experiment has ended in a disastrous destruction of the political framework of France. What form rebuilding should take is too great a question for discussion here, except that it must be done by the people of France. One basic error can be avoided from the start, the error that assumes that only dilapidations are in question. A complete reconstruction is called for and will be called for by the owners, the French people, whatever our perennially hopeful paperhangers think.

North American Lumber

[BY A CORRESPONDENT]

BROADLY speaking, natural resources fall into two categories—recurrent and exhaustible. To the former belong forest and agricultural products, as well as hydro-electric energy, and to the latter petroleum, coal and metallic ores. North America is generously endowed with both. But, for nearly three centuries, timber has been "mined" in the United States, that is, virgin timber has been exploited, leaving in many cases devastated and unproductive areas. The US Forest Service estimates the annual drain of timber resources, including cutting, fire and disease, at 13,500 million cubic feet—a figure which, of late, has exceeded annual growth by 2,200 million cubic feet. The potential productivity of the nation's forest lands, with moderately full use, is placed at well over 20,000 million cubic feet, or virtually double the present rate of growth. The practice of selective cutting and sustained yield is gaining ground.

The principal kinds of soft wood exploited by the United States are yellow pine, Douglas fir, Ponderosa pine and white pine, while oak, yellow poplar, tupelo and birch are the chief hard woods cut. Canada's forest area exceeds 1,220,000 square miles, or 35 per cent of the total land area. About 450,000 square miles of it is unsuitable for commercial operations, but on 770,000 square miles there are trees large enough for use now, or which can be expected to grow to usable size in the near future. The present accessible productive forests cover 430,000 square miles, of which 45 per cent bears merchantable timber, and the balance has young growth. The volume of wood in merchantable forest is reckoned at 313,140 million cubic feet. The most important of all species in the Dominion is spruce, covering over one-third of the total forest area. Softwood or coniferous species together make up 75 per cent of the total, and hardwood or broad-leaved species constitute the balance.

Great strides have been taken in the rational use of timber since the depression, which compelled the industry to initiate and sponsor new ideas and methods. Progress has been noteworthy in three directions—speed of construction, prefabrication, and size of construction. Thus, in one part of the United States, one million foot board measure of lumber is being prefabricated into trusses and columns every twenty-four hours, seven days a week. Glued, laminated wood construction for beams, columns and arches is one of the leading new developments. No metal is required for this purpose, and lumber which otherwise might be structurally useless can be employed with advantage. Composite timber-concrete deck construction is another forward step in the

use of timber. The higher-stress grade lumber is reserved for special uses—aircraft, pontoons and ships. To-day, timber is taking the place of steel in, for instance, truck bodies, and in bunks for soldiers, and wood pipe is being substituted for cast-iron pipe. It is being extensively employed in building camps, in gun stocks, aircraft parts, decks of battleships, pontoon bridges, and keels of Liberty ships. The Curtiss C.76 *Caravan* represents, like the Mosquito bomber, a return from metal to wooden construction in aircraft manufacture.

The War Production Board places the nation's lumber consumption this year at 31,000 million board feet, and the production goal at 32,000 million board feet. The attainment of this goal depends on manpower, tractors, trucks and the flow of repair parts to the industry. Mr R. P. A. Johnson, Wood Consultant, WPB, has pointed out that when one material is substituted extensively for others, the substitute in turn gets scarce, and that was happening to wood towards the end of 1942. Construction lumber was, therefore, placed under a limitation order. Certain grades and species were virtually frozen to direct them into definite war uses, since the overall lumber situation was getting tight. Recent developments have, however, made possible the utilisation of smaller sizes, such as are available from local stands of timber. This is important, because even in 1938 nine States produced negligible amounts of lumber. With the strain on transport, local supplies should prove doubly valuable. In relation to domestic production and consumption, America's exports and imports of timber are relatively small. In 1940, shipments abroad totalled 841 m.b.f., a drop of 261 m.b.f. from the 1939 figure, and imports amounted to 740 m.b.f. (an increase of 15 million m.b.f. over the preceding year)—virtually the entire soft wood supply coming from Canada, and hardwood from the Philippines.

In Canada, the average annual cut for the ten-year period (1929-38) for all uses was 2,546 million cubic feet. Of this, 32 per cent was accounted for by saw mill products: 27.6 per cent by pulp and paper, 34.1 per cent by fuel, 6 per cent by miscellaneous uses, and 9 per cent by exports. The Dominion's timber production in 1943 is estimated to reach 4,000 million board feet, of which 1,000 million board feet are to be set aside for Britain. Last year, shipments of Canadian lumber to the United States are estimated at 1,300 million board feet, or double the normal figure.

A preliminary estimate of the pulpwood supply available this year indicates a total of 20 million cords in North America (including Canada). It compares with consumption at an annual rate of 25 millions towards the end of last year. This has led to a cut in newsprint. Thus, in each quarter beginning on January 1, 1943, each individual American newspaper may only consume paper to an amount based on the total tonnage required to produce its "net paid" circulation for the corresponding quarter of 1941, with certain concessions to those papers which increased their circulations in the intervening period.

Portuguese Banking

[FROM OUR LISBON CORRESPONDENT]

ACCOUNTS of the principal Portuguese banks are mostly in shareholders' hands, and the figures for 1942 are satisfactory. They show that deposits increased by 60-70 per cent on the year, and that there were substantial profits, despite liberal additions to reserves both hidden and visible, and strong cash positions. Nevertheless, there is uneasiness, not of what is, but of what may, lie round the corner. A market full of money at present unemployable, and a reasonable dread lest the diminishing purchasing power of such money, reckoned in terms of everyday goods, should

eventually affect currency conditions, explains this. Up to now, the efforts of those in authority to control prices have kept the brakes on, though the wheels still move, albeit slowly, towards higher and higher prices.

A potential danger may also lie in the system of international clearings, complicated by advances now made to holders whose credits have not as yet been covered by corresponding equivalents in other currencies. But the brighter side is that expressed by the chairman of one important bank, who said, "What currency to-day has the support of an economic and financial system safer than ours? . . . whatever may be the base on which post-war monetary systems may be established, I affirm my unshakable faith in the destiny of our currency, and, what is even more important, in the destinies of this country."

Russia at War

Drive in Agriculture

The Council of People's Commissars and the Central Committee of the Party have jointly issued a number of detailed instructions about the approaching campaign of spring sowing. The directions given afford a glimpse into the difficulties with which Soviet agriculture is struggling and show the means and methods employed to overcome them.

The instructions say nothing about any further expansion of the acreage under cultivation. Instead, "the increase in the yields of all agricultural crops" is considered as "the chief task of 1943." This contrasts strikingly with the insistence on expansion which was typical of Russian agricultural policy in 1941 and 1942. The expansion of cultivated land in 1942 amounted to 5 million acres. This was not large compared with the agricultural losses due to enemy occupation. By the recapture of the Northern Caucasus alone, the Russians have now "expanded" the area potentially under cultivation by more than 30 million acres. The policy of expansion is in any case not likely to produce any significant additions to crops at this stage, because of an unavoidable deterioration in agricultural technique. What may have been gained by bringing new land under the plough may well have been lost lately by a decrease in the yield per acre. It is therefore natural that the new instructions should stress the need for intensification rather than expansion.

Before the present war, the total number of tractors, harvester-combines and lorries working for collective and state farms was at least 830,000. A high proportion of these must have gone to strengthen the mechanical equipment of the army—*Pravda* says that Soviet agriculture can still use "several hundred thousands of machines." The technical staffs—drivers and mechanics—have been depleted; and although new trainees have filled the gaps, their work is of necessity not up to pre-war standards.

An All-Out Effort

The new instructions are meant to overcome the "bottleneck." The reorganisation of the machine tractor stations is the main part of the preparation for the sowing campaign. It seems in fact that this is now the chief preoccupation of the whole administrative economic apparatus from top to bottom. As is usual in all cases when some dangerous bottleneck has to be eliminated, the principle of "personal responsibility" has been firmly enforced. The Vice-Commissar for Agriculture, Vasin, has been made responsible for the timely repair of gas generator tractors; and the Commissars of the republics and the heads of regional party organisations have also had their "personal responsibility" clearly defined.

The campaign is to be carried out under the strictest control from the centre. The regional administrative bodies have been ordered to report progress in the repair of tractors every ten days—from March 10th to May 20th—by direct cables to the Government and to the Central Committee of the party—an emergency measure which is unusual even according to the Soviet standards of centralised control. The time-table for the repair work has been rigorously fixed. Until March 10th, factories have to set up teams of repair workers ("without detriment to the fulfilment of war orders")—to be sent to the machine tractor stations which are behindhand with repairs. The dead-line for the repair of gas generator tractors is April 1st, for the checking of harvester-combines March 15th, and so on.

The way in which machine tractor stations use their personnel has also been modified. Until now tractor teams have been sent out to work in response to the demands of the collective farms. They were shifted from farm to farm without being permanently attached to any. This has been changed. Tractor teams will now be attached for at least one year to particular farms or groups of farms. Similarly, in order to put an end to "the impersonal attitude," driver teams have been instructed to work with their own particular equipment; and the exchange of equipment between various teams has been prohibited.

Incentive Wages

In order to encourage better work, very high bonuses have been fixed, especially for supervising staffs. The interesting point about the bonuses is that they will be paid, not only for overtime, but also for the fulfilment of the normal quota, and for good maintenance of technical equipment. The bonus for a "senior driver" and his assistant amounts to a year's earnings in cash. The basic wage has, in other words, been increased by 100 per cent, at a stroke. Ordinary drivers whose teams of tractors do a minimum of 88,000 acres within the first fortnight of the sowing campaign receive bonuses amounting to a month's wages; for each two and a half acres in excess of that minimum an additional labour day will be paid. This rise in the wages bill of the machine tractor stations has compelled the Commissariat of Finance to make quasi-inflationary adjustments in the budget estimates of agricultural expenditure. The Commissariat will have to advance considerable sums, as the machine tractor stations will not be able to pay the higher wages out of their normal funds.

It is reasonable to expect that this formidable spurt will help Soviet farming to get into its stride during the spring. It is significant that the quotas of petrol allocated for the first phase of this year's campaigning are 10 per cent higher than those fixed in 1939, when Russian agriculture worked under normal peace conditions. The fact that this higher allocation can be made reflects the improved oil position, after the recapture of the Caucasus; but it also indicates the importance attached to the battle for bread.

The Recaptured Land

The crucial question is to what an extent it will be possible to make use of the recaptured land in this year's campaign. The total gain is 55-60 million acres of normally cultivated soil. The Don and Stalingrad regions as well as the northern Caucasus specialised in winter grains during the last pre-war decade. In the Caucasus, for instance, out of a total of 11.5 million acres under wheat not less than 8.5 millions were under winter wheat. A quick change-over to spring grains will be needed. The problem of machinery is the more vital here, because it was in the south that the percentage of field operations performed by tractors used to be the highest in Russia. On the Kuban and the Terek, for instance, 98-100 per cent of the ploughing used to be done by tractors as well as 99-100 per cent of the grain sowing. (The average for the whole of Russia was 74 and 47 per cent respectively.)

It seems therefore that the instructions about the machine tractor stations have been issued with an eye to the needs of farming in the regained territories. The great question is whether adequate numbers of tractors, harvesters and trucks are available. A massive transfer of machinery from the east to the southern regions is probably necessary, if farming on the Don and the Volga and in the Caucasus is to be restored to any appreciable extent.

THE BUSINESS WORLD

Post-war Currency Plans

POST-WAR currency problems are receiving a great deal of attention. The Imperial and Allied conferences which have already been called to discuss the subject, the promise of further official discussions, and the volume of currency memoranda, official and private, which have been circulating seem to guarantee that in this direction, at least, the Allied nations will not find themselves wholly unprepared for the work of reconstruction. The recent speech which the Chancellor of the Exchequer made in the House of Commons on post-war economic policy provided interesting hints of the general lines on which official thought is running. The Treasury communique issued last week after the first session of inter-Allied talks on this problem gave some idea of the scope of the schemes which are being outlined. Muffled echoes of the so-called "Keynes Plan" discussed at this and at a previous Imperial monetary conference have inevitably escaped from the shuttered rooms in which the discussions took place.

What kind of international monetary mechanism is it being proposed to set up in the immediate post-war period? From the rumours and reports it seems reasonable to assume that the currency system of the future will be international and multilateral in its functioning; that it will, therefore, avoid the rigidities of strictly bilateral settlement of international trade; that it will embody some machinery of consultation, with delegated executive powers to maintain an international equilibrium of prices and costs, either by directing changes in the exchange value of different currencies, or by inducing member countries to correct any tendency to deviate from the international equilibrium in their domestic positions, but that it will be able to provide time for these correctives to produce their effect by providing credit for debtor countries; that there is no question of returning to such a system as the old type of gold standard which, even in its most "managed" form, tended to work with arbitrary and painful rigidity; and that the world arrangement must establish some control over international capital movements, and, in particular, over the damaging gyrations of short-term capital. Plainly, for some years after the war, provision will have to be made for coping with a serious lack of balance in world balances of payments. This will be especially true of the immediate post-war period of relief. But it should not be hard to project the mutual aid agreements of the war years into this period. The revivification of Europe, the reconstruction of the essential means of livelihood in devastated countries, are operations that can be planned and carried out independently of financial considerations with no call for international monetary mechanisms. But the years of relief will soon make way for the years of reconstruction proper, of reviving international trade, and of growing self-reliance. It will, of course, still be an abnormal period in which balances of international payments will be heavily affected by the after-effects of war. But it will no longer be a period in which the spirit enshrined in Lend-Lease, Mutual Aid or "free gift" agreements will be directly practicable; and it is to master the special difficulties of this period, as well as to meet the longer-term requirements of international trade and investment, that the new world currency plans must be devised.

If the new system is to be international, it must be decided in terms of what standard the various currencies are to be valued and related. The standard can hardly be other than gold. Ingenious schemes have been put forward for constructing a multiple commodity standard in which gold would be included, but their complexity alone seems to disqualify them for this generation at least. The Keynes plan is said to be based on gold, the international unit of account being christened the "bancor." The official American commentary on this plan apparently envisages some form of international gold stabilisation fund.

Once the choice of standard has been made, the mechanism of the new exchange system must be considered. Since it must in its first years be the means of cushioning

considerable disequilibria in the balances of international payments, it must be endowed with appropriate power to extend international credits, credits which will have to be provided by the nations which in those years are likely to have creditor balances arising out of their international payments. Some form of authority—an international bank—will have to be created to provide the machinery for the ultimate clearance of international payments, and for meeting deficits. The bank will need to allow clearing overdrafts, expressed in terms of the international unit to which all currencies will be related (though not in any permanent or fixed relation) in order to allow debtor countries to meet their liabilities without setting in motion the deflationary forces which would be created by similar circumstances under the operation of the gold standard.

This insulation of domestic credit structures from the shocks of abnormal external influences has already been tried by the operations of Exchange Equalisation Accounts, between 1932 and 1939, and it is this technique that must be developed and perfected by adding to it an international credit mechanism. Improvement is particularly needed in the machinery for remedying the causes rather than neutralising the symptoms of exchange disequilibrium. The gold standard provided semi-automatic correctives. The Tripartite Agreement did not provide any such correctives. Despite the provisions it made for consultation among the member countries, every major alteration in exchange rates which occurred during the life of the agreement was in effect a unilateral decision with which the other members were presented as a *fait accompli*. The new system must, therefore, provide the necessary elasticity to deal with the special problems of post-war disequilibrium and the means by which international discipline in monetary affairs can be maintained. But it must do so without the ruthless automatism of the gold standard.

This means that the international bank or clearing centre must be endowed with capital resources, giving it access to equivalent amounts of the currency of the participating countries. These resources would, however, only be essential to get the machinery into working order. Once in operation, the system would work almost wholly with the resources left in the clearing accounts by the creditor countries. Every debit balance must be matched by a credit balance somewhere. Since the system would be devised to cope with a considerable initial disequilibrium in international balances of payments, each member country would have to be given the right to overdraw on its clearing account up to given limits. These limits would have to be fixed for each country; and it would be reasonable to relate each "ceiling" to the aggregate foreign trade of the country in question over a certain base period. As a country approached the limit of its overdraft facilities, it would have to consult with the international bank and undertake to apply the suggestions made to it in order to remedy the maladjustments to which the increasing clearing debit could be attributed. There would, obviously, have to be some measure of compulsion in these directions to debtors. But the causes of disequilibrium may lie as much on the creditors' as on the debtors' side. It would, therefore, be reasonable to submit the creditor countries, too, to the check of consultation whenever their credit balances rose above a level which, again, could be defined in relation to the normal volume of their foreign trade. Moreover, the process of accumulating credit balances could be penalised by the Irish process of imposing debit interest on excessive clearing credits.

The scheme is obviously dependent for its success on the participating countries being prepared to submit themselves to the check of such consultations. They must be willing to divest themselves of some of their autonomy in monetary affairs (as, of course, they did as long as they adhered to the gold standard and played that game according to its rules). It also depends on the member countries

being able, as well as willing, to apply the suggested correctives. The correctives fall into two categories. Under the first can be grouped all measures designed to affect the domestic value of a currency. It is in applying correctives of this kind that the most serious difficulties can be expected. The rigidity of costs, wages and prices will have been increased by the war and its aftermath of social security legislation. Adjustments of this domestic character will, therefore, prove even more difficult to apply than was the case when they were called for by the restoration of the gold standard after the last war. The second type of corrective will be the adjustment of the exchange value of a currency. One of the problems that will have to be considered in the event of an agreed devaluation of a member currency will be that of apportioning the resulting exchange loss. Although the international bank will keep its books in terms of a fictional gold unit of account (as the Bank of International Settlements does to-day), it will actually owe and be owed an amalgam of the currencies of the participating countries. If the currency of one of the debtor countries is devalued, the bank's assets, calculated in terms of "bancors" or some such unit, will have depreciated, and some formula will have to be devised for distributing the loss of any such agreed devaluation among all participating countries.

Although this international clearing system would be devised to neutralise a considerable post-war disequilibrium in balances of international payments, it is evident that it would have little chance of survival if this disequilibrium

were not comparatively short-lived. The success of the scheme is dependant on the fundamental assumption that within a relatively short period—say, four to five years—the participating countries will have returned to a reasonable equilibrium in their balance of international payments, except on long-term capital account. Capital transactions would, for a time at least, have to remain subject to the control of the international authority and, consequently, the participating countries would have to submit their own foreign investment transactions to the test of consultation with the international authority. But subject to this condition, the international clearing system would be compatible with the application of varying degrees of exchange control by the participating countries. It could certainly accommodate itself to complete freedom in exchange operations arising out of normal commercial transactions, leaving to the member countries the technically difficult, but not insuperable, task of differentiating between trading and capital transactions and ensuring that the proceeds of export trade are, in effect, repatriated.

If the post-war world is to achieve exchange stability and at the same time insulate the international system from the shocks and strains which the years of reconstruction will place upon it, some such scheme will have to be applied. The difficulties and prejudices which such a scheme will have to meet and overcome are apparent. But they are difficulties and prejudices that must face any system which attempts to impose international discipline, whether it be political or financial.

Collection of Income-Tax

SINCE 1939 the scope of income-tax has been greatly extended in Britain. The rate of tax has been substantially increased. Additional layers of personal incomes, swollen by the rise in workers' earnings, have been tapped; the number of taxpayers with gross incomes not exceeding £500 a year rose from 3,000,000 in 1938-39 to 9,500,000 in 1941-42. In view of the increase in the rate of tax and of its extension to the very low income groups, the former practice of collecting the tax in two annual instalments—the first nine months and the second fifteen months, after the end of the year, in respect of which tax is payable—has become inappropriate.

The mass of new taxpayers, unfamiliar with income-tax, could hardly be expected to save enough to meet their liabilities at the appointed dates; and, even among salaried persons above the low income groups, the increase in taxation would probably have tested severely the individual's capacity for making provision for his liabilities. This difficulty was foreseen and solved by the introduction, in 1940-41, of the method of deducting income-tax at the source, weekly from wage-earners and monthly from salaried persons.

But a second, and potentially formidable, difficulty remains. Income-tax is collected, not during the year in which the income is earned, but during the year beginning some months after the end of the period during which the liability was actually incurred. In the event of a fall in income, or a complete suspension of income, many taxpayers may find it quite impossible to pay their taxes, while others may find the liability an intolerable burden. This danger has hitherto been disguised by the general upward trend in incomes, and by the absence of unemployment. But this state of affairs can hardly last for ever. After the war many workers will wish to retire from industry; women, and especially housewives, will wish to return to their homes. Are they to be saddled with an income-tax liability for which they have not made, and often could not have made, provision? Are those of them who have accumulated savings to be asked to surrender part or all of them to the tax collector? Will husbands, whose own earnings have declined, willingly shoulder their wives' tax liability in addition to their own? Are the soldiers who have been unable to discharge their pre-war tax liabilities in full to return to their civilian occupations saddled with debts? Clearly, there are all the ingredients of sore trouble. The Government's tax deduction limits—at least £2 a week must be left after tax deduction for a single taxpayer, £3 for a married taxpayer without children, £4 for a married man with one child, and £5 for one with two children or more—are no solution.

On the face of it, the solution of the problem, which is not confined to this country, does not seem to present any major difficulty. One plan which has been sponsored by Mr Beardsley Rumf, chairman of the New York Federal Reserve,

provides for a reform of the tax collection system, whereby tax would be collected on current earnings at the source. Broadly, the tax liability for any one year would be based on the previous year's earnings, but where a sharp change in income appeared certain, the taxpayer would be allowed to estimate his tax on the basis of expected income. As hitherto, taxpayers would make annual returns

INFLUENZA GUARD YOUR STAFF

STAFF is more precious than ever. Safeguard against depleted Staffs by the right use of "SANITAS," the antiseptic and germicide recommended by Doctors and Medical Officers for very many years. It is safe and non-poisonous.

SPRAYING ROOMS—Spray all offices and workshops with undiluted "SANITAS" at least once a day. If an epidemic has already taken hold, spray more often.

Freshens and purifies the air by **RELEASING OXYGEN** and the odour of pine trees into the atmosphere.

MOUTH and THROAT WASH—"SANITAS" contains Thymol, recommended for this purpose by the Ministry of Health.

Keep a bottle in the Staff Washrooms, and post instructions for use.

AFTER WORK—a little "SANITAS" added to the personal wash after work is a wise precaution against spread of germs.

Widely used in Hospitals, Institutions and Public Buildings.

At Chemists, 1/1½ & 1/8½ (incl. Pur. Tax)

SANITAS
THE SAFE ANTISEPTIC

ON REQUEST—Valuable War Memorandum on prevention and treatment of infectious diseases. Write (enclosing 1d. stamp) to: SANITAS CO. LTD., Dept. BCO/3B, 31 Clapham Road, S.W.9.

to the income-tax authorities; annual adjustments could then be made retrospectively on the basis of actual income. Subject to these annual adjustments, taxpayers would be able to "pay as they go." In theory the Ruml plan involves the cancellation of one year's tax liability, for taxpayers as a whole could hardly be asked to pay two years' taxes during the year of changeover from the old to the new method of collection, though temporary civil servants in Britain, for example, have had this unwelcome experience. Existing taxpayers, it has been argued, would pay taxes for one year less than under the present system, for their liability would end at death; and persons with lower incomes in the first year after the changeover would benefit in the absence of special arrangements. But the change does not really involve the remission of a year's taxes, only an alteration in the basis of assessment. Total tax revenue would scarcely be affected by the change.

In America, the Treasury has objected to the proposal, mainly on the ground that its introduction would give a windfall to big taxpayers, whose incomes have fallen since last year. But as one strong supporter of the plan wistfully remarked:

The Treasury would get the same income right up to the end of the world. Come the Day of Judgment and it would take an awful loss, but on the Day of Judgment the Treasury is going to have so much else to answer for that it won't even think about taxes.

As is shown in a Note on page 326, some form of "pay-as-you-go" plan will now surely be introduced in America. The Canadian Government has already introduced a modified version of the Ruml scheme into its new Budget, though this does not provide for a complete cancellation of tax debts. The Budget proposes that half the tax liability on the earned incomes of individuals and on income from investments up to \$3,000, in 1942, shall be "forgiven"; of the

amount outstanding, one-third is to be paid by June 30th, and the remainder by the end of the year. Provision is also made for the elimination of minor anomalies during the changeover to the new method of collection. Since, in contrast to America, taxes are already collected at source in Canada, the introduction of the plan is not expected to involve much inconvenience.

After the formidable barrage that was put up against any plan for deducting taxes on a current earnings basis in the White Paper on *The Taxation of Weekly Wage Earners* (Cmd. 6348), a year ago—the Treasury did not face the real issue at all—the problem has received little attention in this country. The question is no longer whether or not the second step in tax collecting reform, that is, the introduction of a "pay-as-you-go" plan is desirable—the potential dangers of the present system are too obvious for further academic discourses—but one of formulating detailed proposals for submission to Parliament with the Budget next month. Persons in the lower income-tax groups, dependent on dividends, have to submit to deduction of tax at the standard rate which exceeds their tax liability; they have to wait until the end of the financial year for the refund of tax deducted in excess of their liability. The application of some "pay-as-you-go" system—a variation suggested in *The Economist* on February 7, 1942, provided for a comparatively low flat rate of tax, supplemented by a system of family allowances in cash, with a supplementary progressive tax on any but the lowest incomes—to all persons whose income is already deducted at source can hardly be dismissed as impracticable at this stage; nor, for that matter, can the speedier collection of sur-tax, which is now paid two years in arrears. There are undoubtedly practical difficulties; these are present in all administrative changes; but it would be a pity if sheer inertia and lack of imagination were to hold up an overdue change which does not seem to have frightened the Government of Canada.

Finance and Banking

Enough Credit—and to Spare

The authorities' management of the credit position during this Wings for Victory week has been guided by the basic objective of maintaining ample supplies of credit despite the abnormal flow of funds to Government issues. Thus, despite the transfer of some £150 millions to Government accounts through this channel, the money market has seldom enjoyed so carefree a week as that which has just ended. The banks have throughout been well supplied with funds, they have been keen buyers of bills from the market, and the discount houses have, on balance, been paying off loans. In ensuring this ample cushion of credit to take the shock of heavy subscriptions to Government loans, the main instrument has, no doubt, been the pre-encashment of Treasury Deposit Receipts by the banks. It is probable that a considerable part of the £150 millions odd subscribed this week to the various tap loans of the Government has been countered by maturities or pre-encashment of TDRs. The week's nominal maturities amounted to £35 millions, against which no fresh payments had to be made by the banks. Pre-encashments were also on a fair scale. The banks had for some time past been good buyers of Treasury bills maturing the past week, and these holdings also helped the position, while the week's aggregate bill maturities were £5,000,000 in excess of payments for new bills. In any case, the magnitude of the Government's disbursements would ensure that the money collected through the week's special savings effort was returned to the general credit circulation with very little delay. The Bank return reveals the efficacy with which the powerful factors affecting the credit basis have been neutralised. Bankers' deposits show a small fall of £4,512,000 to the still comfortable level of £160,390,000, while public deposits at £4,743,000 are £2,117,000 down on the week and reveal no immobilisation of funds. The note circulation has jumped by £3,883,000 to a new high record of £926,350,000, a movement which makes a particularly unfortunate appearance in this Wings for Victory week.

February Clearing Bank Returns

The seasonal contraction in bank credit continued last month; the February clearing bank returns showed a re-

duction of £51,735,000 in deposits on the total for January. Tax payments were the principal factor, though on this occasion their impact was cushioned by the first really massive use of Tax Reserve Certificates to meet current tax liabilities. In February, 1942, when tax payments were unaffected by this factor, and when subscriptions to these new Government securities were beginning to gain momentum, clearing bank deposits fell by over £137 millions. Last month's run down of deposits was countered by the banks by letting Treasury bills run off. The decline of £49,423,000

	(In £ millions)

in bills discounted accords with the experience of the discount market which, during the greater part of last month, found the banks exceptionally small buyers of bills. Apart from these two movements, which substantially balanced each other, the latest aggregate clearing bank returns provide no outstanding features. Investments have fallen by £3,728,000, a reaction which promises to be swamped by the bound which this item will make this month under the stimulus of London's Wings for Victory week. Treasury Deposit Receipts are £2,500,000 down on the month, while advances have risen by £2,784,000. Short loans have risen

by £7,837,000, reflecting the larger bill portfolios carried by the discount market towards the close of the month. The cash basis has been reduced by £6,144,000, a movement almost exactly proportionate to the decline in deposits and the cash ratio thus remains virtually unchanged at 10.58 as against 10.60 per cent.

Priority Purchase Certificates

The American "Buy-in-Advance" plans to which reference was made in *The Economist* last week, have had their counterpart in this country. A campaign for a Treasury issue of Priority Purchase Certificates has received the patronage of the *Daily Express*, and broke into the House of Lords this week, where, to all appearances, it has received its *coup-de-grâce* at the hands of the Lord Chancellor. The PPC scheme has followed very much on the lines of the principal American variant, that put forward by Mr Nugent, of the Office of Price Administration. It proposes the issue of low-bearing Government securities which would carry the right to priority purchases of a wide variety of domestic equipment after the close of the war. Viscount Simon, answering a plea by Lord Barnby for official consideration of this scheme, rejected it on a number of counts. The first was on the lofty plane that the introduction of this kind of incentive in the savings campaign would involve a great lowering of our civic ideals. His other counts were more concrete—and seem convincing. The second was that the drawing up of post-war priorities for manufacture and deliveries of such goods could not be left to the choice of subscribers to such securities. "We shall need to make sure that in the post-war world priority should go to the quarters where, on a view of our social and economic needs, they ought to go." The third was that the scheme would involve grave social injustice, since it would favour after the war those fortunate enough to command investible resources during the war. This, thought Lord Simon, reasonably, was not a case in which we should follow the scriptural injunction "to him that hath shall be given." Lord Barnby withdrew his motion. The *Daily Express* has not done likewise.

Stirrings among Building Societies

There is both internal and external evidence that the building society movement is viewing the future with a readiness for reform and adaptation to the new conditions of the post war years. Last week, the chairman of the North Western Counties Association of Building Societies, Mr S. W. Hanscombe, envisaged a vast housing programme after the war which might necessitate the nationalisation of the building societies. He anticipated that the Government would itself undertake such a programme in order to solve the problem of the inequalities of rent which was admitted to prove so great an obstacle to the full implementation of the Beveridge plan. This week Dr A. Mansbridge, president of the Co-operative Building Society, stated at the meeting of that institution that the building society movement would give greatly improved service if some unification and grouping took place within it. He threw out an open invitation to any society of considerable size and influence, to enter into alliance with the society at whose meeting he was presiding. Earlier in the year, Mr W. McKinnell, the chairman of the Council of the Building Societies Association, had urged the need for amalgamation among building societies—partly to ensure greater uniformity of practice, partly to rid the field of a number of moribund societies which were not only a danger to themselves but to others. A reconstruction committee set up by the Building Societies Association and under the chairmanship of Lord Sankey is devoting particular attention to this problem. The authorities, for their part, are fully awake to the need for some tightening of the extremely loose regulations under which building societies operate. The early months of the war provided a test of the societies' position and, in particular, of their liquidity and vulnerability to withdrawals, from which useful lessons have been learned. The strain was overcome without any untoward incident and the position, as shown by the recent recovery of resources of 76 representative societies, is now as sound and liquid as it has ever been. But it would not be surprising if, after the war, special legislation was introduced regulating the activities of building societies and subjecting them to certain restrictions in the distribution of their assets and in the character of their liabilities to the public.

India's Sterling Balances

The facts about India's wartime financial burdens underwent some strange metamorphoses in the course of the debate on the Budget proposals which has occupied the Legislative Assembly this week. The criticisms of the Budget ranged over a wide field—from the assertion that an expenditure of 290 crores of rupees (£217,500,000) imposed on India a burden beyond its capacity, to highly rhetorical questions about what would happen to the Indian currency reserve, now largely consisting of sterling, in the event of defeat for the United Nations. The attack was, therefore, mainly directed against the acquisition of huge sterling reserves over the three years of war. To the plea that this accumulation should not have been allowed to occur, the Finance Member asked the critics if they wanted Britain to interrupt war production and produce civilian goods specially to liquidate the balances which India obtained from British payments for Indian supplies. To the shout of "danger" to Indian currency in the event of an Axis victory, Sir Jeremy Raisman pointed out that, if the United Nations lost the war, India would lose a great deal more than the 400 crores of rupees represented by sterling backing to the currency. Other critics attacked the accumulation of sterling because it threatened a flooding of the Indian market with British manufactures—a strange phobia for a country like India. The highlight of the attack on the sterling accumulation, however, concerned the arrangements to make advance provision out of these sterling balances for the payment of sterling pensions and other obligations. Did this imply, it was asked, that the British were about to quit India? And if so, did it mean that the British expected the new Indian Government to repudiate its liabilities? The gist and quality of the debate, in other words, did not augur too well for the day when Indians will have full charge of their own finances.

Australian Bank Regulations

The December, 1942, issue of the Commonwealth Bank's Statistical Bulletin provides all the data wherewith to judge the first year's working of the Wartime Banking Control Regulations which came into operation in Australia in November, 1941. It will be recalled that the regulations had two main objectives. The first was to make the trading banks' advances and investment policy conform to general principles laid down by the authorities regarding civilian investment. The second was to stabilise the trading banks' profits at around the average of the three pre-war years. The first was to be achieved by submitting all loan and investment operations of the trading banks to the supervision of the Commonwealth Bank. The control of profits was to be effected partly by this supervision of investment policy, and partly by compelling the banks to maintain part of their surplus resources in the form of low interest bearing special deposits with the Commonwealth Bank. The first fact that emerges from the returns of the nine trading banks, covering the twelve months to November, 1942, is that the expansion of bank credit has continued unaffected by the regulations. Against an average of £A350 millions for 1940, the deposits of these nine banks stood at £A375,200,000 in November, 1941, when the regulations were introduced and had grown to £A418,800,000 by November, 1942. Concurrently with this expansion, the item of advances and commercial discounts had fallen over the twelve months to November, 1942, from £A279,300,000 to £A249,100,000. Over the same period, the discounts and advances of the general banking department of the Commonwealth Bank had remained virtually unchanged at slightly over £A20 millions, so that there is no suggestion of the Commonwealth Bank's control of trading bank advance policy having been used for unfair competitive purposes. The control of the trading banks' investment policy has had the effect of stopping the banks' acquisition of longer term Government securities. These investments have fallen from £A62,600,000 to £A60,700,000 in the twelve months to last November. On the other hand, the banks' holding of Treasury bills has from over the same period from £A46,200,000 to £A59,900,000. The principal counterpart to the expansion in bank credit has, however, been the growth of the special war-time deposits with the Commonwealth created by the new regulations. In November, 1942, these totalled £A54,900,000. The deposits bear interest at 1.5 per cent. By directing into this particular channel whatever part of the wartime expansion of credit the Commonwealth Bank may decide, a rigid stabilisation of bank earnings is, in fact, being achieved.

Investment

Specialised Buying

The Stock Exchange had expected that the London Wings for Victory week would lead to a further recession in business and some fall in values. Whatever the cause, these anticipations have been fulfilled, although both movements have been small and the actual change in prices hesitant and irregular. There have been few falls of outstanding importance and the rises have been mainly of a speculative or semi-speculative character. Among them, the most important is that in South African gold-mining shares. The market attributes this solely to the fact that this section has been neglected of late, and finds it natural that, after the run up in diamond shares of last week, "Kaffirs" should have their turn. It seems to be true that such buying as there was, until recently, came mainly from the Cape. The increase in tax on non-resident shareholders should have done something to increase transfers thither, for it is by no means certain that its effect can be offset by Dominion tax relief. It seems probable that the basic explanation of the sudden buying movement is the American plan—as yet unpublished—for the use of gold in a post-war currency equalisation fund. It is not clear that any such plan would necessarily call for gold production, but anything which provides a use for the huge accumulated stocks is of some value to the holder of gold-mining shares. There are in existence plans, both for the settlement of international balances without the intervention of physical transfers, and for the substitution of a mixed parcel of basic commodities for gold. Gold still continues, however, to possess those qualities which have always recommended it as a convenient store of value. The other classes of security to show considerable appreciation are, on the one hand, Japanese bonds and, on the other, some of the Argentine railway stocks and Peruvian Corporation debentures. The rise in the last may well be justified by immediate prospects, but reports from Argentina repeatedly state that concessions so far made, or extended, go no further than to offset old disabilities, or are themselves offset by new ones. Until there is a radical change in the official attitude to foreign capital, railway stockholders have not a great deal to hope for. As to the rise in Japanese bonds, there is an absolute assumption in investment circles that a beaten Japan will honour its obligations as and when it is able to do so. It is true that Japan always did so in the past, but whether this policy will be resurrected as soon as the ability returns is another matter. The argument which causes Japanese bonds to rise a point on every reverse—and two or three on such an event as the destruction of the convoy—appears to be that the sooner war is over, the less completely will Japan's power of recovery be broken. In none of these sections has the demand for stock been really substantial, and it is evident that the investor is off his feed. It is not the first time that professional operators have turned to outside interests in the hope of snatching a quick profit, but, after the experience of last autumn, it seems improbable that the movement into overseas securities will become widespread.

Commission Rebates

The Committee of the Stock Exchange continues its policy of tightening up conditions under which rebate of commission is accorded to agents. The latest case in point is of little direct interest to the public, since it relates to the difference in rebate granted to banks as such, and to their trustee departments. In the former case, the rate is one-third, and in the latter a quarter. Cases have occurred in which the latter have claimed the full third, and where the bank has passed business to a broker which, properly speaking, originated from the trustee department. The Committee is taking action by putting the trustee departments of banks on the General Register of agents, along with the Public Trustee, and by calling the attention of the offending bank to the fact that it is not entitled to pass the business of the trustee department to a broker as its own. It is plain, from the high rebate still given to banks, that the exchange regards them as of special value as channels of providing business and of affording protection against possible defaults of clients unknown to the broker. This action may be presumed to throw some light on the probable attitude towards another recent development, namely, the attempt of a number of solicitors to contract out of the

obligation laid upon them in the judgment in the Hichens case, discussed in *The Economist* of December 12, 1942. As was then suggested, some solicitors have written to brokers stating that they must be considered as acting always as agents, and not as principals, unless there is a specific undertaking to the contrary. It is understood that the Committee is taking legal opinion on the matter, but no action is contemplated unless the practice becomes more common. It is quite evident, however, that the broker will not be prepared to give a rebate of commission merely for the introduction of the business. The days of that method of obtaining quantity of business, irrespective of its quality, have passed, it may be hoped, for ever. It is no longer the case either that the rebate is a payment to the agent merely for doing part of the work. The broker now expects the agent to "vet" his own clients—as the good broker does—and only to do business with people who are both willing and able to meet their obligations.

London Electricity Scheme

The plan of the London and Home Counties Joint Electricity Authority for the consolidation of all power producing concerns in its area came as a minor shock to the market. The technical merits of the scheme are discussed on page 338. The rather vague suggestions as to the treatment of share and debenture holders are another matter. Briefly, the plan aims at transferring some 75 separate undertakings to a central authority which would take over all debenture stocks. Does this mean that present contractual obligations would be honoured? The rights of shareholders would be "satisfied" by the issue of electricity stock. No allowance would be made for goodwill or future profits, but the possibility of distributions from reserves is mentioned. Apparently, the actual amount of stock to go to shareholders would correspond with the ascertained value of the undertaking, less all liabilities transferred to the new authority. Evidently, everything would depend on ascertaining the value—exclusive of goodwill—and this is not an easy matter. The general opinion appears to be that the scheme will not receive official sanction, but, as some such scheme may eventually be put into force, it is as well to state the position of preference and ordinary shareholders clearly. The London Electricity Acts of 1925 extended the rights of the principal companies until December 31, 1971. That did not guarantee the companies' continued existence as fully independent units. It did create a presumption that the terms of issue of the various stocks would govern the shareholders' rights until that date. The same argument can be applied to those employees of the companies who are under contract. If it is desired to alter this arrangement in the national or regional interest, then the nation or the region, and not the individual shareholder or employee, or even the industry concerned, should bear the burden of compensation insofar as it exceeds the charge which is felt desirable on the interests acquired. What is reasonable compensation will not be easily determined, but it should approach as closely as may be to the market valuation which would exist if the full rights were preserved. If these principles, or something very like them, can be adopted, the business of co-ordination—insofar as this is desirable—will make rapid progress. Meanwhile, the impressive title of LHCJEA may easily lead the uninitiated to attribute more weight to its recommendations on the compensation question than either its size or its accomplishments would warrant.

Canadian Pacific Progress

The issue of the full profits statement of Canadian Pacific for 1942 will do nothing to dissipate the general disappointment caused by the earlier announcement that once again there is to be no payment on common stock. The statement shows the profits position to be much more favourable than was thought at the time of the dividend announcement and it is clear that it is managerial policy alone—however enlightened this may ultimately prove to have been—which prevents the resumption of equity payments. A complete analysis of the profit position over the past three years is provided by the following table. Despite

Company Notes

Courtaulds' Accounts

As was suggested by the preliminary statement, discussed in *The Economist* of March 6th last, there is a marked reduction in Courtaulds' total profits for 1942. Disclosed earnings are down from £5,360,007, after war damage contribution of £157,850, to £4,942,753 before this provision which in the latest year is charged to reserves. The decline in tax liability from £2,876,459 to £2,733,271, and the reduction in depreciation provision from £1,132,500 to £947,352 do not compensate for the drop in earnings so that the 7½ per cent payment on ordinary capital is covered by a rate of 8.8 against 9.6 per cent. The directors state, however, that payments to staff funds have been charged against profits in 1942, whereas for 1941 they were deducted from reserves which received £80,000 for this purpose in that year. It is not clear from the balance-sheet whether there has been a further reduction in turnover. Mr. Samuel Courtauld emphasises that the company is now employed almost entirely on Government contracts, and that output

	(In '000's)		
	1940	1941	1942
Gross earnings	170,965	221,446	256,864
Working expenses	135,325	175,489	208,676
Net railway earnings	35,640	45,958	48,188
Dividends received	4,280	4,623	4,621
Net interest, etc.	2,709	4,962	7,486
Steamships after depreciation	3,076	2,788	2,888
Hotels after depreciation	628	1,009	866

Paid on preference	5,043	5,043	5,043
Specific reserves*	10,000	1,670	847
Other debits†	2,410	1,308	3,601
Profit and loss balance	144,045	170,386	201,250

* Against Minneapolis St. Paul holding in 1940, and exchange adjustment in 1941 and 1942.

† Including \$649,076 in 1941 and \$3,576,565 in 1942 written off lines abandoned and property retired.

for common stock from \$29,318,000 to \$35,311,000. The greater part of this is carried forward, but the charge for lines abandoned is up from \$649,076 to \$3,576,565, and the total debit from \$2,978,009 to \$4,446,938. Whether or not the extreme conservatism of the board's distribution policy is in the true interests of equity holders, only the events of the next decade can show. The desire of common stockholders to make hay while the sun shines is understandable. They undoubtedly have a strong moral claim to some financial return before the onset of the next slump—if the trade cycle succeeds in defying elimination in the post war world.

The Building Societies Prepare

The past year has seen a definite change in trend in building society finance. Firstly, the movement appears to have increased its total resources, for the first year since war began. By inference (although no figures are available), this suggests a significant change in the public's attitude towards its holdings of building society deposits and shares; withdrawals—never calamitous at the worst—have substantially abated. According to figures compiled by *The Building Societies' Gazette*, 76 leading societies last year increased their total assets from £487.4 millions to £493.0 millions. (These figures, presumably, do not include the *Halifax Building Society's* position at January 31st last, which shows an increase in total assets from £124.9 millions to £126.2 millions.) Repayment money is coming in steadily, and accounts for a further reduction of £22.0 millions in outstanding mortgages to £386.2 millions. Return money has been largely devoted to a further increase in investments and cash. Indeed, the overall percentage of liquid assets of these societies is now well over 20 per cent of the whole. For the *Halifax*, it is as high as 30 per cent. Compared with a pre-war ideal of 10 per cent—and in practice often less—this one-fifth ratio of liquid assets has much to commend it, even though it may not be very comfortable from the revenue point of view. No doubt, much of this increase in liquid assets represents a preparation for post-war reconstruction. There are good arguments, however, that the societies should regard an appreciable part of this increase as a permanent strengthening of their finances. They will, after all, be prepared to accept new money for new lending in the post-war period. Financial strength should assist the movement in its search for improvement in housing standards.

	Years ended December 31,

† Employees' Pensions Reserve.

can hardly be maintained in the face of any further contraction in the labour supply. The balance-sheet shows a rise in stocks from £2,930,967 to £3,506,560, but how far this is due to the rise in the price level is not disclosed. Net loans to associates and subsidiaries are down from £1,127,255 to £841,194, while net liquid assets are slightly higher at £41,497,139 against £40,154,572. The striking rise in holdings of Government securities, less special reserve, from £11,454,736 to £39,271,438—with a market value of £40,882,197—is, of course, due to the investment of the £27,776,000 received from the Government on account of the acquisition of American Viscose. Mr. Courtauld states that a much wider research organisation is to be put in hand as soon as possible, and that extension of interests in new textile fields and other allied materials, including plastics, is under consideration. The prospect for a satisfactory recovery in net earnings when present restrictions are removed remains encouraging. The £1 ordinary stock, at 47s. 3d. ex dividend, yields £3 3s. 6d. per cent.

Union Cinemas

In 1942, profits of Union Cinemas, whose equity capital is wholly owned by Associated British Picture Corporation, showed a substantial improvement on those of the previous year. After payment of EPT in the later period, there is, however, a decline in the published figure from £591,746 to £423,511. Depreciation is maintained at £60,000, but there is a reduction in income tax liability from £250,000 to £170,000, and in war damage from £22,000 to £4,834. Thus, earnings for dividends are reduced only from £172,482 to £129,353. An amount of £9,861 is earmarked for payment of three months' dividends on both classes of 6 per cent. cumulative preference capital—subject to the passing of the funding scheme; £100,000 is transferred to general reserve against £150,000 to contingencies, and the carry forward is raised from £62,490 to £81,982. The continued advance in gross revenue has been accompanied by a modest improvement in the liquid position of the company. The excess of current liabilities over liquid assets is reduced from £560,118 to £527,339 excluding bank overdraft. There has been a rise of some £90,000 to £343,699 in net loans from subsidiaries and associates, but the bank loan is some £190,000 lower at £646,422 and the total of reserves and carry forward is up from £440,318

to £619,810. There is no reduction in the total of the suspense account at £2,968,986, but the overdraft of a subsidiary guaranteed by the parent is £34,647 lower at £27,084.

The position is clearly ripe for the introduction of a funding scheme, to eliminate preference arrears, and that proposed by the management appears satisfactory and straightforward. Gross arrears for the five years ending October 1, 1942, on both classes of capital amount to £394,444. The directors propose to issue 5 per cent Redeemable Income Certificates to the total of £197,222, equal to the net amount of the arrears, to preference shareholders in the proportion of 3s. of certificates per £1 preference share in compensation for cancellation of past dividends. Redemption will be by operation of a 3 per cent sinking fund as from 1944. The company will have the right of repayment at 101 on or after October 1, 1962. This will mean initially a prior charge on profits, before payment of current preference dividends which are to be resumed, of £9,861 for interest on certificates and, from 1944, of sinking fund charges initially amounting to £5,917. This arrangement provides for the spreading of arrears, together with interest thereon, over a reasonable number of years without variation of the contractual rights of any of the parties concerned. If operating conditions enable the management to fulfil these obligations, the scheme should be completely satisfactory. For the duration of the war, EPT will provide a decisive upper limit to net revenue, but earnings at last year's level would cover interest on the certificates and preference dividends with a margin of £80,000 for reserves and equity dividends. The £1, 6 per cent, cumulative 2nd preference shares, at 21s. 3d. would yield £5 13s. 7d. per cent on the full payment.

BTH Profits

The preliminary statement of *British Thomson-Houston*, the electrical engineering concern controlled by Associated Electrical Industries, shows a rise in profits after all tax from £559,776 to £562,883 in 1942. There is a small reduction in depreciation from £229,667 to £224,950, so that equity earnings may be estimated at £206,758 against £191,103, representing 20.7 against 19.1 per cent. There is no increase in the customary 7 per cent dividend. General reserve receives £100,000 as before and the carry forward is raised from £217,413 to £254,171, the highest level of the past decade. On the face of it, the preliminary figures suggest that there may have been some increase in production. Last year, the chairman pointed out that the concern was working to capacity, but that the management was still striving to raise output. The £1, 7 per cent cumulative preference shares, at 35s. yield £4 1s. 8d. per cent.

Inveresk Paper Improvement

The 1942 accounts of *Inveresk Paper* make more encouraging reading than those of the Bowater-Lloyd group. The company's total profits are up from £204,589 to £251,325, while consolidated earnings have jumped from £678,211 to £879,911. Most of the rise is, of course, absorbed in taxation, which requires £426,516 against £291,827 from the group as a whole and £110,000 against £78,000 from the company. None the less, there is £15,548 against £535 available for dividends on the increased equity capital, and the management have decided to restore the 6 per cent dividend paid in the three years 1938-40, but dropped in 1941. The surplus is added to the carry forward, which is raised from £54,297 to £62,619. The balance sheet shows a reduction in net loans to associates and subsidiaries from £246,873 to £156,733, reflected in a rise in holdings of cash and Government securities. The consolidated statement shows a rise in net liquid assets from £2,571,302 to £2,748,098, for which higher cash items are again mainly responsible. Stocks of the group are reduced from £530,972 to £517,998, despite the easing in the raw material supply position to which the chairman, Mr B. H. Binder, mainly attributes the rise in profits. The group has now been able to bring into use machinery capable of utilising materials, such as straw, available in this country. As in the case of the Bowater-Lloyd group, benefit has also been derived from the increase in selling prices in April last. Costs are, however, still rising, so that there must continue to be some difficulty in maintaining the rate of the ordinary payment. The chairman gives considerable attention to the further rise in holdings of cash assets. He points out that the whole of the outstanding 6 per cent first mort-

gage debentures, totalling £421,679, could now be redeemed on six months' notice. As substantial sums will be required for deferred repairs and reconstruction when the war is over. An attempt will probably be made to convert a part of the issue. But the right to convert into ordinary shares does not expire until August 1st, when the position will be reviewed. The 1s. ordinary shares, at 1s. 6d. ex dividend, yield £4 per cent.

Borax Results

For the fourth successive year, the report of *Borax Consolidated* to September 30th reveals a rise in trading profit, although the improvement from £636,900 to £650,586 is considerably less than in the two preceding years. While expenses are virtually unchanged, taxation requires £30,000 more at £245,000, and after meeting the preference and preferred dividends, the board have reduced the allocation to War Contingency reserve from £50,000 to £30,000. Treating this as a cost, since it is included under current liabilities in the balance-sheet, equity earnings are slightly higher, representing 8.1 against 7.6 per cent. on the deferred capital, which again receives 7½ per cent. A small addition to the carry forward raises it to £260,999. It is interesting to note that the improvement arises primarily from the increased demand for the company's products in the United States, whereas at home, rationing has reduced normal sales, with only partial compensation from rising official demand. To forestall further price increases, and to anticipate growing demand, the company has added substantially to its stocks, which now total £767,418 against £519,219. This explains in part the reduction by a third in cash to £269,677, slightly offset by a new holding of £40,000 tax reserve certificates. Other items are not greatly changed, net liquid assets having risen some £45,000 to £188,519, although net loans to subsidiaries are reduced by over half to £32,936. An increase in the book value of mines and deposits of some £69,000 to £3,456,582 arises from the acquisition of new properties, of which £62,000 was already represented by debenture holdings, the latter item now being reduced by this amount to £144,281. With reference to the immediate future, the chairman states that figures of the first five months' trading show a small decline in home and export trade, although the American demand has been well maintained. Mr Abel Smith points out that the probability of increased taxation in the States will affect the parent company's revenue. Nevertheless, the current yield of £4 7s. 6d. on the £1 deferred shares, quoted at 34s. 3d. ex dividend, indicates no little faith in the post-war activity of the company.

Canadian Eagle Accounts

The *Canadian Eagle* accounts for 1941 show that no decision has yet been given in the matter of the company's claim to a refund of United Kingdom income tax in view of the incidence of double taxation. While this matter is pending, there is again no dividend from the leading subsidiary, *Eagle Oil and Shipping*. Thus, the income of *Canadian Eagle* at £160,313 against £140,775 is once more totally inadequate to meet the customary dividend charges. After 1st preference and *Mexican Eagle* 1st preference payments are met, there is £12,557, against a deficit of £36,676, for participating preference and ordinary capital. The former charges are met and the 6d. per share equity dividend repeated at the cost of transferring £364,056 from general reserve, leaving a sum of £87,197 against £73,510 in 1940 and £436,140 in 1939 to be carried forward. The directors point out that the draft on reserves is more than covered by the rise in undistributed profit of *Eagle Oil and Shipping* from £488,346 to £924,308. It is to be hoped that the income tax dispute will be settled in the near future so that the distribution of accumulated earnings can be completed. Both *Canadian Eagle* and *Eagle Oil and Shipping* show a welcome rise in trading profits although the purchase and sale agreement with *Mexican Eagle* remains in abeyance pending the release of that company's properties by the Mexican Government. The *Canadian Eagle* balance sheet shows a decline in net liquid assets from £554,736 to £496,837, to which a reduction in debtors and stocks and a rise in creditors have all contributed. The balance sheet of *Eagle Oil and Shipping*, however, shows a rise in net liquid assets from £5,905,334 to £6,679,085. The directors announce that, despite hostilities, exploration was continued in four Latin American republics. The ordinary shares of no par value stand at 10s. 7½d., at which they yield some £4 16s. 4d. subject to an undisclosed rate of tax.

LIGHTING for VISION

Reflectors are not installed in a factory for the sake of the metal or glass; their sole purpose is to provide lighting for vision, and the lighting installation should be judged by the standard of vision provided. Benjamin Lighting is planned to suit the needs of all operatives at their tasks; is planned for either works staff or contractors to instal; is planned to be an aid to maximum production and to good relations with workers.

From a full range of equipment appropriate fittings can be selected for any situation. Each fitting is the result of careful design, long experience and constant check; each fitting provides the most efficient light output directed in a specific manner; each fitting is made to stand up to long use without deterioration. There are units for tungsten lamps, discharge lamps or fluorescent tubes, though the latter must be conserved to-day for use in connection with essential work only.

There are Benjamin Engineers stationed in all parts of the country fully qualified to advise on any industrial lighting problem. They are at the service of any factory executive.

Industry and Trade

Road Haulage Scheme

Last November the Ministry of War Transport announced the details of a road haulage scheme designed to secure still further economies in the consumption of rubber and petrol without impairing the efficiency of this means of transport. The scheme was described in *The Economist* of November 7th. Briefly, it envisaged the transfer of as much traffic as possible from road to rail; the concentration of the remaining road traffic on the fewest possible vehicles; and the maintenance of the reserve of laid-up vehicles in serviceable condition, available for immediate use in case of need. It was to be operated through a regional organisation; there were to be twelve divisions coinciding with the civil defence regions; each division was to be subdivided into suitable areas and vehicles grouped into units of about 50 vehicles, each centred on a firm with the requisite facilities. Unit controllers, drawn from the industry, were to be responsible for ensuring that no traffic is accepted which should be carried by some other form of transport; these officers are to collaborate closely with the regional transport commissioners who supervise the issue of fuel to the units. Some haulage undertakings, to be selected by the Ministry, with the advice of the regional transport commissioners, were to be taken over bodily to provide operating facilities for the organisation; compensation was to be on the basis of the net profits of the undertaking concerned for the average of any two accounting years within the period from January 1, 1935, to March 31, 1939, subject to appropriate adjustments for any change in the capital value of the assets employed in the business. Other hauliers who wish the Ministry to take over their vehicles must apply to the regional transport commissioners, and must satisfy them that the lorries are in good condition; such vehicles are to be hired on the basis of a fixed schedule of rates. To begin with, the scheme is to be applied to long-distance traffic only, but its extension is envisaged.

The initial reception of the scheme by hauliers was not unfavourable, subject to the arrangement of financial terms satisfactory to the industry. The storm broke when the Ministry of War Transport issued the details of the terms for taking over whole undertakings. On February 25th, the Standing Joint Committee of Road Hauliers' National Organisations, emphasising their willingness to collaborate with the Government in the national interest, passed the following resolution:

... we are satisfied that the scheme will not achieve these objects (economies in fuel, rubber and labour) and will reduce the efficiency of the road haulage industry. We feel that in the circumstances, and having regard to the fact that the national interest must come first, the agreement cannot be signed in its present form and that an approach should be made to the Ministry with the assistance of MPs in an endeavour to secure the amendments necessary to ensure efficiency and further to see that the whole financial arrangements both with controlled undertakings and in respect of hired vehicles are settled satisfactorily before any operator is asked to sign an agreement.

The SJC's opposition, however, was unable to impede the introduction of the scheme. Indeed, when it passed its resolution, 44 of the 174 main undertakings (several controlling more than one haulage business) first approached by the Ministry with a view to taking them over as the nuclei for area units, had signed agreements with the Ministry, while 81 had notified their acceptance. (The total number of undertakings required as nuclei for area units is likely to be about 300.) The scheme, in fact, has found the support of a large proportion of individual hauliers, and, not surprisingly, the SJC had to face the facts. While maintaining its criticism of the scheme, it decided on March 5th that

... the question of participation in the scheme must be a matter for each individual operator, after consultation with his professional advisors.

Though the Ministry may be faced with further difficulties about the rates of hire which it has decided to offer for vehicles taken over individually for inclusion in the units with the fleets of the undertakings taken over bodily, the application of the scheme is now no longer in doubt. Inevitably, the financial terms offered by the Ministry to the industry have produced the usual crop of "hard cases." But if the basis of the scheme is sound, delay and obstruction are hardly in the national interest.

London Electricity Board

The London and Home Counties Joint Electricity Authority—charged, as its chairman pointed out, with the special statutory duty, under the Electricity (Supply) Act, 1919, of providing or securing the provision of a cheap and abundant supply of electricity throughout the London and Home Counties Electricity District—has recommended the transfer to public ownership of the 75 electricity undertakings within its district. The proposal has been made on the grounds that

by bringing together all the undertakings into the ownership of one competent public authority representative in its constitution, and by reconstructing the capital finances of the industry . . . the way is wide open to bring about all the reforms that for so many years have been regarded as necessary if the industry is properly to carry out its real function.

The proposal, though it has no official sanction, obviously needs careful examination in all its aspects. Mere amalgamation of 75 undertakings does not necessarily ensure the speeding up of standardisation, rural electrification and other desirable improvements. If it would, it would be welcome—on these grounds at any rate; but it might have the reverse effect. This is not to condemn the proposal; but merely to emphasise the need for an independent investigation of its economic merits and of the suggested terms of amalgamation.

Courting the Chancellor

This is pre-Budget time, when industry and trade are courting the Chancellor of the Exchequer in order to secure special favours. Last week he received a joint deputation from the Federation of British Industries and from the Associated Chambers of Commerce. Mr F. R. M. de Paula, on behalf of the FBI, repeated the plea for tax reforms which had already been sent to the Chancellor in January in the form of a memorandum and was discussed in *The Economist* on January 30th. One of his main points was that profits retained in the business should not be subjected to the full rate of tax on the grounds that an era of high taxation was in prospect and that savings which in the past had provided a flow of fresh capital into industry could not be counted upon in future. Mr F. Bower, speaking for the ACC, suggested that loss in the value of capital equipment used up in the course of manufacture was a proper element of costs and that depreciation should be allowed for buildings, patents, trade marks and preliminary and development expenses of no permanent value. There is a good deal of justification for the view that income tax allowances should be used as an instrument for securing efficiency and progress in industry, but any reform of the present system must be considered in the context of general economic policy. Sir Kingsley Wood politely promised to give careful consideration to the proposals put before him.

Shipbuilding

The rate at which the shipping resources of the United Nations can be expanded will largely influence their military operations. It is a dual question of reducing losses and speeding replacements. Shipbuilding affects the one as well as the other, because the strength of naval escorts is a major factor in the defence against the U-boats. Public attention has centred on the speed of new ships, which was discussed in a Note in *The Economist* last week; other aspects of shipbuilding, when they have not been ignored, have tended to be viewed only in their bearing on this controversy. In introducing the Navy Estimates in the House of Commons last week, the First Lord of the Admiralty threw fresh light on the British shipbuilding programme, which is still a vital part of offensive preparations in spite of the great dependence on America for the production of merchant ships. Mr A. V. Alexander emphasised the many sides to the demands on shipbuilding labour and plant for the production of all classes of warships, from minelayers and the new frigates upwards; for the conversion of merchant ships for military and naval purposes—the North African landing involved alterations to over 300 merchant ships; for naval and mercantile repairs—at one period of 1941 the latter amounted to 2,600,000 tons; as well as for the building of merchant

ships. The First Lord revealed that in recognition of the size of the American programmes

it has been decided that it will be profitable, since a ship saved is better than one replaced, to concentrate in this country more upon increasing the output of escort ships even if this interferes to some small extent with our merchant shipbuilding.

He mentioned that the corvette fleet now numbers "well over 200," in spite of losses. The development of shipyards, chiefly the installation of welding equipment, heavier cranes (necessary for prefabrication) and machine tools, has involved an expenditure of £4,500,000. The number of shipyard welders and trainees have increased by 33 per cent since the end of 1941. So far as labour is concerned, plans for this year include the addition of "substantial numbers of trainees" and the transfer of workers from other industries to shipbuilding and marine engineering—a matter, it may be added, that would be facilitated if wage differentials were less marked. Mr Alexander expressed dissatisfaction with the proportion of women employed, which, he said, "ought to be larger than it is." Shipbuilding is a conservative industry in many ways in this country, and shipyards that have lagged in this matter should not be allowed to continue to do so.

Coal Output in February

The output of saleable coal during the four weeks ended on February 20th was again below the standard of 4,161,800 tons a week adopted as a basis for the bonus scheme and below the level of the corresponding period last year. As in January, only three of the 25 mining districts qualified for the bonus:—

WEEKLY OUTPUT OF SALEABLE COAL (Weekly Standard Tonnage 4,161,800 tons)			
Four Weeks ended*	1941 tons	1942 tons	1943 tons
September 5th	4,080,200	3,978,000	
October 3rd	4,146,600	4,076,100	
October 31st	4,131,400	4,124,500	
November 28th	4,196,650	4,126,500	
December 26th	3,853,400	3,880,100	
January 23rd	3,824,800	3,813,400	
February 20th	4,028,000	4,016,400	

* The actual dates given relate to 1942 and 1943.

Had it not been for the mild weather, the absence of transport difficulties and the success of the "Save Fuel" campaign, Great Britain might well have been faced with a serious coal shortage in the early part of this year. But the fact that the winter has passed without a serious crisis, in spite of a fall in production compared with a year ago, does not justify complacency. On the contrary, the task of improving the productivity of coal-mining is as urgent as ever.

Coal Output Bonus

At the end of the present month, the Greene Board of Investigation is due to undertake a general review of the operation of the coal output bonus scheme which has been in force since September 6, 1942. The scheme has, on the whole, yielded disappointing results. In reviewing it, the Board might well consider the introduction of a pit or group standard instead of a district standard. The individual pit standard was originally recommended by the Greene Board, but was not adopted, in deference to the wishes of the two sides of the industry who held that it would be unfair in view of the inequalities in different collieries. But it is clear that a pit basis would offer more scope for individual incentive and emulation than a district target, and many pit production committees are believed to be in favour of this method. The present scheme provides no reward for a particularly good pit in a bad area. The case was recently quoted of 33 miners at a colliery in the Barnsley district of Yorkshire who have produced 62,000 tons of coal in the past six months, between them realising the remarkable average of 10 tons a day; absenteeism in this pit during the same period was 10.77 per cent, as compared with the figure for South Yorkshire of 16.86. The introduction of a pit standard might well encourage miners in other collieries to make similar efforts to improve their outputs. The Greene scheme also provided for revision at the end of six months of the standard tonnages of any district, on application from either of the two district associations. There have, in fact, been special adjustments of the standards applied in three districts—Nottinghamshire, Cumberland and Ayrshire—and in each case the standards were reduced. It has been suggested that all the district standards might justifiably

be lowered, since they were based on the highest district outputs in any period of four consecutive weeks in the first half of 1942. It should, however, be noted that the national standard output of 4,161,800 tons compares with a target of 4½ million tons adopted in April, 1941.

Retail Trade

The outstanding feature of the retail trade report for January, published in the *Board of Trade Journal* on March 6th, was the large drop in the average daily value of retail sales of apparel. The index (1937=100) dropped from 117 in December to 79 in January. In January, 1942, it was 108. In January, 1942, new coupons became available; the current 20 coupons have been in use since last October. This probably accounts largely for the difference, which may have been influenced as well by the absence of the usual January clearance sales. The drop in the volume of sales is clearly brought out by the fact that the index is the

PERCENTAGE CHANGES IN AVERAGE DAILY VALUE OF RETAIL SALES FROM PRECEDING YEAR

	Food and Perishables	Non-food Merchandise	Total
Feb., 1940-Jan., 1941	+2.7	+4.2	+3.3
" 1941- " 1942	-1.5	-5.4	-3.2
" 1942- " 1943	+3.5	-0.1	+1.9

lowest since February, 1940, before the purchase tax, and when prices were lower. The drop in the value of sales was repeated, though not to the same extent, in all departments. The index for all sales stood at 99, compared with 123 for December, 1942, 106 for January, 1942; the average for the year to December, 1942, was 108. The accompanying table shows the percentage changes in the average daily value of retail sales from the preceding year, for the last three years.

Food Ration Changes

For the beginning (on March 7th) of the new four-weekly food rationing period a number of small changes were announced. The most important involves priority supplies of shell eggs. Mothers, who were previously entitled to priority supplies for a year after the birth of a child, become ordinary consumers, and instead children aged between six and eighteen months will receive the priority allocation of three eggs a week. This is a logical step, since children eat eggs from six months. Application has to be made to a food office. The purpose of the reduction of the points value of tinned milk is said to be to clear stocks before the new season's pack becomes available. It is a pity that it was not on a lower pointing during the winter when supplies of liquid milk were smaller. The points value has been reduced from 10, 8 and 6 per tin, according to size, to 2 and 1 points. Retailers are being permitted to obtain replacements of stock to compensate them for loss of points. Vegetarians and diabetics who qualify for the special cheese ration on nutritional grounds, and who fall within any category of workers entitled to the special ration, will, in future, receive two rations. The sweets and chocolate ration remains at 12 ozs. for the four weeks. The Ministry of Food announced that the greater part of the home-grown soft fruit crop this year will be manufactured into jam. Some changes in the maximum retail prices of offal come into effect on March 27th. From March 14th, the maximum allowance of milk to non-priority consumers will be raised by ½ pint to 2½ pints a week. The fifth allocation of shell eggs this year has begun. Barley has been added to the national loaf, and, with oats and rye, constitutes nearly 10 per cent of it. Fish has been more plentiful, and the allowance to catering establishments has been raised by a quarter.

Workers' Canteens

Rather than apply a fully differential rationing scheme to different categories of industrial workers, such as is adopted in Germany or the Soviet Union, the Government has preferred to encourage the development of industrial canteens, at which workers can receive at least one cheap and nourishing meal a day, without surrendering coupons. There are now some 7,500 works canteens in existence, and the adoption of this policy makes it all the more important to ensure that the meals provided are adequate in quantity and of a satisfactory nutritional standard. The need for improvements in efficiency, service and conditions

(Continued on page 344)

COMPANY MEETINGS

LONDON MIDLAND AND SCOTTISH
RAILWAY COMPANY

THE RAILWAY AND THE COMMUNITY

ESSENTIAL IN TRANSPORT SYSTEM

The twentieth annual general meeting of the London Midland and Scottish Railway Company was held at Euston Station, London, N.W. 1, on the 5th instant.

Sir Thomas Royden, Bart., C.B., chairman of the company, presided, and in the course of his speech said:—

Ours is a business that knows no rest, no stop. It covers every form of transport, by rail, by road, by sea, by air and by canal—and for its successful operation it includes almost every form of human endeavour. The ramifications of a great railway like ours are widespread and call for a high degree of skill in management and operation. That in spite of the special difficulties that present conditions necessarily produce, with increased and increasing demands for transport on the one side and reduced means available for meeting them on the other, our railway system has never failed to respond to every call made on it, is a triumph of organisation. The railways have shown themselves to be a highly efficient instrument of transport in war as well as in peace.

One would suppose, and all reasonable people would expect, that in view of their importance to the community the railways would receive at all times sympathetic treatment from His Majesty's Government. They have proved to the hilt that they are an essential element in the social and industrial life of this country. The national war effort, for example, would have been dangerously handicapped were it not for the fact that in the railways the country possessed a highly organised and efficient transport machine in first-rate physical condition. The Secretary of State for War explained to Parliament only last week that the railways had met most of the rail transport needs of the Army. So far, however, from being helpful, successive Governments have made the work of the railways more and more difficult.

Large portions of the railway did not even pay the cost of operation. Regarded simply from the point of view of our personal advantage it would have paid us to abandon whole sections of the line. We, however, knew that to do so would have serious repercussions in the event of war. We therefore carried on, though greatly to our disadvantage, and it was fortunate that we did so. Today these sections are of primary importance: which reflection is so far our only reward.

POSITION IN NORTHERN IRELAND

I referred earlier to the results of working the company's railway in Northern Ireland. It is carrying a very heavy traffic and carrying it with great success despite the damage to it by enemy action, which has now been made public. As late as the summer of 1939, while we were busily engaged in completing our preparations for what happened in September of that year, a joint committee of the Houses of Parliament in Northern Ireland stated that the railways there were not essential to troop movements in time of war. The position, of course, is that the railways of the company in Northern Ireland, like those in Great Britain, have been invaluable in the war effort of the nation. The fact that the Northern Ireland figures are separately available illustrates the position there, but it is in no way different from that in other parts of your undertaking in Scotland and elsewhere. In the north of Scotland before the war, owing to the lavish expenditure of public money on providing roads and the laws regulating railway charges, the

continuance of many miles of railway had no economic justification if the existing road conditions continued. It is fortunate indeed for the nation that the policy of weakening the railways in times of peace, to which my predecessor referred six years ago, did not stop the progress and improvement of the vital railway machine. The lines I have in mind were not closed down but were continued in being at the expense of the shareholders, an expense which I regret still continues in Great Britain where the net revenue accruing to the shareholders is based on the pre-war results. I hope to revert to the future aspects of this matter on a later occasion, when it can be discussed more fully, unhampered by the circumspection required during hostilities round our shores.

HAMPERING ATTITUDE OF PARLIAMENT

The story of the attitude of Parliament to the request of the railways for powers, which most of them did not at that time possess, to extend their transport operations to the road is another instance of hostile bias. Road motor transport at that time was a new thing, but the railways foresaw that it would become a fundamental part of the transport system of the country and quite properly desired to take a part in its development. As far back as 1921 the railways sought to have road powers in the General Act of that year but were refused. A year later, a Bill was promoted in Parliament to obtain the necessary powers, but it was so mutilated by a number of amendments of a crippling character that it became useless from a railway point of view and was dropped. Not until 1928 could the powers be obtained.

Then again, in order to help certain industries, a Bill was passed to give them relief from local rates. The railways were surely as much entitled to this form of relief as any other industry. Following, however, the precedent of unfair discrimination that it had itself set, the Government denied to the railways and compelled them to pay over to certain designated industries the relief that should have been theirs.

Furthermore, they were hampered by a number of statutory obligations and limitations which were reasonable when the railways had a monopoly, but were entirely out of place in an era of unrestricted competition where all monopoly had ceased to exist.

As a result of all these and other injustices, the railways naturally found their position very difficult. We had to choose whether we should make dividends our first consideration at the expense of efficiency or vice versa. We chose the latter course, and we did in fact improve immensely the physical condition of our property, but at the expense of the stockholders. Many of us for years have had to content ourselves with the knowledge that the money we might in ordinary times have received by way of dividend was being spent to keep our property, the railway, in perfect order. Just when we might reasonably have expected to see some reward for our conservative policy war broke out, and the Government took over the railways and it was the community and not the stockholders who reaped the benefit of a railway system that has proved capable of bearing all the enormous demands made on it. As a final travesty of justice, the self-denial of the stockholders in the matter of dividends was actually quoted against them as an argument for cutting down the

price paid by the Government for the use of the railways.

A REAL DANGER

There is a real danger to the country if the importance of the railways is not properly appreciated. Before the outbreak of war it certainly was not understood, and there was a fairly wide belief that railways were becoming, it indeed they had not already become, obsolete as the main means of transport, and that the interests of the country would be best served by an intensive development of the road as against the rail.

The fact that the British railways carry the great bulk of essential traffic in this country is not, I think, sufficiently realised by the public. Before the war the passenger journeys represented some 20,000 million miles of travel, and the freight traffic 17,000 million ton miles, apart from live stock, and the huge quantity of parcels, milk, mails and luggage carried by passenger trains. The importance of this railway effort as part of the normal life of the country is striking, but it is even more striking now with the national effort in this great war. Last year the passenger traffic increased compared with pre-war conditions by a further 10,000 million passenger miles and the freight traffic by a further 7,000 million ton miles.

BACKBONE OF COUNTRY'S TRANSPORT

The fact is that, as successive Ministers of War Transport have said, the railways are, and must, I believe, always be, the backbone of the country's transport system. That does not mean that the road is not also a highly important and essential factor. Owing to the flexibility and the variety of the units operated whether for passengers or goods, it is able to give facilities that the rail cannot give. In any scientific organisation of transport it will be recognised that the road and rail are not competitive but complementary the one to the other, and a frank recognition of this is a necessary preliminary to an economic and ideal system of transport.

Since railways are an essential factor in our transport system, it would be a national misfortune if they were subjected in the future to the handicaps under which they laboured in the past. It is vital to industry and to all of us in our daily lives that our railway system should be as perfect as can be made. Any action that would affect injuriously its capacity for service would react most unhappily on the whole country.

Looking back over the years we can say with truth that we have survived and developed by our own energies and our own alone. The critics who allege that private enterprise is solely concerned with making profits might well examine the record of this company's public service.

The report and accounts were adopted.

GENERAL INVESTORS AND
TRUSTEES, LIMITED

The annual general meeting of General Investors and Trustees, Ltd., was held, on the 11th instant, in London, Mr G. T. Moody, chairman of the company, presiding.

The following are extracts from the review of the chairman, which was circulated with the report and accounts:—The long history of the company there has never been a time when the position gave greater assurance of stability and of increasing financial strength. And this after three years of a devastating war.

The net revenue shows a small increase, and allows the board to recommend a final dividend of 6 per cent. on the ordinary stock, making with the interim dividend 9 per cent. for the year. We are taking the long view, however, and look forward to the time when our stocks and balances, approximately £180,000, may be utilised in further promoting the interests of the nation by assisting in the financing of industry and commerce.

The report and accounts were unanimously adopted.

GREAT WESTERN RAILWAY COMPANY

YEAR'S RECORD TRAFFIC

The annual general meeting of the Great Western Railway Company was held, on the 10th instant, in London.

Sir Charles J. Hambro, K.B.E., M.C. (the chairman), in the course of his speech, said: Notwithstanding the many difficulties arising from shortage of staff, lack of accommodation and food rationing, all grades have responded magnificently to the calls which have been made upon them, and in this connection a special tribute is due to the women, now numbering nearly 16,000, who are included in our ranks and are performing their duties in a highly praiseworthy manner. I should also like to pay tribute to the magnificent work accomplished by our staff in restoring communications during air raids, and keeping the traffic moving at all costs. "Business as usual" has been their motto and worthily have all grades upheld the high tradition of railway service.

FINANCIAL RESULTS

The greater part of the net revenue of £6,932,746 is represented by the fixed annual payment which we receive under the railway control agreement. The excess of £262,143 over this fixed payment is, subject to minor adjustments, the net income from sources not coming within the scope of the fixed payment, and with the balance of £263,938 which was brought forward from last year, the amount available for dividend on the consolidated ordinary stock is £2,206,915, which enables us to recommend a dividend of 2½ per cent. for the half-year ending December 31st last, making 4½ per cent. for the whole year, with a carry-forward of £275,077. This compares with the dividend of 4 per cent. for the previous year when the carry-forward was slightly lower.

In recommending an increased dividend the board were influenced by the fact that the large majority of railway stockholders are persons of limited means, or bodies representing them, who in pre-war days wholeheartedly supported the policy which this company followed of subordinating dividend distribution to the attainment of a high standard in the maintenance and improvement of the undertaking. This policy is the key to the efficiency of our war-time operations. During the long period of trade depression which preceded the war, and in spite of the fact that we were faced with acute and unregulated road competition, we never relaxed our efforts to improve our facilities. There was no doubt in our minds that the railways were, and would remain, the backbone of the country's internal transport system. Between 1928-1938—in anticipation of a return to more prosperous times—we spent over £46,000,000 on improving our undertaking. The new works carried out included the provision of marshalling yards, siding accommodation, modernisation of the docks and of a number of stations, depots, etc.; we also enlarged our renewal programme and during that period built 1,500 locomotives, 3,200 passenger train vehicles and 30,000 wagons, all of improved types, and renewed 3,000 miles of the permanent way.

GREAT WAR EFFORT

The fulfilment of this programme was of great assistance to the Government in their efforts to relieve unemployment, and many of the schemes have proved to be of estimable value in the prosecution of the war effort. It can safely be said that, at the outbreak of war the British railways were as efficient and as well organised as any railways in the world, and I cannot help feeling that the public do not yet appreciate the enormous benefit this has been to the country in the present emergency. It is a great testimony to the high standard of maintenance of our lines and equipment at the outbreak of war that after three years of intensive war-time operations we have been able to meet all the

demands made upon us for the conveyance of essential traffic and that without making any allowance for abnormal wear and tear arising from intensified use, and without detriment to the traffic working we have allowed our repairs and renewals to fall in arrears to the extent of over 8½ million pounds. This amount has been paid into the trust fund constituted under the terms of the railway control agreement which provides for payments in respect of arrears of maintenance calculated on the basis of the pre-war standard, viz., the average expenditure in the years 1935-6-7, adjusted to current prices. The money will ultimately be available for the purpose of carrying out the arrears due to the war period and meanwhile it is invested in Government securities, in the names of trustees, or lent to the company as we are empowered to make temporary borrowings from the fund should we require to do so for the general purpose of our undertaking, subject to conditions approved by the Minister of War Transport.

Although we carried in the past year the greatest volume of traffic in our history the demands on us continue to increase. Shortage of labour and materials is becoming more acute owing to war demands and will add to our difficulties in carrying out essential new works and maintenance.

INCREASING TRAFFIC DEMANDS

Although I am not in a position to give you any figures showing the net earnings of the controlled railway undertaking during the past year, I am not revealing any secret when I say that the earnings were very considerably in excess of the previous year and that it is the intention of the Government to publish the figures in a White Paper at an early date. In consequence of estimates of earnings which have appeared in the press a number of stockholders have written to me suggesting that we should approach the Government for a revision of the present agreement. I should deprecate taking any action in the matter. The railway companies only accepted the fixed annual payment of £43 millions as a war-time arrangement, because it was recognised that in time of war the national interest was paramount and necessitated ordinary commercial consideration being set aside. Our receipts during the past year arose mainly from war traffic carried under exceptional conditions and in pursuance of regulations made by the Minister of War Transport in order to secure the most economic use of all available transport. We dealt with a very large increase in passenger traffic and, as all cheap fares were abolished, and the train services drastically reduced, it is not surprising that there should have been a large increase in net earnings.

The position in regard to freight traffic was very similar. We could not have catered satisfactorily for all essential war-time traffics if traders and others had continued to enjoy the same freedom in dealing with their business as before the war. It will therefore be apparent that although a good case might be made on commercial grounds for more generous treatment from the Government there would be no justification for asking for a revision of the present agreement.

POST-WAR POSITION

The future of all forms of transport in this country is a subject which opens a wide field for discussion when consideration is being given to schemes for post-war reconstruction. It is difficult to foresee what the post-war requirements may be, but in any case, it should be obvious that those who have spent their lifetime in dealing with the many complex problems associated with the movement of passenger and freight traffic are the ones best qualified to advise the Government on the steps to be taken to meet such requirements with the greatest degree of efficiency and economy.

The report was adopted.

LONDON AND
NORTH EASTERN RAILWAY
COMPANY

VALUE OF EFFICIENT TRANSPORT

The twentieth ordinary general meeting of the London and North Eastern Railway Company was held, on the 5th instant, in London.

Sir Ronald W. Matthews (chairman of the company), who presided, in the course of his speech said: The net revenue for the year 1942 was £10,700,599, which is an increase of £53,572, or ½ per cent., compared with the year 1941. The net revenue is made up of £10,130,355, which is the company's share of the annual payment for the use of the railways made by the Government in accordance with the Railway Control Agreement, together with an amount of £564,244 obtained from items excluded from the Railway Control Agreement and consisting mainly of interest and dividends from our investments in omnibus and road haulage companies. The balance brought forward from the previous year was £86,675, making a total sum available for distribution of £10,787,274.

FUEL CONSERVATION

In order to conserve locomotive power and fuel, services have been curtailed wherever this could be done without affecting essential travel, but the volume of long-distance travel severely taxed the capacity of the main line services. These could not be augmented, owing to the demands made by the heavy freight traffic on our stock of powerful locomotives.

We meet to-day in circumstances happier than a year ago, and great with promise for the future. Inexorably, irresistibly, the armed might of the allied nations moves forward to the day when, in the words of the Prime Minister, justice stern and implacable has been done and no vestige of the Nazi or Fascist power is left. Still greater demands in the coming months will be made on the endurance of man and metal, and I have no doubt that in that supreme test the railways of Britain will play their full part.

POST-WAR RECONSTRUCTION

There are, before I close, a few words which I must say to you in regard to the future. If we in this country are to retain, and as we hope improve, our standard of life, we must trade freely and on a greater scale than ever before with the whole world. That means, in a sentence, that we must be able to offer our products in foreign markets in the right quality and at attractive prices. Volume and efficiency of production are what are required. The first can only be achieved by the provision of a prosperous home market, the second by the fullest encouragement of individual enterprise and initiative. The Commission set up at the beginning of last year by the Railway Companies' Association is hard at work on many important aspects of railway operation, and I can assure you that the whole difficult problem of the relationship of the railways to other forms of transport, and of the part to be played by transport generally in the scheme of things to be, is under the closest and most careful examination by specially appointed committees.

This war has proved, if any proof were necessary, the essential part that railways must play in the life of all civilised nations. It has proved, too, so far as this country is concerned, that our railways are able to carry efficiently a much greater volume of traffic than, as a result of the archaic restrictions and regulations by which they were fettered, they were able to acquire in pre-war years. However, the transport services may be recast to meet post-war requirements, the significance of that aspect will, you may be sure, not be allowed to pass unnoticed.

The report was adopted.

SOUTHERN RAILWAY COMPANY

VAST WAR TRAFFIC

The annual general meeting of the Southern Railway Company was held, on the 11th instant, in London.

Mr. Robert Holland-Martin, C.B. (the chairman), who presided, said that the net revenue for the year was £6,913,514, a decrease of £20,746 compared with 1941. The net revenue included the fixed annual payment of £6,607,639 from the Government under the Railway Control Agreement which was finally completed by all parties in May of last year. In addition they received from the Government £300,000 per annum representing the interest on the £7½ million debenture stock issued in 1939. There was a slight decrease in receipts from items excluded from the Government Control Account occasioned by a slight decrease in revenue from one or two of their road transport interests. After meeting the interest on debenture stocks and dividends on the guaranteed and preference stocks and the full 5 per cent. on the preferred ordinary, the balance available for dividend on the deferred ordinary stock was £641,075, which would enable them as last year to pay a dividend of 1½ per cent.

TRIBUTE TO STAFF

It would not be fitting if he let the occasion pass without once more making reference to the immense tasks carried out day to day by the staff of the company. During the past year there had been few heavy air-raids, but there had been many small daylight attacks by enemy aircraft. Their engineering staff had been able to effect marvellously quick repairs to damaged permanent way, structures and rolling stock, so that very little delay indeed had been occasioned by air-raids to their traffic. He wished he were allowed to give exact figures of the many millions of essential service passengers and millions of tons of war freight which were now being moved over their lines.

Under peace conditions there were but few intervals in the 24 hours during which trains did not pass over the main trunk line, on the Southern Railway. Under war conditions the passage of trains was ceaseless. The staff throughout 1942 had responded magnificently to the many calls made upon them. He sometimes wondered if the public realised how much they owed to the ordinary British railwayman.

CURTAILMENT OF NORMAL FACILITIES

The vast movement of war traffic had not been possible without some curtailment during the year of the normal facilities for the travelling public. They had endeavoured to provide an adequate and punctual service for essential travel, but it had been necessary to withdraw cheap-day tickets to discourage needless journeys. During the year all refreshment and Pullman cars were withdrawn from ordinary train services. Needless to say the board looked forward to the time when they would be in a position once more to restore cheap-day travel and to see that each of the longer distance trains was provided with a refreshment car.

Many stockholders were doubtless wondering what was to be the future in the coming years of the railway companies when the war was over. They read of all kinds of plans to solve their problems but he maintained that there was still wisdom and virtue, from a national and trading point of view, in individual ownership—the system under which British railways were conceived, financed and developed and under which the cost to the taxpayer was nil. Let them be proud of what they had done by their energy and skill. Let them speak up for private enterprise—that energetic and truly British contribution to world trade and prosperity—and let every one of them, when they heard prophecies of this and that or the other panacea, shed the light of a little practical common sense on the subject.

The report was adopted.

THE SCOTTISH LIFE ASSURANCE COMPANY, LIMITED

GOOD REPORT FOR PAST YEAR NO ADVERSE FEATURES

SIR JOHN MACLEOD'S ADDRESS

The annual meeting of the Scottish Life Assurance Company, Limited, was held in Edinburgh on Wednesday, the 10th instant. Sir John Lorne MacLeod, chairman of the board of directors, presided.

In moving the adoption of the report and accounts for the year ending December 31, 1942, the chairman said: Gentlemen, I think you will agree that the report is a good one. There has been an increase in new business; the premium income has been more than maintained; mortality, in spite of many war claims, has been light; the net rate of interest earned on the invested funds has actually shown an increase; surrenders of policies during the year have been extremely few; there has been a further saving in expenses; and the life funds have moved up by a considerable sum. I cannot point to any adverse features to set against these favourable points so that apart from the effects of the war on life assurance business in general the results of the year do indeed give ground for satisfaction.

INCREASE IN NEW BUSINESS

The new business which totalled 932 policies for £706,625 sums assured after deducting sums reassured shows an increase of 198 policies and £140,000 of sums assured over the results of the previous year. New business returns are achieved not so much nowadays by successful salesmanship, but rather as the result of demands on the part of the public for policies which are essential to their needs.

The members of our outdoor staff—and only a few seniors are now available—devote their time as far as possible to

satisfying these needs, but our entire pre-war staff of inspectors being now engaged with His Majesty's Forces or in other forms of full-time national service, those left to us are practically all branch secretaries, a large part of whose time is of necessity taken up with inside duties. Considering also that printing and circulation of literature designed to create an appetite for life assurance has practically ceased for the time being, the directors are well satisfied with the new business results of the year.

The premium income at £620,633 showed an increase of about £8,000 on that of the previous year. Claims by death and survival were £96,000 less than the year before. The gross rate of interest received on the invested funds for the past year was 4 10s. 1d. per cent. After deduction of 4 10s. 1d. per cent. the net yield was 3 7s. 5d. per cent. These rates compare with 4 11s. 1d. and 3 6s. 10d. per cent. respectively for the previous year.

INVESTMENT IN GOVERNMENT ISSUES

The whole of the increase in life funds during the year, £188,000, has been absorbed in new Government issues, as well as a further large sum from sales and redemptions of other investments, so that fully 25 per cent. of the company's assets is now represented by British Government securities. The combined success of the Government policy in financing war expenditure has carried the prices of securities outside the gilt-edged market to even higher levels than were current a year ago, and our margin of appreciation over book values is in the aggregate now substantial.

In your name I would like to convey to all employees in the service, both permanent and temporary, an expression of warm appreciation of the manner in which they are carrying on the work while so many of their colleagues, whom we have constantly in mind, are away.

The motion, having been seconded by Mr W. G. C. Hanna, C.A., was adopted.

March 13, 1943

SCOTTISH WIDOWS' FUND AND LIFE ASSURANCE [SOCIETY]

GROWING PUBLIC APPRECIATION OF LIFE ASSURANCE

MR KENNETH MURRAY'S REVIEW

The one hundred and twenty-ninth stated annual meeting of the Scottish Widows' Fund and Life Assurance Society was held, on the 9th instant, in the society's head office, Edinburgh, Mr Kenneth Murray, W.S. (chairman of the ordinary court of directors), presiding.

The chairman, in moving the adoption of the report and accounts, said: The society's activities have naturally been restricted by the necessity for releasing as many men and women as possible for the Forces and for war work. It would not have been surprising had the new business completed in 1942 been substantially less than in the preceding year. In fact, however, new life policies were effected for a total sum of over 2½ million pounds, and the net new business at £2,137,000 was only about £90,000 lower than in the preceding year.

This result suggests that the public are showing an increasing appreciation of the benefits of life assurance and the facilities it provides for regular saving from year to year. It would be strange if this were not so, for the need for life assurance is as great as ever, and, in the case of the society, there is the further attraction that new with-profit policies generally cover civilian war risks in this country without extra charge. Moreover, new life assurance business forms a valuable contribution to the national savings movement in providing automatic annual savings which go to swell the amount invested in new war loans.

The time will shortly come when practically all of our few remaining inspectors will cease to be available for new business work. We must now, therefore, look to those members and others, who require life assurance, to take the initiative and call upon or write to our branch offices or agents, who will be pleased to give them every assistance and advice.

In addition to the new ordinary assurances, a substantial amount of business was again completed under staff pension schemes. This was largely responsible for the further increase of over £30,000 in the total premium income.

The interest income was higher and the average rate of interest on the whole of the assurance and annuity funds after deduction of income tax was 3 10s. 1d. per cent. This is only 6d. less than in the preceding year.

FAVOURABLE MORTALITY EXPERIENCE

The claims by death were less by £40,000 and lower than in any year since 1933. They include a total of £152,000 arising directly from war operations, and it will thus be appreciated that apart from this the mortality experience has been remarkably favourable. Under the society's "W" plan, whereby civilian war risks are normally covered without extra charge in the case of with-profit policies, the experience has again been satisfactory. There has not been one claim since our last meeting.

Another item in which there was a marked fall is the amount paid on the surrender of policies, and over the past 30 years the figure has only once been lower.

Commission and expenses of management fell to below 11 per cent. of the premium income, a reduction of nearly 1 per cent.

The income exceeded outgo by more than £1,000,000 for the first time in the

THE ECONOMIST

343

CO-OPERATIVE PERMANENT BUILDING SOCIETY

POST-WAR DEVELOPMENT

DR ALBERT MANSBRIDGE'S ADDRESS

The annual general meeting of the Co-operative Permanent Building Society was held, on the 4th instant, in London.

Dr Albert Mansbridge, C.H., in his presidential address, said that at the close of the fifty-ninth year the society faced the future in a stable and strong position with determination and confidence. It had sought throughout its life to enable men and women to own healthy houses in which they and their families could discharge the duties and enjoy the privileges of dignified citizenship.

It was a matter of common knowledge that much thought was being devoted to the nature and place of housing, both as regards structure and planning, in the Britain of the future. Government Committees, associations, whether of architects, builders or physicians, and authorised experts, had already published important reports. The "Design for Britain" series of booklets sponsored by the society under the able editorship of Dr E. C. Fairchild and published by J. M. Dent and Sons, Limited, had set before the public the considered opinions of well-known authorities in all that related to housing.

He felt that there was now, and in increasing measure would be in the future, a duty and obligation laid on building societies to prepare adequately for reconstruction. They must ensure that there would be no place in the post-war era for ill-conceived, jerry-built houses. The power of finance held in the hands of building societies must and would be used wisely, equitably and in the interest of all. In co-operation with authority and aided by the best planning thought of the day, building societies could play their part.

INCREASE IN ASSETS

He considered it unnecessary to deal in detail with the figures in the balance-sheet, but would underline the fact that the society's total assets had increased by £1,500,000 to £32,700,000. These figures, due in part to amalgamation, were also affected by the determination of the Society to make advances on houses which men and women, as a result of war conditions, wished to purchase at prices not altered by undue inflation. In this the society had rendered signal service and was not without hope that it would be able to continue to do so, whilst preserving that standard of liquidity of funds which was understood to be the wish of the Treasury.

The share and loan capital had increased to almost £31,000,000, and in these days when liquidity was an important part of a balance-sheet, it was pleasing to report that the society held £4,700,000 of cash resources in Bank, Government and Corporation Loans and Tax Reserve Certificates. Of that sum, over £1,500,000 was invested in British Government securities. The mortgage advances spread over the whole of Britain showed an average amount due on each mortgage of £414, and the reserve, including the balance carried forward, was now almost £1,500,000. This satisfactory position had been attained whilst giving sympathetic consideration to borrowers whose houses had received damage from enemy action, or who had suffered from other happenings arising out of the war. Concessions by way of interest allowances had been given and extension of time had been granted in respect of mortgage repayments.

PLEA FOR UNIFICATION

Pointing out the very large number of building societies operating in Britain, each with directors, manager or secretary and

PEARL ASSURANCE

COMPANY LIMITED

Facts and Figures from the Statement by SIR GEORGE TILLEY, F.C.I.I.
President and Chairman of the Company on the Annual Report and Balance Sheet for the year ending 31st December, 1942.

FUNDS - - £123,280,190
INCOME - - £21,736,705

INVESTMENTS

The funds show an increase of £6,031,350. The market value of the investments exceeded the price at which they stand in the balance sheet.

LIFE BRANCHES

In the Ordinary Branch sums assured under new policies issued during the year amounted to over £8,060,000. Premium income in the Industrial Branch exceeded £10,629,000, an increase of £790,000.

FIRE AND GENERAL

In these Branches the premium income exceeded £1,619,000.

BONUSES

In the Ordinary Branch a bonus of £1 per £100 assured was declared on policies entitled to participate in full profits that become claims by death or maturity during 1943.

In the Industrial Branch a bonus has been declared on policies, with certain exceptions, effected before 1st January, 1936, that become claims by death or maturity during 1943. Up to date a total sum of over £7,180,900 has been allocated for bonuses to policyholders in this Branch.

The bonus for 1940 and 1941 in both Branches is continued unchanged for claims during 1943.

TOTAL CLAIMS PAID EXCEED £165,000,000

Chief Offices: High Holborn, London, W.C.1.

(Continued from page 339)

in industrial canteens was stressed by many delegates, representing trade union branches, catering workers, co-operators and the like, at a conference in London last week-end organised by the Labour Research Department. Many complaints, such as of insufficient helpings, excessive charges, too much time spent in queuing for meals, and inadequate provision for night shift workers, were made, but the point that was most suggested was that the canteens in which workers were themselves associated with the management were more successful than those that were run by outside caterers. The same conclusion was reached by the Chief Inspector of Factories in his 1941 report; he quoted the case of a firm in Scotland, where the canteen was operated "efficiently and economically" by a committee of the workers, and in which any profits were

distributed in the form of free meals for one week to regular users. If the workers have a direct responsibility for running the canteen, whether through a canteen committee or a sub-committee of the joint production committee, they are probably more likely to exact high standards and good service than if they have no say in it. The shortage of labour still seems to be impeding the development of canteens, and it has been suggested that a potential source of labour exists in civilian hotels and restaurants. In one London hotel, for instance, 34 cooks are engaged in serving 1,500 meals, which is far more than would be required to serve an equivalent number of meals in a works canteen; but the wages offered by industrial catering compare unfavourably with those in the hotel trade at the present time so that no voluntary transference of labour is likely to take place.

Note: all dealings are for cash

As anticipated, the diversion of interest to the War Savings effort occasioned a further small contraction in turnover. According to the *Financial News* ordinary shares index, however, prices have remained distinctly steady. Despite the relative inactivity of the *gilt-edged* market, the tone throughout was barely firm, and one or two of the irredeemable and long-dated issues displayed a slightly easier tendency in midweek. Interest in the foreign bond market was focussed on Far Eastern stocks, advances of a point and more being registered for Chinese loans, while Japanese bonds improved $1\frac{1}{2}$ to $2\frac{1}{2}$ points. With the decline of the recent heavy buying of *home rail* stocks, junior issues were dull, and midweek profit-taking accentuated the rather easier tendency, although losses were generally small. The *foreign rail* market provided a cheerful contrast. The BA Western debenture payment and revived hopes of a more favourable exchange rate were the stimuli, and senior issues were outstandingly strong. Central Argentine 4 per cent debenture rose $4\frac{1}{2}$ points, and the majority of debenture issues, including the Peruvian Corporation stock, were between 3 and 4 points higher on the week.

COMPANY MEETINGS—continued

staff, separate organisations and offices, he expressed the opinion that much greater service would result if unification and grouping took place. He felt that it was not improbable that in the national interest, whether suggested by national authority or voluntarily conceived, some society or societies of considerable size and influence, having spirit and traditions in line with his own, might desire to enter into alliance. Any approaches to this end would be sympathetically and carefully considered, all with a view to increasing mutual and joint efforts in home ownership by the people.

HIGH HOPES FOR THE FUTURE

In conclusion, Dr Mansbridge thought that the year 1943, which was now well on its way, would be fraught with great importance, not merely to British life, but to the life of the whole world. The operations of the society in relation to all this might seem small, but in reality would make a powerful contribution to the whole make-up of affairs. He had no desire to assume a prophet's mantle, but was full of confidence and high hope, because he knew the nature, ideals and practice of his society. His desire was that it should proceed deliberately in the spirit of reasonable and fruitful adventure.

The report and accounts were unanimously adopted.

Other classes were firm in sympathy with correspondingly smaller gains.

Numerous small improvements in the industrial market reflected the good tone common to most sections. Thus, brewery shares enjoyed numerous gains of 3d. and 6d., and tobacco issues were firm on the results of Gallaher, but later became uncertain on Budget fears, Imps easing $\frac{1}{2}$. Minor advances of a few pence were frequent in the motor and aircraft section, but Leyland, exceptionally, was weaker. Heavy industrial issues were without any feature, although firm throughout. Textile shares were supported, numerous issues advancing; Courtaulds, recovering an earlier loss of 6d. on the annual report. Electric supply shares were marked down at the reopening on the unification proposals for the London companies. Actual selling was slight, and after the initial surprise the market was steady. Among miscellaneous issues, London Brick advanced 1s. on the maintenance of the dividend, and Wall Paper deferred improved steadily.

After the recent boom in diamond shares the City transferred its attentions this week to gold-mining issues. Demand was strong, primarily on the belief that gold is to be the basis of any post-war currency arrangements, and found the *kafir* market extremely short of stock. Prices were marked up generally, Blyvoors rising 6s. 3d., and West Wit Areas $\frac{1}{2}$, while other gains ranged from $\frac{1}{8}$ to $\frac{1}{4}$. Diamond shares continued to be bought, quotations improving slightly. In contrast, *rubber* and *tea* shares were rather neglected, although some minor, occasional gains were registered. After displaying some strength before the week-end, oil shares turned dull on the absence of active support, although Trinidad Petroleum Development gained $\frac{1}{2}$ in midweek.

New York

DESPITE the favourable war reports, Wall Street failed to maintain the recent strong advance. Many buyers withheld support, and profit-taking tended to dominate proceedings early this week. Numerous lead-

ing issues lost some of their earlier gains, although aircraft issues and several specialties provided exceptions to the prevailing tendency.

COMMODITY AND INDUSTRY NEWS

Paper Control.—The Ministry of Supply have issued the Control of Paper (No. 57) Order, 1943, which came into force on March 7, 1943, and establishes certain revised maximum prices for paper. The principal provisions of the Order are a reduction in the price of esparto (straw) paper of £1 2s. 6d. per ton and of cylinder-dried coated papers of 17s. 6d. per ton, while the price of vegetable parchment is increased by £6 10s. per ton and of ferro prussiate paper by £3 15s. a ton. Certain other amendments to the No. 52 Order are provided.

Control of Scrap Leather.—The Minister of Supply has issued the Control of Scrap Leather (No. 1) Order (S. R. and O. No. 337) by which he has taken powers to control supplies and the use of scrap upper and bottom leather. The Order, which came into force on March 12, 1943, makes the acquisition and use of scrap leather subject to licence and fixes a maximum price for all scrap leather. Manufacturers and repairers of footwear producing scrap leather in excess of 2 cwt. a month are required to segregate metallised and unmetallised scrap leather. Direction No. 1 issued under the above-mentioned Order permits the acquisition and use of metallised scrap leather without licence.

Control of Flax.—The Minister of Supply has made the Control of Flax (No. 17) Order, 1943 (S. R. and O. 347). This Order makes it obligatory for holders of wet spun flax yarns, with certain exceptions, to hold such yarns at the disposal of the Minister of Supply and notify the Flax Controller that they hold such yarns. It comes into operation on March 13th.

Women's Wages in Agriculture.—The minimum wage for women of 18 and over in agriculture was fixed last week by the Central Agricultural Wages Board at 45s. for a week of 48 hours. Girls' wages are to be 22s. at 14 years of age. Boys will begin at 23s. at 14, rising to 56s. at 20. Women's overtime rates have been fixed at 1s. 1d. an hour on weekdays, and 1s. 4d. at week-ends or holidays. Men's overtime rates are 1s. 5d. and 1s. 9d. an hour respectively.

Food Prosecutions.—During January there were 2,990 prosecutions under the Food Control Orders, of which 2,847, a percentage of 95.2, were successful. Convictions were secured against 26 wholesalers and 534 retailers, a conviction percentage of 0.130 per wholesale licensee and 0.089 per retail licensee. Fines up to £10 were inflicted in 2,377 cases, between £10 and £20 in 128 cases, and over £20 in 171 cases. In 40 cases sentences of imprisonment were imposed.

Raw Materials Guide.—The Ministry of Supply has issued, through the Stationery Office, the *Raw Materials Guide* (price 1s. net). The handbook is designed to be of assistance to traders. It gives particulars of the use and control of nearly 1,000 different raw materials, and the statutory rules and orders concerning them. It is intended to issue monthly addenda of changes in controls or in procedure, in order to keep the guide up to date.

Labour in Transition

THE Labour party has entered a period of stress and strain. The next conference of the party will throw into relief three serious problems. First, there is the impatience of the rank and file in Parliament, and outside, with what they regard as the weakness of Labour Ministers in pressing the Labour case in the Cabinet; and the electoral truce has begun to fret and chafe them. Secondly, there is the old division between the trade unions and other sections, which has taken on a new importance with the tendency of Mr Bevin to look to industrial rather than to political action for the social guarantees of the future. Thirdly, there is the pertinacious plea of the Communists to be admitted into the party.

The Communist demand has been rejected by the party executive on the ground that the Communists, because of their extra-national connections and obligations, are not free to be loyal. But a number of important trade unions, including, according to report, the miners and the engineers, are said to be disposed to vote for an affiliation; and there is some confidence, among Communists, that their application may succeed if put to the vote, or at any rate may receive a significantly high proportion of the votes cast. It is impossible to dissent from the fear that, by admitting the Communists to the fold, with their chronic record of political sabotage, the Labour party

would be giving asylum to a Trojan horse of deft and insidious design—though it is perhaps symptomatic of the sense of uncertainty of its leaders that they should be so convinced that so small a minority of new members could exercise so destructive an effect. It is by no means sure that this bid for affiliation represents an attempt by the Third International to place a hold upon the Second—in the British context. In the longer term, it may rather be the first shot in a campaign to liquidate the Third International and to make the Second International the chosen instrument of extreme Socialism—which may, indeed, be the very danger that affrights the Labour leaders.

However this may be, it is certain that a battle is going on for the soul of the Labour party, in which this year's conference may well see a decisive engagement. At the moment, it is hard to see in which way the decision will go. There are three standard bearers—Mr Morrison, Mr Bevin, and, more anonymously, Mr Pollitt. Personally, Mr Morrison has jumped into the lead. In a series of speeches up and down the country, he has stated a precise and positive policy, which is Socialist only in name. He has become a chief spokesman of the progressive element in British politics. By his nomination to be treasurer of the Labour party, he has taken an option on the party

THE CHARTERED BANK OF INDIA AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

CAPITAL (PAID-UP) - £3,000,000
RESERVE FUND - £3,000,000

Branches and Agencies throughout INDIA and the EAST
AFFILIATED BANK IN INDIA

THE ALLAHABAD BANK LTD., with 15 Branches & 30 Sub-Agencies
The Bank offers a complete Banking Service and provides exceptional facilities for financing every description of trade with the East.

Deposits for Fixed Periods or repayable at call or at short notice are received at rates which may be ascertained on application. The Bank also undertakes Trusteeships and Executorships.

F. W. CATER, Secretary.

Toll End Road, Tipton, Staffs. 11th March, 1943.

leadership. But it is very difficult to know how far Mr Morrison has been speaking for his political colleagues, either in the party or in the Cabinet. The attitude of Mr Attlee, the party's nominal leader, is hidden from the public gaze. Mr Bevin's attitude has been made plain enough. It is a trade union attitude that looks to the collective bargain between organised sections of industry as the future sanction of democracy; and Mr Bevin is a strong and forceful personality. Finally, there are Mr

Pollitt and his Communists who, though they have no real chance of obtaining the influence over the Labour movement that they are so industriously jockeying for, may prove to be the essential catalytic agent in the process of fissure and re-integration that will produce the Labour party of the next decade. The course of these events will decide whether the Labour party or some other party is to strive for the New Democracy against embattled sectionalism and restriction.

First Things First

IT is a sound instinct that has led the American public to attach unusual importance to Mr Anthony Eden's visit. Mr Eden has become, in recent months, almost without challenge the second man in the British Government. He is a long way ahead of the field as favourite for the reversion of the Premiership and of the leadership of the Conservative party. Mr Churchill's dogged refusal to think about the future, together with his own comparative youth, have served to make Mr Eden one of the forward-looking figures of the Cabinet. Moreover, the character of the staff he has taken with him proves that the future is one of the important items—and perhaps the most important item—on the agenda for the talks in Washington.

If this is true, then the visit is well-timed. The renewal of the Lend-Lease Act has just passed through Congress with surprising ease and speed, and the foundations of American war policy are confirmed for another year. By coincidence, Mr Eden arrived in Washington on the same day that six Senators, from both parties, published their concern with the foundations of American post-war policy in the form of a draft resolution which, if passed, would commit the Senate to five principles of far-reaching importance for the future settlement. The climate is thus favourable for talks about the peace. The Administration has just had its hands strongly upheld, and the Senate—the other and equal power in American foreign policy—is showing that it is engaged upon the problems. Mr Eden has gone to visit the President and the Secretary of State. But he is not likely to forget that a British Foreign Secretary must also reckon with and, through the medium of public opinion, negotiate with the United States Senate. This is what lends particular importance to the initiative that has been taken by Senators Austin and Wagner and their colleagues. Six Senators do not make the Senate, and their resolution may not pass in its original form. But a sound policy that originated within the Senate itself, and was watched over at every stage by that jealous body, would have an infinitely better chance of being embodied in permanent American policy than any policy, however perfect, that the Administration kept to itself.

There is another sense in which conversations about post-war policies are appropriate now. The time has come for the United Nations to move from the vague and general in their declarations of policy to the precise and specific. The need for precision has existed for three and a half years, and the cause of the United Nations has suffered from having nothing to offer but the unhappy ambiguities of the Atlantic Charter, which can be quoted in support of a distressingly wide variety of policies. But precision hitherto has been impossible on a joint basis. The Governments, as one by one they came into the war and faced the manifold problems of mobilisation, have not all had time to do their thinking, or to find out from the course of public and semi-official discussion how much common ground exists.

There are, of course, two very good reasons why the outer frontiers of post-war policy must remain undefined for a long time to come. First, until the last gun is silenced, no one can tell how much will be possible. And, secondly, until all men can speak freely, no one can tell how much will be agreed. It would be vanity to suppose

that a comprehensive plan could be worked out in advance—or even that it should be at a time when so many nations are in chains and so much of the manpower even of the free nations is, in effect, silenced by its more urgent duties.

But this need not stand in the way of an attempt to crystallise such agreement as already exists. Such a statement is very badly needed—now that the inevitability of German defeat is beginning to be accepted in Europe—as propaganda to turn the hesitant into helpers. And it is also very badly needed as a basis for action. When peacemaking began in 1919, the Allies were already in agreement on the main principles of the settlement—and committed to them. Without that prior agreement, the settlement might never have been achieved, and the alliance might have fatally broken up at the peace table. Without some prior agreement this time, the United Nations will hardly know how to proceed when, as Mr Churchill put it, they “run out of Huns”—and the confusion will be the greater because there is not now, either between or within the nations, even as much agreement on the fundamental philosophies of politics and economics as there was in 1919.

What is required, in short, is some latter-day equivalent of the Fourteen Points—not as a basis for a negotiated peace, but as a guide to action after the enemy's unconditional surrender. The analogy with the Fourteen Points is not exact. In the first place, Woodrow Wilson did not speak for any nation but his own—and not even for his own as the tragic sequel showed. This time there must be prior agreement, between President and Senate and between at least the major United Nations. Secondly, in order to secure the maximum of agreement, such a preliminary statement should be as modest as the necessities of the situation allow. In the complex state of the present world, every step that such a statement took beyond the manifest and immediate purpose of overthrowing Germany and Japan would be liable to offend someone. To be a weapon of unity, such a Declaration of Purpose should be restricted to the essential minimum. Everything that is a *sine qua non* of a sound settlement should be in; everything that is desirable without being necessary should be left out, the proper subject of further discussion. The purpose of the Declaration would be to commit as many nations and individuals, governments and legislatures as possible to what is inescapably essential and, for the rest, to let hopes and ideals, agreements and disagreements roam freely.

This is not, of course, the place to begin the drafting or even to suggest with any exactness the subjects that would have to be covered. Some of the points, nevertheless, are clearly emerging from the mists:

1. There will have to be a clause dealing with the complete, long-term Unilateral Disarmament of the aggressors, and possibly with other aspects of the treatment to be accorded them on which a similar degree of agreement may be found to exist.
2. There is verbal agreement on the need for an International Police Force—or at least on the policing functions of the major victors.
3. Less clear, but no less essential, is the basis of agreement on the law that the Police Force is to enforce—that is, on the Definition of Aggression.

4. Something would have to be said about frontiers. And it could hardly be said without a statement on the Rights—and Duties—of Small Nations.

5. To embody the previous points in a system, there would be need for a pronouncement on the International Organisation that is envisaged. Is the League of Nations to be revived? And if not, what is to take its place?

6. As a conjunction between the political and economic points, there is need for a re-definition of the Rights of Men, on the lines of the President's Four Freedoms, and a statement of the means to assure them.

7. The policy of the United Nations on Relief is already formulated and ripe for announcement.

8. It should by now be possible to declare a policy on International Trade and on co-operation to master the trade cycle, which would be more convincing than the famous Article Five of the Atlantic Charter.

9. There is need for a formal declaration by the rich nations—not by any one of them alone—avowing their policy towards the poorer regions of the earth, whether administered by them as colonies or not.

No prescriptive virtue is claimed for this illustrative list. It would avoid Clemenceau's criticism of the Fourteen Points (*le bon Dieu n'a qu'une voix*) and includes nothing on which drafting could not now begin. The aim should be to attain as much precision as will carry agreement. But agreement is the purpose, the agreement of those, whether legislators or executives, whose consent will ultimately be necessary. If the initiative of the six Senators, by the patient labour of the statesmen and politicians of both the United Nations and the United States, can be broadened out into such a platform as this, then a firm foundation will have been laid upon which wider-ranging hopes can be based.

Servants, Not Leaders

EIGHT weeks have passed since General Giraud and General de Gaulle met at Casablanca. Although the gulf between the two movements has been definitely narrowed in the last few days, they are still apart; yet the need for unity grows more and more urgent as the evidence piles up to show that the resisting French, both inside and outside France, are being confused by the existence of two separate and competing movements.

There was the example of the French sailors from the French warship *Richelieu*. Some of the men, complaining that their officers are for Vichy, left the ship and went to Canada to enlist with General de Gaulle. There were reports of a number of French seamen detained by the Fighting French authorities at Dundee because they wished to transfer to General Giraud. This was a nonsensical and perilous situation. No navy so divided against itself can fight, and fighting is, after all, the first duty of French seamen outside France. The sailors are not an isolated case. In the army, and in the administration, there has been a similar clash of loyalties and such divisions must grow worse the more they are prolonged.

The situation in Yugoslavia is an unhappy example of the military frustration that must result when nominal allies divert their attention from attacking the enemy to attacking each other. The case of France is not so tragic as this. But who can deny that the drift has been in that direction? Fighting in a more violent form has started in France. The first guerilla *communiqué* has been issued. Yet the news of it caused some surprise and some consternation. Was it concerted with the general Allied plan of reinvasion? Was it certain that the rising revolt would

not be confused by the issuing of contradictory instructions from Carlton Gardens and Algiers? This uncertainty and confusion have already arisen in Poland. Are they to be repeated in France? If agreement cannot be reached on so uncontroversial a question as defeating the Germans, it can certainly not be reached on the future organisation of the French State. General Giraud saw this very clearly when he said in his broadcast last Sunday:

The union [of all Frenchmen] is essential. Union in the struggle alone can ensure union in the reconstruction of the homeland after victory.

Unity must be the first objective. How far away is it? The signs are confused. There is progress to record in the stated aims of the movements—the Fighting French memorandum issued to the public at the end of last week and General Giraud's striking broadcast to the world from Algiers a week ago. Both movements agree that unity is essential. The Fighting French add to General Giraud's words on union the rider that this implies “unity on the basis of one legislation and of the direction of effort by one and the same organisation.” General Giraud echoes this—“There can only be one French army facing Germany.”

A notable step forward was General Giraud's total repudiation of Vichy. All legislation made since June 22, 1940, he declared to be “null and void,” since it was enacted by an unauthorised Government. He repudiated the armistice in the name of the French people. This is one big barrier the less. The Fighting French had laid down renunciation of the armistice and of the Vichy

EQUITY & LAW
LIFE ASSURANCE SOCIETY

(temporarily transferred from 20, Lincoln's Inn Fields)

regime as a minimum condition of co-operation. The General's declaration also meets the second guarantee demanded by the Fighting French—the restoration of civil rights and liberties; and it will have the secondary effect of bringing the legal and political framework of North and West Africa into line with Fighting French territory, where the laws of the Republic were officially restored. General Giraud warned his listeners that the abolition of the Vichy decrees could not be carried through "at a stroke of the pen" but, as a first step, he announced the voiding of all racial laws and the restoration of the municipal assemblies and *conseils généraux*.

The vital point of agreement between the two statements is the recognition that the French people alone can decide their future form of government. "No organisation can substitute for national sovereignty," says the Fighting French memorandum. The General repeats, "I give the most solemn assurance to the people of France that their sacred rights to choose their provisional government will be fully safeguarded."

The ground of general principle is now clear. As Mr. Churchill put it in his statement to the Commons: "In order to achieve the liberation of France through victory Frenchmen everywhere outside the Nazi power should act loyally against the common enemy without a day's needless delay." In view of General Giraud's speech and the National Committee's memorandum, it now appears that no question of principle divides these two bodies of Frenchmen. Unfortunately, there is still a gulf fixed between policy and its application. The good faith of General Giraud is beyond question, that of many of his political subordinates is not. The very honesty and guilelessness of a man who prefers to call himself "a simple soldier" are drawbacks in controlling the semi-quislings, place-seekers and dispirited *petits fonctionnaires* through whom his generous decisions on policy may have to filter down. Outside opinion was given a rude reminder of their outlook when, on March 2nd, the Vichy anti-Jewish laws of November last were suddenly published in the *Journal Officiel* of Algiers. The incident led to the dismissal of M. Bouni, the official responsible, and to the closing down of the Bureau of Jewish Affairs. But how many more Bounis are there? The case of the political prisoners, too, is by no means cleared up. On the other hand, the resignations of General Bergeret, who worked with the Italo-German Disarmament Commission, and of M. Rigaud, chief of internal affairs and largely responsible for many of the political arrests, are signs of notable headway, the best steps forward taken so far. Even better is promised by the report that M. Jean Monnet, a noted liberal, and one of the most distinguished of the Frenchmen who have hitherto held aloof from organised resistance, is on his way to North Africa.

On the side of the Fighting French, some tendencies give grounds for alarm. There is too much "personalism" in the movement. General de Gaulle would do well to adopt General Giraud's claim that he is "the servant of the French people, not their leader." However necessary it may have been, in the confusion of 1940, to focus the allegiance of Free France on one man, this should have come to an end with the creation of the National Committee. But this organ, owing to its constitution, is not a Cabinet but a *conseil du roi*. All this might be harmless enough, if it did not mean a cleavage between the Gaullisme of France, which is synonymous with "total resistance," and Gaullisme outside France, which has the character of a personal allegiance. The temptation to make use of the myth which has grown up round a name to enhance the power of a person is not unknown in the history of France. It has always been disastrous.

Whatever doubts and question marks may still attach to the two movements will be set aside once there is certainty of a genuine rapprochement. So far, discussion on the possible ways of securing unity has been limited to the Fighting French statement that the best way to achieve unity would be to incorporate North and West Africa in Fighting France by "the enlarging of the

National Committee"; but the message sent by General Giraud to General Catroux, General de Gaulle's liaison officer, saying, "I am ready to receive General de Gaulle in order to give this union a concrete form," has received a friendly reply from General de Gaulle, and "it is to be expected," says the National Committee, "that General de Gaulle will shortly leave for Algiers." Yet will either General be prepared to act as "Deputy-Leader" to the other? However ready they are in the future to hand over their powers to the French people, are they ready to make personal sacrifices now for the union which—on their own admission—would alone make that transfer of power possible?

The new signs are immensely more favourable. Yet a successful fusion is still not certain, and if these new steps lead to nothing—as did the Casablanca conference—and the situation again reaches a deadlock, the Allies would not be able to shirk the responsibility of helping to break it. It is wholly justifiable and entirely right to wish to interfere as little as possible with Frenchmen who are endeavouring to restore the unity and sovereignty of their country. But it may be moral cowardice not to intercede when their actions may be frustrating the cause of victory and liberation. Britain and the United States are trustees for the people of France, for the simple reason that both General de Gaulle and General Giraud were sponsored by them. Without Anglo-American support, neither General would be leading a great movement to-day. It is extraordinary how often this simple fact is overlooked. If some of General Giraud's officers are planning to send a fascist army to the liberation of France, they are planning to do it with Anglo-American equipment. If General de Gaulle is using his prestige to create a personal following inside France, he is doing so with British funds and the aid of the BBC. If, as a result of this, civil war were to become inevitable in France, Britain and America would have forged the weapons and helped to create the split.

If agreement cannot be reached—and there are high hopes now of an accord—there is still an alternative. The Generals themselves have pointed the way. They have denounced the Vichy interregnum. General de Gaulle has restored republican laws in Fighting French territory. General Giraud has restored the municipalities in North Africa. Both have returned to the Republic which now, as in 1875, may prove to be the regime "that divides men least." So far the return to the Constitution has been only at the periphery. Why not restore it as far as possible at the centre as well? Some sixty or seventy deputies and a few Senators are now outside France. More could be brought out by the same route as M. Philip and M. Massigli. These men, meeting at say, Casablanca (the town is already a symbol) could form an *Assemblée Nationale de Guerre*, in which might be vested trusteeship for France *Outremer*, and which could be the effective centre of sovereignty. As its executive organ, the assembly could appoint from among the many distinguished administrators, scientists, lawyers, economists and technicians of the Monnet type a *Conseil de Guerre* to carry through the orders of the National Assembly. If it were thought advisable to add soldiers to this *Conseil*, they would, in conformity with the French Constitution, return to civil life during their period of office.

Such a reorganisation cannot be discussed in detail. It is only necessary to point out here that deadlock between the two Generals, should it unhappily recur, does not exhaust the possibilities of unity, for there is a practicable way of ensuring it by subordinating both Generals to the only power they recognise, a power based on the choice of the French people when last they were able to give it free expression. Such a National Assembly would not last longer than the process of liberation, and its last task would be to prepare for the general election of a new Constituent Assembly. In the meantime, it could be at once a symbol of unity and a pledge of continuity and a power, under which both General Giraud and General de Gaulle could prove that they are, indeed, servants not leaders of France.

Lend-Lease Extended

THE Lend-Lease Renewal Bill, over whose fate many heads were shaken earlier in the year, went through the American Congress last week with remarkable speed and ease. After one amendment had been rejected by the House of Representatives, the Bill as a whole passed with only six dissentient votes. The Senate passed the Bill unanimously in a single day, and the President was able to sign it on the exact day of the second anniversary of the original Act. In this very satisfactory outcome, which is discussed in more detail in a Note on page 360, the most gratifying aspect is the absence of any limiting amendments. There was never much doubt that the essential principle of Lend-Lease would be endorsed, but in the early days of the new Congress it was feared that it might be impossible to fend off the legislators' desire to interfere both with the present working of Lend-Lease and with its post-war sequel. This danger has not departed, for an Appropriation Bill, to provide the necessary funds, will have to make its way through Congress in the next few weeks. But wrecking amendments are now most unlikely, and the Administration will be on strong grounds in resisting anything that would qualify a principle so emphatically endorsed.

The favourable vote is in part due to the skill with which the President has been handling the new Congress. He has smiled upon its members and taken up none of their challenges, concentrating all his efforts on what is really important. But a great deal of the success is also to be ascribed to the excellence of the case for Lend-Lease. As some of the ex-isolationist Senators were at pains to declare, Lend-Lease has justified itself even in the eyes of the most case-hardened nationalist.

It is important, however, to be quite clear what constitutes the excellence of the case, for definitions of it could vary considerably. To many Americans, for example, the real benefit of Lend-Lease is that it limits the shedding of American blood. This motive is by no means unworthy—the supreme advantage of America to the cause of the United Nations lies in its production rather than in its manpower—but to regard Lend-Lease as a device for limiting American liabilities is not quite the way in which it is looked upon in other countries. Other Americans are impressed by the unexpectedly large reciprocal benefits that the United States is receiving. The magnitude of "reverse Lend-Lease" is not yet perhaps realised by the American public, but Congressmen were greatly impressed by the evidence they were given. They were told that the American Army in Great Britain spends only \$25,000 a month on supplies; that the United Kingdom will provide 400 million lb. of food in 1943; that India has built and turned over more than a score of airfields; that the British Government pays 65,000 civilians who work for the US Army; that American military hospitals in the United Kingdom are 85 per cent equipped by the British—and so forth in a list of items that is staggering in its length.

But to other peoples, and more particularly to the British, the unexpected size of Reciprocal Aid is only an incident—though a particularly happy one—in a policy whose appeal goes far beyond the lore of nicely calculated less and more. That the needs of the American troops in Britain should be provided free of charge has come to be regarded as a matter of course. What is really epoch-making in the Lend-Lease policy is that in it the world's richest nation adheres to the principle of "from each according to his means, to each according to his needs." How far the adhesion goes is not yet quite clear; but it is certainly more than accidental and temporary. The famous Fifth Report to Congress stated the principle, which cannot of course be applied evenly to all nations, because rich nations like Britain or the United States can plainly apply a higher proportion of their resources to war purposes than poorer nations like China or India, without any greater sacrifice.

If each country devotes roughly the same fraction of its physical production to the war, then the financial burden of war is distributed equally among the United Nations in accordance with their ability to pay, and although the nations richest in resources are able to make larger contributions, the claim of war against each is relatively the same. . . . The money costs of the war will fall according to the rule of equality in sacrifice as in effort.

But this is merely a pronouncement of the Administration, which (as must always be remembered in dealings with America) does not bind the United States or commit Congress. There is no means of discovering what the policy is actually likely to be in the future other than that of assaying the state and trend of public opinion. Last week's vote makes it virtually certain that Lend-Lease will operate as at present for the rest of the war (though the formal renewal is only for twelve months). There was much discussion during the Committee hearings of the Lend-Leasing of food and other non-warlike stores, and since these also have been approved, it is legitimate to suppose that the needs of relief in the immediately post-war period may be treated in the same way—that is to say, such quantities as are available will be delivered without payment, though it does not necessarily follow that as much will be forthcoming as the hungry nations may desire. The policy of an international police force to keep the peace after the war is won is now approved in America by a sufficiently large section of the public to encourage hopes that the burden of its equipment would, if necessary, be shared among the participants on Lend-Lease principles.

Beyond this, all is guesswork—and some of the signposts are not very encouraging. For example, a poll of American opinion taken a few weeks ago showed an overwhelming majority in favour of the extension of Lend-Lease and a majority—only a bare majority, it is true, but still a majority—in favour of exacting payment after the war from the beneficiaries of Lend-Lease. It would be a grave mistake to imagine that the attitude of the American in the street is other than this. Moreover, in the discussions that are going on about the necessity of using American capital to open up the less developed parts of the earth, the favourite figure of speech is that of an "international RFC"—and the Reconstruction Finance Corporation is a body which prides itself on the profits it has earned. These are warnings. They are not necessarily fatal; a large and influential body of opinion is constantly at work to preach the gospel. Policies may be possible in two years' time that are as much in advance of the present state of opinion as Lend-Lease itself is in advance of Cash-and-Carry. But clearly nothing can be taken for granted about the part that Lend-Lease is to play in the post-war world.

Moreover, even if this hurdle is surmounted, there are questions to be answered about the technical possibility of fitting Lend-Lease into a post-war framework. At first sight, the position would seem to be fundamentally similar. The great difficulty that Lend-Lease was invented to solve—other nations' lack of dollars—is likely to continue, for a long time after the war. But, on a closer view, difficulties arise. First, there is the question of repayment. If the American people want to be repaid for wartime Lend-Lease, they are still more likely to want repayment for peacetime Lend-Lease. But if so, the whole operation becomes a new method of making international loans, valuable for its emphasis on the non-monetary reality behind loans, but subject to the basic difficulty of all loans, that the debtor can make payment only in goods which the creditor must accept; and the new problem becomes the same as the old one, the height of the American tariff. Whatever devices may be adopted for the working of world economy after the war, their effectiveness must hinge in large part on the readiness

of the United States to fulfil the functions of world creditor, on its willingness to buy goods as well as on its willingness to make loans.

Let it, however, be assumed that the condition of repayment can be waived. After the first period of relief and rehabilitation, the nations' shortage of dollars will not arise, in the main, from their desire to import capital goods from America for special schemes of construction, out from their ordinary trade. The difficulty of the sterling area, for example, will be that, with the market for rubber and tin gone, and with the general disruption of British exports, it will be difficult to earn as many dollars as will be needed for the automobiles and typewriters, the machine tools and tobacco which, in conditions of relatively free trade, this country would wish to buy. This means that, if Lend-Lease is to make a contribution to the solution of the problems of international trade and finance, it is a portion of the ordinary everyday exports of American industry that must be lend-leased. When a man has income to cover only three-quarters of his expenditure, it is of little assistance to offer to enlarge his house on special terms. But of all the probabilities, it is the least likely that the American public will be willing to extend Lend-Lease to the regular transactions of ordinary commerce.

Furthermore, there is the added complication that, in all probability, the post-war world will once again be a buyers' market, the circumstances of which will be very different from the peculiarities of a wartime sellers' market. If the United States lend-leases cotton and wheat and aircraft, will the other producers of these things be best pleased—especially if peacetime Lend-Lease, like

wartime Lend-Lease, carries with it restrictions on the exporting freedom of its beneficiaries? This consideration applies with particular force to precisely those goods to which Lend-Lease is most likely to be applied—namely, capital goods for development schemes. The essence of the present position is that the goods that are lend-leased must be obtained from the United States because they are not available—or at least not in sufficient volume—from anywhere else. But this is most unlikely to be the post-war position, and there would be universal agreement on the undesirability of converting Lend-Lease into a desire to buttress the competitive position of American exports; nor is Congress likely to appropriate funds for that purpose.

These questions do not arise from any desire to deny the service that can be rendered in peacetime by the generosity and the practical collaboration that produced Lend-Lease. They do, however, suggest the necessity of abandoning the easy assumption that the expedients of wartime either can or will be applied to the conditions of peace. Those conditions are not, after all, sufficiently similar. The strictly financial problem, it is true, is likely to be the same—namely, a shortage of dollars. But the economic problem is different. In wartime, the world badly needs more American goods. In peacetime, unless the world can sell more of its goods to America—which is the key consideration—the problem is more likely to present itself as a need for fewer American goods. In this, as in so many other matters, the need is not blindly to continue the techniques of war, but to use the idealism and the comradeship of war to work out new and more appropriate techniques of peace.

NOTES OF THE WEEK

Priorities

The economics of war remain as inexorable as they were in the days of dearth and danger two years ago. Mr Shinwell, in last week's discussion on merchant shipbuilding in the Commons, spoke with alarm about the alleged extent to which food stocks are being tapped because of shipping difficulties. Whatever the truth of Mr Shinwell's unsubstantiated charge—and, in any case, it would be better at a pinch to encroach on food stocks than to reduce the inflow of raw materials—it remains a fact that, while shipping losses remain high, the double task of maintaining the war effort at home and of supplying and ferrying expeditions overseas is perilously hard. The fact that shipbuilding increasingly exceeds losses is only a long-term advantage. The yardstick of success or failure is still the number of ships and cargoes that arrive safely at their destinations. Mr Shinwell himself is not fully aware of the economic choices involved. His root-and-branch demand for faster ships overlooks a threefold dilemma. Fast merchant vessels, escort ships and tanks are in many respects mutually competitive industrially, that is, in the requirements of machinery and materials for their manufacture. The programme builders on both sides of the Atlantic have had to balance the demands of offensive warfare for merchant ships, escorts and armoured vehicles, with their limited stock of machinery and materials in mind. The balance may not have been struck correctly. It may have been struck at too late a date. But the fact remains that, while the materials and capacity available are limited, in relation to the rising demand and because of the bottlenecks that restricted shipping space and shipping losses have created, the prime problem is still to cut the coat according to the cloth—in spite of the immense productive achievements of both Britain and the United States. Germany, on the defence, is faced with a stark choice between maintaining war output and replenishing the depleted ranks of the *Wehrmacht*; they cannot do both, because of the shortage of manpower. The Allies, on the attack, are faced with similar alternatives at a higher level, with the choice between expanding war output still more and mounting their planned offensives with greater speed; and it is the impediments that exist to the flow of materials and men across the ocean which cause these alternatives to press so hard upon Allied policy in this, its crucial phase.

Regrouping?

The middle-aged aches of the Labour party are discussed in an article on page 349. There are noises off from the Conservative side, as well. The Conservative Private Members (1922) Committee has become the Conservative and Unionist Members Committee. The metamorphosis is important, if only because the members of the 1922 Committee still hold the balance of power in the House of Commons. The significance of the change is that it admits Conservative Ministers to membership of the Committee, which thus ceases to be an entrenchment of backbenchers. In one sense, the Committee, by this simple change, has entirely altered its character, and become much more akin to the organisation of the Parliamentary Labour Party. It is true that the pundits say that the change is only nominal, and that Ministers will not in fact attend or be active in the Committee's deliberations. This remains to be seen. Meanwhile, the possibility cannot be ignored that the intention, however vaguely and tentatively it may be envisaged yet, may be to exercise over Conservative Ministers the same sort of control as is exercised—lately with varying degrees of success, it is true—by Labour members over their Ministerial colleagues. It has always been claimed by the Conservatives that the difference between the rigidity of the Labour party organisation and their own looser party machine, except in matters of voting, was a mark of democratic freedom—a freedom made possible in practice by the selection of Conservative candidates with sufficient means to stand on their own feet financially. Has the decision now been made that the Conservatives, too, must close their ranks? If so, the result could only be an increasing pressure to the Right on Conservative Ministers, in response, perhaps, to the tendency of some of the younger Conservative Members to lean somewhat Leftwards—a tendency which has also been crystallised in the permanent Social Reform Committee set up by the Conservative MPs who called, in the recent Beveridge debate, for a Ministry of Social Security. It is doubtful whether the 1922 Committee would be able to resist content with greater control over Ministers. The next stage would seem to be greater control over the party itself; and it is not impossible that some time in the future may see the party conference, under their control or that of the social reformers, coming to occupy something like the decisive and disciplinary place that is occupied by the annual conference of the Labour party.

The Franchise

Sir Richard Acland is frequently accused of being an impractical person. His amendment in the Commons on Tuesday to postpone the writ for a by-election in the Eddisbury division until the register could be brought up to date was doomed to be heavily defeated on a vote; in the event, the Ayes were 12, the Noes 178. Yet Sir Richard's unprecedented action in moving this amendment, an action which set the party powers-that-be all a-flutter, was well timed and shrewd. He put the problem in a nutshell. "If you can register people for chocolate, if you can register them for fire-watching, you can certainly register them for democracy—not all over the country, but in the constituency as by-elections come up." The reason usually given in official circles for the smallness of polls at by-elections is the disinclination of electors to concern themselves with political controversy while the war is on; other pundits put it down to apathy. These are both contributory causes, but a main quantitative reason for the small proportion of votes cast in relation to the number of voters on the register is surely, as Sir Richard Acland argues, the obsolescence of the register itself. Because the register has not been brought up to date for several years, some millions of rightful electors are disfranchised, including all the young people who have reached the age of citizenship since the register was last made up and a very large number of people of all ages who have moved, because of the war, from one constituency to another. If elections are to be held at all, with any pretence of seeking a representative result, it is absurd that any possible step should be left untaken to remedy this state of affairs. It is true that whatever solution is tried may produce a very imperfect result; but it would be nothing like so imperfect as the present position. The Government, as Mr Attlee pointed out on Tuesday in somewhat worried tones, is considering the findings of the recent report of the Committee on Electoral Reform. Although the Eddisbury writ has gone forward, Sir Richard Acland's gesture in seeking its postponement may well speed the Government on its way to a sensible decision on this grave and anomalous matter.

Concentration

Inevitably, appraisal of the 1942 bombing offensive occupied much of the four hours which the House devoted last week to debating the Air Estimates. As usual, the Government case was presented in terms of impressive absolutes. Sir Archibald Sinclair gave figures: two thousand factories damaged, one million two hundred and fifty thousand tons of steel output lost from the Ruhr and Saar, one million persons rendered homeless since the start of bombing. There has also been a steady increase in the weight of bombs dropped, rising to a peak last month when the total weight, in attacks which reached stunning proportions compared with the worst yet done by the *Luftwaffe* to British towns, was half as big again as in any previous month. As usual, too, the critics, of whom Mr Boothby was the most constructive, applied relative standards. The 1942 offensive, it was claimed, had been disappointing, mainly because Bomber Command had not received any substantial increase in the number of planes available—although obsolete types have been replaced and a much greater bomb load can now be carried by a force of the same numerical strength. The number of casualties decreases as the number of planes employed increases, once the point has been reached at which the ground defences are saturated. Concentration in time and space provides more punch and less waste. Bomber Command knows this well; its complete application is inhibited only by the incessant calls of many targets and of other fronts, over the seaways as well as in land theatres. In war economic terms, there is one simple comparative measure of the efficacy of this strategic bombing. Is the damage done to the enemy's war effort greater or less than the effort that has to be exerted to keep up the bombing offensive, with its calls on output and its casualties? In last week's debate there was curiously little discussion of the relation of the bombing offensive either to war economy or to high strategy as a whole. There was no suggestion that the war can be won by bombing alone, and few hints that the recent remarkable crescendo of attack is the direct prelude to invasion. On the other hand, the function of long range bombing as one essential medium of attack, and as a means of containing planes and troops in Western Europe, was more widely appreciated than in previous debates. At the moment there may be no conflict between bombing and operations in other elements—though some observers, with Tunisia in mind, might dispute this. When the "invasions" of Europe begin, there will be. The bomber force will be needed to force an entrance, and there will not be enough bombers to saturate both the defences of industrial Germany and those of the coastal fortresses. It is because this moment of choice will come that it must be fervently hoped that the Second Front has been planned as a combined operation of all available forces.

Warning from Haute Savoie

European guerillas have become a rather romantic feature in the popular press. Yet there is nothing romantic about the dilemma that is inherent in all guerilla fighting. Poorly armed partisan bands are helpless against regular army and police forces, unless they act in conjunction with other regular forces. This has partly been the case even in Russia. Outside of Russia, the only guerilla warfare on any considerable scale has occurred in Yugoslavia, favoured by the mountainous character of the terrain and by the traditional fighting methods of the Serbs. Elsewhere, underground movements have been reluctant to resort to this costly and usually futile way of fighting. Yet in most occupied countries the point is arriving when despair and impatience inevitably begin to produce these heroic but hopeless outbursts. This seems to have happened in Haute Savoie, where resistance to the *relève* has taken the form of guerilla action. According to the Swiss press, the movement is spreading to other remote and hilly districts, and embraces men and officers of the demobilised French army. The Vichy police has been unable to put down the *franc-tireurs*, and Axis forces are moving to the scene. The new guerillas are causing an additional drain on the invader's forces; but this gain is almost certainly not sufficient to counterbalance the inevitable loss of French patriots and the sense of frustration that unsuccessful revolt must bring in its train. But what is the alternative? The stage has been reached when less drastic forms of resistance to the Sauckel-Laval call-up in France have become more or less ineffective. A similar position has arisen in Poland. There the Germans are expelling tens of thousands of Polish peasants from the defence belt on the Bug. The uprooted villagers are forming partisan bands which operate from the forests. To attempt to stop these activities would be as futile as to attempt to make them spread still more widely. This insoluble dilemma springs from the delay in the Allied invasion of Europe which would change the whole position at a stroke and give guerillas all over the Continent a new purpose and a clear hope. The events in Haute Savoie are thus an ominous and urgent warning.

Tough and Right

Two events, one large and one small, give another welcome indication that the Government's former reluctance to exercise the wide powers it possesses to impose the most efficient organisation and methods upon vital war under-

takings is lessening fast. The first and larger event has been announced in the key sector of aircraft manufacture. The Minister of Aircraft Production has appointed Mr K. A. Layton-Bennett to be Authorised Controller of Short Brothers, Limited. About a month ago the Minister obtained the addition of Sir Frederick Heaton to the board of Short Brothers as chairman, in order to strengthen the management of the company, which is particularly concerned with the production of heavy bombers. The appointment of Mr Layton-Bennett has followed logically.

Owing to certain difficulties, which have arisen in the carrying out of the chairman's duties the Minister has, after considering all the circumstances, decided that, in order to safeguard production at Short Brothers, Sir Frederick Heaton's position should be strengthened by the appointment of an Authorised Controller.

In short, these steps have been taken in order to ensure that, in both quantity and quality, the output of heavy bombers shall be brought up to the high level demanded by the present great bombing offensives, and by the requirements of the vast combined operations that lie ahead. No one, except apparently some existing managements, will question the firm action that Sir Stafford Cripps has taken. In place of the dogged opposition that he is said to have encountered within the industry, he deserves the utmost praise and support. So, too, in a much smaller corner of the war effort, does the Minister of Fuel and Power, whose North Eastern Regional Controller has decided to close a colliery near Rotherham, and to direct its workers into other, presumably more productive, pits—precisely the kind of action that was promised last year, but from which the authorities have so far shrunk.

Transport Command

A second subject brought to the fore by the debate on the Air Estimates was the creation of a Royal Air Force Transport Command. This news led to a heated discussion of the precise relationship of the new Command to British Overseas Airways and of its relevance to the civil aviation controversy. The Government spokesmen gave away a minimum of information. The House was told that the formation of the new Command was directly due to the promised delivery of sufficient numbers of transport planes by the United States.

In addition to controlling the operations of Royal Air Force transport squadrons at home, the Command will be responsible for the organisation and control of strategic air routes, for all overseas ferrying and for the reinforcement moves of squadrons to and between overseas theatres.

RAF Ferry Command will be subordinate to Transport Command. British Overseas Airways will remain a separate civil organisation working in close co-operation. The scope of the new Command appears to be reinforcement, ferrying and the military counterpart of civil air transport. All this is obviously essential groundwork for the mounting of the final offensives of the war; indeed it is overdue. What the House of Commons was not told was the name of the Commander-in-Chief of the new Command (though this was announced shortly after the debate), nor indeed the names of any of its leading personnel; no statement was given of its exact relation, as a transporter of troops, to Army Co-operation Command; or of the precise nature of the tie-up with BOAC. In the absence of this kind of information, criticism, as Captain Peter Macdonald pointed out, is likely to beat the air. In any large-scale assault on enemy-occupied territory, the line between invasion and reinforcement will be a fine one; if the precise nature of the liaison between those responsible for carrying airborne divisions—not small groups of parachutists—into action, and those responsible for supplying and reinforcing them is not yet defined, the outlook for the most effective co-operation is not good.

First Mr Stokes and then, on the amendment, Mr Burke, expressed some anxiety that the new air transport arrangement may in fact be run by the rump of the commercial flying interests, who in the course of time may find themselves heirs to the only transport planes capable of launching British civil aviation after the war. Time will show. It is impossible to tell whether the new Command, which must be welcomed in principle, will in practice prove the boon it undoubtedly could be to the development of air transport for both war and peace purposes. The answer depends on whether the aircraft designers, now being withdrawn from combatant units, are to be employed to design transport types, for the future as well as for the present; on the

success or failure of the pending international negotiations on civil flying; and on the ability of the British Government to make a positive policy appropriate to the need, and to apply it. Transport Command has two crucial functions to fulfil. It must help to assure the success of the combined invasions of Europe; and it must provide a proper, fruitful nucleus for post-war commercial aviation. Whether it is capable of performing either of these tasks adequately, neither the House nor the nation is yet in a position to judge.

Servicing the Weapons

As important as the production of war equipment is the need for maintaining its fighting efficiency. The battles in North Africa have demonstrated that the striking power of an army is measured, not only by the volume of equipment originally supplied, but by the proportion of it that can be maintained in serviceable condition on the field of battle. For more than three years, British factories have been pouring out a growing volume of fighting equipment, and the need for trained personnel to handle and maintain it has grown in proportion. Efforts have been made to increase the supply of qualified technicians to industry by intensive training courses through the grant of state bursaries, and to the Services through the scheme of engineering cadetships by which large numbers of young men are qualifying for technical commissions. Nevertheless, it was obvious that the time would come when an increasing proportion of qualified personnel must be transferred from production to use and maintenance, even at the risk of reduced output. This stage has now been reached. In order to carry out the transfer as efficiently as possible, and to avoid the dislocation of production, it has been decided, as a first step, to take a census of qualified technical personnel in industry, aged 20 to 45. The census will be taken next week. Broadly, the categories of technicians that will have to register include men who have served a general apprenticeship in mechanical or electrical engineering; men who have completed an apprenticeship confined to a particular engineering craft and are holding positions above the rank of foreman or are employed on highly skilled tasks, such as design, testing, progress research, rate-fixing, plant installation; and men with academic qualifications in mechanical or electrical engineering. Men falling within any of these categories of technicians may be offered technical commissions. There will be no wholesale calling up of technicians. Men will be transferred to the Services as and where required. They will be needed chiefly, but not exclusively, by the Army. Initially the rate of transfer is likely to be slow, but it may be speeded up appreciably later.

Habeas Corpus

The last public meeting attended by Hitler was the annual Nazi beerhouse assembly in Munich on November 8, 1942. At that meeting many noticed his changed appearance and more than usually hysterical manner. Some said it was as though a ghost laid 19 years ago had been raised from the dead. Here was once again the trivial shrieking demagogue of the abortive Munich *Bierhalle Putsch*. Since November, there have been no more public appearances, no more speeches. January 30, 1943, the tenth anniversary of the Nazis coming to power, was passed over in silence; only a proclamation appeared. Again on February 24th, the anniversary of the founding of the Nazi Party, there was no speech, but a proclamation. Now Heroes' Day has been postponed. True, during this time it has been reported that the Führer received Antonescu (on January 13th) and Doenitz (on February 3rd). A meeting with the Gauleiters is also said to have occurred and photographs were issued. But it is easy to dismiss all these meetings as bluffs and fakes. And so, in fact, they are dismissed. Neutral papers—particularly the Swedish press—have come out with a crop of rumours. Hitler is insane. Hitler has a severe mental breakdown. Hitler has a return of his throat affection. Hitler has a tumour on the brain. Now Dr Goebbels has taken a hand, and has helped to confirm the suspicions by declaring to a special meeting of the foreign press that

the Führer is in the best of health and is still responsible for the conduct of higher operations. I am in constant touch with him by telephone and correspondence.

If the Nazis are really worried by the rumours, they have an easy solution: to produce the body. But are they

worried? If the removal of the "masterhand" is responsible for the German gain at Kharkov, there must be many generals content to see their Führer "rest." And for the Allies the goal remains unchanged, Hitler or no Hitler—the unconditional surrender of Germany.

The German Navy

The replacing of Admiral Raeder by Admiral Doenitz has been followed up in recent weeks by a sweeping reorganisation of the High Command of the German Navy. Inevitably, many commentators have suggested that the changes presage new and striking methods of U-boat warfare. According to this theory, Raeder was dismissed for faulty U-boat tactics and for his failure to use the surface fleet in co-operation with the U-boat packs. But if Hitler had been dissatisfied with the conduct of the U-boat war, he would hardly have appointed Doenitz, who has been entirely responsible for it. As for the theory that the Germans will now make more use of their surface fleet, it is a myth: they always have made very full use of it, both in conjunction with the U-boats and on operations of its own. The first blood in the Anglo-German contest was the battle with the *Graf Spee* late in 1939. Early in 1940 the entire fleet was used for the invasion of Norway. After the fall of France, German heavy cruisers and battleships were operating as raiders in the Atlantic; and in March, 1941, the Germans claimed that for the first time in naval history ships of this heavy calibre were co-operating closely with the U-boats. The *Bismarck* met its end in May, 1941, in the course of just such a combined operation. These tactics were continued once the war with Russia had begun. In February, 1942, the *Scharnhorst*, *Gneisenau* and *Prince Eugen* were transferred to Norwegian or Baltic bases, and the surface fleet has been a constant menace to the British convoys to Russia. There have been surface raiders in the Indian Ocean and the Pacific. The use of both raiders and submarines is the basis of German strategy, and will not change. More U-boats are being used now than in 1941, because there are more U-boats available. It does not imply a change of tactics. The German surface fleet has been, from the first, too weak to take on the British and American Navies. It is still too weak, and must be used chiefly as an auxiliary to the U-boat. Yet there must be some explanation for the changes, and politics, not tactics, may supply the answer. Hitler inherited an Army and a Navy in which the officer corps was dominated by officers of the old school, technically efficient, but with no particular political leanings. This state of affairs could not be tolerated in the Army, for the Army was the key to Hitler's purpose, and had therefore to be under Nazi control. Ever since 1933, the process of dismissing the non-political generals and bringing in the convinced Nazis has gone on. Every now and then, dramatic failure or dramatic success brought these changes into the limelight—for example, at the beginning of 1938, in the winter battles of 1941, and again in the autumn of 1942. The Navy, occupying a subordinate part in the Nazis' general strategy, has not gone through this steady process of purging. Now, when something very like a "crisis of confidence" threatens Germany, it is probably essential to give the control of the Navy to thoroughly Nazi officers. Hitler will not have forgotten that the rot started in 1918 among the sailors.

The Fall of Kharkov

The recapture of Kharkov by the Germans is grievous loss to the Russians. Once again, it has been proved that he who holds the Donetz basin holds Kharkov too. The Russians did not succeed in clearing the Donetz, and the loss of Kharkov followed almost automatically. The Russians have, however, managed to disentangle their overstrained forces in time, and in Kharkov they only fought a delaying action. They are probably using the time gained to regroup their forces for effective counter-attacks which seem, in fact, to have begun in the Byelgorod region, between Kharkov and Kursk. The immediate objective of the Germans seems to be to re-establish the line they held last summer before they started the big offensive. They may therefore try to retake Kursk, too. But even if they succeed in this, they will have regained nothing but the entrance to the blind alley into which they ran, and out of which they were run, last year.

The West Indies

Tuesday's debate on the Civil Estimates was devoted to the West Indies, and it is a welcome sign of the increasing interest in the colonies that this subject, instead of a home one, was chosen. Members had before them two recent White Papers as pegs for their speeches: the new constitution proposed for Jamaica, and Sir Frank Stockdale's report on his development and welfare schemes in the West Indies. To these, Colonel Stanley, who opened the debate with his maiden speech as Colonial Secretary, added a third heading—the work of the Anglo-United States Caribbean Commission. The first has found favour in the House, and, according to Colonel Stanley, its reception "has been not unfavourable" in Jamaica, where the main political groups are now giving it careful consideration. There was also general approval of the work of the Anglo-American Commission, which is rightly regarded as an example of international co-operation, not in administering the colonies, but in trying to solve their problems, that might well be copied in other areas which are under the sovereignty of several powers. Most of the discussion was, as a result, concentrated on the Stockdale Report. It is generally regarded as a valuable and far-seeing document, but further consideration of it prompts one or two serious reservations. One was stated by Mr Creech Jones: though it is recognised in the report that the present system of land tenure is highly unsatisfactory and one of the major causes of unrest, no real attempt at reform is proposed—presumably because any such question as the redistribution of land is outside the Comptroller's province, and has not yet been decided upon by the Colonial Office. The other serious gap in the report—the absence of any fundamental economic proposals—is fortunately to be remedied. Colonel Stanley said that Sir Frank Stockdale now has an economic expert in addition to his other experts on health, education, welfare, labour and agriculture, and he hopes that a survey will be made of the requirements for establishing secondary industries in the Caribbean. He also hinted that a new advisory body may be set up at the Colonial Office to give advice on "big economic questions." It is the absence of any answers to such questions that is at present impeding plans for the real development of the colonies.

Shopping Centres?

In the present unplanned conditions, the number and size of shops varies greatly from one district to another. The Association for Planning and Regional Reconstruction is studying the problem of rationalising retail distribution in the post-war world; and though it has not yet come to a definite conclusion, its object is to discover some relation between household spending and the turnover necessary for the efficient working of various types of shop, and then to group the shops according to the needs of the households concerned. A new PEP broadsheet takes the same line. It claims that, while every residential district needs certain local shopping facilities, modern developments, notably standardisation and transport, indicate that shops need not be so close to the consumer's doorstep as has

hitherto been usual in the older parts of towns. In brief, PEP suggests that there should be shopping centres and sub-centres. The sub-centre, for shops which the customer needs to visit often or at short notice, should be within half a mile of all houses served. This grouping of shops would necessitate an even greater expansion of delivery services, although the danger that the costs of such services are eventually paid by the consumer in higher prices is recognised. But there are other serious drawbacks to the planning of retail trade. Both the Association and PEP ignore the fact that their suggestion for grouping shops in centres plays into the hands of the trade associations, because it implies that the number of shops will be limited—an objective which nearly every important retail trade association is striving to achieve. "The sub-centre should certainly contain one chemist," says PEP. And "a neighbourhood large enough to support such a group of shops could also have a greengrocer or two..." Does this mean that if a more enterprising, and cheaper, greengrocer or chemist wanted to open a business, he would be prohibited? It is quite true that planning has a part to play in retail trade. The rationalisation of the milk round, to reduce costs, has possibilities for peace as well as war; and, as PEP points out, there is a great need in town planning to segregate shopping areas from the main traffic routes. But if, as is implicit in its suggestions, shops are to be licensed, and a condition of the grant of a licence is the maintenance of fixed prices, one of the last remnants of free enterprise will have gone.

* * *

Collection of Income Tax

As a footnote to the article on "The Collection of Income Tax," on page 331 of last week's *Economist*, two changes to be made in the tax deduction scheme on May 1st, and announced by the Inland Revenue on March 15th, must be recorded. First, if an assessment under Schedule E is adjusted in the course of the period during which the tax corresponding to it is deducted, and if the amount of the tax already deducted exceeds the corrected amount due for the whole deduction period, the employer will immediately refund the excess to the taxpayer. This avoids delay and will make it unnecessary for the taxpayer, except in special circumstances, to claim repayment direct from the Inland Revenue. Secondly, salaried employees and weekly wage earners—except weekly wage earners in the building and civil engineering industries, to whom these arrangements already apply—on leaving their employment, will be given forms by their employers showing the amount of the weekly or monthly tax deduction. On taking up new employment, the taxpayer will give this form to his employer, who will then continue deduction at the rate shown, until further instructed. The new arrangement, by ensuring continuity of deduction, is designed to avoid the accumulation of tax liabilities which has caused hardship occasionally. The two changes are welcome improvements in the tax collection scheme; but they, of course, leave unchanged the main problem of putting the system on a pay-as-you-go basis.

* * *

Savings and Assurance

During the debate on the Beveridge Report in the House of Commons, last month, the Government, while accepting Sir William's suggestion that death grants should be one of the benefits paid by the state under a unified system of social insurance, rejected his suggestion that the business of industrial assurance should be converted into a public service. The industrial assurance offices will be

free to develop voluntary forms of insurance, such as endowment insurance, which already accounts for a substantial proportion of their business. If the Government assumes the responsibility for paying death benefit, it will naturally be in the interests of the offices to aim at expanding the volume of other business. That they will take every opportunity to do so was suggested by an article in the *Insurance Mail* on March 10th:

During the next few months there is to be an intensive drive for savings to aid the war effort. . . . Millions will answer this call for a patriotic effort. . . . Insurance men and women will aid the drive to the best of their ability. . . . they may be able to convert some waverers by linking savings with life assurance. . . . Some offices make these bonds (savings bonds) available through the industrial branch by weekly contributions.

Necessary though it may be to secure an increased volume of saving, the endowment policies issued by industrial assurance offices have often been criticised, in the Cohen Report, for example, on the ground that this is an "expensive form of saving," and that there is a danger that "the industrial assurance agent, through the medium of his weekly calls at the houses of the people, should be able to forestall better instruments of saving than that which he provides." This argument would be strengthened by an attempt to canalise war savings into increasingly expensive channels. Sir William Beveridge, too, in discussing the future of the offices, bereft of part of their business, concluded that "it would leave the present defects of industrial assurance—of over-selling and excessive cost—in a narrower sphere, indeed, but still unremedied."

Cardinal Hinsley

The death of Cardinal Hinsley is a heavy blow to the Roman Catholic community, whose very beloved leader he was. The country, too, has lost a great patriot, and the Allied cause one of its warmest and most effective champions. Cardinal Hinsley loved the land of his birth deeply; he had a profound admiration for the British Empire, which, as Apostolic Delegate in Africa, he knew from the inside. He detested Nazism with an energy that made his broadcasts on the subject a thorn in the side of Dr. Goebbels and an inspiration to free men everywhere. He also understood Nazism. When in 1940 the Nazis set out to use in Britain the infiltration tactics that had been so successful in France, the Cardinal was among the first to expose and denounce their campaign, and to rally "all men of good will" to the support of the nation's cause in whose justice he so vigorously believed. Yet for all his immediate concern with his own country—and with its enemies—he did not once lose sight of the deeper issues behind the struggle and the longer perspectives of peace beyond victory. At a time when the more brutal and more material aspects of the war were weighing on men's minds, he spoke of their spiritual problems with a simplicity and directness that ordinary people could grasp. All he said and did manifested a rare quality of charity and good will.

Shorter Notes

The absence of the short rains in East Africa has caused the failure of the maize, potato, bean, and millet crops and produced a serious food shortage. Rationing has accordingly been introduced for the European and Asiatic communities of Kenya, and so far covers bread, rice and maize-meal. With a few exceptions, the position in the native areas is not yet serious, and the export of foodstuffs from them to non-native areas has been prohibited to conserve supplies. Maize, however, is short in the native areas as well, and the possibility of importing any is doubtful, since the South African crop, the most obvious source of supply, has also been affected by drought.

A German newspaper has now confirmed the German suppression of the Warsaw ghetto. This short note appeared in the *Donaueisung* of Belgrade on February 23rd:

It is reported from Warsaw that the dissolution of the Warsaw Jewish quarter in the autumn compelled the application of extraordinary sanitary measures, in order to make the streets concerned accessible for the general population and the houses habitable.

The number of Jews in the Warsaw ghetto was between four and five hundred thousand.

AMERICAN SURVEY

Blueprint for Security

PRESIDENT ROOSEVELT last week sent to Congress the reports on social security and demobilisation which he promised last autumn. Why the reports were held up is Mr Roosevelt's secret, but there is speculation in Washington whether this is the beginning of a New Deal offensive on the home front. At his press conference, the President pointed out that legislation was not enough; it took months of planning before contracts could be let which would provide work to absorb the unemployment inevitable upon demobilisation. It was up to Congress, he said, to decide whether at the end of the war there would be only jobs on paper or work ready for the demobilised men. This is an argument which cannot be lightly disregarded on Capitol Hill.

A certain amount of confusion has been created by the simultaneous submission of the two reports. One, the 600 odd pages of "American Beveridge" is a detailed and thorough-going analysis of the purposes, scope, and character of social security programmes, past, present, and future, in the United States, and concludes with a series of concrete recommendations for the extension, strengthening, and standardisation of social security measures. The other report begins with a new Bill of Rights for post-war America, and goes on to deal with such highly controversial subjects as the participation of the Government in private enterprise, particularly in natural monopolies and industries of crucial national importance such as aluminium, magnesium, shipbuilding and aircraft. The National Resources Planning Board is not popular with Congress—the House recently refused to appropriate funds for its extension—and the wider display of the Board's social and economic philosophy, provided by its report on military and industrial demobilisation, may prejudice consideration of its social security recommendations.

The ground of Congressional and business allergy to the Board is the Board's interpretation of the Federal Government's responsibilities and powers. But, while arguing that the existence of economic insecurity is in large measure due to "serious maladjustments in the operation of our economy, as well as to personal physical or psychological defects," the Board in its stress upon the need for a high level of employment and a national income of about \$100,000 millions a year in order to make its security proposals feasible, places a great measure of reliance on private enterprise. Included in its Bill of Rights is the right "to live in a system of free enterprise, free from compulsory labour, irresponsible private power, arbitrary public authority, and unregulated monopolies." Also included are the right to useful work; the right to fair pay; the right to adequate food, shelter, clothing, and medical care; the right to security, with freedom from fear of old age, want, and dependency; the right to education; and the right to rest, recreation, and adventure. In the Board's view, where private enterprise does not adequately assure these rights of the common man, it is the responsibility of the Federal Government, primarily, though in co-operation with state and local governments, and private organisations, to underwrite them.

The Proposals

The main instrument for attaining these rights is the comprehensive system of social security developed by the Board. The most striking feature is the insistence on the right to work. Work must be provided for all employables, and it suggests that a Federal works agency be established upon a permanent—but flexible—basis to provide jobs where private industry is unable to absorb the unemployed. The Board admits the short-term costliness of work relief, but believes that, in the long term, its material and non-material advantages to the community and the individual outweigh the costs. There should be intensified long-range planning of works projects, by the agency, by other agencies

of the Federal Government, and by state and local governments, and the Board urges that projects should be framed with an eye to the changing needs of the nation and local communities, the probable future demands for certain types of skill and experience, and the occupational and geographical distribution of the unemployed. Broadly, the same standards of performance, of pay, of hours, and working conditions should prevail on works projects as in private industry. Access to the work programme should be only through the public employment offices. The prime financial responsibility would belong to the Federal Government, although joint programmes might be developed. The need of increasing co-operation with states and localities is stressed.
