Partisans and Criminals

The great problem facing the *maquis* is the provision of food and munitions. Of necessity, they have had to resort to food requisitioning in the countryside. This may well have antagonised part of the rural population, which now has to reckon with three varieties of requisitioning: by the occupying forces; by the Vichy police; and by the partisans. Even so, the partisans do, on the whole, enjoy the support of the peasants. But their position has been gravely complicated by the emergence of bogus *maquis*—that is, of criminal bands who exploit the prevailing confusion for their own benefit; and recent reports have frequently spoken of fights between real and bogus bands. Crime has lately increased to a frightening extent. And it is one of the tragic features of French life now that in the underground the young French patriot inevitably runs into the ordinary gangster who wages there his own "war" against authority.

Even so, the *maquis* have become a symbol of national resistance. The great collaborationist dailies devote their columns to discrediting them and destroying their patriotic aureole. The *maquis* have served as an important drain on the depleted labour reserves of France. They have to a large extent frustrated the conscription of labour for Germany. On October 16th Laval signed a new agreement with Sauckel under which the compulsory transfer of labour to Germany has been suspended for the rest of the present year; and Laval's Minister of Production has made several public appeals to those who have evaded the labour conscription, asking them to return home and take work in French industrial undertakings. To what an extent the mass evasion of conscription has upset French industrial life can perhaps be deduced from the Minister's letter to the Committee of the Mining Industry:

I will give you the assurance that the men of the youngest class who work in the mines will be exempted from going to Germany, and will even be freed from any obligation to the Ministry of Labour. They can be sure that they will not be directed elsewhere. The same regulations apply to those who take up work in lead, zinc, gold, sulphur and kaolin mines. . . . The same also applies to . . . metallurgy, building, transport and agriculture. All such undertakings will have a poster put on the doors bearing the signatures of the German and French authorities.

The assurances of the Minister of Production have apparently not produced the desired effect. The men of the *maquis* have reason to suspect a trap; and other inducements, such as the latest increase in miners' wages, have also failed.

The position of the *maquis* has become very difficult with the approach of winter. A partial demobilisation of the groups now seems to be in progress. But members are being advised to disappear into the countryside, if necessary, and not to return to industry, where they might more easily be trapped and transferred to Germany.

Rough Politics

The political profiles of the *maquillards*, as they emerge from various French and neutral descriptions, deserve some attention. The *maquis* has become the first school of struggle—and of political thinking—for the youngest French generation. It is a hard and rough school. In it the young Frenchman steels his will-power and learns discipline. In constant danger, he has to look for his own and his comrade's food, and to get it by force if need be. He has to be on guard against traitors, *agents provocateurs* and bandits. Hatred for the invader and for the regime of capitulation and collaboration are essential traits of the *maquillard*.

But the *maquis* is also a lonely outpost, from which the wider horizons of the war cannot easily be seen. The partisan may feel himself humiliated by the enemy and the collaborators, as well as abandoned by the Allies. Out

of this may grow a self-centred feeling of nationalism coupled with some xenophobia. Nor can the *maquis* be a school of political democracy for those who are likely to play the most active rôle in post-war France. And it is perhaps in the minds of that ardent and courageous youth, so early uprooted and forced into a bitter struggle for bare survival, that the *mystique* of the Leader has struck its deepest roots. Will post-war France be able to give to its youth that democratic education which the heroic *maquis* cannot provide?

Switzerland's Foreign Trade

[FROM OUR GENEVA CORRESPONDENT]

October 28th

SWISS foreign trade returns are marked by a general decline in volume; the volume of both imports and exports this year is about half of that shown in 1939. The value of trade, on the other hand, has increased compared with pre-war averages; it is calculated that, since 1938, the average price of imported goods has increased by 125 per cent, while that of exported goods has risen by nearly 40 per cent.

During the first nine months of 1943, imports totalled 3,204 million francs, against 3,301 millions in 1942, while exports aggregated 1,151 millions, against 1,106 millions in 1942. There has been a drop both in imports and exports since last September, when Switzerland's outlet through Italy was cut off. The only trade routes now left open are through France and Spain to Portugal, with a very reduced train service, and through Austria eastward. The occupation of Italy is likely to diminish commercial exchanges, which were already difficult, still further. This, together with the freezing of Swiss funds in the United States and of American ones here, is causing much anxiety in the watchmaking industry, which had hitherto succeeded in partly maintaining its exports to overseas countries, and a consequent rise in unemployment in that industry is expected.

Though exports are far below the average, Swiss industry time in order to build up reserves in anticipation of a industry. The fact is that many factories are working full time in order to build up reserves in anticipation of a much hoped for speedy reopening of trade routes. But the situation of industry as a whole is not promising owing to the ever-increasing shortage of all raw materials.

Switzerland has concluded new trade treaties, or extended the scope of existing ones, with Spain, Portugal, Hungary and Bulgaria, and the question of payments by means of the clearing system has, for the present, been satisfactorily settled. In spite of long and arduous negotiations, it has not been possible to renew with Germany the trade agreement which came to an end last January. Recently, a provisional arrangement was arrived at which mainly concerns payments to Switzerland and the progressive wiping out of the German arrears that had lately accumulated. But exchanges between the two countries are very much reduced, though Germany has undertaken to make good as far as possible the deficiency in the coal deliveries it was to have made to Switzerland. On the other hand, Switzerland has further reduced the small quantities of agricultural products formerly sent to Germany.

THE BUSINESS WORLD

The Dollar Problem—I

THE new science of practical economics, to whose development the war has given so large an impetus, has two basic concepts, the National Income and the Balance of Payments. Almost every problem of policy can be directly related to one of these two, and accurate information on their magnitude is the basic datum for virtually every economic analysis. Academic economics will, in the future, more and more start out from them in instructing the student, while the problems of national policy will revolve around them in the same way that statesmen in Whitehall and the City have, in earlier times, watched the Budget and Bank Rate.

Nowhere has so much progress been made in assembling the statistics of National Income and of the Balance of Payments as in the United States Department of Commerce, and economists all over the world are under a very heavy debt to the Department's Division of Research and Statistics for the steady flow of admirably detailed bulletins, articles and memoranda in which the results have been set out. The American estimates of the Balance of Payments are many times more detailed and comprehensive than any that have been published elsewhere, and the United States is the only country that has estimates not only of its monthly National Income but also of the collective income of individual States of the Union. The war has led to the compilation in Great Britain both of greatly improved National Income estimates (which have been published) and of detailed figures of the Balance of Payments (which have not). After the war, the Government's statistical services should set themselves the aim of providing information on these two basic concepts

* "The United States in the World Economy." Economic Series No. 23. Prepared in the International Economics and Statistics Unit of the Bureau of Foreign and Domestic Commerce by Hal B. Lary and Associates. Published by the Government Printing Office. 216 pages. 35 cents.

as promptly and as fully as has been the American practice for many years past.

The Department of Commerce has recently published a report* which summarises the American Balance of Payments throughout the entire period from January 1, 1919, to December 31, 1939. It is a considerable achievement to be able to bring together, in comparable form, figures for as long a period as twenty-one years. The compilers would readily admit that the reliability of the earlier figures is far below the high standard that has been attained towards the end of the period. Nevertheless, the comparability is sufficient for lessons of the greatest value to be drawn from a period of very varied experience.

The main figures, which are given in great detail in the report, are summarised in the table at the foot of the page. This is given in the instructive new form adopted by the compilers of the report—that of setting out the "supply" of dollars and the use made of them. It will be noticed that gold movements and changes in short-term capital balances are both treated as "balancing items"—that is, as movements consequential upon the rest of the balance and not causal factors in themselves—while movements of long-term capital, including purchases and sales of existing securities, are treated as deliberate operations undertaken for some reason other than that of balancing the accounts. There is, of course, something artificial in this conception. Short-term capital movements may sometimes be the reverse of balancing items, while, on the other hand, nations may balance their accounts by sales of securities. But the distinction is none the less useful, and it has at least this justification, that the ideal balance of payments would be one that was in exact equilibrium without any movement either of gold or of short-term balances.

In the table printed here, several groups of years have been averaged to save space. In every case the years thus aggre-

gated have very similar characteristics and can be treated as a group. One other change has been made: in accordance with *The Economist's* long-standing practice, the item of interest and dividends is removed from the services group and shown separately. This is logical, since the receipt and payment of interest and dividends are not current trading, like most of the other service items, which differ from merchandise trade only in being invisible. It is also a most useful distinction when it comes to the drawing of conclusions for policy.

For detailed discussion of the different items of the account, the reader must be referred to the report itself. What are chiefly of interest are the conclusions that are reached about the general shape of the American balance of payments in the inter-war period and about the prospects for the future.

The shape of the American balance is not very well understood, especially in England. Accusations are frequently heard that the United States persistently sells more than it buys. But reference to Table II will show that, though this was broadly true of the 1920's, it was, on the whole, untrue of the 1930's. In the ten years 1930-39, American purchases of goods and services* exceeded American sales of goods and services by an average amount of \$23 million a year. If the two years 1938-39, when rearmament sales were swelling the figures, are excluded, the average is \$155 million a year bought in excess of sales. That the contrary should be so widely believed is an instance of the power of the visible over the invisible, for it is America's invisible purchases that redress the balance. It is true that the balance on current account—that is, the balance of trade plus net interest receipts—was usually (though not in 1935, 1936 or 1937) positive. But it is no mark of misbehaviour on the part of a creditor to have a positive balance on current account. Quite on the contrary; a creditor must have a positive balance on current account or cease to be a creditor, and it was the disappearance of this credit balance in the British accounts in the 1930's which led to head-shakings

* Throughout this discussion, charitable contributions and personal remittances are treated as purchases of services, for such is their effect on the balance of payments.

Vitamins in chocolate for liberated Europe

The British Government, having examined all the ways in which sufficient vitamins could be provided to the under-nourished children of liberated Europe, have arrived at the conclusion—as Rowntrees did in 1938—that chocolate offers one of the best vehicles for carrying added vitamins. In chocolate, the vitamins retain practically all their potency.

Before the war, Rowntrees pioneered the addition of vitamins to cocoa and chocolate. Their object was to enhance the protective value of these already highly nutritious foods.

Today, when the Allied Governments are faced with the enormous problem of rehabilitating each occupied territory as it is freed, Rowntree's experience of fortifying cocoa and chocolate with vitamins on a large scale is proving of great value. When the war is won, this experience will again be used for the benefit of the British public.

over Britain's international position. What is misbehaviour on the part of a creditor is to have a credit balance on current account larger than can be conveniently dealt with by the international capital market. This was the American position in the 1920's: in the eight years 1922-29 (i.e. ignoring the exceptional years 1919-21) the average credit balance on current account was \$733 million. But it was not true in the 1930's: in the eight years 1930-37 (ignoring the exceptional years 1938-39) it was only \$139 million—surely not an excessive amount for a creditor to add to his capital assets out of an average annual turnover of over \$4,000 million.

To defend the American balance on the familiar charges is not, however, to say that there were no defects in the position. The shape of the capital account was far more open to criticism than the current account. What has been argued in the previous paragraph is that, in the 1930's, a comparatively small net export of capital would have brought the accounts into equilibrium. What actually happened was a considerable net inflow of long-term capital, amounting to \$49 million on the average of 1930-3, to \$471 million on the average of 1934-6 and to \$215 million on the average of 1937-9—and, on top of that, from 1934 onwards, net inflows of short-term capital averaging \$649 million over the six years. In the first half of the decade of the thirties, there is little to choose between the behaviour of American-owned and foreign-owned capital. But from 1935 onwards the inflow of capital, both long-term and short-term, was preponderately foreign-owned. It is, of course, still true that massive loans of new money by America to other countries could, in theory, have balanced the accounts and avoided the necessity for huge shipments of gold. But anyone who is tempted to argue thus should reflect that the need for these loans arose, not out of anything that was wrong with the current account (i.e. America's trading account), but out of the panic flow of foreign funds to America. It was not faulty American economics, but faulty European politics, that was to blame.

Still another defect in the American position was the enormous variation in the total turnover on the exchanges. In 1928 the balance on current account was favourable to the extent of \$1,027 million; in 1933 to the amount of only \$108 million. But it would be misleading to infer from this comparison that the outside world found it easier in 1933 than in 1928 to acquire the dollars it needed; for the total supply of dollars in 1920 was \$7,507 million and in 1933 only \$2,367 million. The experts of the Department of Commerce are inclined to assign no less trouble-making influence to this wide fluctuation in the turnover of the market than to the balance remaining on one side or other of the market. In other words, it is the size as well as the shape of the American accounts that leads to difficulty. It is, of course, difficult to prove by figures which side of the account is the cause and which the effect. Is it a shrinkage in the supply of dollars that causes other countries to cut down their purchases in America, or vice versa? The compilers of the report have little doubt about the answer. Basing their judgment on close scrutiny of the course of events, on a comparison of relations between America and other countries with their relations among themselves, they have no hesitation in concluding that it is the erratic nature of the supply of dollars that chiefly causes the fluctuations. This candour is surprising in those who might easily have thought it their duty to be national advocates; and it is most gratifying evidence of scientific objectivity.

The analysis of the past is interesting; but its chief importance derives from the light it sheds on the prospects for the future demand for and supply of dollars. This will be discussed in a second article.

Business Notes

War Damage Progress

The Chairman of the War Damage Commission has given the press an encouraging account of the progress that the Commission is making with a task that is unprecedented both in scale and in nature. Sir Malcolm Trustram Eve revealed that the Commission had 2,750,000 separate damaged properties on its books, and that 1,754,000 separate claims had been lodged. Of the 1,124,000 claims which called for payment at once, 1,077,000 have actually been paid. The most important new development of principle relates to the treatment of severely damaged houses. The original Act drew a clear distinction between those properties which could not be rebuilt, or where rebuilding was not worth while, and those which were not a total loss. For the latter, the payment is the "cost of works" at the time that those works can be carried out. The former, however, were to receive a "value payment" equal to the value of the property on March 31, 1939, with such adjustment for changes in the value of money as the Treasury thought proper. As the result of this year's amending Act and of a Treasury direction, this principle is now to be substantially modified. In the case of a house built after March 31, 1914, the Commission is now empowered to make a "cost-of-works" payment if and when the owner has been able to rebuild the house, even if it was totally destroyed by the bomb, and the same provision is to be extended to pre-1914 houses, where the Commission is satisfied that they were, before the damage, not less sound than when erected, and in design, lay-out and amenities reasonably similar to post-1914 houses. In short, all post-1914, or equally modern, houses are to be rebuilt at public expense, not compensated for in money. This is a welcome policy—certainly welcome on grounds of public policy and probably welcome to the great majority of individuals concerned. It will, of course, raise very difficult problems in the definition of what constitutes rebuilding a totally destroyed house, so that the new house is neither better nor worse than the old, but these have undoubtedly been foreseen. The Commission shows a wholly praiseworthy anxiety to let the owners of damaged or destroyed properties know where they stand at the earliest possible moment. All in all, the promising experiment of the War Damage Act is working out very satisfactorily. The chief gap in the public's knowledge relates to the methods of valuation. The good will the Commission is acquiring could be destroyed by ungenerous valuations.

Steel Prices

An interesting and informative report by the Select Committee on National Expenditure dealing with the general subject of price-fixing in war contracts (which will receive extended treatment in a forthcoming issue of *The Economist*) contains some incidental remarks on the price-fixing policies of the Iron and Steel Control which have attracted some attention. The Report describes the complicated system of levies which has been in operation all through the war as a means, first, of spreading over the whole industry the burden of meeting the heavy cost of imported raw materials, and later of supporting the profits of the high-cost producers. This levy is not very heavy. The price of plates rose from £10 10s. 6d. in September, 1939, to £16 3s. in November, 1940, and of this rise of £5 12s. 6d., the levy accounted for £3 12s. 5d. Since 1940 prices have been stabilised, and in recent months the levy has not been enough to meet the charges upon it. If payments continue throughout 1943 on the same basis as for the first six months, public funds will be required at the rate of £9 million a year. This disclosure has been reported in the press in such a way as to imply criticism by the Committee. Their attitude, however, is the contrary. They criticise the fact that the price of steel has been inflated by the levy and contend that the whole cost, both of high-cost imports (now obtained under Lend-Lease) and of additional payments to high-cost producers, should be met by the Exchequer. Their only criticism of the use of public funds to subsidise the steel industry is that a statement should have been made to Parliament. This extension of the doctrine of subsidies is a tenable view; but though steel is certainly a basic material, the analogy with food subsidies would hardly apply, since there is no such direct nexus

with wage rates. And since almost all the steel is ultimately paid for out of public funds in any case, the choice between paying a subsidy to keep prices down and paying a subsidy in the price seems rather academic. The one thing that is fairly clear is that the Control has been right to institute some form of equalisation fund (however financed) rather than raise prices to the level at which they would remunerate the high-cost producer and present the low-cost producer with a large profit. *The Economist* frequently criticised the pre-war pricing policy of the Iron and Steel Federation, and the wartime price schedule is only the peacetime schedule with adjustments. But the adjustments themselves seem to have been soundly conceived in the public interest.

Coal Consumption—

These late November days are foggy and damp, and it is not surprising that people are using more fuel. On the first three days of last week, 11 per cent more gas and 7 per cent more electricity were consumed than in the first three days of the week before. (Compared with consumption in the corresponding period of 1942, 13 per cent more gas and 12 per cent more electricity were consumed.) The Minister of Fuel, alarmed at the upward trend, has renewed his warnings and appeals for economy. Last winter's mild weather helped the Government to justify its decision not to ration fuel, and Major Lloyd George was able to claim that less coal was actually delivered to consumers than would have been required to honour a coupon scheme. But, as *The Economist* has repeatedly pointed out, conditions may not always be so favourable. It is too late to introduce a just and effective system of rationing at this stage—the administrative machinery required and the political controversy which it would revive may be sufficient reasons against it—but, though there is little satisfaction in being wise after the event, it becomes increasingly clear that the retreat from rationing in June, 1942, was unwise strategy. The gap between production and consumption, which the Government claimed to have bridged this summer, is likely to widen dangerously at both ends, as more and more coal is needed for military purposes. The public will no doubt respond, as they always have done, to Government appeals and exhortations. The Ministry will continue to issue brightly worded posters and advertisements; the BBC may revive its "fuel flashes"; as last year, housewives will check their meters and neighbours will share their fires. Some patriots may go to bed an hour earlier; others may consider it equally patriotic, and infinitely preferable, to get up an hour later, to relieve the peak load at breakfast time. All this will help, but diminishing returns apply no less to propaganda than to other commodities. With more than misgivings, the Government will have to look more to increased production by an improvement in the industry's efficiency than to reduced domestic consumption, to save the situation this winter.

Wine Merchants to H.M. the King 92 Wigmore Street, W.1

—And Production

The renewed warning by the Minister of Fuel and Power about the gravity of the coal situation was given on Tuesday. In answer to a Parliamentary question, he stated that it might be necessary to reduce coal supplies to domestic consumers in order to offset the decline in production, brought about by decreased output per manshift and losses from strikes. On November 9th, the Minister had given an indication of the extent of the decline in output per manshift at the coal-face from June, 1941, as shown in the accompanying table:—

1941—July	1942—September	2.88
August	October	2.91
September	November	2.92
October	December	2.88
November	1943—January	2.88
December	February	2.88
1942—January	March	2.89

Figures of average weekly output last month showed a distinct improvement over the previous four-weekly period, but there are indications that this month's will show a substantial drop. The number of strikes has been increasing, and although work has been resumed in the Lancashire coalfield, the stoppage of 10,000 miners for nearly two weeks has meant a loss of about 90,000 tons. The Lancashire and Cheshire Mineworkers' Federation and the Durham Miners' Association have both denounced unconstitutional strikes and stoppages as "sabotage"; but the situation is becoming increasingly critical, and it is feared that the release of Sir Oswald Mosley may result in local strikes, especially in connection with the imprisonment of surface workers who refuse direction underground. This week the miners have been considering the Government's reply to their proposals for improving output. The main demands of the Mineworkers' Federation were for the Government to assume financial as well as operational control over the mines; for the release of ex-miners from the Forces; for the granting of a £6 a week minimum for underground workers and £5 10s. for surface workers.

Progress at Montreal

If the latest cabled advices from Montreal are to be trusted, the Executive Committee which is considering the various schemes for the reorganisation of the City's debt has now reached agreement, by a majority of five to one, on a plan to be submitted to the City Council. How long it will take to draw up the necessary bye-law and what support the one dissident of the Committee will find on the Council are matters of speculation, but the message suggests that the details will be ready in the near future. So far as they go, the outlines of the suggested plan seem to coincide quite closely with the desires of the London Committee. But there are a number of points on which there is no information, and inquiries in quarters which may be considered authoritative show that there is no information on this side on this point. It is, however, regarded as reasonably certain that the Executive Committee has agreed on a plan and highly probable that the plan includes very substantial concessions

North John St. Lombard St.

to the British point of view. How long it will take to pass the plan through the Council of one hundred members is doubtful, but it is reasonable to suppose that an acceptable agreement will be reached in the not distant future.

Gold in Egypt

A considerable widening of the gold market in Egypt occurred this week. Until last Monday, the gold market Alexandria, while free to function without restriction, only handled a negligible turnover, consisting mainly of jewellers' scrap and odd coins filtering through from the Middle East. The price in this market has recently ranged around 177 piastres per dirhem, which, taking the piastre at 97½ to the £ and the dirhem as equal to 48.149 grains, gives a sterling equivalent of £16 10s. per ounce. This week, however, the stream of gold reaching the open market in Egypt has been appreciably increased by metal offered through Egyptian official quarters. This gold is being provided by the British Treasury at the request of the Egyptian Government and after due consultation with the US authorities. It is being sold through Egyptian banks and is made available in the form of small bars of 18.69 dirhems over 2 ounces) of 996/1,000 fineness and at a price of piastres per dirhem. These official gold sales fit into a pattern already made familiar by similar operations in the Middle East and India. Their immediate objective is to counter the forces of inflation which in all these territories proceed, not so much from the unbalanced expenditure of their own Governments as from the expenditure in their countries of other authorities (mainly the British and US Governments). The fiscal machinery of the Governments concerned is crude and inelastic even when dealing with their own direct responsibilities, and has made no attempt to mop up the purchasing power created by the large expenditure of extraneous powers. Hence the fact that these countries top the list of inflation-ridden powers, their counterpart on the enemy side being Bulgaria, where exactly comparable conditions obtain. The gold now being sold in Egypt is paid for out of the accumulated sterling resources held by the National Bank of Egypt. The operation thus achieves two objectives. It reduces the accumulation of abnormal sterling balances, and it should mop up redundant purchasing power in Egypt. The policy of combating inflation by sales of gold has its limitations. Under existing conditions the Middle East could prove a dangerously receptive sink for the precious metal, and it is to be hoped that sales of gold will not exclude more orthodox anti-inflationary measures.

Wool Payments to Australia

It was announced this week that since the beginning of the war the United Kingdom Government had paid to Australian wool-growers a total of £A289,753,000 for the clip and skins, and had, in addition, incurred expenditure of £A10,533,000 for storage charges and £A2,964,000 for processing, making an aggregate disbursement in Australia of £A303,250,000. These figures help to explain the steady improvement in the Australian balance of payments since the war. Although the Australian wool clip is now bought in advance by the British Government, payment is only made as the wool arrives and is appraised in the course of the season, and the totals published this week will apply to the four completed clip years which have elapsed since the war. This means that for each year the clip will have provided a yield of over £A70 million for the Commonwealth. This is well above the figure that obtained before the war. In the five years to 1937-38 the annual proceeds of the Australian clip brought in totals ranging from £A39 million to £A62 million, with an average of around £A50 million. The average maintained during the war is thus much higher than what would have been regarded as an exceptionally good figure before the war. In the circumstances, the strength of the Australian London funds position is not surprising. These sterling holdings are said to have wholly recovered from the recent heavy transfers to the British Government in final discharge of the advances made for war purposes by the Treasury. A persistent and important source of support for these sterling funds is the remittance by the Commonwealth of dollars representing the expenditure of American troops in the Pacific sterling area. Although a small dollar reserve is maintained by the Commonwealth Bank, the bulk of this dollar income is remitted to this country and converted into sterling.

Another Air Service Company

The process of staking out claims to air transport continues, and another group of shipping concerns, the Coastal and Short Sea Group, has registered a company to operate passenger and cargo air services over internal and continental routes. The scheme is dependent upon obtaining the necessary consents and machines. The composition of the group is not specifically stated, but it is understood to include the Currie and Wilson lines, the Hamburg Steam Packet, General Steam Navigation and S. Instone lines, on one side, and Tyne, Tees Steam Shipping, France, Fenwick, the London and Edinburgh and the Dundee, Perth and London Shipping companies, on the other. It is to be noted that none of these concerns appears to be associated with the pre-war civil aviation group centred around the railways and Coast Lines, the scope of whose activity was discussed in a note on page 652 of *The Economist* of November 13th. No statement has, so far, been made by this group, but, since the railways have been interested in both internal air transport and cross-Channel services since 1929, and, in fact, carried a very high proportion of the total route mileage for which licences were issued, it is to be supposed that they will have something to say on the subject of this new claim. There is every reason to look with favour on a healthy competition between services, but the emergence of this new Government decision on the policy to be adopted for all forms of air transport, internal, short sea and long distance, is very desirable.

Financing OFS Mines

Formed in 1924 as a reconstruction of another concern, East Rand Consolidated, a company of British registration, has so far never paid a dividend. After nine years of existence it halved its capital by writing off £117,738 and, under the stimulus of the doubled price of gold, launched out afresh, raising its paid up capital to £1,447,500. At the end of 1941, after revaluing investments at market price, it had a debit balance on profit and loss account of over £300,000, against a rather larger reserve account. Its assets included £576,000 odd, exploration account, and £350,000, properties, operations in connection with which had resulted in losses for seven years running. In the previous year its 5s. shares had been down to 3s., but, as a result of protracted negotiations for the acquisition of certain rights in the Orange Free State—the latest El Dorado—they have within the past few days been as high as 17s. It is now revealed that ERC has purchased, from well-known mining houses, prospecting and option contracts over the mineral rights of certain Orange Free State areas and various interests in other areas. The purchase is to be satisfied by the issue of 120,000 shares out of the authorised capital of the company. Further acquisitions are in contemplation. It is also stated that the market value of investments held by the company is now some £2,185,000, that all loans and advances have been paid off, and £150,000 accumulated in cash resources. There is no mention of creditors, but perhaps the figure of £150,000 is net. Nor is there any statement as to the value of other assets. The figures given represent, however, some 8s. for each old share in the company. On the news the quotation fell to 14s. 6d. The remaining 6s. 6d. is, presumably, a measure of the results expected in the OFS. That is to say, the issue of 120,000 on a basis of, say, 15s. per share, or £90,000, is held to warrant writing up by well over £2,000,000 the capital of a company which, in just under 20 years and despite the doubling of the price of the commodity it is designed to produce, has paid no dividend. One may well ask why such a concern is chosen to be the vehicle for the financing of any part of the new venture, for it is, of course, taken for granted that the mining houses will, in due course, sell the shares they have received and use the proceeds in fresh fields of endeavour.

GUS Developments

The ordinary shareholders of Great Universal Stores received a pleasant surprise on Tuesday in the form of an increase in the interim dividend from 2½ to 3 per cent, both tax free. This caused a modest rise in the price to 22s. 4½d. But, before this news can have obtained any wide circulation, there came another shock of a less pleasing character, in the form of a reply to a question to the

ARE YOU RETARDING
EFFICIENCY

by
INCORRECT LIGHTING?

YOU couldn't read this paper in a poor light. Are you asking your workers to do efficient work under poor seeing conditions?

YOU must drive slowly in the blackout because you can't see far ahead. In the same way your workers may be slowed down because they cannot see well enough to work quickly.

LIGHT—THE VITAL FACTOR IN EFFICIENCY. Incorrect lighting impedes efficiency and retards individual output. When poor lighting is corrected, efficiency increases, accidents and "spoils" are reduced, strain is relieved, fatigue is lessened. Obviously total output gains in ratio.

CORRECT LIGHTING IS A SCIENCE. Correct lighting is not merely a matter of increasing the number and the power of your lights. High wattage is no criterion of good lighting. Glare

does not spell efficiency. Lighting is a science: it is a job for the expert.

AN ADVISORY SERVICE FOR INDUSTRY. The Mazda Lighting Advisory Service has been established to assist the owners and managements of factories to obtain expert advice about their lighting with-out obligation.

On request, a specialist will visit your works and report on your lighting. He may find it exactly as it should be, and you will be pleased to have his confirmation. He may make valuable suggestions which, if given effect, will aid production, and in many cases will definitely reduce current consumption and therefore save fuel. You are invited to write to-day for details.

BTH RESEARCH AIDS INDUSTRY

BTH Research Laboratories have made an intensive study of both the physical and psychological aspects of lighting in wartime industry, and their knowledge and experience are at the disposal of the principals of industrial undertakings through the Mazda Lighting Advisory Service.

MAZDA

LIGHTING ADVISORY SERVICE

THE BRITISH THOMSON-HOUSTON CO., LTD., Crown House, Aldwych, LONDON W.C.2. Telephone: Tem. Bar 8046

President of the Board of Trade. This called for the closing of Jays and Campbells, control of which was recently acquired by Great Universal Stores. Mr Dalton replied that between April and November, 1943, convictions under the Goods and Services Price Control Act were obtained against one firm and four convictions against another in this group of furniture dealers. He added that until proceedings were instituted, or there were further offences and convictions obtained, the courts could not make a closing order under the Act of 1941. If such proceedings were instituted he would certainly ask the Attorney-General, or, if in Scotland, the Lord Advocate, to take action. This news produced a fall in the shares to below 21s., followed by a recovery to that figure, a net decline of 1s. on the day. A great deal depends upon the exact dates of the offences and of the acquisition of control by GUS. Neither of these is quite certain. The company announced in mid-September that negotiations were proceeding with Jays and Campbells (Holdings), and three weeks later the acquisition was, apparently, complete. In the circumstances, it would doubtless relieve the anxiety of shareholders if it could be made clear that, neither in this case nor in that of other firms, had there been any history of offences against the Act while the concerns were under the company's control. Some such statement is all the more necessary in view of the board's persistent refusal to disclose the names of other companies acquired in the course of the last few years.

EMI Reserves

The feature of the latest accounts of Electric and Musical Industries is the replacement of the usual combined statement of the subsidiaries by a full consolidated balance-sheet and profit and loss account. Since all the subsidiary companies are wholly owned, as distinct from merely being controlled, either by EMI itself or jointly with Marconi's Wireless, the new consolidated accounts should be of substantial value to shareholders. Unfortunately, although comparable figures for 1941-42 are given, it is impossible to carry back the comparison further. Consolidated profit shows a rise from £637,486 to £926,802, but

a very large part of this is absorbed in higher tax provision. Tax paid and accrued stands at £283,278, against £76,000, and the provision against the estimated liability for 1944-45 is £417,222, compared with £360,000. The amount earned on the ordinary capital is increased from £139,760 to £164,007, equivalent to 11.3 per cent, against 9.5 per cent. The actual payment, announced six weeks ago, was 8 per cent, compared with 6 per cent in each of the two preceding years. In view of the limitation imposed on manufacture, it appears evident that the profit margin must be very considerable. There is little doubt that, subject to the possibility of further price control, this margin is likely to persist during the period of keen replacement demand after the war.

The date of the accounts of the parent has been put three months earlier in order to coincide with that of the subsidiaries, but this makes no difference to profits, since a full year's operations are included. It does, however, put the balance-sheet position back to end-June last. At that date there was, on the year, a very substantial change in the assets of the company. Apart from a drop of £62,500 in fixed assets, presumably due to depreciation, whose amount is not disclosed, holdings in subsidiaries outside this country have been further written down from £188,324 to a nominal figure. As this item includes some Empire concerns, excluding India, Australia and Eire, and some European interests which may be returned to the group—the Japanese interests were sold before the collapse—there is here a very material secret reserve. But, in addition to this, there appears, for the first time, a general reserve of £300,000, created partly by profits on the sale of the Rudge-Whitworth interest to the Raleigh Cycle Company, and partly by bringing in other reserves, previously concealed and no longer required. There is also, for the first time, a taxation reserve, standing at £417,732 in 1942 and £976,283 this year. Total liabilities for tax up to the date of the accounts are estimated at £700,500, which is more than fully covered by a holding of tax reserve certificates. Net liquid assets of the group have increased on the year from £2,811,665 to £3,960,693, but, on each occasion, liabilities include an unspecified amount set aside to cover the cost of replacements and re-establishment of business after the war, which ought to be given separately since it is in no sense of the same nature as trade creditors. The only other item calling for mention is a rise in stock in trade and work in progress from £3,093,235 to £3,721,060, which indicates the trend of the group's activities. The 10s. ordinary shares of EMI stand at 26s. 6d., yielding a few pence over 3 per cent, less tax.

Blocked Cruzeiros

The persistent improvement in the Brazilian exchange position has made it possible for the Bank of England to tackle the problem of blocked cruzeiro balances held in Brazil for account of residents of the United Kingdom. The cruzeiro was added to the list of specified currencies (which must be offered to the Bank of England) in September, 1942, but it was announced at the time that the Bank was not prepared to purchase blocked cruzeiros. These blocked balances are largely a relic of pre-war exchange difficulties in Brazil which led to a succession of defaults and restrictions on the free transfer of milreis accounts. The body of regulations defining the treatment of blocked balances in Brazil is extraordinarily complicated, and many of these assets are immobilised not only by reason of the regulations, but by their liability to Brazilian taxation and to compulsory contribution to Brazilian war loan. The growing sterling balances accumulating here on Brazilian account provided the basis for a compensation agreement. By this agreement residents of the United Kingdom will be able to obtain conversion into sterling of cruzeiro balances which up to the present have been blocked. Conversion will take place in Brazil at the Bank of Brazil's selling rate for sterling. Holders of blocked cruzeiros are asked to give instructions for their holdings to be transferred to the Bank of England's blocked account with the Bank of Brazil. Where there are good reasons for leaving the balance undisturbed, as, for example, where it might have to bear substantial charges on being transferred, the conversion will not be required by the authorities on this side.

BENEFACTORS OF MANKIND

JAMES CLERK-MAXWELL (1831-1879)

"A man that is young in years may be old in hours, if he have lost no time, but that happeneth rarely" wrote Francis Bacon. The life and career of James Clerk-Maxwell is surely a rare example. A great harvest from a short season!

Initiative

MAXWELL initiated research into a wide range of subjects which the shortness of his life prevented him from completing. He clothed electrical phenomena with the language of mathematics. His researches included the theory of colours, colour blindness, the study of molecules, elastic solids, astronomy, heat, matter and motion. His major contribution to science is set forth in his standard work "Electricity and Magnetism". The Brush organisation has initiated many outstanding improvements in the design and manufacture of its world-renowned electrical products.

Engineering Wages

In accordance with the decision taken at its National Committee meeting in June, the Amalgamated Engineering Union has now submitted to the Engineering Employers' National Federation its proposals for the grading of work throughout the industry, and a meeting between the two sides has been arranged for December 2nd. The AEU's object is to arrive at a formula for grading the various machine operations in the engineering industry, irrespective of whether they are performed by men or women. The question of women's wages and the grading of work performed by women has caused considerable confusion, and it was the immediate cause of the recent stoppage in a Scottish aero-engine factory. The position there was that, after the finding of the Wark Court of Enquiry into an alleged breach of the agreement between the employers and the AEU, laying down the conditions for women's employment, an agreement was negotiated, under which workers were graded into five groups, with a difference of 5s. between the two lowest grades. The strikers' demand was that the bottom grade should be raised to the same level as the grade immediately above it. After a nine-days strike, the workers returned, and informal discussions on grading in the factory are now going on. If agreement can be reached nationally upon the grading of engineering wages, and it were to lead to a simplification of the complex structure of wages in the industry it would remove an important potential cause of unrest. On Wednesday the AEU, together with the other unions comprising the joint engineering trade union movement, decided to apply to the employers for an all-round increase of 10s. a week on the base rate. This claim will affect 2 million workers, and will apply to women who, by agreement, are receiving men's wages. While there may be justification for ironing out anomalies and raising wages of lower-paid grades, it would be surprising if the unions were able to produce sufficient fresh evidence to justify a 10s. all-round increase—a demand which was rejected by the National Arbitration Tribunal in March.

* * *

The Cotton Industry's Future

Sir Raymond Streat, opening a recruitment and training exhibition at Ashton-under-Lyne last Saturday, spoke optimistically about the future of the cotton industry. He pointed out that the British cotton trade was still great and strong—before the war it was responsible for 10 per cent of the total world production of cotton yarn—and had developed and flourished without the assistance of protection; the industry had shown itself versatile and resourceful both in meeting peacetime and wartime requirements (the utility cloth scheme being an outstanding example of its adaptability) while wartime improvements in technical efficiency, together with the skill of the industry's operatives and the experience of its technologists, would provide a firm basis for meeting the period of rapid change and development that would inevitably face the textile trade after the war. Sir Raymond was right to emphasise these positive factors. As he himself pointed out, there has been a tendency in Lancashire for self-depreciation and the "writing down" of past achievements, which has in part accounted for the reluctance of young workers to enter the industry. It is the same story as in mining, and the same remedies—improved efficiency and better wages, conditions and prospects—will have to be applied if the cotton industry is to attract the juvenile labour which it so much needs. Sir Raymond, perhaps wisely, did not elaborate his views on the maintenance of Government control, though it seemed to be implicit in his statement that it was above all necessary to avoid price inflation. It will be equally necessary to safeguard against the over-inflation of capital and to a rapid expansion of plants, that happened after the last war. The dangers of this war, when the main burden of clothing Europe may fall on the British textile trade, will be infinitely greater, and it is good to know that the problems of the transition period, such as deconcentration, demobilisation, new plant and repairs, are being closely studied, and will form "the subject of concrete plans which will cover the whole field." Sir Raymond anticipates a continued strong demand for Lancashire cotton products for perhaps two or three years after the war; thereafter, "unless we can gain export markets, we shall find we cannot occupy plant on the scale we now possess." He was not able to throw any light on the long-term problem or on how export markets could be gained. His advice to the industry to concentrate on improving its organisation and efficiency in the transition period was the soundest counsel.

Equity for Life Policyholders

Not least among the problems engaging life assurance offices during recent months has been that of maintaining a proper balance between the interests of the various groups of policyholders which contribute to the total revenues. This is mainly a question of the relationship between the without-profits group, on the one hand, and the with-profits group, on the other. It is evident that in present conditions—continuously falling net interest rates coupled with exceptional mortality due to the war—the without-profits business of most offices must be operating at a loss, and this loss (apart from those few proprietary offices that maintain separate funds for the two classes of business) falls chiefly on the shoulders of participating policyholders in the form of a reduction in the profits otherwise accumulating for distribution. Such a situation is perfectly fair to the extent that policyholders electing to participate in the fortunes of a life office must be deemed to have accepted the hazards, as well as the benefits, of so doing. Nevertheless, insofar as present low interest returns are attributable to the policy, followed by the offices since the beginning of the war, of investing all available funds in Government securities—a policy dictated by national considerations and contrary to the direct interests of policyholders—it seems hard that the whole of the burden should be borne by the participating group alone. There is, of course, nothing that the offices can do to mitigate this inequity—the terms of contracts are fixed and unalterable—and it was for this reason that Mr William Penman, the actuary of the Atlas, in a recent letter to *The Times*, appealed for some reduction in the rate of taxation on life offices' funds, at present fixed at 7s. in the £. In fixing rates for new insurances, however, the offices have a clear duty to take a cautious view of future prospects, both as regards interest earnings and mortality, so that a further aggravation of the inequity is improbable. Net interest earned may be slow to recover after the war, especially as the standard rate of taxation will need to fall below 7s. in the £ before any benefit accrues under this head. And the possibility of further civilian mortality from war causes cannot be ruled out. From this last aspect the practice of some offices of covering civilian war risks without extra charge seems hard to defend, although reductions from the rates current in the early days of the war are doubtless justified.

Besides the relationship between with-profits and without-profits policyholders, there is also the question of maintaining equity between different sub-groups within the participating section. As regards new-business policy, the position is clear—whenever without-profits premiums are increased, with-profits premiums should be adjusted correspondingly, in order to avoid any diminution in the "bonus loading." This was the procedure followed by the Commercial Union in revising its terms on October 1st; the increase in with-profits premiums only, announced by the Scottish Union and National, with effect from November 1st, merely rectified an existing inconsistency. The issue as between different groups of existing policyholders—depending on such considerations as the length of time for which the policy has been in force, the age-grouping, and so on—is far more complex. Mr H. E. Melville, in his presidential address to the Institute of Actuaries, suggested that owing to the decline in interest earnings, and consequent reduction in the importance of this factor, new methods of bonus distribution might have to be evolved if justice is to be done between one class of policyholder and another. On the other hand, it might with equal validity be contended that the office should seek to apply a constant method of distribution, equity between policyholders being maintained by varying premiums from time to time to conform with expectation when the policy is issued. In any case, it does not seem possible for more than rough and ready justice to be meted out on this particular issue.

Light Metals

In his monthly munitions production report for July, Mr Donald Nelson, chairman of the United States War Production Board, said that "the production problem for magnesium and aluminium has been overcome." Magnesium production in the United States now amounts to about 35,000,000 lb. a month, compared with 500,000 lb. before the war. This represents an annual rate of production more than six times as great as the total world output of mag-

(Continued on page 727)

COMPANY MEETINGS

THE FINANCIAL NEWS LIMITED

AN ENCOURAGING TREND

MAJOR-GENERAL DAWNAY'S SURVEY

The forty-sixth annual general meeting of The Financial News, Limited, was held at the registered offices of the company, 20, Bishopsgate, E.C.2, on the 23rd instant, Major-General G. P. Dawnay, C.B., C.M.G., D.S.O., M.V.O., chairman of the company, presiding.

The Chairman said: You will notice that in presenting the accounts for the past year we have adopted the recommendations of the Institute of Chartered Accountants regarding the grouping of assets and liabilities in the balance-sheet. This follows upon the departure made last year of charging income-tax in the general profit and loss account in full and dividends in the appropriation account net after deducting the income-tax recoverable. We believe that these changes will commend themselves to the shareholders as giving a clearer presentation of the company's financial position and earnings.

You will also see that the figures in the accounts are stated to the nearest pound. This is due to the present restrictions upon the size of printed accounts. To have included shillings and pence, which do not materially affect the figures, would have necessitated either using type so small as to be difficult to read or dispensing with detail.

Turning to the figures themselves, you will see from the directors' report that the profit for the year covered by these accounts amounts to £33,122, leaving, after providing £17,264 for income-tax and N.D.C., a balance of £15,858 against £7,298 in the previous year. As this follows last year's increase from £10,960 to £15,374, or after providing for income-tax and N.D.C. from £5,691 to £7,298, your directors consider this result satisfactory. It shows an encouragingly progressive tendency, which seems to be borne out by the further improvement in results shown by our figures during the current year to October, after the closing of the accounts which are now before you. Moreover, once again we have dealt conservatively with the profits of the subsidiary and associated companies, a policy which you will no doubt endorse. The amount carried forward to credit of the profit and loss accounts of the two principal subsidiaries for the year under review has, for instance, been increased by not far short of £6,000.

THE BALANCE SHEET

There are no significant changes in the balance-sheet. On the liabilities side you will see the increased provision for income-tax required to provide for our liability up to the date of the accounts. The mortgage loan has been further reduced during the year, while current liabilities have increased a little, mainly due to the increased provision necessary for taxation. Fixed assets show a small reduction which represents the amount by which they have been depreciated during the year under review. Current assets show an increase of £14,417; trade debtors are about £3,700 down; investments, almost all in Government securities, have been increased by about £16,600; while the reduction in cash at bankers and in hand compared with last year is more than offset by the holding, in addition, of £70,000 tax reserve certificates. Current assets exceed current liabilities by £65,867, compared with £54,450 last year, showing an increased credit balance of £11,417.

Taking all these facts into account, your directors came to the conclusion that the sound financial position of the company

justifies them in recommending the payment of a dividend of 20 per cent. on the ordinary shares. Payment of the preference dividends has absorbed £5,269 net, and the ordinary dividend now recommended will absorb £10,500 net, leaving a small balance to be added to the carry-forward, which will leave the total credit at profit and loss standing at the not unsatisfactory figure of £98,814.

The factors to which I have previously referred as tending to restrict our revenue-earning capacity continued to operate during the past year; but so also did the economies, many of which have been imposed upon us, but which have tended to mitigate the restrictions of our revenue-earning capacity.

THE OUTLOOK

As regards the future prospects, you will not expect me to indulge in prophecy, and I should most certainly not be willing to do so in any case. It must suffice if I say, as my remarks have already indicated, that, judging by the present trend of our business, we are encouraged to hope that the results for the current year may not compare unfavourably with those shown in the accounts before you.

No one can doubt that the war situation is vastly better than when we held our last annual meeting, or that there are to-day many encouraging indications. But it is, I think, well to remember that even after the war one very important part of our earning power is likely to remain greatly restricted, for one can hardly envisage any outpouring of prospectuses in the controlled post-war economy such as contributed so largely to our revenue in pre-war days.

As regards the staff, this has remained at the bare minimum to which I referred last year. We have continued to supplement the pay of those members of the staff who find themselves on active service. Those who remain continue to carry a heavy burden and to work at extreme pressure. They are rendering very efficient loyal service to your company in maintaining the high quality and goodwill of our publications.

The report and accounts were unanimously adopted and a dividend of 20 per cent. on the ordinary shares for the year ended June 30, 1943, was declared.

TIMOTHY WHITES AND TAYLORS, LIMITED

PROFITS WELL MAINTAINED

MR PHILIP E. HILL'S SPEECH

The fourteenth ordinary general meeting of Timothy Whites and Taylors, Limited, was held, on the 18th instant, at the May Fair Hotel, Berkeley Street, London, W.

Mr Philip E. Hill (chairman of the company), who presided, said: Ladies and gentlemen, You will have seen from the accounts that our profits have been well maintained. Actually, as compared with the previous year, they show a slight increase. This is satisfactory in view of the many trading difficulties which have to be overcome under existing conditions.

During the year under review we have attained a record cash turnover. Records have also been reached in the number of prescriptions dispensed and the number of customers served. That these records have been achieved despite the further depletion of our staff as a result of the continued withdrawal of labour to the Forces or some other branch of national service, indicates the debt we owe to those members of our staff whose services we have been able to retain. I would like to take this opportunity of thanking them for their constant and unwearying efforts.

BUSINESS PROCEEDING SATISFACTORILY

The accounts call for little comment. We have made provision for expenses

which will have to be incurred in the re-conditioning of our branches after the war, while provision for taxation in the accounts of the company and its subsidiaries has been made on the basis of the profits earned.

With regard to the present financial year, there is every indication that business is proceeding satisfactorily.

Our stocks have been well maintained. This is essential if we are to continue to provide our customers with that service which they have grown to expect from Timothy Whites even in war-time.

I trust that when next I have the pleasure of addressing you our hopes of a victorious peace will have been realised.

The chairman concluded by moving the adoption of the report and accounts.

Mr. Louis Nicholas, J.P. (vice-chairman), seconded the resolution, which was carried unanimously.

The recommendations as to dividends were approved.

The retiring directors (Sir Rhys Rhys Williams, Bt., K.C., and Mr J. J. Sainsbury) were re-elected, and the auditors (Messrs Price, Waterhouse and Co.) having been reappointed, the proceedings terminated.

MODDERFONTEIN EAST, LIMITED

(Incorporated in the Union of South Africa)

CONSERVING ESSENTIAL STORES

The annual general meeting of Modderfontein East, Limited, was held in Johannesburg on the 18th instant.

Mr W. M. Frames, who presided, moved the adoption of the report and accounts.

Commenting on the accounts, the chairman said the total profit had amounted to £939,359. Dividends had absorbed £325,782, provision for taxation had amounted to £489,622, and provision for lease consideration had been £128,694.

To effect economies in consumption of essential stores and materials, development had been again severely curtailed, footage advanced amounting to 6,699 feet, a decrease of 18,942 feet compared with the previous year's figure. Payable ore developed had been estimated at 643,116 tons of an average value of 3.8 dwt. per ton.

The available ore reserve had been re-estimated at June 30, 1943, to be 6,712,700 tons of an average value of 3.6 dwt. over a stoping width of 41.7 inches. In comparison with the estimate made at the close of the last financial year, the available reserve had shown a decrease of 455,200 tons, the average stoping width being 0.3 inch lower, while the average value had been unchanged.

LABOUR SHORTAGE

Serious shortage of native labour during the greater part of the year had affected mining operations and resulted on a decreased tonnage of ore milled.

During the year there had been no change in the price received for gold and the rate at which normal income-tax had been payable by the company, but the rate of special contribution had been increased from 20 per cent. to 22½ per cent. as from January 1, 1943. In 1941 a tax of 5 per cent. on dividends payable to shareholders non-resident in the Union had been introduced, and in 1943 that tax had been increased to 7½ per cent.

A large number of the company's European employees was absent on military service.

The report of the proceedings at the meeting would not be circulated to shareholders, but copies could be obtained on application to the head office in Johannesburg or to the London office.

The report and accounts were adopted.

JOHANNESBURG CONSOLIDATED INVESTMENT COMPANY, LIMITED

MINING INDUSTRY'S PROBLEMS

The annual general meeting of the Johannesburg Consolidated Investment Company, Limited, was held, on the 23rd instant, in Johannesburg.

Mr G. H. Beatty, who presided, in the course of his speech said: The strong financial position of the company is fully maintained. The total book value of the assets of £10,366,052 leaves a surplus of assets over liabilities of £7,974,568.

The profit for the year after providing for taxation, for all ascertained and estimated charges and for depreciation, amounted to £881,424, an improvement of £347,675 over the previous year. With the balance of £719,645 brought forward there was an available amount of £1,101,069, which was dealt with as follows: The dividend at the rate of 3s. per share, less United Kingdom income tax, being 1s. per share more than that for the preceding year, absorbed £592,500, and £250,000 was transferred to the reserve fund, leaving a balance of £258,569 to be carried forward.

ABNORMAL CONDITIONS

Conditions are abnormal and the mining industry is working under many disabilities. A comparison between results of the first six months of 1942 and the same period of 1943 is sufficient to indicate the present trend. An acute shortage of native labour was responsible for a fall in tonnage crushed from 33,930,000 tons to 30,148,000 tons, and was primarily responsible for a fall in working profit of £2,575,000 to £1,946,300. Working profits for the current year are being taxed a further 2½ per cent. by an addition to the special contribution, which was increased from 20 per cent. in 1942 to 22½ per cent. this year, and it is inevitable that the year's dividends will be materially less.

The native labour position will probably improve in the course of time, but the fact that working costs have registered a continuous increase is a more serious matter and one for which, at present, no prospect of improvement is in sight. This is a matter of grave concern for the whole community in South Africa. The shareholder, however, need not be unduly perturbed, for the reason that rising costs cut our progressively the lowest grade ore, from which only trifling dividends are paid. It is South Africa that is the loser; it is the mining of ore which produces the bulk of the company's wealth, not the profit which is made from it.

INCREASED REALISATION

At our meeting in November, 1940, I mentioned that the Government had decided to add certain non-existent gold realisation charges amounting to 3.2s. per ounce, to the working costs of the mines, and that thereby anomalies in taxation were, unfortunately, again introduced, in that they formed a tax on the product instead of on profits earned. I also mentioned that these charges fell most heavily on the lowest grade mines. The anomaly has now become apparent. These realisation charges in effect artificially reduce the revenue from gold from 168s. to 164.8s. per ounce. On a low-grade mine such as one in which the costs without these charges exceed 164.8s. per ounce, the realisation charges convert a profit into a loss and have the same effect therefore on the mine as a profits tax levied at over 100 per cent.

The following are the aggregate results of the gold mining companies of the group for the six months ended June 30, 1943:—Tons crushed, 5,815,000; yield, 962,289 ounces; yield per ton, 3,309 dwts.; working costs, £3,928,619; working costs per ton, 20s. 5d.; working costs per ounce fine gold produced, 123s. 3d.; gross profit, including sundry revenue, £2,216,480.

The report was unanimously adopted.

BLYVOORUITZICHT GOLD MINING COMPANY, LIMITED

(Incorporated in the Union of South Africa)

INCREASED ORE RESERVE

Dr Hans Pirow presided at the annual general meeting of the Blyvooruitzicht Gold Mining Company, Limited, held in Johannesburg on the 19th instant. Moving the adoption of the report and accounts, the chairman said expenditure charged to capital account during the year under review had been £59,531, mainly in respect of equipment, leaving a balance of working capital on hand of £82,480. Operations at the mine during the year had resulted in a working profit of £96,974. Deducting from that figure a debit balance on income and expenditure account at June 30, 1942, namely, £35,671 and £1,607, being the difference between sundry items of income and expenditure for the current year, left the amount of £59,696 to be carried to appropriation account. After providing £16,502 for taxation and £202 in respect of miners' phthisis outstanding liability, there had remained an unappropriated balance of £42,992 at the close of the financial year.

Development accomplished at No. 1 shaft during the year under review had totalled 26,758 feet, an increase of 10,839 feet compared with the previous year. Reef development had been carried out on all levels from one to seven, and a total of 16,860 feet had been sampled on Carbon Leader, all of which had been classed as payable, the average sampled value being 60.6 dwts. per ton over a width of 13 inches equal to 788 inch dwts. The Sixth Level Main Haulage Drive West was being advanced in the footwall of the reef with all possible speed in order to expedite holing with No. 2 Shaft. Progress during the last few months had been at the rate of over 250 feet per month.

Ore reserve had been re-estimated at June 30, 1943, and had totalled 1,426,000 tons valued at 15.1 dwts. per ton over an assumed stopping width of 45 in. Compared with the tonnage of ore developed at June 30, 1942, it showed an increase of 843,000 tons, value being 0.3 dwts. higher. A shaft pillar had now been defined, and of above total, 593,500 tons valued at 14.4 dwts. per ton had fallen within its limits. A balance of 832,500 tons averaging 15.6 dwts. per ton, would not become available for stopping until connection was made with No. 2 Shaft.

IMPROVED EQUIPMENT

During the year the initial pumping equipment for the mine had been completed and put into operation. The waste pass system to facilitate elimination of waste rock from development faces which were off the reef had been completed from the third to the sixth level and the South Hoist had been equipped with four-ton skips for hoisting that waste from the Sixth Level bin for dumping on the surface. Ventilation had been improved by the installation of a 108 in. diameter fan on the First Level, which exhausted approximately 100,000 cubic feet of air per minute from the mine. It replaced the temporary fan which had been installed below the Fifth Level.

The reduction plant had functioned satisfactorily throughout the year and had been able to mill and treat all ore obtained from development. The erection of an additional rotary slime filter had been completed.

Towards the end of the financial year work had been started at No. 2 Shaft in preparation for a resumption of sinking. The erection of a Ward Leonard hoist at that shaft had been completed and a steam hoist had been overhauled.

Limitation imposed by mining regulations which restricted to 300 the number of persons who could be employed in single outlet mines had resulted in severe restric-

tions on development. Those restrictions had become increasingly serious as development ends had progressed to longer distances from the shaft. At the end of the year, however, permission had been obtained from the Mines Department to increase the number to 450. That would improve the position considerably when native labour became available.

In order to conserve existing stocks of paper it had been decided not to circulate to shareholders the report of the proceedings at the meeting. Copies could be obtained, however, on application to the head office in Johannesburg or to the London office.

The report and accounts were adopted.

CONSOLIDATED MAIN REEF MINES AND ESTATE, LIMITED

(Incorporated in the Union of South Africa)

DEVELOPMENT POLICY AND ORE RESERVES

The annual general meeting of Consolidated Main Reef Mines and Estate, Limited, was held in Johannesburg on the 18th instant.

Dr Hans Pirow presided, and in moving the adoption of the report and accounts, said the total profit had been £540,152. Dividends had absorbed £265,115, provision for taxation had amounted to £236,450, and provision on account of outstanding liability in respect of miners' phthisis compensation had been £11,886.

Expenditure on capital account during the year had amounted to £13,338, from which had been deducted the sum of £8,248 received in respect of sales of freehold, leaving net capital expenditure of £5,090. The main items of expenditure had been additions to reduction plant, two tube mills and rotary filter which had been on order for a long time and had been delivered during the latter part of the year. Additional expenditure had also been incurred in connection with hoisting and shaft equipment.

Development accomplished during the year totalled 52,375 feet, a decrease of 49,815 feet compared with the previous year's figure. Reduction in development footage had been in conformity with the general policy followed by the gold mining industry to conserve essential stores to the fullest possible extent.

THE ORE RESERVES

Available ore reserve had been re-estimated at June 30, 1943, to be 8,875,100 tons of an average value of 3.6 dwts. over a stopping width of 57.4 inches. Compared with the previous year the available reserve has shown a decrease of 951,800 tons, the average value being higher by 0.1 dwts., while the stopping width had been less by 0.9 inch.

The price received for gold and the rate at which normal income-tax had been payable by the company had remained unchanged throughout the year, but the special contribution had been increased from 20 per cent. to 22½ per cent., as from January 1, 1943. In 1941 a tax of 5 per cent. on dividends payable to shareholders non-resident in the Union had been introduced, and in 1943 that tax had been increased to 7½ per cent.

During the year operations at the mine had been severely hampered by a serious shortage of native labour which was continuing at the present time.

In order to conserve paper stocks the report of the proceedings at the meeting would not be circulated to shareholders. Copies of the report could be obtained, however, on application to the head office in Johannesburg or to the London office.

A large number of the company's European employees was absent on military service.

NEW MODDERFONTEIN GOLD MINING COMPANY, LIMITED

(Incorporated in the Union of South Africa)

PROSPECTS AFFECTED BY LABOUR SHORTAGE

Dr Hans Pirow, the chairman, presided at the annual general meeting of New Modderfontein Gold Mining Company, Limited, held in Johannesburg on the 19th instant.

In moving the adoption of the report and accounts, the chairman said the total profit had been £511,261. Dividends had absorbed £245,000, provision for taxation had amounted to £227,578 and provision on account of outstanding liability in respect of miners' phthisis compensation had been £31,277.

There had been a further reduction in development footage during the period under review, the total amounting to 13,653 feet, a decrease of 16,009 feet compared with the previous year's figure. The payable ore proved had been estimated at 320,300 tons of an average value of 2.6 dwts. per ton, which was a decrease of 265,000 tons compared with the previous year's total, the value being 0.2 dwts. lower. The decrease could be largely attributed to a reduced footage in development brought about by the small extent of favourable areas which still required exploitation. Prospects of developing any considerable new tonnage of payable ore on Upper Leaders were poor and, although development on the Black Reef had proved small isolated blocks of payable ore, occurrence of that reef was limited to a small area near southern boundary.

ORE RESERVE POSITION

The available ore reserve had been re-estimated at June 30, 1943, to be 3,468,200 tons of an average value of 2.7 pennyweights. Compared with the previous year's figure the available reserve had shown a decrease of 1,331,100 tons, the average value being 0.3 dwts. lower, while the stopping width had been 0.1 in. greater. There was little prospect of opening up any large new area of payable ore in the mine and, as indicated to shareholders at last year's meeting, the tonnage contained in reserve must be expected to show a continuous decrease.

The price received for gold and the rate at which normal income-tax had been payable by the company had remained unchanged throughout the year. There had been, however, an increase in the special contribution, which had been raised from 20 to 22½ per cent. as from January 1, 1943. In 1941 a tax of 5 per cent. on dividends payable to shareholders non-resident in the Union had been introduced, and in 1943 that tax had been increased to 7½ per cent.

Throughout the year operations at the

(Continued from page 724)

nesium in 1939; and the American programme has not yet reached its peak. Mr Arthur H. Bunker, Director of War Production Board's Aluminium and Magnesium Division, gave some figures last week of the United States supply of aluminium which show that no less than 1,438,500 short tons of aluminium will be at the disposal of the US Government this year; and output in the fourth quarter this year is already at the annual rate of 1,742,400 short tons, with a number of new plants only now nearing completion. This rate of production is more than ten times as great as United States production in 1939 and between two and three times as great as world production in the last pre-war year—but it includes an unspecified tonnage of aluminium supplied by Canada to the United States. Canada, according to a recent statement by the Munitions Minister (Mr Howe), is now producing over 500,000 short tons of aluminium a year, compared with less than 100,000 tons in 1939. Some 90,000 short tons of Canadian aluminium, scheduled to be sent to the United States next year, have recently been diverted to the United Kingdom, while Russia's allocation for the third quarter of this year had already

mine had been severely hampered by a serious shortage of native labour, which continued at the present time.

In order to conserve paper stocks the report of the proceedings at the meeting would not be circulated to shareholders. Copies of the report could be obtained, however, on application at the head office in Johannesburg or to the London office.

A large number of the company's European employees was absent on military service.

The report and accounts were adopted.

NOURSE MINES, LIMITED

(Incorporated in the Union of South Africa)

DEVELOPMENT RESULTS

Mr W. M. Frames presided at the annual general meeting of Nourse Mines, Limited, at Johannesburg on the 19th instant. In moving the adoption of the report and accounts, the chairman said that the total profit had been £337,252. Dividends had absorbed £137,141, provision for taxation had amounted to £177,230, and provision on account of outstanding liability in respect of miners' phthisis compensation had been £14,139.

Capital expenditure amounting to £16,209 had been spent on the erection of additional staff married quarters which was referred to in the chairman's address last year, the installation of a further tube mill and additional underground pumping equipment.

Development accomplished during the year had amounted to 8,864 feet, a decrease of 10,162 feet compared with the previous year's total, being due to further curtailment of the company's development programme with the object of conserving essential stores and materials. Payable ore developed had been estimated at 265,700 tons of an average value of 4.4 dwts. per ton. Sinking of No. 3 Incline which had been suspended in the early part of the financial year, had been resumed last June and a normal rate of sinking was being maintained. It had been considered essential to recommence that work, as any further delay in sinking would have rendered difficult the opening up of that lower area in the time necessary to enable it to conform to the working of other parts of the mine.

The available ore reserve re-estimated at June 30, 1943, had totalled 3,043,600 tons of an average value of 4.3 dwts. over an estimated stopping width of 47 inches. In comparison with the position at the last yearly estimate the available reserve had shown a decrease of 383,800 tons, the average stopping width being one inch less while the average value had remained unchanged.

Mining operations had been adversely affected by a serious shortage of native labour which had become progressively worse during the latter half of the year and caused a decrease in the tonnage of ore milled.

There had been no change during the year in the price received for gold and the rate at which normal income-tax had been payable by the company, but the rate of the special contribution had been increased from 20 per cent. to 22½ per cent. as from January 1, 1943. In 1941 a tax of 5 per cent. on dividends payable to shareholders non-resident in the Union had been introduced, and in 1943 this had been increased to 7½ per cent.

The report of the proceedings at the meeting would not be circulated to shareholders, but copies could be obtained on application to the head office in Johannesburg or to the London office.

A large number of the company's European employees was absent on military service.

The report and accounts were adopted.

SECOND INDUSTRIAL TRUST, LIMITED

APPRECIATION ON BOOK VALUES

The thirty-second ordinary general meeting of the Second Industrial Trust, Limited, was held, on the 22nd instant, in London.

Capt. E. C. Eric Smith, M.C., who presided in the absence of the chairman of the company, Mr Sanford Poole, through indisposition, said:

The accounts show a gratifying increase of £2,157 in the gross receipts. It will thus be seen that revenue has risen by upwards of £4,000. United Kingdom taxation absorbs slightly more. We have again no direct liability for N.D.C., though some part of our income has been affected indirectly by this duty or by E.P.T. suffered by those companies in whose equities we are interested.

Our net revenue of £24,709 compares with £23,049. After payment of the 4½ per cent. dividend on the preference shares, the balance represents 6.84 per cent. earned on the ordinary shares. We recommend that the ordinary dividend for the year be maintained at 5½ per cent., less tax, for the sixth successive year. Our investments stand at £1,394,056, a reduction of £5,938. The spread of our investments has not varied much; 70.5 per cent. is invested in Great Britain and the Dominions. Holdings in bonds, debentures and guaranteed stocks have declined from 24.37 per cent. to 23.06 per cent., due largely to the repayment or redemption of debenture issues. Holdings of equity stocks have correspondingly increased from 52.69 per cent. to 54.08 per cent. The depreciation of 11½ per cent. in market value reported a year ago has been entirely disappeared, and we are able to announce an appreciation for the first time since 1937.

Looking ahead, I can only express the hope that we shall meet next year in more peaceful times. I anticipate that our revenue will show no marked variation.

The report was unanimously adopted.

been met before the end of the third quarter. Light metals were most prominent among the few key raw materials in the supply of which the Axis entered the war with a substantial superiority over the United Nations. During the war the Axis has continued to expand its production which, however, was last year outstripped by that of the Allies. This wartime race for aluminium and magnesium supplies will create a difficult post-war problem. World supplies of magnesium after the war will probably be at least ten times as great as they were in 1939, while supplies of aluminium are likely to be four or five times greater. A vast expansion in the use of aluminium and magnesium is thus a necessity. Fortunately their extensive employment in war production has greatly increased technical experience in their use. Reduced production costs, because of large-scale production, will enable light metal producers to fix future prices at much lower levels. But aluminium and magnesium will have to compete with the majority of other metals for many of the latter's old-established uses; and the effects of the wartime expansion in light metal production will make themselves felt on practically all metal markets.

RECORDS and STATISTICS

INDUSTRY AND TRADE

Surplus Stocks of Utility Cotton Goods.—The Board of Trade and the Ministry of Supply have discussed with representatives of the trade associations concerned, arrangements under which the Ministry of Supply will purchase stocks of certain kinds of clothing in order to form a reserve for relief purposes. Only utility goods will be purchased in the first instance, but further notice will be issued if non-utility fabrics are required. Only goods which are held by traders in excess of the stocks required for supplying the civilian market will be dealt with. Information will be given regarding the quantities of each kind of clothing which will be required, and while coupons will be issued to replace the coupon value of goods purchased, there will be no replacement of raw material for fresh manufacture. These arrangements do not apply to knitted goods, which will be the subject of a separate announcement.

Iron and Steel.—The Minister of Supply has made the Control of Iron and Steel (No. 32) Order (SR and O, 1943, No. 1530), which came into force on November 3, 1943, and revokes and consolidates the Control of Iron and Steel (Nos. 15-20, 22, 23, 26, 28 and 31) Orders, 1941-3. The Order also extends control to niobium and tantalum ores and all chemical compounds of molybdenum, tungsten or vanadium (exclusive of catalysts or pigments). It permits stockholding merchants to prepare material supplied against an authorisation under the distribution scheme to the extent covered by that authorisation. In other cases stockholders may perform simple operations such as cutting and holding. Where a re-sale is made at the request of the Minister of Supply involving additional transport costs, he may authorise an addition to the maximum controlled price. The Order also authorises a number of price changes.

Paper Ration for Periodicals.—An increase in the quantity of paper which may be used in the production of news-bulletins, magazines and periodicals, is permitted under the Control of Paper (No. 48) Order, 1942, Direction No. 8, issued by the Minister of Supply. The rate for the four months from November 1, 1943, to February 29, 1944 (and any subsequent four-monthly period from March 1st, July 1st or November 1st in any year) will be 7½ per cent as compared with the previous figure of 6½ per cent of the amount of paper consumed of the standard. The allowance for similar publications published since the outbreak of war is fixed on a comparable basis.

Bacon-curing Industrial Council.—The National Joint Industrial Council for the bacon-curing industry was set up last week. It is composed of representatives of five employers' associations and five trade unions, and the scope of the Council will cover the regulation of wages in the industry and also a wide range of subjects upon which joint consultation may be pursued dealing with matters affecting the progress and well-being of the industry.

Combined Food Board.—Canada is to become a member of the Combined Food Board in Washington, which was set up in June, 1942.

"The Economist" Sensitive Price Index.—This Index has remained unchanged at 149.7 (1935=100).

FINANCE AND BANKING

THE MONEY MARKET.—The supply of credit in the money market has again been barely adequate to meet requirements, although the market's contribution to Government floating debt borrowing has been on a small scale. Treasury Deposit Receipt payments of £40,000,000 have this week exceeded effective maturities by about £15,000,000, while Treasury bill payments of £90,000,000 have equalled the maturities. Credit conditions have been strained by the clearing banks' November making-up, which has been in full swing during the week. This factor is reflected in this week's Bank return. Bankers' balances at £183,168,000 are at a level which would have indicated exceptionally comfortable credit conditions, were it not for the banks' window dressing. The special assistance given to the market this week by official purchases of bills, is shown in the rises of £34,965,000 in Government securities

and of £5,054,000 in Other securities. The building up of bankers' balances preparatory to the December dividend payments is not yet apparent in the Bank return, which shows Public deposits £1,768,000 lower at £6,753,000, but it is a factor which should tend to keep money in short supply between now and the end of the month. The note circulation continues its steady climb, the past week's advance amounting to £5,365,000 and reducing the reserve of unissued notes to £31,194,000, a figure which suggests that further reinforcement of the reserve through an increase in the fiduciary issue will be required before the end of the year.

MONEY RATES, LONDON.—The following rates remained unchanged between Nov. 19th and Nov. 25th:—
Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1¾%; 6 months, 1½-1¾%. Treasury Bills: 2 months, 1-1½%; 3 months, 1-1½%. Day-to-day money, 1-1½%. Short Loans, 1-1½%. Bank deposit rates ½%. Discount deposit at call ½%; at notice 1%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between Nov. 19th and Nov. 25th. (Figures in brackets are per cent of exchange.)

United States. \$ (4.862) 4-02½-03½; m.a. transfers 4-02½-03½. **Canada.** \$ (4.862) 4-43-47; m.a. transfers 4-43-47. **Switzerland.** Francs (25.23) 17-30-40. **Sweden.** Krona (18.159) T.T. 16-85-95. **Dutch West Indies.** Florin (12.11) 7-58-62; Portugal. Escudos (110) 99-80-100-20; mail transfers 99-80-100-30. **Panama.** 54-02-04; mail transfers 4-02-04½. **Brazil.** 83-64½ c. (buying). **Uruguay.** 7-6597 p. (buying).

Fixed Rates for Payment at Bank of England for Clearing Offices. **Spain.** Peseta 40-50 (Official rate). **Turkey.** Piastres 520. **Italy.** 71-25 lire.

Market Rates.—The following rates remained unchanged between Nov. 19th and Nov. 25th:

Egypt. Piastres (97½) 97½-1. **India.** Rupee (18d. per rupee) 17½-18½ d. **Belgian Congo.** Francs 176½-1. **China.** National \$3-3½. **Iran.** Rl. 128-130.

Special Accounts are in force for Chile, Peru, Bolivia and Paraguay, for which no rate of exchange is quoted in London. Rate for payment into Argentine special account: 16-03 pesos.

Forward Rates.—Forward rates for one month have remained unchanged as follows: **United States.** ½ cent pm.-par. **Canada.** ½ cent pm.-par. **Switzerland.** 5 cents pm.-par. **Sweden.** 3 ore pm.-par.

The features that have characterised Irish banking since the beginning of the war continue with monotonous regularity. Deposits expand, but such is the absence of profitable investment opportunities that loans and advances steadily contract. The banks' assets are gradually moving from the higher earning to the lower earning categories with the result that profits are not increasing at all proportionately with the increased resources. The accumulation of net sterling assets has reached a new peak, caused mainly by the huge volume of remittances from workers in Great Britain. Eire, being a strong creditor country, is not able to utilise these sterling assets to redeem external liabilities. They will continue to increase, therefore, until the period of restocking after the war when, it is to be hoped, they will purchase many sadly-needed imports.

(Continued on page 732)

GOVERNMENT RETURNS

For the week ended Nov. 20, 1943, total ordinary revenue was £39,521,000, against ordinary expenditure of £94,376,000, and issues to sinking funds of £250,000. Thus, including sinking fund allocations of £8,894,860, the deficit accrued since April 1st is £2,057,207,000 against £1,916,685,000 or the corresponding period a year ago.

change has been made in the method of showing excess of Post Office Expenditure over Post Office revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £1,406 to £2,734,082, the other operations of the week (no longer shown separately) led the gross National Debt by £443,259 to £18,904 million.

THE CONSOLIDATED GOLD FIELDS OF SOUTH AFRICA, LIMITED

NOTICE IS HEREBY GIVEN that the Ordinary General Meeting of Members of The Consolidated Gold Fields of South Africa, Limited, will be held at THE CHARTERED INSURANCE INSTITUTE, 20, Aldermanbury, London, E.C.2, on Thursday, the 2nd day of December, 1943, at 12 noon, for the purposes following, namely:—

To receive and consider the Statement of Accounts and Balance Sheet and the Reports of the Directors and Auditors thereon for the year ended 30th June, 1943; to confirm the dividends paid on the First and Second Preference Shares; to sanction the declaration of a dividend on the Ordinary Shares; to elect Directors and Auditors, to transact the other ordinary business of the Company, and as a special business to confirm the Resolutions passed in Limited, for granting a pension to Mr Douglas Christopher, son, and to his wife, Mrs. Alma G. Christopherson, as stated in the Directors' Report of that Company dated 15th November, 1943.

Holders of Share Warrants to Bearer wishing to attend or vote at this meeting must deposit their Warrants with the Company at the Registered Office in London, 49, Moorgate, E.C.2, not later than 27th November, 1943, together with a declaration on the form obtainable at that Office.

Dated this 23rd day of November, 1943.
 By Order of the Board,
 R. CARR TAYLOR, Secretary.
 Registered Office: 49, Moorgate, London, E.C.2.
 Emergency Office, Motcombe House, Motcombe, near Shaftesbury, Dorset.

Out of Touch?

IN the next weeks the policy and intentions of the Government will be passed under general and searching review. This is a characteristic and essential part of the Parliamentary process, and in these debates the "talking shop" is seen at its most valuable. Sir Richard Acland, who is a crude but shrewd politician, has expressed the view of the Mosley case that, whatever the rights and wrongs, the episode proves the Government to be out of touch with popular opinion. This judgment has wider implications. The release of Sir Oswald Mosley can be justified to the full, as it was in the House on Wednesday. The question which must be asked and answered in the forthcoming debate is whether the Government is out of touch on much broader issues. The general mood, in Parliament and among the people, is one of doubt mixed with a new hope.

The Government starts with a number of disadvantages, some accidental, others self-imposed. Parliamentary rule is at its most vulnerable when the gap between Government and people is wide, and inevitably in wartime there is such a gap. There are no elections, and war policy is settled in official secrecy. It is dangerously easy to do by command what might be hard to do by persuasion. The war itself can, of course, bridge the gap, as it did in 1940, when danger put steel into the Government's resolution and fire into the nation's belly. The question now is

whether the prospects and problems of peace can do the same.

Here the Government has weakened its standing by its own earlier attitude to reconstruction. The programme forecast in Mr Churchill's recent speeches reflects a belated conversion from a stubborn refusal to consider these problems until hostilities end. The principle on which the present Government works is the old music-hall tag: "When father turns, we all turn." It is not surprising that, perhaps unkindly, there is only moderate faith in the willingness and ability of these Ministers to translate "Food, Work and Homes" into practice with skill and promptness.

This lack of faith springs in part from the way in which the Government approaches its tasks. It is, no doubt, a sense of integrity as well as one of political caution that makes Ministers, from the top downwards, disinclined to make hasty promises or rash proposals. To a point, this is very proper. The fate of the nation, as well as that of particular politicians, would be involved in a repetition of the vast disappointments which followed the promises of 1918. But "Homes for Heroes" and the rest proved to be illusions last time, not because the programme was wrong or too ambitious, but because the performance was hopelessly misguided and inept. It is right that the Government should be afraid of failure, but wrong that it should

herefore limit its objectives disastrously. In fact, it is more probable that this coy approach reflects the traditional attitude of the main Government party towards programmes of reform. This attitude has recently been well defined by Mr Kenneth Pickthorn as a belief that, since government is basically the use of force, which should be limited as far as possible, the aim should be a minimum of government; when in doubt, do not legislate or interfere. In part, this view is a natural reaction to the extreme Left's notion that government is a good in itself; when in doubt, nationalise. It is one of the fatalities which has overcome British politics that the making of policy has been caught between these two fires. The futile and distracting discussion about the merits and demerits of Control has been the consequence. In fact the only correct approach to the problem is strictly utilitarian. The object is the greatest possible use and distribution of the nation's resources, material and spiritual, in the freest possible way; and state action is called for only to the extent to which it is necessary to secure this condition of full enterprise. As was said in *The Economist* last week:

Control as such—that is the negative imposition by one set of persons and prohibitions on the activities of others—should everywhere be reduced to a minimum. A community needs to take its brakes off, not to put new brakes on.

Where public enterprise is needed to achieve social needs, it should be boldly introduced; where it is not needed it should be avoided with equal determination. What is required is not more and more planning, but better planning wherever it is needed.

The trouble is that, while this arid discussion of generalities has gone on in public, in politicians' speeches and in the press, the Government's real work has gone on behind the scenes. Not the least of the Government's disadvantages is its habit of secret negotiation. This is true in both home and foreign affairs. No doubt matters of strategy and war production cannot be discussed in public, but there are many vital questions in the preparation for peace, international and national, which could and should be discussed openly. Wherever avoidable, secret diplomacy and collective bargaining *in camera* are thoroughly bad and inefficient practices.

They are inefficient because, inevitably, the result is that the policy made is out of touch with both popular ideals and expert ideas. A year ago the Beveridge Report appeared and caused a great upsurge of popular belief in the future of Britain, a sentiment which much outstripped the narrow concept of social security. In the twelve months that have passed since, the Government has done little, by speech or action, to indicate any response to this new found sense of patriotic confidence. Instead, it has allowed the revival of faith to split again into the cynicism and scepticism so familiar in the thirties; the Mosley uproar is symptomatic. It was, of course, the Government's duty to examine the Beveridge Report and its implications with the utmost care, and to work out, as it has done, its own official proposals. But it was a vast error in leadership to throw continual cold water on the awakening spirit of which the Beveridge Report was only the accidental occasion. And it is unfortunate, for similar reasons, that the Government has gone to work behind closed doors. The ban on economic discussions between Sir William Beveridge himself and civil servants is symptomatic of an attitude which prefers the ivory towers of Whitehall—and perhaps those of Transport House and the offices of the great industrial combines and federations—to the proper pooling of experience and ideas.

Now Parliament and the people look, with some misgivings, for signs of grace. Mr. Lyttelton's opening speech on Tuesday was the merest prologue; nothing that he said about the transition from war to peace, about housing, social security, or town and country planning, was new. The Government's leading players, Mr Churchill and Lord Woolton, have still to make their appearance; as so often has happened in the dramatic moments of wartime politics, it is even doubtful when the Prime Minister will manage to reach his dressing-room. It may be that the Government, by the inspiration of its words and the completeness of its proposals, may gain another victory over its critics. Certainly, whatever political view may be held, it is devoutly to be wished that this may be so. This country has now an opportunity to put its house in order and give a brave new lead to the world; and it is a chance that will almost certainly never come again in the lifetime of the present actors at Westminster.

UNRRA Decides

WRITING in 1919, within a few weeks of the Paris Conference, John Maynard Keynes protested that

the Treaty includes no provision for the economic rehabilitation of Europe—nothing to make the defeated Central Empires into good neighbours, nothing to stabilise the new states of Europe, nothing to reclaim Russia; nor does it promote in any way a compact of economic solidarity amongst the Allies themselves; . . . The Council of four paid no attention to these issues . . . It is an extraordinary fact that the fundamental economic problem of a Europe starving and disintegrating before their eyes was the one question in which it was impossible to arouse the interest of the Four.

Here, at least, it seems that the experience of the last war has not been lost. Another week's work has been accomplished by the United Nations Relief and Rehabilitation Administration at Atlantic City, and the Council has closed its first meeting with the passage of forty-one resolutions. Unfortunately, the reporting of the meeting has been excessively bad. No full and official account of the resolutions has yet been received in this country, even though they undoubtedly cover major decisions of policy; and press accounts of the resolutions have mostly been contradictory. However, while making full allowance for inaccuracy, it is possible to say that the Atlantic City meetings have faced the question of relieving Europe, shared the burden of supplies, reached agreement on methods of distribution and set up machinery to put the agreement into effect. The European Committee under

the chairmanship of Colonel Llewellyn will sit in London. The whereabouts of the Far Eastern Committee, under the chairmanship of China, has still to be fixed—Sydney and Chungking have been mentioned. Russia is not a member of the Far Eastern Committee, but is not only on the Central Committee, but on the Committee for Europe and on the Standing Committee on policy. Any fear that there would be too much Great Power influence seems to have been dispelled by these first sessions. On a number of important issues, the Great Powers did not vote together or were overridden by the smaller states. Nor was it merely a question of voting rights. Very many sub-committees were set up on a functional basis—to examine the position of agriculture, the health services and so on—and whenever a nation, great or small, had a particular contribution to make, its participation was secured. The smaller Powers can feel that their equality of status has a factual as well as a legal basis.

The earlier agreement on the financing of UNRRA has been further clarified by the decision that the contribution of one per cent of the national income should be made only by uninvaded countries. Occupied countries are to make no contribution, but will use any resources they may have to help their own people. Where possible, the donors will make some of their contribution in the form of foreign exchange. Any other aid—for example, the aid given by Sweden—will be co-ordinated through UNRRA. A number of inter-Governmental agencies—for example, the technical services of the League of Nations—

will be asked to work closely with UNRRA. The wise decision has been taken to include rationing and price control in the relief schemes.

Plans for medical relief were elaborated. The key to these will be apparently a sort of "commando unit," under a chief medical officer, each with equipment and personnel to deal with about 10,000 people. The units will be mobile and will be available to any Government for the reconstitution of its own health services. Another task entrusted to UNRRA will be the return to their homes of the millions of Europeans displaced by the war. The Administration is also to help in every way it can with the revival of education and possibly with the training of such vital workers as doctors.

All this evidence of agreement and co-operation is encouraging. It is far from the indifference and ignorance of which Lord Keynes complained twenty-four years ago. Yet there are two points which give rise to disquiet, the more so because they are fundamental, and may easily undo much of the good which the Conference promises. The first is negative. As far as can be gathered from the published reports, nothing in the plans laid down at Atlantic City foreshadows a more constructive, co-operative and unified European economy. At every point, the emphasis has been laid on national sovereignty, on sovereign independence, on the authority of Governments each in its own circumscribed territorial sphere. A suggestion was put forward by one of the British delegates that all inland transport of supplies in Europe should be put under an international authority, for the experience of the last war had shown that, without some unified control, it was impossible to distribute goods according to the most immediate need. It does not appear that any such authority is envisaged. Similarly, the provision of medical relief—the sphere in which, above all, immediate need should determine the method of operation—may be made dependent on the consent of the local authority.

Much more serious is the reported decision to take the second "R" out of UNRRA. Rehabilitation is not to be the concern of the Administration. It will have no power to consider or initiate long-term schemes of recovery. It will have no word to say about their financing or their dovetailing with other schemes in neighbouring areas. It looks as though all the longer perspectives of European rebuilding are to be left in the hands of individual Governments without any machinery for co-operation or any institutions to express the great range of interests the European nations have in common. Obviously local Governments must continue to exercise proper authority. But what is "proper authority" in this sphere? Has nothing been learnt from the chaotic economic nationalism of the twenties and thirties? It may be said that UNRRA is not a fit instrument for building up international institutions in Europe. To this the only answer is that it could have

been, if the goal of international collaboration had been properly envisaged from the start.

This great gap, the failure to exploit a potentially useful piece of international machinery, can still be made good. It is a negative failing. The other matter for concern is more serious, since it suggests that a policy that is positively, not negatively, wrong is on its way to being adopted by the Powers. One of the chief assumptions made about Allied policy in the first years of war was that, however strong the military disabilities imposed on Germany, economic rehabilitation would be extended to both victors and vanquished; this assumption sprang from the experience of the inter-war years, that the economic ruin and collapse of any state had unfortunate repercussions for its neighbours and that, in particular, economic dislocation in Germany had been a major factor in the triumph of Nazism. In 1941 Mr Eden put on record that the military conditions imposed would be heavy but the economic conditions would give the German people a chance to live. This policy was incorporated in Point IV of the Atlantic Charter:

They will endeavour, with due respect for their existing obligations, to further enjoyment by all states, great or small, victor or vanquished, of access, on equal terms, to the trade and to the raw materials of the world which are needed for their economic prosperity.

It cannot be said that the Council of UNRRA have formally rejected this principle, but the debate about the treatment of Germany was significant. UNRRA was apparently debarred from assisting Germans to return to Germany from outside its frontiers. The British amendment, supported by the United States and China, that enemy territory should pay for relief "to the fullest extent possible," was defeated and the motion that Germany should pay to the full was passed. Thus, at a crucial point, the scale of relief is to be divorced from need, and the principle reintroduced which so bedevilled the last attempt at settlement—that capacity to pay and obligation to pay need bear no relation to each other. Yet these evidences of an intransigent temper are mild compared with the mood of the smaller nations outside the conference room. The Norwegian delegates are reported to have spoken of German restitution of all ships lost by submarine warfare, a step, surely, towards saddling the Germans with the full incalculable cost of the war. M. Kerstens, the Netherlands delegate, is also reported to have declared that German industry should not be restored to anything beyond enough capacity to satisfy "Germany's internal needs"—which would, incidentally, make it quite impossible for Germany to meet any other needs, those of Europe or elsewhere, those of reparations or trade alike. It seems that the Dutch, Czechs, Belgians and Poles have been discussing ways and means in London of curtailing Germany's industrial effort. They claim that their industry can fill the gap.

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

ROYAL EXCHANGE Assurance

Head Office at the Royal Exchange, London

This is the background of their attitude towards Germany and UNRRA. The vote against the British amendment is the first attempt to translate the attitude into a policy. There should therefore be no doubt about its direction. The enforced and permanent impoverishment of Germany must mean not only the despair and political insanity of the German people. It means, too, the impoverishment of Europe. Germany's neighbours may hope to take over the former markets of Germany, but in impoverishing Germany they will lose what was one of their largest markets and their most important sources of supply. If at the same time they demand, as they do demand, full restoration of looted property, which is their undoubted right, and also, possibly, the full cost of the war, with what will a crippled and strangled Germany meet the debt? No irrevocable step towards this complete deadlock was taken at Atlantic City, but the pointers of discussion and opinion were all in that direction. Is it necessary to repeat that this is exactly the major error which the Allies committed after the last war? And coupled with the failure at Atlantic City to plot the future of Europe on any broader lines, does it not at least

suggest that the failure of 1919 is on the way to being repeated? In 1919 Lord Keynes wrote:

My purpose in this book is to show that the Carthaginian Peace is not *practically right or possible*. Although the school of thought from which it springs is aware of the economic factor, it overlooks, nevertheless, the deeper economic tendencies which are to govern the future. The clock cannot be set back. You cannot restore Central Europe to 1870 without setting up such strains in the European structure and letting loose such human and spiritual forces as, pushing beyond frontiers and races, will overwhelm not only you and your "guarantees" but your institutions, and the existing order of your Society.

This prophecy has been most exactly fulfilled. Today it is not the world of 1870 but the world of 1919 that stands for "normalcy." Again, the clocks are being put back. Again and inevitably, the results of clock stopping will be the same. It is not too late to plan for an ordered co-operative Europe in which the beaten and the victorious will one day live and work together, but it is very near the eleventh hour.

Special Areas

A REGRETTABLE omission from the King's Speech was the absence of any direct reference to the Barlow report, which has been in the Government's hands since January, 1940. The Government has announced its views about the Scott report, and a statement on the Uthwatt report has been promised in the near future, but both these, despite their immediate importance, are ancillary to the Barlow report, which sets out the basic principle of national planning to achieve a greater dispersal of the industrial population and encourage a better balance of industry.

The Barlow Commission on Industrial Population was set up in 1937 on the advice of the then Commissioner for the Special Areas, Sir Malcolm Stewart; and the specific problem of distressed areas bulks large in its report. The term "special areas" recalls a dismal and discreditable chapter in British history. The areas' population is small in relation to the total population of the country—the three areas of Durham and Tyneside, South Wales and West Cumberland in 1937 represented about 7 per cent of the population of England and Wales—but their proportion of unemployment was appallingly high. They had almost a million unemployed in 1934; and as late as 1938, which should have been a good year for employment in the heavy industries on which the areas are so dependent, nearly a quarter of a million men were out of work.

The recovery brought about by the rearmament programme was recognised at the time as artificial and temporary. *The Economist* wrote in March, 1937:

It is not true that munitions will bring a permanent contribution to the well-being of the Special Areas. Indeed, in the long run, they may make things worse. The end of the rearmament programme . . . will once more devastate areas that have been told to pin their hopes on unproductive activity.

The rearmament programme was succeeded by production for war itself. The war has certainly brought full employment to the heavy industries of the Special Areas. But it has also emphasised their dependence on these industries. New war projects have not, for the most part, come their way. They have had little or no share in the development of aircraft production, which has largely settled in the Midlands or Home Counties. Their mobile labour has been moved away to fresh work elsewhere.

The end of the war, then, will find the Special Areas with greatly swollen labour forces in their heavy industries, a shortage of younger and adaptable workers, some munition plants which cannot, however, be trans-

ferred easily to peaceful production, a serious shortage of suitable factory space—and with their previous lack of industrial balance greatly exaggerated. Their problem is the national problem in a more acute form—that of orderly transition from war to peace, with the reabsorption of demobilised men and the reinvestment of capital in peaceful industry—the problem of full employment in a special localised form.

The measures adopted to maintain employment in these areas before the war were painfully inadequate. Commissioners for each of the Distressed Areas were appointed in 1934. Their functions included the "initiation, organisation, prosecution and assistance of measures designed to facilitate economic development and social improvement." Actually, their powers were very limited—Sir Malcolm Stewart was continually chafing under the restrictions—and they were only granted the derisory sum of £2 million for their purpose. Attempts to encourage the voluntary establishment of new industries had only slight success; the financial inducements offered were insufficient to attract entrepreneurs to areas which they regarded as remote and bleak. Out of 5,829 firms approached by the Special Commissioner, 4,066 failed to reply, and only 64 showed any signs of readiness to co-operate. In 1936, 551 new factories were set up in England and Wales, but only 8 were in the Special Areas; in 1937, there were 17 out of 540. Trading estates, offering standard factories and many practical facilities, helped to relieve the situation; but, at most, Team Valley (Gateshead), Treforest (South Wales), and Hillington (Glasgow), with some smaller estates, employed about 8,000 workers in May, 1939. A large proportion of the trading estates' firms are refugee industrialists, who proved more amenable to Governmental persuasion. The only policy effectively or energetically pursued was that of industrial transference, which tended to drain the areas of the most enterprising and virile elements of their population, and was actually a recurrent source of grievance.

More positive measures than financial inducements, and trading estates will be needed, if the Special Areas are to evolve diversified and balanced economies. Financial inducements should no doubt be increased and trading estates extended; and a revision of transport charges to encourage industrial settlement is essential. But even if the Barlow proposals are accepted, they would still not suffice to bring any significant amount of industry to the areas; the powers of the National Industrial Board proposed by the Commission are purely advisory, except in the London area, where it would have power to prohibit

new factory building. There is, of course, no guarantee that an entrepreneur, refused permission to set up in the London region, would turn to a Special Area. It may be impracticable to transfer industries already established in congested areas—the outcry over the proposed transfer of part of Luton's hat trade to Bishop Auckland is an indication of what would happen. But the Government may have seriously to consider the positive guidance, even perhaps the compulsory direction, of new enterprises to areas where unemployment is, or might be, severe—with the freest possible choice of site in any one of all the needy areas. Much can be done locally. Such bodies as the Northeast Development Board, the Scottish Council on Industry and the Welsh Industrial Council can attract new undertakings, stress the economic possibilities of their areas and break down prejudices. A bold programme of slum clearance and rehousing, improved amenities and social conditions, and public utility works and health services, would not only provide employment locally but would also remove deterrents to the establishment of new enterprises. There is ample room both for public works and private enterprise—if there is the framework of a national policy and a national plan.

It is not merely, or even mainly, a matter of new industries. They can help to restore industrial balance and provide a cushion to fall back on in lean times of employment. But fundamentally, Tyneside, Durham, South Wales and Scotland are still dependent upon the fortunes of heavy industry and more particularly on coal. Their problem is national not regional. Immediately after the war, there will be work enough for heavy industry to meet the needs of restoration and rehabilitation at home and in Europe. Thereafter, if a general policy of economic expansion is pursued at home, if stability and peace can be maintained abroad, and a genuine measure of international trade restored, the problem will be vastly easier. It will not, of course, be solved. It may be that the day of some older industries may slowly pass, at least as they are at present located; and that Britain's future lies with newer trades, newer locations and newer techniques. The problem of secular adjustment, and national efficiency, will remain. It would be wrong, both for these regions and for the country as a whole, if an attempt were made to keep alive activities which, in an altered economic or technical context, had lost their effi-

ciency and usefulness. It would also be, in the long run, an impossible task. But the problem of distress and depression should be avoidable. Given wise and effective economic foresight, it should be possible to adapt the activities of the nation to new needs and new circumstances without the tragic frictions that accompanied the process between the wars; it is the plain duty of the Government to prevent the losses of adaptation from again being concentrated in a few small sectors of the national economy. The Special Areas have a right, economically and socially as well as politically and morally, to suffer no more than other areas in the transition from the present to the future.

To sum up, the Special Areas are not in any fundamental sense "special." They are part and parcel of the national economy; their size and shape depend upon its size and shape. They cannot in any case recover and maintain prosperity unless there is a high level of employment in the country as a whole. But, even within the context of national full employment, there are measures which should be taken to deal with their specific problems. The efficiency of their basic industries, whatever their long-term future, should be raised; in particular, the key coal industry should be reorganised. To achieve a better balance of industry, new enterprises, especially those producing the lighter types of consumption goods, can be located in the areas. There may be a development of industries based on coal, such as plastics, oil-from-coal, industrial alcohol, and hydrogenation; the chemical and electro-metallurgical industries may similarly be extended. The areas are well suited, geographically and economically, for such developments. Then, agricultural production, especially of the protective foodstuffs, may be expanded and, where possible, derelict mining areas transformed to agricultural land. The rehousing of the people in the Areas' towns and villages is overdue. So, too, is the improvement of transport and communications.

The Special Areas are rich potentially; they have supplies of two of Britain's most precious assets—coal and skilled labour—which years of neglect have failed to mar. Efficiency and foresight are the only keys to the redress of their grievances. They must be allowed to live, and not by artificial respiration, not by the maintenance of out-moded and high-cost activities. "Food, work and homes" is a magnificent slogan for the post-war era. The Special Areas have a claim to priority in its application.

The Great Migration

WHEN the first wave of political and racial refugees came out from Nazi Germany after 1933 it was hardly realised that this was the beginning of the biggest displacement of population Europe has ever experienced. Since 1939 the movement has assumed catastrophic proportions. The International Labour Office estimates that more than thirty million of the inhabitants of the continent of Europe have been transplanted or torn from their homes since the beginning of the war.

This estimate* does not take into account the most recent evacuations and transfers which may have brought the number of uprooted Europeans up to "a grand total of over forty million." And these figures do not include the millions of Axis soldiers and German workers who have been shifted from place to place.

These are no more than statistical approximations. The precise magnitude of the migration cannot yet be measured and the movement of European peoples has not yet reached its final stage. More millions of civilians must have been uprooted during the German retreat in the east; and the scope of the mass evacuations, which the Allied bombing and the prospect of fighting inside Europe are bound to entail, is still unforeseeable.

The estimates given in Mr E. M. Kulischer's study for the ILO cover the period up to the end of 1942 or the

beginning of 1943. The biggest single item is the evacuation of Russian civilians to the east which is said to have involved about 12 million people. (Some estimates have put the number as high as 20 million.) Next come the uprooted Jews of Europe, estimated, conservatively, at four million. In the Balkan countries one and a half million Serbs, Croats, Slovenes, Greeks, have been moved. A million and a half Poles were deported or evacuated to Russia in 1939-41. A million Frenchmen, Dutchmen and Belgians have been removed from coastal districts. There has been an exodus from Alsace and Lorraine of nearly half a million Frenchmen—of almost the same size as the exodus which followed the war of 1870-71. A special category of uprooted Europeans are those employed in Germany either as civilian workers or prisoners of war. At the beginning of 1943 they numbered 6.5 million. Inside most of the occupied countries there have been mass transfers from province to province. There has, finally, been the great shifting of Germans themselves. The first year of the war saw the evacuation of the German minorities (about 600,000 persons) from the Baltic countries, Roumania and Southern Tyrol; since then more than two million Reich Germans have emigrated to occupied countries either as colonists or administrators or as refugees from bombed areas.

These approximations suffice to show the magnitude of the problem and its complexity. The task which will arise on the day of the armistice will be repatriation. In

* "Displacement of Population of Europe." By E. M. Kulischer. International Labour Office, Montreal-London, 1943. 171 pages. Price 4s.

Russia, this process is already going on, though on a limited scale. It is by no means certain that the Soviet Government contemplates the repatriation of all the people evacuated from western Russia. Whatever policy it adopts, one thing is certain: resettlement in Russia will be carried out according to the time-table set by the Government. No sudden, spontaneous rush is likely to occur. The prospect is very different in the rest of Europe. There, the "cease fire" will at once be a signal to return home for the millions who have languished in the prisons and camps of Germany, for the foreign workers in the Todt organisation and for the few Jews who may still survive in ghettos. Millions of German soldiers and civilians, exposed in the occupied countries to the wrath of the peoples, will flee home. All this is likely to happen against the background of a shattered transport system. To prevent utter chaos, the great trek will have to be kept as far as possible under control by some central organisation whose task it will be to pool the means of transport and fix priorities. Some branch of UNRRA will probably be the most suitable instrument, for UNRRA will also be concerned with the feeding of the European peoples.

But repatriation is only a starting point. To go home is the first right of every uprooted European, but like many other elementary rights in itself it solves no real problems. Not all the effects of the wartime displacement can be undone by repatriation; the omelette cannot quite be unscrambled. For some of the dispersed people to go home will be impossible, for political and personal reasons. The German minorities from the Baltic countries can hardly go back. It is an open question whether all the wartime transfers of Serbs, Croats, Slovaks, Czechs or Roumanians can be fully reversed. Some of those transferred to other countries may not want to return to their old places of domicile; and, provided their stay at new places is not at the expense of other people, there is no reason why they should not be allowed to stay. In the main, though, the great wish will be to go home.

Only when the great trek back is finished does the real problem begin. How many can be absorbed in the economic life of their countries? Reconstruction may, indeed should, create a massive demand for labour. But there will also be deep dislocations, some temporary but some not. The supply of raw materials and machinery will not everywhere be sufficient to permit full employment; and everywhere the war has speeded the movement from countryside to town. The sudden stoppage of war industries will reverse the trend. Industrial workers will flock back to the countryside, especially in eastern Europe. The old rural over-population will reappear. On the morrow of repatriation emigration will become a burning problem again.

The call for free migration, both overland and overseas, is likely to be raised with a new insistence. Before 1939 the closed frontiers of neighbouring states were part and parcel of the normal thinking of unemployed European

workers and landless peasants. They took it for granted. Since 1939 they have seen the fences in Europe broken down. Press gangs have driven them over the very frontiers at which customs officials and policemen used to hold them back. The sovereign power of nations to forbid entry has been destroyed. Poles, Italians and Netherlands provided most of the agricultural immigrants into Germany between 1870 and 1914. In the interwar years Germany stopped this immigration. After the war the migratory tendency may revive; it springs from deep economic and geographical motives. Will it be possible to prevent farm labourers from going to earn their living in a country where not long ago they or their relatives worked under compulsion for years?

Germany is an extreme case. The problem is not limited to Germany; nor, of course, to Europe. The great "under-populated areas" of the world lie overseas. During the years of occupation, Nazi propaganda has hammered this truth into the minds of the European peoples. Many of Goebbels' slogans will be forgotten after the war; this one probably will not. It would, of course, be physically possible to maintain or to re-erect all the barriers to international migration. This was done between the two wars. But the closing of all possible outlets for the surplus populations of Europe merely resulted in the accumulation of explosive material inside the economic and political structure of Europe. There can be little doubt that in the long run the economic and political stability of many European nations will again be gravely weakened if the "safety valve" of emigration remains shut.

War interrupts many normal economic processes. At the same time, it gives an impetus to others. It magnifies them and distorts them. The wartime migration in Europe is a striking instance. The need for an international redistribution of labour has suddenly been shown in the distorting mirror of a totalitarian war economy. The symbol is Sauckel. His "settlers" live in concentration camps. The prodigious scope and the direction of his redistribution have been dictated entirely by the unproductive purposes of the German war machine and the mad science of Nazi demography. But the problem of redistribution will remain when all this barbarity has passed. What will be needed is a civilised solution.

Migration is, of course, not an isolated problem. It is linked with all the major issues of economic policy. It is part of the problem of full employment on an international scale. Agricultural slumps, and industrial depressions make "over-populated countries" of the least populated areas in the world, and render the movement of labour from country to country accordingly hard. But, in the long run, the real dilemma is between freedom of migration and recurrent migrations on the 1939-1943 pattern, with the force of war, not law. This is only another way of stating the truism that in the long run the dilemma is between international full employment and recurrent depressions and wars.

NOTES OF THE WEEK

Three-Power Meeting

When everyone is thinking about the crushing of Germany and the possibility of "beating Hitler by the Spring," it is perhaps salutary to be reminded, dramatically, of the Allies' urgent tasks in the Far East. With a formidable array of military and diplomatic advisers, Mr Churchill, President Roosevelt and General Chiang Kai-shek have met in North Africa and planned coming offensives in the Pacific in the greatest detail. The fronts of Admiral Nimitz and General MacArthur are already "active," so they could not attend, but Lord Louis Mountbatten, whose work still lies ahead, was there. Will a combined general staff come out of these talks? It would be a great pity if it did not, for the magnitude, distance and variety of the fronts against Japan make the problem of co-ordinating three nations and three Services formidable. Conferences of the kind just held can set general objectives but they may

fail in achieving them unless machinery is set up at the same time to carry decisions to performance. On the political side, the Heads of State announced their war aims—the total defeat of Japan and the restitution of all conquests made since 1894. This sends back occupied China, Manchuria, Formosa and the Pescadores to China, and restores the colonies of Britain, Holland and France, presumably, to Britain, Holland and France, although this is not specifically stated. It is an open question who will get the Marshall and Caroline Islands. In fact, these aims are only the first sketchy outline of peace terms and give very little clue to the fundamental problem of reordering the Far East. The delegates moved on from North Africa "to an unknown destination." It can be surmised that before long the "Europe-firsters" will be satisfied in their turn—and that war aims in the West will be announced.

The Mosley Debate

History distorts itself. Almost exactly two years ago, on a similar occasion—the debate on the Address—Mr Morrison was defending himself against a Conservative amendment to the effect that after a definite period persons detained under Regulation 18B should have a right of appeal to an independent tribunal. A strong feeling of personal security tempted Mr Morrison then to challenge the movers of the amendment to take the matter to a division, and he was criticised for doing so because a division on an amendment to the Address is equivalent to a vote of censure on the Government, which the Conservatives, as Mr Morrison knew well, were anxious to avoid. Since then a new Waterloo Bridge—Mr Morrison's own godchild—has been completed, and much water has flowed beneath it. This week he had to face what amounted to a personal vote of censure on himself, after an amendment, tabled by members of his own party, had been debated, which regretted the release of Sir Oswald Mosley on the grounds that it would retard the war effort and lead to misunderstanding at home and abroad. The reasons why *The Economist* supports Mr Morrison's decision were explained in full last week (page 707). Justice cannot function if it has to bow to popular feeling at home and diplomatic considerations abroad. If the release of Mosley does, in fact, impair the war effort, through an extension of strikes and so on, then the workers' leaders will have sadly failed them. It has become quite clear, and it was emphasised in the debate, that the great majority of people who have protested against the release have no conception of the meaning of 18B and the powers conferred by it. Otherwise they would realise that, as Mr Morrison pointed out in his reply, there was no power to reintern Sir Oswald Mosley and that the High Court would quash any such order. If there are Mosley strikes—and public feeling is still running very high—the trade union leaders will have to bear a load of responsibility for not explaining the truth about 18B, and the silence of Mr Bevin, in particular, is as suggestive as it is disturbing. The result of the vote, 327 for the Government and 62 against, was never really in doubt. But the opposition votes included about 50 Labour MPs, and those who tabled the amendment included three members of the party's administrative committee; other Labour Members abstained. Mr Morrison was not actually defeated by his own party, but his political position has, for the time being, been appreciably weakened.

Advance in Italy

On November 11th the Eighth Army came to the Sangro river and reached out for bridgeheads across it. More than a fortnight elapsed before two were made. On November 27th General Montgomery ordered his men "to drive the Germans north of Rome" and an offensive from the Sangro bridgeheads started next dawn, preceded by a typical Montgomery barrage. The barrage was not followed by a sweeping advance of the kind that characterised the Eighth Army's campaigns in the desert. In such difficult mountainous country the tactical returns of artillery bombardment are inevitably much less spectacular. The first three or four days of the offensive brought a "break in, but not a break through." The Eighth Army reached a twenty-five mile stretch of the road from Casoli to the Adriatic coast. But the "main German defence line" which had been broken into is here a somewhat vague term. Between the Sangro and the Pescara the Germans can still use a number of ridges and minor streams for defence purposes; at this time of the year, the streams still form substantial obstacles. The biggest obstacle of all is the Pescara river, which is capable of holding up the advance for as long as the Sangro did, if it cannot be turned by a landing from the sea. Only after crossing the Pescara will the Eighth Army be able to swing towards Rome. The Fifth Army, on the western coast, is confronted with a similar difficulty. Before it reaches the coastal valley, which leads straight to Rome, it has to overcome the formidable mountain barrier at Garigliano. Here, too, the rate of the advance can perhaps be accelerated by sea landings. It is no reflection on the achievements of the Allied soldiers in Italy to say that the strategic rewards of the campaign so far have been, and are likely to remain for some time to come, disproportionately small in relation to the tactical efforts expended. The invading troops are still "logging up Italy."

Slow Motion

The fall of Gomel towards the end of last week has not changed the general position on the Russian front. Inside the Dnieper bend attack and counter-attack have followed one another without producing any decisive results. The German thrust against the Kiev salient has gained impetus and shifted from the southern flank to the centre. Korosten, a very important railway junction, has been evacuated by the Russians. After the fall of Zhitomir, this is another grievous loss, but no danger to Kiev seems to be imminent. The Russians have reported successes in widening the Cherkassy bridgehead, the key position between the Kiev and the Krivoi Rog sectors of the front. Farther to the north, on the Byelorussian front, the Russians have now advanced to the fringe of the Pripiet Marshes. There the terrain and the weather do not suggest any rapid advances. Probably it is only along the Smolensk-Orsha route that large-scale movements can still take place. Progress may well be slow until the New Year.

Target Berlin

So far official reports on the raids on Berlin during the week from November 22 to 27 have given only the bare fact that a total weight of 10,000 tons of bombs was dropped on the target. German reports speak of devastation. The first raid on Monday, November 22, was the biggest. It was made in exceptional weather conditions. The whole route and the target area itself were obscured by clouds and fog; consequently there was scarcely any night fighter activity, although this was greater in the subsequent raids. A great number of commentaries and innumerable accounts from Swedish and Swiss correspondents, travellers and diplomats have been published. Some of these accounts are mere guesswork; others lack knowledge of the target area; all of them have the serious defect that their authors were unable to get a general view of the effects of the bombing. The area of Greater Berlin, in its mixture of residential and factory

THE COUNTRY BANKER

"... he kept a pack of hounds and dwelt in patriarchal style among his people—hospitable, freehanded and popular. He might be seen at times seated under the great elm... chatting with his neighbours."

So, in the last century, the country banker inspired and held confidence: the evidence of his worth was plainly to be seen. The rising tide of industrial development with its demand for a service which few private firms could provide caused the virtual disappearance of the country banker, but on the firm foundation which he had created, the Westminster Bank continued to build, so that it is today able to offer a service which, in its scope and complexity, might be a source of some astonishment to those pioneer bankers of other days.

WESTMINSTER BANK LIMITED

districts, as well as in its sprawling suburbs, is not very different from London. Greater Berlin with a pre-war population of 4½ millions covers 334 square miles. The Administrative County of London with its 28 boroughs and also a population of 4½ million covers only 117 square miles. But, compared with the area of Greater London, that is, the Metropolitan Police District, the area of Berlin covers only 48.3 per cent of that of London. Factories and actual suburbs, however, extend beyond the administrative boundaries of Greater Berlin. These towns and factories belong to the economic unit of Berlin and it can be said that the entire target area of Berlin forms a circle whose radius is 15 miles from the eastern end of the "Unter den Linden" street. This area is therefore more or less equal in size to Greater London. But its population is probably not more than two-thirds of the 8½ million of London. The town and county of Hamburg, on the other hand, cover 160 square miles and the town itself not more than 52.5 square miles.

Raid Results

Neutral and other reports and guesses give some indication of what part of Berlin has been destroyed so far. Out of a mass of contradictory accounts there emerges the fact that, during the Monday raid, the great bulk of the 4,000 tons of bombs fell on the Whitehall and Oxford Street districts of Berlin. During the later raids a majority of the bombs hit these districts again, and also the Kurfürstendamm district, the new west end area of Berlin, which was obviously heavily hit. The guess made by only one Swedish paper that Spandau, Pankow, Lichtenberg and Neukoelln, all of them industrial districts, had suffered the greatest damage is not confirmed elsewhere. It would mean that the entire outer ring of the circle that forms the target, with the exception of the south-west arc, had been heavily hit. The sector of the circle which cuts through these districts measures at least 25 miles. The bomber force that attacked Berlin would have to be much bigger if these districts were to be hit simultaneously and severely. There seems, however, to be no doubt that the centre of the town and the new west end are in ruins. Adjacent districts like Charlottenburg in the west and the workers' districts in the east must have been severely affected by blast and fires. This is the picture that can be pieced together. In spite of the fact that the destruction has been enormous, caused by the heaviest tonnage dropped on a single town, the main industrial areas have so far escaped. Several railway stations have been hit, but railway repairs can be quick. Bus and tram traffic has been obstructed because the centre of Berlin has been blocked; and there has undoubtedly been much damage to the water, electricity and gas systems. These, too, can be repaired quickly if the sources of supply have not been destroyed. This picture of the damage also explains why casualties were reported to be, relatively, not large. The density of the population in the districts most affected is very small compared with the industrial districts. Some of the women, children and old people were evacuated in August; some have returned, and the new bombings will cause new evacuations. Because such a vast area is covered, the outlying parts of Berlin can be made temporary reception areas; this point is also made clear in many reports. All the estimates that can be made at the moment indicate that the destruction of Berlin in the same manner as Hamburg will be vastly more difficult, if bombing on a really large scale can only be carried out when the exact conditions of Monday, November 22, 1943, occur again. From a morale point of view, the bombing seems so far to have had no more and no less effect than the bombing of the Ruhr towns and of Hamburg.

The Minister of Production

Mr Lyttelton has appeared this week as the chief Government spokesman. Last Sunday, he stated the attitude of Conservatives to national policy; on Tuesday, he stated it again in the House of Commons. In Parliament he was a mouthpiece; at Oxford, addressing Conservatives, he was a politician. Much of what he said was sound sense. He asked for sufficient force after the war to make the nation's policy in international affairs effective. He asked, too, for full employment when the war is over, and for an expansionist financial policy. He emphasised, very rightly, that

full employment is a matter of shaping an environment in which individual initiative is free and able to operate.

He said frankly, again with justice, that the readiness of private persons to take risks and chance losses remains a mainspring of national economy. But, on party lines, Mr Lyttelton was on less sure ground. He denied, for instance, that British weakness in 1939 was due to Conservative inertia, forgetting that in effect the Conservative Party held power consistently throughout the inter-war years. It is an odd theory that blames the Opposition and the electorate for the faults of the Government; at least the pre-war Government could have said frankly to the people what was needed. If any single conclusion arose from Mr Lyttelton's address, it was that the post-war parties must tell frankly and boldly the entire truth as they see it—that there must be no more of the political or strategic secrecy which has prevented our Parliamentary democracy from working properly for the best part of a generation.

Hush, Hush

The prohibitions imposed by Sir Richard Hopkins, Permanent Secretary to the Treasury and "head" of the Civil Service, upon discussions on employment between Sir William Beveridge and civil servants is a ridiculous example of an official attitude which, as pointed out in an article on page 733, has greatly weakened the war effort, and now bids fair to undermine preparations for peace. On the banning of Sir William, David Low, the cartoonist, has drawn the last word: his picture of affrighted civil servants fleeing to cover on the sounding of a Beveridge warning sufficiently underlines the fantasy of the ban. It is no less fantastic that Sir William has had no communication from the Government during the year in which experts have been considering the "impracticabilities" of his plan. But a much wider issue is involved. Throughout the war it has been cause for regret and national loss that civil servants, permanent and temporary, have been prevented from contributing their quota to discussions of national problems; the Beveridge ban is only one spectacular instance. That civil servants should be forbidden to make their contributions to the widespread and valuable examination of British post-war problems is not unlike sabotage, and calls for the most vigorous protest in Parliament. It is the strength of democratic communities that official and non-official views can be combined in free discussion to produce the right answers to the right questions; and the formal prohibitions of the Civil Service, based quite illogically on the non-political character of civil servants, add a distasteful and undemocratic quality to the freedom of speech and opinion, a quality which contrasts strangely with the causes for which, ostensibly, the war is being fought.

Reply on Scott

If the Government needs as many words to declare its decisions on other issues of national policy as it did to answer a direct question on its views on the Scott Report, the public can be forgiven for thinking that all reconstruction matters will be bogged in a mass of saving clauses. Mr W. S. Morrison's reply to a parliamentary question this week occupies over four columns of Hansard, but in effect it leaves the questioner very much where he was before. On the main underlying principle of the Scott Report, that there should be a wider application of town and country planning by the establishment of central machinery for planning, the Minister pointed to the setting up of a Ministry of Town and Country Planning and to the Interim Development Act of last session. Surveys and research are being carried out in plenty, and there is "close inter-departmental co-operation in all matters affecting land use." The dear old phrase, "a healthy and well-balanced agriculture," still undefined, appears again as an accepted element in the Government's post-war policy. The Scott Committee's recommendations on the improvement of the living conditions of rural communities and the preservation of little dispute, are accepted in principle; but the Departments concerned are examining the issues involved—a phrase which shows up the limitation on the Ministry's own powers. In fact, almost the only specific new decision that came out of the Minister's answer was that development by statutory undertakings was to be brought within the scope of the Town and Country Planning Acts. The main conclusion to be drawn from this very long answer is one that has long been realised—that no real achievement can be

accomplished by the Ministry of Town and Country Planning, for all the rosy vistas implied in its title, until someone with real powers has obtained a decision upon Barlow and Uthwatt. This is, presumably, Lord Woolton's obligation, and it is one that public opinion will not allow him to shelve.

Interval at Algiers

The first session of the Consultative Assembly at Algiers has ended, and the next session will not be convened before the New Year. During the fortnight of its activity the Consultative Assembly has well justified its existence. To some extent, it has brought back into French politics the factor of public control, though the Assembly's liberty actually to exercise control has been very restricted. It has also had a moderating influence on the foreign policy of the Committee of National Liberation, or—to put this more exactly—on the purely Gaullist tendencies in it. Even so, the majority of the delegates to the Assembly have expressed dissatisfaction with the Assembly's work. One delegate of the resistance in France, M. Mailloux, a new man in politics, who from the beginning took a foremost place in the debates, expressed this feeling very strongly:

The Assembly has had to ask itself sometimes whether it has been born to live its own life or whether it is still a kind of robot.

M. Gouin, the President of the Assembly, in his closing speech was equally outspoken and critical; so were most of the deputies. The tactics adopted by the Communists deserve some attention, if only because of the great influence they exert in France itself. They said quite a lot of right things, though they may have done so for the wrong reasons. Their leader, M. Marty, made a clear distinction between Gaullism as a popular movement for the liberation of France and Gaullism as an authoritarian tendency:

Frenchmen in their overwhelming majority are Gaullist. But from this it does not necessarily follow that they are the adherents of General de Gaulle. If matters remain where they are now, I do not know what the relations between General de Gaulle and the French people are going to be.

M. Marty demanded for France "the British fiscal system, British parliamentary government, and British freedom of the press." This demand need not be taken literally as a rejection of the native French democratic tradition. But it seems to reflect a strong reaction against attempts to convert Frenchmen to personal rule. One such attempt caused a great deal of irritation. General de Gaulle pressed his right to choose the members of the National Committee from among the leaders of the parties, without considering the candidates suggested by the parties themselves. This is the reason why the Communists have so far refused to join the National Committee, in spite of their consent, in principle, to participate. The suspicion is rife at Algiers that secret Gaullist "cells" may be fostered inside the various political movements, to be used later on to sap them. The Communists made a firm stand on this point, defending the right of all political parties to decide their own policies. It is to be hoped that the other parties will not leave it entirely to the Communists to say the right things, and that those who almost certainly have more and better reasons to say them will actually do so.

Outlines of a New Controversy?

Reports that Marshal Pétain intended to resign his powers in favour of the National Assembly and thus legally to re-establish the Third Republic have brought an important statement by the Council of Resistance in France. The Council has warned all French deputies and senators against putting their signatures to a demand for the convocation of the Assembly. A National Assembly under the German occupation would be a trap to exact the endorsement of the regime of occupation by the Chambers of the Third Republic—now that the endorsement by the National Revolution has proved ineffective. The Council of Resistance is surely right to warn parliamentarians who may play Pétain's game that "they will be brought to account by the freed nation." But the question whether the National Assembly may still play some rôle after the liberation of France must crop up again in the future; a formal resignation by Pétain in favour of the Assembly would re-establish the legal continuity of the Third Republic. On the other hand, the strongest faction in a revived Assembly would be the collaborators and men of Vichy. The pros and cons are easily

foreseeable. The uncompromising upholders of legitimacy would probably favour the convocation of the old Chambers; the Gaullists and the popular movements alike would oppose it violently. In a not too distant future this may well become one of the great controversies in French politics; but there can be no doubt which way the popular verdict would go.

Freedom to Starve

An article in *War and the Working Classes* attacks the Austrian revolutionary Socialists for desiring a Greater Germany and the Austrian Monarchists for plotting the re-establishment of the "Danubian Empire." Both groups are accused of sabotaging the interests of the Austrian people in the achievement of independence. It is difficult to follow the complexities of political opinion in any émigré group, and certainly the reactions of different Austrians have shown considerable divergence. Yet the desire shown to include Austria in a wider framework is not necessarily a sinister recrudescence of Pan-Germanism nor yet a reactionary plot to build a *cordon sanitaire* against Russia. It can spring, in any adult Austrian, from the memory of what it was like to live in pre-1938 Austria. *War and the Working Classes* dismisses the "impotent democrats who kept harping on Austria's lack of vitality." But lack of vitality was a fact. It was a fact in mass unemployment, in under-nourishment, in a birth-rate falling more rapidly than anywhere else. Anyone who has seen the lifeless, hopeless poverty of Vienna under Austrian independence, cannot but ask whether an enforced independence will not mean some old and unlovely freedoms, "freedom from work," and "freedom to starve." It is permissible to take exception to these groping attempts to formulate a future for Austria, but only if the problem represented by that future is faced. Austria must live in a wider economic framework, and if critics do not like groupings or federations or "anschlusses," they must find another way out.

The Imperial Connection

Several resolutions have been put down in the new Parliament on Commonwealth relations. In this war the British Commonwealth and Empire has been an object-lesson in collective security. Yet, in spite of the remarkable rally in the dark days of 1940, the British communities were unable to make themselves safe by their own strength—any more than they were able to make themselves prosperous in the 'thirties by their own resources. There is a call, therefore, for a double policy: one which provides the Commonwealth for the first time with a common policy in diplomacy and defence, during peace as well as war; and one which relates the Commonwealth's provision against attack to co-operation for peace among the great nations. This problem is the crux and reflecting point of the two-fold status of the members of the British Commonwealth; they are British, and at the same time they are independent nations in the world community. Most recently the discussion has taken the form of arguments for and against proposals for some kind of Commonwealth Government and Parliament. If the end, security and co-operation, is borne steadfastly in mind, the discussion is vital. Whatever means may be adopted, the aims are set by the facts of world strategy and resources. Here, as in economic policy, the British nations have now a chance which may never recur to give a lead to the world.

Official Statistics

The best use of scarce resources during the war has involved, first, accurate knowledge about their size and nature, and, secondly, their disposal according to detailed schedules of priorities. The use of manpower and materials has become an act of deliberate decision which cannot be taken without the most careful statistical measurement. There has been a great extension since 1937 in the statistical services of Government departments; and the Central Statistical Office, associated with the Cabinet Secretariat, has been developed as the essential co-ordinating and analysing agency. This is an extension of official activities should not only be retained but carried further after the war; if the Government is to be equipped to shoulder its post-war responsibilities to the community. The permanent improvement of the Government's statistics has found powerful support in a memorandum published by the Council of the Royal Statistical Society. The findings of the Council will be discussed in greater detail in relation to needs in a forthcoming issue of *The Economist*. The Council strongly advocates an adequate statistical branch for every major Government department, with a strong Central Statistical Office, to act as a co-ordinating body and to carry out special research; and it emphasises the need for the largest recruitment and training of personnel. It would be a great pity if the statistical staff recruited during the war were to be disposed of indiscriminately as they were after the last war. But they will be most useful if their functions are clearly defined in terms of up-to-date peacetime needs—a problem that requires more elaborate discussion.

The Catholics Protest

One of the few reconstruction measures specifically promised in the King's Speech was the new Education Bill. It is a measure which, judged by the reception given to the White Paper, passes both the Government's and the public's criterion of securing "a wide measure of general agreement" and of being "non-controversial." Yet the Catholics are protesting about the proposals for the future of non-provided schools. Their case was critically examined in *The Economist* on October 23, 1943 (page 549), where it was pointed out that the White Paper proposals improve the financial position of the Church schools considerably, a fact which the Catholics, in their request for more, never seem to recognise. The latest statement by the Catholic hierarchy is gratifyingly more moderate than the utterances by Dr Downey, but the Catholic case is not improved by the issue of such pamphlets as *The Catholic Claim for Justice*, published by the Leeds Central Council of the Catholic Parents' and Electors' Association. In it, it is actually stated that the Government's intention to legislate on education at the present time is a repudiation of the assurance that contentious questions should not be introduced into Parliament in wartime. The further allegation is made that the White Paper is "a definite attempt to elevate a group of civil ser-

vants to the rank of a ruling caste," a treatment of the ordinary citizen which "can only be compared with the totalitarian practice that we so much deplore on the Continent." The whole tenor of the pamphlet is, not that the position of the Catholic schools is considerably improved but not to the full extent that Catholics would have liked—a point of view which would be understandable and excusable—but that they have been singled out for unjust treatment, a point of view which simply does not bear examination. They appear to think, judged by this pamphlet—which probably goes much further than the Catholic leaders themselves would go—that they are in the position of a minority being imposed upon by other minorities with the Government's connivance. Such polemics as are illustrated in this pamphlet can only prejudice the Catholic case and needlessly embitter the discussion of what promises to be a great educational measure.

New Measures for Mining

On Thursday Mr Bevin announced the plans for compulsory recruitment of men to the mines. Selection will be from men born on or after January 1, 1918, and will be by ballot, as the fairest method of procedure. Recruits will, after medical examination, be directed to preliminary training centres before actually starting work at the pits. The aim is to recruit 30,000 men by the end of April, 1944. However necessary this scheme, in order to provide new and younger manpower, it is in itself a confession that other measures have failed. Major Lloyd George, at Preston, on Wednesday, announced that the Government's proposals for improving coal output, which covered the wartime organisation of the industry, discipline and conditions of work, including miners' welfare and safety would shortly be laid before both sides of the industry. He gave no indication of the nature of the Government's scheme, except that it would not "fully satisfy either side." This presumably means that a further compromise arrangement will be attempted, which might succeed in shelving the problem, but could not solve it permanently. Indeed, the only scheme which would "fully satisfy" the miners would seem to be the adoption of their own programme, the chief points of which were the abolition of dual control and the increase in the minimum wage. The miners' two-day conference in London last week was necessarily inconclusive, since they had not yet received any reply from the Government, and the conference was adjourned until not later than January 14th. The feeling among the miners is hardening—the renewed outbreak of strikes in the Lancashire coalfield is an indication of their impatience—and the Government's delay in dealing with the Federation's proposals has been unfortunate. So, too, and much less excusable, has been the owners' delay in agreeing to accept Lord Greene's recommendation that the output bonus should be based on the individual pit instead of on the district, a recommendation which the miners and the Government accepted nearly eight weeks ago. Wages, which are the miners' principal grievance, are to be left to the existing negotiating machinery in the industry. The Government, however, has been directly implicated by the miners' request for an assurance that it would implement any award by the Greene Board, even if it led to an increase in the price of coal. Whatever the merits of the case, it would be improper, and probably impossible, for the Government to give advance pledges, and it might create a dangerous precedent for wage claims in other industries.

Higher Milk Prices

The most interesting and important change in the schedule of farm prices issued last week by the Ministries of Agriculture and Food jointly is the increase in milk prices. With effect from October 1st, the Ministry of Food will pay to the Milk Marketing Board for England and Wales an additional penny a gallon. Part of the increase is to be used by the Board to remove anomalies and the remainder for an advance in prices to producers. Since the production of milk has become, relatively, one of the least profitable pursuits in agriculture, the Government's decision to redress the balance was wise. Milk is needed in large volume and should be given high priority. The prices of fat bulls and fat cows are to be raised by 5s. a live hundred-weight, but those for most other livestock and livestock products are to remain unchanged. With the exception of a reduction in barley, cereals, sugar beet and peas will bring

farmers about the same return in 1944 as they got in 1943. In the case of wheat and rye, an increase in the average payment will be counterbalanced by a corresponding reduction in prices. The net effect of the price adjustments is expected to be an addition of about £3 million a year to the income of farmers, compared with a rise of some £14 million in their wages bill. The effect on individual farmers will, of course, depend on the nature of their products and on their costs. Dairy farmers will be somewhat better off, as, indeed, they should be. Among others, as a broad generalisation, the larger farms will probably have no difficulty in absorbing the increase in wages, while some of the smaller farmers may earn less. There was, in any case, no ground for a general advance in farm prices, and there are indications, such as the sharp rise in the prices at which farms change hands, that farming is by no means an unprofitable occupation.

Tax Credits after the War

Mr Oliver Lyttelton, commending post-war credits, has given his personal opinion that similar arrangements should be tried in peacetime. The spreading of purchasing power more evenly between boom and slump by means of differential taxation is one of a number of palliatives often suggested for evening out the fluctuations of the trade cycle. No doubt the release of taxation credits during a period of depression might act as a useful stimulus to production. Such a scheme would only be logical and worth-while, however, as part of a much more comprehensive Government policy, including the maintenance of investment, as well as consumption, and a refusal to "economise" and balance budgets in bad times. The complement of this policy, that is, increasing taxation during booms, would call for the most careful timing, and raises many problems. In short, tax credits or forced saving on these lines should only be undertaken as part of a general Government policy for maintaining a constant and satisfactory level of trade, and preserving the needed balance between savings and investment.

Portuguese Islands

In his recent speech to the National Assembly, Dr Salazar reviewed Portugal's external relations in recent months. On Portugal's dealings with the Allies, the Prime Minister had only good things to say. He was remarkably cordial in his references to British restraint in delaying so long before asking for the use of the Azores. Earlier, he long before asking for the use of the Azores. Earlier, he admitted, a British move would have involved Portugal "in catastrophic developments." His forecasts of an Allied victory were more cautious. The shadow of internal unrest lies across the Peninsula, and there was a trace of defiance in his reference to the continuance of the Iberian bloc and its importance for the post-war settlement. In the Far East, the outlook is dark. The Portuguese have had of necessity to tolerate the insults and atrocities of the Japanese. How- to Pacific offensive is gathering momentum, the time for patience has passed. Dr Salazar insisted strongly on the need for "an immediate solution." The contrast is instructive. Both the Japanese and the British have occupied Portuguese islands. To one occupation, the Portuguese reaction is entirely cordial; for the other, they look to a not too distant day of reckoning.

Exports

The future of exports was discussed last week at a conference about "London's Stake in Overseas Trade," organised by the Liberal Party. Mr Thomas Wiles, chairman of the Port of London Authority, quoted some figures showing the great importance of London in Britain's trade; in 1938, the total value of the port's overseas trade was £593 million, equivalent to nearly two-fifths of the total overseas trade of the United Kingdom. He criticised the suggestion that other centres should share to a greater extent in some of London's commercial activities; what is needed is not a redistribution of trade but an all-round expansion. Mr Harcourt Johnstone, Secretary of the Department of Overseas Trade, emphasised the need for a substantial expansion in exports after the war. According to his estimates, Britain's income from invisible exports is likely to be about £200 million a year smaller after the

war. Not only have Britain's overseas assets been depleted, but a large volume of sterling indebtedness has been created. Indeed, Mr Johnstone expects that if Britain is to maintain its pre-war standards—presumably he meant its pre-war volume of food and raw material imports—exports may have to be increased by some £350 million. This is a tall order. Curiously, none of the speakers, insofar as they were reported, discussed the possibilities of Europe as a market for British exports. Yet Europe always has been, and can again become, one of Britain's best overseas markets.

Shorter Notes

Colombia has declared war on Germany. The immediate provocation was the sinking of yet another Colombian ship. The decision makes little difference in the balance of the war, for Colombia had already broken off relations with the Axis. But the approximation of Colombian diplomacy to the attitude of Brazil strengthens Brazil's growing moral and political leadership, especially since it is in this case underpinned by a common interest in the Brazilian development scheme for the Amazon basin.

The Government's inquiry, promised last July, into the population trends of Great Britain, which it was said would be carried out on the broadest lines, is to take the form of a Royal Commission. Its chairman will be the Lord Chancellor.

The facilities, under the Emergency Hospital Scheme, for the specialist treatment of war workers have been extended. At present they only apply to fracture cases, but, in future, similar facilities will be available for other accidents, such as dislocations and sprains, head injuries and severe burns, though not to minor injuries which do not need specialist advice.

Shorter Notice

"Words and Phrases Judicially Defined. Vol. 1. A-C." Edited by Roland Burrows, K.C. (London) Butterworth & Co. 606 pages. 55s. net.

The publishers, in an introductory note, explain that this work is not the first instalment of a dictionary, not being intended to give the meaning of all words and phrases but "only of such as have been the subject of judicial interpretation." The words and phrases are explained by giving the use attached to them in various cases, thus affording not a watertight definition, but a valuable guide to their most accepted meaning. The aim set is carried out with great efficiency and thoroughness, under the guidance of a distinguished group of editors. Especially valuable are the inclusion of cases covering the Appeal Courts of the Dominions and Colonies, and the comprehensive introduction on the Interpretation of Documents contributed by the Editor-in-Chief, Mr Roland Burrows, which forms a necessary part of the scheme.

AGENDA

A Quarterly Journal of Reconstruction

The issue for November, Vol. II, No. 4, contains articles by J. L. Brierly, Margaret Fry, Vera Anstey, M. A. Abrams and others.

Single copies - - 6s. 6d.
Annual subscription - 21s. 0d.

Oxford University Press

AMERICAN SURVEY

Subsidies and Taxes

While the country starts on a pre-Christmas spending spree of breath-taking proportions, Mr Morgenthau has made a last appeal to the Senate to salvage some of the Treasury's tax proposals. Last week the House approved by 200 to 27 its Ways and Means Committee's emaciated version of a new Revenue Bill. This would produce only \$2,100 million more revenue, or about one-fifth of what the Treasury requested. There is a belief in some quarters that the House cut the estimates so drastically as a challenge to the Treasury to endorse a national sales tax. There is no evidence, however, that this is taken seriously in Congress—or by Secretary Morgenthau, although he forecasts "black markets, ruptured price ceilings and substantial increases in the cost of living" if more taxes are not raised. Unfortunately for the Treasury, last week's announcement of Service savings of \$18,000 million has been interpreted by many as doing away with the need for increased revenue. Meanwhile, anti-subsidy legislation has gone to the Senate, and Administration leaders are struggling to save some of the 25 subsidy programmes affecting 40 agricultural commodities. A Bill bearing Senator Bankhead's name, which would prolong subsidies into next year, may provide a basis for compromise. The Opposition's arguments have followed familiar lines: that subsidies merely transfer costs from the grocery bill to the Tax Bill; that they regiment the food industry; that they are unworkable; and that they reduce production below levels it would attain in a free market. There is also increasing emphasis on the political implications of what is regarded as a gigantic "slush fund." Much of the emotional motive power behind the agitation is undoubtedly provided by resentment, on the part of the farmers, of high wages for labour. The success of the Mineworkers this week in inducing three-quarters of the operators to accept the terms of the Ickes contract will fan the flames. But, as Walter Lippmann has pointed out, it is not labour that will be the prime sufferer if prices rise; it will be the receivers of fixed incomes, whether from pensions, salaries or investments. Labour has its own weapons; and the power of its leaders to prevent their use is weakening. Convinced that there has been nothing like "equality of sacrifice," and cynical about the ability, or indeed the desire, of the Administration to fight its battles, the rank and file is increasingly in favour of withdrawing labour representatives from the War Labour Board and revoking the no-strike pledge. These cracks in the national unity are not new, but they are widening ominously.

Hard Knocks for the Army

Army policy was soundly rebuked this week on two scores. The first was the Patton incident. What emerged, after the first burst of righteous indignation had spent itself, was a strong sense that the Army had dealt unfairly with the public. Many commentators have treated the General himself with leniency, and most have now decided to accept Mr Stimson's view that the affair is best left to the discretion of General Eisenhower. What is harder to forgive is the way the incident was handled by the Army authorities. The flat denial, on grounds of mere terminology, of a newspaper story which turned out to be true in its main outlines has left a sour taste. To call the original Army statement a "bunch of half truths" was a flattering overestimate; and nothing could have been more inept than to issue a denial which itself had to be denied the next day. In Congress there has been resentment of the fact that a recommendation for Patton's promotion to the rank of Major-General was made without reference to an incident which might well have a decisive effect upon Senate action. As a result both Houses have requested full inquiries, and it is doubtful whether the Army will be able to retain General Patton, at least in his current role. The second Army blunder, at least in so far as its public relations are concerned, has to do with the highly secret drilling of oil wells in the Yukon. The Army has been under fire both from the civilian agencies, which feel that they should have been consulted, and from critics of the arrangement whereby Canada is given first option to purchase the facilities and 500-mile

pipe-line after the war. Mr Ickes, the Solid Fuels Administrator, has been characteristically caustic, and Senator Truman, after an investigation by his Committee, declared the project "unjustified." Army spokesmen have argued that the cost—estimated at over \$120 million—is a trivial factor in wartime compared with the production of 20,000 barrels of oil a day to serve the Alaska road and its military airports. Whatever the rights of the argument, it is certain that the Army would have been better advised to have taken steps to secure the support of the civilian agencies. It is also clear that its spokesmen would have had a more trusting audience for their version of the "Canol oil scandal" had the public not had fresh in its mind the disingenuous denial of the Patton story.

Petrol Civilisation

Fears for the future of American oil reserves, and indeed of American ability to maintain a "petrol civilisation," have led in recent months to certain glances over the fence at foreign oil reserves. The Five Senators asked for greater use of Middle East reserves; the Truman Committee suggested that Lend-Lease might be repaid by transfers of titles to oil holdings. These fears were given new expression this week in an article by Mr Ickes, the Petroleum Administrator, entitled "We Are Running Out of Oil." Mr Ickes' challenging estimate is that the United States will be short of oil in another fourteen years. This conviction has been responsible for long-standing controversy between Mr Ickes and the Office of Price Administration, in which the Petroleum Administrator, with the support of the oil companies, has endeavoured to persuade OPA to raise oil prices on the ground that this would stimulate exploration and the discovery of new wells. More recently Mr Ickes has begun to argue for increased American access to foreign oil resources. Early this month, in an address to the American Petroleum Institute, Mr Ickes attempted to reassure domestic producers worried about foreign competition and to convince them that post-war importation of oil would be necessary and in fact would not be contrary to their interests. He pointed out that most foreign governments participated in foreign oil activities, and suggested that, where private initiative and capital were inadequate, the Petroleum Reserves Corporation might be utilised to supply them from government sources. In his last article Mr Ickes embarks on a full oil standard. Believing that an equitable agreement on world petroleum resources "will determine the durability of the peace," Mr Ickes proposes a four-power agreement to rehabilitate oil facilities suffering from war damage; to make oil supplies available to all nations; and to forbid supplies to aggressor states. Mr Ickes is a sincere, if truculent, democrat. But it is only too likely that the oil he is pouring on troubled waters will make a tidy flame in less scrupulous hands.

Aid to Service Men

There exists one aspect of post-war policy on which there is virtually complete unanimity between the President and Congress, Democrats and Republicans. That is generous treatment of the disbanded Service men and women. There are not lacking, indeed, certain signs of rivalry as to which side is to get the credit. Last week President Roosevelt in a message to Congress recommended legislation which would provide:—

1. Payment of a uniform mustering-out pay on a monthly instalment basis;
2. Payment of unemployment allowances to those unable to find work within a reasonable time;
3. Extension of old-age and survivors' insurance to members of the Armed Forces.

Mr Roosevelt estimated that about one-half of the members of the Services will not be entitled to unemployment benefits, and pointed out that those who are covered will receive widely varying benefits, because of differences in state laws. In many cases the protection will be inadequate. For this reason uniform benefits under Federal

law are desirable. These should, he said, be extended to members of the Merchant Marine in the form of a Federal Maritime Unemployment Insurance Act. Further, as members of the Forces do not receive credit under the Old Age and Survivors Insurance for the period of their military service, and benefits are based on the number of years under the system, it is recommended that the Federal Government should assume the burden of granting credit to all members for the Forces for their period of service, the Federal contributions to be uniform for all irrespective of rank. Benefits provided for the Services and their families are already extensive and substantial. Dependents' allowances were recently increased to \$80 a month for a wife and one child, \$100 for a wife and two children, and \$120 for a wife and three children. Death and disability pensions have been raised. Other benefits range from the opportunity to buy cheap life insurance through certain kinds of civil relief and hospitalisation to emergency maternity care for the wives and children of Service men. Not long ago President Roosevelt recommended a plan for providing educational opportunities for demobilised Service men. With the present recommendations, the rounding-out of Government protection will be complete. Already two Bills have been introduced into Congress to implement the President's suggestions. One provides a maximum of \$300 on mustering out and the other a \$15-25 weekly allowance. These proposals are specific, their justice cannot be denied; and they are politically attractive. But what the

returned Service man wants is a job, not a benefit. To satisfy the demobilised, and to keep unemployment benefits within reasonable proportions, there will have to be a concerted attack upon the problems of conversion to peacetime production and the provision of employment—what the President in a nostalgic phrase called "the maximum utilisation of human and material resources." The most difficult part lies ahead.

Shorter Notes

The number of women employed has increased from 10,800,000 in October, 1940, to 16,400,000 in October, 1943. Ingenious woman power campaigns have been undertaken, with considerable success, in the nine "tight labour" areas. The ability to recruit women workers does not, however, always imply the ability to keep them. Turnover of women workers, it is estimated, is still about three times that of men, and they show an even more disproportionate rate of absenteeism.

The labour-management production committees which were hailed with so much enthusiasm by WPB a year ago seem to be dying out. Only one-third of the original peak number of 2,100 are still active. Labour representatives, according to managements, were too truculent and over-eager to criticise and assume managerial functions.

THE WORLD OVERSEAS

Canada's Empty Spaces

(From Our Ottawa Correspondent)

October 23rd

AS long ago as 1858, Sir Alexander Galt, Finance Minister of Canada, estimated the Canadian North-West as "capable of sustaining thirty millions of souls." This belief was entertained in even more fantastic terms at the end of the century, one eminent optimist forecasting a population of several hundred millions. Sixty years after the "Great Lone Land" was bisected by the Canadian Pacific Railway the population is less than three millions, but the dream has not yet died. Little was heard of it during the agricultural depression of the 'thirties, but it tends to be revived in the discussions of post-war Canada. Journalists are coming back from the Alaska Highway with tales of unexploited resources now made accessible to civilisation. The importance of "filling up the empty spaces" to reduce the burden of overbuilt transportation facilities is being linked to contention that Canada will need immigrants to help carry the post-war debt. In some quarters, Canada is being urged to provide asylum for the millions of Europeans who are expected to migrate. There is even a theory that a large part of the population of the British Isles will want to move to more tranquil regions, if the long-range bomber has not by then made the idea fallacious.

That Canada possesses the transportation and communication facilities, the legislative, judicial and educational plant, the food and raw materials, the power and fuel for a much larger population, and that a doubling or trebling of the present figure would be desirable for many reasons, has been so clear to the Canadian for years that he is puzzled to explain why, despite a vigorous immigration policy, the population has grown so sluggishly. In the first two decades of this century about 3,600,000 persons arrived in Canada, and the natural increase was 2,000,000 in the same period. This should have doubled the population in twenty years had not the emigration exceeded the natural increase, reducing the net gain for the two decades to some 200,000 below the immigration total.

The map of Canada, especially the Mercator projection, has deluded many amateur enthusiasts. It portrays Canada as the northern half of a great continent, with an area of 3,500,000 square miles. Comparing populations and areas in other parts of the world, they think it incredible that

Canada still has a population density of less than four to the square mile.

A resources map is more edifying, showing, as it does, the tundra, the muskeg of black spruce, the vast Precambrian Shield where hunting and fishing, some mining and a little lumbering (none of them conducive to dense populations) are the only possibilities. Still more illuminating is an accurate soil map of the Dominion, which quickly disposes of the theory that there are vast areas of rich agricultural land still to be exploited.

Only nine per cent of the total agricultural area in the Maritime Provinces is in "improved land," and the average acreage per farm is only 34. This follows from the topography, which commonly compels the farming of small pockets and strips. Prince Edward Island is "the Garden of the Gulf," a million acre farm, but its population of 80,000 is smaller than it was sixty years ago. Nova Scotia finds it necessary to import feeding stuffs for cattle and hogs in order to provide for its own industrial population.

The best farm lands in Ontario and Quebec had been already picked over by Confederation, seventy-five years ago. There are two or three clay belts or pockets in the Precambrian Shield, to the north, which might support a few thousand more people. But, apart from a possible—not probable—increase in the density of rural population in the old settled areas, there is no scope for expansion.

West of the Rockies, British Columbia is a "sea of mountains" and, of a total area of 234,400,000 acres, only 4,250,000 acres are classed as "suitable for tillage." The present farm area of British Columbia is about 3,500,000 acres, of which 705,000 acres are arable and cultivated. This acreage supports a farm population of slightly over 100,000. The maximum potential is evidently not great.

The Great North-West

That leaves the "Great North-West," consisting of the three prairie provinces and the territories to the north. It was of this area that the optimists had fondest hopes. As recently as 1940, the Royal Commission on Dominion-Provincial Relations published a survey called "Prairie Population Possibilities." This effectively exploded the notion that there were still immense areas of fertile land awaiting settle-

ment. It showed that the best lands within economic reach of markets had been occupied, that millions of acres of sub-marginal land then occupied would probably be abandoned, that the density of population in the "short-grass" spring-wheat country was falling, not rising, and that so far from offering opportunity for immigration, the prairie provinces had been "exporting" people to other parts of Canada for several years. (In the five years 1931-36, the net loss was 104,000 persons, representing 60 per cent of the natural increase.)

The survey concluded that, in the absence of such unpredictable factors as the discovery of new mineral resources, a revolution in farm techniques and a profound change in the character of external markets, the area could not absorb any substantial number of immigrants, and, indeed, might find a continuing difficulty about absorbing its own natural increase.

These conclusions may be modified to some extent by the nature and direction of Canada's post-war reconstruction policy. Among the projects being examined by the Parliamentary Committee on reconstruction and re-establishment are irrigation projects which, if fully carried out, would result in the irrigation of about 3,000,000 acres of semi-arid prairie soil, at a cost of about \$110 million. The water resources are said to be available and no insuperable engineering obstacles exist. Some power might also be developed in connection with the scheme.

This might well result in a prairie economy capable of supporting a denser population, although in a limited way. No estimate of the increased population which the completion of this irrigation scheme would allow has been made, but information supplied to the Committee gives a rough answer. One clue lies in the fact that this semi-arid region without irrigation requires from 20 to 30 acres per animal for pasture; with irrigation, nearly ten times as many cattle or horses can be maintained. The Lethbridge Northern Irrigation project was occupied by only 1,500 persons before the water was turned on; now it has a population of 10,000 and the standard of living is materially higher. This came from irrigating about 75,000 acres of land. If the same factors are applied to the 3,000,000 acre scheme being examined by the Parliamentary Committee, the new irrigated area might be expected to support an additional 340,000 persons. As this approximates to the natural increase of the prairie provinces for a decade, it may, at best, offer limited opportunities for immigrant settlers.

Skilled Workers Wanted

It is quite possible that the population of Canada will materially increase as a result of factors quite different from the availability of virgin farmland in the Dominion. And, after all, it is urban population, not rural, which Canada needs to move towards a more balanced and stable economy. Agricultural surpluses have been a great blessing lately, but before the war they were a grave problem, and may become so again. The Canadian Minister of Munitions, Mr Howe, stated a few days ago that in the past four years this country had undergone an industrial transformation which, under normal circumstances, could not have taken place in less than twenty-five years. The development of Canada's water power has been accelerated, so that by 1944 ten million horse-power will be in harness. Though there is little basis at present for the theory that our agricultural fringes or northern frontiers will support a large influx of farm people, it is possible to visualise opportunities for numerous artisans, engineers, scientists, executives, clerks and other immigrants attracted by Canada's new urban developments.

Hungarian Policy

[BY A CORRESPONDENT]

THE Hungarian Government Party, which has been in power for almost two decades, achieved its revisionist aims as a result of Germany's political and military successes in Eastern Europe and the Balkans. Since Munich, Hungary's territory has increased by 84 per cent and its population by 58 per cent. This has been the principal factor underlying Hungary's foreign policy, which now aims at maintaining all the territorial "awards." Politically and militarily, Hungary is too weak to be a barrier against German expansion to the south-east. Resistance against a Germany which is still intact would mean occupation. On the other hand, Allied armies advancing from Russia or from the Balkans would be forced to turn Hungary into a theatre of

war if Germany were still able to fight. These are the two extremes which Hungarian policy, directed by "MEP"—Magyar Elet Partja—commonly referred to by Hungarians as the Government Party, has been trying to avoid. This is Hungary's exclusive aim, a phrase which occurs in any speech made by Ministers or Government party politicians. It seems that Kallay and his Ministers have the idea that Hungary will be extremely valuable as a stabilising factor in the Danubian area, at the time of a German defeat and subsequent collapse of the Nazi regime, if actual warfare can be kept away from Hungarian territory. It is a foreign policy at once difficult and dangerous, a policy, moreover, which demands effective national unity. Never has the demand for national unity been so persistent as since the fall of Mussolini, and never has the assurance that Hungary is actually a neutral been so emphasised in public utterances.

If Hungary had been a totalitarian state like Germany, based on a totalitarian mass party, its policy would have been a simple one, as that of a subordinate member state of a totalitarian European Federation dominated by Germany. But the curious nature of the Government party, which holds, together with the affiliated Transylvanian Party, 253 seats out of a total of 370 in the Lower House, prevented the rise of the Arrow-Cross Party or the Hungarian National Socialist party to power. The Government party rejuvenates itself from a curious class of bureaucrats, which has its roots in the class of the petty aristocracy. The party has no fixed programme, and a recent attempt to lay down a programme in more than one hundred points was a ridiculous failure. But the fiercest opposition of the Arrow-Cross party and the Imredy party, largely backed by Nazi influence and money, came to nothing. The leading members of these parties melted away, and some of them found their way back to the Government party. The fall of Mussolini was an extremely heavy blow to the Nazi party, and enabled the Government to recall parliament in November.

The electoral system perpetuates the power of the Government party. It is based on restricted voting, and, in addition, the Government has the power of co-opting new deputies. Consequently, the opposition parties are, from a parliamentary point of view, ridiculously small and are hopelessly split for economic and religious reasons. Attempts at forming a kind of United Front between Social Democrats, the trade unions, the Smallholders' party, the Peasants' Association, the Catholic party, and a Liberal Bourgeois party have so far failed.

The Government, unable to turn Hungary into a full totalitarian regime, is, however, not adverse to adopting specific totalitarian methods. The Levente Youth Movement for boys and girls is clearly modelled after the Hitler Youth Movement. In the persecution of Jews, Socialists and Communists, the Government party is as experienced as the Nazi party. Very conveniently, the demand for land reform was canalised into a policy of expropriating Jewish landowners, who formed a considerable part of the owners of large and medium-sized estates. The textile and clothing trade was cleared of Jews a long time ago, and all Jews are liable to forced labour. At present, parliament is discussing a bill demanding a capital levy on Jewish property. National sentiment is kept alive by propaganda against the suppression of the Magyar minority in the Roumanian part of Transylvania. Students' demonstrations against Roumania have recently been frequent. Naturally, a regime that is forced to allow some measure of political discussion and freedom of the press is subject to some pressure from public opinion. The burning problem of land reform, the heavy burden of the war economy and industrial expansion provide much material for popular discontent.

Agricultural Measures

After several bad harvests, this year's cereal harvest seems to be an average one. Drought, however, has severely affected the maize harvest and the sugar beet crop. Pastures have suffered and cattle herds are rapidly declining because of the lack of fodder. After several unsuccessful attempts at an effective delivery system of agricultural produce, the much discussed Jurscek plan, named after the Secretary of State in the Supply Ministry, has now been put into operation. The system is based on a points scheme of which a wheat unit is the basis. All other products are expressed in terms of this wheat unit, and the delivery quota is fixed according to the taxable income of the estates and peasant property. Nominally, there is no longer any escape from compulsory delivery. Instead of one agency entitled to purchase the entire harvest, there are now 23 big firms in operation, which can buy in any part of the country. In addition, 120

firms have been given the right of purchasing the harvest within the areas of specified districts. The purchases are registered in a so-called Farmstead Book. The control of milk deliveries has been tightened considerably because the bulk was sold on the black market. Closer control of delivery makes it necessary to increase the storage space. Last year, the storage capacity for cereals was increased by 30,000 tons to 280,000 tons, and more silos are now under construction. Larger milk deliveries demand more dairy capacity, and by amalgamation a huge combine of dairies has been formed, which is trying to handle the bigger volume by the rationalising of working processes. The German model of the *Reichsnaehrstand* organisation is visible everywhere.

The delivery system has been rounded off this year by a compulsory cultivation plan. All farms exceeding roughly 25 acres must cultivate 7 per cent of their total acreage with oilseeds, and it is hoped that vegetable fats will remedy the shortage of fats caused by the slaughter of pigs. Attempts are being made to cultivate rice, but to be effective comprehensive land reclamation would be necessary. In fact, Hungary's agriculture lacks the material foundation for an effective wartime system. The large masses of smallholders work inefficient units. Yet a land reform would seriously disturb the present precarious production. The land reform of 1920 was unsuccessful because it created extremely small peasant plots which were inadequate to sustain a family. Laws passed in 1936 and 1940 aimed at larger units. These half-measures, which arrested any real land reform, are in strong contrast to the anti-Jewish laws. Already in 1938, all Jewish-owned land was requisitioned by the state. It was carried to its conclusion by the Kallay Government in 1942, and 490,000 hectares (1,200,000 acres) of agricultural land and 290,000 hectares of forest land (700,000 acres) were virtually requisitioned. The partition of the big estates has, however, been postponed and the requisitioned estates are being administered by the Land-Credit Bank. It is obvious that the land held by the Government is a powerful instrument in internal policy. The small Jewish estates have been handed over to the so-called "Hero-Capital" organisation, which distributes land to officers and men of the 1914-18 army who bear the title "vitez" (hero). The membership numbers at present 24,000 persons. The Government thus distributes requisitioned Jewish property at will. What happens is nothing but a change of ownership. The large estates which are the backbone of the wartime agricultural policy are left untouched, and the mass of peasants are promised real reforms after the war.

Irish Retrospect

[FROM OUR DUBLIN CORRESPONDENT]

October 15th

AN interesting attempt to provide a materialist interpretation of Irish history has been made by Dr Redcliff N. Salaman, FRS, in this year's Finlay Lecture which he delivered in University College, Dublin. Dr Salaman argued that the adoption of the potato as the staple diet of the Irish poor influenced the whole course of modern Irish history by its effects on the price of labour and on the growth of population. The potato was introduced into Ireland about 1588, at the same period that it was introduced into many other European countries. It was a plant well calculated to serve as a popular foodstuff, nourishing and palatable and less cloying to the palate than its rival, the Jerusalem artichoke. Why, the lecturer asked, was it that it was in Ireland alone that the potato spread rapidly and it supplanted many other crops? Soil and climate were very suitable. Deep friable soils of large acid content, a high rainfall, atmospheric humidity and westerly winds are all favourable to potato culture. These conditions, though present in Ireland, were also present elsewhere, and some further explanation must be sought of the successful invasion of Irish agriculture by the potato.

The open three-field system in England, with its traditional rotation and autumn pasturage, was not favourable to the production of a late root crop. In Ireland the rotation was less fixed, plots were smaller, and the "lazybed" method of cultivation was peculiarly suitable for peasants who still were to a large extent migratory in their habits. The "lazybed" was a protection against frost, pillagers and marauders, and had the additional advantage of requiring very little capital. The agricultural revolution in-

BETTER TAKE A MAC

SUCH is the British climate that there are few days when this is not sound advice. It is also a tribute to the memory of the inventor of the "Mac"—a Scot, Charles Macintosh (not Mackintosh as the dictionaries usually say!) who in 1823 produced a waterproof material by impregnating fabric with a solution of rubber in naphtha. How to make clothes withstand water is still a major problem for the chemist, for modern standards demand something more than heavy proofs against heavy weather. Rubberised garments and oilskins are certainly proof against water, but they are also proof against air and in the absence of special ventilating arrangements are apt to be heavy and hot. Your rain-coat today must be light in weight as well as keep out the wet. It must be water-repellent: that is, water must not cling to it. The difficulty is to treat textile fabrics so as to combine protection with ventilation, but a number of methods have now been perfected, some of which can be applied to the most delicate materials. The latest achievement of British chemists is a waterproof finish which will stand up to laundering. Today there are also the special needs of engineers, fitters and others in the fighting services and in industry. Their working dress must be both light enough to give freedom of movement and strong enough for protection against weather. It is to the credit of the chemist that he has enabled the British textile manufacturer to combine these qualities.

volved in the spread of the potato coincided with a period of extreme disturbance in Ireland. The country was ravaged by rebellion, invasion and war.

I am of opinion [Dr Salaman states] that the relentless dynamism of war succeeded in accomplishing what the blessings of nature and the goodwill of man failed to achieve elsewhere. . . . It was the discovery that the potato offered the only hope of escape from starvation in times of the direst distress which probably sealed the compact so fraught with consequences between the people of Ireland and itself. From now on, we find that the potato, directly or indirectly, enters into practically every phase of Irish life and can be recognised as a potent factor in the shaping, or misshaping, of the destinies of the people.

The principal consequence of the adoption of the potato as the staple food was that Irish labour became abnormally, indeed disgracefully, cheap. The English and Scottish settlers discovered that the old native population could always underbid imported labour. The Irish peasantry thus succeeded in retaining their hold on the land. Their little holdings were paid for in labour, reckoned at an utterly miserable rate of wages. They were therefore secured in the possession of land, but their security was bought at a terrible price. The history of Ireland in the eighteenth and nineteenth centuries is a record of chronic poverty, punctuated by recurring famines in years when the potato crop was bad. The miserable standard of living, the ease of subdividing farms, the natural fertility of the people and the encouragement, on moral grounds, of early marriages all combined to produce an unparalleled increase of population. Begging and drinking were increased by the potato; begging because of the recurrence of hungry periods of food shortage, and drinking by the dullness and monotony of the diet and the possibility of distilling a coarse spirit from potatoes. In the years following the Union these evils grew apace. In spite of consolidation of farms, evictions and emigration, the population continued its upward course until the worst forebodings of Malthus were completely outdone by the experience of the Famine.

The Famine left a trail of evil consequences, some of which are still active after the lapse of a century. Ireland endured a period of woe that can be likened only to the Black Death: starvation, pestilence, evictions and emigration drastically reduced the population of the country, and the good spirits of the people never wholly recovered from the visitation. The memory of the Famine fanned the flames of hostility to England both in Ireland and in the United States, where the emigrants and their descendants stirred up anti-British feeling, and the improvement of the condition of the working classes in Great Britain was delayed by the influx of cheap Irish labour. All these evils can be traced, according to Dr Salaman, to the Irish people's

reliance on a single cheaply produced and nutritionally adequate food . . . which played the part of the least common denominator in Irish economic life for close on three hundred years with an efficiency as great as it was disastrous.

Portuguese Food Difficulties

[FROM OUR LISBON CORRESPONDENT]

November 11th

SINCE last March, when rationing was first mooted, the need for economy has been officially dri'led into all classes. This year's irregular crops and an all-round reduction in imported foodstuffs call for precautions. Imports were as follows:—

	Jan.-Aug., 1942	Jan.-Aug., 1943
	Tons	Tons
Wheat	69,343	61,649
Maize	36,505	29,250
Sugar	49,220	45,336
Dried Cod	12,372	9,696
Coffee	3,292	1,864
Cocoa	365	228

The reductions, especially of the first four items, fully justify rationing restrictions, which are all the more necessary since official figures show the current cost of living as 60.4 per cent above July, 1938-July, 1939. Moreover, actual daily shopping, irrespective of class, means that a

100 per cent increase is in most instances nearer the mark. The one bright spot is the good olive crop. Cheap olive oil is of first importance, and this can only be assured to-day if export, in any shape or form, is severely restricted. It is one of the main food items of the working classes, being used with every dish. Rationing at official prices is excellent, but to-day is merely theoretical. Oil, officially Esc.9\$80 the litre, fetches Esc.20\$- on the black market, where alone it can be bought. There are innumerable petty prosecutions for deals of as small as 5 litres, but such action, however well meant, merely irritates the public. If, with a notably good crop now being pressed, short supplies of olive oil for local consumers continue, there may well be trouble ahead.

Letter to the Editor

Steel Prices

TO THE EDITOR OF THE ECONOMIST

SIR,—As a constant reader of *The Economist* I was somewhat puzzled by the paragraph on steel prices in your issue of November 27th, and its final conclusion. That, of course, is a matter of opinion, but there were two statements of fact in the paragraph which I venture to question.

1. You say with reference to the Central Fund Levy on Steel: "This levy is not very heavy." But surely a levy which on your own showing accounted for a rise of over 30 per cent in steel plates is a heavy one.

2. You say with reference to the report of the Select Committee on National Expenditure that "They contend that the whole cost, both of high-cost imports (now obtained under Lend-Lease) and of additional payments to high-cost producers should be met by the Exchequer." The Select Committee's Report contains no such contention. The full treatment of the matter is in Part II, paragraph 190, and there are shorter references to it in Part I, paragraphs 52 and 55. In paragraph 190 the Committee say: "It seems to them that it would have been better financial policy to have met this particular factor of increased cost by a subsidy, thus keeping down the whole level of war expenditure." This "particular factor" had previously been referred to as "the exceptional cost of imported raw material resulting from artificial war conditions."—I remain, Sir, Yours, etc.,

House of Commons.

Germany at War

Totalitarian Youth

AS the war drags on, ever greater demands have been made on German youth. During the autumn months of 1943 something like a fresh mobilisation of young people for war purposes has shown the extent to which the Nazi leaders rely upon German youth to carry on the struggle. On the customary "day of *Wehrtuechtigung*," or "Pre-military training day," in October, Hitler marked the occasion by sending a special address. Then followed the opening of the first wartime vocational competition for working youth. A new Penal Code for Juveniles was issued. Dr Goebbels, opening the "youth film hours" special winter programmes for young people, appealed to them to stand fast during the new bombing offensive.

What the young Germans do, or do not do, cannot in itself be decisive in maintaining the war effort. All this campaign is part of a series of measures designed to maintain the fighting strength of the Wehrmacht, as well as industrial output, for a long and terrible war. Within Greater Germany the Wehrmacht can recruit about 500,000 boys a year. At present the 17-year-olds are finishing their six months' service in the Compulsory Labour Service. The 18-year-olds have been at the front since the summer. In other words, for some time to come, the Wehrmacht can replace an annual loss of half a million men.

At the beginning of the war pre-military training was entrusted to the Hitler Youth Movement under the supervision of the SA. After Stalingrad pre-military training came under the direct supervision of the Wehrmacht. Selected boys are now trained in special camps. The instructors are soldiers with front-line experience. From these boys the Wehrmacht selects future officers and non-commissioned officers. The Hitler Youth maintains, in addition, special groups in which boys are trained to be motor-car drivers, pilots, signallers and sailors. It can be assumed that at least 50 per cent of any class of young men called up for the Wehrmacht have already had an extensive military training.

Work in Factories

The present campaign of exhortation is necessary because of difficulties in the factories, as well as Wehrmacht losses. There is a shortage of boys and girls for apprenticeship in almost all occupations. This year only two-thirds of the vacancies could be filled. The shortage has become more pronounced because of the reduced numbers at school-leaving age and the growing calls of the Wehrmacht. But leaving age and the growing calls of the Wehrmacht. In a one underlying reason is the wasteful way in which, in a totalitarian system, young labour is exploited. Germany has a long tradition of a very extensive vocational training. In the absence of a free labour market voluntary vocational guidance has become conscription according to a central plan. The labour exchanges direct boys and girls into jobs whether they are suitable or not. Psychological and intelligence tests have become just a pretext for placing them as the plan requires. The workshops of artisans, which have absorbed yearly more than 100,000 apprentices, have been closed down in great numbers. Young people go more and more into factories as actual workers to pick up their training, if any, by chance. On paper, in contrast to these actual conditions, there is a flood of decrees and measures regulating in detail training, tests, wages and every detail of working conditions. Now, after four years of war, a "Reich-vocational competition" has been opened, which will go on throughout the winter. In industry, commerce and agriculture boys and girls will be assembled to show what skill they may have picked up. The winners will be sent to "selection centres" to be trained according to their ability. The Nazis think always in terms of military organisation, and the main object of this competition is to find N.C.O.s for the factories.

An equally pressing problem has been the deterioration of factory discipline. The carefully built up system of factory youth wardens and all the activities of the Youth Branches of the Labour Front have broken down. The youth-leaders and wardens are now serving in the Wehrmacht. Special regulations for maintaining discipline, among them, "week-end custody" and now "youth imprisonment," have become necessary. At the compulsory voca-

tional schools there is a shortage of teachers. In the factories boys and girls are much influenced by the presence of foreign workers. Some of them who have been made foremen over foreign workers at the age of 17, or even 16, display an overbearing attitude. The rest imitate the slow working methods of the foreigners. The aim of the present propaganda campaign is to counteract these influences.

Each successive stage in Germany's war economy has reacted in two ways on young people in factories. Apprenticeships were cut short by the closing down of shops and factories. Theoretically, the boys and girls remained apprentices, but, in fact, had to do the work of unskilled labour in the factories to which they were directed. Bombing and the evacuation of women and children from bombed industrial centres left young people at work without parents and in many cases without a home; they had to stay with their factories. The number of boys and girls housed in special youth hostels and camps has been increasing steadily.

Little Totalitarians

Young Germans between the ages of 10 and 17 present in their organisation and activities an exact replica of the hierarchical political, industrial and military organisation of adults under the Nazi rule. The total nature of the war effort is made astonishingly plain by an analysis of what the different age groups are doing. Schoolchildren between the ages of 10 and 14 are mainly employed in collecting waste and salvage. From 13 onwards all boys and girls are liable to do compulsory service on the land during harvest periods and other war work, including street cleaning, hospital work, service as tram-conductors, and so on. Between 14 and 16 physical exercises on military lines are compulsory. After that, pre-military training begins in earnest. Girls up to 16 do their war work in hospitals, in the so-called neighbourly or domestic help and on the land. At 16 they enter the "Service Year," which is a form of compulsory domestic service. The seven months' compulsory labour service for girls has been extended by five months of "war-help service," or as an alternative service in the home establishments of the Wehrmacht, in military hospitals or on farmsteads. Heavier air raids have produced the "Luftwaffe helpers," boys of 15 and 16 years from secondary schools serving with anti-aircraft batteries. Boys and girls are also recruited as fire-fighters.

Most significant of all these activities, however, is the actual system of education and schooling. Besides the normal elementary and secondary schools, a variety of Nazi party schools have been formed. These "National Political Schools," which are boarding schools, train N.C.O.s for the Nazi party and the political administration. The "Adolf Hitler Schools" prepare selected boys for the higher political and military careers up to the age of 18 years.

The Hitler Youth Movement itself is the supreme controlling body of all these activities, with its own judiciary and its special patrols in the streets watching over boys and girls who offend against the curfew or the prohibitions on smoking, drinking and visiting cinemas during the black-out.

THE BUSINESS WORLD

The Dollar Problem—II

LAST week's article contained a summary discussion of the analysis* made by the United States Department of Commerce of America's balance-of-payments experience in the period 1919-1939. Space precludes the reprinting of the table that contains the main evidence, which can be found on page 717 of last week's issue. The conclusion can, however, be briefly summarised by saying that the supply of dollars was highly erratic, and also that it had a tendency to be inadequate, though this inadequacy would not have been so marked if it had not been for the panic inflow of foreign funds, for which America can hardly be held responsible. (In the five years 1935-39, the gold inflow was \$8,813 million; in the same years the recorded inflow of foreign-owned long-term and short-term capital was \$4,047 million, and it is probable that a large part of the "unexplained" inflow of \$1,988 million was also composed of foreign-owned funds which escaped recording.) What is the position likely to be after the war? What probability is there that the supply of dollars will meet the report's desiderata of being both adequate and regular?

The discussion of these questions is quite the most valuable part of the report, the more so since the conclusions reached are stated with clarity. They are disturbing. In merchandise trade, the authors of the report are clear that

both exports and imports probably will increase in total value as compared with their pre-war levels, but the forces stimulating exports will be different from and stronger than those determining imports.

In brief, the shortage of dollars will be intensified. Nor will they concede that the position will be substantially better (as is often argued) in years when America is prosperous than in lean years. Even if full employment is attained in the United States

the resulting stimulus on imports should not be exaggerated. . . . The behaviour of imports stands in marked contrast to that of exports, which consist largely of high-standard-of-living goods and which, under conditions of economic expansion and rising incomes abroad, are susceptible of attracting a still more rapidly growing volume of foreign purchases. Imports of some finished manufactures, it may be noted, demonstrate a capacity for rapid increase in times of rising prosperity similar to exports, but the variety

* "The United States in the World Economy." Economic Series No. 23. Prepared in the International Economics and Statistics Unit of the Bureau of Foreign and Domestic Commerce by Hal B. Lary and Associates. Published by the Government Printing Office. 216 pages. 35 cents.

of such goods has been severely limited by the tariff, and they constitute only a minor part of the total.

Under the head of services and invisible trade generally, the conclusion of a careful discussion is the same—namely, that the balance can be expected to shift sharply in favour of the United States. This conclusion is qualified, however, by the probability that for several years there will be substantial American grants to the outside world for relief purposes.

The main conclusion is that, whether or not there was a problem of the dollar before the war, there will certainly be a very serious problem of the dollar after the war.

Examination of forces and trends now discernible in our international transactions indicates that, especially after the termination of immediate post-war aid to foreign countries by the United States, the flow of dollars supplied through purchases of goods and services from other countries will be not only less than they would like to spend in this country, but less than they must spend if reconstruction and development programmes abroad are to be carried through on a scale commensurate with basic needs and legitimate aspirations. In addition to retarding recovery and progress abroad, with attendant delays in the achievement of a more peaceful and orderly world society, restriction of our international transactions to a relatively low level would . . . inevitably mean perpetuation of restrictive trade and financial controls abroad and further development of bi-lateral arrangements among foreign countries to the exclusion of the United States.

There is nothing in this that is very new or surprising, at least to a British observer. But it is most valuable and opportune to have the diagnosis thus authoritatively confirmed and backed with such impressive documentation. There is a tendency in America to regard the need for international financial reconstruction as virtually synonymous with the need to rescue the pound sterling. Mr Leon Fraser, for example, has recently referred to the weakness of sterling as "the world's financial problem number one," and there is a disposition among many of his compatriots to ascribe British hesitations about agreeing to the immediate restoration of free exchanges and stable exchange rates simply to lack of self-confidence in Britain's ability to surmount her difficulties. But if the Department of Commerce is right (which admits of virtually no doubt) it is not the pound, but the dollar that is the world's financial problem number one. It is not the propping up of the one that is likely to be the major necessity so much as the holding down of the other. And it is not British pusillanimity that impedes the immediate return to a gold standard, stable exchange, free trade world so much as a lively apprehension of the problems that are likely to be set to the world by the American balance of payments and a desire, before entering upon commitments, to see what proposals are put forward for solving these riddles.

The authors of the report have two suggestions to make. "One way [to make available a larger and more stable supply of dollars] is by a renewed outflow of American capital, and the other is by positive measures to permit a larger volume of imports." If there is any criticism that can be made of this admirable report it is that these possibilities are not analysed with the same realism and the same quantitative spirit as the other topics discussed. It is not, perhaps, for officials of the Department of Commerce to forecast to what extent Congress is likely to reverse its high tariff policy. But they might have gone further in attempting to assess what the effects of a substantial reduction of the tariff would be. Looking backwards they say that "the wide fluctuations in domestic economic activity and world prices were of much greater consequence in determining the behaviour of imports during the interwar period than were upward or downward revisions of the tariff." If this was true before the war, why should it not be true after the war? Indeed, it may very well be that the much-abused American tariff is more of an irritant than a real obstruction to the flow of trade. It is

almost certainly true that any reduction in the tariff that is at all likely to be politically practicable would be wholly inadequate to solve the problem of the dollar. It may be, in fact, that the problem should not be regarded as the fruit of aberrations of policy (or at least of economic policy, for two world wars have played their part in bringing it about), but that it should be looked upon as the result of a set of economic circumstances never contemplated by the textbooks—namely, the existence of a country which, all policy apart, needs so little from the rest of the world, while the rest of the world requires so much from it, that an equilibrium of accounts can be brought about by no means available to a free, or even a tolerably free, market.

There remains the possibility of international lending as the *deus ex machina*. It is a possibility—but before it can be called a probability there are several reasons for scepticism to be mentioned. First, such lending would have to be very large. The average deficit in the supply of dollars in the decade 1930-39 was \$507 million a year out of a total demand of \$4,095 million—or if the rather exceptional years 1938 and 1939 are omitted, \$405 million out of \$4,017 million. It is true that these figures include in the "demand" for dollars sums used by foreign countries in purchasing American securities; but so long as there is a risk that another war will start with a "cash and carry" period, some reconstitution of dollar reserves by other countries must be allowed for. It is, of course, hazardous to put any figures upon the future trends that are discussed in the report. But it may very well be that, after the immediate relief period is over, the annual deficit in a reasonably free market (i.e. the deficit that would arise if countries put no more restraints on their citizens' use of dollars than they did in the 1930's) would rise from the half-billion of the 1930's to, say, a billion and a half in the late 1940's and the 1950's. This is a very large sum indeed to be lent internationally. Secondly, loans only postpone the

day of reckoning unless they lead to an increase both in the exports of the borrower and in the imports of the lender. What products are there which the world, with the aid of American capital, can put itself in a position to sell in larger quantities on the American market? Thirdly, loans are of assistance to close the gap in the balance of payments only to the extent that they are not spent by the borrower on additional American goods. Some part of almost every loan is spent on labour and local supplies in the borrowing country; but there is also a tendency, notably in the United States itself (as witness the Import-Export Bank's loans to Latin America), to stipulate that any supplies not available locally must be bought from the lending country. There is something of a vicious circle in this. Private loans are less likely to have such restrictive clauses than those that are made with public money. But if the volume of lending needed to balance the accounts is too large for private resources, as it almost certainly will be, public funds have to be brought in, and their restrictive clauses immediately increase the total of lending necessary to cover a given gap in the balance.

It would be a mistake to reach a conclusion of hopelessness. There may be hitherto unrevealed factors that will help to solve the problem—for example, an inflationary rise in costs in the United States unaccompanied by any fall of the dollar or any enhancement of tariffs. It would be even more of a mistake to discuss the subject in terms of criticism when the unfortunate situation that looks like arising is not the deliberate product of policy and may possibly not be susceptible of correction by policy. But it is also clear that it would be the very height of folly for other countries, and especially for Great Britain, to engage themselves in any rigid or inescapable commitments until it can be seen far more clearly than at present whether any solution can be found to the great dollar mystery.

Business Notes

Brazilian Debt Settlement

The general terms of the agreement reached between the United States of Brazil and the holders of sterling and dollar loans, and the details insofar as they affect the former loans, have been available for almost a week, and there have been daily adjustments in market quotations, often of considerable magnitude. There has also been a great deal of discussion of detail, aimed at securing a just assessment of individual stocks, but not much has been said of the plan as a whole. The first point which seems to call for comment is that all parties were agreed that the settlement should be permanent. Since Brazil had fixed the annual charge—and only made minor concessions in this respect—and since it was fixed at a level which appears to ignore the great change which has taken place in that country's economy in the past few years, her attitude is easily understood. But the representatives of the bondholders know that a settlement is only permanent so long as the debtor cares to implement it. That they should have been prepared to base such a settlement on past history suggests that they have very little confidence in the industrial development of Brazil after the period of scarcity is ended. The second point is that Brazil wished that the terms should include a partial repayment of capital, doubtless at a substantial discount, as an essential part of the plan. This the lenders have been able to reject in part, but only by the expedient of a double option. The bondholder is given the choice between (i) a partial repayment in cash at a heavy discount, a current interest rate of 3½ per cent on the remainder of his holding, and a rate of amortisation which ranges from over 33 to a small fraction of 1 per cent; or (ii) the retention of the whole holding with a substantially lower sinking fund and a rate of interest which is always lower than under the other choice, and usually very much lower. Apart from the needs of individual investors, the decision which option to adopt will depend on the estimate of Brazil's future credit status. If the view of those who made the agreement is adopted, certainly holders of all junior securities and probably those of some senior ones ought to opt for partial repayment at once. It must not be forgotten, however, that the extent to which either option is used will vary the amount of money employed for redemption as a whole.

Apart from the question whether the total which Brazil is prepared to devote to the service of her foreign debt is

reasonable, there is the possibly more important question of its division among the very long list of securities involved. While the terms are much better than those of the temporary settlement of 1940, the division among the various groups is broadly similar. The plan covers, not only the original obligations of the Central Government, but those of the states and cities. Even within the first class, little regard appears to have been paid, either to the terms of the original loans or to the principle of allocating special revenues to the debt service. It is probable that no tying down of revenues would avail to secure the service if the Brazilian authorities were averse to meeting it; but it should surely have been possible to effect a division of the reduced service in an equitable manner between the various classes of debt. The clue to the failure to do so is, presumably, to be found in a sentence from the statement made by the Council of Foreign Bondholders, which runs as follows:—

Moreover, the allocation of the available money between the various bonds revealed marked differences of outlook, not only between the creditors' representatives and the Brazilian Government, but between the British and American points of view.

It is easy to agree with the Council that the result is unsatisfactory. But it is necessary to go further than that. There is no hope of securing a reallocation in this instance, and it is, perhaps, the case that no other settlement of similar interest and complexity is immediately in view, but nothing less than the whole basis of international lending is involved. It is useless, on the one hand, to talk of international loans to assist the less economically developed countries to improve their position, and, on the other, to destroy all means of assessing the precedence of any given international debt. Even if all loans are in future to be between states and not by individuals to states, some means of obtaining adequate security and of establishing priority will be necessary, since it is highly improbable that all

finance will be arranged on the basis that any state which participates in any international loan is to share in all in the same proportion.

Brazil's Balance of Payments

The Brazilian debt scheme makes an attempt to adjust the burden of the external debt charge to the framework of what can be regarded as a "normal" Brazilian balance of payments. The full statutory foreign debt service of Brazil would call for an annual outlay equivalent to £23 million. Seldom has the Brazilian favourable balance of payments exceeded this figure, and in good pre-war years it hovered around £20 million. Out of that figure not only the foreign debt but other important invisible outlays had to be met, and it is not altogether surprising, therefore, that the history of Brazil's relations with her external bondholders should have been frequently punctuated by defaults. Under the 1940 arrangement, now being superseded, the external debt service called for annual payments equivalent to about £4 million. The new scheme calls for something between £7,700,000 and £8,300,000 a year, according to whether bondholders choose option one or two. These figures do not appear impressive in the light of the current balance of Brazil's international payments. For 1942 the favourable balance amounted to about £35 million. This figure, however, must be deemed wholly abnormal. The Allied Powers have been buying everything that Brazil can offer them. For example, Brazilian meat has been bought in substantial quantities, whereas in normal times it would not find a market. Brazil has, during the war, sold cotton manufactures to West Africa and to neighbouring South American countries, but will find it more than difficult to retain these markets when competition from Lancashire and other manufacturing centres is again met after the war. Imports into Brazil have, by contrast, been curtailed to a minimum owing to shortage of goods and of shipping. A substantial part of the materials going into Brazil enter on Lend-Lease terms and do not have to be paid for. These abnormalities explain the exceptionally favourable balance of payments of Brazil and the ability

of the country to build up substantial reserves of sterling and dollars. The latest debt offer is attuned to that abnormal situation in that, under option two, it offers bondholders partial cash payments which would involve an outlay of as much as £23 million if all bondholders were to choose it.

Credit Stringency

The turn of the month of November was marked by considerable stringency of credit in the money market. It is normally a difficult period because of the temporary immobilisation of funds in Government accounts preparatory to the big War Loan dividend payments on December 1. On this occasion the pressure was increased by the fact that one of the largest clearing banks was making up on the last day of the month and by the banks' heavy Treasury deposit receipt payments this week, namely £100 million, against which effective maturities were somewhat below £50 million. The market, for its part, appears to have made insufficient preparation for the inevitable stringency, no doubt on the confident assumption that "everything would be looked after" by the authorities. Although the authorities did ultimately "look after" things, both by direct purchases of bills from the market and by providing the required resources indirectly through purchases of bills from clearing banks, it was not until many discount houses had passed through some anxious moments watching the hands of the clock moving all too fast towards 3 o'clock. After the turn of the month the position was fairly quickly restored. In the past, War Loan dividend monies have taken a long time to trickle back to the market, but the response to the authorities' request that dividends should be paid direct to bank accounts has shortened that period, and by Wednesday there were already indications that the credit position was being eased by this factor.

TDR's Leap Ahead

The monthly debt return, covering the four weeks ended November 27, 1943, shows a net increase of about £244 million in the nominal total of Government debt during this period. Of this, £132 million was raised by short-term borrowing. Treasury deposit receipts again provide the chief ingredient in this last total, the net amount raised through this channel being £78 million, which carries the amount of TDR's outstanding to £1,291 million. The gross amount raised was £240 million, and, of the redemptions of £162 million, it is notable that pre-encashments only accounted for £26 million. This latest jump in TDR's outstanding makes it virtually certain that when the clearing banks issue their November statements, the aggregate figures will show TDR's above the total of investments and thus taking first place in the ranking of bank assets. The October statements showed a gap of only £23 million between the two items, and this should be covered, and with a good deal to spare, during November. The balance of floating debt borrowing was, in the main, contracted through ways and means advances. Advances from the Bank of England increased from £16,750,000 to £27 million (having no doubt been at zero for a considerable part of the intervening period), while there was a jump of about £41 million in advances from public departments. The later movement probably represents the accumulation of savings banks and extra budgetary funds pending their more permanent investment by the National Debt Commissioners. The Treasury bill issue is now very static, the past month's rise of £6,595,000 almost exactly cancelling the previous month's fall. This stability contrasts with the persistent and considerable expansion in TDR's. Even the "tap" issue of Treasury bills has remained close to its present figure of £1,868 million since February of this year. During the intervening months, Empire and other official sterling assets held in London have continued to increase in substantial measure. It was the expansion in these assets which to a considerable extent explained the increase in the issue of tap bills, and the recent stability of that item suggests an interesting change in the investment of these official funds.

"Berwick" Stockholders' Association

The formation of the London and North Eastern Railway Stockholders' Association, Ltd., under the chairman-

ship of Mr Austin E. Kavanagh, to put pressure on the Government to vary the existing railway agreement, seems to be a move of doubtful wisdom. It is, of course, true that the disparity between the standard revenue under the Act of 1921 and the receipts under the present agreement is greater in the case of this line than of any other, but this merely serves to stress the defects of the 1921 scheme. Few who remember the discussions which preceded and followed the fixing of the capitalisation of the four new group railways will deny that, whatever might be thought of the other lines, the prospects of earning anything appreciable on the junior "Berwick" issues were considered slender. Even in 1921 it was felt to be improbable that an arrangement based on 1913 traffics would work out very well. There is correspondingly less justification for returning to that basis after the lapse of a further 23 years, and those the most critical in the history of railways from the standpoint of the stockholders. That is, however, precisely what Mr Kavanagh's association does, and it bases its argument on the ground that all the assets of the company are now fully employed. There is no reason to suppose that, where the railway managements and the Railway Stockholders' Association have failed, this much less representative body will succeed. Nor is it particularly desirable that railway stockholders should speak with different voices through these two bodies, as they very well may. While it is hard not to feel some sympathy for those railway stockholders who are still receiving little, or it may be nothing, on their stocks, sympathy must be extended equally to a very high proportion of investors in other fields whose luck is little better and may even be worse. One thing is certain. The rights of railway stockholders must be based on the part their physical capital and organisation can play in peacetime under conditions as nearly approaching competition as may be, not on the purely artificial results obtained during the war. If, for strategic or other reasons, the country wishes to retain in being any part of a system which would not survive under the test outlined, there is every reason for relieving the stockholder of any burden on that account. There can be none, however, either for subsidising the stockholder or for giving a purely artificial protection to the lines in general in order to preserve in being those fractions

which are uneconomic. What is really required is modern costing methods as a check to the policy of charging what the traffic will bear.

Electric Power Companies

The report on the future of the electricity supply industry, submitted by the Incorporated Association of Electric Power Companies to the Minister of Fuel and Power, has little in common with the sweeping proposals made by the Electrical Power Engineers' Association. The latter proposed a drastic reorganisation of the industry, whereby the generation, transmission and retail distribution of electricity would be carried on by a single public authority, by a "National Electricity Supply Board." The Incorporated Association of Electric Power companies—the association representing part of the privately owned section of the industry—takes the view

that revolutionary changes in the constitution and management of electricity distribution, such as are inherent in ownership by a public corporation or regional boards, would result in a serious and unnecessary dislocation of the industry without any compensating benefit to the community. The Association, in fact, falls back upon the report of the Committee on Electricity Distribution—the McGowan Committee—which recommended (in 1936)

the retention and utilisation, where possible, of the larger and more efficient of the existing undertakings (both public authorities and companies) and the absorption by such undertakings of the smaller and less efficient undertakings.

As an initial step, the Association suggests the passing of legislation suspending the exercise of the rights of purchase by local authorities and other bodies of electricity undertakings in order to prevent the splitting up of comprehensive undertakings. The Electricity Commissioners would then delimit suitable electricity districts and appoint a scheme committee for each district to prepare and submit to the Commissioners, within a prescribed period, a draft scheme for the improvement of electricity distribution "in accordance with the views and recommendations of the McGowan Committee." The scheme committees would consist of re-

Vitamins in chocolate for liberated Europe

The British Government, having examined all the ways in which sufficient vitamins could be provided to the under-nourished children of liberated Europe, have arrived at the conclusion—as Rowntrees did in 1938—that chocolate offers one of the best vehicles for carrying added vitamins. In chocolate, the vitamins retain practically all their potency.

Before the war, Rowntrees pioneered the addition of vitamins to cocoa and chocolate. Their object was to enhance the protective value of these already highly nutritious foods.

Today, when the Allied Governments are faced with the enormous problem of rehabilitating each occupied territory as it is freed, Rowntree's experience of fortifying cocoa and chocolate with vitamins on a large scale is proving of great value. When the war is won, this experience will again be used for the benefit of the British public.

ROWNTREES

Throughout the world the name of MILNERS is a synonym for SECURITY. The same sound craftsmanship which has made MILNERS' SAFES and STRONG-ROOMS so universally respected is embodied in MILNERS' STEEL EQUIPMENT, which is designed to promote office and factory efficiency. THE FUEL WATCHER'S JOB

MANAGEMENT'S RESPONSIBILITY

Through a fuel watching system which is properly planned and supervised, management can encourage and ensure the active co-operation of every single employee in the effort to save fuel. Everybody is made to realise that the small amount each can save makes a substantial saving for the plant as a whole.

Here is an example of what planned fuel watching can do. At a place in the North there has been, in electricity alone, a 40 per cent. saving as a result of reducing idle running of machines; planning capacity furnace loads; lagging electric ovens; reducing the wattage of lamps (where practicable and safe); keeping lighting fittings clean; seeing that lights are switched off when not needed; reducing to a minimum the use of lifts.

It is well within the power of every management to make equally substantial fuel savings through a planned fuel watching system. Keenness, encouragement and whole-hearted co-operation are the keys.

**SUCCESS LIES IN THE
HANDS OF MANAGEMENT.
GIVE THE FUEL WATCHER
YOUR FULL SUPPORT

WATCH ELECTRICITY

Industrial consumption of electricity is rising rapidly. Impress upon your Fuel Watchers that every saving of electricity is a saving of coal. Examine meter readings each week. If there is a rise in consumption, find out if it is justified. If it is not, take immediate steps to check it.

The Secretary of your Regional Fuel Efficiency Committee can advise you on the organisation of Fuel Watching.

The Ministry's Regional Offices are at:

BRISTOL • READING • LONDON

ISSUED BY THE MINISTRY OF FUEL AND POWER

representatives of the authorised undertakers in each electricity district, though the schemes would be subject to the approval of Parliament. The Association suggests that, if Parliament decides that the industry should ultimately come under public ownership, fifty years should expire before the first optional purchase date. It advocates a measure of standardisation of tariffs—not to be confused with uniformity of charges—and of voltages and systems. It is difficult to resist the conclusion that the Association has been concerned mainly with the problem of maintaining the private sector in the industry. There is nothing wrong in this. But quotations from the McGowan and other reports hardly provide a convincing answer to the proposals of the Electrical Power Engineers' Association.

London Chamber's Recommendations

The recommendations of the London Chamber of Commerce to the Cohen Committee on the reform of the company law contain much that is excellent. In particular, they favour imposing on all investors the duty to disclose the beneficial ownership of shares and this would have retrospective effect. They also favour the preparation of a consolidated balance sheet and profit and loss account and the compiling of all the accounts involved with reference to a single date. It is less easy to be enthusiastic about the concession that, if this means a prohibitive amount of work, balance sheet dates may differ, but there must be a reconciliation statement. Apart from the question as to whether any company should be allowed to have so many subsidiaries as to make this position possible, it is surely only necessary to spread the work of auditing over a larger number of firms to secure the necessary speeding up of the process. An interesting suggestion is to substitute the voting list for proxies in the normal course and to reserve the proxy for cases where it is desired to send a representative to the meeting and leave it to him to use his discretion. Although interesting, this suggestion ought not to be adopted. It presupposes that the shareholder is not fully informed before the meeting, and the whole essence of the matter is that, in these days of widely spaced holdings, all the information ought to be available well before the meeting. The Chamber of Commerce also favours the publication of a trading result. This is a step in the right direction but not a long enough one. A trading account is required, if the shareholder is to have any real idea of the efficiency of those in charge. It is, however, on the matter of publication of inner reserves that the Chamber seems to fail to understand the modern trend of feeling. It is, of course, quite true that most companies use their reserves in a perfectly proper manner. All laws are, however, made to control not the majority, but the disreputable few. Further, there can be no question but that the owner of the business is entitled to know what his money has earned and what is being done with it. This is recognised in the recent recommendations of the Institute, which the London Chamber appears to ignore. It is, presumably, a similar belief that the concealment of a great deal of information is justified which accounts for the fact that no recommendation is made as to the publication of accounts by private companies. Without this it will always be possible for the unduly secretive and the ill-disposed to conceal anything.

Waring and Gillow Scheme

Unlike schemes submitted some months ago by other Oxford Street stores, that of Waring & Gillow (1932) is of strictly limited scope. The profits of the company for the year ended January 31st last have reached a level where some payments of interest are possible, but it is intended to retain them as additional working capital and the new arrangement is to run from that date. Briefly, interest on income debentures—themselves issued in satisfaction of interest arrears—has not been duly met. It is proposed to fund this by the issue of 5 per cent cumulative redeemable priority preference shares. The necessary capital to cover the issue is provided by writing down the ordinary capital from 20s. to 12s., but this involves no surrender of equity, nor any sacrifice other than that arising from placing a new charge in front of them. Since this charge replaces double the amount of accumulated arrears of interest, it is likely to be a benefit, rather than the reverse, to holders of both ordinary and pre-

ference capital. Further, there is no danger that the new charge will constitute a permanent reduction of the profits accruing to either of these classes, for the new priority shares are to be redeemed over a period of twenty years, provided profits are available. Redemption of the priority shares ranks, to this extent, before dividends on the old preference issues, but they will benefit almost at once from any material expansion in distributable earnings. The board, however, reserve the right to use such funds for accelerating the repayment of the new priority shares. Those who have evolved the scheme are to be complimented upon their simple and direct approach to the problem and upon limiting their action to what was necessary instead of attempting to pre-judge the results of a period which must be full of uncertainty.

Aircraft Production

The replies of the departments to the Select Committee on National Expenditure (published as the Committee's 17th report) do not give much new information about the activities of the various Ministries. As usual, there is the inevitable time-lag, first between the Committee's investigations and its report, and then between the Committee's report and the departments' replies. For instance, the Ministry of Fuel, replying to the 8th report, is able to announce as a *fait accompli* the measures undertaken, or in train, to ensure fuel economy both by domestic and industrial users, to introduce new mining machinery and to speed up the procedure for dealing with absentees. To say this is by no means to detract from the value of the Select Committee as a watch-dog over de-

partmental procedure and efficiency. One of its most useful reports was that on aircraft production, on which the Ministry of Aircraft Production, the Air Ministry and the Ministry of Labour have now offered their comments. The Select Committee had praised the achievements of the industry, which had started from scratch and built up a formidable organisation, but had nevertheless shown that there was room for improving its efficiency. The Committee was concerned at the effects of programme changes and constant modifications of types, which were often not sufficiently discussed with the industry and resulted in a loss of output. It recommended a review of dispersal firms, with a view to eliminating inefficient units and concentrating capacity on the most efficient; a reduction in the number of sub-contractors and fuller utilisation of the Ministry of Production regional machinery. It suggested the strengthening of the technical side, by arranging for closer co-operation between the drawing and planning departments, and encouraging training and research, while it considered that more attention should be paid to personnel management, with a view to reducing excessive labour turnover and wastage. The Air Ministry and MAP deny that excessive dislocation has arisen from the change-over in types and stress the need for flexibility in order to maintain operational superiority. MAP states that the advantages of employing immobile labour and the efficiency of many dispersal units makes it undesirable to undertake any rapid concentration of their capacity, but that steps are being taken to increase their output by making them specialise on particular items. The Ministry considers that good use is made of the regional machinery for finding capacity and placing sub-contracts. The importance of research and training and of personnel management are recognised. There are clearly many matters on which the outsider is not qualified to judge, but now that the development of the bombing offensive is placing an increased strain on the industry's resources it is imperative that every effort should be made to attain the maximum degree of technical efficiency and economy in aircraft production.

Royal Bank of Scotland

The "statement of the affairs" of the Royal Bank of Scotland, covering the year to the second Saturday in October, conforms to the broad lines of banking developments in this country over the past year, but in matters of detail presents some interesting contrasts. The expansionist trend is evident in the growth of deposits from £89,200,000 to £95,337,000, and of notes in circulation from £6,357,000 to £7,622,000. The whole of this expansion in resources finds its counterpart in the holding of liquid assets and investments. Government securities, which are by far the largest assets item, have risen from £39,342,000 to £43,310,000. Cash is up by over £2,000,000, money at call and short notice by over £1,500,000, and bills discounted by some £300,000. The most interesting contrast with the experience of the clearing banks is the stability of the Royal Bank's holding of Treasury deposit receipts, which, at £7,000,000, show no change over the year. The total of TDR's outstanding over the comparable period rose from £760,500,000 to £1,114 million, while the clearing banks' holdings kept pace with this movement—namely, from £693 million to £1,044,500. The allocation of TDR's to the Scottish banks is not believed to have been reduced during the past year, and the stability in the Royal Bank's holding suggests that this institution has indulged fairly extensively in the practice of pre-encashing TDR's in order to finance subscriptions to Government loans. Another interesting contrast with the general experience of other banks is the comparative stability of loans and advances over the year. This item fell from £25,253,000 to £25,162,000, while for the 11 clearing banks a drop of about £41 million was shown over the year covered by the September returns. The Royal Bank's profit for the past year, struck in the customary conservative tradition, amounted to £532,960, compared with £516,386 for the previous year.

Commercial Bank of Scotland

The figures of the Commercial Bank of Scotland, covering the year to October 30th, follow fairly closely the movements indicated by other Scottish bank balance sheets. The contrast with clearing bank figures in the matter of

TDR holdings is even more marked in this case, this item having actually fallen from £10 million to £9 million during the year. As against this, some £1,400,000 more is shown to be employed in the short loan market and Treasury bills, of which none were held a year previously, amounted to £1 million at the date of the last balance-sheet. The main expansion, however, is in the item of British Government securities, which have risen from £42,909,000 to £50,620,000 over the year. The feature of the balance sheet lies in the fact that the bank's investments are now more than five times the combined loans, advances and commercial bills—a rather top-heavy position. Given the redistribution of assets shown by the last two balance sheets, it is not altogether surprising that the profit for the year should have risen from £286,275 to £320,792.

South Africa's Sterling

The weekly returns of the South African Reserve Bank have this year shown an interesting persistence in the accumulation of foreign bills discounted—which in overwhelming part represent sterling Treasury bills. At the end of 1942, these amounted to a bare £950,000. After a sudden jump to £11 million early in January, they fell back to around £5,500,000 in March, but from that point began a steady climb which brought them to £12,330,000 on October 1st last, the latest date for which a return is available here. The jump in the holding of these bills earlier this year was undoubtedly connected with the accumulation of sterling resources preparatory to completing the repatriation of some £40 million of South African sterling debt covered by the vesting order issued last December. In that respect the movement followed the precedent created by previous operations of this character. But the subsequent increase in these holdings of sterling cannot be explained in such terms and seems to represent a new departure for the South African authorities. Until this year, it had been their policy to keep their sterling balances down to a minimum and to invest the surplus of their balance of external payments in gold—a policy which could be readily carried into effect since the South African authorities have first pick of the gold mined in their country. One possible explanation of the increase in South African sterling assets is the need to maintain a reserve against current payments which the South African authorities are making to cover the expenditure of their troops engaged outside Africa. It is also possible that the increase in this item may follow the sales of gold which have been made, largely on British account, in India, the Middle East and Egypt. Much of this metal is probably South African newly-mined gold. In so far as these operations mean that the British Government is buying rather more South African gold than it otherwise would have bought—in other words, that South Africa's first pick is not quite equal to its favourable balance of payments—South African sterling assets would inevitably expand. The figures of this accumulation remain small and, even if there has been some change of South African policy in this matter, it will readily be seen that the Union will have contributed very little to the problem of abnormal sterling balances.

Consumer Needs

An important wartime branch of the Board of Trade, which arises from the curtailment of supplies for civilian needs, is the one known as the Consumer Needs Branch. Its staff is not large, and it does not undertake research into what constitutes a minimum standard of consumer needs. But it does endeavour, within the framework of the resources which can be spared for civilian production, to point the way to satisfying as much of the demand as possible. Its method is that of asking questions of controlled samples of the public on market topics. It undertakes three regular inquiries. For the first, 3,000 different housewives are questioned each month on the articles they have attempted to buy, and the degree of success with which they met. The second questionnaire is answered by a panel of 2,500 assorted retailers, who report on the state of their stocks of personal and domestic articles. From this information, charts are drawn, showing the percentages of retailers who have in stock the various items about which questions are asked. Thus the relative shortages are apparent at a glance, and in conjunction with the housewives' survey, decisions can be made to switch production where necessary. The third re-

COMPANY MEETINGS

ROYAL BANK OF SCOTLAND

ANNUAL GENERAL COURT OF PROPRIETORS

SUCCESSFUL RESULTS—INCREASED PROFIT

RECORD ASSETS FIGURES

DUKE OF BUCCLEUCH'S ADDRESS

The annual general Court of Proprietors of the Royal Bank of Scotland was held at Edinburgh on the 1st instant, Mr Alexander Maitland, K.C., D.L., presiding in place of His Grace the Duke of Buccleuch and Queensberry, P.C., G.C.V.O., Governor of the bank, who was unable to attend through indisposition.

Mr Maitland read the Governor's address as follows:—

I assume it will be your pleasure that the annual report and balance-sheet, with auditors' report, should be taken as read.

Before dealing with the ordinary business of the meeting I should refer to the loss sustained by the bank through the death of General Sir Herbert Lawrence, G.C.B., one of our extraordinary directors. General Lawrence was chairman and managing director of Messrs Glyn, Mills and Company, and was held in the highest esteem in banking and commercial circles in the City of London. He became an extraordinary director of the Royal Bank of Scotland in August, 1939.

Since the publication of our annual report and balance-sheet the death has occurred of Mr J. T. Tulloch, M.C., C.A. Mr Tulloch had resigned from the ordinary board of the bank in March, 1943, for health reasons, and later he was elected an extraordinary director. With his passing we mourn the loss of a valued colleague of engaging personality, whose wide experience of men and affairs was always at the service of the bank.

In the course of the year Colonel Eric Gore Browne, D.S.O., O.B.E., T.D., A.D.C., and Mr Stephen J. L. Hardie, D.S.O., C.A., have been elected extraordinary directors.

The period covered by our accounts coincides with the fourth completed year of the war, a year in which the feats of the Allied arms must have brought appreciably nearer the day of final victory.

DEPOSITS AND OTHER LIABILITIES

Turning to our balance-sheet, our total assets amount to £115,681,681. These impressive figures constitute a fresh record, and are more than £7,500,000 in excess of last year's total.

We have had continued evidence of the support of our clients throughout Scotland to the various Government issues for war finance purposes, while Tax Reserve Certificates are making a widening appeal. Notwithstanding withdrawals for these purposes, it is noteworthy that on balance our deposits and other credit balances have increased by £6,136,377 to the figure of £95,336,360.

Our notes in circulation have again increased, and at £7,621,699 exceed the previous year's figure by £1,264,326. Increased wages and salaries and higher prices all have a bearing on this, but, as stated by the Chancellor of the Exchequer, the retention of this spending power in the hands of the public is disappointing and shows that many are still unresponsive to the appeals to save. It is very desirable that the rising trend in the note issue should be checked.

The figures under Acceptances and Endorsements of Foreign Bills and other obligations are not materially changed and do not call for comment.

LIQUID ASSETS AND INVESTMENTS

On the assets side a very liquid position is evidenced with cash, balances with the

Bank of England and other banks, money in London at call and short notice, etc., totalling around £25,500,000. These quick assets, together with Treasury deposit receipts £7,000,000 as shown in the balance-sheet, represent 31 per cent. of our liability to our depositors and holders of our notes.

British Government securities at £43,310,319 exceed last year's figures by £3,968,709. The Government's war finance requirements therefore continue to benefit substantially by our increased resources.

A high proportion of our investments in Government stocks is in short and medium-dated loans. These and our other investments are all valued at or under market prices ruling on the date of our balance.

In spite of the continued shortage of commercial paper we are pleased to show a portfolio of bills totalling £3,151,513. Of this sum Treasury bills account for £1,465,000.

ADVANCES

A modest decline is revealed in advances on cash credit and current accounts. The bank has continued to support clients requiring accommodation for vital war work, under which heading we include agriculture, fishing and coal mining. These industries are vital if not so direct as munitions and shipbuilding.

PROFITS

The net profit for the year at £532,960 is approximately £16,500 up on last year. Taxation, National Defence contribution and charges of management remain heavy items of expense.

APPROPRIATIONS

The directors are pleased to be in a position to recommend that a dividend for the half-year on the capital stock at the rate of 17 per cent. per annum be declared; that £30,000 be carried to property maintenance reserve account; that £60,000 be contributed to the Trustees of the Staff Pension Fund, and that the remaining £81,710 after these appropriations be carried to our inner reserves against contingencies. Perhaps I should say that the appropriation to property maintenance reserve account is in lieu of our usual writing down of heritable property. As you will readily understand many needed renovations are impracticable at the present time and must perforce await the cessation of hostilities. This account will form a convenient nucleus for such expenditure later on, and it is probably unnecessary to say that our heritable property at the figure to which it is written down, viz., £1,095,246, bears little relation to its real value.

BUSINESS OF THE BANK

The business of the bank has been well maintained throughout the year, and our associates in England—Glyn, Mills and Company and William Deacon's Bank, Limited—have also prospered.

SCOTTISH INDUSTRY

Business in Scotland, as in England, is now so closely allied to the national needs

that any reference I make to it must necessarily be in very general terms. It is gratifying to note, however, that Capital and Labour are working harmoniously to bring the war to a successful conclusion.

The farming section of the community, whose interests have been far too long neglected, is now receiving a fairer measure of recognition for its labour and enterprise. Scientific research and labour-saving appliances are factors which cannot be ignored by the agriculturist to-day, and the Scottish farmer, with his reputation for shrewdness, can be safely relied upon to avail himself of new opportunities. He should be encouraged to preserve the maintenance of fertility of the soil and be adequately safeguarded in any expenditure for that purpose.

Last year I referred briefly to the important work being done by the Right Hon. Thomas Johnston, Secretary of State for Scotland, along with his Council of State and the Council for Scottish Industry. Under their ægis the North of Scotland Hydro-Electric Scheme has come into being. Still in its infancy its potentialities cannot yet be gauged, but it is an example of courageous, far-seeing and broad-minded planning. You are probably aware through the reports in the Press that all the Scottish banks are assisting the financial side of this new enterprise.

710 members of our staff are at present serving with H.M. Forces. In addition 24 have laid down their lives, and we wish to express our deepest sympathy with their relatives. We greatly regret also that 25 are reported missing or prisoners. We have continued the arrangement through the intermediary of the Red Cross by which monthly parcels of books, cigarettes, etc., are despatched to these prisoners wherever such facilities are available. We have received letters of gratitude from different camps, and we are glad that we are able to do something to ease the lot of these young men.

TRIBUTE TO OFFICIALS AND STAFF

The Government requirements in regard to man-power and woman-power continue and are being loyally met, but this naturally increases the already heavy burden on those who are left to carry on the bank's business. To the permanent and temporary staff, therefore, I express our deep appreciation of their loyal co-operation, without which the affairs of the bank could not have been carried on without loss of efficiency.

During the year a Knighthood has been conferred on our cashier and general manager, an honour which has been received with the greatest satisfaction by all connected with the bank and also by his wide circle of friends. It would be difficult to overestimate the value of Sir William Whyte's services to the bank over a long period of years, and to him in very large measure is due its present position. Sir William's reputation in banking and finance is recognised far beyond the confines of the Royal Bank of Scotland, and outside banking he has found time and energy to devote to many worthy causes, and no appeal for help has been made to him in vain. To Sir William I wish to express our heartiest congratulations on his well-merited Honour.

The Honour of Knighthood has also recently been conferred on Lord Provost William Y. Darling, one of our directors. To him also I wish to tender our sincere congratulations on this recognition of his pre-eminent services to the City of Edinburgh. I would only add that we consider ourselves very fortunate in having Sir William Darling on the board of the bank, a position which has been occupied by six of his predecessors.

To Sir William Whyte, general manager, the assistant general managers and the officials at Head Office, London, Glasgow, Dundee, Aberdeen and Branches, our

thanks are once again due for the unremitting and devoted services they have given and are giving in these days of exceptional stress and strain.

APPROVAL OF ACCOUNTS—DIVIDEND

I now beg to propose that the report, containing a statement of the accounts and balance-sheet, be approved, and that out of the profits of the year a dividend at the rate of 17 per cent. per annum for the half-year, under deduction of tax, be declared in conformity therewith.

The report was approved and the Governor, Deputy-Governor, extra-ordinary directors and the retiring ordinary director were re-elected and auditors were reappointed for the ensuing year.

AGAR, CROSS AND COMPANY, LIMITED

The thirty-seventh ordinary general meeting of Agar, Cross and Company, Limited, was held, on the 29th ultimo, in London.

Mr S. C. Sheppard, the chairman, presided.

The following is the chairman's statement circulated with the report and accounts:—

The principal item in these accounts is, perhaps, the writing down of a large proportion of the goodwill asset from £300,000 to £100,000. This so-called asset has figured in the balance-sheet since the business was turned into a limited company. It has nothing tangible to represent it, and your board are of the opinion that the time is now opportune to write it off gradually. The question of Excess Profits Tax has not yet arisen, nor has any figure been settled in connection therewith.

For some time past your board have had under close consideration the question of the reconstruction of the share capital of the company, and a scheme to put this into effect will, I hope, be circulated to the members of the company very shortly. It is thought that the time is now ripe to undertake this, so that at long last the balance sheet may be cleaned up in anticipation of the day when the company can be brought to a dividend-paying basis.

NEED FOR HUSBANDING CASH RESOURCES

I am glad to be able to report a further improvement in the sales and turnover of the business during the past year, notwithstanding the continued severe restrictions on all exports both from this country and North America. Nevertheless, as exports will be urgently required both from here and North America, and as Argentina, like all other South American countries, is equally anxious to receive them, it is hoped that the interregnum period between war and peace may not prove to be of such long duration as is at times anticipated. It is for this reason we are anxious to husband our cash resources to the utmost extent so that we may be able to deal economically with the situation when it arises.

OUTLOOK IN ARGENTINA

The future trading prospects in Argentina are hopeful. Their late large stocks of cereals have been disposed of and, in contrast to past years, the farmers are now being urged to increase their acreage of wheat and maize to the fullest extent. In addition to this, the local prices of all cereals have considerably advanced, so it is reasonable to expect that the farmers may soon be in a position to consider the replenishment of their agricultural machinery. The local industries, likewise, are doing well and our connections with them are being satisfactorily extended.

Before closing I would again like to register the thanks of the board to your staff in all of its departments and equally so to wish success to those members who are serving with H.M. Forces.

The report and accounts were adopted.

MITCHELLS AND BUTLERS, LIMITED

POST-WAR RECONSTRUCTION PROBLEMS

MR ARTHUR MITCHELL'S STATEMENT

The fifty-sixth annual general meeting of the ordinary stockholders of this company was held at the White Horse Hotel, Birmingham, on the 2nd instant, under the presidency of Mr Arthur Mitchell.

The following is the Chairman's statement circulated with the report and accounts:

Ladies and gentlemen: Since our last meeting we have appointed two new directors: Mr Walford H. Turner, J.P., and Wing Commander H. Maynard Mitchell, D.F.C.

Mr Walford Turner is a gentleman of first-class business and financial experience and well known in the Midlands. We have made this appointment knowing he carries the complete confidence of the stockholders.

With regard to Wing Commander H. Maynard Mitchell, he is at present on active service, but his past training and experience with the company well qualify him for a position on our board. We look forward to his return, when we shall have the benefit of the services of this young man in the future conduct of our business.

BREWERY COMPANIES' TAXATION BURDEN

The heavy burden of taxation which presses alike on the trade and consumer is accepted with resignation as a grim war-time expedient in view of the present heavy drain on the country's finances. The contribution now being made by the trade plays an important part in the national war effort. The full weight of the present impost on brewery companies' finances, however, is not perhaps fully realised, and I would mention that during the current financial year the total charge against our profits for all forms of taxation considerably exceeds 10½ million pounds.

CATERING WAGES ACT

Legislation dealing with the catering trade—which includes the licensed trade—has been engaging the attention of Parliament recently, and as a result the Catering Wages Act has been placed on the Statute Book. Its purpose, in the words of the Act, is "to make provision for regulating the remuneration and conditions of employment of catering and other workers, and, in connection therewith, for their health and welfare and the general improvement and development of the industries in which they are employed." Let me say at once that the proper remuneration and suitable living conditions of our employees in licensed houses have always been our first consideration, and we have never endeavoured to build up our business on any other lines. So far as these requirements are concerned, therefore, the provisions of the Act do not cause us any anxiety. I am glad the trade has chosen to proceed by a Joint Industrial Council and use voluntary machinery rather than a wages board. In an industry where employer and employee, wholesaler and retailer, have so many matters of common interest, it is perhaps natural they should do so, and I see no reason why that same spirit of goodwill which has been exercised in the past should not be maintained in discussing any problem which may arise out of this new legislation.

POST-WAR RECONSTRUCTION

Last year I devoted a considerable part of my remarks to the problem of post-war reconstruction, but the question is of prime importance and I make no apology for returning to it.

The war will bring in its train a vast amount of rebuilding; the homes of the people, public buildings and new roads, and bound up with the re-housing of the people

is the rebuilding and redistribution of licensed houses.

The first claim on building will be working men's homes with all the amenities which workers will rightly expect. To meet the needs of the inhabitants we consider that any new centre of reconstruction should be built and developed as a whole, properly equipped for shopping, education, social activities, entertainment and with reasonable licensing facilities.

We have carried out extensive plans of reconstruction and redistribution of our licensed houses since the last war, perhaps more so than any other brewery company, and it is not therefore a new problem for us.

The Home Office Committee is considering the question, and the trade owes its representatives, Sir Sydney Neville and Mr H. G. Griffiths, a debt of gratitude for their very valuable work on this committee.

DECENTRALISATION OF DETAILS

Our view is that after the broad principles of reconstruction are settled the details should be decentralised and left to the locality and the individuals concerned to work out for themselves. The question of the style of architecture, construction and size of the public-house of the future is not one that can be decided by any central body.

To refer to our own trading area, we are fortunate in having some of the ablest architects in England for this type of work, and we are most anxious that our houses will stand in after years not only as works of the highest architectural merit, but also planned to cater for the best service to the public.

We do hope that reconstruction will be tackled wholeheartedly. Our earnest endeavour has at all times been to work in

RAPHAEL TUCK AND SONS, LIMITED

RECORD PROFIT

The forty-second annual general meeting of Raphael Tuck & Sons, Limited, was held on 2nd instant, in London.

Mr Desmond Tuck (chairman and joint managing director) in the course of his speech, said: Ladies and gentlemen, this year's profit of just on £120,000 constitutes a record in the history of the company. It is a result upon which, I suggest, we may, with justification, congratulate ourselves, pointing as it does to a spectacular recovery after many lean years which culminated in 1940 in the loss by enemy action of so much of our valuable properties.

We shall be called upon to hand over a very substantial part of this profit for excess profits tax. Let us remember that this contribution is in the nature of a practical recognition of our debt to the country for the position in which industry finds itself in this, the fifth, year of the war.

THE GREETING CARD INDUSTRY

The greeting card industry was at one time singled out to be the Cinderella of the paper industry, but a wise and far-seeing fairy-godmother appeared in the wood in the person of a new Minister of Supply, who realised how useful and necessary to the war effort were greeting cards, expressing goodwill and hope for the future, and how from a psychological point of view these were assisting morale by maintaining customs and traditions so dear to the heart of the English-speaking peoples.

Your company, true to its reputation, has played the role expected of it in upholding its high quality and popular appeal of such productions, consistent with the limitations imposed upon them.

Included in our general pictorial publications is a portrait of the Prime Minister in his famous siren suit, from the original painting by Mr Frank Salisbury. This has been published in full colour in several sizes, from 3 guineas to 3s. 6d. No more inspiring picture could adorn any wall, and I can safely recommend all who have not yet secured a copy to invest in one.

May I take this opportunity of acknowledging the helpful co-operation which we have received from our wholesalers and retailers throughout the country, who are displaying a great spirit of mutual helpfulness—one of the happy outcomes of this war.

Your company have recently acquired the controlling interest in an up-to-date and efficient printing factory in the Midlands. This will continue to run under its existing technical directorate, and it is confidently hoped that our combined resources will prove mutually beneficial.

CURRENT YEAR'S TRADING

Some seven months of the company's trading in the next financial year has already elapsed. The figures which these disclose to date are highly satisfactory, and it looks as if next year we shall again be called upon to pay excess profits tax. It

harmony with the authorities and the magistrates. If this can be continued and proper facilities provided we intend to break the back of this problem in the shortest possible time and thus carry out further improvements of which we shall be proud.

It must be emphasised that the trade's compensation fund must not be used in any way to facilitate reconstruction. That fund was created and subscribed by the trade itself for the purpose of compensating owners of redundant licences, and it would, of course, be grossly unfair to the trade to divert it to any other purpose.

COMPANY'S CONTRIBUTION TO TRANSPORT ECONOMY

The national need for economy in transport has been engaging our serious attention. In this connection I would like to mention that Mr R. H. Butler, as chairman of the Birmingham and Midland Counties Wholesale Brewers' Association, is on the midland panel of the Ministry of Food Transport and has put in a great deal of time on this question. As a result of our efforts, we are able to point to a saving in the consumption of petrol for the past year of 54,000 gallons. This has not been achieved without disturbing our trade in some districts, as part of the economy has been effected by exchanges of trade with other brewers, who have also been enabled to save transport and petrol. We thank all who have been affected by this temporary arrangement for the manner in which they have accepted the change-over and assure them it is our wish to return to normal conditions of supply at the earliest opportunity.

The demand for our products continues to grow and has been greater than the supply. To meet very difficult and sometimes complicated conditions we have requested our tenants and managers so to spread over their supplies that their distribution shall be as far as possible. It is a perplexing problem calling for the exercise of goodwill on all sides, and we hope the public will appreciate we are doing our best in very difficult circumstances.

TRIBUTE TO STAFF

We have again to thank our staff and workpeople at our breweries, maltings and our licensed houses for their loyalty and hard work under most trying conditions. I would especially like to express deep gratitude to our old employees who have stood so steadfastly by us through these years of war. You must understand this task has become more onerous to the older of our people owing to the depletion of our numbers of younger men who have answered the country's call.

For those who are serving with H.M. Forces we have a special fund which was instituted at the beginning of the war for the purpose of maintaining their homes, and I am happy to say that no employee has had to give up his home for financial reasons through joining the services. All will join in wishing them a safe and speedy return.

Dr Harold Thwaite seconded the adoption of the report and accounts, which was carried unanimously.

(Continued from page 756)

gular survey is exclusively concerned with the clothing ration, and a panel of between 11,000 and 14,000 return detailed records of their coupon expenditure. Allied to this is a yearly survey of the contents of a number of individual wardrobes. Special inquiries are undertaken *ad hoc* (for example, the number of items of bed linen used on the average bed was ascertained), and into local needs and shortages. Among the facts discovered by the branch are the following: The coupon income of retail trade fluctuates widely, according to coupon releases. In July, coupon income was 90 million, and in September, 310 million. It is more difficult to buy a saucepan than a razor blade, and the average number of saucepans in a home is four. The average price paid for a pair of women's shoes was 23s. 6d. in 1942-3. Housewives use fewer coupons than women working in

offices, and factory women workers prefer turbans to other headwear. An important section of the branch consists of thirty-seven area distribution officers, based on the Civil Defence Regions. Their functions are to investigate local shortages, to advise on the licensing of new shops and the granting of coupon floats to retailers. In the case of bombing, they arrange for shopping facilities to be maintained, and for additional supplies of essential goods such as mattresses, blankets and domestic utensils, a reserve of which is kept for raided areas. They try to arrange traders' schemes of mutual assistance to operate in event of bombing. In general, the area distribution officers have a wide knowledge of their locality, its special needs and shopping facilities, and they form a link between the public and retailer on the one hand, and the Board of Trade on the other.

would be unwise to venture to look too far ahead during the war period, and to make any prediction as to the trade we shall be able to enjoy, so much depending upon the supply of raw material that will be available to us. One thing, however, seems pretty certain. Now that we have tasted, once again, the fruits of success and proven what we are capable of doing, we should, when operating facilities are more normal, and material made more readily available, render a good account of ourselves. There are, in my judgment, wide possibilities of development open to the company in many directions, and with the priceless advantage of a great world-name, the path, under competent management, to future and greater successes must unfold itself before us.

The report was unanimously adopted.

WALTER SPENCER AND COMPANY, LIMITED

The seventh annual general meeting of Walter Spencer and Company, Limited, was held, on the 1st instant, at Sheffield, Mr John R. Winskill (chairman and managing director) presiding.

The following is an extract from the chairman's address circulated with the report and accounts:—

The profit and loss account shows a pleasing advance, and, generally speaking, the output for the year has been very gratifying and helpful in the war effort, towards which all our energies have been directed. This is the seventh report the directors have submitted, and the steady progress during the period will be very interesting and gratifying to the shareholders.

Your directors recommend the payment of a final dividend of 7½ per cent., less income tax, making (with the interim dividend of 5 per cent. paid, less tax) a gross dividend of 12½ per cent., less tax. After providing £3,750 for the final dividend and £5,000 to be added to reserve (making that account £30,000) and writing off £589, the cost during the year of War Damage Insurance for plant and buildings, there remains to be carried forward £24,423.

The report was adopted.

STRAND HOTEL, LIMITED

The thirty-sixth ordinary general meeting of The Strand Hotel, Limited, was held, on the 1st instant, in London, Major M. Gluckstein (the chairman) presiding.

The following is an extract from the chairman's statement circulated with the accounts: The trading account balance amounts to £99,257, slightly more than the previous year, and it is proposed to pay a dividend of 10 per cent. on the participating preferred ordinary shares, absorbing £23,000, to distribute a like sum on the deferred ordinary shares, both amounts being the same as last year, and to carry forward the surplus of £39,503.

The trading experience of the year has, on the whole, been satisfactory, and the improvement recorded last year has been maintained. We have not been able to satisfy all the demands made upon us.

The report was adopted.

FIXED INTEREST AND EQUITY SECURITY MOVEMENTS (July 1, 1935=100)

Financial News Indices of 20 fixed-interest securities (converted to new base) and 30 ordinary shares.

FINANCE AND BANKING

THE MONEY MARKET. The credit stringency that has been experienced this week is discussed in a Note on page 752. By Wednesday, the day on which the Bank return is made up, conditions were easier, and the return gives little evidence of the earlier stringency. Thus, bankers' deposits, though £15,128,000 down on the week from the exceptionally high figure of £183,168,000, are still at the comfortable level of £168,040,000. The Government securities item, which is down by about £1,000,000, shows no indication of the help given to the market. On the other hand, there is a big end-month rise in the note circulation, which is at the high figure of £1,030,824,000; the "proportion" is consequently reduced from 13.5 per cent to 8.8 per cent.

MONEY RATES, LONDON.—The following rates remained unchanged between Nov. 26th and Dec. 2nd:—
Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½%; 6 months, 1½%; Treasury Bills: 2 months, 1½%; 3 months, 1½%; Day-to-day money, 1½%; Short Loans, 1½%; Bank deposit rates 1%. Discount deposit at call 1%; at notice 1%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between Nov. 26th and Dec. 2nd. (Figures in brackets are per cent of exchange).

A change has been made in the method of showing an excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £143,872 to £2,590,210, the other operations for the week (no longer shown separately) raised the gross National Debt by £43,154,436 to £18,947 million.

INDUSTRY AND TRADE

Utility Furniture.—Owing to the present heavy demands of war industry on available timber supplies, it is sometimes impossible for firms manufacturing utility furniture to find quickly supplies of oak suitable for furniture production. The Board of Trade has therefore arranged for certain other timbers, such as ash and chestnut, to be substituted for oak when the need arises. Manufacturers may use these other timbers only by permission of the Board of Trade, whose Technical Officers will in each case satisfy themselves that the timber which it is proposed to use is suitable, and will produce articles which are in every respect up to the standard of quality specified for utility furniture. The prices of articles made of these other timbers will in no case exceed the prices shown in the Utility Furniture Catalogue for the corresponding articles made in oak.

The 1943-44 Clothing Quiz.—A new edition of the Clothing Quiz, issued by the Board of Trade, price 2d., has appeared. This booklet contains 34 pages of questions and answers about clothes rationing and shows the number of coupons needed for all kinds of clothing. There is also information about second-hand articles and goods sold at clearance prices and a list of the principal coupon-free articles.

Extra Dried Eggs.—To offset the fact that the production of shell eggs and of milk reaches its lowest level in mid-winter, the Ministry of Food will release more dried eggs during the four-week period from December 12th to January 8th. During this one period every holder of R.B.1 or R.B.4 can obtain two packets and every holder of R.B.2 four packets.

Cocoa Purchase.—For this year's purchase by the West African Produce Control Board of the entire cocoa crop of the Gold Coast the basic price is the same as for 1942-43. The full basic price of £13 1s. 4d. per ton for good fermented Gold Coast cocoa will, however, be paid not only, as in the past, at ports of shipment, but also at all buying centres situated on the railway line. This arrangement will mean that producers in up-country districts, who have hitherto had to bear the cost of transporting their cocoa to a port, are no longer at a disadvantage with growers near the coast.

Space Heating Apparatus.—The Limitation of Supplies (Heating Apparatus) (No. 3) Order, 1943, continues without alteration the existing control on the supply of gas and electrical space heating apparatus of the kind used for domestic purposes, for the period of restriction beginning with January 1, 1943, and ending with May 31, 1944. The quota for 1943, 1944, and the standard period is June 1 to December 31, 1939, as before.

Toys for Christmas.—The Board of Trade has issued a General Licence under the Limitation of Supplies (Miscellaneous) (No. 21) Order, 1943, permitting wholesalers and manufacturers who are registered in Class 13 to supply toys and certain children's indoor games without any quota restrictions between December 1st and December 31st, 1943, so that extra supplies will be available for the Christmas Trade.

REPORT BY THE COURT OF DIRECTORS OF The ROYAL BANK of SCOTLAND

To the ANNUAL GENERAL COURT OF PROPRIETORS, on Wednesday, 1st December, 1943

The Directors now submit to the Proprietors the annexed Abstract Statement of the Affairs of the Bank at the Second Saturday of October, 1943, with relative Profit and Loss Account, certified by the Auditors.

The Net Profits of the year, after providing for Income Tax, National Defence Contribution and all bad and doubtful debts, amounted to £532,960 3 6.

Dividend for half-year paid at Midsummer at the rate of 17 per cent. per annum, required £180,625 0 0.

It is now proposed to pay a Dividend at Christmas for the second half-year at the rate of 17 per cent. per annum which will require £180,625 0 0.

Less Income Tax £361,250 0 0

There has been transferred to Property Maintenance Reserve Account £180,625 0 0

Contributed to Staff Pension Fund 30,000 0 0

And added to Inner Reserves against Contingencies, the Balance of 60,000 0 0

81,710 3 6 £532,960 3 6

All the Bank's Investments are valued in the annexed State of Affairs at or under the prices ruling at the date of the Balance.

The Directors record with deep regret the death of General The Hon. Sir Herbert Alexander Lawrence, G.C.B., Chairman of Glyn, Mills & Company, who had been an Extraordinary Director from 1939.

Mr. John Taylor Tulloch, M.C., C.A., who resigned from the Board on account of ill-health, has been elected by the Directors, in virtue of their powers under the Royal Bank of Scotland Act, 1873, an Extraordinary Director of the Bank. Colonel Eric Gore Browne, D.S.O., O.B.E., T.D., A.D.C., and Mr. Steven James Lindsay, D.S.O., C.A., have also been elected Extraordinary Directors.

The Governor, the Deputy Governor, the Extraordinary Directors and the Senior Ordinary Director (Mr. Murray), all retire at this time and are eligible for re-election. Auditors also fall to be appointed for the ensuing year, and Mr. George James Gregor, C.A., and Mr. S. W. Murphy, C.A., offer themselves for re-election.

By Order of the Court of Directors.

WILLIAM WHYTE,
Cashier and General Manager.

Power and Peace

IN the last three weeks the whole field of Allied military and political strategy has been surveyed by President Roosevelt, Mr Churchill, Marshal Stalin and General Chiang Kai-shek in a succession of meetings in the Middle East. From the wording of the communiqués issued after each conference it appears that an almost complete integration of Allied military plans has now been achieved. The concentration of physical power promised by this unity is overwhelming and quite new in history.

The peoples of the world know much less about the political results of these and earlier discussions. Definite decisions have been announced only in the cases of Italy and Austria, after the Moscow meeting, and Korea and Persia, after the latest conferences of Allied leaders. The Cairo Conference, which General Chiang Kai-shek attended, established the negative principle of stripping Japan of its conquests since last century. The Teheran Declaration underlined the general and more positive need for co-operation between all states, great and small, and affirmed the principle of non-interference in the internal affairs of peace-loving nations. But these two pronouncements do not yet add up to the outline of a policy.

The picture has been further confused by the publication in Britain, on the eve of the Teheran Conference, of a long address delivered by General Smuts in London. The speech was a personal not an official pronouncement, and he is a member of the War Cabinet, and since the statement of foreign policy has yet been made, it is

the speech has inevitably been taken to give more than a glimpse of the British attitude.

Broadly, the theme of the speech is the relation of power to peace. "Peace unbacked by power remains a dream." Power rests now, he argues, overwhelmingly with the three Great Powers, the "trinity," Britain, Russia and the United States. France has collapsed, Germany may not be allowed to rise again, Italy will never be a Great Power. It is, therefore, on the trinity that the peace of the world depends. But, his argument goes on, the three are themselves unequal partners. Russia is a "colossus that bestrides the Continent." The United States has unrivalled strength. And Britain?

From the material economic point of view she will be a poor country. . . . The purely European position of Great Britain will be one of enormous prestige and respect . . . but she will be poor.

The balance of power must, therefore, be redressed. To this end, Britain must form a closer union, General Smuts proposes, with the smaller Western democracies.

This is by far the most concrete statement on the post-war world that has yet been made. The speech has two things in common with the various official communiqués—consciousness of power and indifference to concrete policies. After the last war, the political principles of reconstruction—League of Nations, self-determination, national sovereignty—were very widely discussed. Wilson's Fourteen Points were

a digest of a much wider volume of thought. The failure last time was the failure to grasp the relation of responsibility and power to the new political framework. This time, power is in the centre of the discussions. It is the framework, the policies, the principles that are missing.

The approach through power, however sharply it may underline the need for collaboration among the great nations and the fundamental nature of their special responsibility, does not in itself constitute a policy. In the first place, power relations are the most difficult to define exactly. A policy based entirely on an assessment of power is an attempt to reach a static settlement of a dynamic problem. After the last war, four great Empires collapsed—the German, the Russian, the Austrian and the Turkish. The collapse in Russia and Turkey was as great as the collapse in France to-day; yet both these empires reasserted their power.

Nor does it serve the cause of constructive peace to assess actual power wrongly. Russia is not "the mistress of the Continent, with the others down and out." The Russians are fighting desperately on the Dnieper with terrific wastage in lives and resources. Nor is Britain so poor. Power depends on industrial potential. If the figures of aeroplane construction said to have been given by Marshal Stalin at Teheran—10,000 planes a month in America, 3,500 planes in Britain and 3,000 in Russia—are correct, the disparity is not so great as General Smuts suggests. Power is thus difficult to assess. It is also a disintegrating factor in international relations, unless it is clearly related to a concerted policy. This war has certainly taught that policy without power leads to frustration; The opposite truth should not be forgotten. Great concentrations of power, if their policies are obscure and their intentions hidden, lead to counter-blocs and counter-action. Indeed, this fact is indirectly admitted by General Smuts. If his estimate of Russia as a "colossus" did not fill him with apprehension, why should he fear an "unequal partnership"? The way of power, unrelated to constructive ends, means uneasy juggling for a margin of strength between the great nations and panic manoeuvring among their smaller neighbours to join this or that sphere of influence. This may be rationalised or formalised into the concept of a "Western fringe"; but it nevertheless remains an unstable balance of power.

The Teheran Declaration, by its emphasis on the co-operation of all states, gives hope that the three leaders had some much more constructive purpose before them. Only it is impossible to deduce what it was. They made no declaration about Germany. They mentioned no principle for the negotiation of frontier differences. They hinted at no plans for the economic integration of Europe. They made no statement on regional groupings or on any other co-operative framework for individual sovereignty.

Without policies on the Europe's future can be as dangerous principles of power, counter-blocs, by spheres of influence, xenophobia, backed by economic nations degenerating slowly—or perhaps rapidly—into man's-land of a new world war.

Britain's interest is obvious, even if the means of achieving it are more difficult. Britain does indeed need a restored Europe, and restored, not to division and Great Power rivalry, but to the unity in diversity which was for long the hallmark of European civilisation. The European nations exist. Indeed, they are furiously alive; there is no graveyard to be cleared and built upon, no vacuum to be filled according to some novel plan. They need a co-operative economic and functional framework to make their separate national sovereignties workable. They need, behind this regional frame, the world power of the "trinity" to ensure them peace. It should be the aim of British policy to achieve right and effective organisation at all three levels. The obstacles are there. The Soviet Union still distrusts a reorganised European system on the ground that it might be directed against them. The nations of Europe show little sign of realising that if they hope to restore the prosperity and prestige of their continent, they must not only renounce their largest national ambitions, but also allow the German people to rise with them. The economic backing of the United States is by no means yet assured. Doubtless there are other hazards, but the course should be surely set.

A Europe reorganised in variety and unity can never be merely the product of power politics, any more than the British Commonwealth is the product of power politics. They both must have a framework of power to keep them secure; but their inner principle is consent and agreement. So much power has been needed to destroy Hitler that power seems sometimes to hypnotise the lovers of peace. Britain should at all costs resist this hypnosis. Overwhelming power has never solved the problem of Europe and it would be folly, in defeating Hitler, to accept the premise on which he worked.

As Raymond de Becker, a Belgian quisling, has written:

With the help of all Europe Germany could have won, but for that she would have needed a great European policy. She has not applied this policy. European unity is in the making, but against Germany.

There are signs that the Allies in the name of "realism" are ready to mistake Europe just as the Nazis mistook it. These signs are perhaps misleading. So we may hope; but until concrete decisions emerge from the conferrings of the great, we cannot be sure.

First Come, First Served?

THE Minister of Production made an important remark last week that has so far escaped attention. In the Commons debate on the Address he spoke of the need to "hold back" capital reconstruction "somewhat" after the war until the insistent demand for consumption goods—that is, mainly for clothing, shelter and maintenance—has been made. Does this mean that it is the Government's view that industrial re-equipment must be given only a secondary priority in post-war plans because of the inevitable shortage of resources?

Up to a point, of course, this is a truism. There is an acute shortage of houses, household goods, clothing and boots and shoes, measured by the certain sudden need when demobilisation from the Services and factories begins. The main public outcry will be, rightly, for homes, the third item in Mr Churchill's trinity. But there is another item in the trinity which is at least as important, and upon which all else, in fact, depends—namely, work. The most persistent demand, by the satisfaction of which all policies will be tested, will be for full employment.

Immediately after the war, there will, of course, be more work to do than workers to do it. But there is work and work; the demand for the highest possible standard of living will also be persistent. The need will be, that is, for wealth and welfare as well as work; and full employment, with the highest possible yield in terms of goods and services, cannot be obtained unless the country's industry is re-tooled and re-equipped with the utmost speed. Money incomes can be redistributed on Beveridge lines, whatever the size of the national income; but the choice between this or that project, in real terms, depends on the volume of resources available, and the order of priorities must be rightly drawn.

This is the dilemma, made familiar only by more than four years of war economy, the problem of how far a community is required to forgo present advantages to secure greater advantages in the future. Some months ago when the Government published its plans for the scale training of building labour, the doubt was cast in these columns whether too much of the

was not being mortgaged for house-building and too little for industrial reconstruction. At the least, Mr Lyttelton's words have not removed that doubt; it all depends on what "somewhat" meant in his pronouncement. In practical terms, the question is how far the immediate imperative post-war demand for food, clothing, shelter and amenities can be met without prejudicing the country's future or post-war employment. It is not the purpose of this article to offer a precise answer to this question, but merely, having stated it, to suggest two points which appear to be relevant.

The first point is that, in terms of bare accommodation, the demand for housing is much more short term and small scale than is usually admitted. It is true that the immediate shortage of houses will be acutely felt when the war ends; but it is equally true that the actual shortage, in terms of a dwelling of some sort for every family, is very much smaller, perhaps only a quarter, of the houses the Government is apparently preparing to build in the next ten or twelve years. If the worst comes to the worst, much less house-building will suffice. It is, of course, very desirable that three or four million houses should be built. Many existing dwellings are hardly fit to inhabit by the best modern standards. There will be no better future investment, when the resources are available, than to replace the bulk of the nation's working-class houses. But it would be very poor policy indeed, from the standpoint of the nation's power to produce and trade to build them at the expense of the nation's power to produce and trade efficiently; and it was this disturbing prospect that Mr Lyttelton's words almost seemed to imply.

In other words, there is a case—a very strong case—for putting industrial re-equipment higher on the list of priorities than the replacement of obsolete or obsolescent dwellings—equally high, that is, as the remedying of the actual housing shortage. It may well be possible, if a policy of full employment can be successfully applied, and if the equipment and efficiency of industry can be raised to the highest point—if, in short, the nation's resources can be effectively expanded—to do both, to replace plant, machines and houses equally. To say that there would be work for all in building houses is no answer. Full employment means much more than universal bricklaying. However many the building jobs that could be provided, the basic needs of industry must still be met, if there is to be real full employment with the highest possible national income and standard of living. The only way to raise the standard of living rapidly, as an article on page 769 once more argues, is to raise the rate of industrial investment—and then, perhaps *pari passu*, the rate of "amenity" investment. As Lord Woolton said on Wednesday in his first statement in the Lords as Minister of Reconstruction, first things must come first. Admittedly, the immediate shortage of houses when the war ends must be included among the first things. But

this is an argument, not for committing the nation to start at once on a large-scale programme of housing replacement, but for providing accommodation for the homeless and overcrowded by the quickest and least costly methods. The crucial task is to fill this immediate gap without holding back industrial re-equipment perilously; that is, the onus rests upon the capacity of the building industry to consume as little as possible of the nation's resources in meeting the minimum needs that must be met in any case.

Equally important is the need for all building to be carried out in such a way as not to prejudice the larger aims of rebuilding and town and country planning. Nothing in the economic argument advanced in this article contradicts the urgent necessity for effective powers to guide industrial location; to promote schemes for the decentralisation of population and work; to solve the problem of compensation which at present blocks all planning of land use; to lay down standards of maximum density in housing reform; and so on. The next generation's building will be done in the way in which it is started, and it is little short of fantastic that local authorities should now, perforce, be busy on their plans for post-war building without any guidance on these points.

But the economic problem remains. It may be that Mr Lyttelton did not intend to imply that the re-equipment of industry has been put back, side by side with the planning of land use, to be dealt with after the post-war scramble for goods and services for immediate consumption has been tackled. Perhaps the dilemma is not as absolute as he seemed to suggest. The public has not been given the necessary facts and figures to decide, even if the Government itself has collected them. But the suspicion that this may conceivably have been the Minister's meaning reinforces the demand that is now being made in Parliament for a very much clearer statement from the Government of its policy for post-war production and employment, and of the principles upon which it is working out that policy.

Lord Woolton did not make such a statement on Wednesday. From the start he has caught the native woodnotes mild of the present War Cabinet. He refused to promise anything—and in the case of the much discussed four million houses he may have been wise. But it is a significant commentary on this generation's politics that a pledge to act in a responsible fashion, which should surely go without saying, now serves as a substitute for a declaration of policy; and an odd reflection on the attitude of a Coalition led by Mr Churchill of all men that its motto for reconstruction should be "safety first." Whatever the risks of the future, and they are great, inaction cannot be a virtue; and action can only be vicious if it is carried out reluctantly, piecemeal and without the proper context of a master-plan—for social security as well as for the social services, for production as well as for employment, and for industry as well as for separate industries.

Imperial Regionalism

REGIONALISM is the fashion. In one form or another it is proposed as a solution for the problems of English local government, European politics and international relations generally. It is hardly surprising, therefore, that it should also be suggested for the British colonial empire, especially since the majority of the colonies have the same problems as English boroughs and Balkan states—they are for the most part poor and solitary, unable to stand on their own feet.

There are additional reasons why regionalism appears an appropriate remedy for the colonial empire. More than in any other part of the world, frontier divisions cut across natural divisions, with the result that in Africa a tribe may have been cut in two and put under two different administrations—sometimes under two different colonial powers—and in the South Seas the three big racial divisions, Polynesia, Melanesia and Micronesia, and the geographical grouping of the islands bear no relation at all to the patchwork quilting of the political divisions, which place the islanders under the sovereignty of eight different powers and twice as many types of jurisdiction.

There is thus at first glance much evidence to support General Smuts's wish, expressed in his address to the Empire Parliamentary Association, to "tidy up the show." He proposed that the number of independent colonial units should be reduced by grouping colonies together; that the larger units thereby formed should be given larger powers and greater authority in order to

overcome the difficulty of the highly centralised system . . . which . . . gives outsiders the occasion to blaspheme and to call the colonial empire an imperialist concern, run in the economic interests of this country.

Further, he suggested that the new colonial groups might be brought into closer contact with neighbouring Dominions, with the result that

you will bring to bear on the problems of these colonial groups the experience and resources and leadership of the local Dominions, too.

There would thus be a link between Great Britain, the Dominions and the colonies—in other words, the dualism of Commonwealth and Empire would be diminished—which might best be forged by "a system of regional conferences," to include both the local Dominion and the regional colonial group concerned. Specifically, he suggested grouping together the British African colonies into West Africa, East Africa and Southern Africa.

There is nothing very novel about General Smuts's proposal. The idea of amalgamating, for instance, Northern Rhodesia, Nyasaland and Southern Rhodesia into a single Central African territory has been discussed for many years. There have been regular meetings of the East African Governors' Conference for some time past. Since the war, the economies of the four British West African colonies have been co-ordinated by the appointment of Lord Swinton as Minister Resident. Outside Africa, the Anglo-American Caribbean Commission was established in March, 1942,

for the purpose of encouraging and strengthening social and economic co-operation between the United States of America and its possessions and bases . . . in the Caribbean, and the United Kingdom and British Colonies in the same area. . . .

Finally, the British Government itself has spoken on the subject. As an afterthought to a Commons debate on the colonial estimates last July, the Secretary of State for the Colonies said that the Government "have in mind"

the possibility of establishing Commissions for certain regions. These Commissions would comprise not only the states with colonial territories in the region but also other states which have in the region a major strategic or economic interest. While each state would remain responsible for the administration of its own territory, such a Commission would provide effective and permanent machinery for consultation and collaboration. . . .

Thus, both actual developments and official utterances have in fact already outrun General Smuts. He, it appears, was thinking solely of British colonies and British dominions. There is no hint in his address that his regional conferences should be extended to include representatives of other colonial powers in the region, much less of non-colonial powers with only "a major strategic or economic interest." But the Anglo-American Caribbean Commission is international. So, too, is the Middle East Supply Centre, which is different again in that it includes in its scope independent states as well as colonial dependencies. As a factor in promoting closer international co-operation and thereby helping to secure the peace of the world, the General's proposal is to this extent behind the times.

But the time has come to discuss imperial regionalism, not from the point of view of international relations, but from that of the colonies. Is it in the colonies' real interests that they should be grouped together and administered regionally, or is it merely a paper device, theoretically sound but impracticable and possibly dangerous?

The case for and against colonial regionalism has been well argued in a pamphlet* issued by the Fabian Colonial Bureau, which also gives the historical background of international co-operation in the colonies. A thorough analysis of present developments. Briefly, the arguments given in the pamphlet in favour of regionalism are—from the colonial standpoint alone—first, that many colonial problems, such as disease, soil erosion, transport, migrant labour, and so on, cross frontier boundaries and can only be effectively tackled over a wide area; secondly, that through a regional commission economic policy could be integrated and made complementary, and that a larger area has a better chance of obtaining the finance necessary for development than has a small poor colony acting in isolation; and, thirdly, that the third party judgment provided by a commission will be a stimulus to national and local administrations to undertake progressive policies.

But, if the advantages of regionalism are obvious, the drawbacks, which the Fabian pamphlet next enumerates, are not so apparent and therefore more dangerous. The pamphlet points out that the interposition of an intermediate authority between a colony and a colonial power may tend to obscure the place where real responsibility lies. This is very important. At present, responsibility is clearly placed on the Colonial Secretary, on whom the pressure of public opinion can be brought to bear, but, for all General Smuts's plea for decentralisation in the Empire, a regional authority "may widen the gap between the governors and the governed." Secondly, the pamphlet cites the case of a colony well on the way to self-government, which suddenly finds the powers and responsibilities it was about to assume transferred to a new organisation. Thirdly, it is possible that the actions of such a commission might be kept secret, for there is no provision for popular control or the safeguard of public criticism. Finally, there is the danger that a reactionary power might assume, through size or wealth, the dominating influence on the commission.

This last danger is the crux of the whole question. And it has a special significance in view of General Smuts's speech. For if a local Dominion were to take an active part in the affairs of the Southern African African colonies, it would be his own Dominion, and a Dominion whose native policy is disliked and feared by the natives of East and Central Africa—by the great majority, in other words, of British colonial peoples in those areas. But the General made no mention, in his address, of this formidable obstacle to African regionalism. Indeed, his admission of the race and colour problem in the Empire contained no indication

* *International Action and the Colonies*. Fabian Publications, Ltd., and Victor Gollancz, Ltd. 1s.

that the Union of South Africa intends to pursue a more racial policy in this respect. Nor is it solely a question of native policies in the Union. Grouping together Northern Rhodesia and Nyasaland with Southern Rhodesia would mean either that this self-governing colony would have much of its responsibility in internal affairs taken away—which is hardly a possibility—or else that the first two territories would come under Southern Rhodesia's domination, and it will be recalled that the Africans, giving evidence before the Bledisloe Commission, showed a remarkable firmness in their opposition to amalgamation. Similarly, the grouping together of Kenya, Uganda and Tanganyika might only result in an extension of the influence of the Kenya settlers to the other two colonies. When General Smuts said that

your own British people . . . living in Crown Colonies, are very critical and restive under this system which is centralised in London

he must have been referring to this small minority of settlers, not to the great mass of Africans who look to the Colonial Office as the protector of their interests. It is significant and disturbing that at the present moment, when regionalism is in the foreground of discussion, the Europeans in Southern Rhodesia and Kenya are once again pressing for closer union between their own colonies and neighbouring dependencies.

This is not to say that imperial regionalism should be

rejected. It exists already in one form or another, and looks as if it has come to stay. But it is important to see that it is developed along the right lines, and this cannot happen unless the dangers are openly stated and faced. Even when the dangers have been avoided, there will be many difficulties to overcome. There will be the difficulty of associating the colonial peoples in the work of the regional commission, which is a *sine qua non* whatever form it takes—the West Indians are restive because they are not represented on the Anglo-American Caribbean Commission—and yet enabling it to function efficiently; the difficulty of associating existing colonial governments in its work and overcoming possible local jealousies—Sir Frank Stockdale's development and welfare commission in the West Indies, which is regional in its scope, has come up against this; the difficulty of determining who is to have the last word when the sovereign powers represented on the commission differ on a policy to be adopted for the region. In short, Colonel Stanley can be forgiven if his parliamentary afterthought was a little vague. Imperial regionalism is not a policy that can be adopted overnight or in the same form throughout the colonial empire. But its possibilities for good are too great for it to be allowed to drop, or to proceed haphazardly, and the Colonial Office will not be forgiven if the dangers and difficulties are used as an excuse for inaction.

Consumption or Investment

THERE is nowadays a very wide measure of agreement among economists in attaching particular importance to that part of the community's income which is not spent on current consumption, and to that part of the community's output which is not intended to be immediately consumed. What is not so often realised is that there are two entirely separate, though connected, questions of public policy concerning the relationship between Saving and Investment. The first question is how the two shall be brought into equilibrium with each other. The second is whether, when brought into equilibrium, they are too large or too small.

The first question is familiar; it is the common material of all discussions about full employment policy. Two schools of thought are emerging from this discussion: one which advocates removing any discrepancy between Savings and Investment by manipulating Savings—that is, in less technical language, curing a slump by stimulating consumption—and the other which advocates the contrary policy of curing a slump by stimulating investment. In an article that appeared on October 3, 1942 (page 407), *The Economist* sided with the Investment school. But the reasons for doing so were those of political expediency rather than of principle. There can be little doubt that a practical policy for Full Employment would have to pursue both policies as far as it could. They are, after all, complementary, not contradictory.

It is not intended in the present article to reopen this question, but rather to explore the second problem, which is far less frequently discussed. This second question leaves aside the Full Employment problem and asks whether, on the average of boom and slump, in good years and in bad, the British community should devote a higher or a lower proportion of its total output to the maintenance and increase of its capital equipment. There is a connection between the two questions, for if the view is accepted that there should be an increase in capital investment in the long run, there will be more inclination to believe in the policy of stimulating investment in the slump phase of the trade cycle. But the connection is by no means organic, and it might be wholly reasonable to hold that, though there was a case for reducing the long-run average volume of Investment, nevertheless it was right to stimulate it in years when it fell below that average. In any case, the long-term problem can be discussed in abstraction from the short-term problem.

Should the country consume more? In the crudest

sense, of course it should. The whole object of the economic system is, or at least should be, to increase the volume of consumption. But it is one of the earliest lessons of elementary economics that the best way of increasing the level of consumption is to accumulate capital, which makes it necessary to abstain from consuming the whole output of the community. The question is whether the proportion of total output that goes into immediate consumption should be increased or diminished?

There is no reason why this should be regarded as a matter of political controversy. It is true that a decision to increase the proportion of consumption would make possible a number of immediate improvements in the standard of living which—at least on a shortsighted view—would be desirable. The politicians of the Left would be especially pleased, for political as well as social reasons. The fallacy that the problems of production have been solved and that the only remaining problems are those of distribution has gone deep in this country, and its result has been to make the parties of the Left what may be called "consumption-minded." But it is

probably sufficient answer to point out that probably no one in the history of the world has ever taken such gigantic measures to reduce the proportion that consumption bears to total output than the Russian Communists. If to advocate an increase in Investment is to be a conservative or a reactionary, then Marshal Stalin is the most reactionary man alive.

The answer to the question turns almost entirely on the yield that can be expected on increased Investment. If present abstention can be made to result in a rapid increase of future output, and the future standard of living, then it is worth while. If the prospective yield—not in money terms, except in so far as they are an accurate reflection of the real physical increment—is low, then an increase in Investment is *pro tanto* unattractive. To phrase the matter once again in homely terms, can Britain effectively use more capital?

Lord Keynes has frequently and persistently argued that there is a shortage of remunerative projects of Investment at the rates of interest that have prevailed in past periods. But those of his disciples who argue that there is a shortage of practicable projects at any rate of yield are going beyond the master. They are also flying in the face of the facts. It may well be that, in this age, the marginal productivity of capital in this country is less than in some others—in Russia, for example. But there can be little doubt that the investment of capital in this country will still yield returns substantial enough to make it worth while.

Various factors combine to give one country a higher standard of living than another. Wealth of natural resources plays some part, as does the size of the domestic market. But that these are not the dominant factors is perhaps best attested by the fact that the British standard of living is the second highest in the world. The chief explanation of varying national productivities is so simple and obvious that it is usually overlooked—it is the volume of capital. The formula "horse-power per head = income per head" is doubtless crude; but it is more nearly true than most general propositions in economics. The more mechanical helpers are provided for each pair of hands, the more that pair of hands will be able to produce in a day's work, and the more the owner of the hands will be able to consume. The whole of British and American economic history in the last two centuries, the whole theory of the Russian Five Year-Plans, is based on that simple doctrine.

It is, therefore, only if the investment of capital has already reached, in this country, the stage of sharply diminishing returns that it would not be worth while continuing with it. But for this there is no evidence at all, while there is considerable evidence for the contrary. Dr Rostas's article in the April, 1943, issue of the *Economic Journal* established, by comparison of the official censuses of production, that the productivity of

the average worker in British manufacturing industry, before the war, lower than in Germany and much lower than in America. On the other hand, the British wage-earner received a higher share of the total receipts of industry than either the American or the German. The British worker can increase his income only by increasing his productivity towards the American level. And the great advantage that the American worker has over the British is not that he is more skilled (he is usually less skilled) or better organised (organisation alone could not account for the size of the differential), but simply that he is provided with more mechanical assistance. Until the degree of mechanisation in British industry is raised to the American level, it is ridiculous to say that there is no advantage in increased Investment. On the contrary, now that the process of redistributing income between rich and poor has gone so far, an increased rate of industrial Investment is the only means by which the standard of living of the British worker can be rapidly improved.

Nor is it simply a matter of more industrial investment, more capital for industry. In addition, there is an obvious need, if the standard of living is to be raised, as it should be, for more "amenity" or consumer's capital, for houses, roads and hospitals, a need which the "consumptionists" often, oddly enough, overlook. Such investment does not add in any measurable way to the national income, but it must plainly be provided.

This does not necessarily mean that Savings will have to be increased—that is, that consumption will have to be reduced. It may be that, with Full Employment, the people will spontaneously save enough to cover both the required volume of "amenity capital" and also an enhanced rate of replacement and extension of productive capital. What is fairly certain is that the £287 million of net domestic private investment achieved in 1938, 4½ per cent of the community's net income in that year, is not enough. And it is certain that a deliberate policy of discouraging Savings and Investment would be a mistake. The right course is to plan to find productive outlets for at least the volume of savings that the people will spontaneously generate in conditions of Full Employment. And if this is not enough, it may be necessary to consider ways of stimulating further savings, either by the voluntary methods of the National Savings Committee or by the more direct methods of the Five Year Plan.

The heart of the matter is that the Industrial Revolution is not yet finished. Other countries have already carried it much further than the British, with evident benefit to their standards of living—and even they have not yet found the limits. The Industrial Revolution was a British invention, but in recent years Britain has been tending to lag in the race for higher standards of material welfare. If we are to regain our place in the van, we shall need not smaller, but much larger, supplies of capital.

NOTES OF THE WEEK

The Turks in Conference

Ever since the Turkish Foreign Minister returned from his November consultations with Mr Eden at Cairo, there has been a growing tendency in the Turkish press to warn the Turkish people that their rôle in the war might soon become more active. The Turkish President warned the Kamutay when it reassembled that "sacrifices" would be needed for the cause of freedom and independence. Throughout the war the Turks have made no secret of their wish for an Allied victory. Even in the dark days when the Germans were moving forward in both Egypt and the Caucasus, Turkish statesmen and journalists continued to attack German policy, and to proclaim the principles of national freedom. The only question for Turkish policy was the expediency of transforming this desire for an Allied victory into active collaboration. Various forces worked against action; the most potent was the fact that Turkey had not been attacked. Neither Russia nor the United States abandoned neutrality until they became the direct victims of aggression. And the general unwillingness of a nation to risk war was reinforced in Turkey's case by two particular

limiting factors—uncertainty about Russia's intentions and doubts about British and American military strength in the Mediterranean theatre. Time has much modified both fears. Each exchange of views, every discussion or conference has strengthened the understanding between Russia and its Western Allies, and the closer their friendship, the less the Turks feel they have to fear. The wording of the Teheran communiqué, with its emphasis on co-operation between the nations, great and small, and their right to live "according to their varying desires and their own consciences," was almost certainly a real reassurance to the Turks. Doubts may still remain on the other score—Allied military weakness. The fall of Leros and Samos is recent history. But, here again, the complete military agreement at Teheran provides a far more certain background of security than has existed hitherto.

To Fight or Not to Fight

There is only one question in Turkey's foreign policy—continued neutrality or entry into the war. This is the

question which was thoroughly discussed at the meeting between President İnönü, President Roosevelt and Mr Churchill in Cairo. The plans for the southern front have presumably been laid before the Turks, and the part they might play clearly indicated. The chief pressure for Turkey's full entry into the war has been coming from Russia. The British and Americans, who would have to reinforce the Turks if the German counter-thrust were vicious, have been more inclined to let the Turks decide for themselves. It is possible that, after Teheran, it has been possible to agree on a solution resembling the Portuguese loan of the Azores to Britain. Air bases, harbour facilities and free use of the Dardanelles would all greatly assist the Allies in a Balkan campaign. They might involve Turkey in war. On the other hand, as in the case of Portugal, it may be that Germany's strength is spread too thin in the south-east for further commitments, unless made compulsory by declaration of war. This is the gamble the Turks are being asked to make. There must be a military risk, yet inaction now entails even greater political risks for the post-war period.

Aid to Persia

The declaration on Persia issued by President Roosevelt, Marshal Stalin and Mr Churchill has more than immediate importance. It laid down for the first time certain principles of action for the post-war period, and suggested that these principles will be carried out through common action by the Great Powers. The mere fact of the Allied occupation has inevitably raised the problem of Persia's future status, the more so because the record of British and Russian diplomacy in Persia has not always been above suspicion in the past. The renewed affirmation of the Great Powers' "desire for the maintenance of the independence, sovereignty and territorial integrity of Iran" is a guarantee that the Persians need not fear the parcelling out of their territory into zones of influence, nor the continuation of the occupation beyond the duration of hostilities. The extent to which the Russian authorities, on the one hand, and the British and Americans, on the other, have tended to work in isolation from each other has tended to accentuate the "zones of influence" approach. Possibly there will be more co-ordination of policy as a result of the Teheran conference. Some machinery for closer consultation is needed, to ensure that decisions taken in different parts of Persia do not clash. The more the Powers work together, the more the Persians can feel that the visitors in their midst are acting under wartime necessity, and not pursuing separate imperialist policies.

The Problem of Supplies

The economic issues in Persia are as important as the political, and even more immediate. It is an undoubted fact that, economically, Persia has suffered considerably from the effects of the Allied occupation. The northern areas from which grain surpluses normally come have not been sending their qubas south. The British and the Americans have brought in grain, but it has not been properly distributed. There has been a tendency to blame the Persian Government for this, on the ground that hoarding and black marketing have prevented fair distribution; and the Persian Government has certainly failed to some extent to take the proper measures. But lack of transport is at the root of the shortages. Here the Allies are frankly to blame. Under wartime conditions it may have been necessary to keep Persia short, because of the urgent need to get supplies to Russia, which has been, of course, always paramount. The Persians have suffered as a result. In common justice they have a high claim in post-war reconstruction, and the aid they receive should be more than a mere dole or direct compensation. Persia requires much assistance if the country is to be equipped with the economic apparatus of a modern state. The Great Powers can give this aid, which will prove at the same time the best guarantee of Persia's ability to achieve full political as well as economic independence.

Labour and the Land

Nationalisation of the land has long been the central plank of Labour's agricultural programme, but the concept has always been somewhat nebulous. In its latest statement, the party, reviewing the effects of the war, concludes

that nationalisation is not only more necessary than ever, but has been brought appreciably nearer, and it puts forward a scheme for bringing it into effect. The State would be empowered to acquire all agricultural land by a General Enabling Act, which would lay down the basis of compensation. The present owners would receive in exchange special land-stock of appropriate amounts at a fixed rate of interest; but the Government would have the right to redeem the stock after a period of years. Acquisition should be "carried out as rapidly and on as large a scale as practically possible," but, pending the total acquisition of land, a National Land Commission would issue development bonds at low interest rates, and make loans for providing farmers with equipment; if existing owners were unable to provide sufficient capital, the Commission would buy the land outright. The report recognises that acquisition is not enough; the land must be efficiently farmed and managed. It therefore recommends that the wartime County Executive Committees should continue, and, in conjunction with the Land Commission, fix standards of cultivation and see that these are reached. The Ministry of Agriculture would be responsible for formulating a home food programme, which should be directed towards the production of protective foodstuffs, and aim at a "balanced" agriculture. Prices should be fixed "at the level necessary to bring forward the required supply from farms run at a fair level of efficiency," while a more economical and orderly system of distribution would be introduced, under the general control of the Ministry of Food. The Labour party asks for increased wages for farm workers, improved rural amenities, housing, education and communications—it would abolish the tied cottage, that survival of feudalism. It recommends an extension in the number of farm colleges and institutes and stresses the importance of education and research. A great many of Labour's proposals will command wide support—political groups from Conservatives to Communists, owners, farmers and farm-workers have all expressed themselves in favour of much of what they propose. Some will oppose the retention of farm agricultural committees, and there will inevitably be a sharp controversy over the question of land ownership. Nationalisation has indeed been proposed by quite non-political agricultural experts, such as Sir Daniel Hall, as well as by Socialists. It is not a doctrine or an end in itself. If it can be proved that the land will be farmed more efficiently, and used more in the community's interest, under State ownership, and that this is the only way of ensuring sufficient supplies of capital equipment to farmers, then the case for acquisition is made. But onus of proof rests with those who advocate it.

Policy for Agriculture

Throughout Labour's farm programme, emphasis tends to be laid on producers' interests and "fair prices" for the producer. It would be a pity if, in the first flush of excitement at its crusade among the agricultural community, the

YOUR WILL

Have you thought of the anxiety which may be caused to your dependants if for any reason your affairs have not been satisfactorily arranged?

In these days when life is so uncertain, the advisability of appointing a corporation rather than an individual as the Executor of your Will or in the capacity of Trustee needs little emphasis. By so doing, continuity is preserved and you are assured of efficient administration.

Full details can be obtained, whether you are a customer of Lloyds Bank Limited or not, from any Branch or from its Executor and Trustee Offices at

Ewhurst Place, Ewhurst (near Guildford), Surrey, 39 Threadneedle Street, E.C.2, 5 Albemarle Street, W.1, Birmingham, Bournemouth, Bristol, Exeter, Liverpool, Manchester, Neath (Glamorgan) and Newcastle upon Tyne.

LLOYDS BANK
LIMITED

Head Office: 71 Lombard Street, London, E.C.3

Labour party were to fail to remember that the interest of industrial workers who, after all, form the vast majority of the population and are the mainstay of the party, lies in the provision of cheap and abundant food supplies. The only purpose of food production is food consumption, and the only object of expanding world agricultural output is to meet the immense human nutritional needs, as recommended by the Hot Springs Conference. In the short run, Britain may have to continue its expansion of every type of production to meet postwar needs. In the long run, to aim at a "large and prosperous" agriculture, except within carefully defined limits, would be uneconomic in the world context, and would be contrary to the interests of producers and consumers alike.

Mr Morrison's Party?

Mr Morrison is at present politics' chief fighter. So far, he has not engaged in the championship bout for which most people believe he is in training. Most of his current battles are rather minor affrays in the booths—on the floor of the Commons or at public meetings. Last weekend he faced and beat hostile critics at a meeting at Wembley. He said, as he should have said from the start, that Sir Oswald Mosley has not in fact been released, but only moved under the severest safeguards. He asked his critics to state under what law he could now charge or imprison Sir Oswald, who has not been proved guilty at law of any offence. But this is only a chapter in a longer story. Mr Morrison is at the parting of the ways. There is much interest in whether or not he really intends to contest the title of party or national leader. His position is peculiar. A major weakness of the Labour party at the present is the lack of a policy. Mr Morrison in his speeches has outlined a policy; but the party has not taken it up. The party also lacks decision. It is divided on the question of Coalition, and still more divided on the question of returning to Opposition as soon as the war ends—which indeed, without a policy, might be disastrous. At Wembley, Mr Morrison called again for unity in reconstruction, but once more left it quite uncertain whether by unity he meant the perpetuation of the Coalition after the war. In other words, Mr Morrison has not yet made up his own mind. Meanwhile he has his party in a cleft stick. The party's only present prospect of regaining prestige and attraction is to adopt something like Mr Morrison's programme; but Mr Morrison remains, to all appearance, a chief advocate of the merging of party identity in a national front.

The Beveridge Ban

The Chancellor of the Exchequer has sternly rebuked critics of the instruction sent out to civil servants not to talk about the Government's plans for post-war employment with Sir William Beveridge. His justification of the ban is a double one: first, that this is no more than the particular application of a general rule; secondly, that it is specially important that people should realise that Sir William's own inquiries into employment prospects are, unlike his survey of social security, entirely unofficial. Of the first point, it must be said that the rule is a bad one, especially in wartime, when many of the most useful and active brains are employed in Government service; there is an urgent need for the fullest participation of all individuals, official and non-official, in discussions about post-war policy. The second point is equally unconvincing. If the intention was to make plain that Sir William Beveridge's present work is not official, the proper means was to make a public statement to this effect in Parliament or elsewhere; the instruction to civil servants merely tells them what they surely already knew.

Italian Side-show?

The Eighth Army has advanced to half-way between the rivers Sangro and Pescara, and may reach the Rome-Pescara road in the next days. The fighting has, all the time, been heavy and "old-fashioned," so much so that it has evoked memories of bloody battles in Flanders mud. The same has been true of the fighting at the western end of the front, where the Fifth Army has stormed and taken some of the mountain obstacles in front of the Garigliano, but is still hampered in its advance by bad weather and

swollen streams. But the sluggardly tempo of the Italian campaign is not due only to the weather. Despite massive artillery bombardment, much less striking power seems now to have been put into the attack than was anticipated earlier. This is only natural in view of the new and great demands of strategic plans, made since the Quebec Conference, for the Far East, for the West, and perhaps also for the Eastern Mediterranean. The great concentration of power, previously expected in the Central Mediterranean, may now have been very largely dispersed. The strategic decisions announced at Teheran seem, in fact, to suggest that the Italian campaign is now considered as, if not a side-show, only a secondary operation, compared with the great blows which are being prepared "from East, West and South."

University Battleground

Dramatic events at Oslo University mark the final failure of stubborn German attempts to nazify the political and spiritual life of occupied Norway. The policy of *Gleichschaltung* was started in September, 1941, when the Principal and several professors of Oslo University were deported to Germany and replaced by adherents of Quisling. The university was, however, allowed to carry on, and since then, up to the end of last month it was the scene of a half-hidden struggle between patriotic professors and students, on the one side, and the Germans and the Quisling Principal, on the other. More than a year ago the independent professors opposed and prevented the recruitment of students for the Anti-Bolshevik Legion. The latest conflict broke out over the attempt to limit entrance to pro-German students; the Principal was to decide whether candidates were worthy of being admitted. The entire university sprang to the defence of its traditional "freedom of entry." Twenty-five professors and teachers and 1,300 students, were arrested and threatened with deportation to Germany; the rest of the students went into hiding. The university itself has been closed. This has led to a most impressive movement of protest in the remaining universities of Europe. Even in occupied Denmark the universities have raised their voices, and the Finnish Government has had to forward the protest of the Finnish universities to Berlin. Such protests, coming from occupied or Axis lands, are perhaps even more significant and encouraging than the demonstrations in neutral Sweden and Switzerland. The Swedish Government went a step further and itself made a formal protest to the German Government—the second official demonstration of this kind, the first being its protest against the deportation of Danish Jews. This time Ribbentrop could not ignore it, and replied with a counter-protest against Swedish interference in German-Norwegian relations. These events show how low German prestige now stands in Europe.

Civil Strife in Yugoslavia

The split between King Peter's Government and the partisans in Yugoslavia has come to a head with the formation of the National Committee of Liberation by General Josip Broz Tito. Yugoslavia has thus two Governments which means that the state of civil war has now become quite open. King Peter's Government rightly claims for itself the qualities of legitimacy and continuity. But these are its only virtues. Its vices are many. It is not representative of all the southern Slav nationalities; it rather represents the most narrow pan-Serbian outlook; it is not democratic. Last but not least it had allowed itself to be swayed too far by the "prudent" tactics of inactivity, which has brought General Mikhailovitch's army to the point of disintegration. The number of his followers is said to have dwindled to 15,000; and parts of his army have undoubtedly compromised themselves by obscure dealings with the Nedić Government, if not with the Germans. It was presumably to them that the warning of General Maitland Wilson was addressed some weeks ago; and it is a fact that there has been no liaison between the Allied Command and Mikhailovitch's Chetniks for some time past. Tito's Provisional Government, on the other hand, cannot produce a legitimate birth certificate. But while its origin is obscure its fighting record is not. The partisans are said to number between 150,000 and 200,000; and there is close liaison between them and the Allied Command—and, despite disingenuous tales of Soviet leadership, no liaison, until its start

in the last few days, with Russia. The composition of Tito's Provisional Government is far too broad to justify the label "movement of terroristic violence" attached to it by the Cairo Government. It includes, besides Communists, people of all political colours, such as Ivan Ribar, ex-President of the Yugoslav Constitutional Assembly, M. Smolaka, ex-Ambassador to the Vatican, Dr Seruce, ex-Governor of Slovenia under General Zivkovic, and the orthodox priest Zecevitich. It is, however, impossible to say whether these personalities participate in the Provisional Government merely as individuals, or whether they do so on behalf of the political groups with whom they were associated in the past. And on this the degree to which the Tito Government is really backed by different social and political forces in Yugoslavia depends to a very large extent.

Hudson on Farm Prices

Mr Hudson, the Minister of Agriculture, can hardly have expected applause from farmers for his 1944 price schedule. Indeed, he could not expect applause from them for any price schedule, however generous. He had little difficulty, however, in countering the criticism of his new price-lists when he addressed farmers, farm-workers and landowners at Leeds on December 3rd. The Minister pointed out that the cost of increased wages would be £15,000,000 in a full year, and £9,000,000 in the current year. Against that, farmers would receive £5,500,000 in higher milk prices and another £500,000 in increased prices for fat cows. In other words, farmers' receipts will fall short of their increased wages bill by £3,000,000, that is, by appreciably less than has been estimated unofficially. This, in his view, is a small sum if related to the expected turnover of farmers, that is, between £570 and £600 millions. (At the Ministry of Agriculture, a comparable pre-war figure is said not to be available; an indication of the increase is provided by the fact that the gross value of agricultural and horticultural produce in 1938-39 was £219 million.) Prices for 1944 have been fixed at levels which, in the view of the Government, will enable all efficient farmers to obtain a "reasonable," and in some cases a "generous," return for their work. The Minister insisted that the prices farmers are enjoying to-day—the Government's index of farm prices during the first half of this year shows an increase of some 86 per cent over the figures for the corresponding period in 1939—not merely cover their increased costs, but provide a markedly bigger incentive to production. The only fundamental criticism that can be made of the Government's wartime price policy is of the distribution of incentives between different sorts of produce; and in the latest changes a welcome attempt has been made to remove anomalies, notably in the case of milk.

The Disabled Persons Bill

The second reading of the Disabled Persons (Employment) Bill was due to take place on the fourth sitting day of this week. It may be regarded as the first piece of reconstruction legislation, for though there have been other measures, improving the position of the unemployed and old age pensioners, they have for the most part patched up existing social services, whereas this Bill breaks new ground. Moreover, it has a certain right to priority, for the disabled or battle casualties and air-raid casualties are already the most obvious cases in need of reconstruction after the war. Rightly, however, the Bill does not only cover war casualties. It includes within its scope all disabled persons, and a disabled person is defined as a person

who, on account of injury, disease, or congenital deformity, is substantially handicapped in obtaining or keeping employment, or in undertaking work on his own account, of a kind which . . . would be suited to his age, experience and qualifications.

The Bill follows closely the employment recommendations of the Tomlinson Committee. It makes provision for the vocational training and industrial rehabilitation of the disabled and for the registration of such persons; it places on employers with 25 or more employees an obligation to employ a quota of registered disabled; it appropriates vacancies in certain employments for persons so registered—a new schedule of reserved occupations; and it makes provision for assisting seriously disabled persons to obtain work under special conditions—under this heading would presumably come bad or chronic cases of tuberculosis, as well as the badly crippled. There are some—the Central Council for the

Care of Cripples among them—who disapprove of the registering of the disabled and the scheduling of certain occupations for them, because, they say, it emphasises a person's disability, whereas all action should concentrate on proving that a disabled person can become, as regards employment, perfectly normal again. This attitude is justifiable; it is very necessary to break down the suspicion of employers when faced with a disabled applicant for a job, and to abolish the idea that the best job for the disabled is as lift attendant. But it is a too strictly medical view. It ignores both the operation of workmen's compensation and the actual circumstances of the labour market at a time when employers can pick and choose their workers. It is very right and necessary that the medical aspect of rehabilitation should stress a disabled person's normality, and that the facilities should be there to restore him to normal working capacity. It is also essential that the workmen's compensation laws should be reformed. When these steps have been taken, the provisions of the new Bill may wither away. But, in the meantime, it will ensure that many, if not all, of the disabled will be trained for and secure proper employment. And in so doing it may well make its own contribution to breaking down the old reactionary attitude towards the disabled.

Secret Diplomacy?

One consequence of the latest spate of Allied conferences may do more harm than it deserves. The press has held a Protest Week. Complaints have stormed in from Cairo; they have flashed across the Atlantic. If all the world were comprehended in newspaper politics, the great Allies would by now be in the grips of a struggle more bitter than the war itself. The storm centre has been the Cairo and Teheran conferences, which have given rise to two different kinds of protest. The first concerns the actual handling of publicity at the meetings. It was decided in advance that, for security reasons, nothing should be known about them. The Egyptian and Turkish papers leaked a little, but most of mankind did not know that the Allied leaders were to meet first at Cairo and then at Teheran. Neither President Roosevelt nor Mr Churchill have any great affection for the press; they do not much like being bothered by journalists. They decided not to see anybody, and not to tell anything, and they left a flustered, if willing, official to deal with one of the most formidable packs of newshounds ever brought to bay together in a single place. Frustrated at every point, the pressmen, seventy strong, sent a collective protest to Mr Bracken and Mr Elmer Davis. The point raised is much more important than the wounded feelings of these particular correspondents. What is gained by the massive but ineffectual secrecy which surrounds the meetings of the great men? If security is vital, then no journalists should be admitted, no correspondents invited. If, on the other hand, publicity is held to be important, the press should be given the chance to report freely and fully. There is much to be said for the second method. It is a far cry from "open covenants openly arrived at" to the all-enveloping mystery of to-day, when the new leaders meet to decide the nations' fate; and right and complete reporting would do something to restore the people's contact with the Titans, who are, after all, responsible to them.

Press Hysteria

The protests about the handling of publicity at the Cairo and Teheran meetings were justified. The protests about leakages of information seem very much out of proportion. The offenders were Tass and Reuters. The Tass Agency has escaped lightly in the outcry. All the weight of press wrath has fallen, strangely, on the British authorities. The facts are simple. Reuters' correspondent in Lisbon picked up the story of the conference, and sent it through London for distribution abroad. By a formality, it is a fact that the British censors pass "news in transit" without censorship. The censor may have blundered, but there was no ill-intent. Then the storm broke. The British authorities were hotly attacked by the British press, who alone had not received the Reuter news, and by the American press, who felt that their readiness to hold the story had been exploited by "the British"—without attempting to specify—to secure a scoop. The temperature rose to such a pitch that Mr Elmer Davis, head of the American Office of War Information, protested to Mr Bracken that the "premature disclosure had seriously jeopardised Anglo-American relations." The

whole affair shows an astonishing sense of self-importance and lack of proportion in the newspaper world. If Anglo-American relations depended on nothing more than the good-will of temperamental journalists, then relations between the two countries might indeed be critical. Fortunately there are more solid foundations. American protests about leakages—Reuters is not an isolated example—nearly always overlook the fact that the scoops which slip through the British censor are more often than not secured by American journalists in Britain from American sources. If the British censorship were stricter, would there not be an equally violent protest in the opposite sense? The allegations made against British journalists by some of their American colleagues—that they are cheats and tricksters, and so forth—reflect most discreditably on the state of mind, and knowledge of facts, of some American newspapermen.

Colonial Research

The Colonial Research Committee has issued a progress report (Cmd. 6486). It will be recalled that the Colonial Development and Welfare Act of 1940 provided for expenditure of up to £500,000 a year on colonial research. This was vastly greater than earlier grants from the Imperial Exchequer, and, unlike the £5 million a year made available under the Act for development and welfare, which is to be limited to ten years, no term was fixed for the provision made for research. The statement of policy made before the Act was passed announced that it was intended to establish a committee to advise on colonial research, but it was not found possible to do so until June, 1942, when the present committee was appointed under the chairmanship of Lord Hailey. Its functions are to advise on the expenditure of the £500,000 a year provided by the Act and to advise upon and co-ordinate the whole range of research in the colonies, irrespective of the provision of funds. Its first report shows that its first function of recommending grants is sadly limited in wartime. Even where individual colonial research facilities have been maintained, it has not been possible to recommend their expansion, and in some cases they have been diverted from pure research to *ad hoc* wartime needs. Thus, since the committee was set up, grants for only ten research schemes have been made on its recommendation, amounting to a total value of only £47,250. To this must be added the grants made under the Act before the committee was established, which totalled some £56,658. Among the latter, the most important is the grant made for an organisation to conduct research into the utilisation of colonial products—the Colonial Products Research Council under the chairmanship of Lord Hankey, which, unlike the committee, is an executive body and organises research. It is also worth noting the small grant of £500 made to the Population Investigation Committee for the completion of a compilation of a demographic survey of the colonial empire—a much neglected but badly needed piece of research, which, it is hoped, will fill the large gaps that now exist in colonial vital statistics. The Research Committee has not yet been able to complete its survey of the problems and needs of colonial research as a whole, but it has done enough to convince it that

scientific facilities and terms of service must be improved, and new or additional methods of recruitment and organisation devised, if research is to play an effective part in colonial development.

In spite of its small beginnings, the committee is evidently thinking large and on the right lines.

Internal Combustion

One of the characteristics of reconstruction reports published by trade associations is their comprehensiveness. Most of them volunteer suggestions about high policy at home and in international relations. Few of them deal at all adequately with the problems of their own particular industries. The report of the Internal Combustion Engine Manufacturers' Association is one of the most ambitious yet issued—it consists of more than 80 closely printed pages. Like many other memoranda, it deals at length with general economic and political problems. Since nearly two-thirds of the output of the industry represented by the Association was exported before the war, its interest in problems of international relations and trade is scarcely surprising. It quotes at length from the "Network of World Trade"—a League of Nations publication—in support of a

return to a system of multilateral trade. It strongly advocates the reform of taxation insofar as it inhibits industrial enterprise and emphasises the importance of research. It urges the Government to exercise care in the disposal of its stocks of internal combustion engines after the war and suggests that they should be used to meet the needs of devastated countries, to provide for a war reserve, and to improve the training equipment at engineering schools and technical institutions. The balance might then be taken over by an organisation "representative of the Association's industry and the Government" to be disposed of by it

in the way best calculated to promote the national development and least likely to affect injuriously employment in the Association's industry.

The Association's anxiety about the disposal of Government stocks can be readily understood. But, while a policy that would result in the disposal of the industry's stock would be against the national interest, the disposal of surpluses can hardly be dictated by the interests of producers.

Shorter Notes

New draft regulations relating to supplementary pensions and unemployment assistance came before the House of Commons this week. They codify and simplify the existing regulations which, because of the frequent amendments, are very difficult for an applicant to understand. The main change is to present the new scales on an *ex-rent* basis; that is, they are sums for needs other than rent to which a reasonable rent allowance will be added. Secondly, winter allowances will be dropped, and appropriate adjustments made throughout the year to those who have to provide their own fuel and light. Thirdly, rural differentiation will cease. Fourthly, rates for women will be the same as those for men. Fifthly, there will be no distinction between the rate for a wife who is a pensioner and one who is not. Lastly, the rates for children have been improved. The effects of these changes on an individual pensioner cannot be stated in general terms, for they depend on individual circumstances as, for instance, whether he or she was in receipt of a winter allowance or not. But over the whole body of supplementary pensioners the standard will be raised, for the new regulations are estimated to cost the Exchequer an extra £7,250,000 a year.

In the debate on the Address, on Friday of last week, a statement of policy was made on Newfoundland. There is to be no change in the present form of government until after the end of the war in Europe, when, as soon as practicable, machinery will be provided "for enabling the Newfoundland people to examine the future of the island, and to express their considered views as to the form of government they desire, having regard to the financial and economic conditions prevailing at the time. . . . In the meantime, a vigorous attempt should be made to push on with the development of local government . . . as well as with general reconstruction plans. . . ."

During the debate on the pensions of retired state servants, the Chancellor of the Exchequer announced that legislation will be introduced in the near future to deal with their position, but he emphasised that attention must be concentrated on cases of real hardship.

In a Note entitled "Higher Milk Prices" on page 743 of *The Economist* on December 4th there appeared the statement: "In the case of wheat and rye, an increase in the average payment will be counterbalanced by a corresponding reduction in prices." The reference, obviously, was to the increase in the *acreage* payment.

In October a detention order was made under Regulation 18B against one person, a British subject of enemy origin. Ten persons were released, and on October 31st the total number detained was 355. Of this total, about 30, according to the Attorney-General's statement in the Mosley debate, are Fascists.

OXFORD PAMPHLETS ON HOME AFFAIRS

6d. net each

A new series of Oxford Pamphlets dealing with home front topics, political, social and economic, and designed for the general reader.

Published:

- H.1. *How Britain is Governed*, by R. B. McCallum.
- H.2. *The Newspaper*, by Ivor Thomas, M.P.
- H.3. *The Transition from War to Peace*, by A. C. Pigou.
- H.4. *Britain's Future Population*, by R. F. Harrod.
- H.5. *Will the War Make us Poorer?* by M. Young and H. N. Bunbury.
- H.6. *English Law*, by J. L. Brierly.
- H.7. *British Trade Unions*, by Mary A. Hamilton.

Will be followed at short intervals by others on such subjects as The Civil Service, The British Political Parties, Education in Britain, Money, Agriculture, Britain's Foreign Trade, The Problem of Full Employment, The National Debt, and many others.

Oxford University Press

★ no need for WINTER COLDS

THERE is no longer any need to dread winter colds. They can be prevented by taking SEROCALCIN, the scientific immunising agent that gives complete freedom from colds in the majority of cases.

How it is done

SEROCALCIN acts by stimulating the natural defence powers of the body. It enhances the resistive capacity against invading organisms that cause colds. SEROCALCIN prevents a cold before it happens.

Simple and Safe

The immunising course consists of 60 SEROCALCIN tablets taken at the rate of two daily for thirty consecutive days. In 80 per cent. of cases this course gives immunity from colds for a period of 3 to 4 months. There are no "drugs" in SEROCALCIN—it is perfectly safe both for adults and children.

Proved by Tests

Scientific tests by Doctors in private practice, in Hospitals and in Factories have established the claims made for SEROCALCIN and confirm its ability to give successful results in 80% of cases.

Supplies and Prices

Hospitals, Schools, Munition Factories and export trade have first claim on supplies, but most Chemists have adequate stocks. The immunising course of SEROCALCIN (Reg. Trade Mark) costs 8/5d. including tax. Industrial and School Medical Officers, Nurses, welfare workers, Labour Officers and interested members of the public are invited to write for a booklet "Immunity from Colds" which will be sent on receipt of 1d. stamp (to comply with official requirements).

For existing colds, too

If you already have a cold, SEROCALCIN will probably clear it up in 48 to 72 hours. The dose for this purpose is three tablets three times daily, and a small treatment pack of 20 Tablets (price 3/4d. inc. tax) is available.

SEROCALCIN PREVENTS COLDS
Harwoods Laboratories Limited, Rickmansworth Road, Watford, Herts.

Studies in Economic Dynamics

M. KALECKI

Author of *Essays in the Theory of Economic Fluctuations*

These five interconnected essays (Costs and Prices—The Short-Term and the Long-Term Rate of Interest—A Theory of Profits—The "Pure" Business Cycle—The Trend) present the results of further research into the subjects which the author discussed in his *Essays in the Theory of Economic Fluctuations*. This inquiry also includes a discussion of the influence of the increase of population and technical progress upon the economic development of a capitalist economy. 5s. net.

Iron and Steel in Britain

T. H. BURNHAM and
G. O. HOSKINS

"The position of Britain in the world iron and steel industry changed from one of unquestioned predominance to the fourth in rank both in production and exports." In order to discover the factors which were responsible for this, the book examines the history of the industry between 1870 and 1930 and throws a spotlight on these critical decades. T. H. Burnham is well known as the author of the book *Engineering Economics*, which since 1927 has been widely used, and in the authorship of which G. O. Hoskins is now associated. With Text Diagrams, 25s. net.

Vitamins in chocolate for liberated Europe

The British Government, having examined all the ways in which sufficient vitamins could be provided to the under-nourished children of liberated Europe, have arrived at the conclusion—as Rowntrees did in 1938—that chocolate offers one of the best vehicles for carrying added vitamins. In chocolate, the vitamins retain practically all their potency.

Before the war, Rowntrees pioneered the addition of vitamins to cocoa and chocolate. Their object was to enhance the protective value of these already highly nutritious foods.

Today, when the Allied Governments are faced with the enormous problem of rehabilitating each occupied territory as it is freed, Rowntree's experience of fortifying cocoa and chocolate with vitamins on a large scale is proving of great value. When the war is won, this experience will again be used for the benefit of the British public.

ROWNTREES

AMERICAN SURVEY

Industrial Incentive—Two Models

(From a Correspondent in Ohio)

Cleveland, October 23rd

If travel were easy, two Cleveland concerns would be receiving more visitors from this and other countries to-day than the old showplace near Detroit, Ford Motors. About as many newspaper and magazine articles are written about them concurrently as all other Ohio manufacturing concerns put together. They are Jack and Heintz, Incorporated, and the Lincoln Electric Company.

Jack and Heintz is the closely-owned company founded about three years ago by William S. ("Bill") Jack, of Cleveland, and Ralph Heintz, of California, to make aircraft accessories. Built up rapidly to more than 7,500 employees in five suburban works, it attracted national publicity first for the high bonuses paid to executives, and then for the high earnings of all the men and women employed there, even the sweepers averaging more than \$100 a week.

Lincoln Electric, maker of electric-welding equipment and welding rods, is smaller but much older; it has become notable for a bonus system which for several years has been paying annually to employees as much money as they earned in wages. Nearly all factory workmen there have incomes upward of \$4,000 a year. But what put Lincoln's name into every newspaper lately was the resistance of its president, James F. Lincoln, to the demand of the Navy Price Adjustment Board to return \$3,250,000 of the company's 1942 profits of nearly \$5,000,000 under the recapture procedure which this and several other Boards have been carrying on. He has recently defied the Board to collect, but has until the end of October to present further evidence. The Board is prepared if necessary to stop payments to the company, as well as further orders.

Rewards and Profits

Jack and Heintz and Lincoln Electric share the regional leadership in rewards to their entire complements of factory workers, although a number of skilled workmen in other concerns make more than the average men in these two companies' employ—earnings of \$200 a week, for example, are not unknown in such crafts as boring-mill operation, if a man works many hours overtime. But though the wages bills of these two companies, in proportion to numbers on the pay-rolls, both exceed those of all other employers here, and though both of them obtain very high production per man and make large profits, their policies might be said to lie at opposite poles within the frame of industrial success.

Jack and Heintz's efficiency can be measured against that of other manufacturers making the same new product; their ability to bring down costs more rapidly than older contractors in the same field led the Services to ask them to take on the difficult production of the automatic pilot. To Heintz, a mechanical genius, is said to go much of the credit for recent production short-cuts.

The enormous savings of mass production of what had once been hand work were first divided three ways—in price reductions, in bonuses to executives, and in benefits of every sort to employees. The bonuses had to be given up, but the US Treasury has permitted the company to charge to production costs the expenses of meals in the plant, banquets, music piped continuously through the factory, life insurance, dentistry, surgery, two-week vacations (in Florida until travel restrictions cut them off), steam baths and rubdowns, all without charge. Only the free vitamin pills intended to prevent colds (\$25,000 worth) were disallowed. Jack is the son of poor Scottish and Canadian immigrants and says he decided to treat his "associates" the way he wanted to be treated when he toiled at a machine.

Hard Work

The hourly wages paid are at approximately the going rates of the community; the workers' high earnings are due to the fact that they normally work 84 hours a week on two seven-day shifts. No little of their spirit is due to their feeling they are people of superior stamina.

As the plants developed the lure of the large wages from premium overtime drew men and women from every large establishment in Cleveland, with perhaps the sole exception of Lincoln Electric. A waiting list exceeding 20,000 was built up. Because employees must be on the job for longer than the business day, the plants maintain a large department to handle for them the "red tape" of daily life, such as tax returns, automobile and other licences, house rentals and purchases and rationing.

"Bill" Jack talks daily over the plants' loud-speaker systems in that voice of magic quality which once, when he was business agent of the Machinists' Union many years ago, called out on strike the employees of the city's largest machine-tool works. At that time he merely stood on the pavement and shouted into the windows. To-day all his employers must belong to this union.

Jack has no piece-work in the plant. He relies solely on the collective spirit of the men and women to reduce absenteeism, tardiness and slackness of work, and even the sceptics, of which Cleveland had many, now concede that Jack "has something on the ball." Employers from as far as the Pacific coast have sent men to Cleveland to study his unique methods. Technical journalists visit the enterprise to inquire if it's "Factory or free-for-all," "insane management or common sense."

Lincoln Electric has the same collective spirit among the workpeople, but without the daily evangelism. J. F. Lincoln, a far colder personality than Jack, preaches "intelligent selfishness" and opposition to unions, has no organisation in his plant, makes no labour agreements, and writes pamphlets in the economics of the pure Manchester or Herbert Spencer school. Competitors in the welding field admit his price-cutting methods have led to lowering the cost of the welder to one-seventh of what it was 25 years ago, and the welding rod to one-third in the same period, with the result that the company has made large profits, even after paying the workmen double what they normally make for the same employment elsewhere. Their working week is only about half that of Jack and Heintz, Lincoln holding that they cannot be at top efficiency for much more than 40 to 45 hours a week. The US Treasury has recently decided to disallow the annual bonuses as deductions from profits, on the ground that ordinary workmen should not be worth \$5,000 a year. Lincoln replies that the enthusiastic and confident spirit obtained by paying an entire force high wages yields a collective efficiency which is reflected in low prices and public benefit.

Jack and Heintz profits were \$1,776,000 in 1942, of which Jack sought to retain \$961,000, but he was renegotiated down to \$156,000. Lincoln, upon being told to return over \$3,000,000 out of the \$5,000,000 he made on \$34 million of business, stormed before the House Ways and Means Committee in Washington, demanded Congressional inquiry into renegotiation of contracts, and announced he wouldn't pay. Apparently his voice will be effective, with that of others, in obtaining changes in detail in the recapture legislation, but not in its repeal. He is now making speeches about "dictatorship" and giving out numerous statements. Senate Clevelanders have enjoyed Jack's arguments with other employers over the "theft" of labour and Lincoln's ruckus with the Government, but some are inclined to be thankful that the city has only a few industrialists of similar innovating and disturbing energy.

American Notes

Subsidy Strategy

The Administration, which seemed to be playing for time on the subsidy issue, has abandoned this tack. Marvin Jones, War Food Administrator, has admitted that delay would not improve the Administration's chances, and would merely bog down the food programme. It is not yet clear whether this change is due to the opposition's refusal to agree to the proposed 60-day postponement, or whether the Administration has either succeeded—or realised that it cannot succeed—in healing the split in the Democratic party on this issue. Some compromise proposals have been put forward, like that of Senator Ellender, who suggested limited subsidies on condition that the "little steel" wage formula was maintained. But the opposition pressure has not slackened. The Senate Agriculture Committee has approved a bill banning subsidies for milk-feed, amounting to \$200 million, and requiring instead an immediate one cent a quart rise in the price of milk. The National Council of Farmer Co-operatives has proposed wage subsidies in four key industries as a substitute for food subsidies. The United Steel Workers have announced their intention of reopening their contracts to secure a 17 cent an hour increase in their basic wage. The Senate Finance Committee shows no signs of increasing taxes beyond those of the House Bill. In view of accusations that the food programme has kept domestic supplies below what they might have been in a free market, the announcement of an increase in the meat ration is good politics. It will amount to about 30 per cent more in December, and is possible because of heavier slaughterings this autumn owing to the scarcity of feed—a case of jam to-day but not to-morrow. But the prospects of maintaining an effective and integrated anti-inflation front remain dim.

Down on the Farm

The impact of the war on farm living standards is the subject of a recent study by the Department of Agriculture. President Roosevelt, in his Message on Food Subsidies, pointed out that the income of farm operators has not only increased rapidly in the war years but has risen more than the average income of other groups in the population. Cash income is higher than ever before. In 1941 half the families operating farms received less than \$760 cash income from all sources. In 1942 the corresponding mid-point was \$1,320, and in 1943 it may reach \$1,500. Distribution is less unequal, although it is still true that the upper 10 per cent of farm families received 37 per cent of farm income, and the lower 10 per cent less than 1 per cent. In part this increase is offset by higher prices and increased taxes, which are being paid for the first time. The average expenditures of a farm family on the same pattern of living are estimated to have increased from \$823 in 1941 to \$981 in June, 1943. Nevertheless, as income went up faster than retail prices, the lower-income farmers were able to increase their consumption. Rationing did not prevent this, as they had never before been able to afford even the ration. Those in the higher

income groups may be just maintaining their standards, or even cutting them down as a result of restrictions, rationing and taxes. There remains, however, a substantial amount of cash in the farmer's hands. Some of this is being used to reduce debt. Farm mortgage debt declined in 1941 by 1.6 per cent, in 1942 by 5.4 per cent, and in 1943 by about 10 per cent. More homes are being bought and paid for in cash. Nevertheless, black spots remain, and in some cases have grown. The farm home, always notorious for its lack of amenities, has gone without repairs, partly because the farmer was too busy, partly because of materials restrictions. The provision of medical care, always at its worst in rural areas, has suffered disproportionately by the calling up of doctors and nurses. Rural education, with its poor salaries, has been denuded of teachers who have been called up or gone into better-paying occupations. Restrictions on transport, particularly petrol rationing, have further reduced the meagre opportunities for recreation which are available. Farmers are still ineligible for the most important benefits of the social security programme. Plainly after the war there will be scope and need for vast improvement in rural standards of living as regards education, group medicine, dentistry and hospitalisation, home amenities, and recreation. It is also easy to see why the farmer, with more cash, but in many cases seriously impaired living standards, and fewer opportunities to spend his money than non-rural workers, suffers from a sense of injustice and is inclined to return to the Republican fold.

The Soldier's Vote

The authority of the states over election procedure was upheld this week when the Senate set aside a Bill providing for a simple Federal war ballot for absentee Service men, members of the Merchant Marine, and some civilians serving abroad. Instead, by a vote of 42-37 a Bill was passed merely recommending the states to pass enabling legislation. Most states—46 out of 48—already have statutes on their books permitting Service men stationed in other parts of the United States to vote, but these do not apply to men serving abroad. In view of the crucial importance of next year's Presidential election, and the growing numbers of men overseas, the concern of both parties over the procedure to be adopted is increasingly lively. Under the American electoral system, the vote for Federal offices is not cast directly, but for the delegation of each state to the electoral college. A majority of hundreds may secure the whole state vote at the electoral college for the successful party. Thus a small number of votes may swing several key states and decide the issue. A recent Gallup poll gives some support to the Democrats' contention that in past elections they have suffered disproportionately from the disfranchisement of Service men. On the floor of the Senate support for the simple and efficient Federal supervision of absentee voting was withdrawn when the opposition threatened a series of court cases contesting the results of such elections on constitutional grounds. But despite the rallying cry of the constitution and states' rights, the debate was not purely a matter of academic principle. Unless the states waive their rights, the maintenance of state authority

would mean the export of such contrivances as the poll tax, which in a number of Southern states disfranchises many poor whites and most negroes.

Suckers and Scruples

The bitterness of the American press over its chance to publish the product of Reuter's "spontaneous enterprise" (on the details of the Allied conference in Cairo) can hardly be exaggerated. For a moment it seemed as though the bungling of the publicity end would receive almost as much attention as the conference itself. It was inevitable that a fair share of the criticism should have been directed at Mr Davis and the Office of War Information, and this may account for the heat of Mr Davis's reproaches. There has been rather less attention than might have been expected to the failure of the liaison between the publicity agencies of the two Governments. Roughly the critics may be divided into two groups: those who never took the security arrangements very seriously, and feel the United States ought to take its "defeat" with a good grace, and be more nimble-witted next time; and those who were proudly conscious of co-operating by not publishing the story and now feel they have been badly let down—which, as a Note of the Week on another page suggests, is a travesty of what actually happened. It is among the latter that the main damage has been done. The recurrent belief that Uncle Sam is a sucker in international affairs, and incapable of holding his own with slick foreign politicians, has never died out. It was revived by the five Senators, and has now been tremendously reinforced. There is a natural, if unfortunate, desire to show that the Americans too know

how to act tough. There has been a stimulus, as well, to the belief that in international communications—cable, and wireless—the United States should be increasingly independent of other nations.

Unregenerate Kansan

Mr Hull's suggestion of a common foreign policy plank for both parties has evoked violent disagreement from Mr Landon, who disapproves not only of any entangling alliances, but of the Moscow pact. Mr Landon is not a believer in "One World" or its proponent, Mr Willkie. It is believed that his statement is proof that the anti-Willkie movement is getting into high gear. Mr Landon, unsuccessful Republican candidate in 1936, is, perhaps, more important as a portent than a prophet. Both by natural inclination and careful study he represents what the average Middle-Western Republican, of conservative cast, is thinking, as well as the Old Guard of the party. Isolationism is not dead if Landon is once more its mouth-piece, or if a substantial section of the party is willing to challenge the achievements of the President in foreign policy. The threat, it is true, is much reduced. Mr Willkie has agreed that if Landon's views represent those of the party machine, he will not be its candidate. There is no doubt that many Republicans would approve his decision that a retreat from the cautious commitments of Mackinac would cost the party dearly in terms of votes. After the last war the desire to preserve the unity of the party led Republican supporters of the League to go along with Harding. But the lesson of the last twenty years makes it unlikely that such a sacrifice could be exacted again from the progressive wing. Mr Landon may succeed in stopping Willkie but at the risk of splitting his own party in two.

THE WORLD OVERSEAS

The Relief Resolutions

THE United Nations Relief and Rehabilitation Administration's conference at Atlantic City ended on December 1st. The conference has done much preparatory work. But it is still hard to get any precise idea of some of the decisions adopted or of the course of the preceding discussions. All that is available is a ridiculously chaotic medley of resolutions, fragmentary reports and contradictory statements issued by the Inter-Allied Information Committee. A more comprehensive and complete report should be issued at once. Public interest in relief and rehabilitation is too great for this confusion to be permitted.

The major issues before UNRRA have been discussed in two previous issues of *The Economist*. It is now possible with some ingenuity and imagination to sum up the decisions made and to make clear a few of the points that have given rise to criticisms.

In one vital respect the work of the Conference has been very useful. It has dispelled exaggerated and over-optimistic expectations. The report on post-war requirements of the earlier Inter-Allied Committee rested, to some extent, on such false hopes. The report estimated that nearly 46 million metric tons of supplies and 23.5 million tons of shipping would be required for shipment to Europe

during the first half year after the war. The longest list of requirements was drawn up for France—nearly 7.5 million tons, including 1.4 million tons of petroleum and petroleum products and 292,000 tons of wine. In food-stuffs, Poland's needs are the greatest—1.7 million tons. The overall figures for other countries in this list were: Belgium-Luxemburg, 3 million tons; Czechoslovakia, 1.8 million tons; Greece, 1.7 million tons; Netherlands, nearly 3 million tons; Norway, 1.8; and Yugoslavia, 1.1 million tons. In his report to the Council of UNRRA Sir Frederick Leith-Ross explained that these estimates "were only a target." New and reduced estimates have now apparently to be made, which will have to reckon with the very high needs of Russia, so far not even tentatively calculated. According to the report of the sub-committee "on procedures for ascertaining and meeting deficits in supplies requiring importation" the revised estimates will be based on regional standards of pre-war consumption; and from these figures a proportion will be deducted to take account of the overriding current shortages.

Contrary to some reports, the Conference has not entirely dropped "the second R" from its name. Something called rehabilitation remains, but a distinction has been made between rehabilitation and reconstruction. What is envisaged is not merely immediate relief, but also some assistance in putting some industries to work. The principle seems to be that such assistance should be confined to production of consumers' goods in existing establishments. "No new construction work is within UNRRA'S scope"—as the report of one of the sub-committees says. Raw materials, machinery, machine tools and spare parts will, however, be supplied; and even the restoration of local coal and mineral mines by UNRRA has been promised. For agriculture UNRRA "should concentrate on the first crop year after liberation." The agricultural sub-committee speaks with marked optimism about agriculture in the non-devastated areas as a "going concern." It recommends the continuation of war production policy; the expansion of fisheries and whaling industry in view of the shortage of animal protein fats and vitamins; and priorities for imports of dairy cattle feeding stuffs over others.

The sovereignty of the Governments of liberated countries has been accepted as the principle in distribution.

Most of the Governments concerned are confident that the necessary agencies for distribution will be in working order, which may or may not be true. The immediate exercise of national sovereignty by the recognised Government in each of the liberated countries is, however, not taken for granted.

In the case of a liberated territory [says the report on the scope of UNRRA's activities] in which a government or recognised national authority does not yet exercise administrative authority, UNRRA will operate from such a time and for such purposes as may be agreed upon between the military command and the administration, and subject to such control as the military command may find necessary. The administration shall, as far as circumstances permit, seek the advice of the national government or recognised national authority concerned.

Methods of distribution have been only very sketchily defined. From the available reports and resolutions it is not clear, for instance, to what extent supplies from UNRRA will be distributed on the basis of charity and to what extent through commercial channels. The report on distribution policies speaks of

measures to ensure that in so far as the distribution . . . is done through private trade, the remuneration earned by private traders for their services is not more than is fair and reasonable.

The general principle is that

distribution should be so conducted that all classes of the population, irrespective of their purchasing power, shall receive their equitable shares of essential commodities. When supplies are sold to consumers, prices should be set at such levels as to facilitate the flow of supplies into the proper hands.

Effective rationing and price controls are recommended with much emphasis:

The suppression of black markets should not be left to general pronouncements and decrees, but should be the subject of active measures of enforcement applied vigorously and unrelentingly.

Finally, the important provision is made that "at no time should relief be used as a political weapon" and that "no discrimination should be made in the distribution . . . because of race, creed, or political belief"—provisions which, if they are not to remain mere lip-service, would call for very scrupulous surveillance of the distribution by impartial UNRRA authorities. Unfortunately, the principle of a hundred per cent sovereignty may in some circumstances rob these provisions of much of their practical meaning.

Financing Relief

The financial proposals provide for contributions by the non-occupied countries to the amount of one per cent of their national incomes during the year ended June 30, 1943. This is to be not an annual contribution, but the basic share of the countries concerned "for UNRRA's entire term of operation." The recommendation is, of course, subject to approval by the constitutional bodies of each country. Not less than ten per cent of the contribution is to be paid out in currency which can be spent outside the paying country; the rest in credit in local currency to cover internal purchases. Contributions will also be accepted from private sources. Advances made by a member country to cover the administrative costs of UNRRA

may be deducted from the country's basic contribution. On the other hand, the recipient countries' ability to pay for supplies will be estimated by the Director-General (or by the Council in case of disagreement). Finally, member-Governments will be asked to waive export taxes on UNRRA supplies.

The estimate of the purely administrative budget of UNRRA itself, not the cost of relief, is £2,500,000 for the rest of 1943 and for 1944. Of this total, forty per cent is to be covered by the USA; and fifteen per cent each by Great Britain and the USSR. China would pay five per cent; France and India four per cent each; and Canada three per cent.

Inflation in Eire?

[FROM OUR DUBLIN CORRESPONDENT]

November 22nd

In popular discussion about the economic effects of the war on Eire, the word "inflation" is bandied about a great deal without much inquiry into its precise meaning. It is interesting to investigate to what extent inflation has taken place. Many inflationary symptoms are to be observed. The cost of living has risen by 64 per cent since 1939, the monetary circulation has increased from £18 million to £32 million and bank deposits from £119 million to £162 million. The purchasing power of the Irish pound has unquestionably been reduced, and the amount of money has been increased. It does not, however, necessarily follow that the Irish economic system is suffering from inflation. An increase in prices and an increase in the volume of money are not in themselves inflationary. The question that has to be answered is whether the impulses generating these conditions came "from the side of money" or "from the side of things."

Inflation is the consequence of an increase in the money income of a community not matched by a corresponding increase in the output of consumers' goods. The national income of Eire in 1939 was about £160 million. It is estimated that in the present year it is about £200 million, an increase of 25 per cent. The greater part of this increase is accounted for by the increase in the net agricultural output, which rose from about £55 million to about £85 million. Farmers are notoriously savers, and a considerable proportion of their increased incomes is withheld from consumption. Wage rates have risen by 15-20 per cent, but emigration has caused a reduction in the numbers employed. There has been no vast expansion of working class incomes such as has taken place in Great Britain. The Government has paid for its expenditure by taxation or by borrowing the real savings of the people. In 1942, the deposits in the Post Office Savings Bank and savings certificates increased by nearly £4,000,000. The Exchequer has not borrowed from either the Central Bank or the commercial banks. One definitely inflationary element is the income entering the country as remittances from emigrants and as expenditure by tourists from Northern Ireland. This is estimated at £10 million in 1943. In so far as this income is not saved, it is an inflationary influence. It is, in fact, an inflow into Eire of the British

inflationary tide. The effect of this income should not, however, be exaggerated. It amounts to only about 5 per cent of the national income of Eire, and a substantial part of it is known to be saved by the recipients.

The increase in the cost of living is the result of increased prices of agricultural products and imports. The agricultural price index has risen by 76 per cent since 1939. Prices of many farm products have been raised by the Government in order to stimulate the production of essential food, but, in the opinion of many people, the increases have been excessive. Increased prices in the export market have necessarily been reflected in the home market. The import price index has risen by 115 per cent, but the volume of imports has fallen by two-thirds. Heroic attempts have been made to control prices, profits and wages, but the forces pressing upwards are very strong and the control has not been completely successful. Subsidies amounting to about £4,000,000 a year are being given to assist in keeping down the cost of living, but the capacity of subsidising is limited by the restricted field for additional taxation. There is no rich class in Eire to bear the taxes necessary for an extensive policy of subsidies on food.

The increase in the monetary circulation reflects the higher agricultural prices, together with a tendency to hold additional reserves of cash in a period of uncertainty. The increase in the Irish banks' charges to their customers has led to a certain substitution of cash for cheque payments. The expansion of deposits is the result of the lack of profitable investment opportunities. Loans and advances have been reduced, and the diminution in private borrowing has not been offset by any increase in public borrowing. In Great Britain, the expansion of deposits reflects the vast Government borrowing from the banks; in Eire, it signals idle money and the growth of savings. The general conclusion that can be reached is that the inflationary symptoms in the Irish price and monetary statistics do not indicate an inflationary condition in the economic system. The upward impulses have been on the side of things rather than on the side of money. If the war were at an end, agricultural prices and import prices would begin to move down and the cost of living would be automatically reduced. If wages were allowed to rise, their reduction would not be automatic and might give rise to considerable difficulty. It is therefore very important that the policy of holding down wage rates should be consistently pursued.

Latin American Coffee

[BY A CORRESPONDENT]

November 23rd

DURING the past four months, the position of Latin American coffee has entered a new phase. The surplus problem of the area, which supplies over nine-tenths of the world's coffee, has given way to a comparatively tight supply position. This may become serious if the course of the war allows the resumption of coffee shipments to Europe on any scale in the next few months. The position is not unlike that at the end of the last war, when a serious Brazilian crop failure caused an international coffee shortage. The resulting scramble for supplies stimulated production to such an extent that at no time during the interwar period did the world coffee market become normal again.

In the years preceding this war, the world coffee crop fluctuated between 32 million and 36.4 million bags of 60 kilos each per season, of which Brazil supplied between 60 and 70 per cent. World deliveries never exceeded 27 million bags in a single season, and of this total some two-fifths was taken up by the European Continent. The blockade thus caused a serious shrinkage of consuming markets, and the Latin American producers, for most of whom coffee is by far the most important export commodity, were severely hit. In October, 1940, the United States Government came to the rescue. It encouraged the conclusion of the Pan-American coffee agreement, which accorded each of the Latin American producing areas fixed import quotas in the United States and the rest of the world. For the duration of the war, the quotas for countries outside the United States were only of theoretical interest, but as the United States import quotas were fairly large, they helped the Latin American producers over their worst difficulties.

This scheme worked well in its first year. In the 1940-41 season, the United States consumed 16.4 million bags of coffee and arrivals of coffee in US ports even reached

17.65 million bags, both of them record figures. The situation, however, changed in the following season, when the shipping shortage reduced US domestic deliveries by 4 million bags and port arrivals by 6 million bags. In the first half of the 1942-43 season, the outlook became even worse. The smallness of the shipping space available for coffee resulted in a big reduction in United States stocks, with the result that coffee rationing was introduced in the United States in November, 1942. Since the beginning of this year, however, the tide has turned again. More shipping became available, and it was chiefly used to convey coffee from the producing countries in Central America and the northern part of South America to the United States. In the 1942-43 season, which ended on June 30 last, coffee arrivals in the United States showed a considerable improvement on the year. The total quantity imported amounted to 12.99 million bags, against 11.71 million bags in 1941-42. Whereas, however, US arrivals from non-Brazilian sources rose from 4.61 million bags in 1941-42 to 8.72 million bags in 1942-43, those of Brazilian coffee declined from 7.09 to 4.27 million bags. Both the revival of shipments and the rationing of consumption restored the statistical position in the United States sufficiently to enable the Government to revoke the coffee rationing order from the end of July.

As a result of this revocation, the United States will have to continue to import coffee on a larger scale. There are, indeed, reports that the increasing imports, combined with the fact that the coffee ships arriving from Latin America now carry between three and five times the normal pre-war quantities of coffee, are causing considerable storage difficulties in US ports. As the heavy imports last year from non-Brazilian sources have largely absorbed the surpluses of the smaller Latin American producing countries, the bulk of future imports will have to come from Brazil.

Brazil's Supplies

Brazil, however, which for more than two decades had suffered from very heavy coffee surpluses, is this year for the first time faced with a somewhat tight supply position. The country's coffee crop fell, owing to heavy frost damage, to 12.79 million bags in 1941-42, and showed only a moderate recovery last season. In September, 1943, frosts again played havoc with the growing crop, and, although latest reports speak of smaller damage than was at first expected, the quantity available in Brazil from new production this season will hardly be in excess of 13 million bags. There are in addition some 7.90 million bags from former crops, but the great bulk of this total supply is covered by the current year's quota and the quota arrears under the Pan-American coffee agreement. After the fulfilment of these obligations and the execution of current orders from countries outside the United States, Brazil will have little coffee left to meet a possible demand from Europe.

As a result the President of Brazil has already signed a decree abolishing, for the first time since the introduction of the present control policy in 1931, the "sacrifice quota" for the current crop, which earlier this season had been fixed at 15 per cent of the output. This move will assure the fulfilment of current contract obligations, but it cannot solve the problems that a resumption of regular imports into Europe would create. If a free market in coffee were resumed under current supply conditions, prices would once again be forced to high levels, with all their inherent dangers. On the other hand, a wise international distribution and allocation system, under which competition between the individual buying countries would be eliminated, could assure sufficient supplies everywhere until the trees have recovered from the frost damage of the past three seasons. The present position of Latin American coffee thus offers a good opportunity to restore, for the first time for two decades, a sound equilibrium of the world coffee market. But if this opportunity is missed, it can, as after the last war, prove once again the beginning of a long-term disruption of normal trading.

West African Cocoa—A Correction

In the article on West African Cocoa, which appeared in *The Economist* on November 20 (page 680), it was stated that the buying price to producers had been reduced from 7s. 6d. to 7s. a load in the 1943-44 season. This statement was based on official information, but it now appears that the writer was misinformed and that the current season's price is again 7s. 6d. Moreover, it is payable at all buying centres on the railway, not only at ports of shipment, which means that the up-country producers do not have to bear the cost of transport to port.

THE PASSAGE OF THE YEARS

THERE was a time when this 15-h.p. Singer was the very latest thing in horseless carriages and an object of some considerable pride to her owner. That was in 1907. For the next thirty years we must assume that her life was

both active and useful, for it is not until 1938 (when you might have thought her life had ended) that we hear of her next. Not as a prized museum exhibit but bowling along the high roads at over 30 m.p.h. to win at rallies and gymkhanas!

NOW WHAT IS IT ABOUT THE SINGER? Why is it so many people who bought a Singer once, insisted that each subsequent car must also be a Singer? Perhaps the secret is that the same skill which made that Singer of 1907 such a champion is put into every car we ever make.

More NEWS of No. 4 WHITE HORSE

Safeguarding the quality

Like many other good things, White Horse Whisky is not so easy to obtain as it was, and more people than ever are anxious for a share of the regulated supplies that are available.

But rarity lends an added charm. We enjoy good things even more when we get them only now and then. And how good is an occasional glass of White Horse Whisky in this fifth year of war. A whisky of rich fragrance, and full, round flavour, of rare delicacy and bouquet. A whisky in which all the qualities of great age are crowned by a genial, heartening glow with never a trace of fire.

Forethought and a provident care of stocks laid down in years of plenty have provided a modest supply for your pleasure to-day. But the supply is regulated. Regulated to ensure that, to-day and always, White Horse shall be the whisky 'fine as a fine liqueur.'

ARE YOU RETARDING EFFICIENCY

by
INCORRECT LIGHTING?

YOU couldn't read this paper in a poor light. Are you asking your workers to do efficient work under poor seeing conditions?

YOU must drive slowly in the blackout because you can't see far ahead. In the same way your workers may be slowed down because they cannot see well enough to work quickly.

LIGHT—THE VITAL FACTOR IN EFFICIENCY. Incorrect lighting impedes efficiency and retards individual output. When poor lighting is corrected, efficiency increases, accidents and "spoils" are reduced, strain is relieved, fatigue is lessened. Obviously total output gains in ratio.

CORRECT LIGHTING IS A SCIENCE. Correct lighting is not merely a matter of increasing the number and the power of your lights. High wattage is no criterion of good lighting. Glare

does not spell efficiency. Lighting is a science: it is a job for the expert.

AN ADVISORY SERVICE FOR INDUSTRY. The Mazda Lighting Advisory Service has been established to assist the owners and managements of factories to obtain expert advice about their lighting without obligation.

On request, a specialist will visit your works and report on your lighting. He may find it exactly as it should be, and you will be pleased to have his confirmation. He may make valuable suggestions which, if given effect, will aid production, and in many cases will definitely reduce current consumption and therefore save fuel. You are invited to write to-day for details.

BTH RESEARCH AIDS INDUSTRY

BTH Research Laboratories have made an intensive study of both the physical and psychological aspects of lighting in wartime industry, and their knowledge and experience are at the disposal of the principals of industrial undertakings through the Mazda Lighting Advisory Service.

THE BUSINESS WORLD

Official Statistics

LACK of knowledge about the facts of economic life has been a most important deterrent to economic and social progress. It is the cause of many misconceptions and mistaken policies. Probably it can be traced, very largely, to the nineteenth century attitude of *laissez faire*. Individuals and institutions have, of course, tried hard to remedy the deficiency; and, sometimes by accident rather than purpose, but with increasing deliberation as the field of public administration has widened, Government Departments have added steadily to the stock of facts and figures, especially since the last war. But, on the whole, the prevailing indifference to economic data has stood in striking contrast to the progress made in scientific knowledge and business administration.

Accurate facts about Britain's economic make-up in the form of significant statistics are indispensable to the proper functioning of democratic organisations. Positively, their publication spreads accurate knowledge about economic and social defects and stimulates the demand for reforms. Unemployment statistics did much in the inter-war years to make the country aware of the evils of mass idleness. Figures of road accidents have done much to promote safety measures. Figures of the trend of the population have done much to make people realise the gravity of this problem for the future. And statistics have a second, more negative, function. If politics is the art of the possible, measure-statistics show what is possible and what is not. Measure-statistics show the national income, for example, shows that the only way to secure a substantial increase in average incomes is to increase the total; the elimination of the remaining rich will make only little change. But these national income figures also show that the present total is large enough to provide for everybody the minimum necessary for health. As *The Economist* pointed out a hundred years ago, on November 4, 1843,

Statistics are a simple array of those facts and that experience which can alone enable us to come to clear and certain conclusions on any subject.

If statistics are essential as a guide to intelligent public opinion, they are vital to the Government in carrying out the wishes of the community. The Government must possess, in policy-making, all the relevant facts; it must be able to record economic changes before it can control or guide them; it must be able to assess in advance the quantitative effects of its actions. A policy of full employment, for instance, would be quite impossible without complete figures of employment and expenditure on investment. The establishment of a minimum standard of living requires careful and continuous study of prices and wages. If full employment is to be accompanied by expanding national income—which can only be got by a steady increase in productivity per head—the Government must be able to test the use made of national resources and measure both work and efficiency.

Much progress has been made during the war, and because of the war, in the collection and handling of statistics, precisely for this purpose of making the most advantageous use of scarce resources. The nation's total manpower and material resources are counted closely, and their employment is statistically controlled. Unfortunately, the few of the new statistics are available to the public—the Budget White Paper on national income and expenditure is the most important exception. Almost certainly, despite reasons of national security, secrecy has been carried too far. The statistical experience gained during the war can be invaluable after. In a Memorandum on Official Statistics, the Royal Statistical Society has rightly drawn attention to the need for an efficient statistical service after the war. The need is as urgent as the need for the sort of Economic Civil Service that was outlined in *The Economist* on October 23rd; in fact, they are two facets of the same requirement. The Memorandum deals with matters of organisation and machinery rather than with the range

of tasks which the statistical service will have to perform. But it makes quite plain how inadequate the Government's statistical service was before the war, and shows how many wartime improvements have been made.

Broadly, the Royal Statistical Society suggests that every major Government department should in future have a properly staffed and equipped statistical branch; that there should be, as now, in wartime, a Central Statistical Office to co-ordinate departmental work and initiate research; and that co-ordination could be aided by a small committee, selected from heads of departmental branches with the head of the Central Statistical Office as chairman. Most important of all, perhaps, the proposals lay stress upon the importance of rightly trained personnel.

These suggestions are, of course, sound, so far as they go. But an Official Statistical Service does in fact exist, in part at any rate. It has been built up piecemeal during the war, largely by the recruitment of temporary civil servants. The immediate practical problem is not the creation of new machinery, but what to do with this existing organisation. If it is allowed to disperse, if all the temporaries, being temporary, depart, it will take many years to reach even this point again. It must not be broken up; it must rather serve as a starting-point for the statistical service that is wanted. Inevitably many members of the present statistical organisation will wish, or be obliged, to go back to their peacetime jobs in universities and in business. But as many as possible, sufficient in numbers and in quality to provide the needed nucleus, should be induced to stay by the offer of suitable salaries and suitable status. If such a nucleus can be held together, and if the peacetime importance of statistical work is recognised by conferring upon it the appropriate rank in the Civil Service, the further problem of recruitment and training should not present serious difficulties—provided that, as in the case of an Economic Civil Service, it is made possible at every level to recruit from outside as

well as from inside and to exchange personnel for particular work with non-official statisticians.

The thing that must be settled first, in fact, before the establishment officers batten down on this Service, is the vital part of statistics in post-war policy making, that the people cannot be given what they want, however good the will of the Government they choose, unless they mobilise and use statisticians and economists at a high level in the public service. The Central Statistical Office should preferably remain attached to the offices of the Cabinet rather

than be placed under the authority of, say, the Treasury; and, last but not least, measures should be prepared to enable the organisation to secure the statistical returns that may be required. The aim is not, and should not be, to bring about an arbitrary increase in the scope of Government interference and control; the degree of public intervention in private affairs must be decided by the people's elected representatives. The aim, of both an Economic and a Statistical Service, is simply to enable the Government to do properly whatever work it may be given.

American Banking in Wartime

(From a Correspondent in Chicago)

THE outstanding feature of the past twelve months of banking in the United States was that more people, individually, got out of debt and more people, collectively, went deeper into debt than at any other time in the nation's history. The weekly statement of the Federal Reserve System for October 20th showed that money in circulation in the United States had crossed the \$19 billion level for the first time. Cash in the hands of the public had increased more than \$5 billion over a year ago.

The money supply of the nation has increased in these proportions as a result of the Government's gigantic war financing operations. Dr Charles R. Whittlesey, of the University of Pennsylvania, in his report, "The Effect of the War on Currency and Deposits," published by the National Bureau of Economic Research of New York, opens with the statement that the increase in the money supply between June 30, 1939, and the beginning of this year, roughly \$37 billion, was greater than the total increase in the preceding century and a half. Proportionately, the increase has been far larger than during the first World War. The increase in currency in circulation, from approximately \$6 billion on June 30, 1939, to over \$19 billion on October 20th this year, is a continuation of a twenty-five-year trend; but the trend has been very greatly accentuated during the war by the monetary necessities of enormously expanded production.

Some commentators have sought to explain the large volume of money in circulation as a sign of money hoarding. But Dr Whittlesey emphasises the fact that

many of the individuals receiving increased income and dependency allowances have never been accustomed to handling their affairs through banks.

Shifts in population, inconveniences in the way of establishing new banking connections, and the temporary nature of the residence of many workers have had a similar effect, he believes.

In the three and one-half year period covered by the study (June 30, 1939, to the beginning of this year) another item was noted, the other form of "money" used by the American people—bank deposits (including Government deposits)—increased in round figures to \$29 billion. The expansion and contraction of bank deposits formerly reflected the changing money needs of business and the public; but one of the results of war financing is that, since the vastly increased deposits are now based on bank ownership of Government obligations, "any automatic tendency toward early contraction of the supply has now disappeared." Hence, the increased volume of deposits generated during the war may be here to stay. Money at the command of individuals and business firms has been comparatively idle. The turnover of bank deposits in 101 leading cities, as computed by the Federal Reserve Bank of New York, has declined from 22.5 to 20.5 times per annum.

Combined loans and investments of Federal Reserve System banks in 101 leading cities reached a record high level of \$51,648 million in the week ended October 13th, a reflection of heavy purchases of Government securities. Dr Whittlesey remarks that Government borrowing from banks is equivalent to the manufacture of so much paper money, since the volume of demand deposits in banks ultimately come to the disposal of the general public. It is

one of the most ingenious operations of the entire financial system, yet sufficiently subtle to remain a mystery to most customers of banks, and even to many bankers.

This was the reason why the Third War Loan Drive (\$15 billion), just ended, was confined to individuals and business firms.

The mighty public debt built up by the operation of financing the war was revealed at \$168,614,410,296 in the United States Treasury statement of October 19th, a total which compares with a figure of \$95,737,316,513 a year before. On October 22nd the Government released figures which seemed to indicate that, in spite of the fact that spending from the public purse was breaking all records, the Treasury deficit was being kept under some sort of control. The Government had spent \$27,049 million in the 113 days since this fiscal year began on July 1, 1943, approximately \$10 billion more than was spent in the whole of 1919—the peak year of expenditures during the last war. But the net deficit so far in this fiscal year is down \$100 million compared with the corresponding period last year,

RESERVE BANK ITEMS

Changes in member bank reserve balances and related items during the week and the year ended October 20, 1943, were as follows:—

	(In Millions of Dollars)		
	Oct. 20, 1943	Oct. 13, 1943	Oct. 21, 1942
Bills discounted	11	—	4
U.S. Government direct obligations	8,875	—	154
" " guaranteed obligations	39	—	6
Industrial advances (not including ten million commitments Oct. 20)	—	—	—
Other reserve bank credits	12	—	—
Total reserve bank credits	444	—	198
Gold stock	9,380	—	18
Treasury currency	22,132	—	23
Member bank reserve balances	4,101	—	2
Money in circulation	12,002	—	19
Treasury cash	19,019	—	41
Treasury deposits with F.R. banks	2,284	—	3
Non-Member deposits and other F.R. accounts	530	—	150
	1,778	—	178

U.S. TREASURY POSITION

	Oct. 19, 1943	Oct. 19, 1942
Receipts	\$ 122,663,849	\$ 54,795,774
Expenditures	415,095,332	307,477,533
Net balance	21,105,045,883	5,888,656,274
Working balance incl.	20,342,339,497	6,126,166,989
Customs receipts for month	23,070,925	13,256,771
Receipts for fiscal year (July 1)	11,607,686,271	4,220,795,528
Excess of expenditures	27,049,378,584	19,815,920,310
Total debt	15,441,692,313	15,595,124,781
Decrease under previous day	168,614,410,296	95,737,316,513
Gold assets	22,132,050,099	22,758,879,813

the figures being \$15,441 million and \$15,592 million respectively. The 1942 Revenue Act would appear to be accomplishing at least something. The Treasury collected \$11,607 million from American taxpayers in the 113 days following July 1st. In the corresponding period last year the collection amounted to \$4,220 million. Spending is much greater (President Roosevelt asked Congress for \$3 billion with which to pay interest in this fiscal period), but the debt is only growing at approximately the 1942 rate—which is, of course, very fast. Interest on the public debt amounts to nearly as much as the cost of running the Government during the years 1922-31. It has been estimated that the debt will be increased during the present fiscal year by about \$71 billion—a figure that suggests a calculation in astronomy.

The reverse side of the national debt picture concerns the individual, who is paying his share of the war costs,

buying his share of his Government's obligations, putting money in the bank, opening bank accounts at an unprecedented rate, and paying his debts. Most tellers in the banks of a city of reasonable size will testify that \$20 bills have supplanted \$10 bills as the most widely used paper currency. Around the time of the March 15th income tax payment date, a Congressman achieved brief publicity by stating that people of the United States were borrowing many more millions of dollars in order to meet their income tax instalments. Testimony of specialists in the personal loan business did not bear out the Congressman's view. Their business has been growing smaller, and some of them (notably institutions which financed automobile sales), finding themselves with an abundance of cash, have bought their way into manufacturing companies that needed money and had good war contracts, thus becoming investment trusts of a sort.

Americans, since 1900 and up to the present emergency period, have shown an increasing disposition to go into debt up to their necks, buying cars, furniture, clothes, and practically any kind of consumers' goods, besides paying doctor's bills and hospital fees in the same way. Statistics prepared for the Federal Reserve System recently show a drift to thrift that cannot be denied. For the year ended last July, total consumer instalment loans, personal loans made by banks and small loan institutions, credit unions and the like, fell \$928 million from \$1,428 million. Commercial banks' loans dropped to \$281 million from \$521 million; small loans to \$363 million from \$481 million; industrial bank loans to \$170 million from \$253 million, and credit union loans (loans company organisations of a mutual type,

set up by and for employees in order to accomplish easier "character loan credit" and lower interest rates) to \$114 million from \$173 million. And pawnshop business, the "poor man's bankers," is in a bad way; the owners are very vocal about it.

People are saving money. Mr Elliott V. Bell, superintendent of banks in the state of New York, said recently that the indications are that savings banks in New York state will have a larger gain in deposits this year than in any other year of their history. In the first nine months of this year, he said, bank deposits rose \$329 million, exclusive of dividends, against a decline of \$155 million in the corresponding period of last year. In the ten years ended last January 1st, he said, savings deposits increased by only \$257 million. The banks not only failed to attract new money, but were unable to retain on their books \$866 million of the \$1,123 million paid out in dividends. Mr Bell traced the changes in the composition of the assets of savings banks for the last twenty years, declaring they now had \$6 in cash for every \$100 of assets, against \$5 in 1930 and \$4 in 1920, and \$37 of Government securities, against \$16 in 1920 and \$4.50 in 1930. Net dividends after earnings, he said, had actually increased in the last eight years, although operating expenses had gone up nearly 50 per cent.

So Mr Average American, the white collar worker, the punch press operator, putting in overtime, the soldier and his wife and children collecting Government allowances, are generally located on the black side of the book-keeper's ledger, while the Treasury side gets redder and redder.

Business Notes

Russia and Gold

Although representatives of Soviet Russia have taken part in the recent informal talks on post-war currency plans laid in Washington and London, it is not until this week that a semi-official expression of Russian views on the subject has been made. It comes from the leading Soviet economist, Professor Varga, and takes the form of an article contributed to the periodical *War and the Working Class*. Professor Varga's position in the Soviet Union would suggest that his views have behind them a wide measure of official support. As far as may be judged from the cabled summaries of his article, Professor Varga states that Russia, while interested in all steps calculated to hasten the restoration of world economy, is not impressed by the international bank or stabilisation fund proposals of the Keynes and White schemes. His own country, writes Professor Varga, would prefer a return to a world gold standard.

If all the Soviet Union's trade with the rest of the world could be done on the basis of a fixed value gold currency, this would undoubtedly facilitate trade operations.

For Soviet Russia the "gold standard" has never meant what it means in the context of free and liberal economies. All that Professor Varga asks is that there should be stability of exchanges, which Russia needs for her foreign trade, and that there should be a fixed world-price of gold, which Russia also needs since she is the second largest gold producer in the world. For Russia, a return to the gold standard would have none of the implications which such a move would have for a country operating a relatively free economy. The fixed external value of the Soviet rouble has at no time maintained a close relation to its internal purchasing power. The problem of maintaining equilibrium with international cost and price structures hardly arises in a wholly planned and socialised economy, where the State undertakes the whole of foreign trade. For that reason the Soviet experts are bound to be profoundly disinterested in the technical devices by which the Keynes and White plans propose to maintain international discipline in matters of currency policy. Apart from this, the Keynes plan will be suspected by them because it envisages the possibility of changing the unitas price of gold, and thus endangering the world-price on which Russia depends for her output of the metal, while the White plan, with its stress on freedom from exchange controls, can hardly be expected to make any appeal to them.

The Soviet Russian attitude to gold has always been severely practical and utilitarian. It is true that in the early

years of the revolution an attempt was made to break completely away from a money economy. The printing presses were used consciously as an instrument of indirect taxation, and the old rouble was inflated out of existence. The experiment only served to show that, even in a communist economy, money has an important rôle to play, and can only play it if the unit is kept reasonably stable. The chervonetz was thus created as a new monetary unit stabilised in terms of gold. Its introduction synchronised with the concessions to private enterprise embodied in the New Economic Policy. Those concessions were only a temporary pause in the revolutionary process. Even the return to a gold parity for the currency caused Lenin a pang of regret, and he announced at the time that he still hoped to see the day

when we will place in the streets of some of the largest cities in the world, public lavatories made of gold . . . a most just and instructive use of that metal. Meanwhile we must see that we get full value for our gold. When you live with the wolves you have to howl like a wolf.

But whereas NEP was to pass fairly quickly, and make way for the intensified socialisation of the Five Year Plans, the concessions to monetary orthodoxy remained. Soviet Russia has never regarded gold as backing for the currency. In the words of Stalin, spoken in 1933:

"the stability of the Soviet currency is secured primarily by the tremendous volume of commodities in the hands of the state, and placed in circulation at stable prices. What economist can deny that such security is more real than any gold reserve?"

Gold reserves were built up in Russia to maintain a fund out of which temporary disequilibria in the balance of external payments could be met. That is still the main rôle which gold is expected to play in the economy of the USSR. As these reserves are fed by the second largest gold-producing industry in the world, it is not surprising that Russia should want the world to return to a currency standard which will ensure a world market and a stable price for gold.

Control of the Coal Industry?

The Minister of Fuel's plan for the coal industry, which has been rendered more and not less urgent by the calling-up of youths for the mines, is now on its way, and both the owners and the miners are considering its implications. Major Lloyd George had hinted that the scheme would not "fully satisfy" either side, and the present plan is essentially a further attempt at compromise. The aim of the Government is to strengthen its control over the in-

dustry without, however, accepting the miners' plan to take over financial responsibility. The new proposals, it is understood, include a scheme for the compulsory grouping of the pits within each region so as to form a compact unit for administrative purposes, and the appointment to each group of special technical directors (whose salaries would be paid from the Coal Charges Account) to assist the Regional Controller and advise colliery managements on improving their output. The ownership of the pits and the financial structure of the industry would not be affected, and it is hard to see how a group of pits can be operated as a unit without some variety of financial pooling. This scheme, if it is accepted, should correct the principal defects of the present operation of the control—the inadequacy of supervision and the insufficient application of technical advice; it should facilitate the concentration of production on the most efficient units which the Government White Paper of June 1942 stated would be "the most direct means of securing an early increase in output." It does not, in fact, go very much further than the White Paper, which proposed that each Controller should have technical assistants to advise on concentration and supervise operations at particular collieries, and that technical advice should be made available to managements, if necessary by the grouping of pits. It offers to do what, in fact, was offered, with flourish of trumpets, over a year ago.

"Cavilling" for the Pits

The system of "cavilling" or balloting for work in places underground is an established usage in the north country coalfields. It was also used for a short time in the last war to determine the order of release of miners from the Forces. Mr Bevin's decision to adopt this method for selecting conscripts for the mines is a happy thought. The miners like it, because they know how it works, and it appeals to their liking for a gamble, while its use should remove any fears that class prejudices might influence the choice. The chances are that, in any random selection of the population, the working-class element will predominate. Fitness and capacity to work in such a hazardous and arduous industry will, in any case, be the first criterion. In the circumstances, choice by ballot from among fit men is almost certainly the best course. Voluntary recruitment had completely failed to produce the requisite manpower. The right to "opt" for the mines in preference to the Services had been exercised by only 3,366 youths up to the end of September. The scheme, as Mr Bevin pointed out, may help to break down the sense of isolation in the mining community, and the miners' leaders have welcomed the introduction of new blood into the industry. With proper training and with the intensified use of mining machinery, the recruits may do much towards the maintenance of output. Provision is being made for their training and welfare (the details of the training scheme are given in a note on this page), and it is essential that these should be properly carried out and overseen. Accommodation may provide the biggest single problem. Housing in many colliery villages is crowded and bad, and if not enough youths can

be billeted in satisfactory conditions with miners' families the Government will have to tackle the problem of providing hostels and huts with as much energy as it has shown in meeting the needs of the US Armies. But when all is said and done, conscription of young men for service in the pits is not a substitute for the long overdue reorganisation of the industry, nor for the miners' own proposal for abolition of the present dual control.

The Mines Call-Up

Details of Mr Bevin's scheme for compulsory recruitment to underground mining were announced in the House of Commons last week, and are likely to be debated in the near future. Recruits will be selected by means of a ballot from men born on or after January 1, 1918, who would otherwise be called up to the Armed Forces and are placed in medical Grade I, or Grade II if their disability is for defects only. Three classes will be exempt: men accepted for flying duties in the Royal Air Force or Fleet Air Arm or as artificers in submarines, or men on a short list of highly skilled occupations. Every recruit who has no previous experience in the industry will undergo a period of intensive training, which will be given in two stages. Stage "A" training will be at eleven special centres in the main coalfields and will normally last four weeks, before the men are posted to the selected pits by the Ministry of Fuel, where Stage "B" training will begin. Training will continue a fortnight and for their first month underground the men will come under the supervision of an experienced miner. The Ministry of Fuel is establishing an Inspectorate to supervise the schemes. The training week (except in South Wales where special conditions apply), will last approximately 44 hours and will be made up of physical training (25 per cent), below ground practical training (30 per cent), surface work (20 per cent), classroom work, and demonstration (25 per cent). Trainees will be paid the national surface workers' minimum rates, ranging from 39s. 6d. a week at 17 years to 78s. a week at 21 years and over. During Stage "B" trainees will receive the appropriate district rates. They will receive allowances, including travelling expenses above 5s. a week. Arrangements are being made for medical supervision and welfare. Recruits will be able to express a preference for a particular coalfield, but the final decision rests with the Ministry of Fuel and Power. There will be no compulsion upon the men to join the miners' union, but it is expected that union membership will in fact be automatic. Some 30,000 men are to be drafted to the pits by the end of next April, but the Government hopes that voluntary recruitment will continue.

More Settled Prices

The recovery in prices of industrial equities which followed the sharp setback of middle and late-October has for some days been tentative. Business in this section is rather restricted, and price movements, other than those in response to individual company announcements, are small and without much definite trend. Most British fixed interest stocks still tend to sag, and most other sections including many foreign bonds, are heavy. These more speculative sections are not likely to see any appreciable rise in prices just yet, owing to the existence of disappointed speculators, who have still stock to sell on a rise. It will not be surprising if the genuine investor turns once more to industrial equities. Whether the adjustment in these has gone far enough to attract buyers, despite the uncertainties to which the lack of any definite Government pronouncement on most aspects of reconstruction exposes the investor, is uncertain, but it has been substantial. According to *The Actuaries' Investment Index*, the margin between the yield on industrial preferences and that on equities was 0.08 in favour of the former on September 28th, whereas two months later it was 0.12 in favour of the latter. On the two months almost every class in the equity section has fallen, but the falls have been very unequal in extent. Possibly a more useful comparison is that with the position of a year ago. Aircraft manufacture and shipping shares are lower, for very evident reasons while a modest decline in electrical distribution is, presumably, due to the demand for nationalisation of this industry. Of the rises, most are moderate, but against a year ago stores and catering shares are up by 21 per cent, while the corresponding figure for gas stock was 17.3, that for

(Continued on page 789.)

JUST AND DURABLE

"Industry is helping to win the war . . . industry must help build a peacetime world. After the war is decisively won . . . what kind of world is essential for a just and durable peace?"

This question is being asked to-day everywhere in the world. No expert is needed to tell you the answer.

It must be a world as peaceful and neighbourly as your own town; a world in which decent people can bring up their children decently. It must be a busy world where factories and farms are working and where there are jobs for all. How can such a world be brought into being? The surest way is to think and talk about it. Full and complete discussions on the porches of this country, over its fences, in churches, schools, clubs, and always at meals—that is how the terms of A JUST AND DURABLE PEACE can be formulated.

In your discussions keep in mind this fact: your terms of peace must be such that the people of other lands can agree with them. There must be provision in your plans for sustained production and for consumption of that production.

Only a world peace that squares with the conscience of men of good will can be just. Only a just peace can endure."

★ ★ ★

The above Statement has been issued by the International Nickel Company of Canada and is widely published in Canada and the U.S.A. We reproduce the Statement here because we believe that all engaged in industry in Britain will approve its principles and desire to collaborate with all the United Nations in formulating plans for "a just and durable peace."

LINES OF COMMUNICATION

¶ In the raid on London during the night of the 10th May, 1941, the Central Operating Station of Cable and Wireless (the hub of its world-wide system) was gutted by fire.

¶ While some of the staff on duty there fought the flames throughout that night, others made their way across a London ablaze and under bombardment to emergency premises made ready for such a contingency, so that the service of vital overseas telegraph communication, linking London with the battle-fronts, might not be interrupted.

¶ There was no interruption.

¶ Only the few knew of this. It is an illustration of the un-resting continuity of a British Service whose traffic outward from London is *five times* what it was in 1938.

CABLE AND WIRELESS LIMITED

"At your service"

"THE NEXT ITEM IS THE HEATING SYSTEM..."

Fortnightly meeting of a works' Fuel Efficiency Committee

"THAT'S A JOB FOR OUR FUEL WATCHERS"

"Even in a mild season, room heating can run away with a good slice of our fuel. We know from what we've read in the Fuel Efficiency Bulletins that much can be done without making working conditions uncomfortable.

"We are now putting in thermostatic control throughout the factory, but until this is fixed the heating system must be the fuel watchers' job. We know the minimum temperature we need, and it's up to the fuel watchers to keep an eye on the thermometers. The important thing to ram home is this: *If the temperature rises only one degree higher than we need, we may be wasting no less than 5 per cent. of the fuel used.*"

Here are the pointers they gave their fuel watchers:

- Check the room thermometers at least four times in every shift;

- See that doors are not left open needlessly, and that somebody isn't opening windows just to cool the place down;

- To hold back a rising temperature, turn down the radiator valves or switch off the unit heater fans (but do not forget to shut off the unit heater steam as well or else heat will be wasted through the roof);

- Shut off the whole system towards the end of the shift, and put on again 15 minutes before the next shift starts.

Without proper control a works heating system can be a real fuel waster. If you have not yet put in the thermostatic control, see that your fuel-watching team controls room temperatures. If you need advice, get in touch with the Regional Fuel Efficiency Committee.

yields in the list, namely, 3.15 per cent for gas stock, 3.18 for building materials, and 3.42 for stores—a tie with cotton shares. Compared with these, returns of over 4 per cent on electrical equipment, motors, breweries and the large miscellaneous section appear almost generous.

Post-War Foreign Investment

While the British stock exchanges, under a system of Treasury control, which, if not unintelligent, is certainly not very intelligible, sees its activities almost daily reduced, Wall Street is busy planning to become the world's central security market. Such a position must, of course, be based on loans in terms of dollars to overseas countries, and the official view of the New York market on this point is that, outside a limited sphere, the finance of reconstruction must be left to the private investor. It is now widely realised in the USA that much of America's foreign lending between the two wars was ill-advised. It would scarcely be an exaggeration to say that the parlous state in which the British investor in foreign loans now finds himself is due to a combination of the fact that America overlent to the same borrowers and the fact that inadequate allowance is made for the rights of those whose loans had originally a first claim on the resources of the borrower. However that may be, it is scarcely possible to gainsay the fact that American markets in foreign loans were vastly inferior to that of London, and Wall Street has a long way to go to catch up. Since much post-war lending will inevitably be financed by the saving of US nationals, there can be no question that Wall Street ought to provide a first-class market. But it is to be hoped that Treasury policy will find room for substantial overseas loans financed from this country as well. This is only one of many fields in which it was once supreme; there are still substantial benefits to be reaped from running international markets. The whole of the funds with which London finances foreign countries need not be British. London has the skill and the necessary machinery—probably in a higher degree than any country—but they cannot be used if the new issue market and the ordinary business of dealing in stocks and shares are too narrowly regimented.

Shipping Freight Markets

Not unexpectedly, the agitation for the reopening of London's commodity markets after the war is gaining ground. The latest move, made by deep sea tramp ship owners, is designed to enable London, or, more precisely, the Baltic Exchange, to resume its place as the centre of

the world's freight markets. They do not advocate the opening of markets immediately after the last shot has been fired but "as soon as practicable after the cessation of hostilities." It is very unlikely that the markets will be reopened as soon as the war ends in Europe; the resumption of "normal activities" must wait upon the defeat of Japan. In fact, it is probable that the present methods of control may have to be continued for some time after the end of the war, at least during the period of transition from war to peace conditions. An early re-opening of the freight and other markets is therefore unlikely. But if there is to be a return to free markets for the distribution of commodities, there is everything to be said for ensuring that London's markets are in a position to reopen speedily and to earn foreign exchange by the export of their services.

Pre-fabrication of Houses

The volume of house-building after the war will depend not only on the resources that can be allocated to this purpose and on the type of construction but also on the limit of productivity. New methods of construction, such as pre-fabrication, may make it possible to speed up output quite appreciably. Mr Alfred C. Bossom, MP, a member of the building commission which recently returned from a special study of new materials and methods used in the United States, drew attention to the progress and success of pre-fabrication across the Atlantic in an address to the Incorporated Association of Architects and Surveyors on December 2nd. He suggested that at least 75 per cent of British post-war houses could be pre-fabricated in factories, free from weather difficulties, leaving only 25 per cent of the work to be done on the site. Such a degree of mechanisation would amount almost to a revolution, but, if pre-fabrication methods can be successfully applied in Great Britain, there is no reason why house-building should not be increasingly mechanised. Mr Bossom's other suggestion, that, contrary to tradition, women war workers could assist in the construction of houses after the war is no less revolutionary but seems equally sensible.

To MEMBERS of the Scottish Widows' Fund

Most of our new-business staff is on war service but the utmost will be done to maintain the Society's life assurance service.

In two ways MEMBERS can do much to help:—

1. Keep correspondence with the Society at a minimum, and.
2. Either to us or to your agent, give introductions to likely new members.

REMEMBER, we cannot now send anyone to urge you to increase your own life assurance—just DO IT WITHOUT BEING ASKED.

Write to your agent or to the Secretary,

SCOTTISH WIDOWS' FUND

More Bank Notes

A mere nine weeks sufficed to mop up the £50 million additional Bank of England notes created early last October and this week a similar addition has again been made to the fiduciary issue. The move could not have been much longer delayed, for a further £14,471,000 of notes went into circulation during the week to last Wednesday, and, had it not been for its £50 million reinforcement, the reserve of unissued notes in the banking department of the Bank would by then have fallen to £4,947,000. The seasonal expansion in the note circulation is proceeding much faster this year than it did last; this contrasts with the remarkable stability of the circulation during the spring and summer months, which compared with a persistent and considerable expansion in the corresponding months of 1942. Heavier spending this December may be due in part to the larger number of overseas troops stationed in this country. It also indicates a definite relaxation in the prevailing mood of national austerity, for which the drift of the war news is no doubt responsible. The relative stability of the circulation in the earlier months of this year was partly attributable to the success of the Wings for Victory weeks, while the recent sharp expansion in the circulation has coincided with a remarkable drop in the weekly subscriptions to the Government's tap loans. Unless the expansion in the note circulation between December 8th and the end of the year is much greater than in the corresponding period of 1942, when it amounted to £33,906,000, the latest increase in the fiduciary issue should suffice to tide the Bank over the coming seasonal peak—but not with a substantial margin to spare.

Eire's Balance of Payments

Neutral Eire is one of the few countries to which the statistical black-out has not spread. For example, the recently published particulars of the balance of international payments for 1942 make extremely interesting reading. The main items are shown for each of the last three years in the appended table:—

	Credit			Debit		
	1940	1941	1942	1940	1941	1942
Capital Items:—						
Transactions:—						
Government	1,349	1,491	371	131	1,513	6,609
Currency Commission	...	...	...	7,048	2,388	5,388
Banking	...	...	...	3,675	14,930	13,935
Other capital	9,219	5,387	4,266	1,968	2,349	4,839
Total Capital Item	10,566	6,878	4,637	12,822	21,180	30,771
Current Items:—						
Merchandise	32,974	31,831	32,666	46,790	29,530	34,630
Income from external investments	13,100	12,550	13,000	6,900	8,350	8,400
Emigrants' remittances:—						
(a) From U.K.	700	2,600	6,800	...	...	...
(b) From other countries	1,428	1,257	1,579	...	...	...
British Govt. pensions	2,550	2,684	2,993	...	...	...
Other known items	881	1,621	4,601	1,018	2,556	2,353
Total Current Items	51,633	52,743	61,639	54,708	40,436	45,383
Total Current and Capital Items	62,201	59,621	66,276	67,530	61,616	76,154
Balance unaccounted for	5,324	1,995	9,878	...	...	...

The current balance of payments has recently run consistently in favour of Eire. The merchandise trade has hardly contributed to this favourable balance, imports and exports being approximately balanced for the years 1941 and 1942, though there was a substantial export surplus in 1940. The main impact on the balance of payments comes from emigrants' remittances, and income from overseas invest-

ments. The most striking feature of the statistics is the increase they show in remittances from workers in the United Kingdom. This is a reflection of the considerable recruitment of Irish labourers for war work in this country. Remittances to their families in Eire now represent one of the main credit items in that country's balance of payments. Emigrant remittances from other countries, mainly the United States have kept fairly stable in the past three years, but are well below the pre-war figure which ranged around £2,500,000. It will be seen that for 1940 and 1942 there were substantial credit items unaccounted for, the figure for 1942 nearing £10 million. These represent, in the main, errors of estimation in invisible items. The corrective movements are found in the capital transactions of Irish banks and of the Currency Commission. The war will leave Eire the strongest per capita creditor country in the world.

Brazil Settlement Injustice

Last week on page 751 some general strictures were passed on the new Brazilian debt settlement. This week it is possible to carry the story a step further, thanks to the detailed treatment of the position of the San Paulo Coffee Institute 7½ per cent bonds by Lazard Brothers and Co., Ltd., who were responsible for the issue. Under Option 1 of the settlement, holders of these bonds receive one-third of their contractual interest and one-fifth of their sinking fund. This treatment is much worse than that afforded to many other loans, some at least of which had no specific security, while others had security which has disappeared by virtue of economic developments. As against this the Coffee Institute bonds were protected by every known device, and it is essential to an understanding of the case to realise that, had they not been, the money could not possibly have been raised on such terms. The security included a specific charge on a transport tax fixed at 2s. 3d. gold on every bag of coffee grown and transported in the State of San Paulo, a specific charge on 7½ per cent bonds of the State of San Paulo and a general charge on all property, assets and undertakings of the Institute present and future. There was also a dollar option, a premium on repayment and a special reserve fund. The Institute was constituted a body corporate and recognised as a legal entity. Lazard Brothers claim, and investors certainly believed, that the obligations of such a body were better than the general obligations of the State or Central Government, and the standing of the German Potash bonds can be adduced as proof of the widespread character of this belief. Further, the sale of coffee produced and produces the foreign exchange, the lack of which was the ground for the original default, while the assets of the Institute and the actual sums credited to Lazard's account in milreis were for some time after default sufficient to provide full service. All these considerations and, apparently, Lazard's balances, have been swept on one side in the settlement.

There is much to be said for the view that only the bonds of the State of San Paulo properly came within the scope of the negotiations of the Council of Foreign Bondholders, and that, whatever view the Brazilian Government might adopt, the Council was not empowered to negotiate the settlement in respect of this loan, having in view its exceptional status. In any case, the Council appears to have admitted that in principle the loan had superior rights, but that the general rights of British bondholders and the need for maintaining such agreement as had been achieved between British bondholders and their American counterpart, on the one hand, and the Brazilian Government, on the other, made it inexpedient to urge the special claims

December 11, 1943

of any particular issue. If this is a correct reading of the position, the Council has surely done a disservice to all serious investors in foreign bonds and has made complete nonsense of the whole legal basis of finance; that full effect should be given to the terms of the original contract, and particularly to the distinction between fully secured, partially secured and unsecured loans. It is the duty of the Council to protect both the contractual rights of existing bondholders and the British business of foreign finance, not to liquidate British foreign interests as though Britain were a distressed debtor.

US Patent Reform

Those who believe that the patent laws of this country are in need of drastic reform may find the report of the US National Patent Planning Commission rather discouraging. Appointed just two years ago to study the American patent system and consider whether it provides the maximum service in stimulating inventive genius, the Commission reports that the system should be preserved, that it has placed the USA far ahead of other countries, facilitates rapid development and general application of new discoveries, contributed to the achievement of the highest standard of living that any nation has ever enjoyed, and stimulated creation and development of products and processes necessary to wage successful war. This is high praise, but it makes curious reading alongside some of the strictures of the ill effects of the existing system which have appeared in the USA from time to time. Unfortunately, in the absence of any of the evidence heard by the Commission, there is no means of deciding how far these strictures have been met. In passing, it may be questioned whether the patent system has played a large part in creating America's differential advantages. The Commission does not find the system perfect, and it makes a number of recommendations for its improvement. Naturally, these are recommendations only to American conditions. In this mainly applicable only to American conditions. In this category are the suggestions that the Licence of Right—unknown in the USA at present—should be permissible, but not obligatory, and that there should be a single court of appeal for all patent cases instead of many. The Commission, however, also recommends that all future agreements which have patents for their subject matter must be recorded in the US Patent Office, while a similar record must be made in the Patent Office, or which include any restrictions as to price, quantity of production, geographical areas or fields of use. Further, it recommends that a patent granted may be revoked if any member of the public successfully challenges its validity in proceedings commenced within six months after it is granted. More interesting is the suggestion that

there should be a uniform standard as to what constitutes invention, determined objectively by the nature of the contribution to the advancement of the art, and not subjectively by the nature of the process by which the invention may have been accomplished.

The remaining recommendation of importance substitutes, as the maximum life of a patent, 20 years from the date of filing for the present 17 years from its allowance. This is, however, subject to an extension to a maximum of 22 years where there has been great delay beyond the control of the applicant.

It seems open to very serious doubt whether similar recommendations would suffice to remove the great abuses of the patent law which are believed to exist in this country, the abuses which make it an important vehicle for the restraint of trade. Two of the recommendations, if they can be put into effect, do, however, go much further than perhaps appears at first sight, namely, the registration of agreements, and the definition of patentability. It can be safely said, however, that the registration of agreements, while a large step in the right direction, would not suffice in this country where control is often exerted without any formal agreement. In the matter of standardisation of practice, the objective in the USA is to avoid differences of opinion between the Patent Office and the Courts. What is required here is, rather, a much higher and more clearly defined standard of what constitutes patentability. On the whole, the report contains little that is readily applicable to con-

Cotton Mill Reconstruction

In view of the fact that Crosses and Winkworth Consolidated Mills have had little or nothing to distribute on any class of capital for well over a decade, and have paid out very little since their formation during the post-war boom of 1920, it is very difficult to arrive at a just appreciation of what treatment should be given to the various classes of holder. Clearly, on a legal basis everything belongs now to the Crosses and Heaton's debenture-holders, but the board clearly do not consider that a full enforcement of legal rights is justified. Having pulled the company round to a point where the liquid position, from appearing hopeless, is reasonably sound, they put forward a scheme which preserves, even for the ordinary shareholders, some 13.7 per cent in the equity of the business. The debenture-holders are to exchange, pound for pound, into 6 per cent cumulative redeemable preference, and to receive in consideration of this and the cancellation of all arrears of interest, 50 per cent of the total of the arrears in ordinary capital. This gives them some 56.3 per cent of the equity, and the remaining 30 per cent goes to the old preference shares, whose holdings are cancelled. If the scheme is accepted, it is expected that dividends will be forthcoming on both classes of new capital. Evidently the scheme is beneficial to both preference and ordinary shareholders in the short run, but it is not clear that the long-term prospects are sufficiently certain to warrant the debenture-holders accepting even a heavy participation in the equity, unless they can sell out at something like par. Rejection of the proposals would, presumably, mean that there would be an appreciable amount available, so long as current earnings are maintained, for payment of interest arrears. The position is, however, complicated by the anomalous treatment of debenture interest under EPT.

COMPANY MEETINGS

CROSSES AND WINKWORTH
CONSOLIDATED MILLS, LIMITED

SCHEME OF RECONSTRUCTION

CHAIRMAN'S STATEMENT

Mr Joseph R. Heaton, the chairman and managing director, will make the following statement at the class meeting to be held on 30th instant, in the Albert Hall, Peter Street, Manchester, of the various classes of debenture stockholders and shareholders, giving the observations of the board of directors.

Your directors now submit to you a scheme for the capital reconstruction of your company, but before going into details the board wish me to make a few preliminary observations, as it is thought this may assist you in your consideration of the scheme, by giving you some idea of the problems we have had to contend with over the last decade or so.

In 1930 Crosses and Heaton's Associated Mills, Limited, the whole of whose share capital was owned by Crosses and Winkworth Consolidated Mills, Limited, found itself unable to meet the service of its debentures, and a moratorium was granted by the holders to give time for the affairs of the combine to be gone into. The investigation resulted in the amalgamation of Crosses and Heaton's Associated Mills, Limited, with Crosses and Winkworth Consolidated Mills, Limited. The following extract from the speech of Sir William McIntock to the debenture stockholders on October 6th, 1931, reflects the position as it then was:

"As I explained to you at the last meeting, the present value of your security is considerably less than the amount of the outstanding debentures. It is obvious, therefore, that the only source to which you can look for payment of interest on your debentures is the future earnings of the concern. What you are being asked to do is in effect to take control of the direction of the combined companies through your trustees and the gentlemen you are nominating as directors of the company, with a view to giving these gentlemen a chance to see whether they can restore the fortunes of these two companies and thereby enable you ultimately to receive the full amount of your claims as creditors of these companies."

What in fact the directors were asked to do was to rehabilitate the finances of a virtually bankrupt concern. I was one of the gentlemen referred to by Sir William as being given the chance to restore the fortunes of the company and was appointed joint managing director of the combine. In 1936 I became sole managing director and in 1941 was elected chairman of the board.

During the intervening years my whole time and attention have been given to the management of your company, and I need hardly tell those of you who have followed the fortunes—or should I say misfortunes—of the cotton industry in general and this company in particular of the many difficulties we have had to face and overcome. Our first balance sheet after the amalgamation showed we were indebted to our bankers for £488,984, which in the year 1935 had increased to £545,578. At one period our finances were in such low water that it was difficult to finance our normal trading requirements, but fortunately we were able, with the co-operation of certain of our financial friends, to evolve a scheme which freed part of our assets and enabled us to obtain the necessary facilities. Reference to the balance sheet at the 31st March, 1943, disclosed a different state of affairs; the loan from the bank had completely disappeared, and the debentures securing it cancelled; readily realisable assets, including cash £231,173, amounted to £740,461, against total outside liabilities

(exclusive of the Heaton debenture stock) of £136,389. I think you will agree that apart from the claims of the debenture holders the company is now in a sound financial position, which the scheme now before you is framed to consolidate.

The holders of the "Heaton" 6 per cent first mortgage debenture stock are secured creditors of the company, both for the principal amount outstanding, £1,396,215, and the accumulated arrears of interest, which to 31st March last amounted to £928,617—or a total of £2,324,832. Although the arrears of interest are not immediately payable, they are nevertheless a liability and in so far as profits computed in accordance with the trust deed are earned, they must be paid out to the debenture holders until all accumulated arrears of interest have been paid off.

Under the trust deed securing the "Heaton" debenture stock the profits remaining after

(a) payment of any bank interest and usual bank charges,

(b) cost of maintenance of building and fixed plant, etc.

(c) depreciation at the rate of £75,000 per annum or such other rate as may be agreed in accordance with the trust deed, have to be applied

(i) in paying interest on the debenture stock and any arrears thereof,

(ii) in establishing a sinking fund for redemption of the stock, and

(iii) in creating a special reserve account equal to two years' interest on the stock for the time being outstanding.

The accumulated requirements under the trust deed at 31st March, 1943, amounted to £2,169,033. This is far in excess of the profits available. In addition, future earnings are likely to be fully absorbed in taking care of the annual charges for depreciation, interest and sinking fund, amounting to £173,018, and there thus seems no probability of overtaking the arrears of interest, which must be satisfied before either the preference or ordinary shareholders can receive a dividend.

A suggestion was made that the arrears of interest should be dealt with by an issue of funding certificates, but this method would be of no real benefit either to the company or to the shareholders, for although the certificates would not appear as a liability in our books, interest would have to be paid thereon and a sinking fund set up for their redemption. Both of these items would have to come out of our profits, in addition to debenture interest and other requirements under the trust deed, before any dividends could be paid to shareholders.

FIXED ASSETS

In our balance sheet at March 31, 1943, the "Winkworth" and "Heaton" land, buildings, etc., are carried at £2,654,955, but if you refer to the auditors' report on the balance sheet at March 31, 1943, you will see that no provision has been made for depreciation since March 31, 1930, or for the loss on fixed assets realised during the year ended March 31, 1937. It is obvious, therefore, that these assets are being carried at a figure which considerably overstates their present value. We have accordingly had an independent valuation made which brings out a figure of £1,562,214, or £1,092,741 less than our balance sheet value. To provide for this deficiency, we propose to utilise the depreciation reserve of £100,000, and the balance at credit of profit and loss account,

£581,295—together £681,295—leaving an amount of £411,446 still to be found, which the scheme contemplates should be written off the share capital of the company.

SCHEME

As a detailed copy of the scheme accompanies this statement, I do not propose here to do more than give you an outline of its main proposals, which are as follows:

(a) The existing issued preference shares to be converted into ordinary shares of 1s. each.

(b) The company's share capital to be reduced by £411,446 16s. 6d. by writing off 4d. per share on the ordinary capital, including that converted from preference shares.

(c) The ordinary capital so written down is then to be converted into stock transferable only in sums of £1 and multiples of £1.

(d) The company's authorised share capital is to be increased back to a round figure of £4,000,000, of which £1,396,215 will consist of 6 per cent redeemable cumulative preference stock. This redeemable preference stock will rank in priority to all other classes of share capital for a 6 per cent cumulative preferential dividend and in a winding-up for repayment of capital and any arrears of dividend.

(e) The holders of the "Heaton" 6 per cent first mortgage debenture stock to change their debenture stock for, redeemable preference stock at par, such debenture stock and the securities therefor to be cancelled.

(f) The holders of the said debenture stock to agree to all arrears of interest thereon, totalling £928,617 down to 31st last, being cancelled and extinguished, and in return for this the existing shareholders to provide out of their half for the debenture stockholders £464,308, the new ordinary stock as follows, £276,902 of such stock will be provided, the existing preference shareholders, £187,406 will be provided, the existing ordinary shareholders, etc.

If the scheme is approved and carried by the court, the whole of the debenture stock and arrears of interest will have been extinguished without in any way doing our cash resources, and the consolidated share capital will then consist of £1,396,215 6 per cent redeemable cumulative preference stock and £822,892 new stock. The resulting position of different classes of security holders will be as follows:

"HEATON" 6 PER CENT. FIRST MORTGAGE DEBENTURE STOCK

The stockholders will receive the same nominal amount of new 6 per cent redeemable cumulative preference stock as they now hold in the debenture stock. They will also receive from the shareholders ordinary stock to a nominal value of £464,308 in compensation for the cancellation of arrears of interest.

SHAREHOLDERS

The preference shareholders will be left with new ordinary stock to a nominal value of £246,141, equivalent to 31.37 per cent of the nominal value of their existing holdings. The ordinary shareholders will be left with stock to a nominal value of £112,443, equivalent to 25 per cent of the nominal value of their existing holdings. In proposing more favourable terms for the preference shareholders the directors have taken into account their priority over the ordinary shareholders for return of capital in liquidation, but against this they are only entitled to receive a non-cumulative dividend of 6 per cent without any further right to participate in profits. By converting into ordinary capital they will, moreover, fully participate in any future prosperity as the company may enjoy. The conversion of the debenture stock into preference stock is an important part of the scheme, as it will considerably strengthen our financial position and allow the company to pay dividends when profits are available.

As in the aggregate its constituents are substantial holders of the "Heaton" debenture stock, your directors deemed it proper and advisable to submit the scheme to the Association of Investment Trusts, and I am pleased to inform you that the Association, as representing its members holding debenture stock, is recommending them to accept the scheme.

Finally, our standard for excess profits tax has been agreed at what your directors consider a satisfactory figure, and provided our earnings are substantially maintained and the scheme accepted, the board see their way to recommend payment of a dividend on both the proposed new redeemable preference stock and new ordinary stock for the current year. If, on the other hand, the scheme is rejected, then there is no likelihood, so far as your directors can see, of either the present preference or ordinary shareholders seeing any return on their capital. The scheme has been carefully weighed so as to give fair treatment to all classes, and I trust you will show your confidence in the board and pass the scheme by a large majority.

THE CONSOLIDATED GOLD
FIELDS OF SOUTH AFRICA,
LIMITED

LIQUID POSITION IMPROVED

The ordinary general meeting of the Consolidated Gold Fields of South Africa, Limited, was held in London, on the 2nd instant, Mr Robert Annan (deputy chairman) presiding.

The following is extracted from the address of the chairman, Mr H. C. Porter, issued with the report and accounts.

The accounts of New Consolidated Goldfields show a profit of £908,399 which, after allowing for tax deducted from dividends, etc., is £15,950 greater than last year's figure. Conditions in the market have afforded opportunities for profitable transactions and our revenue from dividends, interest and other sources has been well maintained though on a slightly lower level than last year.

Taxation in South Africa is £27,800 higher and the provision for U.K. taxation £76,000 lower. The usual reserve for depreciation of £100,000 has been made, and following modern practice provision has been made for a dividend of 12½ per cent, less tax. This enables the Consolidated Gold Fields of South Africa, Limited, to pay a similar dividend. In the balance-sheet the gilt edged investments are £406,000 more, while shares in companies are lower by £210,000, accounted for by the £100,000 transferred to reserve for depreciation and to the excess of sales over purchases. The liquid position, including gilt edged, has been strengthened and now amounts to nearly £2,500,000.

MINING INDUSTRY'S DIFFICULTIES

While the price of gold remained unchanged, there was a further increase in direct taxation, the special contribution being raised from 20 per cent. to 22½ per cent., and the State now takes nearly 71 per cent. of the taxable profits of the industry as a whole. There has been a considerable falling off in the supply of labour during the year.

The result of these factors has been to reduce output and to increase operating costs. Curtailment of development, which will have to be made good later, and the rise in costs both tend to a reduction in

ore reserves available for treatment, but, in spite of these adverse conditions, the effect has been limited and the general position is as satisfactory as could be expected in the circumstances.

Operations on the Gold Coast continued under increasing difficulty owing to shortage of supplies, and a scheme for the concentration of the gold mining industry was imposed by the Colonial Government in February last after consultation with the interests involved.

The burden of taxation on mining companies incorporated in the United Kingdom is a matter of serious concern. Strong representations are being made to the Chancellor of the Exchequer.

The report and accounts were adopted.

AERONAUTICAL AND
GENERAL INSTRUMENTS,
LIMITED

DIVIDEND AT 12½ PER CENT

The seventh annual general meeting of Aeronautical and General Instruments, Limited, was held, on the 8th instant, in London, Mr W. McClelland, C.B., O.B.E., M.Inst.E.E. (the chairman) presiding.

The following is an extract from the chairman's statement: I have the pleasure to inform you that your company has had a busy and successful year, during which it has created another production record and succeeded in meeting the ever-increasing demands made upon it.

We can be justly proud of our year-by-year production records and are convinced that your company's great contribution to the war effort, which has been much appreciated by Government Departments, will be recognised in the post-war period.

After deducting all expenses, including insurances arising out of war risks, etc., and after making adequate provision for depreciation, the profits amount to £61,930, from which have to be deducted, first, an amount of £33,000 in respect of E.P.T., and, secondly, an amount of £13,375, being provision for income tax for the year 1943-44. Shareholders will be interested to know that the amount paid or payable by the company on account of E.P.T. to March 31st last amounts in total to £145,500.

Each of our trading subsidiary companies has had a successful and profitable year; but owing to the absorption by taxation of a large part of the profits, it has been thought prudent to carry forward the balance in the accounts of the respective subsidiaries. During the year the policy of maintaining the plant and machinery at the highest efficiency possible under the present strenuous conditions has been continued.

Arduous and difficult demands are often made upon our employees, and I am sure that the shareholders will join the directors in congratulating and thanking our staffs and workpeople for their loyal and enthusiastic support.

Your company's reputation in radio communication, including domestic radio, always stood high, and during this war considerable technical success has been achieved in connection with Government requirements. It is believed that this development work and technical progress, together with new processes and equipment, will be of considerable advantage to the company in the post-war period.

Earlier in the year, certain unavoidable delays appeared in the final completion of

the year's accounts, and in consequence an interim dividend of 6 per cent. was paid in August last, which payment you will be asked to confirm, together with a final dividend of 6½ per cent., making a total of 12½ per cent. for the year.

The report and accounts were adopted.

MALAYALAM PLANTATIONS,
LIMITED

The twenty-second ordinary general meeting of Malayalam Plantations, Limited, was held, on the 9th instant, in London, Mr H. J. Welch (the chairman) presiding.

The following is an extract from the chairman's address circulated with the accounts: In spite of the manifold difficulties arising from the war, the year has been a successful one for the company and many high records have again been established. Much of the fruits of the year's work, however, has been absorbed by taxation. The profit and loss account shows a profit of £249,086. The directors propose a final dividend of 6 per cent., making 10 per cent. for the year.

With regard to the current year, it is estimated that the tea crop will be reduced to about 13,500,000 lbs., but we hope to increase our rubber crop to over 6,000,000 lbs. More distant prospects for tea appear to be good for many years ahead. The report was adopted.

DICTOGRAPH TELEPHONES,
LIMITEDEFFECT OF GOVERNMENT
CONTROL

At the seventh ordinary general meeting of Dictograph Telephones, Limited, held on December 9th at Croydon, Mr John H. Whitfield, managing director, presided, and the following is an extract from the statement he made on behalf of Mr Philip V. Summer, the chairman of the company, who was unable to be present:—

I consider the results for the 12 months ended August 31, 1943, can be regarded as satisfactory and reveal once again the resilient nature of our business and its ability to withstand hard knocks.

The Machinery, Plant and Appliances (Control) (No. 3) Order, 1942, imposed an obligation upon intending users of private telephone equipment to secure a Board of Trade Licence or other Government authorisation. I am of the opinion that in the early months of control due discrimination was not used by the Board of Trade in the interpretation of the Order. I hope that the Board of Trade will review its attitude in this matter in the interests of the war effort and general efficiency.

The stability of the Rental Installation Asset has been maintained in spite of restricted trading. The nature of the rental investment is such that the present net rental income is not likely to be affected to any extent during the period of Government control and restricted trading conditions. The rental income will greatly assist in stabilising the company's affairs during the post-war years.

Another year of satisfactory trading can be reported on behalf of our subsidiary company, Gramophone Reproducers, Limited. Its output is fully absorbed.

The board again feel justified in recommending a final dividend of 6 per cent., less income tax, making 10 per cent. for the year.

The report was unanimously adopted.

RECORDS and STATISTICS

INDUSTRY AND TRADE

Pharmacy J.I.C.—Trade unions and organisations of employers concerned in retail pharmacy have established a National Joint Industrial Council. The organisations included in the membership of the Council are the National Pharmaceutical Union, the Company Chemists' Association, the Co-operative Union, Ltd., the London Employers' Association, the Retail

Distributors' Association, the Multiple Shops Federation, the National Amalgamated Union of Shop Assistants, Warehousemen and Clerks, the National Union of Distributive and Allied Workers, the National Union of Co-operative Officials, the Association of Scientific Workers and the Chemical Workers' Union. The scope of the Council will cover not only the regulation of wages and conditions, but also a wide range of

(Continued on page 796.)

Trade stated in the House of Commons on December 7th that the allocation of leather to civilian footwear repairs has been increased by 20 per cent in the quarter to December 31st. Extra supplies of composition rubber material have also been made available.

"The Economist" Sensitive Price Index.—The index (1935=100) remained unchanged during the week to December 7th, and was as follows:—Crops, 122.9; raw materials, 182.3; complete index, 149.7.

Retail Trade.—The index number of the average value of daily retail sales (1937=100), published in the *Board of Trade Journal* for December 4th, was the same in October, at 109, as in September, and three less than in October, 1942. The average for the year to September was 106. The index for non-food merchandise dropped from 115 in September to 100 in October, and was four points above the average for the twelve months to September. Food rose by 10 points to 117 and apparel dropped from 132 to 104. Household goods rose by six points to 76.

Pies and Sausages Zoning.—At the request of the Ministry of Food, the manufacturers of open-pack meat products (sausages, pies, etc.) have recently been considering, through the Food Manufacturers' Federation, economies in the transport of their products. The methods adopted have been the exchange of the more distant customers, and similar arrangements for the supply of goods by a manufacturer nearer to the customer, on behalf of a more distant original supplier, to eliminate long hauls and cross hauls. The interests of the customers have been safeguarded by providing that they shall continue to receive, as nearly as possible, goods of a similar type and equivalent weight to their original supplies. The result has been to achieve an annual saving of transport on over 5,000 tons of goods, equivalent to nearly 1,000,000 ton miles.

FINANCE AND BANKING

THE MONEY MARKET.—The position in the money market has been rather difficult. The banks were called upon to pay £90,000,000 against Treasury Deposit Receipts during the week of which some £55,000,000 was new money. Partly for this reason they have been very diffident buyers of bills from the market. The application for Treasury bills at last week's tenders increased to £201,035,000, the total being swollen by substantial tenders of an official character. The market thus saw its allotment cut from 30 to 23 per cent. Even so, it found it difficult to match its take up of new bills by sales to the clearing banks. The scarcity of credit is seen in a reduction of £13,430,000 in bankers' deposits at the Bank of England. This movement balances an increase of £14,471,000 in the note circulation and it is evident that the authorities have not gone out of their way to neutralise the effect of the withdrawal of notes on the volume of bank cash. Government securities show a reduction of £53,675,000 of which £50,000,000 represents the transfer of securities to the Issue department following the increase in the fiduciary issue.

GOVERNMENT RETURNS

For the week ended Dec. 4, 1943, total ordinary revenue was £41,609,000, against ordinary expenditure of £145,746,000. There were no issues to sinking funds. Thus, including sinking fund allocations of £9,045,735, the deficit accrued since April 1st is £2,203,591,000 against £2,060,540,000 for the corresponding period a year ago.

Shall We Be Poorer?

"FOR some years to come we shall be a nation poor in wealth, though we shall be rich beyond any dreams of the past in reputation." The quotation is from Lord Woolton's speech in the House of Lords on Wednesday of last week. It was given prominence by the BBC and has been much discussed in the press. Taken together with a remark in very similar vein in General Smuts's speech to the Empire Parliamentary Association, it has left on the public mind the impression of a settled official view that post-war Britain will be a poorer country, in material terms, than pre-war Britain. That is not what Lord Woolton said—he used the word "poor" without comparison of time or space, and his phrase "for some years to come" might mean two or twenty years—but it is what he has been taken as meaning.

It is a natural enough conclusion for the man in the street to come to. The economic waste of war is all too clearly visible, and at first sight nothing is more obvious than that this vast outpouring of wealth will leave the community poorer. Poorer than it might have been by this time if there had been no war—so much is true as well as obvious. But that the community will, after the war, be both absolutely and permanently poorer than it was is by no means either obvious or true. It is very essential that the simple-minded assumptions of the man in the street (and, apparently, of Ministers) should be put right.

There will, of course, be a period of transition during which the standard of living of the people will be below

pre-war level. The country cannot bound back to peacetime conditions in the twinkling of an eye. There will be a period during which a very large part of the nation's manpower, its materials and its mechanical equipment will be still absorbed by their wartime uses or in process of transfer and sorting out. During this period the resources available for purposes other than war—whether they are the consumption of the people, the raising of housing standards, capital development or anything else—will be less than normal. In a word, we shall be poorer. But this is so obvious that it hardly needs stating and certainly lends itself to no dispute. The transition period may very well be shorter than is now generally believed—the three years that has been widely mentioned may prove to be a very generous allowance.

The real interest, and the real argument, attach to what happens thereafter. What will the British national income, in real terms, be in, say, 1948 and in subsequent years? If Lord Woolton's remark was intended to have anything more than platitudinous content it must be taken as applying to this post-transition period. The sentences immediately preceding it in his speech were as follows:

May I remind your Lordships that we have vastly increased our internal debt, on which interest must be paid? In carrying out this war we have sold or pledged much of our investment overseas, on the interest of which we depended so much for our imports. Our wealth has been destroyed, our ships have been sunk, our towns have been burnt and broken.

Lord Woolton was again careful not to say that these were the reasons for his conclusion, but no other construction can well be put upon them. One of his reasons—the higher total of the internal debt—is, of course, almost entirely fallacious. A large internal debt creates difficult technical problems for the Chancellor of the Exchequer. He has to devise means whereby larger sums of money can be abstracted from one of the community's pockets—its taxpaying pocket. But the whole of the sums thus raised goes back into another of the community's pockets—its debt-holding pocket. The annual service of the national debt consumes no real resources of labour or materials, except for the few score additional clerks required in the Bank of England. It can be a real impoverishment of the community only if it leads the Chancellor of the Exchequer to impose taxation in a form that is crippling to industry or enterprise.

The rest of Lord Woolton's reasons—the lost investments, the destroyed wealth, the sunk ships, the blitzed towns—are real enough. The problem is to know what effect they will have. Some guidance may be drawn from the experience of the last war. The destruction of wealth was of roughly the same order of magnitude; if there was less material damage, there was a far greater loss of skilled manpower. Two estimates are available of the comparison between the pre-war national income of the British community and the level to which it was restored after the transition period had elapsed. Professor Bowley and Lord Stamp estimated in 1927 that "the total social real income of Great Britain and Ireland increased 1 or 2 per cent in the thirteen years 1911 to 1924, while the income per head diminished 5 per cent." They point out that these results were achieved in spite of the fact that "in 1924 unemployment resulted in a loss of about one-twentieth of the possible output in addition to the loss in 1911, and the working-week was about one-tenth shorter." According to Mr. Colin Clark's estimates, the output per person actually in work in 1924-27 was about 7 per cent higher than in 1911-13, and the output per head of the population of working age (including the unemployed) was almost identical. These two estimates are in rough agreement. They can be broadly summarised by saying that the post-war British community produced about as much material wealth as it did before the war, in spite of reduced hours of labour and increased unemployment. Without these two factors, the material income might have been 10 to 15 per cent higher.

There is no reason to suppose that the circumstances of last time will exactly reproduce themselves. But the guiding principles of the matter are still the same. A nation emerging from a war can produce as much as it did before unless there has been a substantial reduction in the quality or quantity of its manpower; or there has been a substantial reduction in its capital and industrial equipment; or the war has brought about such large dislocations that part of the labour force is compelled to stand idle. The wealth shot out of guns or blown up from the air is relevant to the problem only in so far as it affects these three factors. There have been losses under each of the three headings. But they were not enough after 1918 to prevent the resumption of the pre-war standard and there is no very apparent reason why the result should be very different this time.

The manpower position looks as if it will be more favourable this time than last—unless there are very heavy and long-continued casualties still to come. Under the heading of capital equipment, there have been large drafts on the privately-owned domestic capital of the country—£395 millions' worth in three years—but the Government has certainly spent more than this on new capital facilities, and though these are primarily designed to serve the purposes of war, it may well turn out that the country is, on balance, better equipped, not worse, even for the different purposes of peacetime production.

The two great question marks are those that must be set against employment and foreign trade. Before unemployment can make the nation poorer than it was in 1938, it will have to be larger than the 1,800,000

of that year, and it is not perhaps expecting too much from the prospective Full Employment policy to hope that it will do considerably better than that. Unemployment was one of the factors which tended to make the national income of 1924 less than that of 1914; it is reasonable to hope that this time it will be one of the factors making post-war income greater than pre-war.

There is an admitted—indeed, an all too obvious—risk of difficulty in procuring after the war the full volume of imports that the British community requires. The simple result of any such difficulty would be unemployment in the export industries. But there might be compound dislocation if failure to secure adequate supplies of those foods and raw materials, which are only obtainable from overseas, were to interfere with the activity of industries depending on these imports. The question is whether these calamities are likely to happen. Before the war, British imports amounted to rather less than £1,000 millions a year and were paid for, in rough terms, as to three-fifths by exports of goods and as to two-fifths by investment income and the sale of shipping, insurance, banking and other services. It is surely not too optimistic to believe that it will still be possible after the transition period, to pay for 60 to 70 per cent of the pre-war volume of imports. (This does not mean that the pre-war markets for export goods will automatically return; but neither will the invisible income have entirely disappeared.) To expect anything worse than this is to assume that experience after this war will be even worse than it was after the last war, in spite of the long string of cardinal errors (such as internal deflation, external over-valuation and technical apathy) then committed. The risk of difficulty, rationally regarded, thus relates to the remaining two-fifths or one-third of British imports—that is, to a volume of trade which amounted before the war to some £350 to £400 millions, or round about 7 per cent of the gross national product. This simple proportion does not, of course, tell the whole story. But, even if it comes to the worst, it should be possible to secure that all imports which either cannot be replaced at all from domestic production or which can be so replaced only at very heavy cost, are given a prior claim on the foreign exchange available. Success or failure in reorganising Britain's economic relationships with the outside world may very well determine whether the national income of 1948 is slightly greater or slightly less than that of 1938. It is most unlikely that, on this account, we shall be substantially poorer.

If the same quality of management can be applied to these two great problems of full employment and expanding overseas trade as has been applied to the problems of war economics in the past four years, there is no reason why the national income of 1948 should not be larger than that of 1938, possibly by as much as 10 per cent. This is a more conservative figure than that reached by Mr. Kaldor in an article in the April issue of the *Economic Journal*. Even so, it will doubtless strike many people as a very optimistic conclusion. Three qualifying remarks may therefore be appropriate. The first is that this suggested increase of 10 per cent is no better than the increase between 1914 and 1924 would demonstrably have been if there had been no reduction in working hours and no increase in unemployment. The second is that not all of the 10 per cent will accrue to the standard of living of the people; Government activity and capital formation can both be expected to require more of the community's resources than they did in 1938.

Thirdly, an increase of these dimensions will not mean that the war has left no permanent cost to be borne by the British people. Without a war, but with a successful employment policy, the British national income in the 1938-48 decade might have increased, not by 10 per cent, but by 20 or 25 per cent, almost all of which could have accrued to the standard of living of the people. The economic cost of the war will not be that we shall be poorer than we were. It will lie in the fact that we shall be poorer than we might have been.

Power and Fear

THE penalty of power is to be distrusted. Any very great nation has to reckon in its policies on the fears and suspicions of its smaller neighbours. It can, by adopting a really generous and constructive attitude, allay the fear to a very large extent. But the undercurrent remains. The example of the United States is obvious. Fear of "Yankee imperialism" is a perpetual strain in Latin American politics. Similarly, in Europe, after the war, Russia will have to deal with the problems created by its own massive power. Nations and groups do, in fact, fear Russia. It is the stock in trade of German propaganda. It is an unexpressed undercurrent in many peoples' thinking. When a statesman of the rank of General Smuts refers to Russia as a "colossus bestriding the continent" or "mistress of the Continent, the others down and out," he sets chords of fear vibrating everywhere. This war has shown, or rather, all the wars in Europe have shown, that if there is one thing the European peoples will not tolerate, it is to have any nation as their "mistress" or to be bestridden by anyone. If their inherent fear of domination is increased by the statements of responsible Allied leaders, their fears may lead them at the worst into irresponsible action. At best, it will destroy the atmosphere of calm and confidence needed to reach even a minimum settlement in Europe.

General Smuts's statements raise two questions. Is his picture true? And, whether it is true or not, do the Russians behave as though it were true? There can be little doubt that the picture is exaggerated. In 1941, the English-speaking world had on the whole a very poor opinion of Russia's military and industrial efficiency and a fantastic belief in German invincibility. The great Russian victories this year have led to a violent reaction. It is now Russian power that seems invincible. This is a natural psychological reaction, but it needs to be checked against the facts of Russia's economic position. In the past, the recurrent fears of the Russian "steam-roller" have been based on Russia's manpower. Manpower does not win wars, as China, with its even more abundant manpower, has shown. Machine-power is decisive. The strength of the Russian "colossus" is a function of its industrial power. That power has increased enormously in the last twenty years and will almost certainly increase enormously in the years to come, but for the next decade there are very solid reasons for supposing that it will not be on the gigantic scale envisaged by General Smuts.

The Russian economy before the war stood in industrial wealth and strength between China and the Western Democracies. Before the war, according to official Russian statistics, Russia was well behind the West in output per head of the population. For example, in 1937 the figures

for electricity were (in kilowatt hours per head of population) 215 for Russia, 608 for Britain, 735 for Germany and 1,160 for the United States; for steel, 105 kilograms for Russia, 279 for Britain, 291 for Germany and 397 for the United States.

During the war, Russia's industrial capacity has been directed almost solely to the war. Coming on top of nearly ten years' preparation for war, this has meant a lopsided development of the Russian economy. The Guns or Butter dilemma has been resolved almost entirely in terms of Guns. The result of this is obvious. Russia's capacity for fighting does not reflect its comparative productive and industrial position. It represents a unique and supreme exertion which almost certainly cannot be sustained in the immediate post-war years. The Russian people cannot stand it. There will have to be a more balanced development, more Butter even at the cost of fewer Guns.

Two wartime factors have further complicated Russia's immediate postwar problem. One is the mass evacuation of industry to the east. It is in this way that most of the additional capacity was secured. But under the conditions of exodus and haste, the plant and the machines and the workers themselves are operating with a high degree of wastage. Much of the construction was necessarily provisional. Many of the installations are wearing out. An enormous work of consolidation and replacement lies ahead before the new industrial areas can be brought to full standards of peacetime efficiency. The other factor is the devastated areas. So far only the most essential services and some coal mining have been restored. Even so, these limited demands have already clashed with the needs of the armaments industries, so narrow is the margin. Machine tools, in particular, are a serious bottleneck.

The position in agriculture shows the same strain. Tractor stations are without machines. Only last week the underlying crisis came momentarily to the surface with the dismissal of the Soviet Commissar for Agriculture, M. Benediktov.

Russia's power is growing and will be very great, but to speak of a colossus bestriding Europe is the language of fantasy. The evidence suggests that the Russians themselves take a far more sober view of their own position. They have in a variety of ways shown their anxiety to maintain close relations with Britain and the United States—by the abolition of the Comintern, for example, and their readiness to delay the signing of the Russo-Czech Pact until the wider settlement at Teheran had been reached. In their relations with some of their smaller neighbours, they have shown moderation. The Declaration on Iran, guaranteeing full political and economic sovereignty is their answer to Germany's

whispering campaign about Russia's "advance to the Persian Gulf." In recent months, relations between Russia and Turkey have become far more frank and cordial, and the willingness of President İnönü to associate himself not simply with Britain but with all the United Nations at Cairo, and to discuss political as well as military problems, is almost certain proof that Turkish fears—partly traditional, partly stimulated by the 1939-41 interregnum—have been stilled. Mr Eden told the Commons that he had good reason to hope that the Cairo talks "established a sound basis for future co-operation between" Britain, Russia, Turkey and the United States. Now the signing of the Russo-Czech Pact with its guarantees of friendly collaboration and non-interference in the internal policies of the two nations can be another stabilising factor. In particular, the protocol which invites Poland to join the partnership, gives it a regional character which, if it is followed up, would widen the Pact into a general instrument of security.

All this points in a constructive direction towards the only policy in which power can be applied without bringing fear—a good neighbour policy between the Great Powers and a good neighbour policy with the smaller nations. However, until the findings of Teheran are made public, it is difficult to say whether Russia's various initiatives and reactions add up to a comprehensive policy in European politics. The first and obvious obstacle is the Polish problem. There is no need here to underline the dangers. They have been analysed often enough. Diplomatic relations have not been renewed and intransigence is apparently growing on both sides. Yet the interests of the two nations are in many ways identical. The Russo-Czech Treaty stresses the need to counter any future *Drang nach Osten* and underlines this as a common Slav responsibility. The Poles must know that their security cannot be achieved in hostility to both Germany and Russia. They have to choose, and Hitler has largely determined their choice. The Russians, to be secure on their western frontiers, equally need a friendly Poland if their *cordon sanitaire* against a possibly resurgent Germany is to hold. The Russo-Czech Pact itself, to be militarily effective, demands Polish collaboration. Yet one thing is certain; if both sides abide with obstinacy by their maximum demands, the breach will not be mended. Concessions there must be, and Russia, as infinitely the more powerful partner, should make the preliminary gesture as generously as possible—and as soon.

To achieve a Polish settlement would go far towards

The Indian Prospect—I

India's Economic Needs

DEFENCE, famine and its aftermath of disease are the chief preoccupations in India at the present moment. No new political negotiations for a settlement of the constitutional problem have been started. This does not necessarily mean, however, that no political progress whatever is being made. In India, some observers believe that the parties are more ready to seek an agreement among themselves than they were when Sir Stafford Cripps made his fruitless journey. In Britain there is renewed discussion of the possibilities of such an agreement, and of the problems, economic as well as governmental, which it must solve.

It is not possible for an observer in this country, however well informed, to assess the likelihood of Indian agreement if brought suddenly to the point—by, say, the trial or release of the Congress leaders and some new constructive initiative on the part of the British Government. It is possible, however, to stare in outline the tasks, material and political, which confront all concerned in India's future. The fact of famine, and the important economic consequences of the war upon Indian life, have caused recent discussions to start with India's economic needs. Broadly, three questions are being asked. What kind of reconstruction programme is required to mitigate and remove Indian poverty? What kind of Indian

guaranteeing postwar peace. It would not go all the way. At the heart of the European problem is the question of Germany, and here, too, in the long run, power in isolation from more politic methods is no solution. A settlement which attempts merely to hold Germany down for all time and makes no provision for the eventual re-integration of Germany into the European political system, will not work. An Anglo-Saxon power bloc on the West and a Russian power bloc on the East might have come into existence with the same purpose, the policing of Germany. But so long as they were separate power blocs, events would drive them apart. Even a difference as innocent as a divergence of opinion on the degree of severity to be shown to the defeated enemy would be enough to arouse suspicions. Where there is gigantic power at stake, no country can take any risks; it is compelled to take its most absurd suspicions seriously. The danger inherent in bloc building is not necessarily the aggressive intentions of either bloc. It is the mutual fear generated by the mere fact of their massed power. The only solution which avoids this danger is that the policy to be pursued towards Germany—and that means towards Europe as a whole—shall, in the short and in the long run, be not merely vaguely "agreed" and applied individually in separate "zones," but a single policy, jointly arrived at and jointly applied. Europe can be led by Britain and Russia but not divided between them or bestridden by them. On their policy towards Germany, all the Powers have been remarkably silent. The hints that have come out are not reassuring. Mr Eden in the Commons added nothing to public enlightenment on this or any other point.

The solution of the problem inherent in power, whether in Russia's single power or the overwhelming power of what General Smuts called the "Trinity," lies only in clear and unequivocal guarantees of how that power will be used. Insofar as the policies of Russia, Britain and the United States remain ambiguous, fear will remain to create the tensions and manoeuvrings and unilateral actions which can at any point in a peace settlement undo all the patient work that has been accomplished so far. If the Teheran Conference has increased the fear and foreboding in Germany it has done half its task. Only when its results have banished fear among the smaller Allies in Europe can its work be really complete. This is a Russian responsibility. It is as much a British and American responsibility. Only the powerful can banish fear and it is their only hope of lasting peace.

Government is needed to carry out such a programme? Will the kind of Indian Government that seems politically likely be capable of doing the job?

It is the purpose of this and a subsequent article to indicate some of the answers that have recently been given to these questions. So far as it has gone, the discussion seems to have reduced itself to a dilemma. On the one hand, it is argued that, economically, India requires a strong central Government, based upon recognition by the provinces and states of the country's fundamental economic unity. On the other hand, it is argued that, politically, a weak central Government, recognising the separate claims of provinces, states and communities, is more likely. Dilemmas are not new in the latest Indian chapter. Before the famine jerked the discussion back to Indian poverty, the most conspicuous feature in the Indian scene appeared to be the paradox between the unanimous wish of Indians to see India independent and their almost equally unanimous disinclination to agree upon the form of freedom.

The annual income of India has been estimated at Rs. 2,500 crores (£1,875 million), of which a fifth is derived from industry and four-fifths from agriculture. This amounts to just over £4 per head of India's vast population. In India are found the richest and the poorest persons

in the world, all Indians. The Indian worker lives for a year on what the British worker spends on cigarettes. As the famine shows, the first need is to make more of India's soil, to produce more food and to enable the many impoverished millions either to grow or buy it. The development of Indian agriculture depends upon large improvements in its capital equipment and in the organisation of production, marketing and distribution. It depends, too, upon the removal of the great weight of debt incurred by peasants and labourers in their unending effort to keep alive in bad and good seasons; and thus upon the provision of credit assistance.

The war, which has seen privation turn to famine, has not helped Indian agriculture. Indian industry, in many branches, has been much assisted. An industrial expansion has taken place under the stimulus of war requirements. But the need for increasing agricultural production side by side with industrial output has been neglected. Expenditure by the Government on "Grow more food" campaigns during the war has been less than Rs. 2 crores (£1,500,000). Owing in part to shortage, and in part to inflation, farm prices have risen high above what the overwhelming majority of Indians, without food of their own, can pay; in some provinces, cattle prices, for instance, are five times what they were before the war. The wretched state of Indian agriculture is illustrated by the minute quantities of fertilisers used. At the beginning of the war, while Denmark consumed 226 lb. of artificial fertiliser per square mile, and Britain 178 lb., Indian consumption was 0.06 lb. per square mile. Even so, Indian production of fertiliser was less than a tenth of annual consumption. Soil erosion has become a real danger in some areas; and similarly, war demands, made on inadequate pre-war resources, have seriously endangered Indian supplies of cattle and even timber. It is not hard to see the underlying causes of the famine.

The war cannot, however, be dismissed as wholly disadvantageous, economically, to India. The gain in industrial production is real. Employment and wages have been high. Moreover, India has been enabled by the way in which the Indian war effort has been financed, mainly from British resources, to discharge its large public debt, and to accumulate sterling assets, which represent Britain's biggest war debt. This method of financing has, of course, caused considerable current damage to India. Purchasing power has been multiplied, while stocks of goods for civilian purchase have been exhausted or sharply reduced; the currency in circulation has risen from Rs. 60 crores in August, 1939, to Rs. 800 crores last month—in part an indication of much greater economic activity, but in part simply a reflection of harmful inflation. Nevertheless, India's new sterling assets, solely the consequence of the war, the proceeds of the sale of Indian materials for war purposes and of British war financing, provide a peace chest for Indian reconstruction.

There is much talk among Indians about reconstruction. In sum, the argument is as follows: more output must be obtained from Indian agriculture with the use of less labour. At present three-fifths of India's employed population, and a very much larger proportion of the occupied population, are entirely dependent, at subsistence level at best, on agriculture. The proposal is that, in the first decade of reconstruction, acreage should be increased by a quarter, output by the same or more, while farm manpower is reduced by the same proportion. Work must, therefore, be found in manufacture for the peasants and labourers released. It is by the simultaneous increase of productivity in both agriculture and industry that the first steps in the solution of Indian poverty are, rightly, seen. As part of a ten year plan, the period mostly discussed, the task is very large. Not the least trouble during the past ten years has been that the increase in Indian population has been out of all proportion to the increase in India's annual income. Even a programme that, say, doubled the national income in a decade might be cancelled out by the flood of births; such a rapid rise might bring in new factors to arrest the increase in population, but the planners would do well to recognise that there can be no certainty that the vicious Malthusian circle can

be broken, no guarantee that productivity will outstrip population, even under the boldest reconstruction policy, unless the increase in population can be slowed down.

Thus the goal is the production, *pari passu*, of more food and more goods. Briefly, it means a swift increase in horsepower per head in both branches of Indian economy. In agriculture it requires the provision of new tools and new machinery and instruction in new methods of farming. In industry it requires not only the continued expansion of certain heavy industries, but also the development of chemical, electrical, metal and automobile industries, distributed through the Indian provinces according to transport and markets. One aim set out by Indian economists is to increase industrial output from Rs. 500 crores to Rs. 2,000 crores annually within ten years; and always, when accused of over-ambition, they point to Soviet Russia, which invested the equivalent of Rs. 2,000 crores in co-operative industries alone in 1933.

The Russian precedent is ever present in Indian arguments, and is pertinent. To escape from the morass of poverty, the Indians, like the Russians, require to go through an agricultural and industrial revolution in a fraction of a lifetime. The ten year plan they envisage includes the doubling of Indian roads and the increase by a third of Indian railways; the development of power and hydro-electricity; and the building of docks, harbours, irrigation works and canals. The cost of such a programme has been estimated at Rs. 600 crores (£450 million) for financing industrial projects and agricultural improvements; and it is believed and hoped, by Indians, that a great part of this sum might be secured at home, as in Russia, where saving was forced by Government policy. Indeed, there is a strong protectionist and isolationist tone among Indian planners. They seek to build up their industries behind high tariffs, to strive for a permanent foreign surplus in India's balance of payments.

It is, of course, very doubtful indeed whether this is the right road to success. If India's postwar sterling assets are to be the basis of the reconstruction programme the entry of imports in large quantities is essential. India will be dependent in its rebuilding upon foreign material and foreign machinery, as indeed Russia was. The precedent of America in the nineteenth century is as apt as the precedent of Russia, and it was by the entry of foreign capital that the transformation of the United States into a great industrial power was hastened. Russia was compelled to squeeze its capital out of the standard of living of its own people. India is in the much more favourable position of being able to get it from overseas, much of it without cost. The short commons upon which the Russian people have been compelled to live during the self-dependent remodelling of Russian industry and agriculture offer the prospect of little relief to the poor of India, if the road of self-sufficiency is sought. Even the Indian planners admit that "tariff policies must be so formulated as to encourage and attract investment capital."

It is plainly not possible to carry through such a programme of reconstruction without the establishment of a Government with sufficient powers to plan and act for India. It is at this point that economics and politics touch crucially. The advocates of a ten-year plan for India speak of an all-India Economic Council of experts and business men, working closely with the Development Department supplied with a General Economic Staff; provincial economic councils on the same model; and local councils, fitting into this national framework, in every district and city. Is it really possible for India so to settle its internal political, racial, religious and class divisions as to set up a structure of this sort and, still more important, to endow it with the tremendous powers over all parts of India and all branches of Indian life that it would require? Most Indians accept, in theory, the need for a strong central government; would they do so, equally, in practice? A following article will discuss the relation between the kind of government that India appears to need and the kind of government that appears to be politically practicable.

NOTES OF THE WEEK

France and Britain

The Germans have naturally made great play with General Smuts's crude and discourteous dismissal of France. By an unhappy coincidence, the text of his speech became known after two particularly heavy Allied air raids on the old Vichy zone—Toulon and Modane—where opinion is less formed on the question of raids than in the hardened north. The substance of German propaganda is simple. "See, the Anglo-Saxons bomb you flat while they are still at war. And what do they promise you afterwards? Extinction." Hostile comment is not confined to the French. In Switzerland, the point has been made, justly, that any policy for a strong and unified Europe demands the full collaboration of France and is inconceivable without it. Britain would be the first Power to suffer from the eclipse of France. No official protest has come from Algiers, but General de Gaulle in a very dignified speech, delivered in Constantine, accepted, and countered the implications of General Smuts's attack:

I do not hesitate to say that . . . our country measures completely the distance between the point where it stands today and the point it hopes to reach. France, which for two thousand years has lived a life of risk, used to catastrophe and the abyss and used, too, to glory and grandeur, knows how hardly and protractedly it will be necessary to fight, suffer and work in order to play its part in victory and rebuild its strength.

The more the French are chided and mocked, the more their reconnaissance may take on a violent, explosive and xenophobic stamp. It is Britain's interest in every way to foster a healthy resurrection, by understanding and encouragement, by believing with France's leaders in the possibility of resurrection. General de Gaulle's confidence in the lessons of French history is not misplaced. His words are almost an echo of the testimony given over a hundred years ago by a very great Frenchman, Alexis de Tocqueville:

Was there ever a nation on the face of the earth so full of contrasts and so extreme in all its actions . . . led therefore always to do either worse or better than was expected of it, sometimes below the common level of humanity, sometimes greatly above it . . . guided by a thread when no one resists, ungovernable when the example of resistance has once been given; always deceiving its masters who fear it either too little or too much; never so free that it is hopeless to enslave it or so enslaved that it may not break the yoke again.

Divided Italy

Little news comes from northern Italy. This week, however, riots have been reported from Pavia. The police arrested British prisoners of war who had escaped. The local population reacted violently and the governor was compelled to bring in a curfew. The incident is significant. Under the façade, the north of Italy is more active than the south. And the façade itself is pitiable. All the promised signs of the new Republican Fascist regime have failed to materialise. The regime has not even had the courage to proceed with the trial of its own "traitors." The promised tribunal has not sat. Ciano is still untried and unshot. The evidence—what there is of it—suggests that the disintegration of Fascism is complete. Significantly, the German authorities in Rome have arrested the regional secretary and forty members of the Roman *fascio*. Mussolini is a ghost. Even his name is evoked more and more rarely. In the south, in liberated territory, political divisions are shaping, and at least with some vigour and point. Bari radio, Badoglio's mouthpiece, has made appeals for the King, and it seems that the six parties are split on the question of the monarchy. They are to meet on December 20th, but the Liberals and the Christian Democrats (the *Popolari*) are sharply opposed to the anti-monarchical line of the other groups. They are not for Victor Emmanuel, but claim, with some reason, that this is the last moment to start mass agitation over a profound constitutional change. Nothing will be decided until Rome is reached. Meanwhile, the weather and the Appennines are effectively postponing the day.

Trade Possibilities

The danger of pretending that the impossible will be possible simply because it will be desirable has lately been

emphasised in discussions of Britain's economic policy after the war. Several critics, economists and politicians, have been urging that, in its negotiations with the United States, the British Government should not accept, in the name of international co-operation, the placing of any ban on regional arrangements with, say, the Empire, the sterling bloc, or western Europe. They do this, not because they are narrow internationalists or hard-bitten Imperialists—they include Mr Shinwell—but because the essential feature of any wise international agreement about currency, commerce or the exchanges, however unexceptionable its aims, is that it should be workable. It is desirable and, indeed, necessary in the national interest that we should trade as widely as possible with all countries; very largely the level of our standard of living, though not necessarily the level of employment, will depend in the future as in the past on the extent to which we can benefit from international division of labour. The British, above all, are free traders. But this does not mean that, in fact, a multilateral trading on a worldwide basis without restriction, will be possible; we may not be free to be free. In practice, regional trade or currency agreements and controls on imports and exchange may well be unavoidable, if only because of the very great difficulties that we and other countries are likely to experience in obtaining United States dollars. Encouragingly, this point has been stated afresh on the other side of the Atlantic. Without American understanding and co-operation, declares a recent publication of the Foreign Policy Association, Britain, the world's biggest importer and the United States' best customer, may be "forced to adopt a bilateral trade policy to survive"; and, judged by brief cabled reports, the author apparently means by "understanding and co-operation," a more liberal tariff policy and a programme of domestic full employment, both calculated to raise American demand for foreign goods, and so, the world's supply of dollars.

Sunday Entertainments Again

Questions to Sir James Grigg, Secretary of State for War, on Tuesday have again brought up the ridiculous position in which the country finds itself regarding Sunday entertainments. The Lord's Day Observance Society is now engaged in banning Sunday performances for the troops, by invoking the Sunday Entertainments Act, though, as Sir James Grigg said, no such restriction can be placed on the presentation of plays or entertainments in costume inside military camps. His questioner claimed, and Sir James Grigg agreed with him, that the discrimination between costume shows outside and inside a camp was ridiculous. But the Secretary of State for War was not altogether justified in claiming that the remedy is within the discretion of the House of Commons. It is quite true that the Home Secretary gave a lead on the matter: nearly three years ago and that the House rejected his proposal to allow Sunday theatres. But the decision was then reached by a free vote of the House, with the result that a vocal minority was able to obtain a majority for the occasion because there was no compulsion on members to turn up to vote. Most of those who voted against Sunday opening were too old to fight and were either members of the English squirearchy, who normally read the lessons in church on a Sunday morning and spend the afternoon and evening in their comfortable armchairs, or were representatives of the Scottish, Welsh and Irish Nonconformists. Since then, Mr Morrison has refused to reopen the matter again until he is convinced that a majority in the country and the House want it. This attitude is not up to his usual fighting tactics, and if the welfare of soldiers and civilians, at a time when war weariness is very widespread, is not to be left entirely at the mercy of a minority of cranks and reactionaries, it is his duty to present another permissive regulation—and, if it is opposed, to put the Whips on. The opinion of the country as a whole can be very simply tested. If there is no demand for Sunday theatres, they will quickly close again.

Bulgarian Scare

On the second anniversary of the declaration of war on the United States by Bulgaria, Roumania and Hungary, Mr Cordell Hull issued a solemn warning that unless these

states left the German camp, they would have to share the disastrous consequences of Germany's defeat. The warning, coming on top of the Teheran Conference, has behind it the weight of the three Great Powers; yet it is difficult to see how, until the military situation again develops dynamically, the smaller satellites can do much about it. Italy is still a plain example of what happens to a nation which tries to escape from the Axis while the Germans are still on its soil. The mass of the people cannot do much without a Badoglio; and Badoglios tend to arise only when invasion is imminent. It is significant that the strongest reactions to the Teheran and Cairo talks came from Bulgaria, which, if a joint Black Sea and Balkan operation were to be launched, would immediately come under fire. It was the report that President İnönü had gone to Cairo, taking only his Chief of Staff with him, that started some sort of a panic in Sofia. The Council of Ministers met; then the Sobranje was summoned to a secret session. The Government party held a meeting, followed by another meeting of the Government. Wild rumours circulated about the complete reshuffling of the Ministry, which would, among other things, remove the Foreign Minister, M. Shishmanov, from office. Axis sources reported peace demonstrations in the streets of Sofia. It is even possible that, in this extremity, the Bulgarian Government did attempt to send a peace-feeler to the Allies. However, the crisis came abruptly to an end when President İnönü stepped smiling and calm from his Cairo aeroplane. Immediately the word went out that Turkey was not coming into the war, "for the time being at any rate." The President and M. Menemenjoglu spoke of full understanding and complete accord, but stressed Turkey's non-belligerency. The Bulgarians felt that they still had a respite, even if only "the hundred days" referred to by American journalists returning from Turkey. With the fear of invasion lifted for the time being their political pulse returned to its customary sub-normal.

Missions to Tito

The Yugoslav Government in Cairo still refuses to see anything but treason in the widespread military activities of the Tito groups. If the young King persists in keeping to such poor counsellors, he may lose any hope of identifying himself with his people. His Cabinet has even addressed reproaches to Britain for giving military support to the partisans. The truth is that the Yugoslav Cabinet in Cairo is, apart from the King, rapidly rendering itself completely irrelevant. Meanwhile neither Britain nor Russia has recognised Tito's political claims. They are now confining their support to military matters. Russia is now to send a military mission which will have as its opposite number the British mission which Brigadier Maclean, MP, established last spring. For the future, it is to be hoped that all parties will abide by the three principles laid down by Mr Eden in the Commons—full support for all military activity directed against the Axis, full freedom of the peoples, unweighted by prior commitments, to choose their own form of government when the time comes, and full loyalty to all Allied nations. The difficulty in all this is, of course, the exact location of the *pays réel*. It is a question which cannot of its nature be settled in time of war.

The Influenza Epidemic

Unlike the weather—except in the Straits of Dover—epidemics are not censorable, and the press is allowed to discuss the present outbreak of influenza with impunity. Inevitably, comparisons have been made with 1918. Then, the epidemic began a month or so earlier, but it came at a similar stage, chronologically, in the war. There, however, the comparison ends. In 1918, the epidemic was virtually world-wide, and was devastating in its destruction of life. Ten million deaths is an estimate that has been accepted authoritatively. To-day, it is reported that there is an epidemic in the United States, but no reports yet of one on the continent of Europe—with the exception of reports of "cellar flu" in Berlin—or in Asia or the southern Dominions. The nature of the disease is also incomparably milder. The Registrar-General's return for the 126 great towns of England and Wales shows that influenza deaths in the week ended December 4th totalled 709, compared with 375 in the preceding week and 31 in the first week of November. The returns published this week-end will probably show a total of about 1,000, which compares

with the 1937 epidemic's peak of 1,155. In spite of its mildness, however, influenza sufferers need medical attention and nursing, and for the first time since the war began the reduced medical facilities available for civilians have been severely tested. In general, doctors have been able to cope with the situation, but in parts of the country they badly need help, and the Minister of Health announced last week that Service doctors would be available, so far as their military duties permit, if county medical officers of health get into touch with the ADMS for their area, and with the secretary of the Local Medical War Committee. This scheme has been urged for a long time now. But, unfortunately, it will take time for it to operate, and by the time the applications for help have been made, and the red tape has been cut, the influenza wave in any particular area will have passed on. It would surely have been better for the arrangements to have been made, and the formalities completed, months, or even years, ago rather than to wait until an epidemic is at its height. The same consideration applies to the scheme for home help now being organised by local authorities at the request of the Ministry of Health. The shortage of domestic help has placed some households in very great difficulty when the housewife is ill. Moreover, doctors have frequently been confronted with cases of patients living alone who have no one to fill a hot water bottle for them, much less shop and cook. They have no option but to send these people to hospital—if a hospital can be found to take them—where they can be nursed, which places a further strain on the hospitals' straitened resources, and involves the danger of spreading infection in the hospital itself. The plan for organising first-aid post and rest centre staffs, and members of the voluntary services, into "mutual help" schemes is a good one, but its benefits will not be fully felt until the next epidemic.

Location of Industry

The first sign that the Government has any policy on the location of industry was given by the President of the Board of Trade in the House of Commons last week. Members representing constituencies in the former depressed areas of Scotland, the North-East and South Wales had tabled an amendment to the Address, regretting the absence of any specific reference to the location of industry in areas where unemployment was high before the war. They spoke with considerable feeling, which was clearly shared by Dr. Dalton, who himself represents Bishop Auckland, one of the blackest spots during the depression. The amendment was withdrawn after an assurance that the areas would receive special consideration in the period of change from war to peace within the context of the Government's policy of maintaining full employment. Dr. Dalton agreed that the exclusive dependence of the areas on heavy industry had been unfortunate, and that the aim should be to achieve a more balanced and diversified economy. The Government is proposing that, as far as possible, necessary defence production shall be continued in the areas; and, where suitable, premises no longer required for Government work will be converted into trading estates. A big difficulty in placing new work in the areas may be the shortage of factory space,

and, in the issue of permits for industrial building, the areas will be given high priority, and premises requisitioned for storage purposes will be cleared rapidly. The Board of Trade is making a number of surveys into the possibilities of industrial production in the special areas, and lists of Government factories which could be released for peaceful production are being compiled. Perhaps the biggest change is a psychological one—the areas are henceforward to be known as “development” areas, thus removing the taint of depression or distress. Dr Dalton's statement could very usefully be followed by a speedy declaration of the Government's policy on the Barlow proposals for guidance of the location of industry.

The Restoration of Shops

The President of the Board of Trade told the Commons on Tuesday that the wartime licensing of shops will continue for a time after the war. Some increase in numbers will be allowed, and additional licences will go first, rightly, to ex-shopkeepers on war service, and to disabled persons. It would do no harm if Dr Dalton were also to state now that, when the wartime scarcity of supplies and manpower which made restriction advisable is over, the principle of free entry will be restored, without restraint of retailing by the Government or by trade associations. After shortage, the only reason for restriction would be to further full employment or fair distribution, and so far from limitation of entry to shopkeeping being an aid to this, it would in fact be an obstacle. The curtailment and concentration of retail trade during the war have been allowed to go on largely unhappily with indiscriminate losses to those squeezed out, and it is important that its remobilisation should not be straitjacketed, directly or indirectly, by the quasi-monopolistic bodies which may see in the war their chance to fasten an even stronger hold than before on shops and shoppers.

Wheat Supplies

The agreement for United Nations Relief and Rehabilitation Administration has now been published as a White Paper (Cmd. 6491). Its main provisions, for the administrative working of UNRRA, are now well known and need not be restated. Simultaneously with the publication of the White Paper, the post has brought from Stanford University, California, a copy of *Wheat Studies*, containing the latest of Mr Joseph S. Davis' excellent surveys of world wheat supplies. His carefully documented study shows, at least for the current year, how much will be available of one of the most important of the foodstuffs that will be needed to relieve the undernourished people of the present occupied countries. The facts he gives are encouraging and show, as was pointed out in an article on UNRRA in *The Economist* on November 27th, that in wheat—which is, with wool, a rare exception—there is at present no shortage. At the end of the latest crop year, the combined stocks of the United States, Canada, Australia, and Argentina—the four major exporting countries—amounted to 1,694 million bushels, against 1,421 million in 1942 and 785 million in 1939. The crops of the four countries, on the other hand, have shown a marked fall, from 1,929 million bushels in 1942-43 to 1,440 million in 1943-44; but, owing to the larger carry-over, total supplies available during the current season at 3,134 million bushels, are only 216 million bushels smaller than during the preceding season. They are more than 1,000 million bushels bigger than supplies in 1938-39, which is equivalent to about two-thirds of Continental Europe's average pre-war crop. The situation when the war ends depends upon how long it lasts. The supplies of wheat available for relief would be sufficient if the war ended next year. But production will probably continue to fall; the size of the next harvest is unpredictable; and much will depend on the volume of wheat diverted during the remainder of the war to feed livestock and to industrial users.

Finnish Dilemma

The United States is not at war with Finland. It was not included in Mr Hull's warning to the satellites. Yet for the time being it is more under fire from Russia than any other Axis power. In recent weeks the tone of Russian broadcasts has been very fierce; atrocity stories of the treatment of Soviet prisoners in Finnish camps have

been broadcast widely (especially in English) and *War and the Working Classes* have attacked Finland several times. The Russians also accused the Finns of shelling Leningrad—an accusation which led the Finns to deny solemnly that they had done any such thing. The reason for this campaign may well be the apparent failure of the peace manoeuvres in October and November. It is rumoured that direct contact was established between Finland and Moscow and conditions discussed. It is also rumoured that the Finns turned down a moderate Russian proposal—agreement on the lines of the 1940 settlement. Whether or not these reports are true, the defeat of the more conciliatory elements in Finland is suggested by the resignation of M. Fagerholm, for six years Minister of Social Affairs, who was known to have strong pro-Allied sympathies. The difficulties facing the Finns are tremendous. The Germans are still on their territory. They face a hard winter on meagre food supplies guaranteed only by Germany. Yet intransigence on their part must inevitably decrease the chances of securing a reasonable settlement. Possibly the Russian attacks are a smokescreen to cover continued negotiation. If so, there is still a chance that no final decision has been taken, either on the Russian or the Finnish side to bar the way to an eventual peace.

Reform in Algeria

In his speech at Constantine on December 12th General de Gaulle outlined a new policy for Algerian Moslems. On the morrow of his speech, the French Committee of National Liberation passed a resolution containing the main points of the promised reform. The most important change is the decision to confer French citizenship on Moslem *élites* immediately. Until now, Moslems, who because of their religion would not submit to the Napoleonic code, have been French subjects, but not French citizens. Now the acquisition of citizenship by Moslems will not be made dependent on their abandonment of the Koran. Further, the Moslem representation on the Algerian Administrative Council will be increased, and the suffrage extended to administrative jobs will be opened to more Moslems. The Commissioner for Moslem affairs has been asked to work out a comprehensive scheme of social and economic reform for the native population. So far the reforms apply to Algeria, but not to Tunisia and Morocco. This change in French colonial policy, though still confined to one dependency, is a direct result of the war. Under Vichy the Moslems were drawn into the Legion of Combatant, and into the *Service d'Ordre Légionnaire*. The privileges of citizenship which the Jews enjoyed under the Crémieux law, and which caused a great deal of jealousy among Arabs, were then abolished. Recently the Crémieux law was re-enacted, which must have again given rise to Arab resentment. The present reform puts Arab *élites* on an equal footing with Jews; and it may partly remove a major cause of friction between Arabs and Jews in Algeria. The reform may also have been inspired by General de Gaulle's desire to undo the unfavourable impression made by recent events in Lebanon among the Arab population of North Africa. It is doubtful whether it will be possible to limit the reform to Algeria only and to the *élites*. For seventy years, French administration has refused to grant citizenship to Moslems because of the incompatibility of their religious practices (polygamy) with the Napoleonic code. Now this refusal has been discarded. And this may well stimulate a movement among the Moslems for a wider and more radical reform.

Mounting the Winter Offensive

The German counter-offensive in the Kiev salient goes on after a month of effort. General Manstein's army has advanced more than half way from Zhitomir to Kiev. The pace of the advance has been very slow—about two miles a day in flat country. But the danger to Kiev has considerably increased. Perhaps it is true that the offensive has been mainly due to the desire of the German High Command to prop up the morale of the troops. But it may well be the purpose also to tie down as much of the Russian strength as possible during the winter “lull,” which the Russians wish to use for the preparation of the winter offensive. In spite of the continued fighting, these preparations are in full swing. The Russian press has recently provided some evidence of their nature. The supply system in the immediate rear has been reorganised and simplified. The idea is to make the main fronts self-sufficient; the distribution of supplies within each of the main fronts is to be highly centralised. This aim is to secure increased mobility on

each separate front. At the same time, specialised winter equipment is being carefully distributed among the armies, according to the varying weather conditions on the different fronts. Despite the Kiev counter-drive, so far only poorly rewarded, the Russians are mounting the winter offensive, for the time when blows will be struck from west and south, as well as east. Even so, the prospects of that winter campaign still hang largely on the successful defence of Kiev.

Education for Demobilisation

Army education is divided into three parts. The Army Education Corps is part of the regular military organisation and, while mainly concerned with technical training, was intended at the end of the last war to do something like the job which is expected of the larger and more varied system at the end of this one. The other two parts are the Central Advisory Council for Adult Education in H.M. Forces, a product of this war, intended to make available to troops all the resources of civilian adult education, sadly diluted in wartime by other calls; and the Army Bureau of Current Affairs, an internal organisation designed to provide discussions between officers and their men on matters of public importance, as well as on the broader implications of strategy and tactics. The appointment of Mr P. R. Morris, Director of Education for Kent, to be Director-General of Army Education will bring closer, at the top at any rate, these three strands which at present are only partially interwoven. The temptation to see army education through somewhat romantic glasses is too seldom resisted. The picture of a great civilian army pulsing with interest and information on world affairs and civic problems is almost entirely a well-meaning myth. The mass of soldiers, like the mass of citizens, is mostly unmoved and unaffected by matters outside daily work. Moreover, it appears to be inherent in the character of any army that the educational opportunities provided for it should have a “way and purpose” very strictly related to its peculiar military tasks. ABCA was an excellent idea to arouse the curiosity of civilians and soldiers and encourage free thought on democratic lines; in some units and under some commanders it has had notable effects. But, in the main, army education is necessarily propagandist—though not in the worst sense. The large proportion of it that is technical in character has its direction set by the needs of battle. The penumbra of more detached instruction, which has grown strikingly and significantly during this war, has, in the last resort, equally specific objectives. It is provided for two definite reasons: first, so that the soldier may fight better, with some knowledge of what the war is and being fought for and how it is being conducted; and secondly, so that when the war ends, the soldier may come to the change-over from war to peace in an understanding and orderly mood. This second motive, which largely inspired the development of the AEC after the last war, has now become uppermost in the mind of the authorities, faced with the tremendous task of demobilisation in the not distant future. Mr Morris's appointment, very welcome because it brings in a civilian of known imagination and ability, is part of the preparation for peace. If the new Director-General realises the limitations as well as the possibilities of the work he is now called upon to oversee he can make an important contribution to the shape of things to come in the next few years.

Couponeers

For over four years the word “coupon” has meant, as twenty-five years ago, a title to rations. Now, with victory not too far off, another meaning is creeping in, the meaning acquired at the election of 1918, when the first post-war parliament was elected on the “coupon” of support for the Government which had won the war. There is much discussion about whether the same unsatisfactory practice should decide the next post-war election; and, appropriately while the discussion goes on, the Parliamentary relics of the 1918 couponneers have held a dinner to celebrate twenty-five years of survival—unbroken in only a handful of cases. The 1918 Parliament is remembered as a collection of “hard-faced men who looked as if they had done well out of the war.” The breed has not survived so long; none at the small war dinner held on Thursday, which included the Speaker, deserved this description. Probably, the hard-faced men and profiteers either went on to do well out of the peace, rather than politics, or sank back into well-earned oblivion. But this meeting of the survivors, presumably (because they survived) the fittest, brings an important point very much to

mind. What will the next Peace Parliament be like? There are three schools of thought about the reconstruction period immediately after the war. One, much favoured by Conservative and independent members without party supports, is that everything should be sacrificed to “unity,” that there should be a coupon election, and that the return to party politics, if any, should be delayed as long as possible. Another is that while a return to genuine party politics is desirable, a party election immediately after the war, even if it were possible, would be disastrous. The third, not much advocated by Members of Parliament, for obvious reasons, is that the future of British politics and the character of the peace depend upon finding true popular answers to questions fully and frankly stated, which can only be done by the method of statement and counter-statement between parties, once the strength of our political system. The first post-war Government will largely be bound by the mood, talents, and imagination of the first post-war Parliaments. For more years than it is comfortable to remember, Parliaments have been poor in quality, hazy in ideas and reluctant in action. It would be a poor outlook if the sole choice were between the continuation of this kind of Commons and the appearance at Westminster of another crowd of hard-faced and short-sighted men.

Saving the Countryside

For most of his speech last week at the annual meeting of the Council for the Preservation of Rural England, Mr W. S. Morrison trod upon safe ground. Everyone wishes well the efforts for saving the lovelier parts of the countryside from further spoiling. This is one field where the sentimentality of the Scott Report, with whose implementation the Minister seemed chiefly concerned, is not out of place. The generosity of individuals, as shown by the work of the National Trust, and the good intentions of local authorities, are guarantees that the best views and walks may be saved for all to enjoy. This requires no new powers; but is this enough? Mr Morrison's only concrete statement was that he had commissioned two expert surveys, one for national parks and the other for the coastline. On another recent occasion the nation was reassured that there will be no new “Peacehavens” after the war. But to stop the sort of coast development associated with Peacehaven, or similar sprawls inland, there is needed not the preservation of particular areas, however beautiful, but improved powers over the use of all land, and of those the Minister made no mention. The intention of the LCC to build an estate at Oxhey, in Hertfordshire, is the first indication vouchsafed to the public of how the London area is likely to grow in practice.

Shorter Notes

The Disabled Persons (Employment) Bill was given a general welcome, and a second reading, in the House of Commons on Friday of last week. Other measures approved last week were the Local Elections and Register of Electors (Temporary Provisions) Bill, which obtained its third reading, and the new draft regulations for supplementary pensions and unemployment assistance.

The following table gives the number of civilian casualties in air-raids since September, 1939:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept., 1939-Aug., 1940.	1,494	1,980	3,474
Sept.-Dec., 1940.....	22,282	28,522	50,804
Total, 1941.....	20,863	21,839	42,702
Total, 1942.....	3,221	4,149	7,370
1943:—			
January-June.....	1,830	2,515	4,345
July.....	167	210	377
August.....	108	164	272
September.....	5	11	16
October.....	118	283	401
November*.....	119	238	357
Totals to date....	50,207	59,911	110,118

* Those killed last month included 41 men, 49 women and 28 children under 16. The vast majority of the total were accounted for by a single incident, when a dance hall in a London suburb was hit. It should be pointed out that Service casualties in this incident are not included in the figures.

AMERICAN SURVEY

California Boom

(From a Correspondent in Los Angeles)

November 8th.

RECENT surveys show that Southern California aircraft workers plan to stay here after the war. They know many will lose their jobs. Federal and state authorities have warned that, after the war, the Los Angeles area "may be one of the most seriously distressed industrial districts in the United States for a few years." San Diego, the second city of the area, will have post-war readjustments probably "more difficult than in any other south-west community." And yet the workers plan to stay.

The reasons for the above warnings are not hard to find. Of Los Angeles County's 7,500 factories, 2,000 are new since 1939, and have never made anything but war goods—1,000 of them are aircraft accessory plants, and 500 others specialise in dies, tools, machines. The transfer of their productive capacity to peace-time goods is obviously going to be a major transfer. In 1939, Los Angeles County had relatively fewer factory workers than any large eastern industrial centre. In the ten counties of Southern California, motion pictures, sportswear, cosmetics, automobile assembly, petroleum products, tyres and tubes, furniture, aeroplanes, specialty food products, electrical appliances, pottery, were the main occupations offering industrial jobs; further employment was available in transportation, distribution, service—the balmy climate was a natural resource for the tourist trade.

By contrast to the lack of development of heavy industry before the war, specialised agriculture was highly developed, particularly the production of fruits and vegetables; Los Angeles County's assessed valuation for agricultural products is more than \$3 billion, 40 per cent of all California's. But since the war industry has caught up. This year the Los Angeles County aircraft industry will double Germany's and quadruple Japan's probable output. Currently, the California shipbuilding industry outbuilds the rest of the world.

To get these end-products, two kinds of supplies are indispensable; the raw materials, power and other accessories which the people who make the end-products need as producers, and the food, clothing and other necessities which those people need as consumers. Serving in both capacities, a Pacific south-west feeder region is developing, with Arizona, Nevada and Utah included in close trade ties with California. The extent of the new demand is reflected in the fact that population in the ten Southern California counties increased more than 25 per cent between 1930 and 1940, and another 13 per cent since 1940—nearly one person in three of all the people in the eleven western states live there. The Los Angeles metropolitan area is now exceeded only by New York and Chicago, both in population and buying power.

In the field of consumers' goods, these hundreds of thousands of newcomers, mostly young, offer possibilities for low cost distribution to a growing mass market. Manufacturers are establishing local or branch plants—400 of the 2,000 post-Pearl Harbour factories are making apparel—and in a variety of lines they set the pace so as to attract buyers from elsewhere: in 1939 there were 750 such offices; to-day over 1,800 department stores in the US and abroad maintain permanent resident buying offices in Los Angeles.

Similarly with food: livestock men on the western ranges are beginning to discover that there is such a thing as a dairy cow, and that beef and mutton can move west as well as in the usual direction. (Food comes to Los Angeles by water as well as over the mountains—the city is now the world's greatest fishing port; last year's catch exceeded half a billion pounds.)

Similarly again with supplies for the machines and the furnaces of the new industries. Los Angeles' Bethlehem and Columbia steel plants have long made steel, hauling their pig iron from Utah. Now the Henry Kaiser \$100 million

dollar steel plant has begun production at Fontana, less than 50 miles from Los Angeles; this plant will make its own pig iron, since it has easy access to the necessary iron ore, coal, limestone and water. Also, a recent find of the US Geologic Survey has revealed huge high-grade iron ore deposits within 200 miles of the city. At the same time, the needed power has been developed. Installations at Geneva, Utah, bring the furnace capacity of the region west of the continental divide up to 3,548,020 net tons of ferrous metal, compared with 1,061,620 net tons before the war. The open hearth and electric steel capacity in the Los Angeles area has increased by 308 per cent during the war, compared with increases of 109 per cent in the Portland-Seattle area, and 43 per cent in the San Francisco area.

The working of immense manganese beds near Las Vegas, Nevada, and the discovery of rich tungsten ore in the state, the opening up of lead-zinc and possible molybdenum deposits in a formerly inaccessible area of Arizona, the manufacture of aluminium and manganese under the combined influence of war and hydro-electric power—all are encouraging workers to expect to survive the change-over from war industry with the prospect of the far west becoming one of the major light metal-producing areas of the world.

Another prospect is synthetic rubber; the Pacific South-west has a sixth of the nation's known underground petroleum reserves, as well as large supplies of natural gas, oil-bearing shales, bituminous coal. At the moment, however, this industry is having growing pains. When Los Angeles' Southern California Gas Company, scheduled to supply about 80 per cent of the butadiene for the synthetic rubber plant set up at Torrance by the Goodyear and US Rubber Companies, began to make butadiene in its largest artificial gas plant, exhaust gases at times blanketed parts of Los Angeles. Wiping their smarting eyes and holding their noses, citizens protested loudly; synthetic rubber production is now temporarily held up through an injunction action. Nevertheless, major tyre companies are counting on a post-war synthetic rubber and tyre industry employing at least 12,000 workers.

A third prospect is plastics; the California industry has expanded more than 500 per cent in the past three years, and this year may turn out \$500 million worth of products.

Then, too, aircraft and shipbuilding, though their production will undoubtedly be sharply cut, will certainly not drop out entirely after the war.

So the workers in Southern California think they'll stick around awhile.

American Notes

Third Party Threats

By a curious coincidence, threats to bolt from the major parties have come this week both from Republican and the Democratic ranks. Mr Willkie has refused either to confirm or deny a story that he has "thoroughly explored" the possibility of forming a third party. Only a few days earlier a number of Southern Senators, enraged by the accusation that they had entered into an "unholy alliance" with the Republicans to kill the Soldiers' Vote Bill, threatened to form a new Southern party. The substance of the allegation was that the Southern Democrats put the retention of their hold over the South, through the poll tax, before the interests of the national party and indeed before those of absentee Servicemen. This flare-up has subsided somewhat with Senator Byrd's prudent refusal to captain the revolt. It could hardly be taken seriously. Within the Democratic framework the Southern bloc holds a position of great power and has not failed to extract its pound of flesh in the form of repeated concessions from

Mr Roosevelt, who, it is said, will make almost any sacrifice on the home front to secure the acceptance of his foreign policy. Through nominally Democratic, the Southern group feels no hesitation in voting against the Administration and with the Republicans when its special interests are at stake. The defeat, in the Senate, of the Bill to establish a two-party federal commission to supervise the procedure enabling Servicemen to vote was an excellent example of its freedom from party inhibitions. As matters now stand, unless the House succeeds in dissuading the Senate, control of Servicemen's absentee balloting remains with the states, and it is doubtful whether the law, in a number of cases, can be changed in time to permit effective participation by men overseas.

Another Blitz?

The fact that Mr Willkie has chosen not to deny his reported "exploration" of third party possibilities does not mean that, at this early stage, he is seriously considering a bolt from the party, though, if he is passed over for the nomination, it would not be unlikely. Even a man so convinced of his own destiny and of the rightness of his stand both on foreign and domestic issues as Mr Willkie can hardly imagine that the creation of a third party would provide the key to the White House which he is seeking. The third party in American national politics has been, without exception, a losing proposition. To split one of the major parties is a form of suicide pact. The threat of a bolt is another matter. It will certainly reinforce the suspicions of the party regulars, who have always contended that Mr Willkie is not a real Republican, but only a Democrat turned Willkie-ite. But it is the strongest weapon in Mr Willkie's armoury, for although to resort to it would be a confession of personal failure, it would guarantee a Democratic victory. That he should feel the need of using such blitz tactics suggests that he is becoming alarmed at the pace of the stop-Willkie movement. The increasingly sensational attacks upon him, like the accusations of the *Chicago Tribune* that he is the tool of "Wall Street financiers, Communists and ex-convicts," probably will not do much damage, though they suggest that a dirty campaign is in the making. The manoeuvres of Mr Landon and Mr Hoover are worth more attention. Their refusal to commit the party to approval of the Administration's foreign policy suggests that they may, if it seems politically profitable, urge the party to adopt some such slogan as Governor Bricker's "co-operation but no subservience," which, while giving lip-service to collaboration, would permit attacks on Mr Roosevelt's policies.

NAM and the Future

Reports on the Second War Congress of American Industry, which has just concluded its meeting at New York, are still fragmentary. It appears fair to say, however, that its position on international affairs has proved more constructive than its stand on domestic issues. The Report of the Post-war Committee of the National Association of Manufacturers took a firm stand in favour of an international organisation and prompt action against aggressors, the rehabilitation of the permanent court of international justice and the creation of international agencies to deal with specific problems in the economic field. It is not difficult to imagine, however, that members of the Congress listened with even more eagerness to the plea of Mr Sloan, of General Motors, for a thorough revision of the tax system after the war in the interests of free enterprise. Mr Sloan was probably typical of big business in the enthusiasm with which he regarded post-war opportunities. In the expectation of a national income of about \$100 billion, General Motors has committed itself to the spending of \$500 million on plant reconversion and technological improvements. But he insisted, as business generally has insisted, that a prerequisite was the reconstruction of the tax system, to reduce taxes on enterprise and those on individuals where they discourage saving and investment. In the opinion of the Post-war Committee, business will be able to find new outlets for the production which during the war has been bought by the Government only by a vast new emphasis on the importance of distribution and the ability to increase consumer wants.

Manpower Politics

President Roosevelt has signed a Bill embodying the results of the agitation to delay the drafting of fathers.

The measure provides that fathers may not be taken until all available single men have been inducted, and by tightening up occupational deferments and urging that, if possible, mental and physical standards of the Services should be lowered in some respects, attempts to postpone the evil day. Neither of these devices is likely to be of much avail; the exhaustion of the reserve of single men is so near at hand that about 1,000,000 of the Service intake of 1,700,000 are expected to come from the privileged class of "pre-Pearl Harbour fathers." The law also makes substantial changes in manpower authority, partly because of widespread dissatisfaction with Mr McNutt's handling of the problem, and partly, perhaps, because current reductions in the war production programme appear to justify a more easy-going attitude. Supervision over the Selective Service System, which administers the draft, is returned to General Hershey despite Mr McNutt's protests that it would weaken the overall programme by dividing civilian and military control of recruitment. The controversial "work or fight" order of the Commission comes to an end. This was Mr McNutt's attempt to force men into essential occupations under the threat of induction into the Forces. It has been criticised as ineffective, and also as a slur on the Services. There are reports that as a result of these invasions of his slender authority Mr McNutt may resign, particularly as they follow an attack by Mr Elmer Davis on his handling of publicity, a function in which even his enemies previously admitted he excelled. The belief that cuts in war production will end the strain on manpower is not borne out by the Commissioner's revised estimates for the coming year. Although munitions employment will not increase as rapidly as had been estimated in June, war industries are expected to need another million workers by next July. The overall increase in Service and civilian requirements is put at a million.

Inflation and National Unity

In the past week Congress has made two direct and ominous attacks upon the agencies responsible for keeping down prices. The Senate, by 74 votes to 4, adopted and sent to the House the Truman resolution supporting the wage increase of 8 cents an hour for non-operating employees of the railroads which had been denied by the Stabilisation Director. The House has since ordered the Office of Price Administration to reverse its stand and allow an increase in the price of crude oil of a minimum of 35 cents a barrel. These are the first instances of Congressional interference with the details of price and wage policy. While they may fail to reach the President, or may then be vetoed, they open the way for a new flood of log-rolling and seriously impair the prestige of the agencies involved and their ability to carry out a consistent policy. As Mr Vinson said, the Senate itself has broken the wage stabilisation line. With such encouragement, Labour can hardly be expected to exhibit superhuman restraint; and, in fact, the drive for increased wages, for example in the steel industry, is proceeding, and a "progressive" strike on the railways has been called for December 30th by the railroad brotherhoods. The administration is straining desperately to turn back the tide. Mr Byrnes, in a Pearl Harbour Day address, warned that if the line were not held now against inflation there were no prepared positions to which the country could retreat. Frankly admitting many defects in the anti-inflation programme, Mr Byrnes insisted that, so far, the record was vastly better than that of the last war, and appealed to the patriotism of the leaders of labour, agriculture and industry to help the Government, "so that we will not lose the peace while our boys win the war." Mr Charles Wilson, the distinguished industrialist now with the War Production Board, made a similar appeal to the National Association of Manufacturers. In one striking passage he said:—

I know of no other period except perhaps the Civil War when there has been so much need for unity in our country and so few signs of it. . . . It is an appalling thing to see the separate groups and special interests separating out of the main body of the American war effort in order to work for their own special purposes and private ambitions. . . . Now we are coming into an election year when passions and prejudices are likely to be accentuated. . . . I submit that if we give way to these passions and prejudices, if we lend ourselves to the breaking up of our society into partisan groups and cliques, we are jeopardising our entire national future.

Mr Wilson was speaking specifically of the dangers of a right-wing reaction among some sections of capital, but his words have a wider significance.

THE WORLD OVERSEAS

The Confession of a Quisling

(By a Correspondent)

"LE SOIR" is a Belgian paper which has preached collaboration with the Germans. Until quite recently its editor was Raymond De Becker. In October De Becker had to resign, probably because of misunderstandings with the Nazis. Before he resigned he spoke to his staff; gave his views on the present position in Europe; and made a long apologia for the policy of collaboration he had pursued for three and a half years. The speech shows, with some degree of cynical sincerity, the tortuous and slippery road which a quisling has travelled in the years of European eclipse.

De Becker seems to have been a quisling of a peculiar type. He might almost be called an honest quisling, if this description were not a contradiction. Perhaps it would be truer to say that he has been a quisling with a purpose. He never belonged to the mercenary ranks of a Fifth Column. He claims to have held aloof from the other brand of Belgian collaborators, the Rexists, whom he treats as a contemptible pack of hirelings.

De Becker clearly speaks for a certain kind of collaborator which can be found in almost every country—the quisling who has not been bought. These gentlemen could be found in Europe even before 1940. Sometimes they come from the most "respectable" political circles. In Belgium there was De Man, the Socialist philosopher and sociologist, who hailed Hitler's victory in 1940. In France there were leading figures in very conservative and right-wing circles like Pétain himself, parliamentarians like Déat or old Socialists like Paul Faure. In Czechoslovakia there was the former President of the Supreme Court, Hacha, or Tisso, the leader of a well-established Catholic movement. In a sense De Becker speaks for all of these and a whole host of others. He presents the common denominator of the political blindness and moral cynicism that have misled them. He tells dispassionately the story of their disillusionment.

De Becker lost his belief in German victory long ago, though he still does not see the inevitability of German defeat. He still believes that, in collaborating with the Germans, he fulfilled a patriotic duty as a Belgian. In 1940, he took Hitler's victory for granted. He was then out "to secure for Belgium the best possible future status in a Europe controlled by the Axis." This is this kind of quisling's first trait: the false realism which induces him to make peace with the fact of German conquest. The "best possible future status of Belgium in a Europe controlled by the Axis" was always a mirage, because in such a Europe Belgium's "best possible status" could never be much better than political death. Even so, he says:—

From the Belgian point of view it is indeed natural that some Belgians should play the German card in the event of a German victory, and that others should play the Anglo-Saxon card in the event of an Anglo-Saxon victory. They are all patriots so long as they collaborate for the good of the nation and constantly guard their moral and financial independence.

The philosophy of expediency has seldom been expounded with so much disarming frankness. This is the formula that might help any quisling to whitewash his record and to become a Darlan. De Becker is not merely an apostle of expediency. He was also a believer in the New Order. He admits that, in 1940, he felt a blissful exaltation over Hitler's victories.

We participated in that false sense of well-being which then existed throughout Europe, we shared the hopes of the young European generation, we thought that a new world would arise out of the revolutionary war.

Those hopes are now destroyed. In 1940, however, they were real—though not "throughout Europe," but throughout some section of European society. De Becker explains that the opponents and critics of the democratic *ancien régime*

could only rejoice at the chance that seemed to offer itself of destroying it and of setting up along with the youth of Europe a new order.

But here the disillusionment starts. Even the quisling discovers that the claim of National Socialism to pass for a European revolution was sheer bluff. He discovers the old German imperialism under a new guise. He finds few "genuine" National Socialists among the Germans; and even the true National Socialists have no understanding of their Belgian confrères. At first the German appeal to the sense of European unity did not fall on deaf ears. Soon it became clear that the "European" policy was not meant in earnest. At every step it clashed with the Pan-German policy, and gave way to it. The Nazis based a spurious unification of Europe on an utter disregard of the national susceptibilities of the peoples they had conquered.

Thus the occupying power and the collaborators clashed. The "honest" quislings could find no common language with the conquerors, who now preferred the plain mercenaries of the Rexist movement. The call-up of Belgian labour was the main cause of conflict. De Becker, Poulet, De Man advocated voluntary recruitment; but the Germans left their advice unheeded. "They legislated in the void and then got angry if the law was not observed"—this is De Becker's melancholy complaint. The crisis grew ever bigger until even the Flemish Nationalists turned against the occupying power and the whole quisling press was submitted to a radical purge.

Reluctantly, De Becker reveals how superficial the difference between the "decent" quisling and the mercenary had been. The "decent" quisling wanted collaboration to be based on voluntary principles; he wanted the impossible, and failure was inevitable. The Germans have no use for the *Schwärmer*. What they needed was labour, and more labour; and this they decided to obtain even at the cost of alienating many of their "idealistic" friends. True, they failed to obtain the labour they wanted. But the believers in voluntary collaboration can hardly boast of greater realism; they also thought in a void.

What hopes does the frustrated quisling still entertain in the fifth year of the war? He proclaims a magnanimous amnesty to those of his countrymen who have played the Anglo-Saxon card, and probably expects reciprocity. Yet, he also urges his followers to drink the cup of collaboration to the last bitter dregs. He points to the European fight against Bolshevism as the last remaining link with National Socialism. He holds out the prospect of an "Anglo-German reconciliation" against Russia, the only chance of survival for the European civilisation of which the "decent" quisling thinks himself to be an essential element. The quixotry of collaboration comes full circle. The future historian of Europe in 1940-44 has here a pitiful document on the aberration of political minds in those years.

"Co-Prosperity" Takes Shape

[BY A CORRESPONDENT]

HITHERTO South-Eastern Asia has disposed of its enormous surplus production of rubber, tin, coffee, sugar, and so on, on the world market, and most of its constituent countries used to depend on large imports of foodstuffs and manufactured goods. Most of these goods are not at present available from the production of Japan, which, in any case, could hardly spare the necessary transport; on the other

hand, Japan, though still short of some raw materials, is unable to use up the whole surplus of those products which have been typical of its new dependencies. Japan is consequently willing to introduce far-reaching changes in the economic structure of the whole region; it was revealed, for instance, at the June session of the Japanese Diet that the Imperial Government intends to make each of the constituent territories of the "Co-Prosperity" sphere almost independent of the import of foodstuffs, and a period of ten years was mentioned as the time necessary to attain this goal in Malaya, whose agriculture, at the time of the conquest, was based on rubber. This plan incidentally contradicts earlier reports, according to which the present autarkian measures would be undone after the war, and South-Eastern Asia would then exchange its traditional products with the produce of German Europe and other parts of the western world.

Japan, in present circumstances, may have roughly two million tons of shipping to spare for transport within the new sphere, but a high Japanese authority recently stated that 17 million tons would be required for an adequate system of communications. Evidently, the Japanese cannot expect a solution of their Empire's economic problems during the war merely from improvement of their transport system, although, of course, they pay due attention to the problems of both land and sea transport. Shipbuilding has first priority in Japan's economic programme, and wooden boats are built in Hong Kong, Borneo, Celebes, and New Guinea; a plan for a motor-road from Korea to Singapore is under consideration; other, less ambitious, road-building schemes are actually in operation, for instance, in Borneo and in Burma.

Self-Sufficiency in Food

The policy of local food autarky in the various territories of the region is served mainly by increasing the cultivation of rice and other staple products. The area under rice is reported to have increased by over 10 per cent in the Philippines between 1941 and 1943. Rice, maize, bananas and groundnuts are the plantations to be fostered in Java; there is to be more fishing throughout the whole area. This autarkian policy is evidently accompanied by a further reduction in the living conditions of the local populations, which were on an unsatisfactory level even before the Japanese invasion. A correspondent of a leading German newspaper recently reported from the Philippines that the local wage level had been "adapted to Japanese conditions," and that life therefore has become "simpler and more frugal."

Apart from foodstuffs, the Japanese are also encouraging an increased planting of cotton, in order to replace their imports from the United States. More cotton is being planted in practically all the newly conquered territories, and the most encouraging results are said to have been achieved in the Philippines, where the transport conditions also are comparatively favourable in view of the short distance from Japan proper. About 70,000 hectares have been taken over for cotton cultivation in the Philippine archipelago during the first two years of the Japanese rule, and a much sharper increase has now been foreshadowed in a new Five Years' Plan. The cultivation of jute is fostered in French Indo-China, and even more quinine than before is now grown in Java; the area under castor oil has been quadrupled in the Netherlands East Indies.

The Rubber Surplus

As a supplementary measure, the area under rubber, coffee, tea, kapok and sugar is being reduced in all countries of South-Eastern Asia. The Philippines' sugar production is to be reduced to meet only local demand, including the requirements of new factories producing alcohol and butanol. The Japanese want to reserve for themselves the sugar market of China and Manchuria, while the demand of the southern countries can easily be satisfied by local producers, mainly in Java. A limitation of the rubber output of the area is not practicable in a similarly rigid manner, and the Japanese have to think of new ways and means to put the abundance of rubber and other raw materials to some useful purpose. Whereas the western countries have learnt to make rubber from fuel, the Japanese in Malaya have started to manufacture substitute petrol from rubber. They are also to produce asphalt from a mixture of rubber, lime and palm oil, while the authorities of French Indo-China have prepared a scheme to convert rubber into a new textile fibre. Artificial fibres, as well as paper, are now also produced from local timber in the tropical lands of the

"Co-Prosperity" Sphere, and a variety of substitute products, including artificial coal, soap, oils and condensed "milk," are made from coconut.

Mining activities are greatly fostered, although gold mining is being severely reduced. Prospecting seems to have been lively in various parts of the Netherlands East Indies, more particularly in Borneo, where new deposits of coal, and of iron, manganese, bauxite and molybdenum ores are to be exploited; more oil has been discovered in Siam. Blast furnaces, partly for the use of charcoal, have been erected in Malaya, Southern Borneo and Indo-China, in order to economise transport. The coal and iron of the southern countries seem to be mainly designed to form the base of local manufacturing industries, while the main supply centres of coal and iron for Japan itself remain, for the time being, in the northern region. The combined coal output of Manchuria and the province of Shansi, in Northern China, was over 50 million tons in 1941, and has grown considerably since. The smelting of the ores is also carried out to an increasing extent in these provinces; skilled Chinese workers are being transferred to the north of their country in order to help with the new industries in the coal and iron belt. The Philippines are also to produce some iron and chromite, thus replacing the traditional Japanese imports from North America.

The Japanese Government has made it clear that the greater part of the overseas populations are to remain, for good, in agricultural occupations; even so, it is in their immediate interest to stimulate some growth of manufacturing industries in the area under their command. Manchuria is said to be producing considerable numbers of aircraft for Japanese use, but the industrialisation process is not entirely confined to the old Japanese protectorates. About 10,000 cotton spindles have been transferred to the Philippines from the closed-down establishments of Japan, in order to help the establishment of a local textile industry; the output of tinned food, toilet articles, soda and other chemicals, and of electric bulbs and wires, have also been increased in the Philippines. Malaya is about to start the production of steel, and of wire, tools, and other metal goods; it has even been claimed that in July the construc-

Vitamins in chocolate for liberated Europe

The British Government, having examined all the ways in which sufficient vitamins could be provided to the under-nourished children of liberated Europe, have arrived at the conclusion—as Rowntrees did in 1938—that chocolate offers one of the best vehicles for carrying added vitamins. In chocolate, the vitamins retain practically all their potency.

Before the war, Rowntrees pioneered the addition of vitamins to cocoa and chocolate. Their object was to enhance the protective value of these already highly nutritious foods.

Today, when the Allied Governments are faced with the enormous problem of rehabilitating each occupied territory as it is freed, Rowntree's experience of fortifying cocoa and chocolate with vitamins on a large scale is proving of great value. When the war is won, this experience will again be used for the benefit of the British public.

ROWNTREES

tion of the first Malayan motor cars was started, although German commentators say that the cars have probably only been put together from parts manufactured in other countries. Java has started the manufacture of pharmaceutical goods, and Burma is to increase the output of clothing.

Post-War Outlook

It is impossible to judge, merely from a study of the enemy press, how far all these schemes are really successful. As to the immediate wartime problems, it is safe to say that the Japanese derive considerable advantages from their huge empire, even though they have not yet fully absorbed, economically, all their newly-conquered territories. But the Japanese experiment is well worth studying from a long-term viewpoint as well. It appears clear that Japan, through a great variety of unorthodox methods, is about to change the vast area under its control into one homogeneous sphere which is more or less independent of the outside world. The Cairo Declaration has removed the last doubt that Japan, after the war, will be divested of its political hold over Eastern Asia. But the re-incorporation of the liberated territories into the world order will not be an easy job, and it will be the more difficult the longer Japan's rule will have been allowed to stay. The Pacific World, even from an economic point of view, will be different after the defeat of Japan from what it was before.

Hungarian Supplies

[BY A CORRESPONDENT]

FORMALLY, Hungary's first Five-Year Plan for industrialisation ended in the spring of 1943. The initial capital expenditure of 1,000 million pengoe had been increased to 4,500 million, and a bigger proportion than the original 60 per cent had been used for purely military purposes, although, compared with the available manpower, military mobilisation remained small. The slow progress of the ambitious programme for industrialisation may be explained by the fact that Hungary, cut off from all overseas trade, followed Germany's policy of replacing imported raw materials by substitutes from home resources. Apart from vague estimates, there is no indication of the actual industrial progress. The output of coal, which was about one million tons in 1938, is said to have increased by some 30 per cent. In contrast, the mining of bauxite and the output of oil and natural gas increased by 200 and even 300 per cent during the last four years. German sources suggest that the output of bauxite may reach 2,000,000 tons in 1943, against a pre-war record of 485,000 tons. It is quite possible that Hungarian bauxite is used for replacing former imports from Yugoslavia and Italy. The present output of oil would be sufficient for the normal peacetime consumption, which seems to indicate that the greater part of the oil is requisitioned by the German firms controlling the oil industry. As in other European countries, there is an intensive search for non-ferrous metal ores, and some lead and zinc ores are being mined. No expansion in the iron and steel industry has been reported, and it can be assumed that the small capacity is fully used. German exports to Hungary were sufficient for some time, but, from the beginning of this year, the supply of iron and steel and semi-finished materials has been severely rationed.

On the other hand, Hungarian industry is almost completely dependent on imports of machine tools and machinery, apart from certain specialised products in electrical machinery. Without German and Swiss deliveries, Hungary's manufacturing industry can hardly expand, and there seems to be no doubt that during 1943 no further advance has been made. In 1942, there was already a marked difference between the actual progress in industrial output and the continued founding of new companies. The increase in the number of workers was not accompanied by a corresponding advance in output. Land reclamation, the construction of roads and canals, electric power stations and factories for substitutes, as well as the mining industry, absorbed great numbers of workers.

Civilian Shortages

In spite of an acute shortage of the most important civilian commodities, particularly textiles, clothing and footwear, no attempt has been made to introduce a comprehensive system of rationing. The first step to overcome the

supply difficulties was the standardisation of clothing and shoes and the introduction of a purchasing-book for consumers, simply for the recording of purchases. A short time ago, maximum clothing purchases were fixed. It seems doubtful, however, whether factories will be able to supply shops with the necessary material. Shortage of supplies and exorbitant prices suggest that new clothing and shoes are luxuries for most Hungarian people. The indices of the wholesale prices and the cost of living index are no guide to the actual advance in prices. Individual articles of clothing and footwear sell at four and five times the pre-war price, whereas the official indices give an average increase of roughly 100 per cent. A really comprehensive system of rationing seems to be impossible. The ineffectual administration is one reason, and in addition the general character of Hungary's economy makes it impossible to extend effective rationing beyond the towns.

Wartime control of finances and prices bear the stamp of the German model. Roughly 30 per cent of the national income is paid in taxes and excise duties into the Treasury. The inevitable budget deficit is covered by the issue of Treasury bonds. Bank notes in circulation are three times the pre-war circulation, and bank deposits had increased by roughly 100 per cent during the four years from the summer of 1939 to 1943.

The financial problems are aggravated by Hungary's foreign trade with Germany. In value, Hungary's total foreign trade shows an impressive advance. Imports and exports have been as follows:—

	(In Million Pengoe)		
	Imports	Exports	Exports as per cent of Imports
1939	490	604	123
1940	603	515	85
1941	740	797	108
1942	923	1,144	124
1943 (6 months)	557	630	113

During all these years, Germany's share in Hungary's imports and exports exceeded 50 per cent, although Italy, which took second place, increased its share during 1941 and 1942 at Germany's expense. Under the clearing agreements, Germany's clearing debt to Hungary has been steadily growing, whereas trade with other countries was more or less balanced. In value, Hungary's foreign trade almost doubled during four years of war. But the rise in prices indicates that the volume remained at best unchanged.

The Clearing Debt

It is clear that Germany is no longer able to balance its trade with Hungary. The increase in German exports to Hungary during 1940 was not the result of larger German production, but was due to the fact that German manufactures, which could no longer be shipped to overseas countries, were diverted to Hungary and the Balkans. First, Germany tried to reduce the clearing debt by manipulating transfers within the Central European clearing system. Last year, however, the Nazi Government agreed to sell Hungarian securities held in Germany. All Hungarian securities held in Germany have now been called up and a considerable part has already been transferred to Hungary. But this is no solution and, in any case, the amount of securities held in Germany is probably small. An indication that Hungary's clearing debt is a serious financial problem for Germany is given by the fact that recently the Treasury bond issue was increased from 750 million pengoe to 1,000 million for the sole purpose of covering the necessary payments to Hungarian exporters on account of the German clearing. At present, Germany, having already transferred the bulk of Hungarian securities in payment of the clearing debt, can only offer promises of payment in goods after the war. On the basis of these promises, it is suggested that future Hungarian importers should place their post-war orders with German firms now and at the same time make advance payments to the Hungarian central bank, which would then from a purely technical point of view balance the German clearing debt. It is even suggested that the Hungarian Government should finance these advance payments in the form of credits to Hungarian importers. There is no doubt that there are many possibilities of technically balancing the clearing debt. In the last resort, the clearing debts will reappear as part of Hungary's national debt owed to Hungarian exporters, and this debt will grow the longer the war lasts and Germany's inability to export manufactures becomes more pronounced.

Germany at War

The Metal Puzzle

BY early November a special copper drive had been going on for a year in Germany, and inevitably Dr Luehr, in charge of the campaign, reported that it had been a great success. During the past twelve months copper and other non-ferrous metals have been stripped from the plant of closed-down factories. Copper in high-tension cables and machinery of electric power stations has been replaced by other metals, mainly aluminium; aluminium cables with iron cores are being used. Stocks of copper and semi-manufactured copper held by factories have been drastically reduced; all copper boilers, fixed or movable, with a capacity of a gallon or more, have been requisitioned. In the same period the staffs of the special commissar for the use of metal substitutes made of iron, plastics, ceramics and glass have been hard at work. The size of the new organisation set up for this purpose suggests that the copper, lead and tin supply situation in Germany is now very difficult.

However, the base metals have, relatively, receded in importance compared with the light metals, aluminium and magnesium, on the one hand, and the metals used in steel alloys, such as manganese, chromium, nickel, tungsten, molybdenum, vanadium, cobalt, on the other. These metals, to which cadmium, a by-product of zinc reduction, must be added, among others, are used in the brass and bronze alloys of the base metals as well as in the alloys of aluminium and of the base metals like indium and sodium, magnesium. Rarely known metals like indium and sodium, produced from zinc ore and caustic soda, respectively, are being used in appreciable quantities. In general terms, the use of these metals in steel, base metal and light metal alloys has been stimulated by the need for greater hardness and greater resistance against corrosion, especially in aero engines.

Misleading Statistics

Any purely statistical approach to Germany's present metal supplies must necessarily be out of date. The wide use of plastics, the much improved substitution of copper and other metals by iron and steel and general improvements in metallurgy might confound the most able statistician using pre-war figures. But, although ammunition takes only a small part of the total war consumption of steel and other metals, some facts have been published about the manufacture of munitions which give some useful pointers. For some time rifle cartridges have been manufactured from carbon steel. Detonators in rifle cartridges no longer contain mercury, though what substitute is being used has not been disclosed. Considerable quantities of brass were formerly used in cartridge cases for artillery munition. The Germans use open-hearth steel, which is cold rolled and either brass coated or galvanised. It is interesting to note that steel is also used for cartridge cases in the United States.

The lead core of the German rifle bullets has been replaced by an iron core. To make the change was mainly a ballistic problem, and it is claimed that it has been solved satisfactorily. The driving band round artillery shells is no longer of copper, but is manufactured from sinter iron, which is apparently also used extensively for other undisclosed purposes. Manganese in special steel alloys has largely taken the place of nickel, and so forth. In locomotives the use of copper and tin has been cut down to a minimum, and the same is reported from most of the mechanical vehicles and machinery. The hardening metals for high-speed tools and for special armour plate have been carefully husbanded.

There is no doubt that pre-war standards in high-quality steel alloys and metal alloys have suffered. Ruthless suppression of civilian production and repeated salvage campaigns may have had the effect of building up stocks of scarce metals. In the last war the reclaiming of metals from alloys was often quite unsuccessful. But these methods have been practised on a large scale in Germany since 1935-36, and considerable improvements may have been worked out. The science of metallurgy is by no means perfect and new methods of changing the composition of metals in alloys may be found. The present consumption of metals in this country and the United States may be a misleading guide to consumption in Germany, for in both countries aircraft ship manufacture is proportionately larger.

Stage by stage, during the war, Germany has passed through periods of relative plenty in some metals and acute shortages of others. At the beginning of the war stocks of imported manganese, chromium, wolfram ore, copper, lead and tin were certainly sufficient for a short war. A tremendous expansion in the manufacture of aluminium, although dependent on supplies of bauxite from the Balkan countries, Hungary and Italy, and the even greater expansion of magnesium based on home supplies of Austrian magnesite and other sources seemed to be enough to meet any possible demand. But these metals were used so extensively that soon restrictions had to be placed on their use, even for military purposes. The reduction plants of these light metals are large-scale consumers of electricity in which they compete with most other substitute industries.

There is no lack of bauxite in German-controlled Europe. A report stated that Hungary aims this year at an output of 2,000,000 tons of bauxite, against 485,000 tons in 1939. Austria and Greece were the largest producers of magnesite, and there are other sources in Germany's potash industry. The limits of expansion in these two metals is set by electricity, materials and labour for the construction of plants. Of the four base metals, tin, copper, lead and zinc, only zinc is available in sufficient quantities. Germany, Poland, and Italy were leading producers. Europe may perhaps be producing a quarter of Germany's pre-war copper consumption and only a fraction of the tin supplies. The output of nickel, mainly in Finland and Norway, is insufficient.

The European output of manganese even after the loss of Nikopol, which is probably near, might just keep up the present output of weapons and munitions for a time at least, and this may also be so of chromium, although the loss of Turkish supplies would create a difficult situation. Wolfram is still imported from Spain and Portugal. Molybdenum, which can be used instead of wolfram-tungsten, is produced in Norway. There is quite a considerable output of antimony in Europe; the metal is used chiefly in the manufacture for storage batteries and babbitt metals which are employed in bearings, and generally speaking for the purpose of hardening lead.

Danger Signals

The most important point is that the tremendous number of metals which are in use in modern industry offer a great variety of substitutions. The introduction of electrolytic reduction, the chemical reduction of metals which were formerly only known as elements and the extensive use of plastics, ceramics and glass make it unwise to assume that, under present conditions, Germany will be forced to end the war simply because of an acute shortage of this or that metal.

The period when Germany was able to capture large stocks of ores and metals has long since passed. The relatively plentiful supply of manganese ore perhaps had its cause in unusually large stocks found in France apart from increased production. In Russia, however, Germany has never fully enjoyed the use of the manganese centre of Nikopol. The Allied occupation of French Morocco, Sicily, Sardinia and Southern Italy has deprived Germany of supplies of pyrites, molybdenum, sulphur, zinc and antimony. Italy's main sources of metals, however, are situated in the north. So far, these losses have been only danger signals pointing to new difficulties and to the necessity of working harder on less profitable sources, either in Germany or in the occupied countries.

The determination to continue the war is producing curious results. All over the continent, particularly in Saxony, Bohemia and the Balkan countries, there are still the traces of the mining activities of the ancient Romans and medieval Germans. Century-old slag heaps and abandoned mines to-day yield small quantities of tin, nickel, wolfram and cobalt. (The last three names recall the anger of medieval German and Bohemian miners thwarted in their search for copper and tin by unknown things which they named after the demons of their folklore.) The labour costs of utilising these remains are tremendous. Germany's metal supply situation has hardly been affected by the bombing of the Norwegian mines; but the destruction of the high quality steel works at Krefeld or the metal works at Dueren would certainly be felt. The loss of the Balkan countries and Northern Italy would at once transform the situation, and, without Hungarian and French bauxite, Czechoslovak manganese and Swedish iron ore, Germany's capacity to continue the war would certainly be crippled.

THE BUSINESS WORLD

Accident Insurance in War

A GOOD deal has been said and written about the assistance rendered by British insurance to the war effort. The mobilisation of overseas assets; the large subscriptions (especially by life offices) to Government loans; the Ship Warrant Scheme for withholding marine cover from goods destined for the enemy; the administration of war damage schemes by the fire offices; and their campaign to reduce fire waste—all are well known. Little has so far been heard, however, of the specific contributions of the accident departments. This shortcoming was made good in an interesting lecture given recently by Mr A. F. O'Shea, accident superintendent of the Royal Insurance Company, before the Insurance Institute of London. Mr O'Shea made available much information not hitherto published. The record contains nothing spectacular, but the long list of special wartime arrangements constitutes in turn a solid body of achievement and adaptation, involving considerable work on behalf of the Government, and many departures from well-established principles and practice.

Of the various classes of business which make up the combined accident account the largest and most important is motor insurance. Partly for this reason, but chiefly because of the many schemes introduced by the Government for husbanding the nation's motor resources, this class takes the leading position in Mr O'Shea's survey. On the outbreak of war, one of the first projects to require consideration related to the insurance of vehicles acquired by local authorities for Civil Defence purposes; and the Ministry of Home Security, in the interests of administrative economy, asked insurers to quote flat premiums, differentiating only between whole-time and part-time use. This was a somewhat startling innovation, because it involved the complete abandonment of the usual rating system, based on such considerations as the type, size and value of the vehicle, the use to which it would be put, and the district; in Mr O'Shea's words, "a small private car in Cornwall was to carry the same premium as a five-ton lorry in London." Moreover, little was known concerning the numbers of each type or the distribution of the vehicles. Nevertheless, a premium was fixed which, in the result, proved to be reasonably correct. Later, on the formation of the National Fire Service, a further departure was made from normal practice in the issue to the Ministry of Home Security of three master policies (likewise at flat premiums) covering all NFS vehicles, and subscribed to by all insurers, who share the premiums and losses.

The insurance of commercial vehicles in wartime has presented many difficult problems, arising from the official Road Groups and Road Haulage Schemes, and the numerous unofficial local groups, mainly among retail traders for pooling of very work. Prior to the war, rates were graded steeply according to the type of licence—"A," "B" or "C"—held; yet, on the introduction of the Road Groups Scheme, insurers expressed their willingness to maintain policies in any general change in rates, although this involved the insurance of "A" or "B" licence work at "C" licence rates. Under the present Road Haulage Scheme, the Ministry of War Transport has a virtual monopoly of long-distance haulage work. A large number of haulage firms were selected to act as "Controlled Undertakings" in different centres, and the insurances of these concerns are being continued without the normal driving restrictions. In addition, other firms were invited to hire their vehicles to the Ministry, and trolled Undertakings" for operation—these are being insured at agreed rates varying only with the tonnage. Insurance is also being provided for the Ministry against its liability as a carrier of goods, this being accomplished by a single policy subscribed to by all interested insurers. A feature of this arrangement is that, although no payments are made in respect of "Government goods," i.e., goods carried on behalf

of other Government Departments, insurers are nevertheless asked to submit reports, so that the Ministry has the benefit of their expert investigations into allegations of negligence.

A question which had to be decided at the outbreak of war was the interpretation to be placed on the war risks exclusion clause. This had been drawn in very wide terms, and it was arguable that any claim arising from the black-out, for example, or through a doctor answering a call "to attend air-raid casualties," was a "consequence direct or indirect of war" and therefore not the subject of indemnity under the policy. Such a situation would, of course, have been impossible, and all insurers accordingly decided in August, 1939, that only claims arising out of specific acts of the enemy or of the defence services would be excluded. Special arrangements were made, however, in connection with the use of private cars for duty purposes. In the case of Home Guard use, a most simple and effective agreement permit anyone to drive cars for Home Guard purposes, including the carriage of fellow volunteers to and from the place of duty; the War Office, for its part, undertakes to relieve insurers of all liability arising out of use in the face of the enemy, and to indemnify them in respect of forces against another. As regards private cars belonging to officers in the regular forces, the use of these for duty purposes was insured at additional premiums which, however, have now been abolished owing to administrative difficulties. Special arrangements were also made from time to time to meet the needs of voluntary organisations, like the Women's Voluntary Service, and to provide insurance in connection with the Volunteer Car Pool, the national reserve of cars created by the Ministry of Home Security for use in emergency.

So much for motor insurance. In workmen's compensation the problem of the transferred employee came before insurers in a wide variety of forms, from the shop assistant who might be called upon to salvage the goods of a neighbouring shopkeeper under a Mutual Aid Scheme to a workman transferred from one employer to another on a semi-permanent basis. But after joint discussions with the Home Office and Ministry of Labour, arrangements were made which safeguarded the workman's position and protected both employers. In 1940, when the London Regional Commissioner assumed responsibility for the demolition and clearance of bomb-damaged buildings in the Greater London area, a Site Clearance Risks Pool was formed to handle the insurance at an agreed loss ratio, an arrangement later extended to other regions. Mr O'Shea states that the experience had proved very much better than was expected in fixing the original rate, because it had been possible to carry out the work without undue haste instead of labouring at great pressure, as had seemed almost inevitable at the time. Ordinary third party (other than motor) insurance—where similar arrangements to those for workmen's compensation were made in connection with site clearance—brought some difficulties created by bomb damage, but insurers "have gone as far as was reasonably possible to place a generous interpretation on the change of risk clause," and have also accepted, often without extra premiums, the additional hazards consequent upon the introduction of shelters, sand-bags and other protective devices, some of which have given rise to serious claims. In burglary insurance, normal requirements in the way of protection have frequently been incapable of fulfilment owing to raid damage or the necessity of permitting access to premises by Fire Guards; another factor has been the extent to which private premises have been left unoccupied during daytime, because of the call for labour. In this latter connection insurers, in response to an approach by the Board of Trade, undertook not to charge a higher rate because of such unoccupancy.

to insist upon reasonable precautions being taken. Stolen goods have a ready market under present conditions and that insurance has remained profitable without any general increase in rates "can be ascribed only to the fact that the best practitioners have been directed to more laudable pursuits." Additional hazards in personal accident insurance were created by the "black-out," and by participation in Civil Defence, Home Guard and other wartime activities, and these were usually accepted without extra premiums. The war risks exclusion clause has been interpreted, in respect of accidents happening in this country, as excluding only specific acts of the enemy or the defence services; assurances were given to the Home Office, in relation to group policies for Volunteer Fire Brigades, and to the Board of Trade, in relation to Home Guards, that the clause would be regarded as excluding only injuries defined as war injuries in the Personal Injuries Act, 1939, so that policy holders would be sure of protection either under their policies or under the Act. A special scheme was prepared at the request of the Ministry of Agriculture for the insurance of school-boys and adults engaged in agriculture,

and a similar scheme is under discussion with the Air Ministry for members of the Air Training Corps. In fidelity guarantee insurance, shortage of staff has in many cases rendered it impossible to adhere to stipulated systems of supervision, but insurers "have generously met many claims which they could have avoided had they wished."

The foregoing conveys, in broad outline, only the highlights of Mr O'Shea's address, which covered the whole subject in considerable detail. Mr O'Shea stressed the co-operation between all insurers—tariff and non-tariff companies, and Lloyd's underwriters—which has been so valuable a feature of the conduct of accident insurance in wartime. Indeed, without such co-operation many of the rating concessions and simplifications would have been impossible. Insurers have, no doubt, been fortunate in that during the war period the underlying trend in loss ratios on the two major classes of accident business—motor and workmen's compensation—has been downwards. This has enabled them to shoulder the additional commitments without noticeable reactions on profits which have, in fact, been better than in many pre-war years.

Business Notes

Motorways

The "Motorways for Britain" exhibition, organised by the British Road Federation and opened on December 9th, in London, has been designed to focus attention on the attractions of a system of high-speed motor roads and, presumably, to create a body of public opinion in favour of their construction as soon as possible after the war. In a speech following the opening ceremony, Sir William Rootes, chairman of Messrs Rootes, Limited, went to the heart of Great Britain's post-war economic problem:—

If we are to retain our prestige in the world, and restore the wealth of these islands, we cannot do so with worn-out tools. Rather must we be prepared to have the best equipment, and fearlessly scrap that which is out of date.

Transport is one of the most important of these tools and, because of its universal use, one of the first that should be brought to the highest pitch of efficiency within the limits of technical knowledge. In its compactness and geographical position Great Britain has a great natural advantage, and one that provides the conditions for the best transport system in the world. The approach to the improvement in the transport system, however, should not be a sectional one. The plea of the British Road Federation for a thousand miles of motorways should be considered in the general context of inland transport needs and facilities. True, the case for motorways is not new. It has long found powerful support, not only among road users and those who provide the means of road transport, but also by technical experts. And the need for an improvement in Great Britain's roads, for fitting them to their modern tasks, need no longer be argued. The question is whether investment of, say, £100,000,000 in the construction of the proposed motorways will yield a higher return to the community than the investment of an equivalent amount in other transport facilities. It may well be that the test of experience would provide a favourable answer, especially on the reasonable assumption that traffic will continue to grow after the war. But a thousand miles of motorways can hardly be constructed in a single year; in practice, the programme might have to be spread over a period of about five years. The best approach, therefore, might be to try them out between a number of suitable points as soon as possible after the war and, if they are successful, to extend them without delay. It is very doubtful whether a subsidy would, or should, be forthcoming from public funds; but if the reduction in transport costs between the points linked by motorways exceeds the interest on the capital invested plus maintenance charges, there should be no need for a subsidy.

Squeezing the Lender

No excuse is needed for returning to the question of the conduct of Brazil as a debtor, since the principles involved are of fundamental importance for all international finance. An opportunity is provided by a further statement of Lazard Brothers. In this case the issue in question is that

of 6 per cent guaranteed mortgage bonds of the Bank of the State of San Paulo. The general history of Lazard's efforts and their experiences are, *mutatis mutandis*, similar to those discussed on page 790 of *The Economist* of last week, but on this occasion there are more details of the action of the Brazilian Government in the matter. After the default of 1931, when the Federal Government ceased payment on some of its loans, including some described as "secured on the Customs receipts," holders of the Bank's bonds continued to receive full service for fifteen months and interest for a further six. This suggests recognition of the fact that, whatever might be happening to Brazil as a whole, the State of San Paulo as the chief source of coffee—and therefore of foreign exchange—was in an exceptional position. Thereafter, until the conclusion of the Aranha Plan, the equivalent of the service was deposited in local currency. Lazard's claimed exemption from that plan on the ground that the bonds were not a Federal, State or Municipal issue. The plea was rejected, but, although the plan provided for the full service in milreis to be deposited, the bonds were excluded from this protection because their service was not included in the Federal, State, or Municipal budgets, and the earlier deposits were withdrawn. At this time the Bank held substantial sterling securities which it realised. Lazard's claimed that the net proceeds should be used for the service of the bonds, since the ostensible reason for the default was merely lack of foreign exchange. This request was not granted, but the Brazilian Government decided that the proceeds should be used to redeem bonds, chiefly by tender. Some bonds were paid off at 47 per cent, but on the last occasion notice was given that no tender above 30 would be accepted.

The position now is that the Bank is very prosperous and is paying a dividend of 10 per cent on a capital which has recently been doubled by a 100 per cent bonus. Meanwhile, it is to pay on the excellently secured bonds in the hands of British investors one-third of its interest and one-tenth of contractual sinking fund. The Bank is, apparently, still in receipt of foreign exchange which it has used to buy up the bonds at low prices caused by default. There is now no shortage of foreign exchange. The milreis—rechristened cruzeiro—is a specified currency of which the Bank of England is prepared to buy any supplies available. Foreign companies operating in Brazil are receiving foreign exchange even to pay ordinary dividends. The whole story confirms the belief, expressed here more than once, that Brazil's intention has throughout been to escape from her obligations as lightly as possible and that she was enabled to do so by persistent disagreement between the representatives of America and Britain, and by the inability or unwillingness of the British authorities to play any effective part in securing reasonable terms. The result is not only to deprive this country of much-needed foreign exchange, but to strike a very severe blow at the carefully built up principles of international lending, a blow from which future lenders and borrowers alike will suffer for a long time to come.

Premium Bonds in India

The Government of India's anti-inflation campaign is gathering momentum rapidly, though not too rapidly for the needs of the situation. Following the issue of a large number of orders attempting to control speculation and hoarding in essential produce and the initiation of substantial official sales of gold in the open markets, the authorities have now decided to start a state lottery. There will be two lotteries, the first consisting of bonds of 100 rupee denomination and the other of 10 rupee bonds. The issue should thus appeal to every part of the income strata in India. The two lotteries will be in series, each totalling 10,000,000 rupees in the case of the larger bonds and 1,000,000 rupees for the smaller. The bonds will bear no interest and will be repaid at par after five years. There will be half-yearly drawings for prizes, which will range up to 50,000 rupees. The total half-yearly prize money will represent 1 per cent of each series, and the funds will thus be raised by the Government of India on a 2 per cent per annum basis. The response to a straightforward 2 per cent loan would probably be negligible. Reports from India, however, already suggest that the demand for the lottery bonds will be on a substantial scale. No limit has been placed on the total issue of bonds, and it is the hope of the Indian authorities that the response will be sufficient to absorb a considerable part of the redundant purchasing power (redundant only in relation to available consumption goods) which has bedevilled the Indian economic system for the past three years. On the general principles involved one would hesitate to applaud the decision of the Government of India; but as an expedient to deal with an urgent and abnormal situation the move will probably be justified. It may be well to remember that the Soviet Government normally has on tap two state loans, one bearing interest at 4 per cent, the other consisting of interest-free lottery bonds which cost the state rather less than 4 per cent. The public response to these issues is of the order of 9:1 in favour of the lottery bonds.

Preparing for Peace

In his address to the annual meeting of Singer Motors, Ltd., Lord Latham, chairman of the company, emphasised the need for adequate preparations by industry to carry out a speedy and smooth transition from war to peace production:—

The capacity of industry to re-absorb those returning from the forces, to find work for those now engaged on munitions, and therefore the avoidance of unemployment, will rest in no small measure upon industry being permitted to plan in advance the means and methods of the change-back to peace-time production and to employ for that purpose a reasonable number of technical and pivotal workers on the essential preparatory work. Works will need to be reorganised; lay-out of plant and machinery restored; and a hundred and one things of that order done, according to particular circumstances, before actual production can be commenced.

In Lord Latham's view, it is not too soon to urge upon the Government to permit, "at the earliest possible moment consistent with the needs of war," the employment, and if need be, the release of such personnel as is required to prepare for a change-over with the least disturbance of employment. Lord Latham's emphasis on the need for preparations is timely. Some of the preliminary work is, in fact, being carried out by the Board of Trade, which is eliciting the views of industry on their change-over problems. But the work might now be carried a stage farther by permitting industrialists, as far as possible, to make the technical arrangements necessary for the speedy resumption of peace production. Of the motor industry Lord Latham said that the change-over problems are neither few nor simple; he could discern no grounds for easy optimism. Industrial firms, including motor manufacturers, will have to undertake substantial capital expenditure in re-tooling, and many of them may not be able to meet this expenditure from their own resources. Lord Latham, obviously, was

anxious to stress the magnitude of the problem. In doing this he was rendering a service to the community, for nothing could be more harmful in its effect than a spirit of insouciance.

Outside Placings

The *Economist* has more than once expressed surprise and regret that the Treasury should forbid the recognised stock exchanges to deal in certain securities, but permit outside houses to carry on a traffic in the same shares. So long as these issues were solely, or mainly, additions to the amount of shares of a given company which already had the same security quoted in the market, the ill-effects of this policy were largely limited to inconvenience to shareholders, the waste of time in settling business and of labour and paper in advertising, and the discouragement of legitimate traders. Recently, however, there has been a large and growing number of cases in which issues of stock in new concerns have been made by this system of private placing outside the stock exchanges. In these cases there is an added danger, and one which may adversely affect the reputation of the Stock Exchange among the unthinking, although nobody but the Treasury will be to blame. It is common knowledge that the law demands certain information in a prospectus which is not insisted upon in an offer for sale. In recent years the new issues sub-committee of the Stock Exchange has added to its demands until the information which has to be published, before it will grant permission to deal in an issue by either method, considerably exceeds that required by law for an offer by prospectus. This is a great protection for the investing public. It stops some issues altogether and it draws the attention of the investor to some at least of the relevant facts concerning those which are made. The outside houses, naturally enough, make no such stipulations, and, too often, either little is heard of the actual placing or the information is insufficient for anyone to pass a reasonable opinion on the issue's merits. It almost seems as if the Treasury's view is that anyone foolish enough to place his savings in anything but British Government loans deserves to lose them. Such a rigid and partial interpretation of the investor's obligations would be a disservice to the country, even in wartime when, in any case, a ban on issues is possible. There is reason to suppose that the dispersal of savings will continue. Every effort ought always to be made to reduce the number of cases in which the dice are weighted against the investor. But special care is essential with a host of small savers in order that they may be encouraged to take the legitimate risks without which the finance of real enterprise is impossible. The Stock Exchange has, for well over a decade, done its best to achieve this object. It is particularly hard that it should be thwarted by a department whose duty is surely to promote sound financial principles without discouraging initiative.

TDR's on Top

The November clearing bank returns published towards the end of last week, show one interesting change—the overhauling of investments by Treasury deposit receipts as the banks' largest asset, which has been so long prophesied and so inexorable in its coming that it has lost much of its news value. Last month's jump in the banks' TDRs amounted to £51,500,000 and carried their total to £1,186,500,000. Investments for their part also rose, but by only £8,730,000 to £1,166,863,000, and so are displaced from their leading position on the assets side of the aggregate return. Given the big TDR demands made on the banks this month, the gap between the two items must be widening very rapidly. The other important movement shown by the returns is a fall of £15,910,000 in loans and advances. This item, which touched £1,013 million in October, 1939, has dropped almost continuously to £723,962,000. The chronic liquidity of commercial and industrial concerns in this country is reflected in this substantial and continuous repayment of bank advances. More and more of the working capital required by war industry is being provided by the progress payments of the supply departments. Deposits last month rose by £51,862,000 to a new record level of £3,864,550,000. Their real rise was understated by £7,434,000, since cheques in course of collection and items in transit fell by that amount during the month.

Chinese Exchange Control

Messages received from Chungking suggest that important changes have been taking place in the mechanism of exchange control in China. The Chinese Currency Stabilisation Board, on which Britain and the United States were represented as well as China, has been dispossessed of some of its functions, and from December 1st these have been taken over by a purely Chinese Exchange Control Commission. The Commission has restricted foreign exchange dealings to nine authorised banks. That seven of them are Chinese institutions and the other two are the Hongkong and Shanghai Banking Corporation and the Chartered Bank of India, Australia and China. This restriction of exchange business to a few selected institutions is of no great importance at the present moment. Chinese exchange business has virtually disappeared and is merely concerned with the trickle of charitable, diplomatic and personal remittances to China. In any case the Hongkong and the Chartered are now the only foreign banks represented in China. Their inclusion in the list of authorised exchange banks must not necessarily be taken to imply the exclusion of all other foreign banks from exchange business when normal conditions return and the great Chinese ports are once again opened to international trade. Without freedom to engage in exchange business few foreign banks would choose to return to China, and the latest regulations will probably be modified in due course.

Barclays Bank (D.C. and O.) Follows the Flag

Special interest attaches to the annual reports of Barclays Bank (Dominion, Colonial and Overseas), for this is the institution which has followed the British armies in their conquering advance through East and then North Africa. The latest report announces that the branch in Addis Ababa, opened in July, 1941, has been closed, the special needs for which it was established having been fulfilled. But branches have been opened in Libya, at Tripoli and Benghazi, and in Somalia at Mogadishu. The bank has played a great part in serving the needs of the Mediterranean and Middle Eastern armies, and this no doubt helps to explain the exceptional expansion in its figures over the past three years. Between September 30, 1940 and 1943, its deposits have risen from £126,501,000 to £247,774,000. The expansion over the past year finds its main counterpart in cash, bills, and investments. The bank has shared the experience of most British banks in finding very poor demand for its advances. The general increase in liquidity responsible for this has had the effect of releasing a considerable proportion of the funds which the bank had previously set aside as provision for doubtful debts. As a result, £300,000 has been transferred from this source to the Reserve Fund which has thus been raised to £3,600,000, against an issued capital of £4,975,000.

Australian Exchange Control

The Australian exchange control regulations have this week been tightened in order to cover certain activities of overseas subsidiary companies controlled by persons in Australia. The most important amendment is one which allows the Australian authorities to compel persons controlling such a subsidiary to declare and pay a dividend if the position of the subsidiary warrants it. By ploughing back the profits of such subsidiaries it has been possible for certain persons in Australia to evade the exchange regulations, since the profits in question were retained in the subsidiary's country of operations and thus withheld from the Australian Exchange Control. If a dividend is actually declared, the exchange in question must be offered to the control in exchange for an equivalent amount of Australian currency. These amendments of the Australian regulations bring them into line with the provisions of the United Kingdom Defence (Finance) Regulations. Under section 5C of these regulations the Treasury or its agent is given considerable discretionary powers over the activities of overseas companies controlled by residents in the United Kingdom. This section was purposely drawn in wide and general terms, which give the authorities effective control not only over the disposal of such companies' profits, but over changes in their assets.

South American Bank Proposal

Another evidence of the sectional approach to the problem of international monetary reconstruction is provided by a message from Rio de Janeiro reporting proposals for the formation of a "Bank of the American Nations." The suggestion was made at a meeting of the Brazilian Economic Congress which represents all important industrial and commercial associations in the republic. The undisclosed author of the plan proposed the creation of an inter-American bank in opposition to the White or Keynes proposals, which, he said, were unacceptable to the South American nations. The new bank would issue currency based not on gold but on the production of the member countries; it would stabilise the exchange values of their currencies and provide a clearing system for settling payments between them. There is no reason why such a project should not take shape and ultimately weld itself in the wider pattern of a truly international monetary system. The Belgo-Dutch monetary agreement has already shown the way in which regional agreements of this kind can be made compatible with currency plans made on a fully international basis. Indeed, the fewer the units that have to be welded into an international system, the easier the task of instituting that system will be. The main obstacle in the way of the South American scheme will be to obtain the required hegemony of monetary policy among the various countries concerned. Past experience has shown that in no other part of the world has there been greater disparity in currency and credit technique and in commercial and financial morality. If some unification can be achieved in these matters, the cause of international stability—whether underpinned by a White or Keynes plan—will have been served.

The Coal Control

It was not expected that the miners would be enthusiastic about the Government's new plan for improving the control over the coal industry, since they have consistently maintained that, without financial as well as operational pooling, the Ministry's Regional Control cannot function effectively.

HOME SERVICE

In the Prudential this means:

- ★ Attendance each week on policy-holders at about 5,000,000 homes.
- ★ Payment each week of £500,000 in claim moneys to policy-holders at their homes, often within 24 hours.
- ★ Payment each week of £100,000 to members of The Prudential Approved Societies at their homes.

"Home Service" follows Prudential policy-holders and Approved Society members wherever they go. Holders of more than 2,500,000 policies change their addresses each year—continuity of "Home Service" is assured to them.

POLITICAL AND ECONOMIC PLANNING,
16, Queen Anne's Gate, London, S.W.1.

The Miners' Federation has now turned down the scheme, as completely inadequate to meet the needs of the present situation. The Minister of Fuel's proposal to group the pits in each region, under group production directors, would simply have the effect of strengthening the position of the present colliery company agents, and undermining the authority of individual colliery managements. The only difference it would make would be that company agents would be paid from the Coal Charges Account instead of by their coal companies. The whole position is extremely unsatisfactory, and the sharp decline in output during the last four weeks—shown in a table on page 828—increases the need for speedy decision. Last month only two districts qualified for the output bonus, and it is surely time that Lord Greene's recommendation that the bonus should be transferred from a district to a pit basis should be adopted. The miners and the Government agreed to the proposal some ten weeks ago, but the owners, for no very clear reason, have apparently delayed the decision indefinitely. The miners are particularly resentful at the delay in dealing with their wage claim, which is the principal grievance in the coalfields. They have asked the owners to grant a minimum of £6 a week for underground and £5 10s. for surface workers. If no agreement is reached, the claim will be referred to the Tribunal.

Coal Utilisation Research

With the continuing decline in coal production and the difficulties of maintaining the industry's manpower, the need for maximum economy and efficiency in coal utilisation becomes more pressing, and it is satisfactory to learn from Sir Evan Williams' presidential address that the British Coal Utilisation Research Association has made excellent progress during the past year. BCURA is now six years old, and has become the largest co-operative industrial research enterprise in the country. One of the most important developments has been the research into hydro-carbon oils from coal by more efficient methods than the German Fischer-Tropsch process, which is highly wasteful of coal. The Association is also co-operating in the development of chemical products based on coal. The increased efficiency in coal utilisation will be of direct benefit to consumers. A coal fire has been evolved, which, it is claimed, will dispose of the smoke problem, and have a heating efficiency more than double that of the old-fashioned fire. Plans for the mass production of this type of fire are now fairly advanced. The Association has acquired a site at Leatherhead for a central coal research station, and it hopes for the necessary priorities after the war to enable it to be equipped with the most up-to-date plant and facilities. As Sir Evan pointed out, "If we are to maintain our place as an industrial nation in the future, the acceleration of scientific research will be one of the most urgent national duties."

"The Industrial Ten"

The President of the Board of Trade promised that arrangements would be made for the issue of ten additional clothing coupons to industrial and agricultural workers in the current rationing periods as in the last. Accordingly, he announced in the House of Commons on December 14th that applications for the coupons could begin on the following day. The principles follow closely those laid down in the last rationing period. The coupons are distributed by employers, and the onus for applying for them rests with the worker, through the works committee, where one exists. The list of fifty occupations which qualify for the coupons is substantially the same as the last, under which twelve and a half million men and women qualified. Special arrangements are again being made for certain industries such as mining, heavy chemicals and shipyards, in which workers have exceptionally heavy clothing needs. Last year there were two million workers in this category, who qualified for coupons in addition to the "industrial ten." During the current period eligibility for these coupons is to be extended to another three-quarters of a million workers, although ten per cent of those available in the last period were returned.

Cotton Wages Advance

Cotton spinning and weaving operatives are to receive an advance in wages from January 10, 1944, after consideration of their claim by the Conciliation Board, under the chairmanship of Sir Charles Doughty, K.C. The rise agreed upon is a flat rate of 4s. a week for adults and 2s.

a week for juveniles, one-third of the original demand made by the trade unions last month. The increase is to be paid on the same terms and conditions as the increase of 5s. a week granted last January. It is estimated that the higher wages will cost the industry about £35,000 a week, and that it will raise production costs by 2 to 3 per cent. It is believed that employers have already applied to the Cotton Controller for a revision of the fixed yarn and cloth prices to cover the higher production costs.

P & O Accounts

Some changes in the method of presenting their balance-sheet, which certainly achieve a more logical grouping if not increased information, make it difficult to compare the accounts of the Peninsular and Oriental Steam Navigation Company with those of last year. The chief difference, for this purpose, is that current taxation, including provision up to the maximum liability for E.P.T., is shown as a separate item instead of being knocked off the earnings of the fleet. The deputy-chairman, Mr Lang, remarks that, were both to be calculated on the new basis, this year's net profits would be £45,293 higher than last year's, the improvement being due to a larger income from Government securities. The earnings of the fleet may, therefore, be assumed to be, and the dividends from subsidiaries are shown to be, roughly the same as last year. However, if there is first deducted the allocation of £75,000 to provident good service account, which received nothing last year, earnings on deferred stock are slightly lower at £820,469, or 27.9 per cent, against £830,342, or 28.1 per cent. The usual 8 per cent dividend is paid on deferred stock, while the company's reserves, already very strong, are further strengthened by considerably more than last year. The capital position of P and O is a more interesting study than its trading figures. A new contingencies reserve of £1,300,000 has been created, consisting of various war risks provisions, which seem likely to be no longer needed for their original purposes, and of a reserve against contingencies which was previously included among current liabilities; one effect of the previous arrangement was to disguise the true strength of net fixed assets. Tonnage replacement reserve now stands as much as £4,000,000 higher at £7,790,177. In addition to this, there is available for fleet replacement, which is, nevertheless, stated by the deputy-chairman to be a cause of considerable apprehension, a sum of £1,755,100 to the company's credit in the Government tonnage replacement account, against £568,800 last year. The effect of these changes is set out in a table on page 827. Part of this increase is due to the changed presentation of contingencies reserve already mentioned, but the major part is due to an increase of over £3,700,000 in gross liquid assets, which are held mainly in the form of Government securities. Certainly, however considerable the amount of the fleet which has to be replaced—the gross valuation exceeded £21 million in 1941—the P and O has already accumulated a substantial amount towards it. The lack of consolidated statements of profits and assets make it impossible, however, to gauge the true position of the group.

Diamond Shares Payments

Final dividends have been declared during the past few days by three of the four concerns interested in diamonds in which the public is principally concerned. De Beers and Consolidated Diamond Mines of South West Africa pay dividends cover the present calendar year, and that of CAST is

	High 1943	Low 1943	Close Dec. 15th	Dividends Paid 1942-43	10-Year Average	Yield %
Anglo-Amer. Trust 20/-	69/9	35/-	57/6	115	\$6-75	15-36
Cons. African Sel. 1st 5/-	26/-	17/-	22/6	20	12 5	44-47
Cons. Diamond Mines 10/-	47/3	13/10 1/2	39/-	45	8-5	11-92
De Beers Deft. 50/-	460/-	212/6	375/-	70	16	9-59

† For 1942. ‡ Approximate, based on present capital. § Seven years. * Free of tax.

for six months earlier. Anglo-American Investment Trust has still to make its intentions known. The De Beers payment has been described as disappointing, although it is almost double that of 1942, and in general the announcements have led to lower quotations. That there is plenty of room for disappointment is shown by a comparison of

Tuesday's prices with the maximum of the year, which showed a fall of the order of 22½ per cent. Since then a recovery has produced the position set out in the table. *The Economist* has already committed itself to the view that, with good management, and owing to the development of the demand for industrial diamonds, the quasi-monopolistic position of the South African diamond group should enable them to avoid a collapse such as occurred between the two wars. This does not mean, however, that it will necessarily be possible to support even the present level of prices.

Seamen's Welfare

A Committee on Seamen's Welfare in Ports has been set up jointly by the Minister of Labour and the Minister of War Transport, under the chairmanship of Mr H. Graham White, MP. Its wide and comprehensive terms of reference are:—

... to consider the activities and functions respectively of the Government, the shipping industry and the voluntary

organisations in the establishment and maintenance of hotels, hostels, clubs, recreational facilities and other amenities for merchant seamen in ports in Great Britain and in that connection, to consider, in consultation with the voluntary organisations primarily concerned with merchant seamen, their appeals for funds not only for welfare but for benevolent and samaritan purposes whether for expenditure in Great Britain or elsewhere, and to submit recommendations.

The Committee is composed of representatives of ship-owners, trade unions, voluntary organisations and an accountant, and it has received a cordial welcome from the Merchant Navy. That is not to say that seamen's welfare has hitherto been entirely neglected by the Government. In October, 1940, the Seamen's Welfare Board was constituted to advise the Minister of Labour. It has set up and reconstituted local welfare committees in the ports, and under its auspices clubs have been opened. Recommendations of the Joint Maritime Commission of the International Labour Conference have been recognised in the terms of reference of the Graham White Committee. Possibly the chief task of the Committee will be to decide

(Continued on page 827)

BRITISH CELANESE LIMITED

Report of the Directors for the year ended 3rd July, 1943.

To be presented at the TWENTY-FOURTH ANNUAL GENERAL MEETING of the Company to be held at THE GREAT HALL, WINCHESTER HOUSE, 100, OLD BROAD STREET, LONDON, E.C.2, on Tuesday, the 21st day of December, 1943, at 12 noon.

The Directors herewith submit the Report and Accounts for the year ended 3rd July, 1943.

The Balance of Trading Account (after charging cost of Production, including provision for Deferred Maintenance) amounted to ... £3,369,147

The Profit, after providing for General Sales and Administrative Expenses, Excise Duty, Adjustments of Stock Values, Research and Advertising, Patent Rights written off during the year and Directors' Remuneration, amounted to ... 2,181,346

Add—
Bank Interest ... £15,186
Dividends (gross) on Shares in Associated Companies and Sundry Securities ... 14,042
29,228
2,210,574

Deduct—
Depreciation ... £376,000
A.R.P. Expenditure, proportion written off ... 11,422
387,422
Interest (gross) on—
5½% Mortgage Debenture Stock ... 143,254
4% First Mortgage Debenture Stock ... 839
4% Debenture Stock ... 14,388
158,481
Expenses of Issue of 4% First Mortgage Debenture Stock and Redemption of 5½% Mortgage Debenture Stock; proportion written off, less Reserve provided in previous years ... 4,268
Provision for Excess Profits Tax and Income Tax ... 1,312,000
1,862,171

Balance for the year ... 348,403
Brought forward as at 27th June, 1942 ... 511,988
Balance available ... 860,391

Deduct—
(i) Dividends (less Income Tax) on £2,500,000 7½% Cumulative First Preference Stock paid in respect of the year ended 30th April, 1943 ... 87,500
(ii) Interest (less Income Tax) on £1,699,947 5% Funding Certificates paid in respect of the half-year ended 30th April, 1943 ... 21,249
(iii) Dividends (less Income Tax) on £4,250,000 7½% Participating Second Cumulative Preference Stock paid in respect of the year ended 30th April, 1943 ... 159,375
(iv) Funding Certificates purchased and cancelled at the time of issue ... 53
268,177

Leaving to be carried forward as at 3rd July, 1943, free of tax ... £592,214

Trading for the year under review continued to be dominated by Government restrictions due to war conditions.

The balance of Profit (before provision for Taxation) of £1,660,403 compares with the previous year's amount of £1,498,495. The scope of the Company's activities for some time past has covered a much wider field than that of Textiles alone.

CAPITAL EXPENDITURE, MAINTENANCE AND DEPRECIATION.—Net Capital additions for the year in respect of British Celanese Limited and its Subsidiary Companies amounted to £489,391. The amount expended during the year on Maintenance of Buildings, Plant and Machinery, together with a provision for Deferred Repairs, amounted to £568,592. As a result of the transfer of certain assets to a Subsidiary Company, the provision of £376,000 for Depreciation is lower than that for the previous year.

4% FIRST MORTGAGE DEBENTURE STOCK.—4% First Mortgage Debenture Stock was created in April, 1943, limited to a total Authorised amount of £3,000,000, of which £2,572,761 has been issued and was outstanding as at the 3rd July, 1943, in substitution for a similar amount of 5½% Mortgage Debenture Stock which was fully redeemed on the 30th June, 1943. The expenses incidental to the issue of the new 4% First Mortgage Debenture Stock totalled £158,033, of which £124,955 has been carried forward in the accounts submitted.

4% DEBENTURE STOCK.—A further £238,000 of this Stock was issued during the year, bringing the total issued as at 3rd July, 1943, to £400,000, out of a total Authorised amount limited in the first instance to £550,000, which may be increased to not exceeding £1,500,000 as provided by the Trust Deed securing the Stock, subject to the conditions therein contained.

RESEARCH AND ADVERTISING.—The amount written off for the year, including Patent Rights, amounted to £170,587, which compares with £163,227 for the previous year. The amount carried forward is £179,104.

TAXATION.—The provision for taxation in the Accounts submitted is sufficient to cover the Excess Profits Tax liability and in addition, as formerly, the ultimate Income Tax liability based on the present standard rate, on the profits to the 3rd July, 1943.

WAR DAMAGE CONTRIBUTIONS AND PREMIUMS.—The liability for the year amounting to £53,766 has been added to the amount carried forward in Suspense Account, which now totals £252,133.

FUNDING CERTIFICATES.—In accordance with the conditions of issue of the Funding Certificates, the amount of £14,639 requires to be applied out of the profits for the year for the purchase or redemption of Certificates.

BOARD OF DIRECTORS.—The following Directors retire in accordance with the Articles of Association and, being eligible, offer themselves for re-election:—Mr. Walter MacLachlan; Mr. Thomas Levy, M.P.; Dr. M. Soller.

AUDITORS.—The Auditors, Messrs. Thomson McLintock & Co., retire and, being eligible, offer themselves for re-election.

By Order of the Board, W. H. POXON, Secretary.

CELANESE HOUSE,
HANOVER SQUARE, LONDON, W.1.
2nd December, 1943.

COMPANY MEETINGS

THE COMMERCIAL BANK OF SCOTLAND, LIMITED

SATISFACTORY RESULTS—INCREASED PROFIT

FIELD-MARSHAL LORD MILNE'S ADDRESS

The annual meeting of the shareholders of the Commercial Bank of Scotland, Limited, was held, on the 16th instant, at Edinburgh. Field-Marshal Lord Milne, G.C.B., G.C.M.G., D.S.O., the deputy-governor of the bank, presided in the absence, through illness, of the governor, the Earl of Mar and Kellie, K.T. Before commencing the business of the meeting the deputy-governor made suitable reference to the loss sustained by the bank during the year through the death of Lieut.-Com. Sir August B. T. Cayzer, Bart., one of the extraordinary directors.

The deputy-governor in submitting the report said:

I am sure we all very much regret that illness has prevented the governor of the bank, the Earl of Mar and Kellie, K.T., from taking his accustomed place to-day, and I propose, with your approval, to express to him our sympathy and the hope that he will soon be restored to health again.

His Lordship's absence provides for me the opportunity and pleasure of meeting you again and submitting for your approval the report and accounts on the working of the bank for the past year. The figures, with which we will deal, reflect very clearly war-time trends, and I should like to place before you, particularly as we meet at a time when the course of the war with Germany has turned in our favour, to what extent and in what ways this old institution has met the needs of the times through which we are passing.

RELEASE OF MAN-POWER

In the first place, as a soldier, I am interested to hear what it has been possible to achieve in the way of release of man-power for the Services. Looking to the fact that out of a pre-war male staff numbering 1,352, no less than 804 men have gone to the Services, I think you will agree with me that it reflects the very greatest credit upon the small remaining pre-war staff and the temporary female staff, which has had to be recruited and trained, that the day-to-day business, which in many directions has been increased by war conditions, has been carried on with so little, if any, inconvenience to the public. Not only has this large proportion of men been released by the substitution of women who, as I have said, have had to be trained, but the total number now employed is some 15 per cent. less than the pre-war figure.

ALLOWANCES TO SERVING MEN

I think you will be interested to note the attitude your directors have adopted towards the question of allowances to serving men, and I am glad to be able to say that a system of fixed allowances, based on salary, has been in operation throughout the whole period of the war. These are not diminished when men obtain promotion and increased emoluments in the Services. As a result there remains a stimulus towards application and the acceptance of responsibility which I regard from my experience to be of the very greatest value, both now and in the future. I think that you have every reason for satisfaction that such a wise, generous and farseeing policy has been adopted by your governing body. An analysis of the ranks reached in the three Services, recently compiled, shows that there are approximately 40 Officers in the Royal Naval Volunteer Reserve, 160 Officers in the Army, and 50 Officers in the Royal Air Force, drawn from the staff of the Bank. Many others have reached senior non-commissioned rank and 12 of our staff have been decorated or mentioned

in despatches. Fortunately the casualties so far have been on a very much lighter scale than in the last war, but even so, 33 have been killed or died on Service, three are missing and 17 are prisoners of war. To the relatives who are suffering bereavement or passing through times of grave anxiety I would express our profound sympathy.

BALANCE SHEET—LIABILITIES

Turning to the balance sheet we find very substantial increases under nearly all heads. The Note Circulation has again increased by nearly £900,000 and stands at the high figure of £8,641,000.

Deposits and other credit balances have reached the record figure of £76,556,000, or over £8,000,000 more than a year ago. That increase is spread generally throughout our branches.

Acceptances and engagements on account of customers are also higher.

ASSETS

On the assets side you will find the first five items, representing cash, bank balances, money at call and short notice, and British Government treasury bills and deposit receipts make a total of £29,000,000. To that is added the amount of our investments, which for practical purposes, are now almost entirely British Government Securities. These amount to over £50,000,000, and when added to the cash items provide a total of just over £80,000,000 or 94 per cent. of our liabilities to the public in respect of Notes in Circulation and deposits. The British Government Securities have been carefully chosen as to maturity dates, and it is satisfactory to note that the market value at the date of the balance was greater than the amounts appearing in the balance sheet.

Bills discounted and loans and advances together amount to £9,695,000, which is a low figure in relation to our resources. Our experience of a reduced loan and advances item has been common to most banks and is incidental to the circumstances of war-time finance. Ready and liberal facilities have been granted to our customers engaged in the carrying-out of contracts for the Government, but the intervention of Governmental Controls in many commodities and the liquidation of stocks by customers who, in normal times, required seasonal finance for replacement purposes, have tended to keep our advances figure lower than would normally be the case. It can be seen, however, that we are in a very favourable position to meet the demands of our trading customers when, as we hope may be the case at no very distant date, they can again utilise properly the facilities available to them.

Our property accounts show only minor change in the year.

PROFIT AND DIVIDENDS

As to this year's results, it is satisfactory to note that the profit at £320,792 is £34,517 more than the previous year. Out of that profit the directors have allocated £70,000 to reserve fund; £50,000 to a fund for deferred repairs and renewals to property; £40,000 as an addition to the funds of the Pension Trust and £10,000 to the Widows' Fund.

Interim Dividends on the "A" shares of 7½ per cent., and on the "B" shares of 5 per cent., less income tax, were paid in July last, and it is now proposed that a further distribution of 7½ per cent. on the "A" shares (making 15 per cent.

for the year) and 5 per cent. on the "B" shares (making 10 per cent. for the year), both subject to income tax, be approved. After payment of these dividends and allocations the carry forward to next year's account amounts to £69,655.

RESERVES

In addition to the £70,000 added to the reserve fund from this year's profits, you will have noticed that the sum of £230,000 has been transferred to the fund from contingency account. During the years of great uncertainty through which we have been passing allocations have been made to contingency account instead of to reserve fund, and I think you will agree that it is satisfactory that the directors now feel it suitable to make this transfer to the published reserve, bringing it up to £3,450,000, or £1,200,000 more than the paid-up capital of the bank. It is obviously desirable, in view of the substantially increased figures of the balance sheet, that the ratio of capital and reserve to public liabilities should, if possible, be increased.

CONTRIBUTIONS TO GOVERNMENT LOANS, NATIONAL SAVINGS CERTIFICATES AND BONDS

It may interest you to know that our direct contributions in new money to the Government during the war, by way of loan in one form or another, now amount to £36,000,000, and on behalf of customers, loan applications have passed through our hands aggregating almost £39,000,000, of which more than £14,000,000 represents small savings invested in National Savings Certificates or Bonds of small denomination, giving a grand total of approximately £75,000,000. I think, therefore, from what I have said it will be evident that our contribution to the war effort in man-power, finance and general service, has not been an unimportant one.

TRIBUTE TO STAFF

I feel that in these difficult times a special word of thanks and praise is due to the bank staff. Four years of war means four years of strain, physical, mental and, at times, financial. A strain which the civilian population of this country has endured with superb courage and ceaseless devotion to the duty on hand. In the efficient services of the bank there has been no relaxation of effort. Great credit is due to our public spirited general manager, Mr Erskine, and to the loyal and competent officials and staff of the bank, both at head office and throughout the branches. Later I will ask Sir Thomas Henderson to propose a special vote of thanks to that effect.

The Deputy-Governor then moved the adoption of the report and the motion, having been seconded by Mr Inglis, was put to the meeting and carried.

VOTE OF THANKS TO DIRECTORS AND STAFF

At the close of the meeting, on the motion of Sir Thomas Henderson, a vote of thanks was accorded to the directors and the staff for their services during the year, and acknowledgment was made by Mr Houston on behalf of the directors and by Mr Erskine, the general manager, on behalf of the staff.

CANADIAN BANK OF COMMERCE

RECORD TOTAL ASSETS FIGURE

At the annual meeting of The Canadian Bank of Commerce, held in Toronto on the 14th instant, the president, Mr S. H. Logan, paid high tribute to Britain for the Allies' fortunate position to-day and said that the achievements of Great Britain alone constituted an imperishable epic in human history. The Allies' war effort was now supported by the full power of the United Nations with an armament about

three times greater than that of the Axis, of which the British Empire produces nearly a quarter. American war production was now sufficient to equip ten million men for the armed Services and provide lease-lend supplies of nine billion dollars annually. Canada's war effort was on a vastly greater scale than last year, and she was now the third largest exporter in the world. To carry on foreign trade after the war, however, Canada would have to meet the needs of world consumers in a highly competitive market, but after first post-war uncertainties the demand for civilian goods, aided by rehabilitation, would bring high employment and generally active business.

The general manager, Mr S. M. Wedd, said that the bank's total assets were now the highest in its history and there were over one million deposit accounts. This year Canada's industrial activity had reached a new high record, but her primary industries all showed lower production. The shift from war to peace economy would inevitably complicate matters, but he thought a smooth readjustment could be achieved through the co-operation and determination which had characterised Canada's outstanding contribution to the war.

GOODE, DURRANT AND MURRAY, LIMITED

A SATISFACTORY BALANCE SHEET

MR JOHN HEWITT'S STATEMENT

The forty-fifth ordinary general meeting of Goode, Durrant and Murray, Limited, was held, on the 15th instant, at Woodberry, Wood Road, Hindhead, Surrey. Mr John Hewitt (chairman of the company) presided.

The following is an extract from the statement by the chairman which had been circulated with the report and accounts and was taken as read:—

I have pleasure in presenting the company's balance sheet for the year ending July 20, 1943. During the year under review controls comprising licences, allocations, sponsorships, &c., have certainly not been relaxed, but I am glad to report that, in spite of the difficulties with which we had to cope, the balance sheet which I have to present can, in the opinion of the board, be described as quite satisfactory.

As I advised you in my remarks at last year's annual meeting the board had decided to redeem the £111,000 of 6½ per cent. notes then outstanding, and this was accomplished on December 20th last.

This sum, of course, had to be remitted from Australia, and the consequent loss of exchange, amounting to £27,750, had to be faced, the greater portion of which has been found from the profit of the year now under review.

It is this charge that accounts for the drop in the balance of profit in comparison with the figures shown in our last balance sheet, amounting to £9,588.

DIVIDEND MAINTAINED

The charge of £3,006 in these accounts is for interest for five months for the now extinct note issue, and, as it is a non-recurring charge, your directors feel justified, in spite of the reduced amount of profit shown, in recommending the continuation of the small ordinary dividend of 2½ per cent. The payment of this dividend will still enable us to carry forward from this year's profits a sum of £2,286, thus bringing the total carry forward figure to £11,873.

Since my last report the company's standard for excess profits tax has been agreed with the Income Tax Authorities, but, owing to past losses and deficiencies, there is no liability under this heading at the present moment.

Turning to the balance sheet, you will find that our liability has increased by £136,000, and reserves for income tax, exchange, etc., show an addition of £25,000,

but if we deduct the £111,000 outstanding on notes last year the net increase in liability is £50,000, whereas our floating assets show an increase of £69,000. The total of floating assets is more than double our floating liabilities. Cash in hand and at bank, at £105,000, shows a reduction of only £10,398, in spite of the fact that we have had to find £111,000 from our cash for the liquidation of our note liability.

The report and accounts were unanimously adopted.

IMPERIAL SMELTING CORPORATION, LIMITED
BUSINESS WELL MAINTAINED

The fourteenth annual general meeting of Imperial Smelting Corporation, Limited, was held, on the 16th instant, in London.

Mr P. E. Marmion presided in the unavoidable absence of Mr John R. Govett (the chairman).

The following are extracts from the chairman's statement circulated with the report and accounts: The profit of the corporation amounted to £119,167 net, which compares with £119,352 net in the preceding year. The directors recommend a dividend on the ordinary shares at the same rate as last year, namely, 4 per cent.

The Corporation's E.P.T. standard plus the income from outside investments this year is equivalent, after meeting the preference dividend, to 7½ per cent. on the ordinary capital. The items, however, disallowed for E.P.T. and income tax, viz., War Damage Insurance, sinking fund allocations, etc., plus tax thereon, amount to £92,000, or equivalent to approximately 3½ per cent. on the ordinary capital. In view of the uncertainties of the future your directors deem it expedient to continue to debit these items to revenue account. I need not concern you with the question of profits in excess of 7½ per cent., for, in effect, E.P.T. absorbs any surplus that is earned.

The Corporation and its subsidiary companies have continued to play their part in war production and have again responded well to the many calls that have been made upon them.

EFFICIENT UTILISATION OF RESOURCES

The products of the industries in which we are engaged are essential to the national defence as well as to many of the country's major peace-time industrial activities. While the war lasts our sole objective must be the efficient utilisation of all our resources in the national interest. This duty, however, has not prevented the study of new problems in both production and fabrication which it is clear we will have to face when peace and reconstruction take the place of war and destruction. We feel justified in believing that industries which are essential to peace as they are to war will be expected to continue their activities without diminution, and we are framing our policy for the future in accordance with this belief. Our success will depend on our ability to maintain our operations, and in so doing giving security of employment to a large body of men. I am hopeful we will succeed.

The works councils, to which I referred last year, have fulfilled our expectations to the utmost. The councillors, representing both management and employees, have given of their best, and I am satisfied that the results attained will go far in promoting and maintaining the good relations so essential to good work. To them I express my thanks.

The National Savings Groups at all of our works have shown substantial increases in the amounts subscribed, and it is worthy of note that during the recent Wings for Victory Campaign our staff and employees contributed a total of over £45,000, while in our Swansea works subscriptions amounted during that week to the very satisfactory figure of £17 per head.

The report and accounts were unanimously adopted.

ANSELLS BREWERY, LIMITED
CO-OPERATION ON TOWN PLANNING

The forty-third ordinary general meeting of Ansell's Brewery, Limited, was held, on the 10th instant, at Birmingham. In the absence of Lt.-Col. J. A. Fairhurst, T.D., D.L., J.P., the chairman, Mr A. E. Wiley, deputy-chairman, was in the chair.

The following is an extract from the chairman's statement issued with the report and accounts:—It is not only on financial grounds that we are justified in taking pride in our accomplishments during the war. For the last four years we have managed to keep open our licensed houses and have supplied them to the best of our ability. We have not, of course, been able to satisfy completely the demand owing to the shortage, but we have allocated the available supplies to our various customers with scrupulous fairness and we make a point of advertising our prices and displaying them in every house under our control.

A COMMON FALLACY

In consequence of our exertions many millions of the public have been able to meet in our public houses and enjoy the warmth, light and company together with their favourite refreshment, if available, be it excisable or otherwise. It is a common fallacy for those who do not frequent public houses to imagine they are compelled to have a strong drink. As a matter of fact we sell and are glad to do so the maximum quantity of mineral waters that is allowed to us by the War-time Soft Drink Industries which is controlled by the Government.

The position as to post-war reconstruction, which is so vitally important to us, has not materially altered since the information I gave you in my speech last year.

Mr Wiley (Joint Managing Director), in the course of moving the adoption of the report and accounts, said: When the maintenance work is postponed—as it must be at the present time—there is always the risk of heavier depreciation and undoubtedly when peace comes and restrictions are lifted we must be prepared to lay out very large sums in maintenance work. In addition we must also be ready to develop and improve our properties in line with the steps which are being taken by the authorities for replanning the cities and areas in which we conduct our business. Unquestionably, when the time comes, the expense will be heavy and therefore we must continue to pursue the conservative policy in regard to finance which has been so beneficial to this company in the past.

BEER DUTY BURDEN

Mr Walter Scott, J.P. (Joint Managing Director), in seconding the motion, said: Colonel Fairhurst in his statement has dealt with post-war reconstruction, but one of the first matters with which the Government will be confronted is the question of a substantial reduction in the Beer Duty, which during the two wars has risen from 7s. 9d. in 1914 to 28s. 10d., being over 36 times greater now. Beer drinkers, with hardly a murmur, have accepted this exorbitant increase as a war measure, but cannot be expected to bear such a disproportionate burden indefinitely.

The collection of revenue, however, is dependent upon our products and the social amenities that go with them giving satisfaction to our customers. Taking our sound financial position as a measure of our success in this direction, we are entitled to congratulate ourselves upon our efforts in dispensing good cheer to the millions of customers who appreciate the help good beer is able to give in these depressing times.

The report and accounts were approved.

THE NATIONAL BANK OF SCOTLAND, LIMITED

FURTHER SUBSTANTIAL PROGRESS THE MARQUESS OF ZETLAND'S ADDRESS

The one hundred and eighteenth annual general meeting of The Proprietors of The National Bank of Scotland, Limited, was held in the bank's head office, Edinburgh, on the 16th instant.

The Most Hon. The Marquess of Zetland, K.G., P.C., G.C.S.I., G.C.I.E., the Governor of the bank, in the course of his speech, said: The accounts for the year now before you again show substantial progress. Deposits at November 1st last exceeded £60 million, an increase of approximately £5,000,000 in the twelve months. The bank's notes in circulation have reached the unprecedented figure of £8,242,000, a rise of £1,353,000, an indication of the continued growth of Government expenditure in wages. I have on a previous occasion stressed the importance of the speedy return to the banks of notes not immediately required for normal expenditure, and I would again emphasise that it is the duty of everyone to ensure that notes not so required are paid in to bank and not retained or hoarded.

LIQUID FUNDS EXCEED £19,332,000

The assets of the bank naturally show an expansion similar to the liabilities. Increased resources are evident in a rise of over £2,000,000 to £19,332,000 in our liquid funds, namely, cash, balances with the Bank of England and other banks, cheques in course of collection, and money at call and short notice. These sums, with £6,000,000 in Treasury deposit receipts and a holding in Treasury bills, place the bank in a highly liquid position, which in these days is obviously desirable. British Government securities now stand in the books at £35,000,000, an increase of roughly £4,000,000, representing our support of Government war issues. A large proportion of these holdings is in short and medium dated stocks.

The value of our investments is in excess of the figures at which they stand in the bank's books. Advances, which last year showed a rise of £800,000, have fallen by £600,000 and now just exceed the £10,000,000 mark, at which they are still higher than in 1941. The heritable properties owned by the bank have been further written down to £574,000, which you may be assured is a very conservative indication of their value. The balance sheet figures total £74,775,000, an increase of £6,000,000.

ALLOCATION OF PROFITS

The profits for the year amount to £260,967, comparing with £257,000 for the previous year. With £91,290 brought forward, a sum of £352,257 is available, from which the following allocations have been made by the directors: To Contingent Fund £100,000, Heritable Property Account £10,000, Trustees for Officers' Pension Scheme £50,000, Staff Widows' Fund £5,000, a total of £165,000. The dividends proposed to be paid will cost £98,000, leaving £89,257 to be carried forward to the current year. In view of the very low rates of interest earned on the large proportion of our funds lent to the Government for the prosecution of the war, and the increased expenses of conducting business, the results are regarded by your directors as satisfactory.

TRADE AND INDUSTRY

We are now in the fifth year of this stupendous war, with the energies of the whole nation devoted to its successful prosecution, and while it may safely be said that good progress has been made during the past year towards the achievement of the Allied objectives, there can be no rest from our labours until final victory has been won. At the same time business people cannot wholly refrain from turning their thoughts in the direction of post-war

trade and industry, and making tentative preparations for the future.

Many new problems, some already perceived and others yet unknown, will undoubtedly arise and will call for imagination and initiative if they are to be solved satisfactorily. It is clear that only efficient organisations with up-to-date equipment can hope to tackle these problems successfully, and in this connection research work in the various fields of industry must take a foremost place. It is, surely, not too much to ask that every encouragement should be given by the authorities for carrying out research and experimental work, and that special allowances should be made by the revenue to make research work possible; for investigation and experimentation involving, possibly, the erection of buildings and the provision of equipment and other expenses, constitute in themselves a heavy tax upon industry, already sufficiently burdened and liable at any time to be called upon to shoulder fresh responsibilities.

For example, it would appear to be faced at a not distant date with an added burden in being called upon to operate the "Pay as you earn" tax deduction from wages. It is difficult to see how businesses employing a large number of workers, with pay-staffs depleted to a bare minimum, can possibly carry through in the time at their disposal so complex and difficult a task, unless indeed means can yet be devised of making workable a scheme the aim of which is no doubt eminently desirable.

TRIBUTE TO SECRETARY OF STATE

It is a rule in addresses from this chair to eschew references to politics, and I have not the least desire to depart from so salutary a practice; but it is not, I think, out of place to commend the initiative of the present Secretary of State for Scotland in securing the establishment of the North of Scotland Hydro Electric undertaking, from the operations of which in due time considerable benefit should accrue to the Highland areas of Scotland.

There is always, of course, in cases of industrial development of this kind, the possibility of a clash of interests and, in particular, of a conflict between utilitarian demands and amenity requirements; and I should be the last to underestimate the importance of the latter in the post-war world. But I look forward to a Britain in which indiscriminate growth will be superseded by carefully planned progress, with a Central Planning Authority with power to decide, after due consideration of all the relevant factors, between the competing claims of the various interests affected, be they industrial, agricultural, recreational or purely aesthetic.

In this particular instance the Scottish banks have given ready support to an enterprise which, without seriously detracting from their natural beauty and amenity value, seems well calculated to restore a long overdue and badly needed measure of material prosperity to the Highlands.

MEMBERS OF STAFF ON SERVICE

There are now 620 members of the staff on service with the Forces, representing 57 per cent. of our pre-war male staff, in addition to which three members of the permanent female staff are also on active service. We appreciate the valuable service which the men and women of our staff are rendering to their country.

The Governor concluded by moving the adoption of the report and the payment of dividends at the rate of 16 per cent. per annum, less tax, on the consolidated capital stock and of 5 per cent. per annum, less tax, on the "A" stock, and the resolution was carried.

SINGER MOTORS, LIMITED

POST-WAR PROBLEMS

The sixth ordinary general meeting of Singer Motors, Limited, was held, on the 10th instant, in London, The Rt. Hon. Lord Latham, F.L.A.A., J.P. (the chairman), presiding.

The chairman said that as a consequence of E.P.T. and the full charge this year for income tax, the available balance of profit was reduced from £78,450 last year to £42,039 this. The preference dividends already paid and the dividend of 6 per cent. less tax, now recommended, would take £24,937, leaving of the profit for the year £17,102 to be added to the carry-forward, raising this to £93,128.

PREPARING FOR PEACE

As the day of victory drew nearer the directors could not fail to be increasingly concerned with the problems of peace and with the necessity of preparing to meet and surmount the difficulties that would then confront the motor industry, especially during the period of the change-over from war production to normal peace-time activity. They were being assured that in various ways the Government were working out their plans to deal, *inter alia*, with the many home problems which would follow in the wake of the good ship "Peace," but however ample and complete those plans might be, the success of many of them would depend in no small degree on the maintenance of reasonably full employment in this country through the speedy resumption of full industrial activity, including the restoration and expansion of our export trade.

The capacity of industry to re-absorb those returning from the Forces, to find work for those now engaged on munitions, and therefore the avoidance of unemployment, would rest in no small measure upon industry being permitted to plan in advance the means and methods of the change back to peace-time production and to employ for that purpose a reasonable number of technical and pivotal workers on the essential preparatory work. If the work of reinstatement was to be carried out in the shortest possible time after war production ceased or was appreciably reduced, planning and preparation for it must be completed, or substantially so, well before hand. Unless this was done in advance it was difficult to see how the risk of serious and possibly lengthy interruption of regular employment of much operative labour could be avoided at many points, however strong was the desire on the part of employers to prevent it.

In his view, it was not too soon to urge the Government to permit at the earliest possible moment, consistent with the needs of war, the employment and release of such technical and other personnel as were essential to enable industry to prepare, so that the change-over to normal production might be accomplished with the least disturbance of employment.

APPEAL TO GOVERNMENT

For the motor industry the problems involved in the change-over would not be few or simple and he could discern no grounds for easy optimism. It was doing no disservice to the motor industry, or to the public at large, to face the facts with realism and resolution.

It was in no captious spirit, nor was it without full appreciation of the heavy burden the Government bore in maintaining the war effort at its maximum, that he begged them to give urgent consideration to the question of enabling industry to start now those preparations for the change back to peace-time production which were essential if industry was to get into its peace-time stride with the minimum of delay and the maximum volume of employment was to be maintained.

The report was adopted.

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)

HIGH LIQUIDITY RECORD CURRENT AND DEPOSIT ACCOUNTS SIR WILLIAM GOODENOUGH'S STATEMENT

The ordinary general meeting of the stockholders of Barclays Bank (Dominion, Colonial and Overseas) will be held on the Bank's Premises, 29, Gracechurch Street, London, E.C., on Thursday, the 23rd instant.

The following is the statement by the chairman (Sir William Macnamara Goode, Bart.) which has been circulated with the report and accounts:—

In accordance with the procedure adopted last year, I am sending to stockholders this brief statement which will take the place of the speech at the annual general meeting.

It is with great sorrow that I have to record the loss which the bank has suffered through the untimely death of Sir John Caulcutt, our late chairman, after which general manager of the bank, after which he became a director, deputy chairman, and, finally in the year 1935, chairman. It is not possible in a few words to do justice to his great qualities or to his services to the bank and to the Empire. He made an invaluable contribution to the building up of the present strength and prosperity of the bank, and his skill and ability have guided us through many difficulties.

I am deeply sensible of the honour of having been elected by the board to succeed him. I shall endeavour to carry on the high traditions which have been associated with the chair and which he so worthily upheld.

PERSONNEL CHANGES

Mr A. B. Gillett, who has been a director since the bank's re-incorporation in 1925, has been elected deputy chairman, and Mr W. O. Stevenson a vice-chairman; both of them have rendered signal service to the bank. I am fortunate in the co-operation and support which I have received from them and from our other vice-chairman, Mr J. R. Leisk, who, as you know, is also the chairman of our South African board.

Since the close of our financial year, Mr. D. F. Rigby, one of our assistant general managers, has been appointed a general manager, and Mr H. P. Sheldon an assistant general manager.

Mr A. W. Patterson, who for a number of years has been a local director of the bank in East Africa, has been greatly appreciated, and we wish him well in his retirement.

The news of the death in July last of Sir Patrick Duncan, the late Governor-General of the Union of South Africa, was received with very deep regret. I should like to take this opportunity of paying tribute to his great public services, which have been of such outstanding value to South Africa.

Our branch at Addis Ababa has been closed. It was opened in July, 1941, to meet the special needs of the British military authorities, and the purposes for which it was intended have now been fulfilled. We have since opened branches in Libya, at Tripoli and Benghazi, and in Somalia, at Mogadishu. I feel sure that the stockholders will be glad to know that we have been able to perform these special services to help the occupying authorities and the

GUY MOTORS, LIMITED

STRONG POSITION

Mr Sydney S. Guy, the chairman, presided at the twenty-eighth annual general meeting at Wolverhampton, on the 14th instant, and said:—

Your company has been fully occupied during the year and the output has surpassed previous levels. In addition to military vehicles, we have been instructed to produce chassis for double-deck omnibuses to an austerity specification, and have already produced over 1,000.

STOCK INCREASED

On the balance-sheet you will observe that the figure of stock-on-hand and work-in-progress is lower than it was last year. The amount shown, however, is after crediting Governments payments for work-in-progress, which naturally vary considerably from time to time. The actual stock has increased.

STILL STRONGER FINANCIAL POSITION

The debtors, like the creditors, are higher, due to the increased business we are doing. It will be noted that, when consideration is given to the improvement in the bank balance, the net result of these three items is an improvement in the liquid position.

COMBATING DEPRECIATION DANGER

In the profit and loss account the item of depreciation and maintenance has increased by some £10,000, the increase being, of course, mainly in the latter item. This arises from the effects of further dilution of labour and of long hours in the factory, and does, we feel, confirm our view, repeatedly expressed for some years, that the allowance granted by the Inland Revenue for depreciation is totally inadequate. For this reason your directors again propose to reserve an extra £5,000 for obsolescence and deferred repairs, not covered by the taxation allowance.

Directors' fees are increased by the election of Mr John Good to the board. Your confirmation of his election will be asked at this meeting.

15 PER CENT. DIVIDEND MAINTAINED

The net profit is approximately the same as last year, and your directors have pleasure in recommending, for the seventh year in succession, a dividend of 15 per cent. on the ordinary stock, and the other allocations set out in their report.

PROFIT-SHARING BONUS RESERVE INCREASED

The reserve required for profit-sharing bonus has increased somewhat owing to the fact that, under the terms of the scheme, additional staff, engaged in the 1941-42 year, now qualify for full bonus.

A WELL-EARNED TRIBUTE

I would like here to pay tribute to all in the employment of the company, both full time and part time, who have worked so well and co-operated with the management so wholeheartedly in obtaining a record production under difficult conditions, and particularly would I like to mention all those who have given up their spare time to manning the various defence services connected with our organisation.

The appointment of Mr John Good, O.B.E., to a seat on the board was confirmed, and Mr W. E. Bullock was re-elected a director.

The report and balance-sheet having been unanimously adopted, a vote of thanks to the chairman and directors brought the meeting to a close.

THE STAFF

While the number of our staff serving in the Forces continues to grow, I am pleased to be able to tell you that several who were posted as missing have since been reported to be prisoners of war. The total number now notified as killed or missing is 77. I am confident that the stockholders would wish me on their behalf to offer our most sincere sympathy to their relatives.

It is a special pleasure to me to have this opportunity to pay tribute to the work which has been achieved by the staff of the bank during another year of war. On behalf of the stockholders and of the board, I should like to convey to them our warm appreciation of their services.

To those who are in the Forces and also to those who are serving with the bank overseas, we wish a speedy return as soon as circumstances permit after the war. Many of them have now been deprived for several years of the normal opportunities to take leave at home and with their families. To them our thoughts are specially directed.

MALAYAN TIN DREDGING,
LIMITED

FUTURE OF THE INDUSTRY

The thirty-second annual general meeting of Malayan Tin Dredging, Limited, was held on the 16th instant, in London, Mr C. V. Stephens (the chairman) presiding.

The following is an extract from the chairman's statement, circulated with the report and accounts for the year ended June 30, 1943:—The board is fortunate in being able to show a profit for the year under review of £12,339 and to recommend payment of a dividend of 2½ per cent., free of tax, due to the profit of £12,475 on the company's contribution of ore to the Buffer Stock Pool.

At the request of the Secretary of State for the Colonies plans are being prepared by the Malayan Chamber of Mines to cover the rehabilitation of the tin-mining industry in Malaya. It would appear that an unfortunate misconception has arisen in some quarters in connection with the tin potentialities of Malaya, and it has been suggested that the tin reserves of the country are within measurable distance of exhaustion. In my opinion this is a groundless and most fantastic suggestion.

In the opinion of the board, Malaya possesses very large reserves of tin which are still untouched—in the jungle, in forest reserves, in the hills, in land under cultivation and in swamp areas. There is also a possibility that payable areas of some considerable extent may in due course be developed along the coastal areas. I consider it to be a justified assumption that Malaya will be maintaining her share of the world's production of tin for very many years to come.

The report was unanimously adopted.

SOUTHERN MALAYAN TIN
DREDGING, LIMITED

IMPORTANCE OF RESEARCH

The seventeenth annual general meeting of Southern Malayan Tin Dredging, Limited, was held, on the 16th instant, in London, Mr C. V. Stephens (the chairman) presiding.

The following is an extract from the chairman's statement circulated with the report and accounts for the year ended June 30, 1943: The board is fortunate in being able to show a profit for the year under review of £23,616 and to recommend payment of a dividend of 2½ per cent., free of tax, due to the profit of £20,553 on the company's contribution of ore to the Buffer Stock Pool.

A matter which I consider vital to the welfare of Malaya and to the tin industry is the development and expansion of the research work carried on by the International Tin Research and Development Council (a body representing the majority of the important tin countries engaged in the production of tin) at the Tin Research Institute at Greenford, Middlesex. The growing need of scientific research in this keenly competitive age has recently been stressed in a comprehensive report on the subject issued a short time ago by the Federation of British Industries; and more recent references to the importance of the subject have been made by other influential bodies.

The work carried on by the staff of the Tin Research Institute has resulted in a great deal of valuable data being obtained and in improvements and in the development of further uses.

The extent and nature of assistance to be given in respect of compensation against losses suffered are not likely to be precisely defined by his Majesty's Government until after the cessation of hostilities.

The report was unanimously adopted.

ALLIED BAKERIES, LIMITED
PROVIDING FOR POST-WAR
REQUIREMENTS

The eighth annual general meeting of Allied Bakeries, Limited, was held, on the 10th instant, in London.

Mr S. Hodgkinson presided in the absence through indisposition of Mr W. Garfield Weston, M.P., the chairman of the company, and read the statement which had been prepared by Mr Weston, from which the following is an extract: Last year I referred briefly to the fact that we had acquired control of H. W. Nevill, Limited. I am pleased to inform you that the potential earnings of this company, on which the purchase price was based, had been exceeded by a substantial margin.

Investments in subsidiary companies have increased during the year by approximately £438,000. Our liquid position has improved slightly during the year, liquid assets being £2,307,961, exceeding current liabilities by £356,700, against a surplus of £366,050 in 1942, but the net amount of the second interim dividend of 5 per cent., amounting to £34,955, has been included in total liabilities this year, so that in effect our liquid position is £25,600 better than last year.

Your company's total contribution to the National Exchequer in taxation, including N.D.C., and income-tax and E.P.T., represents more than 75 per cent. of the net earnings of the operating companies.

After payment of the preference dividend, and interim dividends of 10 per cent. on the ordinary shares, there remains a balance to carry forward of £128,022, as against £88,313 brought in. Your directors do not recommend any further payment of dividend on the ordinary shares because they constantly have in mind the necessity for considerable capital expenditure after the war to rebuild and re-equip those bakeries which do not conform to the high standard of efficiency we require.

The report was unanimously adopted.

CRYSTALATE, LIMITED

SIR HERBERT MORGAN'S SPEECH

The annual general meeting of Crystalate, Limited, was held on the 15th instant in London.

Sir Herbert E. Morgan, K.B.E. (the chairman), said that there had been an increased profit on trading and the liquid position of the company was most satisfactory.

They were now preparing a scheme for the reconstruction of the capital of the company, which they proposed to place before shareholders in the course of the current financial year. The recommendation would be made that the "Assets Deficiencies" account must be eliminated. The proposed reconstruction would have been undertaken before, but it was impossible until they had arrived at an agreement with the Inland Revenue as to their EPT position and until they could formulate something approximating an exact idea as to what their profit-making capacity was. Subject to being placed on a proper capital basis, he regarded the prospects of the company as good. They were engaged in an industry which was on the upgrade and for whose products he foresaw a continued demand in the post-war period.

The day would come when munition contracts would be cancelled, resulting in some temporary stoppage of work. Plans to lessen it to the minimum called for a

(Continued from page 821.)

how far the activities and functions exercised by the three providers of welfare—the Government, the shipowners and voluntary organisations—should be co-ordinated. A corollary to this is the financing of welfare. There are a number of alternatives: it could be done by the Government out of public funds, by the industry, by charitable and voluntary contributions, or by a combination of these methods. *Prima facie*, the strongest case exists for the financing of welfare by the industry itself, so that the cost could be passed on, so far as necessary, to the consumer. The Committee's findings, if accepted, will not apply only in the war period. Although the war has no doubt quickened the public conscience on the important matter of seamen's welfare, the Committee's recommendations are intended to have a long-term validity.

Company Results

Prices Tailors.—	Years ended June 30,	1943
	1941	1942
Profits	503,611	411,108
Taxation	230,000	195,000
Depreciation	95,911	94,910
Directors' fees	1,250	2,000
War damage contributions	18,342	14,269

Gross liquid assets	1,185,510	1,416,224
Stock in trade	924,813	1,143,853

† These payments to Prices Trust permit the payment of dividends of 25 per cent for 1940-41 and 20 per cent in subsequent years.
‡ Due to a change of method in presenting the balance sheet, which resulted in a reduction of the amount stated as current liabilities, these figures are not strictly comparable with those for 1942 and 1943.

The 5s. ordinary shares of Prices Trust, at 32s. 6d. ex dividend, yield £3 1s. 6d. per cent.

COMPANY RESULTS

Definitions of terms used in these tables are as follows:
Net fixed assets include everything from land to loose tools, less any distinguishable provision for writing them down.
Net inter-company items include holdings in, and loans and advances to, subsidiaries and associates, plus trade investments, minus all sums, other than dividends of the company, due to subsidiaries and associates.
Net liquid assets include all other assets less current liabilities, bank loans and profit and loss appropriations not retained as additions to reserves, carry forward, or other established funds.

measure of preparedness. The establishment of a Department of Supply by the Ministry of Works for the building trade would help to shorten the period of change-over in those industries now engaged on war work, but normally making fittings for houses. His belief was that some such organisation was vital in order to speed up the provision of housing and for the prevention of unemployment. The individual manufacturers would be straining at the leash to regain trade lost and must not be kept waiting, because it was the industrialist who could create plans for work when he had guidance from the Government.

The report was unanimously adopted.

PRICES TAILORS, LIMITED

CLOTHING PROBLEMS

The fifteenth annual general meeting of Prices Tailors, Limited, was held, on the 13th instant, at Leeds, Sir Henry Price (chairman and managing director) presiding.

The following are extracts from the chairman's statement circulated with the report: The results of the past year's trading, bearing in mind the difficulties and problems with which we have had to contend, I consider to be satisfactory.

Although no new drastic legislation has

been imposed upon the clothing industry during the past year, nevertheless there has been a progressive tightening up and modification of existing orders which has made trading conditions more difficult both for the manufacturer and the retailer. The various departments of administration are to be congratulated upon the success achieved in keeping the public well catered for during four years of war.

It is now, however, two-and-a-half years since clothes rationing was first introduced, and coupon spending has become a serious problem, as the wardrobes of all classes of the community must now be greatly depleted. I feel that it would be greatly appreciated by the public if the Board of Trade could plan to allow sufficient coupons during one period to enable men folk to buy a full suit of clothes. The public is not over-indulged under the inevitable rationing system, and in any event the saving of coupons, like saving of money, is a psychological process which would require many years to develop. Hence I trust this view will have consideration by the Board of Trade. The scarcity of coupons has developed a very marked tendency on the part of the public to require the highest possible value for them. Accordingly, it has been our constant aim to provide the highest quality materials and workmanship possible within the scheme of Government control.

The report was unanimously adopted.

ELECTRIC & MUSICAL INDUSTRIES LIMITED

THE GRAMOPHONE COMPANY LIMITED
COLUMBIA GRAPHOPHONE COMPANY LIMITED
THE MARCONI COMPANY LIMITED
THE PARLOPHONE COMPANY LIMITED

ANNUAL GENERAL MEETING

HELD ON 16th DECEMBER, 1943

ACCOUNTS TO 30th JUNE, 1943, AND
SUMMARY OF CHAIRMAN'S STATEMENT

Profit of the Group for the period ended 30th June, 1943, after providing for the liability of the company and its subsidiaries for taxation, including that on the profits for the period covered by these accounts, and after providing for charges and contingencies arising from war conditions	£174,357
Amount brought forward from last year	247,504
Total available	£421,861
Out of which provision for a net Preference Dividend paid and accrued to 30th June, 1943, and a Dividend of 6% less tax, and a Bonus of 2% less tax, on the Ordinary Stock, authorised at the Annual General Meeting, requires	£126,465
Leaving to be carried forward	£295,396
General Reserve now stands at	£300,000
Taxation Reserve covering estimated taxation on profits to 30th June, 1943, is	£976,283

The directors have issued a Consolidated Balance Sheet and Profit and Loss Account of Electric and Musical Industries, Limited, The Gramophone Company, Limited, Columbia Graphophone Company, Limited, and their English subsidiaries.

To enable the consolidation of the accounts to be completed without adjustments, the end of the company's year has been changed from 30th September to 30th June so as to coincide with the accounts period of the two operating companies and their English subsidiaries. Although the actual period of the company's accounts as now presented is, therefore, nine months, it should be noted that the trading and other results now reported correspond exactly with the previous year.

All recommendations of the directors including provision for the payment of a dividend on the ordinary stock of 6% and a bonus of 2% less tax, were adopted by the stockholders.

Mr. Alfred Clark (Chairman) presiding, stated that the omission of the usual speech was again due solely to war-time conditions.

The output of the factories has been maintained at a satisfactory level.

The directors have sold to the Raleigh Cycle Company, Limited the shares of Rudge-Whitworth Limited.

It has been considered prudent to write down to a nominal figure of £2 the Investments in and Advances to Empire and Foreign subsidiary Companies.

Business has continued to operate in Australia, New Zealand, Africa, South America and India, as well as in neutral European countries.

There is a large demand for gramophone records, gramophones and radio receiving sets which, unfortunately, cannot be met because of war-time restrictions.

During the war, further advances have been made in the sciences relative to television and the company aims at maintaining its leadership. Further improvements in technique are expected, and it is believed that when broadcasting is resumed after the war television will surely increase in popularity.

The directors desire, once more, to place on record their appreciation of the splendid work being carried on by employees of all stations in the vast organisation working for the company at home and abroad. The tradition of good relationship with its employees continues and stockholders may well be proud of their workers.

RECORDS and STATISTICS

INDUSTRY AND TRADE

Trawler Fishing E.W.O.—The Minister of Labour has made the Essential Work (Trawler Fishing) Order, 1943, which came into force on December 13, 1943. It makes provision for the approval of schemes under which trawler fishermen will be registered, and reserve pools of such men will be established in trawler fishing ports from which British trawlers will be manned. The schemes will be submitted to the Minister by, and be operated under the control of joint committees of representatives of trawler owners and trawler men.

1944 Potato Crop.—Growers' prices in Great Britain for new potatoes of the 1944 crop will be reduced, as compared with the 1943 prices, by amounts varying from £2 per ton at the commencement of the season to 10s. per ton at the end of July. There will be an increase of 5s. per ton in maincrop prices for the months of February, March and April, 1945, as compared with growers' prices for those months in 1944. The acreage payment of £10 per acre will be continued.

* Highest level reached during 1932-37 recovery. † Revised.

"The Economist" Sensitive Price Index.—The index (1935=100) remained unchanged during the week to December 15th, and was as follows:—Crops, 122.9; raw materials, 182.3; complete index, 149.7.

Coal Output.—The output of saleable coal in the four weeks ended November 27th averaged 3,815,100 tons, compared with 3,998,000 tons per week in the previous four weeks.

AVERAGE WEEKLY OUTPUT OF COAL

(Weekly Standard Tonnage 4,161,800 tons)

Four Weeks ended*	1941 tons	1942 tons	Four Weeks ended*	1943 tons
Dec. 26th	3,853,400	3,880,100	June 12th	3,724,800
Jan. 23rd	3,824,800	3,813,400	July 10th	3,987,200
Feb. 20th	4,028,000	4,016,400	Aug. 7th	3,339,300
March 20th	4,074,600	4,013,700	Sept. 4th	3,978,900
April 17th	3,739,800	4,005,200	Oct. 2nd	4,076,100
May 15th	4,103,900	3,824,600	Nov. 27th	4,126,600

* The actual dates given relate to 1942 and 1943.

The production from opencast workings averaged 107,400 tons per week. During the previous four weeks, an average of 126,500 tons per week was produced. Only two districts Leicestershire and South Derbyshire qualify for the output bonus, and approximately 13,000 miners will benefit, those in Leicestershire to the extent of 1s. 6d. per shift, and in South Derbyshire 3d. per shift.

FINANCE AND BANKING

THE MONEY MARKET.—Credit has again been a short supply in the money market this week and relief has had to be obtained from the authorities through sales of bills to the official agents. One of the main influences on the position has been the exceptional withdrawal of currency from the banks. The circulation increased by £21,662,000 during the week to last Wednesday. This is the largest weekly expansion in the note issue ever recorded. It only leaves £33,284,000 of unissued notes in reserve and as there are two more weeks to go before the peak is reached it will be touch and go whether or not yet another increase in the fiduciary issue is needed before the turn of the year. The efforts of the authorities to neutralise the effect of the increasing circulation on the volume of bank cash together with the special assistance given to the discount market are reflected in a rise of £40,535,000 in Government securities. To the extent of £6,300,000 this offsets a decrease in Other securities. On balance these movements leave bankers' deposits £6,542,000 higher at £161,152,000, a total which would not suggest undue shortage of credit were it not that preparations are already being made for meeting the end-of-year pressure.

MONEY RATES, LONDON.—The following rates remained unchanged between Dec. 10th and Dec. 16th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1¾%; 6 months, 1½-1¾%. Treasury Bills: 2 months, 1½%; 3 months, 1½%. Day-to-day money, 1-1½%. Short Loans, 1-1½%. Bank deposit rates 4%. Discount deposit at call 1%; at notice 1%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between Dec. 10th and Dec. 16th. (Figures in brackets are par of exchange.)

United States, \$ (4.863) 4.024-031; mail transfers 4.024-031. Canada, \$ (4.863) 4.43-47; mail transfers 4.43-47. Switzerland, Francs (25.22) 17.30-40. Sweden, Krona (18.159) T.T. 16.85-95. GOVERNMENT RETURNS

For the week ended Dec. 11, 1943, total ordinary revenue was £35,218,000, against ordinary expenditure of £87,381,000, and issues to sinking funds of £370,000. Thus, including sinking fund allocations of £9,415,735, the deficit accrued since April 1st is £2,256,123,000 against £2,129,208,000 for the corresponding period a year ago.

A change has been made in the method of showing in excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £205,230 to £2,813,151, the other operations for the week (no longer shown separately) raised the gross National Debt by £53,446,754 to £19,103 million.

International Loan Morality

IN the general scheme of ideas on international economic reconstruction that is gradually emerging from the official discussions between London and Washington, great emphasis is laid on the part to be played by international lending. Loans will be needed for two distinct reasons—both to assist the transition to a workable international currency system and to provide funds for that development of backward areas from which so much economic and political benefit is rightly expected. Without an active international capital market, currency reconstruction will be impossible, and if world reconstruction is to depend upon charity its scope will be very limited.

Much of the necessary lending will doubtless be made under Government auspices. But the notion that the whole of international lending should be done by Governments is not likely to be one that will commend itself either in Washington or in London. If loans are not to be mere political subsidies, pawns in the game of economic power politics, it is essential that at least part of the required total should be freely negotiated, on a basis of mutual interest, between borrower and lender. Whether any privately-owned funds will be forthcoming, however, depends more upon anything else on the experience that has been gained in past loans. It is for these reasons that the readjustment of the Brazilian debt, on which detailed comment has been made in the "Business Notes" section of *The Economist* in recent weeks, assumes an importance far greater than the amount of capital involved would by itself indicate. It is a test case for the future of international lending.

No one, after the experience of the last two decades, would maintain that international loan contracts should never be modified. With the best will in the world, a country may find itself genuinely unable to meet its debt obligations. But to say that contracts can be modified when circumstances change should not be interpreted as meaning that there is no difference between morality and immorality in these matters. In particular, two rules can properly be insisted upon. The first is that the debtor should make a genuine effort to pay as much as he can without endangering his economic health. The second is that, if the amount paid is less than the amount due, a prior claim should be allowed to those creditors who have lent with wisdom and have been given prior security. Without this rule, sound and prudent loans made between an honest borrower and a careful lender may be ruined by a subsequent spate of loans made without security or reflection for the purpose of taking advantage of political opportunities or of riding a speculative market. The rule is a sound one in all bankruptcies, and is recognised by the domestic legislation of all countries; it is no less necessary in international loans.

The new Brazilian scheme violates both these rules. The details are complex and cannot be rehearsed here. Broadly speaking, however, the plan embraces the whole of the external debt of the Federal Government, the states, the municipalities and of one or two semi-private or wholly private debtors. In each case the creditor is offered an option, the two alternatives combining present cash

repayment and future interest in different proportions. In each case the offers are far below what is contractually due. The total statutory service of the foreign debt—itsself the result of a series of adjustments in the past—would call for some £23 million of foreign exchange a year. The present scheme would require between £7,700,000 and £8,300,000 according to the option. A good year before the war used to produce about £20 million of foreign exchange; in 1942 the favourable balance of payments was some £35 million and it will be about the same this year. It is clear that the sums offered by Brazil are much less than the country could reasonably expect to be able to find.

The breach of the second rule is no less patent. The great bulk of the British loans to Brazil date back to before the last war; when made, they were reasonably sound and prudent. During the two decades between the wars, however, Brazil benefited—or suffered, as the truth may be—from the plethora of capital available in New York for foreign loans. The methods followed in this foreign loan boom are too well known to require further description; the Brazilian loans were neither the best nor the worst that came to birth in that mad decade. Furthermore, the bulk of the British loans, as they stand to-day, are to the Federal Government, which should represent the highest security. American creditors, though they, too, lent to the Federal Government, also went in for loans to states and municipalities to a greater extent than the British. Finally, many of the British loans have specific and excellent security, while the American practice was not to require more than a general obligation.

It does not need to be proved that the American creditor has received better terms than the British, for the Accountant-General of Brazil, Senhor C. Souza Lemos has so stated in explicit terms. Of the outstanding debt, American hold 34.2 per cent; but they are to receive between 36.4 and 39.3 per cent of the payments according to the option chosen.

Here, then, is a manifest injustice and a most unfortunate precedent. If this is to be the treatment meted

out to creditors, then any hope of a revival of genuine international lending had better be abandoned. It must be asked how such an arrangement has seen the light of day. In former times, negotiations were carried on by the issuing houses which had originally been responsible for the loans. Nowadays, the Council of Foreign Bondholders enjoys official recognition as the representative of all British creditors. Official recognition, however, carries with it the obligation to pay heed to the wishes of the authorities, and the British authorities, in this case, were unwilling or unable to put any pressure on the Brazilian Government in favour of a less inequitable settlement. And it is an open secret in the City that the reason for the authorities' reluctance was the fact that Washington would not permit it. The official policy of the United States towards the whole of Latin America is generously paternalistic, and Brazil is the United States' best friend in the Continent. To have offended Brazil by asking for more would have run counter to the Good Neighbour policy; and it was necessary to secure relatively favourable terms for the American bondholders to prevent any agitation in American public opinion against so munificent a policy. Any British attempt to secure better terms than the present offer would not have received any support from Washington; it would quite possibly have excited official American disapproval. To put the matter quite bluntly, the British holder of Brazilian obligations has been made a sacrifice to Pan-Americanism.

It is difficult to criticise the British authorities, unless it be for their unwillingness to let the public know what has been going on. There are higher things at stake than Brazilian bonds. Least of any journal in the country would *The Economist* object to anything that smooths the path of British-American co-operation, even if it involves some sacrifice. If this is Washington's idea of a fair bargain, there is nothing to be done but to acquiesce. But it is as well that the record should be clear. In the Presidential campaign that is just beginning, Mr Roosevelt is going to be accused of being subservient to the British. Here is one proof to the contrary.

Balkan Mosaic

WHATEVER the excitement caused in the Balkans by the various Allied Conferences, it has now died down. M. Menemenjoglu interviewed German journalists on his return from Cairo. When they asked him whether his statements about the strengthening of the Anglo-Turkish Alliance meant that Turkey would "play a more active part in the war after Cairo," he replied: "No. I believe my declarations were clear enough: the policy of Turkey remains unchanged." Rightly or wrongly, the Axis countries look on Turkey as the barometer of war in the South East. They assume that no Allied invasion would be possible without Turkey's passive or even active assistance. They appear to have accepted M. Menemenjoglu's assurances at their face value. The tension has relaxed, for it is only the fear of invasion that in any way undermines Axis political control in the Balkans. The rats do not leave the still seaworthy ship. In Croatia, the Cabinet crisis has been resolved, and Pavelitch is conducting a propaganda tour in the newly incorporated Dalmatia. In Serbia, Neditch is raising a new militia, the Serb Security Corps. In Hungary, the Prime Minister, M. Kallay, addressing the Upper House on the question of foreign policy, declared that Hungary could not hold aloof from the present historical struggle, that the Hungarian people were wholeheartedly for defence against Bolshevism, and all that they asked was the righting of the "injustice of Trianon"—in other words, the maintenance of the frontiers Hungary has secured, under German patronage, at the expense of its neighbours. In Bulgaria, too, the Cabinet discussions and party meetings of a fortnight ago have ended in a strengthening of the Government's determination to secure "unity" in order to keep Greater Bulgaria intact.

The unsettling of Balkan politics, which continued

for a period after the collapse of Italy, has, for the time being, come to an end. No military forces fighting in the Balkans without outside assistance can disturb the political situation again. Invasion is the key. It is thus rather difficult to accept the extremely high value which quite suddenly in the last few weeks the military authorities have laid on guerilla operations in the Balkans, particularly on the fighting of Tito's partisans. No one will deny that they are doing heroic marvels of improvisation in questions of supply, that they are a perpetual embarrassment to the Germans, and have complicated the Axis defence problem by their ceaseless harrying of communications. In the days of disorganisation after the Italian collapse, they were able to conduct near-military operations in Slovenia and down the coast. Yet their activities remain essentially guerilla activities, and to say that they are holding up as many German divisions in the Balkans as does the Allied advance in Italy is straining credulity rather far.

It is important to get the scale of operations in the Balkans into proper perspective first for the military reason of not underestimating the enemy, and not miscalculating the degree of inside help awaiting the Allied invasion forces; but also for a political reason. The unfortunate position forecast long ago at the time of Casablanca—that of Allied countries possessing two or more governments—has now come to pass in Yugoslavia. This delicate situation, it is vital that the Allied statesmen should see all the factors involved without sentiment exaggeration. The problem presented by Yugoslavia can easily be repeated elsewhere. In a sense, it is a test case. On the Allies' handling of it may depend the success of their European policy. Two chief questions are involved in an internal one, the question of recognising a nation

government; an external one, the future relations of that nation with its neighbours and the Great Powers. For the first, the general principle should surely be that any government must represent all resisting groups and interests inside its country, and that it must accept its own provisional character. It is true that the conception of the *rassemblement national*, the representation of all forces, prevents the war from being fought ideologically. But why should it be fought ideologically? Resistance is not confined to any group or class, and the development of sharp political lines leads immediately not to a concentration of force, but to its dissipation. Yugoslavia is a case in point. Until the Yugoslav Government in exile failed completely on the federal issue, and substituted Serb nationalism for the co-operation of Serb, Croat and Slovene, no counter government was formed inside Yugoslavia, presumably because the Croats and Slovenes were still prepared to look to King Peter's Government. The adoption of the emigré Government of a definite and controversial political outlook immediately undermined its authority. Similarly with the partisans' National Committee, if it were to adopt Communism as its fighting political line, it would lose liberal support, and it would lose the very influential Catholic support of the Slovene and Croat clergy and faithful. Between the two "governments," there is no question which is nominally more representative. Tito's committee covers all shades of political and religious opinion, and includes all three nationalities. Its weakness lies in its excessive claims. It is not a government. A guerilla council cannot be a government because on the one hand it cannot claim continuity or constitutional rights, while on the other it is not in a position to sound public opinion and secure a popular mandate.

If the reports are true that Tito has "exiled" King Peter from his own country "until the people can decide," this is evidence of a self-assertive arrogance which bodes little good for future reconciliation in Yugoslavia. Allied diplomacy should counter this provocative move and work on the contrary to round off the representative character of the new Committee by uniting with it the one element in Cairo which is still not completely compromised by the pan-Serb follies of recent months. That element is the young King, who represents not only the continuity of the Yugoslav community, but also the forces which in March, 1941, took the decision which freed Yugoslavia from satellite status. At the same time, the Allies should check any attempt to secure for the partisan Council more than provisional status. The people must be able, without prior manipulation, to decide. Similarly in Greece, the Allies are right in working for the fusion of the two partisan groups in Greece, ELAS and EDES, and a new attempt should be made to strengthen the link between the partisans and the progressive forces represented in the Greek Government by M. Exintaris, for example. The

recent letter of the King promising to reserve the decision on his eventual return to Greece has, by its acceptance of the idea of the people's choice, done more for the monarchy than the rigid and uncompromising attitude of many of his supporters. Finally, in Italy, too, statesmanship is needed from the Allies, if the full representation of all groups and forces within a provisional government is to be secured. The refusal of the King to abdicate has alienated the liberals, who would have been the bridge between the Monarchists and the Left. His obstinacy threatens to destroy the hopes of securing, under Marshal Badoglio, a provisional Government from Left to Right. As a result, opinion, probably disastrously, is hardening against the idea of monarchy as such. Matters will not have been improved by the Allied authorities' fatuous decision to ban the Naples Conference of the political parties.

The chances of securing provisional and representative governments in South East Europe depend very largely at this point on vigorous Allied leadership. It is very fortunate that the second evil forecast at Casablanca, the backing of each local government by a different Great Power, has not come about. A very real degree of collaboration has been secured by the Moscow and Teheran Conferences, but so far it has tended to be negative rather than active. For example, the Soviets have not broken off relations with the Yugoslav Government in Cairo, and they delayed the sending of a military mission to the partisans until the British position has been made clear. All this is very much to the good, but what is still lacking is a more positive conception of the kind of general European policy the Allies intend to support after the war. It is impossible to postpone indefinitely such questions as a Balkan federal or regional organisation or the joining of the South Slavs in the Slav bloc against the *Drang nach Osten*. The mere building of the bloc under Russian leadership, though it would provide some of the conditions of military security, is not a long-term solution of East European problems, for behind military security lies economic restoration, and here not only do the Balkans need the economic support of the Western world; they will ultimately need German industry and German markets. Obviously the Slav *cordon sanitaire* does not solve the problem of the peaceful reintegration of Germany into a restored Europe. Yet Balkan peace in the long run depends upon that problem being solved.

We must hope that the meetings at Moscow and Teheran have taken the Allies on to these positive problems. The European Commission exists as a useful piece of machinery for carrying discussions forward to a more detailed stage. Much of the suspicions which float like a cloud of hornets round Balkan problems springs from the fear on either side that this or that Government, or this or that manœuvre in reality represents a jockeying for influence at the level of the Big Three. Their unity is the best assurance of Balkan unity—both within the nations and in their ultimate relations with each other.

Beveridge-As-You-Go

GOVERNMENT Departments are currently engaged in working out two separate and extremely complicated sets of arrangements concerning the financial relations between the state and the citizen. The Inland Revenue is working out a complete system of pay-as-you-earn taxation upon wages and salaries. Other departments are working out the complex rules by which Social Security benefits and allowances are to be paid in a revised Beveridge plan. At first sight, there is no very obvious connection between the two orders of ideas, and they are being handled in administrative isolation from each other. But in the course of working them out they seem—to the outside observer, if not to the Government official—to grow together. The purpose of this article is to suggest that they should be handled as two aspects of the same matter, that the aim should be to produce, not a Beveridge plan and a pay-as-you-go scheme, but what might be called Beveridge-as-you-go. The advantages would be not only a vast amount of administrative simplification—bringing with it the added benefit that the plain citizen will be able to understand the calculation of the amounts he pays and receives—but also the approach to a great new principle of economic democracy.

The pay-as-you-earn scheme represented by the White Paper of last September, and by the Income Tax (Employments) Act passed in November, is a highly complicated matter. Doubts are being freely expressed whether it will ever prove capable of being worked. But even if the Inland Revenue and the employers of the country do contrive, from next April, to perform their respective duties, the burdens the scheme will impose will certainly generate very heavy pressure for a revision. The Inland Revenue will quite certainly have to think again. The basic defect in the scheme, as has frequently been pointed out in *The Economist*, is that it is conceived on too narrow a basis. The attempt has been made to evolve means whereby tax can be collected as-you-go without any alteration, however minute, in the present structure of rates and allowances. The result is inevitably cumbrous. The only way in which a pay-as-you-go scheme can be made simple is by separating off into two distinct operations the payment of tax and the making of allowances. Instead, for example, of being allowed to deduct £50 a year from his taxable income for each child, the taxpayer should pay tax at a flat rate on the whole of his income, and, as a separate operation, be paid £25 a year (or any other convenient sum) for each child plus other appropriate sums in respect of the other allowances. To call this a separate operation does not mean that the actual cash transactions could not be combined. The simplest method would be for the taxpayer, at the beginning of each year, to be issued, in respect of each of the allowances to which he is entitled, with a set of dated payable orders—similar to the present old age pension books—which he would deposit with his employer to be used, week by week, in meeting his tax deductions. But the calculations would be separate, and the employer would calculate all his tax deductions at a single simple rate on all wages paid. This would be a great simplification for him, and the employee, on his side, would have the advantage of being able to understand how the net amount paid him is arrived at—as he certainly will not be able to do under the present scheme.

Such a system could not be arranged to be an exact replica of the present scales and allowances, though it would come very close to it. It can be predicted, with some confidence, that the Government will sooner or later turn to this method, since it is the only way in which pay-as-you-go can be made simple. But as soon as the income and become payments made in cash, or as offsets against collection of tax, an analogy with Social Security allowances begins to arise. The analogy is heightened by the fact that the benefits proposed by Sir William

Beveridge are very similar to the cash equivalents of the present income-tax allowances. The present income-tax allowance of £50 for a child is equivalent, at a standard rate of 10s. in the £, to a cash payment of 9s. 7d. a week, or at a standard rate of 9s. in the £ (which may be regarded as the standard rate applying to earned income) of 8s. 7½d. Sir William Beveridge proposed 8s. a week. By this process of reasoning, the income-tax approaches the Beveridge plan. If the plan were enacted, and income-tax were reformed as here indicated, the position would be that everyone who was unemployed, ill, over age, or otherwise qualified for Social Security benefits, would be receiving cash allowances from the state on a certain scale, while every income-taxpayer (above a certain level) would also be receiving allowances from the state on an almost identical scale. The case for an amalgamation of the two procedures is already strong.

There is, however, something to be added to it on the Beveridge side. The existence of dependants, and the necessity of providing for them, is a complication in social insurance as well as in income-tax. So long as contributions are levied at a flat rate on all workers, but benefits depend upon individual circumstances, there is a departure from the principles of insurance. Not only so, but the need for dependants' allowances so greatly increases the cost that the scheme cannot be made self-supporting. Sir William Beveridge proposes contributions at the rate of 4s. 3d. per week for an adult male worker, with an amount of 3s. 3d. to be contributed by the employer, and even so his plan involves a large subsidy from the state—that is, from general taxation. As a flat rate tax, the employees' contribution is large enough to be seriously inequitable, while the employers' contribution amounts to that worst of all taxes, a tax on employment. These financial proposals, as was pointed out in *The Economist* at the time, are the weakest part of the Beveridge plan. Sir William is aware of their defects; his defence of them is, in substance, that any attempt to levy the cost of social security by contributions proportional to income would be too complicated. So it would—if social security is regarded in isolation. But a proportional weekly levy on all incomes is precisely what pay-as-you-go income-tax achieves. Thus not only does income-tax approach Beveridge, but Beveridge approaches income-tax.

An amalgamation of pay-as-you-go with social security would make possible a very substantial administrative economy. But beyond and above that, it would be a long step forward on the way to the goal towards which the finance of democracy has been feeling its way for decades past. The ultimate aim of Beveridge-as-you-go should be twofold: a minimum cash income provided for every citizen, employed and unemployed, rich and poor, old and young; and a simple proportional income-tax deducted at a flat rate from all incomes however arising. (A progressive surtax would, of course, be added for the higher incomes.) Such a further extension of the idea of combining social security with pay-as-you-go, if it were practicable, would have enormous attractions. Tax collection would be a simple matter of deduction at source. And since the standard allowances would be paid to every citizen, it would be unnecessary to have any complicated machinery to determine who was entitled, in what circumstances, to draw social insurance benefits. And what more decisive demonstration of economic democracy could there be than that every citizen should be given a minimum income by the community, and pay to the community a fraction of all he earned?

This picture is attractive, and it may not be very remote. But it cannot be attained in full at present because of its heavy cost to the Exchequer. It is true that Beveridge-as-you-go would provide the unemployed man or the pensioner with no more than it is already proposed to give him. It is also true that the taxpayer with an income of such a size that, but for the present allowances, he would

be paying tax at the standard rate would also not gain. But these incomes are quite large. The borderline is reached for a single man at about £270 a year, for a childless married couple at £335, for a couple with one child at £390. For those in employment but with incomes below these, it would be a good bargain to pay the standard rate of tax on the whole of their income if in return they were to receive from the state payments equal to the cash equivalent of the present income-tax allowances. And if the standard rate of income-tax goes down without the cash payments being reduced, the borderline incomes are still higher. The cost of these good individual bargains would be too heavy for the finances of the state to bear.

The dream of a complete and simple combination of National Minimum with Universal Tax must therefore be deferred. But there is no reason why there should not be as close an approximation to it as can be contrived. One such scheme, drawn up by Lady Rhys Williams, has been adopted by the Women's Liberal Federation and published in the press. It has four main features:—

1. A self-supporting social insurance scheme, entirely financed by employers and employees' contributions, but covering the risks of wage-earners only, with no dependants' allowances.
2. Allowances to be paid in cash for all housewives, children and old persons.

3. Personal allowances for wage-earners to be paid only as offsets against income-tax due.
4. Tax to be deducted at the source at a single flat rate from all incomes.

The details of this particular scheme may or may not be acceptable. But the essential point is this—that by choosing appropriate rates of tax and scales of allowances, a scheme of this general nature could be worked out now, whose net effect on the Exchequer would be no different from what the combined effect of income-tax and social security, on the present model of each, is likely to be after the war. This is not a proposal for greater expenditure; it is a proposal for a simplification and rationalisation of the scale of taxation and expenditure to which the community is already committed. It is a rearrangement in preparation for a further advance.

It would be a resounding achievement if the British community could make provision, out of a simple tax on all its citizens, for a national minimum income for all its dependants—that is, for all those who through youth or age, through sickness or unemployment, through domestic ties or misfortune, are unable to earn their own livings. It would be a still greater achievement if, at the same time, the community could proclaim its intention of moving on, as soon as its wealth permits, to the ultimate simplicity of a cash allowance for all, financed out of a tax on every income.

The International Labour Office

THE Governing Body of the International Labour Office, which concluded its meeting in London on Monday, took decisions that affect not only the future of the ILO itself but raise important principles of social and economic co-operation between the nations. It agreed to hold the next session of the International Labour Conference in April, 1944, probably in Philadelphia, and decided upon an agenda of subjects to be discussed. This decision is welcome, because the special problems of post-war reconstruction with which the ILO will have to deal are growing in urgency.

It is widely recognised that the International Labour Organisation has a leading part to play in the transition from war to peace and in the shaping of future society. Both Mr Eden and Mr Bevin, in their speeches last week, declared that it was an obvious instrument for giving effect to the policy laid down in the Atlantic Charter, to attain "the fullest collaboration between all nations in the economic field with the object of securing, for all, improved labour standards, economic advancement and social security." In some ways the war has improved the prospects for international co-operation over labour matters. Social consciousness has advanced considerably in many Allied countries. In Britain, for instance, the introduction of the guaranteed week, factory canteens, industrial health reforms and joint production committees have increased the standards and responsibilities of the workers, while full employment has resulted in a general levelling-up of incomes. Labour conditions in occupied Europe have deteriorated, but this has only increased the determination of the workers in those countries to wipe out the effects of Hitler's New Order and Dr Ley's Labour Front. At the same time, the movement for international co-operation, and the determination to avoid the economic insecurity of the pre-war period, have acquired new dimensions.

In other ways the war has created great difficulties for the ILO. The physical obstacles to consultation and co-operation have inevitably been considerable. The rift in the American Labour movement has undoubtedly created difficulties, while the exclusion of Soviet Russia, which will inevitably play a leading rôle in future labour policy, must weaken the Office's effectiveness. Moreover, it is hard to get agreement nationally on matters of post-

war reconstruction, much less internationally, and there are some sections of employers who might be reluctant to support an organisation the main purpose of which is to strengthen collective bargaining. Fundamentally, of course, the ILO must reflect the position of the international trade union movement, which is inevitably disorganised under war conditions.

The net result has been that the International Labour Office has, to some extent, been out of the picture. There seems to have been a certain tendency to sidetrack the Office, to leave it out of international discussions, and a reluctance to give it the support necessary to equip it for its post-war tasks. At the last International Labour Conference, held in New York in October, 1941, the broad outlines for a post-war policy were laid down. The ILO was given a "Social Mandate," with very wide terms of reference, and resolutions were passed stipulating that the ILO should be associated in reconstruction plans and should be represented at any peace conference. Six months later, the ILO's Emergency Committee met in London to discuss ways and means of carrying out its policy. But in fact little was done. The ILO was not associated with the Bermuda Conference on Refugees nor, originally, with the Hot Springs Food Conference, though subsequent consultations have taken place. Nor did it figure in the Washington monetary talks.

Concern lest the end of the war should find the ILO without sufficient preparation or support have been expressed by the Office's Acting Director, Mr Edward J. Phelan. On October 6th he asked: "Will it be used? Are the United Nations really alive to its vast potentialities? Have they the vision to see how greatly its use, based as it is on the joint collaboration of Governments, workers and employers, will facilitate the many difficult problems that lie ahead? Trade Unionists in many countries, and from the occupied countries of Europe in particular, are asking these questions with growing anxiety." The same fears, and a determination that the ILO should adequately and actively participate in the international agencies for post-war reconstruction, were forcibly expressed last week by the representatives of the workers' group.

But latterly there have been signs that the difficulties have been, or are being, overcome. The United Nations Relief and Rehabilitation Administration specifically

referred to the place of the ILO as a vital international agency, and the Moscow Conference agreed on the necessity for collaboration on economic and social matters. The decision of the British TUC to summon a world trade union conference in June, 1944, is indicative of a restoration of international trade union strength and activity. Moreover, the statements by Government representatives at the Governing Body's meeting show that the United Nations are prepared not only to pay compliments to the ILO but to utilise its services.

Failure to make full use of the International Labour Office would certainly be short-sighted. Technically it is well equipped to handle the tasks of labour administration and co-operation. It is one of the products of Geneva which has best withstood the test of time. During the last three years it has collected information and compiled statistics which would not otherwise have been collected or compiled. Its staff is compact and skilled, and the organisation has built up a great deal of good will in all the free countries of the world. But, however perfect the machine, unless it has a motor it will not work. The political sections of the League of Nations' Secretariat lacked nothing in skill, but there was no will to use them. Equally, the ILO will not be able to function unless its member States are prepared to make it a live and effective instrument of policy, and unless it rests on an active international workers' movement.

The first, and most important, item on the agenda of the forthcoming International Labour Conference is "the future policy, programme and status of the ILO." What, in fact, is to be its status? If the ILO were content to remain purely an instrument for the co-ordination of information, or to act as an advisory body for Ministries of Labour in various countries, its path would no doubt be smooth. But it must do more than these things. Its functions, laid down in its original Constitution, cover a very wide social and industrial field. They include the improvement of working hours and conditions, the regulation of labour supply, the

provision of an adequate living wage, the protection of workers against sickness, old age and accidents, the protection of children, young persons and women; they cover industrial welfare and safety, labour relations and collective bargaining. The organisation has already achieved a notable and creditable measure of progress in these fields. But the other aims laid down in the preamble, the "recognition of the principle of freedom of association and the organisation of technical and vocational education," have hardly been touched, nor has there been any sustained international attempt to raise the workers' standards of living. And even in the field of social insurance there is wide disparity between the practices of different countries.

To meet the immediate tasks in the transition period and to fulfil in the longer term the broader mandate outlined in the Atlantic Charter, the machinery of the ILO will need to be strengthened. One proposal, now being discussed, is for the bringing together of occupational groups within the framework of the ILO. The British Government has suggested that joint industrial committees should be formed to cover the main industries of mining, iron and steel, engineering, building, textiles, railways and transport, docks, and distributive trades. The Joint Maritime Commission, dealing with seamen's conditions and standards, is an outstanding example of successful co-operation on these lines. Seafaring is perhaps more international than industry, but as Mr Bevin, who is "a great believer in the value of 'occupational groups,'" urged, the common interests can be greater than national or racial distinctions.

With its organisation strengthened by such means, and assured of the support of its constituent members, the ILO can make a real contribution to the raising of social standards. Its activities, as Mr Harold Butler has said, touch on "all those wider questions which are inherent in the vast problems of stabilising employment and lifting the standard of life to more civilised levels everywhere." But these activities must be related to the broad social and economic policies of the constituent Governments.

There is a difference between labour standards and standards of living. It is true that the conditions of labour are dependent upon the level of wealth and productivity. Before a country can guarantee short hours, high wages, extensive welfare arrangements and the rest, it must first attain to an adequate national income to support these things. There is some tendency among the enthusiasts for the ILO to reason that, because labour problems cannot be solved except within the framework of wider economic policy, the ILO should take the whole of international economic relations as its province. It is in this spirit that the absence of ILO representation from the Washington monetary discussions was deplored. But any such extension of the ILO's functions would be a serious mistake—not because it would be illogical but because it would not succeed. Questions of employment and trade are, in these days, matters of the highest policy. It is unlikely in the extreme that Governments will be content to deal with them through the mechanism of the ILO. And if they did, the ILO would immediately become what, to its great advantage, it has hitherto avoided being—a political organisation.

The ILO will be well advised to leave the high politics of economic affairs to other agencies. Its particular function is to see that Labour in each country gets its fair share of the national income of that country. That is neither a small task nor an important one. The fear of unfair competition from "cheap labour" has been one of the most potent causes for the construction of the Chinese Wall of trade obstructions. Absolute equality of labour standards and labour incomes throughout the world is an impossibility for many decades to come. But if labour everywhere gets a return, in wages and conditions of work, that is proportionate to its productivity, there can be no unfair competition based on "cheap labour." International pressure to raise labour standards is thus not only a work of justice: it is an assistance to that restoration of free and fair trading to which the signatories of the Atlantic Charter have pledged themselves.

NOTES OF THE WEEK

The Education Bill

"If Mr Butler can, first, repair the omissions in his White Paper and, then, pilot through Parliament a Bill which unambiguously commits him and his successors, he will be, beyond question, the most effective President the Board has ever had. Until then, a certain scepticism will be in order." These were the concluding sentences of *The Economist's* comment on the White Paper on Educational Reform when it was issued in July. The Bill has now appeared, with 111 clauses and 9 schedules, and the Parliamentary omens appear to be favourable. Some of the scepticism is accordingly dissolving. The Bill follows the White Paper very closely. The two main departures from it are concessions to the Churches and to the smaller local authorities, and are therefore to be regretted; but they are not large and may be the means of avoiding a great deal of trouble. The concession to the Churches is that the maintenance of the dual system, wherever the managers of the school can find 50 per cent of the cost of external repairs and improvements, is to apply to new schools as well as to existing schools. This makes a generous offer still more generous. It means that whenever a religious body can find half the cost of the bare external shell of an adequate school, the public authorities are committed to finding the other half, and the whole of the internal cost, the cost of playgrounds and playing-fields and the running expenses, while the religious body appoints the teachers and, within wide limits, controls the education. That the making of such an offer can be represented as an oppressive attack on the Churches (as some Catholics and a few Anglicans are saying) merely illustrates the lengths to which distortion of language can be carried. It is inconceivable that Parliament should pay any attention to clamour resting on such slender justification. The concession to the local authorities is a complicated set of provisions by which the county council may (and, in some cases, must) delegate some of its educational powers to minor bodies. In all cases, however, the levying of an educational rate is reserved to the county (or county borough) council. This may save the concession from being really harmful. But it is nevertheless a pity that the President has thought it necessary to depart from the simplicity of his original plan.

The White Paper outlined a considerable advance, and the Bill, when it becomes an Act, will be a great achievement. Nevertheless, the three major criticisms of the White Paper still remain as criticisms of the Bill. The first is that the time-table is rather sketchy. Part I, which deals with little but the internal organisation of the Board of Education, is to come into effect immediately the Bill is passed. Part II, which is more important, will, it is true, come into force on a specified day, April 1, 1945. This part raises the leaving age to 15, creates the new educational authorities, and requires them to submit development plans within one further year. Beyond that, all is vague. Moreover, the time-table will certainly be extended by the second defect, which is that the Bill imposes very heavy new burdens on the local authorities. In 1938-39, the total expenditure on education out of public funds in England and Wales was about £103 million, of which about £49½ million fell on the rates. The total expenditure, it is now estimated, will "ultimately" (after the leaving age is raised to 16) be £203 million, of which the rates will have to find £88 million. This increase of £38½ million is almost exactly one-fifth of the total amount levied in rates, for all purposes, before the war—an average increase of the order of 3s. in the £. It is not, of course, Mr Butler's responsibility to tell the local authorities how they are to find this sum, together with the similar sums they will be told to find for medical services, housing, town planning and so forth; but their difficulties will inevitably slow down the pace of educational reform. A sum of £900,000 a year is to be provided for special grants to the poorer authorities; but it is far too small to be of any real value. Thirdly, the Bill does not repair any of the patent omissions in the White Paper. It says nothing about the recruitment and training of the large number of teachers that will be needed. It says nothing about what is to be taught in the schools, other than the very carefully drafted clauses relating to religious teaching. And it says nothing about the great national schism by which the English people,

almost alone in the world and to their great discredit and disadvantage, continue to maintain separate educational systems for the rich and for the poor. It may be that there are technical and Parliamentary advantages in getting the present Bill through before these large questions are tackled; and it should certainly not be attacked or obstructed because it is incomplete. But until these omissions are repaired, the Government's policy cannot be described as one of educational reform; it is a technical preface to reform.

The Future of Coal Mining

Mr Bevin's statement in the House of Commons last Friday that the Government intends to maintain the coal-mining industry on a sound basis after the war has been generally welcomed. The protracted negotiations between the Minister of Fuel and the two sides of the industry have so far concentrated on the immediate problems of wartime control and grouping, labour discipline and production bonuses (described in a note on page 852), but the long-term problems are not very far in the background. Mr Bevin said bluntly that the Government could not "leave the coal industry where it is and expect it to survive," and he stressed the importance to this country's industrial future of developing coal by-product and chemical industries. One method of approach is to encourage research and technical development; another is to improve the miners' security and working conditions. The Minister of Labour was able to give the House some assurances about the scheme for recruitment to the mines and, in particular, about the provision for medical examination and continued education. Members were, on the whole, not critical about the details of the scheme, though some doubts were raised about the adequacy of housing arrangements, nor of the method of selection by ballot, which was accepted as the fairest and probably inevitable under the circumstances. They welcomed the introduction of fresh recruits as a means of breaking down the isolation of the mining industry. Their criticisms were directed at the Government's whole handling of the coal situation, which had made these measures of conscription necessary, and at the alternation between optimism and pessimism in Ministerial speeches, and the "humiliating position where the greatest coal exporting country in the world is moving from month to month from one coal crisis to another." Lieut.-Colonel Lancaster, in a sensible speech, thought that it would take at least twelve months before 50 per cent of the recruits became fully productive and 18 months for the remainder. He, and other Members, urged the adoption of the Forster Committee's report on the recruitment and training of juveniles. Most of the youths, who are conscripted for the duration of the war, will want to leave the industry at the first opportunity, unless conditions are made more permanently attractive and coal-mining can offer the prospects of a career. The problem of lack of manpower may well have been only postponed.

The Baltic Front and Ukraine

The Russian thrust from Nevel towards Polotsk has achieved an important initial success. Vitebsk is being outflanked from the north and north-east. The Vitebsk-Nevel railway has been cut in several places, between Gorodok and Oserishtche. It is, however, not at all certain that the real winter offensive has already begun on the first Baltic front. General Bagramyan's troops are now fighting in an area which is very densely dotted with lakes—Oserishtche means in Russian the district of lakes. At this time of the year the lakes are still not quite frozen, and the defence can use them as invaluable obstacles to the Russian advance. The Nevel thrust is therefore more likely to be a preliminary manoeuvre designed to divert the Germans from some other sectors where the prospects of a Russian offensive look more promising; for instance, from Vitebsk itself, or from the Smolensk-Orsha road. It is in any case clear that the Baltic front will become the main theatre of operations in the near future, because during the early winter the weather is more favourable for an offensive in the north than in the south. So far, the new Russian operations have not offered any immediate threat to the German forces in

JAEGER

Facts

1. Wool does not become damp like cotton or linen.
2. Wool is warmer in winter and cooler in summer because it is a slow conductor of heat.
3. Wool ventilates the skin, so keeps it in good condition.
4. Wool is just as important in bed.
5. Wool therefore is best for health and comfort.

the Leningrad province. And no such threat can arise as long as the Leningrad-Dvinsk-Warsaw railway, 150-200 miles to the west of Nevel-Vitebsk, remains beyond the Russians' reach. On the Ukrainian front in the south enormous tank forces are still interlocked in the battle of the Kiev salient. Manstein's offensive has, however, achieved no further success in the course of the past fortnight or so. The renewed Russian pressure in front of Cherkassy, and in the directions of Kirovograd and Nikopol, is preventing the German Command from achieving that higher degree of concentration which might possibly enable them to recapture Kiev. The liquidation of the German bridgehead across the Dnieper mouth, opposite Kherson, does not materially alter the position in the extreme south, where the Germans are still holding out in the Crimea.

Justice or Vengeance?

Last week the first "trial of war criminals" took place before the Military Tribunal of the Fourth Ukrainian Army Front in Kharkov. The four defendants were a corporal of the German Auxiliary Military Police, an SS *Untersturmführer*, a captain of the German counter-espionage and a Russian who had been employed as a driver by the Gestapo, in a word the smaller fry in the German terror apparatus that had held in its grip large parts of Russia for nearly two years. A characteristic feature of the proceedings was the self-accusations of the defendants, the oddity of which cannot fail to strike people accustomed to Western judicial procedure. Whatever one may think of the conduct of the Kharkov trial, there can be no doubt that the atrocities of which the men were accused have taken place. The use of "gas-vans" for the mass extermination of innocent people, the execution of hospital patients and of women and children, the shootings of prisoners of war—these and a host of similar practices have for some time past been reliably reported from occupied Russia as well as from the other occupied countries in eastern Europe. "International law or any other law has had no validity on the eastern front"—said one of the defendants in the Kharkov trial. Somebody should and must bear the responsibility for this frightful state of affairs, if all demands of justice are not to be simply thrown overboard.

Yet two principles must be maintained. First, the men in leading and responsible positions should be punished, and not subordinate ranks who may have acted on the orders of their superiors. "I acted upon the orders of my immediate superiors." "If I had refused to carry out such orders I would have been court-martialled and shot on the spot"—these were the refrains repeated by each of the defendants in the Kharkov trial. The reports of the trial available here do not give the impression that the Russian Military Tribunal gave sufficient attention to this point or that these assertions of the defendants were convincingly refuted by the findings of the Court. The issue has, admittedly, been extremely difficult. "Not soldiers but hangmen sit in the dock," wrote an authoritative Russian commentator when the trial was on. They were, in fact, both soldiers and hangmen, and this makes the problem desperately complex. The second essential principle is that justice should not be confounded with vengeance. Unfortunately, the atmosphere which surrounds the Kharkov trial gives no guarantee that the distinction between the two has been made with sufficient clearness. The press campaign was extremely violent. It exalted the "punishing sword of justice and vengeance." For the first time since Tsarist days gallows appeared; and the hanging of the convicts was made a public spectacle. What is involved here is not merely sentimental scruples, for which there may be little room in this age of iron and blood, but one of the major political problems of war and peace. The Kharkov trial is intended to be the first of a series. It may well set the pattern for the punishment of war criminals throughout eastern Europe. Retribution may easily degenerate into irresponsible acts of mass vengeance, of which the aftermath is certain to that the Kharkov trial was meant to forestall acts of spontaneous lynching of Germans and of Russian traitors by the Russian people themselves; and this would, to some extent, seem to explain the shortcomings in its proceedings. Even so, it to be jointly agreed among the Allies, both as to forms and principles; and perhaps some special courts, not necessarily military tribunals, ought to be set up to try the

war criminals in a spirit somewhat less affected by the passions which are bound to prevail amid the ruins of a destroyed city almost behind the front lines.

Good News from the Far East

The week has brought good news from the Far East. The next stage in the Allied advance on Rabaul has opened with a successful landing on New Britain. The Arawe area is at the extreme tip of the island, furthest from the great Japanese base, but once airfields have been established, it should be possible to prepare the way for a direct attack by intense close-range bombing. Throughout the area, the Allied air attacks are growing in intensity, and it is likely that the weight of bombing on the Japanese airfields will obviate the weeks of hand-to-hand fighting which, for example, preceded the capture of Munda. It is not only the immediate conduct of the war that is developing favourably. A new and successful step has been taken to improve the vitally important machinery for victory. The technical difficulty of welding three services, several nations and a multitude of fronts into a fighting unity is undoubtedly the most serious problem facing the Allied Commanders in the Far East. Lord Louis Mountbatten has taken a big and imaginative step forward with the fusion of the British and American air forces into a single air command under Sir Richard Peirse, with Major-General George Stratemyer as his second in command. Lord Louis, in announcing the fusion, said

I feel certain that the American and British forces will prove far more effective now that they are united into a single Allied airforce.

This raises the question whether the process of fusion might not be very usefully extended, to the land and sea forces in the first place, and, although the technical difficulties would be greater, to the problem of co-ordinating air, land and sea forces into a single striking force. The Far Eastern war will be essentially a three-service operation. If, as Lord Louis said, "the Allied command works best with closely integrated forces," how much further can the process of integration go? The arrangements announced for the division of the new air command into a tactical air force under Air-Marshal Sir John Baldwin, and a strategic air force under Brigadier-General Howard Davidson, suggest that the technique worked out in the Mediterranean will be applied in South-East Asia. The tactical air force will co-operate in the closest liaison with the land and sea forces, the strategic air force will fulfil functions similar to those of Bomber Command in Britain. The system appears to have worked well in Tunisia, Sicily and Italy. It may well be the best method for the coming Burma campaign.

Crisis in Bolivia

The Government of the Bolivian President Peñaranda had been under fire for some time past. It was violently unpopular with the Left because of its handling of the Catavi strike a year ago in which a number of miners were shot. It was equally unpopular with the extremist Right because it was not sufficiently "nationalist" and because, as national socialists, the young men of the *Movimiento Nacionalista Revolucionario* attacked the Government for its "bourgeois capitalist" outlook, its dependence upon the mineowners and on foreign interests. To this extent—a familiar phenomenon—Right and Left could make common cause against the rather shabby and shop-soiled "democracy" of the centre parties. After a defeat in Parliament in September, those parties, the Liberals, the Unified Socialists, the Republican Socialists and Republicanos Genuinos, drew up a working agreement to secure a parliamentary majority and to work together in the approaching municipal elections. This move was interpreted as a bid to exclude the extremists permanently and it is perhaps not without significance that one of the leaders of the *coup d'état*, Señor Victor Paz Estensoro, paid a visit to President Ramirez at Buenos Aires about this time. The revolutionaries had the support of strong sections in the Army (which is behind most moves in Bolivian politics), and after stiff fighting in La Paz, they were able over last week-end to turn the President and his Government out of office. The first announcement of the new President, Maíor Gualberto

Villarreal, was a promise to keep the democratic constitution, pursue a good-neighbour policy and uphold international relations and the Atlantic Charter.

It is early to prophesy the consequences of the *coup d'état* with any certainty. In internal politics, it is almost certainly Fascist with strong prejudices against foreign capital. Although half of Bolivia's chief raw material, tin, belongs to a Bolivian, Simon Patiño, the rest was divided at the beginning of the war between Argentine and Swiss interests. Since the war, the United States has entered into the Bolivian economic picture more and more as a mass purchaser of tin and tungsten, Bolivia's whole economic life to-day is dependent upon United States purchases. It follows that although the Bolivians may resent their dependence, they are not in a strong position to take action against foreign capital. Señor Estensoro has a reputation for radical sympathies. He led the attack on the Peñaranda Government as the corrupt tool of the mineowners. Will this radicalism survive office? The Ramirez Government in Argentina came in with a great crusade to clean up public life. It has grown noticeably dirtier since. The condition of the Bolivian workers is evil beyond belief. Even so, the Governments of this national socialist type very rarely turn the promises which gained them working-class support into actual performance. They are even opposing the United States effort to ensure that a proportion of the increased price paid for tin is passed on to the workers. The owners fear the precedent. The only attack likely to be launched against their position will come from the nationalism and not the socialism of the new regime. There may be an expropriation of foreign capital. The international attitude of the new Government has not yet become manifest yet, but it is hard to avoid the belief that it will be unfavourable to United States influence, will look to Argentina rather than Brazil and pursue a vexatious policy in its relations with most of its neighbours. The shadow of post-war problems and clashes of interest already lies across the continent—first Buenos Aires, then La Paz, The Bolivian experiment may be more moderate, but this is, perhaps, unlikely. Bolivians are not moderate by temperament.

Bolivia's Future

The cardinal fact about Bolivia's past, present and future is the grinding poverty of nearly all its three million inhabitants. The high plateau produces little or no food. Supplies are imported against exports of metals. If the world market for metals were to collapse, nothing but starvation would face great masses of Bolivians. Little or nothing has been done to build up subsidiary industries or make mining the centre of a more balanced economic structure. To do this would require capital, but successive Bolivian Governments have permitted the larger part of the profits of the mines to leave the country. Señor Patiño's fortune at one time was estimated at £100 million. Little of it found its way back to Bolivia. The country needs a vigorous government action to ensure that the proceeds of the mining industry are ploughed back into the community, other industries developed, and the stark economic ruin which hangs over Bolivia warded off. More capital is needed, and it would be tragic if indiscriminate nationalism were to drive out American aid, or were to allow the country to be torn between the competing economic advances of Argentina and Brazil. There is little in the new Government to suggest that it grasps the real basis of Bolivia's unsettled economy and explosive politics. Yet if understanding is long postponed, the problem will be insoluble. An ominous warning came recently from the Bolivian Development Corporation. It stated in a report that "the Bolivian mining industry has entered a period of decline and exhaustion which will be definitive if no new deposits are discovered, and no substantial technical improvements introduced for the exploitation of low-grade ore." The Peñaranda Government proposed to set up a National Institute for the Investigation of Ore and Oil Deposits in order to extend and diversify the industry, as well as build up refining plants in Bolivia itself. If the new regime allows its zeal to flow into similar channels, the economic crisis which will make Bolivia a Latin American storm-centre may yet be avoided.

Australian Labour

Mr Curtin has won a victory almost more difficult than his triumph over the Opposition at the polls: he has persuaded the exultant Labour Party, assembled in conference, to bring its proclaimed policy into closer accord with realities. From the internal point of view, the most important steps taken last week were constitutional. On the one hand, the Labour Party disavowed its long-standing intention of abolishing the separate Parliaments of the States; and on the other hand it advocated the re-submission to plebiscite of the amendments to the Federal Constitution rejected last year, which would have the effect of strengthening the hand of the Commonwealth Government. It remains to be seen whether the authority of the Labour Party, which in the recent election polled a majority in every state, will suffice to carry this reform through. The other great change in policy that the conference, under Mr Curtin's leadership, enacted, was the complete abandonment of that isolationism, or semi-isolationism, to which Australian Labour has long been addicted. The facts of the world are, of course, superabundantly clear; there can hardly be a country in the world for which isolation is a more fatuous impossibility than it is for Australia. But it is a great advantage to have the record clear.

Commonwealth Integration

The question of Australia's place in the world was very naturally coupled with that of Australia's place in the British Commonwealth of Nations, and Mr Curtin reverted to his earlier advocacy of some strengthening of the organs of Commonwealth association. His remarks have aroused some discussion in Australia, but the critics appear to have limited themselves to pointing out the discrepancy between Mr Curtin's suggestions and his speeches of two years ago, with their strong anti-British tinge, or the inconsistency between his advocacy of more frequent meetings and his record as the only Dominion Prime Minister who has persistently stayed at home during the war. Such accusations are the customary small change of Australian politics; the important fact is that the critics do not dis-

More NEWS of No. 4 WHITE HORSE

Safeguarding the quality

Like many other good things, White Horse Whisky is not so easy to obtain as it was, and more people than ever are anxious for a share of the regulated supplies that are available.

But rarity lends an added charm. We enjoy good things even more when we get them only now and then. And how good is an occasional glass of White Horse Whisky in this fifth year of war. A whisky of rich fragrance, and full, round flavour, of rare delicacy and bouquet. A whisky in which all the qualities of great age are crowned by a genial, heartening glow with never a trace of fire.

Forethought and a provident care of stocks laid down in years of plenty have provided a modest supply for your pleasure to-day. But the supply is regulated. Regulated to ensure that, to-day and always, White Horse shall be the whisky 'fine as a fine liqueur.'

MAXIMUM PRICES: Bottles 25/9, Half Bottles 13/6

agree with the policy Mr Curtin proposes. New Zealand opinion, it appears, is also in favour of anything that draws the bonds of the Commonwealth closer. There would be, as always, strong support for any such proposal in the United Kingdom. Public opinion in South Africa, and especially in Canada, is more hesitant but not openly hostile. On the surface it would appear that the Commonwealth is on the verge of a new phase, in which the tendency will be towards closer association rather than towards greater freedom of action for the Dominions.

This may be. But it is important to note that the reasons for closer association are different in different parts of the Commonwealth. The reason that Mr Curtin gives is so that Australia shall not again find itself committed to a policy in the shaping of which it has had no real hand. His wish is not to abridge Australia's sovereignty, but to express it more effectively. United Kingdom advocacy of the same proposal springs from the desire that the British representative in the counsels of the Great Powers shall speak in the name, and with the authority, of the whole Commonwealth. These two approaches are not, of course, irreconcilable. But they do mean that any precise proposal for closer association will have to have a keen eye to the fears of both parties. The Dominions do not want any machinery which, whatever its phraseology and whatever its parade of equal consultation, leaves them in fact in the position of merely being informed, after the event, of the United Kingdom Government's decisions and invited to regard themselves as committed thereby. They have that already, and they are not satisfied with it. If London wants the whole Commonwealth to have a common policy, it must give the whole Commonwealth a genuine opportunity to participate in its formulation, from the first minute to the last commitment. On the other hand, the United Kingdom's apprehension is lest the Dominions seek to have a voice in British decisions without being committed to the execution of those decisions, and to their consequences. Mr Curtin has often appeared to imply just that, and last week's resolution, with its emphasis on Australian sovereignty, could be read in that way. Any such suggestion would naturally be unacceptable as a principle of policy. It is true that a Dominion can no more be led to war against the will of its own Parliament than can the United Kingdom itself. But this very obvious principle of democracy does not hinder Governments from entering upon policies that involve commitments. It is also true that neither the United Kingdom nor any of the Dominions can be coerced into or out of a policy by the votes of its colleagues. The precedent of Eire sufficiently establishes that, and any scheme of closer association would have to provide for any member to contract out of any policy from which it dissented. But what cannot be in the interests of the United Kingdom, or the Dominions, is that they should neither assent nor dissent, and that they should, in some sudden crisis, find themselves committed, not by coercion from London but by their own interests and wishes, to a policy which they have never fully appreciated and for whose consequences they are quite unprepared. The need is not to elaborate federal organs, but machinery by which there can be constant, free and equal consultation

and by which the British nations can act in concert in that great majority of issues where they think alike.

A Liberal Revival?

For the second time in a few months, an "Independent Liberal" candidate has come close to winning a Parliamentary by-election. In August Donald Johnson lost Chippenham by only 195 votes, and last week Miss Honor Balfour came within 70 votes of being returned for Darwen. In both cases the candidates were members of the Liberal Party Organisation, from which they were compelled to resign, since the party loyally observes the political truce. The "Independent" in their title thus represents a revolt from the party line as well as opposition to the Government. By-elections are rarely significant in themselves, and two are not enough to establish a firm trend. Nevertheless there is something that needs explaining when Conservative candidates, backed by the Labour and Liberal leaders, have such difficulty in defeating candidates who carry the standard—albeit differentiated with independence—of a party that has so often, by its opponents, been formally buried. It is true that both these Liberal candidates were of high quality—but so were the official candidates. It is true that Darwen was Lord Samuel's seat—but it rejected him in 1935. It is true that Miss Balfour gained a lot of Catholic votes by an attitude to the Education Bill which will certainly not be that of the Liberal Party in the House of Commons—but there is always some issue that can be turned to account by a skilled electioneer. These two results cannot be shrugged off in this way. Undoubtedly, they show a deep dissatisfaction among the electorate with the political leadership the Government is providing. Nor can there be much doubt that the cause of the discontent is the excessively timid and inarticulate way in which the Government is approaching the domestic problems of post-war reconstruction. What the elections do not show is whether this strong and widespread feeling is purely negative or whether it is taking a positive turn. Do people vote for an Independent Liberal candidate because they believe in the Liberal Party as an effective instrument of government? Or because to do so is the only way of taking a slap at the Government? And what would happen if an Independent Liberal contested a by-election in a Labour seat? There are those who are talking of a Liberal revival. Certainly nothing would be better for British politics than the re-emergence of a party of the quality of the pre-1914 Liberals. But it still looks rather like wishful thinking.

Industry and Research

As in the last war, the compelling need for new and better instruments of war has given a powerful stimulus to research and, significantly, has brought a widespread realisation that the future of Great Britain as a great industrial power depends, in no small measure, on its ability to remain in the forefront in fundamental and applied research. This realisation is reflected in the many reports on the future of research that have recently been issued by scientific and industrial organisations, and in the plea of the deputation from the Parliamentary Scientific Committee, received by Mr Attlee on December 15th, for more direct encouraging and research. In fundamental research British scientists have been second to none, but its extension will involve a substantial increase in expenditure at universities after the war; in asking for a grant of £1,000,000 to enable universities to extend their research and training facilities, Mr E. W. Salt, chairman of the PSC, was certainly not aiming too high. Moreover, if highly trained and qualified scientists are to be attracted and retained in sufficient numbers by universities, and encouraged to concentrate on fundamental research, they should be provided with incomes more comparable than at present with those they could obtain in industry. The scope of applied research in industry, too, should be substantially enlarged. At present research is carried on independently by individual firms as well as—since 1917—collectively by industrial research associations financed, apart from subscriptions from members, by grants from the Department of Scientific and Industrial Research created by Order-in-Council in July, 1915. Of the two, the first is probably the more important, but the scale of expenditure on both, though increasing, has been lagging behind practice in many other countries. According to a sample

inquiry carried out by the industrial research committee of the Federation of British Industries, 422 firms spent £1,736,000 on research in 1930 and 566 devoted £5,442,000 to this purpose in 1938. Expenditure on collective research has also shown an increase. In 1930, 18 research associations obtained £162,000 from subscriptions and a grant of £93,000 from the DSIR; in 1938, 22 associations received £362,000 in subscriptions and £177,000 in grants, and in 1941 they secured £368,000 and £192,000 in subscriptions and grants. One example of the growing realisation of the need for more collective research is the research budget of the British Coal Utilisation Research Association, one of the grant-aided associations; in 1938 this association spent £25,000, but during the five years 1943-47 it will have at its disposal £1,000,000, or £200,000 a year. Another example is the post-war plan for the International Tin Research and Development Council proposed by Mr John Ireland, its director. The Government could encourage both independent and collective research in industry by treating all legitimate expenditure as cost items in income-tax assessments. Sir John Anderson informed the deputation from the PSC that he would welcome concrete recommendations before the Budget about the effect of taxation on industrial research. But an intensification of research, though vital, is not everything. "To be first in the field of application," as the industrial research committee of the FBI put it, "is of even greater advantage to a country than to have been the birthplace of the discovery."

The Future of Newfoundland

The history of Newfoundland in the last ten years should be an object lesson to the Colonial Office. By the Newfoundland Act of 1933 the oldest Colony had its Dominion status taken away and its constitution suspended, and was placed under the government of a Commission, with the Governor as chairman, who is responsible to the Secretary of State for the Dominions. The main reason for the change was economic. In the words of Mr Emrys-Evans, Under-Secretary of State, to the House of Commons on December 2nd,

The island was in imminent danger of financial collapse . . . poverty and distress were widespread, and unemployment was rife. The condition of the people was pitiful. . . .

It was consequently laid down in the schedule to the Newfoundland Act that as soon as the island was again self-supporting and its difficulties were overcome, responsible government, on the request of the people of Newfoundland, would be restored. Since the war, prosperity has apparently been achieved and Newfoundland is now in the position of lending money, free of interest, to the Imperial Government. Yet it is clear that the prosperity has largely been brought about by wartime conditions—chiefly by the expenditure on the naval and air bases—and all three members of the Parliamentary Mission to Newfoundland, who spoke in last week's debate on the island, are agreed that there must be considerably more reconstruction and development, and expenditure from Imperial funds, before it can really be called self-supporting. They spoke of a ten-year expenditure on development of £16 to £20 million. But development in itself is not enough. The other condition for the restoration of self-government is that the Newfoundlanders themselves should request it, and what is perhaps more disturbing than any other aspect of the island's present condition is that most of the people seem to be completely apathetic about their political future. The only thing on which they appear to have an opinion is that they do not wish to return to the corrupt and inefficient Governments of the period before 1933. But public opinion has hardly a chance of forming, much less making itself heard, because of such practical difficulties, mentioned by Mr Ammon, one of the Parliamentary Mission, as the lack of adequate communications, which cuts the people in different parts of the island off from each other. The development of local government, therefore, which the Government's recent statement of policy proposed, is as urgent and necessary as is economic development. Those who regard development and welfare in the colonial empire as an end in itself should learn from the history of Newfoundland in the last ten years that it is not enough. As the Parliamentary Mission found, the Commission of Government has done a great deal of useful work—it has started hospitals, introduced compulsory education, established co-operative societies and so on. But it has made the big mistake of not associating the people with its work—or even trying to—and the present political apathy of the islanders is a good

illustration of how development here, and elsewhere in the Empire, should not be carried out.

A Colonial Dual System

On the Christmas adjournment, a short debate took place in the House of Commons on Kenya. It would be a pity, as Colonel Stanley emphasised in his reply, if the short and hurried character of the debate gave the impression that Parliament could not spare more time for the affairs of East Africa. The reason why the subject was raised at all was that recent events in Kenya have aroused grave misgivings, not only among the Labour party which asked for the debate, but among all who have the interests of the colonies at heart. First of all, there was the conscription of natives last year to work on European farms and even on European tea and coffee plantations. This was followed almost immediately by a bad food shortage all over the country but particularly in the native reserves, where cases of starvation occurred. The immediate cause of the shortage seems to have been the failure of the rains; but the evidence given before the Food Commission brought to light other reasons as well, of which the African witnesses tended naturally to concentrate on the absence of the young men through conscription and on the low price for African maize—the guaranteed price, given to stimulate production for the Middle East, applied to European grown maize only. The result of the food shortage was that conscription of labour was suspended for a time, and is now only applied for the production of sisal, pyrethrum, rubber and essential foodstuffs not including tea or coffee. But in giving this information to the House, and emphasising how much he and the Kenya Government disliked the policy of forced labour, Colonel Stanley did not explain why it has not been possible to secure the necessary labour by voluntary means—or whether any attempt had been made to remove the cause of the African's unwillingness to work on European farms.

The third reason for misgiving about the future of Kenya is that, on top of all the evidence that the European settlers have been able to strengthen their own position during the war at the expense of the Africans, come reports that they are now pressing forward plans for increased European settlement after the war—and for European read British. In the debate, Colonel Stanley stated that there is no new development in regard to white settlement in Kenya, apart from the Settlement Committee's proposals in 1938 to settle a few hundreds over a period of ten years, which were recently reaffirmed by the Kenya Government. This is a reassuring contradiction of the assertion of Major Cavendish-Bentinck, a prominent settler and chairman of the New Settlement Section of the Agricultural Production and Settlement Board, that

a carefully conceived settlement scheme does in fact exist, and has been accepted both by the Government and by the Secretary of State for the Colonies.

He and the others are not thinking in terms of a modest few hundreds. The situation in Kenya needs careful watching if the dual system, which has given subsidies and privileges to Europeans—but has yielded no returns to the colony as a whole—is not to be perpetuated and strengthened.

The Swedes Protest Again

The Swedish Government has not been content to let Ribbentrop's "mind your own business" retort to stand. They have renewed their protest over the deportation of Norwegian students to Germany and stated bluntly that if no notice were taken of their protest, a "serious deterioration" might occur in their relations with Germany. Some sections of the Swedish press have criticised the Government for not stating more clearly in what this deterioration would consist. The attitude of the general public is best demonstrated by Gothenburg University, which has decided to suspend its scientific relations with all German universities. The Swedish authorities would certainly have popular support if they threatened some form of reprisals. They are, of course, in a position to inflict serious embarrassment on the German war economy. Any final interruption of the flow of Swedish ore to Germany would drastically complicate the position of the German war economy. Equally, however, the Swedes depend upon German imports to keep

their industries working. In a sense, the diplomatic notes and counter notes are a trial of strength. Sweden can threaten to cut Germany's economic lifeline. Germany can threaten the same, with the risk of invasion added. The result so far suggests that Sweden is for the time being in a stronger position. Trade talks between the two countries are continuing and the Germans have suspended the deportation of Norwegian students.

Property and Incomes

A statement by Sir William Beveridge in a recent speech that "80 per cent of the private property of the country is owned by 7 per cent of the population" has attracted a certain amount of attention. It may be of interest to put such facts as are available on record. The most complete estimates of the distribution of property in Great Britain are those published by Mr H. Campion shortly before the war.* Mr Campion's definition of property is a wide one, including land, houses and buildings, the capital of industry, transport, commerce, finance and agriculture, railways, British and foreign government securities, other overseas investments, furniture and moveable property. The total of private property in 1936 is estimated at between £15,853 and £17,548 million. Of this total, an amount estimated at between £13,604 and £14,613 million—that is, between 83.3 and 85.8 per cent of the total—was held by between 1,727,000 and 1,874,000 persons, each of whom held over £1,000, and these persons were between 6.8 and 7.4 per cent of the total number of persons over the age of 25. These estimates are in close agreement with Sir William Beveridge's rounder figures. That 84.5 per cent of the private property of the country should be held by 7.1 per cent of the adult persons (these figures are the

* "Public and Private Property in Great Britain." By H. Campion. Oxford University Press. 1939.

middle of the range of estimates) will be a surprise to many people. It will be still more of a surprise to learn that it is necessary to go as low as holdings of £1,000 to include even as much as 7.1 per cent of the persons. Those holding over £10,000, who are 1.0 per cent of the persons, own 55.8 per cent of the private property. Mr Campion estimates that the total value of public property in Great Britain in 1932-34 (excluding the value of roads, armaments and securities held by local authorities) was between £2,455 and £3,325 million.

The distribution of property is not, of course, the same thing as the distribution of incomes. In incomes, though there is great inequality, it is not so severe as in property. The Budget White Paper of last April gave figures for the distribution of incomes in different categories of size. Unfortunately, it did not give an estimate of the total number of incomes, but only of those in excess of £250 a year. From figures given in the Government Actuary's Memorandum on the Beveridge Report it is possible to estimate that the total number of incomes in the middle of 1944 will be 27 million (married couples counting as one). If this figure be applied to the income statistics of 1941-42 (the error is not likely to be large), those persons with incomes (before tax) of £500 a year or over were 5½ per cent of the total number of incomes and enjoyed 24.8 per cent of the total of individual incomes before tax. To get 1,800,000 persons (the number who owned 84.5 per cent of the private property of the country in 1936) it would be necessary to go down to a little above £450 a year, and these persons would have something like 28 per cent of the total of individual gross incomes. As a rough statement, therefore—slightly less rough than Sir William Beveridge's—it can be said that 1,800,000 persons, who are 7 per cent of the adult persons in the country, own 85 per cent of the private property and draw 28 per cent of the individual incomes of the country.

AMERICAN SURVEY

Labour-Management Councils

(From a Correspondent in Massachusetts)

BOSTON, November.

BOSTON has just seen an exhibition, the first of its kind, of the work of the Labour-Management Councils, which were devised, as in England, to stimulate production in war plants. These councils have been an important factor in the production record achieved in United States plants since Pearl Harbour. There are now over 3,000 of them, covering plants employing more than 6,000,000 persons. More than a third of these have been established in the last four months (July-November), a period that has seen the council movement rapidly accelerated by the momentum of success of the early councils.

More than 1,000,000 workers have contributed suggestions, through their plant councils, for improving production, and more than 1,000 of these have been of enough value to receive government awards. Some of the most interesting were shown at the Boston exhibition, although a number are military secrets. This one aspect of the work of the councils testifies eloquently to the inventive capacity and the instinct for economy and efficiency of the American factory worker, when he is encouraged to think in terms of the better performance of his own job. The suggestions displayed are largely mechanical, for the saving of time or the conserving of materials, increasing the life or performance of tools, removing bottlenecks in the flow of products. But it is likely that the larger effect of these councils has come in their attack upon the human factors in industry through efforts to give consideration to the comfort, health and morale of workers. Councils generally seek to find the causes of excessive absenteeism and high turnover of labour and to correct them. This leads them into problems of adequate transportation of workers, securing suitable shopping hours at local stores, and other community situations such

as housing, restaurant facilities, food allowances and opportunities for women workers to leave small children under supervision. The efforts of the councils in these directions have been uneven. But many have corrected high absenteeism by increasing opportunities for women to shop at convenient hours and by making more satisfactory transportation arrangements. Some councils supervise the canteen and restaurant facilities in their plants to insure good food and clean quarters. Many have nutrition committees that seek to suggest more nutritious lunch-box meals for workers. But little has been done in American plants to have the systematic service of adequate meals in plants, that is common in England.

A Labour-Management Council is composed of equal representation of management and employees who choose their members by their own methods. Both labour and industry have endorsed the council plan, which was instituted at the request of Mr Donald Nelson, chairman of the War Production Board, in March, 1942, after President Roosevelt announced his goal for plane, tank and ship production for 1942. At first the councils spread slowly and management was cool to the idea of consulting its labour about production methods. But Mr Nelson made it plain that the councils were for the sole purpose of securing maximum output, and that they were not to put labour into management or management into labour. They have nevertheless introduced into many plants the first consultations of management and workers on problems of the shop. Many managements have kept the scope of the councils quite narrowly limited to avoid any strictly labour discussions. Collective bargaining and grievances are, by definition, outside the scope of the councils, which may exist in shops that are either union or non-union. But many councils have

dealt with questions which, if not specifically grievances, have in their solution avoided grievances, and many others have dealt with questions of incentives, including adequacy of bonuses to stimulate production.

The councils have recently spread even in conservatively managed New England plants, where there are now 250 councils in shops employing nearly 500,000. The council is a device of especial need in the very large plant, where management cannot know the shop personnel. But very successful councils are operated in plants with as few as 100 workers. Conceived as a war production measure, the council has won its way in many an industry to a point where management hopes to retain it as a permanent factor in improved *esprit de corps*. Doubtless some managements hope by this means to avoid unionisation of their employees. It would be a mistake to think of these councils as having in most cases effected any radical modification of management or any extensive democratisation of plant operation. They are perhaps primarily a means of bringing to the attention of management the suggestions and attitude of the workers on problems that are creating production difficulties, and of bringing stimulation for greater effort to the workers through a channel more acceptable to them than direct management exhortation.

Fire prevention and safety campaigns have been quite typical council activities that have had high success. Many councils operate recreation programmes for the employees. The most obvious activity is just keeping before the employees a constant appeal for rapid output; there is no question of its effect. The quite American interest in breaking records and in competing with other departments for highest performance score is exploited with effect. And dramatics are not overlooked. The New England Shipbuilding Corporation of Portland, Maine, has erected a large ornamental plaque with a scroll of the war dead from that plant under the heading: "These men have earned the right to be absent." The same plant introduced religious services on Sundays in the yards, after a study of absenteeism showed that the interest of the workers in a Catholic community in attending church services was largely responsible for heavy absenteeism on Sundays.

All councils instal "Suggestion Boxes" in the various departments, where employees can drop suggestions through a letter slot. Some carry this a step farther and instal also a "Gripe Box," which invites unsigned complaints of conditions which make work unnecessarily difficult, slow, inefficient or unpleasant. Typically, councils report that they "have brought the men closer together and increased output." Some have tackled such central problems as streamlining the assembly by installing a line system. In one case this involved a change in the top personnel of assembly. Improvement in ventilation and rearrangement of machines to avoid over-congestion in work rooms, introduction of hand trucks to avoid excessive and slow hand work are characteristic council changes.

Quite typical American advertising appeal methods are commonly used by the councils to win the interest of the workers. The poster is the most conspicuous means used. Posters in the shops exhort men to conserve materials, to follow safety cautions, to avoid absence, to back up the fighting men, to "share the ride," to buy war bonds, to join in scrap salvage. The plant newspaper and the plant slogan extend the appeal of the posters. A good deal of graphic art goes into these posters, and personal recognition of individual achievement is featured in the plant newspaper, in awards, and in banquets and trips to Washington for those who have contributed especially meritorious suggestions or made outstanding work records. All the councils in the country are knit together in their programme by a paper, *Labour-Management Council News*, published by the War Production Board, which records their achievements, features Government awards to their plants and members and emphasises the production campaigns and goals sought. The War Production Board claims that plants with councils have won twice their proportionate share of Army and Navy "E" awards for excellence in production. Thirty-four per cent of the plants with councils in New England have won these "E" awards, even though many of the councils are quite recent.

The recent growth of the council movement has come under the spurring leadership of Theodore Quinn, a quite remarkable product of American industry. He made a phenomenal record as a salesman of electrical equipment and became the youngest vice-president in the history of the important General Electric Company. Son of an Irish labour leader, Mr Quinn has a warm appreciation of the human factor in industry; he has the confidence of labour

and at the same time is recognised by industrialists as a highly successful business executive.

That this strong exponent of human engineering in industry is a partner of Mr Lou R. Maxon, the extremely reactionary advertising man who flounced out of the management of the Office of Price Administration with a flamboyant attack upon the whole system of wartime price control as a menace to the American way of life, is a striking instance of the axiom that you can't judge an American business man by the company he keeps.

American Notes

The Home Front

President Roosevelt has returned from his five weeks' absence to find that conditions have deteriorated steadily on the home front. It is true that Congress has departed for its Christmas recess without carrying to a finish the innumerable attacks upon Administration domestic policy which have marked the past month. There may yet be time for the President to rally his forces, but it is getting very short. With the strike vote of the five operating railway Brotherhoods the attack of the unions upon the "Little Steel" formula is entering its final phase. The intellectual contortions needed to solve one hard case—that of the coal miners—might be explained away, but if the railway workers drive an equally hard bargain, it is difficult to see how even the Administration can insist that the formula has been maintained. Mr Davis, head of the War Labor Board, has urged that the real meaning of the wage demands is the belief that Congress, in its attack upon subsidies, has deserted its earlier anti-inflationary position. In the main this is certainly true, but it is probably too late to convince the unions of a Congressional change of heart even if this should occur at the eleventh hour—of which there are no signs. The Senate has not yet followed the House in prohibiting the payment of subsidies, so that they may continue until February 17th, but the "compromises" now being explored lean over backward to conciliate the farm bloc. Even so Senator Taft's proposal to sacrifice the meat, milk, and butter subsidies, in order to retain a \$600 million annual price support programme, has not won farm bloc agreement. The lobby does not object to all payments to farmers, only to those which effectively keep down costs to the consumer. But it is these on which the Administration's case with labour rests. There are other threats against the price-control machinery. The House is considering amendments to deprive the OPA of its control over the price of coal and food, as it has already done in the case of oil. The Senate has as yet made no decision on the rehabilitation of the shrunken tax bill which was the answer of the House to the Treasury's appeal for something like a \$10 billion increase in revenue. Mr Roosevelt is often represented as willing to accept the defeat of his programmes at home if that is the price of success for his foreign policy. The bill looks like being presented. He will not submit without a struggle, and once more Congress may prove itself unwilling to accept final responsibility for inflation. But the atmosphere of an election year, and the accumulated aggravations in the relations between President and Congress, are not propitious for a settlement.

Working on the Railroad

Demands for wage increases have been made by both operating and non-operating railway workers, but for the moment it is only the five operating unions that have threatened to call a "progressive" strike on December 30 if a satisfactory agreement is not reached. The strike vote of the 350,000 members reached the impressive proportion of 97.7 per cent, and according to union officials reflected "deep dissatisfaction with the economic management of the war." It was an historic decision, for not since 1916 have the powerful—and peaceable—brotherhoods taken strike action. The unions originally requested a \$3 a day increase, and the 4 cents an hour award they won was declared inadequate. The dispute has been referred to the White House and at first it was believed that sufficient materials for a compromise existed in over-time pay (railway workers have not ordinarily received payment for over-time) and in holidays with pay, in addition to the 4 cents an hour which the Stabilisation authorities declared was all that could be allowed. In cash, the payment for over-time would double the 4 cent increase, but the latest news is that the

unions have rejected the President's plan and are preparing counter-proposals. It is plain that the strike, with its disastrous effects upon civilian as well as military supplies, must be avoided at all costs. The country's transport system is already working under an almost intolerable physical strain. The railways alone are handling a volume of freight 80 per cent greater than they moved in 1918, and a passenger load almost double that of 1918. Rail revenue ton-miles for 1943 are estimated at 13 per cent above 1942, passenger miles at 58 per cent over 1942. The burden is still increasing. The Truman Committee's report on transportation, which has just been published, while paying high tribute to the work of management, labour, and the Office of Defence Transportation, insists that if a general crisis is to be avoided, travel must be cut drastically and, more important, additional equipment must be provided by the readjustment of priorities. The shortage of skilled labour is equally pressing. It was partly in answer to this problem that the President's Committee on Fair Employment Practices—established to end racial discrimination—ordered a number of Southern railroads to cease agreements with their unions which provide for a continuous lowering of the numbers of negroes employed and prevent their promotion into skilled jobs. Similar orders have gone out to Pacific Coast employers. The railroads, however, have insisted that as Southern society is now run, the order is no answer to their problem, but would, through the increase in racial antagonism, completely dislocate the service they are now able to provide. The prejudice, primarily, is not that of management, but of the negroes' fellow workers. Logically, the case for a wartime end to discrimination is overwhelming, but it is a question whether what the scarcity of labour has been unable to effect can be brought about, peaceably, by executive order.

Future of the Contracts

If the war should end to-day there would be outstanding more than \$75 billions worth of war contracts on which deliveries had not yet been made. There is an understandable interest and anxiety in business circles about the methods by which these contracts will be settled, and particularly on the question of promptness of payment. The aeroplane industry, for instance, insists it is "broke on paper", and gloomily prophesies financial collapse unless its contracts are speedily liquidated. Negotiations after the last war dragged on to such an extent that at the beginning of this war there were some manufacturers who were still government creditors on account of last war contracts. The concern is not that of business alone. There is obviously a strong public interest in seeing that contract obligations are paid off promptly, as well as equitably, so that business can set about its job of conversion to peace-time production, and employment can be maintained. As Mr Bell, Under-Secretary of the Treasury, said last week:

A dollar paid out during the reconversion period may in terms of national well-being be worth several dollars paid out a year or so later. It is far more important, therefore, that the settlements be prompt than that they be accurate to the last dollar according to some accounting concept which may itself be open to question.

Mr Bell was referring to the insistence of the Comptroller-General that the General Accounting Office must have the final say on contract settlements. It has been the Comptroller's contention that if terminations are left to the contracting agencies—and particularly to the Army—it will not be a question of accuracy to the last dollar, but "improper payments amounting perhaps to millions of dollars." He has charged such laxness in military auditing procedures that contractors were allowed to claim as war costs such items as spare false teeth, vitamin pills, and juke boxes. The weight of authority seems to be against the Comptroller, however, although no decision has as yet been reached. Both the Treasury and the Federal Reserve Board have supported the need for speed of settlement. The former is prepared for the inevitable heavy outflow of funds in the first few months after the war. One aspect which is receiving particular attention in the Senate is the problem of the small business man and the sub-contractor, who probably will find himself worse off than the large prime contractor, and who, without special procedures, would have to wait until the prime contracts had been settled. So far two suggestions have been made: one that would use the Smaller War Plants Corporation as a source of loans to small manufacturers with unsettled war contracts, the other Senator Murray's Bill to make mandatory

within 30 days a loan of 75 per cent of the amount claimed by the contractor with the provision that if the claim were later found too high, the excess would be returned with 6 per cent interest.

Sixth Senator

The wit who christened Senator Butler of Nebraska the "sixth senator" was somewhat less than fair to the five who had gone before. The purpose of Senator Butler's expedition into darkest Latin America was to discredit the Administration by charges of wholesale boondoggling under the mantle of the good-neighbour policy (Boondoggling is the Lewis Carroll word invented by the enemies of the New Deal back in the early thirties to ridicule some of the less-considered schemes to keep the unemployed busy.) The report which emerged alleged expenditures of \$6 billion in furtherance of good neighbourliness; in passing, it also cast doubts upon the democratic integrity of some of the Latin American Republics. Senator Butler has discovered to his sorrow that a line of criticism which evokes laughter and applause in home politics is considered to be in poor taste south of the border. Secretary Hull launched a full-scale attack, calling the report full of "inaccuracies, fallacies, and misrepresentations." Senator McKellar, in a long speech on the floor of the Senate, demolished the Senator's figures. Instead of \$6 billion, the correct total is \$324 million, and it has been mainly for military purposes. The expansiveness of Senator Butler's calculations is illustrated by his inclusion in his total of expenditures of the cost of operation of the Panama Canal, and the aid to Puerto Rico, which, as Senator McKellar reminded him, is a United States territory. It was Senator McKellar's contention that the Butler expedition was made in search of material for the elections. With the revelation that Senator Butler and his companions—two journalists—went by air, and in some cases spent only a few hours in a country, the Butler report stands thoroughly debunked. Some of the mud may stick, but the episode suggests that it is not always good political tactics to impugn the faith of America's Allies. There is only one lion whose tail can be safely twisted in US politics.

Revere Rides Again

The latest instalment of Colonel McCormick's adventures, as told by himself, describes how the Colonel assisted the US General Staff to foil a dastardly plot by the British to invade the United States after the last war. The General Staff, according to the Colonel, "feared that an army of 300,000 regular troops, then in England, would be landed in Canada and marched against this country." But though America was totally disarmed, the Colonel was ware and waking. The knowledge that his superb military genius had been recruited for the occasion by the General Staff was sufficient to make London think again, and Detroit was saved from a fate worse than Ford. Revere rode, twenty years after, and no Redcoats came. Superman has his prototype. It is a pleasant failing of eminent men, when they get on in life, to recall triumphs in which they never participated. When George IV was advanced in years he frequently entertained the Duke of Wellington with vivid narrations of his heroic conduct on the field of Waterloo. There are entrancing evenings ahead for the US General Staff when the fine old warrior of Chicago sits with them by the fireside and reminds them how he won the battle of Detroit. They will probably echo the Duke's grim comment, "I have frequently heard your Majesty say so."

Shorter Note

In order to improve the production of essential civilian goods the Office of War Mobilisation has announced a policy of relaxation of price ceilings which hinder production. The intention is to equalise profit margins for all products and price lines of the individual consumers' goods industries. Presumably this action is being taken, under proper safeguard, to remedy the decline in the output of lower-priced goods, which manufacturers have been abandoning for more remunerative lines. Producers with exceptionally high profits will be required to produce needed consumers' goods and sell them at cost.

THE WORLD OVERSEAS

Canada After the War

(From Our Ottawa Correspondent)

November 15th

THE sober warning of leaders that the war is not yet won does not appear to have appreciably halted the flow of Canadian post-war ideas and plans. It is rarely one picks up a newspaper nowadays without learning that a municipal works commissioner has tabled a programme of projects to provide post-war employment; that a provincial government has set aside a block of land for settling returned soldiers; that a new national radio series on the post-war world is about to begin; or that a political leader has listed 14, or 18, or even 30 points as his platform for the rehabilitation of Canadian agriculture or industry or some other branch of our national life. Unquestionably, growing attention is being paid to the post-war world. Some of it represents merely selfish haste to get ring-side seats in the new arena of business opportunities; to the extent that key personnel may be slipping quietly away from war jobs to resume normal occupations, there may even be some impairment of the current war effort. But for the most part the current attention to post-war problems can be justified by the fear that peace may otherwise catch the Canadian economy as unprepared as it was for war four years ago. The Government itself has given mild blessing to a soundly-proportioned shift of emphasis from the prosecution of the war to the world around the corner.

The international framework in which Canada after the war must work is still far too obscure to permit any guess about the fortunes of this Dominion when peace returns, but some domestic conditions can be forecast with reasonable accuracy, and they include some reassuring factors.

Canada will emerge from the war one of the great industrial nations. She will be able to produce 50 per cent more iron and steel, five times as much aluminium, quantities of magnesium, tungsten, mercury and chromium. Her hydro-electric power capacity will be 20 per cent higher. She will have great shipyards, aeroplane factories, explosives and chemical plants, a synthetic rubber plant, armament factories, machine tool industries, instrument laboratories which were not here before the war. About \$1 billion has been spent in four years in addition to plant and equipment. There is a new industrial army of skilled men and women workers. A new tradition and a rich experience have been acquired.

Some of the production will cease even before hostilities do, as being neither necessary nor economic in a peaceful world of international competition; but when all allowances for strictly war production have been made, these four years have changed the face of Canadian industry in a permanent way. Canada after the war will manufacture within its own borders a larger percentage of its manufactured needs than it did. Also, its exports of finished products will rise in relation to its exports of raw materials.

Higher Farm Incomes

The war has given Canadian farmers a financial lift, and they will go out of the war in a stronger position than they entered it. The farm income of Canada is currently running 25 per cent higher than in 1942 (despite smaller harvests), and the 1942 income was the highest in history, in dollars. The farm debt problem, a most acute concern in the decade before the war, has been substantially alleviated. Farm economists report that prudent agriculturists are using their current surpluses to wipe out farm indebtedness in a big way.

A similar process has been at work in municipal and provincial finance. These governments have been sharing in the greatly enhanced national income, and their obligations have not risen proportionately. Social welfare measures

(especially unemployment relief, which has about disappeared) are costing much less in some parts. Several provinces were desperately seeking to stave off default in the years before the war, and one province (Alberta) actually took the plunge. The new state of affairs is illustrated by the substantial surpluses being piled up by Alberta, which, while it permits new maturing issues to default, is negotiating with financial interests the refunding and consolidation of its defaulted loans. It is a fair prediction that the provincial governments will enter the post-war world in good fiscal shape, though here, as with the farm debts, the war will have temporarily relieved their long-term problem rather than done anything to solve it.

Effects of Financial Policy

As compared with the last war, the Dominion Government has managed its taxation and price control policies in an impressive fashion. Last time, we raised only 20 per cent of the cost of the war at the time from taxation: this time 50 per cent. Last time, most of the war loans were floated at 5½ per cent and were issued tax free; this time, hundreds of millions have been borrowed at less than 1 per cent and the highest coupon rate has been 3 per cent. Last time, the cost of living rose 60 per cent in the first four years of war; this time 18 per cent. In effect, the last war was financed by skimming off, from the large and concentrated pools of war profits, sufficient loans to prosecute the war, paying 5½ per cent and offering tax-exemption as a special inducement. The pools had been created by an inflationary process which reduced real wages and swelled profits. By the time the war was over last time, a new concentration of wealth had been effected, and the high interest rate, coupled with the tax-exempt feature, confronted the Dominion Finance Ministers for years with a very awkward situation. The new war loans had to be serviced by a combination of consumer taxes on sales and imports. This time, though the gross sums are much larger, the loans are far more widely distributed, the average cost is much lower, and the tax-collecting machinery has been so improved and refined that the servicing of present loans should be possible without an undue burden on the country's industry.

Canada will have a cushion against post-war unemployment which it did not have after the last war. The unemployment insurance fund already stands at \$150 million, although it was started after the outbreak of the war. The compulsory savings features of the income tax, the sums withheld from temporary civil servants' salaries until after the war, and the very widely held war savings certificates and war loans will in Canada, as elsewhere, help to tide individuals over the period of adjustment.

Without a yardstick by which to measure Canada's external markets after the war, the gravity of the chaotic

international scene as bearing upon Canadian conditions cannot be appraised. The favourable features outlined above may do little to weigh against adverse world factors. But internally the war appears to have done Canada little irreparable damage, and that mainly in the tragic loss, common to all countries, of some of the fine flower of its manhood. At one time a breach between Quebec and the rest of the country as serious as that of 1917 seemed to be growing up, and the degree of misunderstanding between parts of the Canadian people is still far more serious than most outsiders would guess. So far, however, the situation is not beyond redemption, though compulsory service for overseas action would have tested the Canadian fabric to the utmost.

Peace will compel us to face constitutional reforms. War, by converting Canada overnight from a confederation to a unitary state, drove the problem underground. Once peace returns it will face us again, almost immediately. The controls, which all agree must be maintained until consumer production begins to match available purchasing power, would be *ultra vires* the Dominion Government in a state of peace. Nearly all the impressive programmes of rehabilitation promised by the political parties envisage Dominion control, and at present large sections of necessary power are exclusively vested in the provincial governments. A show-down and some resolute statesmanship on this problem cannot well be avoided.

Family Allowances in Eire

[FROM OUR DUBLIN CORRESPONDENT]

December 6th

THE Government has introduced its long-expected scheme of family allowances. It is proposed that a payment of 2s. 6d. a week should be made in respect of every child, after the first two children, under 16 years of age living in the same household, though not necessarily belonging to the same family. An assessment of the number of children ranking for allowances will be made every six months, and the allowance will be paid weekly on that basis until a new assessment is made. The country is to be divided into three regional areas for the administration of the scheme. Allowances will be made to every family with the requisite number of children, irrespective of income. It is calculated that 150,000 families will benefit and that the number of children qualifying for allowance will be 340,000.

One noteworthy feature of the scheme is the absence of any means test. The receipt of the allowance will, therefore, not be tainted by any suggestion of indigence or pauperism and the cost of administration will be reduced. Families in the higher income groups will not, however, derive any net advantage because the allowances for children in the income tax code will be correspondingly reduced. The allowances will be provided by the state out of its general revenue. Alternative methods of providing the allowances were rejected after full consideration of their merits. Equalisation funds are distasteful to the trade unions as well as being limited in their scope to persons in regular employment. Contributory schemes are, likewise, limited to wage earners and would not relieve the large class of small farmers who live near the poverty line. The allowances are justified by the Government entirely on the ground that many family incomes are insufficient to bring up a large family. They are to be regarded as a social service and are additional to the existing children's allowances paid to the unemployed and to pensioners. No effect on the marriage rate or the birth rate is intended or expected.

Paying for It

There is no reason to believe that the allowances will add anything to the national income, and they must, therefore, be regarded as a redistribution in favour of large families at the expense of the taxpayer. In view of the level of taxation in Eire, increased taxation requires a very strong justification. The Government is prepared to defend additional taxation for this purpose amounting to £2,250,000 a year, which represents about 25 per cent of the present expenditure on social services. It is this figure that limits the amount of the allowances. It has not yet been disclosed how this sum is to be raised, but, in order to demonstrate the narrow capacity of the country to undertake new expenditure, the Government spokesman in the Dail stated that, in order to raise this sum, it would be necessary to add a shilling to the present income tax rate of 7s. 6d., and substantially to increase indirect taxes on tobacco, tea, sugar and beer. It is not suggested that these increases will actually be made, but it is difficult to see how the necessary revenue will be obtained without imposing additional burdens on the poorer and larger families in the community, and thus neutralising to some extent the advantage of the allowances.

A Beveridge Comparison

The principal impression made by the debate in the Dail on the scheme is the difficulty of doing much to improve the lot of the poor in Eire unless the national income can be expanded. The age structure of the population, containing abnormally large numbers of children and old people, makes very expensive any social service designed to benefit the very young or the very old, while the absence of a rich class of surtax payers reduces the possibility of a net redistribution of income. Comparisons between the Irish scheme and the proposals contained in the Beveridge Report are not quite fair. Great Britain and Eire differ in many respects and, as the Government spokesman remarked, the Irish scheme is concrete and practicable, whereas the Beveridge proposals are still largely in the air. But, when full allowance is made for these considerations, it is difficult to resist comparing the extremely modest allowances that represent the utmost effort of the Irish Exchequer with the far higher allowances that form the basis of the discussion in Great Britain. The difference in the level of the social services in the two countries will inevitably influence the movement of Irish labour after the war.

Palestine's Inflation Problems

[FROM OUR JERUSALEM CORRESPONDENT]

November 17th

It was only late in the fourth year of the war, that an alarmed public opinion recognised the existence of a genuine inflation problem in Palestine, for up to the end of 1942 the traditional argument was still maintained that no such development could possibly take place in this country as long as the Palestine pound remained chained to sterling. As time went on, however, the inadequacy of the Government's price control measures became apparent; the influx of money, resulting from military orders, strategic works, and the troops stationed in the country, continued and even increased; and the purchasing power of money continued to drop. For over a year now bank deposits rise by some £P1.5-2 million, that is, 3-4 per cent of the total, every month, while the demand for credit remains almost stationary despite the pronounced downward trend of interest rates. During the twelve months ended August, 1943, the currency in circulation rose by over 50 per cent, to a level of £P31.8 million, against £P20.8 million in August, 1942, (and £P4.8 million in August, 1938), while the increase in the volume of the physical output may be estimated at perhaps 20 per cent. It is true that a not unsubstantial part of the notes is now hoarded, both in Palestine and in the adjacent countries, but this is counterbalanced by the increased velocity of circulation of the other part. Wholesale prices advanced by 33 per cent during the twelve months ended July, 1943, according to the official index (based on January, 1938), and the Wages Committee cost-of-living index reached 243 in August, against 197 in the previous year.

An almost universal extension of the system of cost-of-living allowances, inevitable though it has been for social reasons, is not by itself anything like a remedy, and under the prevailing circumstances it serves still further to intensify the inflationary pressure on prices. A standard allowance of 131 per cent (on the "basic" wage of £P10.5 per month) is now paid by industry, but many branches are paying additional bonuses too, and agricultural wages have increased by 200-300 per cent. Already Palestine producers find it, in some instances, difficult to compete with overseas countries, and as peace draws nearer this problem must grow in importance. The recovery of the purchasing power of the Palestinian pound, in accordance with its nominal parity with the pound sterling, is, therefore, very important for Palestine's economy and a prerequisite of its future stability. For it should not be forgotten, quite apart from other considerations, that Palestine is now a creditor country with a positive balance of some £P80 million, and it is this liquid reserve on which its ability to undertake reconstruction and further development will depend to a very great extent.

Up to now, however, these considerations have not exerted a decisive influence upon the Government's economic policy, although a reduction of prices is of direct interest for the Treasury, since allowances on the basis of the cost-of-living index have been extended to Government servants and employees. Real prices should not, however, be identified with the official index. According to Government figures, the prices of clothing and footwear increased by 26 per cent during the first eight months of 1943 (last year during the same period they decreased by 12 per cent), and prices of miscellaneous articles increased by 19 per cent, against no change last year, while the food index this year shows an advance of 18 per cent, against 22 per cent in 1942. The food index, however, should be taken with a grain of salt, for half of the prices on which it is based are maximum prices that are more or less fictitious. In fact, the over-charging of agricultural products is the main motive power behind the increase in the cost of living and one of the most important sources of inflationary purchasing power—

which is not yet even touched by taxation, for the collection of income tax is confined to the Jewish sector. This year, not even an attempt was made to enforce the Government monopoly of the cereal trade, and exorbitant prices are paid for grain (£P70 a ton for wheat, £P40 a ton for barley, and so on) and all the products dependent on it; in addition, peasants are receiving big issues of Government flour, so that they are enabled to put on the market the quantities they normally need for their own consumption. On the other hand, large sums have been allocated for the maintenance of the price of the "standard" flour, and another subsidy has been granted in order to reduce this price; but no particulars have been disclosed about this expenditure, in spite of the criticism to which it has been subject.

The existence of black markets for many commodities has become almost the normal thing, and quite recently another was added by the attempt to fix reduced maximum prices for vegetables, which, however, was carried out in such a clumsy manner that protests ensued even from municipal councils and consumers' organisations. That considerable shortages exist cannot be doubted. Responsible quarters maintain that Palestine is not receiving its fair share in the goods distributed by the Middle East Supply Centre. At least, there is no fair distribution within the country, and some of the black markets account for a considerable part of the total supply (for instance, in grain, meat, margarine, flour, newsprint, and so on), or even for the greater half of it (as in the case of eggs and potatoes), while the points rationing system is more or less fictitious beyond the boundaries of the Jewish municipalities. In recent months, small quantities of engineering goods, chemicals, &c., have been released at reduced prices, but passenger fares, postal fees, and some Government prices have been raised.

Gold Sales

The official sale of gold specie and bullion was begun in order to skim off excessive purchasing power, but could not have much effect owing to the limited quantities put on the market; and the propaganda campaign launched in favour of Government saving bonds and certificates has hitherto

met with but little success. The production of utility goods, especially in the textile industry, has, it is true, attained a substantial volume, but it is strongly felt that there still remains wide scope for further rationalisation and utilisation of local human and material resources. Whether this can be done depends, however, on effective measures being taken

against the deterioration of money and the social corruption connected with it, but as the Government looks like intensifying its policy of appeasing the landowners and the peasantry, there appears to be little hope of finding a way out of the impasse, and the air of discomfort and distrust is gaining ground.

Russia at War

The Third Winter

INDUSTRIAL reports for 1943 record the fulfilment of plans by Soviet war industries. In aircraft, tank, mortar, gun and munition factories output is said to be slightly ahead of schedule. Compared with output in 1942 the increases reported this year are not abnormally high. Expansion in the production of arms was limited by the supply of iron and steel. The increase in pig iron output between October, 1942, and October, 1943, is given as 28 per cent; and the increase in steel output was 18 per cent. These figures roughly indicate the room for expansion.

The outstanding fact in Russia's economic life during the past few months has been new demands for all sorts of raw materials and finished goods which have arisen from the needs of the liberated areas. In 1943 alone, no fewer than 350,000 square kilometres have been freed, most of it utterly devastated. In peacetime this area was inhabited by a population of 35 millions. How many people still live there is not known; but from all reports it seems that only a fraction of the pre-war population remains.

The restoration of these regions, particularly in the south, is of prime importance. The southern Ukraine was Russia's first base for iron, steel and coal. It possessed the densest network of railways in the whole country—39 kilometres of track per 1,000 square kilometres. The importance of the regions freed this year is shown by the fact that, taken together, they used to supply about 65 per cent of the country's winter wheat, 10 per cent of its summer wheat, 50 per cent of its maize and about 70 per cent of its sugar beet. In recent months their restoration has absorbed the attention of the Government almost as much as the fighting itself.

The degree of devastation differs, of course, from place to place. On the whole, reconstruction has so far not gone beyond the most essential services; and frequently it was not possible to restart even these without substantial help from outside, and only after some considerable time. Kharkov's water, electricity and tram services were not resumed until the end of November—three months after its final capture. Dnepropetrovsk, on the other hand, was one of the few happy exceptions. On the fifth day after its recapture this city was able to report not only the restoration of essential services, but also the resumption of work in a number of large factories—which suggests, of course, that its industries were, after all, working to some extent during the German occupation. In the Donbass a number of minor coal pits have begun work again; and now a big effort is being made to restore the larger collieries. In the great steel centre, Makeyevka, the first furnace has been restored. It will take much time before Stalingrad rises from its ashes; the workers of that heroic city are pledged to restart its tractor plant next May.

The Repair of Devastation

The needs of the freed areas have now created a new problem and made the industrial position more difficult. These requirements have to be set against the immediate requirements of the arms industries. On the other hand, rehabilitation of the freed areas is necessary for the war effort itself. Inevitably, however, claims overlap; uncontrolled, the conflict might become a scramble for materials and tools. This was seen at the All-Soviet Conference of Machine Tool Producers which took place in Moscow towards the end of November. The conference was called in order to break the "bottleneck" in machine tools due to the heavy demands of war industries and freed territories.

Before 1941 machine tool production was concentrated in the neighbourhood of the Donbass. In the short run, there is something like a vicious circle. The Government aims at restoring in part the machine tool production of the south; but to do this it must first provide the machine tools needed to put the half-destroyed plants in order. The State Committee for Defence has therefore decided to put

the Commissariat for Machine Tool Production on an equal footing with the Commissariat for Arms Production. This means that producers of machine tools will now have the same priority in their demand for materials and labour as producers of finished arms.

Spare Parts for Tractors

Another critical instance arises from the shortage of spare parts for tractors, which seriously affects the whole of Soviet agriculture, and especially farming in the freed territories. In the first days of December, *Pravda* attacked the Commissariat of Agriculture for having neglected to provide for the production and repair of spare parts. A few days later, on December 11th, the Commissar of Agriculture, M. Benediktov, was dismissed and made Vice-Commissar in the same department. The new Commissar of Agriculture is A. A. Andreyev, a member of the Politbureau, one of the small group of energetic Party leaders whom Stalin usually puts in charge of the most acutely threatened sectors of the "economic front." The problem of spare parts for tractors is now pushed to the fore with the greatest insistence: "Spare parts will decide the next sowing campaign and the next harvest." The production of spare parts has been made a first priority. "One hundred and seventy-two Moscow factories [reports *Pravda*] have been put on to the production of spare parts." The Commissariat in the country, has been ordered to produce agricultural machines in addition to its normal output. The same order has been issued to the Kirov works, Russia's greatest tank plant, which has been evacuated from Leningrad to Sverdlovsk in the Urals. The Commissar for Mortar Equipment has already been given a public warning because of his failure to fulfil the assignment. The directors of the famous Magnitogorsk works, the Commissar for the Timber Industry and the Commissar for the Rubber Industry have all been rebuked for failing to supply the materials needed. The bottleneck may be broken just in time to improve prospects for the next sowing and harvest. The episode illustrates strikingly the new pressure under which Russian industries are now working.

The labour position has not been very different. What has been taking place in recent weeks looks like a final comb-out of manpower. This comb-out has been reported in the press in the somewhat paradoxical form that this or that factory "has refused" eight or five hundred "additional workers." Previous comb-outs were very thorough indeed; and the latest has been made not so much for the Forces, though the Army still enrolls new reserves, as for work in the liberated territories. Acute shortage of labour has undoubtedly stimulated technical progress throughout industry. The replacement of men by machines and the introduction of the conveyor-belt system has been the main remedy. The press characterises 1943 as the year of the great conversion to the conveyor belt.

THE BUSINESS WORLD

A Railway Birthday

ON January 1st it will be 21 years since the numerous railway companies of Great Britain—they then numbered some 120—were grouped into four systems by the Railways Act of 1921. The occasion has been duly celebrated this week, but now that the candles of the birthday cake have been blown out, it may be appropriate to look back over the past and, what is far more difficult, to look ahead over the next 21 years.

One question that is inevitably being raised is whether the railway amalgamations were justified, that is, whether they benefited the community. It is not a question that can be answered categorically, and certainly not without taking account of the changes that have taken place in the national economy and in transport as a whole. As a broad generalisation, it may be said that the trend of general business activity has been rising, but that the expansion was mainly in the "lighter" trades and at the expense of the heavier trades. The broad trend has been reflected in the traffic in coal and of minerals and heavy merchandise; the volume of coal moved by rail declined from 209.2 million tons in 1924 to 188.1 million tons in the boom year of 1937, and that of minerals and heavy merchandise from 65.4 million tons to 58.7 million tons. Traffic in general merchandise also declined, from 60.9 million tons to 50.3 millions, and the number of passenger journeys fell from 1,247 millions to 907 millions. These latter changes, however, are quite unrepresentative of the general trend of British economic affairs; the declining volume of traffic was due only in part to depression in the industries for which they cater, and in the main to the rapid changes in the transport industry, that is, to the enormous expansion in motor traffic, and the consequent loss by the railways of their monopoly in the general merchandise and passenger traffic. Mr Gilbert Walker estimated the volume of goods carried by road at 100 million tons in 1936, though the average length of haul was shorter than by rail. The railways, in fact, were doubly hit, first by the decline in the total volume of heavy traffic, and, secondly, by the growth of road competition, which deprived them not only of any additional traffic in general merchandise and passengers, but actually diminished it. How did they stand up to this double onslaught? Financially, the amalgamated companies certainly disappointed the hopes of those who had drafted the Act of 1921, but mainly because the Act failed completely—and, perhaps, understandably—to foresee the changes in the nature of traffic, and (in company with *The Economist*) to admit the possibilities of the petrol engine. Before the war, the companies never earned the standard revenue of some £51 million a year—defined as an annual net revenue equivalent to the combined net revenue in 1913 of the amalgamated companies—which they were expected to earn with efficient working and management. The nearest the four companies came to the target was in the first year of their existence, when their combined net revenue was £45.6 million. The average net revenue for the period from 1923 to 1942, exclusive of 1926, was £37½ million, equivalent to a return of some 3½ per cent on the capital. From being "as solid as a rock," railway shares have become rather unsteady, and many of the junior issues are now speculative counters. In the light of actual, as distinct from expected conditions, however, the companies can hardly be said to have done badly. An average net revenue of some 3½ per cent—the figure never fell below £28 million during the thirties—on the capital of the companies is by no means a black record. What is surprising in retrospect is not so much the low rate of the average net revenue as the ability of the companies to continue earning a substantial net revenue every year since their formation, and to find £330 million out of income during 21 years for the replacement of equipment. They have stood up to their difficulties very well indeed, though not without the assistance of restrictions on road traffic since the early thirties.

During the war, the four railway companies have had to

handle a greatly increased volume of traffic in difficult conditions. Both passengers and goods traffic are reported to be some 50 per cent up. If the railways had not maintained their facilities in good working order by heavy capital expenditure in the past, they might well have broken down under their wartime load.

The Railways Act of 1921, in fact, has provided Britain with a transport system that has maintained its efficiency in the face of great difficulties before and during the war. Amalgamation has certainly proved no disaster. Whether the multitude of companies existing before 1923 would have served the country—and the investor—better, can never be known; any expression of opinion can only be based on hypothesis. From the financial point of view, some of the stronger of the old lines might have done better than the large combined companies. But many others would have been in bankruptcy or on the verge of it. The public has not been badly served, and many individual investors have been saved from heavy loss. Amalgamation presented a number of opportunities for technical improvement, and many of these have been taken—it is not often realised by the public to what an extent the railways, both permanent way and rolling stock, have been rebuilt since 1921. Whether some of the larger opportunities—main line electrification, for example—have been fully seized is perhaps more questionable. But in the day-to-day search for efficiency and for economy of means, the four railway companies have a very fine record. It might be argued that they have been better able than their constituent elements would have been both to keep unremunerative lines open, and to secure legislation putting limits on the development of road transport. But there is a double "might-have-been" involved here. It is not certain that, without amalgamation, there would have been any greater elimination of unremunerative capital. Nor would everyone agree that the Road Traffic Act of 1930 and the Road and Rail Traffic Act of 1933 were prejudicial to the public interest.

The first 21 years have shown the importance to the railways of changes in the national economy as a whole, which must be the starting point for any forecast of the future. What those changes will be is all the more difficult to perceive, since pre-war trends may not necessarily continue after the war. Broadly, the conditions for further expansion in general business activity are likely to remain favourable, and hence the total volume of traffic to be moved by all forms of transport should continue to grow, but mainly in the general merchandise and passenger categories. A successful employment policy would probably bring a fairly sharp rise in total traffic above pre-war levels, at least for a number of years after the change-over from a war to a peace economy. Considerations such as these are relevant to the planning of a capital development programme for the railways.

Another vital question to which the railway companies—and the public—require an early answer, is the future relationship between the various means of transport, and in

**FOR ALL
INSURANCE
NEEDS**

Head Office:
LIVERPOOL LONDON
North John St. Lombard St.

particular between rail and road. There are, broadly, three lines of policy that could be pursued. The first would be a return to open competition, with some equalisation between road and rail of the burdens placed upon them by the State. The second would be the continued maintenance of road and rail as separate entities, with each providing a complete, or fairly complete, transport service, but with agreement between them on the rates to be charged. The third would be some form of community of interest between the two which, by making it a matter of indifference to them whether traffic moved by the one means or the other, would make it possible to eliminate all overlapping, and to secure the maximum of real efficiency—but at the cost of removing the public's choice of route. The trend of opinion among the railways—not surprisingly—has long been in favour of the second solution. More unexpectedly, similar views are beginning to be expressed by road operators, though not yet with anything like unanimity. On October 12th, Sir William Wood, president of the LMS, expressed this view:

I consider that the way is now clear for the adoption of complete equality in regard to charging powers, leaving the users of public transport free to choose the system they prefer to use at a particular time, thus achieving a natural allocation of traffic between the various forms of transport. It would permit a system of correlated charges, not necessarily uniform, agreed between the forms of transport.

Such a policy, involving joint price-fixing, would amount to a transport cartel in private hands. It envisages the creation of a system of tribunals to whom consumers could bring

their complaints about charges; but are such tribunals likely to be effective? True, there are two other important safeguards, the "C" licence for the movement of goods, and the private car for the conveyance of passengers. So long as there are no restrictions on these, they might act as a brake on excessive charges for public transport. This is not the occasion for these difficult questions to be argued out in full—indeed, it is questionable whether the facts are available for a very decided opinion. But an answer will have to be found within the second twenty-one years.

In the narrower field of railway operation itself, there will be large questions to be resolved. The most obvious is that of electrification. The Weir Report in 1931 pronounced in favour of electrification of the main lines, on the basis of 1929 traffic. Declines in traffic and technical improvements in steam traction were regarded as removing the basis of this calculation. Will this revised view still hold good after the war? Even if the verdict goes against main line electrification, there is still a great deal of work to do in suburban and short-haul electrification. Or, again, is there a case for the replacement of the present rather antiquated style of goods wagons by new stock with continuous braking, so that goods trains could run faster? Will the replanning of London and other cities involve large-scale re-routing of the railways and re-siting of their main termini? These are only three out of the many equally large problems awaiting solution. If there is one thing that is certain it is that the amalgamated companies' second twenty-one years can be relied upon to be as full of the unexpected as their first.

Business Notes

Christmas Note Circulation

The seasonal expansion in the note issue slackened slightly during the week to last Wednesday. The Bank note circulation touched £1,081,022,000 last Wednesday, showing an increase of £14,065,000 during that period, which compares with £21,562,000 for the previous week, but with £12,146,000 for the immediate pre-holiday week of last year. The slight slackening in the net outflow of notes from the Bank of England during the past week does not necessarily indicate a slower withdrawal of notes by the public from the banks. The joint stock banks had anticipated the record public demand for currency by stocking up their tills, a process which was reflected in the exceptional expansion of the circulation noted the previous week. The latest increase in this item leaves £19,219,000 of unissued notes in the reserve of the banking department. This should more than cover the further net outflow of notes which may be expected over the week to Wednesday next, and it should, therefore, be unnecessary for the authorities to proceed to yet another increase in the fiduciary issue before the turn of the year. As notes have gone into circulation, so the holding of Government securities by the banking department has increased, and the effect on the credit position of withdrawal of currency from the banks has thus been neutralised.

End of Year Preparations

Preparations for meeting the end-of-year pressure are already in full swing in the money market. Prospects are rendered rather ominous by the accident of the calendar which will compel the discount market to pay in December for the whole of the bills issued next week. Usually it is possible for the market so to arrange the dates of the Treasury bills for which it applies in the last week of the year that the bulk of its payments are made in the first days of January, and not in the final days of December. This year the final day of the year falls on a Friday, and in normal circumstances it would have been possible to concentrate the applications at this week's tenders on bills dated and payable on Saturday, January 1, 1944. But since the banks will be closed on that day, no Treasury bills will be paid for, and the market will therefore be compelled to take the whole of next week's quota in bills payable during December. This means that, contrary to the experience of the last three years, it will not be possible for the market to shift a considerable part of the burden of the end-of-year pressure to the broad shoulders of the Treasury. On those

earlier occasions, the Treasury had to meet the bulk of the maturities in the final week of the year in December, and to wait until January for the new money brought through the newly issued bills. This meant heavy ways and means borrowing from the Bank of England over the turn of the year. On the present occasion the money market will have to bear the pressure without this adventitious aid. This will probably mean that substantial sales of bills will be made towards the end of the year to the official agents. Such sales have already been in evidence this week. The scale on which they are likely to be made between now and the end of the year will largely depend on the amount of Treasury Deposit money which the banks are called upon to pay to the Treasury next week. In each of the past two weeks the fresh money paid over in this way has been heavy, and the banks have consequently been poor buyers of bills from the market. If another big payment is expected of them next week, their calling of loans from the market will be on a greater scale, and the special help to be given to the market by the authorities will be correspondingly scaled up. If the market were compelled to take any of this assistance in the form of direct loans from the Bank—as they customarily did before the war—the event would rank as a sensation in Lombard Street.

Output Bonus

Among the subjects discussed between the Minister of Fuel and the two sides of the coal industry this week have been methods of providing greater incentives to production. It is generally recognised that the existing output bonus scheme has failed and that more direct inducements to individual effort are required. It was for this reason that Lord Greene in his fourth report recommended that the output bonus should be transferred from a district to an individual pit basis. It is perhaps worth recording the sequence of events leading up to the present situation. The Mineworkers' Federation, which had originally opposed a pit basis, withdrew its opposition, and in its Memorandum to the Minister of October 7th urged that this method should be adopted. Major Lloyd George, Minister of Fuel and Power, intimated in the House of Commons on October 13th that, subject to acceptance by both sides, the Government was prepared to implement the recommendation, and in his reply to the Federation's Memorandum on November 2nd gave an assurance that the necessary financial and administrative assistance would be forthcoming. (Lord Greene estimated the cost of operating a pit bonus scheme at about £3.5 million per annum, as compared with the district scheme's cost of

£600,000.) In the meantime, negotiations were proceeding with the Mining Association, which objected to the pit basis on the ground that it would create difficulties and grievances between the pits, owing to the wide variations in size and geological conditions, and might lead to "pressure towards a movement of labour to the more successful pits." The Association stressed these difficulties in a letter to the Minister on October 22nd and, verbally, on November 3rd. On November 11th it submitted in writing to Lord Hyndley its arguments and examples of these difficulties, and on November 29th put forward a counter-proposal to the Greene scheme. This proposal, which was discussed with the Minister on Wednesday and will now be discussed with the Miners' Federation, is for an increase in the attendance bonus, from 6s. a week to 10s. 6d., so that regular attendance on the last two days of the week, which are the most vital to output, would be rewarded. If an attendance bonus scheme produced the same results in terms of output as the adoption of a pit bonus, it seems immaterial which form of incentive is adopted—the chief consideration to-day should be speed in decision and effect on output. The same applies to the other proposals now under discussion. The Government is suggesting as a means of improving discipline the setting up of pit "courts," on the lines of the Durham and Yorkshire schemes, for dealing with absenteeism and indiscipline. A further proposal is that group labour officers would be appointed under the Government's scheme for grouping pits who would in general be responsible for discipline. The miners' leaders have now accepted in principle the Government's proposal for improving control by grouping pits, though they still do not consider that this will be as effective in increasing output as the assumption of financial, as well as operational, control over the mines. (It was stated in *The Economist* of last week (p. 819), on the basis of statements in the press, that the miners had rejected the Government's proposals on the grounds of their inadequacy.) The Mining Association has also accepted the Government's scheme for the grouping of pits. The greatly needed improvements in control may now be given effect.

Australian Loan Repayment

The announcement that the Commonwealth Government will repay £4,491,129 of 3½ per cent stock, falling due for final redemption on January 1st, marks a further step in the rehabilitation of Australian finance. The improvement of the years immediately before the war was reversed by disturbance to normal trade and Australia borrowed £12,000,000 from this country to fill the gap before the present system of purchases became effective. In *The Economist* of November 6th, when dealing with the repayment of this advance, it was pointed out that the Commonwealth holdings of sterling probably exceeded £60 million after the repayment. In view of the fact that Britain is paying Australia something like £470 million per annum in connection with the purchase of the wool clip alone, the accumulation is likely to continue and it is not surprising that there should be some reduction in the very large publicly held debt. If Australia wishes to effect repayments there is plenty of scope. Of loans amounting to some £66 million, which could be repaid at any time on due notice, £30 million in 4 per cent stocks would, and £9 million in 3½ per cent might, be worth repayment or conversion. Further, October 1, 1944, brings a 3 per cent Commonwealth maturity of £8,125,000 odd and three months later there falls due almost £4,000,000 of Queensland 3½ per cent stock. Finally there will be the chance to repay or convert in the second half of 1945 over £108 million of 5 per cent issues of the Commonwealth and State Governments. These are very large sums and it must not be supposed that the Commonwealth will necessarily make every effort to repay them. The existing sterling holding of some £60 million is probably not too great a sum to hold in reserve. Possibly, some would say it was insufficient. Conversion of the 5 per cents—and, possibly, of the 4 per cents—will, however, certainly be undertaken unless conditions show grave deterioration. The authorities will want to cut interest rates as much as possible and the use of some resources to effect redemptions simultaneously with, and in anticipation of, any large scale conversion offer seems to be probable.

Outlook for Kaffirs

The half-yearly dividend declarations of the gold mines operating on the Rand and contiguous areas are now complete and it cannot be said that they throw any special light on the general outlook for the industry. The amount to be

Consider what Naafi staff have achieved for the Forces in the third year of war—and come and help them to do even greater work in the urgent months ahead. Naafi, the official canteen organisation, has recently rendered an account of its stewardship for the third year of the war. In that one year, Naafi distributed to H.M. Forces over £8,000,000 in cash and amenities—nearly double the figure for the previous year. Of this sum, a total of nearly £6,000,000 was distributed in cash—by monthly cheques paid to units for the benefit of the men, in proportion to the volume of the trade in their Naafi canteen. A further £1,200,000 was spent on Naafi/Ensa entertainment for the Forces at home and overseas, and no less than £1,000,000 was allocated to benevolent funds of the three Services and to the Red Cross Prisoners of War Fund. This contribution to the Services' welfare can be continued only if Naafi canteen service can be maintained with an adequate staff. That is why more men and women* are wanted for canteen duties at once. Manageresses, Cooks and Counter Assistants are urgently needed. Apply, NAAFI, Imperial Court, Kennington Lane, London, S.E.11, or any Employment Exchange.

NAAFI belongs to the Forces. It has no shareholders, and serves no private interests. It is financially self-supporting and all its available profits are used for the benefit of the Forces

* This does not apply to single women (or widows) born in the years 1918-1923.

ence of all those areas in which Allied expenditure has been on an abnormal scale and has not been accompanied by a corresponding reverse flow of goods. One important effect of the import difficulties to which Lord Wardington pointed was the stimulus to industrial self-sufficiency imparted to the economy of all countries in question. This is especially true of Brazil, which is now becoming an exporter of manufactured products on a fair scale. For the first half of this year such exports represented 23 per cent of the total Brazilian exports, whereas in 1941 the proportion was only 3 per cent.

Consultation Between Exchanges

It may be recalled that in April of last year there was brought into being an advisory committee to consider matters of common interest to the Stock Exchange in London and the twenty-two provincial exchanges which have actual markets and are grouped in the Associated Stock Exchanges. Further, early in June of that year, the Provincial Brokers' Stock Exchange, a body grouping individual brokers working in centres where there is no exchange, joined the committee. Representatives were elected, London and the Associated having four each and the PBSE two. They were elected for the period ending December 31, 1943, and are consequently due to retire. The final meeting of this first session met last week, and, although no report has been issued, it is a fair inference that all members agreed that consultation had produced even larger results than had been expected. There was, however, one difficulty. The Associated includes both English and Scottish exchanges and markets which are large like Glasgow and Liverpool and many more which are so much smaller as to have a different outlook on many questions. It was difficult to secure adequate representation of all these interests within the prescribed four representatives. It says a good deal for the spirit in which the deliberations of this body are conducted that London immediately suggested that the representation of the Associated be increased to six, while it retained four members only, and that this amendment was accepted without demur by the PBSE. As the rule of the Committee is one vote for each representative, this means that London's position will more easily be challenged; but that it felt to be a matter of minor importance compared with adequate consultation, for virtually all the Committee's recommendations have been the result of an agreed opinion, not of a majority vote.

Chartered Accountants Break New Ground

The Institute of Chartered Accountants is to be congratulated upon the election of Mr F. R. M. de Paula to fill the gaps left vacant by the resignation of Mr K. A. Layton-Bennett from the chairmanship of its Taxation and Financial Relations Committee and a seat on its Council. The former appointment was almost inevitable, since Mr de Paula was in the direct succession, but this is the first time that a member who was not publicly practising the profession has been admitted to direct participation in its management. It is to be hoped that this step is symptomatic of a new outlook. This election does not mean that all the barriers are down. It may be some time before there is any appreciable further change in the composition of the Council, and it is, therefore, essential to convince its present members of the need for early and energetic action. The accountants, like most other people, are making plans for the post-war period. The main bodies are trying to get together to seek some sort of Government licence. The Institute and the Society are both making efforts to solve some of the intellectual problems which face accountancy, as well as the organisational puzzles which are likely to crop up when demobilisation releases members at present serving. Now is the time for the Institute to take the initiative in putting forward the long-delayed programme for providing for post-graduate training in the wider aspects of accountancy. *The Economist* has more than once advocated this reform, among others, and, from his varied experience and his past association with university work, Mr de Paula is the man to put the matter before his colleagues with an authority which should win their support. It is to be hoped that he will urge it upon them without delay, for the universities, too, are making post-war plans. Further, the post-war world will greatly

need more men of wide outlook and training in both the practice and theory of accountancy if it is to make its proper contribution to the solution of economic problems.

Cotton Cloth Exports

Exports of cotton yarn and piece goods have been controlled for more than two years, and allocations have been on the basis of past performance. The Cotton Board, the Textile Exporters' Committee, the Cotton and Rayon Merchants' Association and the Cotton Control have been discussing means of making the system more flexible, partly to meet the position when exports will be larger. The Cotton Control has announced that for the first quarter of 1944 some four-fifths of the total of about 100 million sq. yds. will be allocated to individual exporters, the remainder being left to be produced by manufacturers who, from time to time, have some productive capacity available, and who may sell to any allocation holder qualified in the respective markets. This will in no way penalise small firms, and will leave room for initiative and enterprise—qualities which will be needed in the post-war period. The new scheme has been welcomed by the trade. No export allocations will be issued for September to December, 1943, since deliveries on export account have not kept pace with the volume allocated; deliveries will thus be eased. At the end of September, the equivalent of six months' allocation was outstanding. Yarn licences against the allocations for 1944 will not be issued until January 10th. New prices come into force on that date, to offset the advance in wages. This advance was estimated to raise production costs by two to three per cent; yarn and cloth prices are to be raised by nearly four per cent.

Miners' Welfare

The Mining Industry (Welfare Fund) Bill, which was given its third reading in the House of Commons last week, maintains the welfare output levy at 1d. per ton to the end of 1951. With an output of 200 million tons a year, this levy would yield about £833,000. It would otherwise have reverted to the 3d. rate at the end of this year. This provision has been warmly welcomed both inside and outside Parliament. Sir Frederick Sykes, chairman of the Miners' Welfare Commission, gave an encouraging review of the work which has been accomplished through the Miners' Welfare Fund, but a lot remains to be done to improve the miners' working conditions. There are now 362 pithead baths with facilities for 57 per cent of the men employed, but the building programme was suspended at the beginning of the war and there are still 322,000 men for whom no provision has been made. Many of these are employed at small collieries. Unlike baths, canteens do not involve the installation of specialised equipment and the canteen programme has progressed rapidly. By the beginning of December, 893 collieries out of 1,028 had canteens, covering 95 per cent of the workers. Of these 415 served full meals, the remainder providing only "snack" and "snack" service (pies and sandwiches), but when the canteens now under construction are completed, 70 per cent of the men will be able to get full meals. Apart from the extra cheese ration of 12 ounces a week, pithead canteens are the only means by which miners can get additional nourishment—the policy of differential rationing for heavy manual workers has not been favoured in this country; it is essential that adequate meals should be provided, and that full use should be made of the facilities. At present, for various reasons, such as transport, habit and domestic arrangements, about a third of the miners use them. The third main programme of the Miners' Welfare Commission is the provision of rehabilitation centres. About 60 per cent of the miners are now covered, either by special centres or by arrangements with hospitals. The centres at Gleneagles in Scotland and Berry Hill Hall in Nottinghamshire have been in operation for some time; a new centre was opened at Talygarn, South Wales, last Saturday; and others are planned for Durham, Northumberland, Lancashire and Derby. It is hoped that by the summer, each of the main coalfields will have a centre. Rehabilitation, or post-hospital treatment, to restore the working capacity of men injured or diseased in the course of their employment, is a comparatively recent development, to which increasing attention is being paid. Its importance to miners can be gauged from the fact that the accident rate in mining is six times higher than in factories.

BANK OF LONDON AND SOUTH AMERICA, LIMITED

SUCCESSFUL RESULTS

LORD WARDINGTON'S STATEMENTS

The annual ordinary meeting of the Bank of London and South America, Limited, will be held on Tuesday, the 28th instant, in London.

The following are extracts from the statement by the chairman, Lord Wardington, which has been circulated to stockholders:

From the directors' report you will observe that the net profit after providing for bad and doubtful debts and for legal reserves in South America amounts to £655,475, which, together with the sum of £176,338 brought forward from last year, makes a total of £831,813, compared with £813,758 a year ago. I feel you will endorse the board's view that the results may be regarded as very satisfactory.

The interim dividend of 2 per cent. paid in June last amounted to £80,800, and transfers to contingency and taxation reserves have been made amounting to £410,000. The directors now recommend a final dividend of 4 per cent., amounting to £161,600, payable December 29, 1943, making 6 per cent. for the year, subject to income-tax, and leaving a balance to be carried forward on profit and loss account of £179,433.

THE FUTURE

After the usual review of conditions in the South American countries, the statement continues: Present general economic tendencies in Latin-America may be expected to continue so long as the war lasts, although the shipping situation has lately shown some improvement. The varying effects upon local markets of such factors as inflationary tendencies or of the measures taken to combat them, as well as the changes in business atmosphere which will certainly occur when the end of hostilities is more clearly in sight, call for especial vigilance on the part of your directors and officials to maintain this institution's traditionally sound position, and you may be sure that this is unremittently forthcoming.

Plans for post-war international trade and currency stabilisation are now much in the air, and, whatever their outcome, from the point of view of Latin-America the large holdings of gold and foreign exchange should prove a stabilising influence there against the effects of post-war changes in balances of payment. At the same time it is important to remember that the success of plans of the nature indicated must depend ultimately upon internal economic stability in individual countries and the general pursuit of governmental policies likely to promote business confidence. It is not yet possible to foretell what international economic arrangements will emerge after the war, but it is certain that lasting world prosperity cannot be built upon individual national opportunism. I will, therefore, merely add my own expression of confident hope to those of many others that, as the war will be won, so also will the peace—despite the admitted difficulties—through continued co-operation between the United Nations in a joint reconstruction programme based as far as possible on the removal of the trade barriers which operated for so long after the last war and on the mutual recognition of the obligations and advantages of encouraging the maximum exchange of goods.

NEED FOR EXPANDED BRITISH EXPORTS

In aiming at the ideal of a real equilibrium in trade there must be general

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)

ANNUAL MEETING OF STOCKHOLDERS

The eighteenth ordinary general meeting of stockholders of Barclays Bank (Dominion, Colonial and Overseas) was held, on the 23rd instant, at 29, Gracechurch Street, London, E.C. 3.

Sir William Goodenough, Bart., who presided, said: As has lately been our custom, the chairman's address to the stockholders has been printed together with the figures of the bank for the past year, and I hope that you will agree to take them as read.

For those of us who are here present, however, I feel that I should endeavour to pay special tribute to the memory of our late chairman, Sir John Caulcutt, whose sudden death has been a great loss and a source of grief to all of us. Sir John had been closely associated with the work of the bank since its reincorporation in 1925. It is indeed difficult to exaggerate the debt which we owe to him for his skill and for the unfailing energy which he devoted to his work until the end of his life. He was proud, and rightly proud, of our business, the success of which was in no small measure due to his efforts and which brought him warm recognition from the City of London, and, indeed, wherever the bank is established throughout the Empire. His interests were not limited to the City or to the bank. He was a worker in many good causes, to which he gave his help unstintingly. We who were his colleagues here will remember him not only for his achievement as a man of business, but also as a good friend, whom we held in warm regard, and we greatly deplore his sudden loss.

Perhaps I may be allowed to say how proud I am to succeed Sir John as chairman.

TRIBUTE TO STAFF

I am sure you would wish me to convey to our staff a message of good-will and appreciation for their excellent service during the past year. You would also wish me to convey a message of sincere sympathy to the relatives of those who have fallen in the service of their country. (Hear, hear.)

The chairman then moved the adoption of the report of directors and the statement of accounts for the year ended September 30, 1943, and the payment of a final dividend of 4 per cent. actual on the 8 per cent. cumulative preference stock and of 3½ per cent. actual on the "A" stock and "B" shares. The motion was seconded by Mr A. B. Gillett (deputy-chairman) and carried.

The retiring directors, Mr Arthur Bevington Gillett and Mr Walter Osborne Stevenson, were re-elected.

On the motion of Mr Joseph Nissim, seconded by Mr W. Rhodes, Messrs Deloitte, Plender, Griffiths and Company; Price, Waterhouse and Company; Peat, Marwick, Mitchell and Company, and Cooper Brothers and Company were re-appointed auditors.

A vote of thanks to the chairman, directors, management and staff concluded the proceedings.

E. W. TARRY AND COMPANY, LIMITED

The annual general meeting of E. W. Tarry and Company, Limited, was held, on the 17th instant, in London, Commander Oliver Locker-Lampson, C.M.G., D.S.O., M.P., the chairman, presiding. The following is the directors' statement

South America has continued to escape the material destruction of the war, and her fortunate position contrasts strongly with a devastated Europe. Possessed of such vast natural resources, the continent must play a prominent part in world reconstruction, and with the success which is attending Allied arms, I may be permitted to hope that twelve months hence may see the dawn of that era of reconstruction.

circulated with the report and accounts:—The results of the year must be considered satisfactory having regard to the difficulties of trading after four years of war.

South Africa has experienced great industrial activity and has expanded its local manufacturing, but we are confident that there will continue to be a great demand for goods from this country.

The profit available for distribution is £32,117 17s. 3d., and of this amount the directors recommend the transfer of £10,000 to the reserve account and the payment of a dividend of 7½ per cent. on the ordinary shares.

The report and accounts were adopted.

LAKE VIEW AND STAR, LIMITED

MR. D. CHRISTOPHERSON'S REVIEW

The thirty-third ordinary general meeting of this company was held, on the 17th instant, in London, Mr D. Christopherston, C.B.E. (the chairman), presiding.

The following is an extract from the chairman's statement, which was circulated with the report and accounts for the year ended June 30, 1943:—The profit from mining operations was £389,378, which compares with £437,771 in the previous year. In order to provide income-tax on the previous year's profits payable on January 1, 1944, and the total taxation on current profits, it has been necessary to transfer £75,000 from reserve to appropriation account. This makes provision for the company's total estimated liability.

The directors recommend the payment of a final dividend of 25 per cent., less tax, making a total distribution of 37½ per cent., which is the same rate as paid in the previous year.

Development amounted to only 5,868 ft., or 34,000 ft. less than normal. On the No. 4 Lode a southern extension of the ore shoot was discovered on the upper levels of the Chaffers, and the 1,700-ft. Level south drive was advanced 114 ft. in ore averaging 6.4 dwt. This shoot is now being developed on the 1,553-ft. Level. In the Minor Lodes, where only 1,362 ft. of development was done, the reserve position remains satisfactory. No. 6 Lode, which was discovered in the previous year and proved on the 1,884-ft. Level, was further developed at the 2,000-ft. Level, where 226 ft. averaged 4.9 dwt. over 58 in.

At the Lake View Mine good results were obtained from the 2,008 ft. of development; out of 1,174 ft. of driving 686 was in ore averaging 9.7 dwt. over 64 in. At the 300-ft. Level an east crosscut was put out from the Lake View Main Lode to cut an ore body located by drilling, and the first 31 ft. of driving on this has averaged 7.8 dwt. over 70 in.

Shortage of skilled labour has again held up development of the ore body on the 2,670-ft. Level. Driving off the winze from the 2,300-ft. Level at the 2,474-ft. horizon has so far given poor results over the 188 ft. advanced. At the 2,664-ft. Level a north drive in the hanging wall of the wide ore body was advanced 149 ft., 108 ft. of this being in 4.9 dwt. ore. A north drive in the footwall was advanced 166 ft., 77 ft. being in ore averaging 12 dwt., while a south drive in the footwall side showed free gold, the first 21 ft. averaging 70.6 dwt. over 70 in. In the centre of the ore body a north drive was advanced 52 ft. in 9.2 dwt. ore.

Ore reserves estimated at 4,112,600 tons averaging 5.01 dwt. show a decrease of 87,600 tons and 0.04 dwt. in value from the preceding year.

At Chaffers plant 321,509 tons averaging 5.95 dwt. was treated for a record extraction of 91.48 per cent.; 827,201 tons of residues averaging 0.84 dwt. per ton was also treated at the retreatment plant.

The report and accounts were unanimously adopted.

CARRERAS, LIMITED

CONTINUED PROGRESS

The fortieth annual general meeting of Carreras, Limited, was held, on the 22nd instant, in London.

Sir Edward S. Baron (chairman and managing director) said that it gave him pleasure to be able to report continued progress. This annual meeting was their fortieth, and he thought shareholders would agree that the achievements gained and the progress made since their formation must be a source of satisfaction and pride to all concerned. Never during those 40 years had they failed to pay a dividend. That record was due in no small measure to that outstanding characteristic of private enterprise—the pioneer spirit—a spirit which, in his view, was a first essential of future world prosperity. The growth of this business was a fitting testimony to the efficacy of private enterprise; pioneering in the scientific development of production machinery and methods of manufacture; in the encouragement of those twin assets, initiative and enthusiasm; in a courageous and enlightened progressive policy, beneficial to workers and shareholders alike.

OUTPUT GREATER THAN ANTICIPATED

The net balance, after charging directors' fees, ample depreciation, superannuation contributions, war damage contributions due, was £3,629,974, a new record in their history. That, in a large measure, could be attributed to revised methods, more efficient machinery and altered conditions, which had enabled them to obtain a greater output of cigarettes than any of them could have possibly have anticipated a year ago.

The amount provided for taxation, both Excess Profit Tax and income-tax, was £2,837,695, representing approximately 80 per cent. of their earnings, and was an increase of something under £400,000 on last year's figure. That did not mean that some of their additional profit escaped taxation, but was due to the fact that last year they had to provide an amount in excess of a year's taxation, so that the whole of their expected liability on all profits made up to October 31, 1942, would be covered. In the present accounts no extra period needed to be provided for, but only the profits made in the past 12 months, and adequate provision had been made for those according to the best information available. Now that the company's liability for taxation had been covered up to date and the general position was so sound, it was felt that there was no reason whatever why the rate of dividend in force at the beginning of the year should not be restored. The proposal was, therefore, that a final dividend of 17½ per cent. should be paid on the ordinary shares of all three classes, making 30 per cent. for the year.

BONUS TO STAFF

In recognition of the part played by employees in securing the satisfactory results of the past year, they had continued their practice of letting them have a share in the company's prosperity, and it had been decided this year to pay them a bonus for the year amounting to six weeks' wages.

In the light of to-day's forecast of last year had not been sufficiently optimistic, but he was sure shareholders would rather he erred on the side of caution, which course he felt it prudent again to adopt, as one could not foresee all the unknown factors that might arise during the coming year. This much he could say, however, that whatever the circumstances he felt confident that the administration and organisation would meet them with resource, energy and to the advantage of the shareholders.

The report was unanimously adopted.

AVON INDIA RUBBER COMPANY, LIMITED

MAJOR R. F. FULLER'S REVIEW

The fifty-fourth ordinary general meeting of the Avon India Rubber Company, Limited, was held, on the 17th instant, at the company's offices, Melksham, Wilts, Major R. F. Fuller, D.L., the chairman, presiding.

The following is an extract from the chairman's statement circulated with the report and accounts:—The directors submit to the shareholders the fifty-third annual report and accounts with satisfaction at the results shown.

The amount of essential work accomplished by your company during the year is substantial.

For the first time there is included in the accounts a memorandum which shows the company's total liability for taxation and the provisions made for its liquidation on due dates. In particular, it will be noted that not only is EPT fully covered, but also the 1944-45 income-tax, which will be calculated on the profits of the past year.

BALANCE-SHEET ITEMS

In total, fixed assets appear in the balance-sheet at £500,144, compared with £510,069 last year. The opportunity has been taken, commencing with the written-down value in 1932, to show additions at cost to fixed assets since that date, and the amount of depreciation written off, over the period of 10 years and the year under review. In 1940 the board obtained an expert and independent valuation of the company's fixed assets in Melksham on the basis of pre-war values of a going concern. This was "about but not less than £597,500," compared with the book figure of £465,333. All ARP expenditure to date has been written off.

Other assets would not appear to call for special comment except to mention that stocks and work in progress are advantageous and valued at cost or market price, whichever is the lower. There are no items for patents or goodwill, although, in fact, these constitute valuable assets.

On the liability side we have no prior charges. The excess of total floating assets over total current liabilities and provisions is £182,288 (last year £146,704).

ALLOCATION OF PROFIT

Turning to the profit and loss account, the sum available for appropriation is £350,759, but after providing for taxation and the payment of War Damage Contribution, the balance remaining is £57,932 5s. 10d. Your directors now recommend:—Contribution toward staff pension fund, £4,000; final dividend on ordinary shares of 4 per cent. plus 3 per cent. bonus (making 10 per cent. for the year), £20,778 18s. 10d.; less income-tax at 10s in the £, £10,389; leaving a balance to be carried forward to next year of £31,590, against £11,907 15s. 9d. brought in. Dividends are shown net after deducting income-tax and consequently the total amount of distribution is disclosed.

The past year has continued to entangle us in difficulties arising from war conditions and the incidence of war-time control restrictions, but in large measure these have been overcome from day to day, and factory results attained, in the main, of the loyal and unstinted efforts and efficiency of our workpeople and station grades. They have completed another year of hard work in the national cause, and thanks are due to them.

It is not possible to forecast the course of the current year, but it is pleasing to be able to report that the year has commenced well and profitably. Assuming a continued adequate supply of raw materials and labour, the results to be presented a year hence should not be disappointing.

The report and accounts were unanimously adopted.

BRITISH CELANESE LIMITED

RECORD TRADING PROFITS

DR HENRY DREYFUS'S ADDRESS

The twenty-fourth annual general meeting of British Celanese Limited, was held, on the 21st instant, at Winchester House, Old Broad Street, London, E.C.2, Dr Henry Dreyfus (chairman and managing director) presiding.

The chairman said: Ladies and gentlemen,—I call upon the secretary to read the notice convening the meeting and the auditors' report.

The assistant secretary having read the notice convening the meeting and the report of the auditors,

The chairman said: With your approval I suggest that the report and accounts be considered as read. The profit and loss account shows a balance of trading account of £3,369,147 compared with £3,152,115 last year and is a new record. After providing for general sales and administrative expenses, Excise duty, research and advertising, etc., there remains a balance of £2,181,346 compared with £2,016,290 last year, and after providing for depreciation, debenture interest, etc., there remains a net profit of £1,660,403 as compared with £1,498,495, subject to taxation, which item this year requires £1,312,000. Whilst the tax free profit actually earned in the previous year amounted to £328,495, this year it was £348,403, or nearly £700,000 gross.

This profit was earned on a restricted production, and were it not for the heavy burden of Excess Profits Tax, the amount available after meeting the dividends on both preference stocks and the interest on the funding certificates would have been sufficient to provide the full 2½ per cent. participating dividend on the second preference stock and a substantial dividend on the ordinary shares, apart from providing a much greater fund for the redemption of funding certificates. Provision has been made, as formerly, for the payment of allowances to those of our employees in the National Services. The carry forward to the current year of £592,214 compares with the amount of £511,988 brought forward* as at June 27, 1942.

Trading and profit for the current year continue to be satisfactory, and, subject to unforeseen circumstances, a further large E.P.T. provision may probably be required in the current year. Up to July 3, 1943, Excess Profits Tax amounted to £1,800,000. No credit has been taken for any possible 20 per cent. refund after the war.

DIVIDEND POSITION

Whilst the profits earned in the year under review alone—or combined with the previous carry forward—would allow an ordinary dividend and a second preference participating dividend to be paid, your board do not recommend such dividends at the present time in view of prevailing war conditions. I said at the last annual general meeting that your board will give favourable consideration to the claims of ordinary shareholders and participating shareholders of second preference stockholders as far as they consider it prudent to do so. Your board will also be influenced by the changing factors, and in addition the incidence of taxation may be changed based on possible new financial laws, all of which may react favourably on the possibility of paying such dividends in the future.

I mention change in finance law specially because steps are being taken by the Government in relation to post-war

planning which include increased exports. The incidence of war taxation prevents the majority of firms from setting aside sufficient funds to provide for improvements or additions to their plants and other post-war planning. Accordingly unless this heavy burden is somewhat alleviated the development of new products and new technique, coupled with their development in the export trade, is likely to be seriously restricted.

CONTROL AND CO-OPERATION IN THE INDUSTRY

The volume of rayon production and its allocation to the home and export trade are very restricted and controlled. Export demands continue greater than supply. I am glad to say that all sections of the rayon industry continue to co-operate harmoniously, and the formation of the British Rayon Federation will further help in this direction.

RESEARCH AND MANUFACTURING DEVELOPMENT

Research and development of new products and new processes have been continued, and have covered a wide field. The research has been directed in the main to our war effort, and has covered a large range of textiles and chemicals and their intermediates, including dyestuffs and plastics of many kinds. Plastics have figured in the activities of your company continuously from the period of the last war, and our research has been extended to embrace chemical products of many kinds, and their intermediates which lend themselves for use in the plastics industry of thermo-plastic and thermo-setting types. You will be interested to know that for some time we have also been developing new products which combine the thermo-plastic with the thermo-setting types at will. When you consider all these points you will understand that in this industry also we are in the forefront.

You have probably noticed in the press that the production in America of acetate plastics is of the order of 75-80 million pounds weight a year, and that the American Celanese Company, together with their friends engaged in the same manufacture in their war effort over there, are making good progress in this field, and in particular with acetate plastics and derivatives and other important products relative to them, which later imply also dimensional stability and other improved qualities.

We ourselves are rather keeping stationary in our war effort in this respect owing to difficulties experienced in obtaining licences for the materials necessary for erecting installations for further developments. This also applies to our strong yarns which were invented and developed in this country in which again our American company are expanding far more quickly than we. We hope when hostilities cease and controls become less rigid your company will then be in a position to develop more rapidly in these various fields.

TECHNICAL PROGRESS

The research organisation of your company, which is one of the largest of its kind in the country, has always kept itself in the forefront of scientific and technical progress. I have previously mentioned to you that our strong yarns are the strongest in the world, and we are now able to produce products having strengths of 11 grammes per denier, compared with

our previous values of 6 to 7 grammes. So far as extension is concerned, this can be made to be anything that is needed in practice for most textile purposes at the expense of a certain amount of strength. The importance of this strength can only be properly assessed when it is considered that natural silk, which was at one time the strongest fibre known, has a strength of 3 to 3½ grammes per denier and the product which is known as nylon, and which has been given so much publicity, particularly in America in the last few years, has a strength of 4 to 6; that is to say, just about half the strength of our newest high tenacity yarns. Whilst natural silk was previously the finest known textile, with a filament denier of 1—that is to say about 10,000 yards weigh 1 gramme—our strong yarn can be produced in filament denier varying from ten to one hundred times finer than natural silk. Thus Celanese continues to lead in the textile world.

SYNTHETIC PRODUCTS

I indicated at the last meeting that we were busy on many other completely synthetic products, including those made from coal and hydrogen, with or without nitrogen, and that they also might be used in the textile industry for certain specific purposes. When I mentioned that, I had in mind amongst other synthetic products of various kinds the nylon products which fall into the category of products containing carbon, hydrogen and nitrogen.

Your company therefore will be in a position, based on its own processes and the products resulting therefrom, to produce them as the need arises. In this connection we are arranging to produce all the raw materials which are important from an economic point of view, in the form of the intermediate chemicals needed for such final textile or other products. Hence you will realise that we will be independent of any agreements of international character concerning profit participation, royalties, prices, licences, etc. Therefore we are also helping to make our country free from outside influences in this respect.

NYLON AND RUBBER

I have referred to the publicity in connection with nylon. Nylon is a word coined to describe a certain group of products the scientific name for which is "polyamides," and the originators of the name decided at the time that the word should not be protected as a trade mark, and therefore may be used without restriction by anybody. Our own products, while sharing all the textile properties of nylon, are distinct from a chemical point of view and also differ in other respects. You will appreciate that when we market our products we shall adopt our customary policy of using our own trade names.

Lately you have also heard that we are entering the field of synthetic rubber production. In this connection I confine myself to saying that we have been active in this field for many years, and all the known synthetic rubber products, and many up till now unknown, will be produced by us. That is as far as I can go to-day.

The American and Canadian companies continue to work satisfactorily, as you will have seen from the reports published from time to time in this country.

Before I close my remarks, I take this opportunity, with your consent, of thanking all our employees in our various factories and establishments throughout the country for all the work they have done under prevailing difficult conditions. Their effort has contributed substantially to the results achieved.

The report and accounts were adopted, and the re-election of the retiring directors and of the auditors concluded the proceedings.

ASSOCIATED TALKING PICTURES, LIMITED

SUCCESS OF STUDIOS COMPANY

The fourteenth annual general meeting of Associated Talking Pictures, Limited, was held, on the 22nd instant, at Ealing Studios, Ealing Green, London, W., Mr Stephen L. Courtauld, M.C. (the chairman) presiding.

The secretary (Mr L. F. Baker, A.C.A.) read the notice convening the meeting and the report of the auditors.

The chairman said: The report and balance sheet have now been in your hands for some days, and with your permission I will take them as read. (Agreed.) During the year under review the operations of your company have necessarily been restricted to the endeavours to obtain from your company's past productions as much revenue as possible by the re-issue of the older films. The results of these efforts are shown on the credit side of the profit and loss account, from which it will be observed that realised profit and sundry revenue total £39,240 19s. 5d. The balance of profit remaining in the company's hands after paying bank and debenture interest and all expenses amounts to just over £28,000, against which balance is charged £2,000 for the directors' fees and a further provision of £25,000 on account of the unascertained taxation liability of the company, leaving a balance of profit of £1,155, which has been deducted in the balance sheet from the very heavy adverse balance brought forward on profit and loss account. The shareholders will note that the directors' fees have not been formally waived this year, but provision has been made for them in the accounts, which course it is hoped will commend itself to the shareholders. It will be remembered that the directors have forgone their directors' fees for a very large number of years in the past.

TAXATION POSITION

Regarding the company's taxation position, shareholders will doubtless remember that when I had the pleasure of addressing them last year I took the opportunity of dealing in detail with the acuteness of the company's position in this respect. This position is at present receiving very earnest consideration and investigation both by your company's auditors and by consulting accountants who are engaged with the auditors on this matter. It still remains to be seen whether any easing of your company's burden can be obtained. In the meantime, it would appear from the information at present before your directors that such profits as may be made by your company are almost entirely dedicated to the payment of direct taxation charges in one form or another.

Regarding the subsidiary companies, Ealing Studios, Limited, has had a quite difficult, though successful, year, so far as its manufacturing programme was concerned. It will be appreciated that with the limited supplies of technical labour and of materials, prices necessarily show an upward tendency, and with the keen competition supported by large cash resources, which has been prevailing during the year under review for available sup-

plies, this tendency has been very marked indeed. The present cost of manufacture is fully twice that of pre-war or early war days, and although box-office takings are to-day higher than they were before the war, there is a grave danger in the present situation since it is patently obvious that a quite reasonable reduction in earning power will leave production companies with very high priced negatives on their hands, the costs of which cannot be recovered.

FAVOURABLE ACCEPTANCE OF FILMS

I am glad to be able to report that the films produced by Ealing Studios, Limited, have had a favourable acceptance both by the trade and the cinema-going public, and that company's efforts are still continuing, although the difficulties to which I referred earlier are almost daily on the increase. The films so manufactured are now being distributed in the United Kingdom by the other subsidiary company, now known as Ealing Distribution, Limited, the name having been changed during the year under review from the former name of Associated British Film Distributors, Limited. During the year under review, the distribution arrangements with United Artists Corporation, to which I referred two years ago, were terminated and satisfactory business is now being carried out by Ealing Distribution, Limited.

It is not possible to give any forecast of the future; this is an ever-changing industry, and it is at present beset by difficulties which are both numerous and complicated. I am sure that in the light of the vicissitudes of the past, shareholders will have a full appreciation of this.

Mr Reginald P. Baker, F.C.A. (managing director), moved the adoption of the report and accounts.

Mr Basil Dean seconded the motion, and it was carried unanimously.

The retiring directors, Mr Michael E. Balcon and Mr Roger F. Ould, were re-elected; the auditors, Messrs Layton-Bennett, Billingham and Company, were re-appointed; and the proceedings terminated with a vote of thanks to the chairman, directors and staff.

J. BROCKHOUSE AND COMPANY, LIMITED

CONTINUED SUCCESS

The forty-sixth annual general meeting of J. Brockhouse and Company, Limited, was held, on the 22nd instant, at West Bromwich.

Mr J. T. Brockhouse, J.P., chairman and managing director, said that the balance-sheet showed the continued success of the company during the past year. It was essential that thought should be given to the methods that would be adopted in rebuilding the structure of trade after the war was won. Industry would have a large part to play, and it was only through industry that improved standards of life could be made a possibility.

They had a number of new products to bring on to the market. They would be introducing a range of municipal vehicles, and they felt that they had a large field to explore at home and possibly abroad.

with the patent Lewin road sweeper, the universal sweepers and the Lewin compressor refuse collectors. They had for many years been large producers of cold rolled steel sections, and the introduction of pre-fabricated building structures, particularly houses, had brought new and varied uses for that product. They were manufacturers of cooking stoves, cooking utensils, household baths and many other domestic products which undoubtedly would be in great demand after the war. For these reasons and others he did not see why the company should not continue to extend in the future as it had done during the past twenty years, in fact.

He thought it would be agreed that the consolidated balance-sheet and that of the parent company showed a considerably stronger position as the result of a satisfactory year's trading.

The report was adopted and the final dividend of 12½ per cent., making 20 per cent. for the year, was approved.

PENINSULAR AND ORIENTAL STEAM NAVIGATION COMPANY

MR A. O. LANG'S STATEMENT

The 103rd ordinary general meeting of the Peninsular and Oriental Steam Navigation Company was held, on the 22nd instant, in London.

The following is an extract from the statement of Mr A. O. Lang (deputy-chairman) circulated with the report.

The ships of the Mercantile Marine continued to be actively engaged in all theatres of war, and during the year under review the steadily increasing momentum of the Allied offensive has made demands on our ships even greater than hitherto. While shipowners are glad to make every possible contribution towards winning the war, it is only right to stress that the question of fleet replacement causes considerable apprehension. Compensation payable in respect of ships lost falls short of the cost of replacement, hence our "tonnage replacement reserve," large though it is, is insufficient for requirements, and it has been thought prudent to augment this by transferring a further £175,000 from profit and loss account. Our problems do not end with the replacement of ships that have been lost during the war; some of those that remain are approaching the end of their useful life and will likewise have to be replaced.

The profit and loss account on this occasion has been remodelled. Had the accounts submitted at this time, last year been drawn up on the basis now adopted, the profit for 1942 would have been £742,475, as compared with £787,768 for 1943. This improvement is due to the larger income from Government securities. The board is continuing to watch with vigilance the question of participation in post-war civil aviation, but it will be understood that until the Government policy is both settled and announced the company can make no definite plans. The report was adopted.

GOVERNMENT RETURNS

For the week ended Dec. 18, 1943, total ordinary revenue was £37,290,000, against ordinary expenditure of £104,706,000, and issues to sinking funds of £125,000. Thus, including sinking fund allocations of £9,540,735, the deficit accrued since April 1st is £2,323,665,000 against £2,197,134,000 for the corresponding period a year ago.

ORDINARY AND SELF-BALANCING REVENUE AND EXPENDITURE

Total	589,303	394,722	414,440	11,783	10,656

A change has been made in the method of showing an excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £24,770 to £2,788,381, the other operations for the week (no longer shown separately) raised the gross National Debt by £68,105,937 to £19,171 million.

INDUSTRY AND TRADE

Tomatoes.—During the 1943 tomato season, 230 million lb of tomatoes were distributed through the Ministry of Food's distribution associations. This is the equivalent of 5 lb. per head of the population, and an increase of 40 per cent. of the 1942 figure of 166 million lb. The large increase in the quantity distributed through the associations was due to the fact that this year the associations were compulsory, but in 1942 they were voluntary.

"The Economist" Sensitive Price Index.—The index (1935=100) remained unchanged during the week to December 22nd and was as follows:—Crops, 122.9; raw materials, 182.3; complete index, 149.7.

Problems of Liquidity

THERE was some apparent increase in the rate of bank credit expansion over the past year. Taking the clearing bank figures to the September returns, the expansion in deposits over the preceding year amounted to £379 million, compared with £244 million for the previous twelve months. This acceleration in the expansion of bank credit is largely corrected if allowance be made for the influence of tax reserve certificates on bank deposits. This particular form of borrowing was primarily intended to tap funds which, but for their investment in these certificates, would to a large extent have accumulated in bank deposits in anticipation of tax payments. From their issue up to the end of September, 1942, these certificates had accumulated to a total of £377 million. In the subsequent twelve months the further accumulation amounted to £205 million only. Allowing for this factor, therefore, it will be found that the forces determining the rate of credit expansion over the past year were operating with a vigour approximately equal to that of the preceding year.

What is true of the growth of bank credit over the past two years is also true of the influence at work behind that expansion. It is again deficit financing which has provided the whole of the motive power. This is almost certain to remain the position until the end of the war, and it is a state of affairs which promises to project itself well into the years of peace. There has, however, been some marked divergence in the distribution of bank assets of course, has followed dutifully in the steps of the expansion of deposits. Though more will be said later about changes in the true cash ratio, that shown by the published figures shows no net change over the twelve months in question, beginning at 10.4 per cent and ending exactly on the same figure. The authorities evidently take good care to create just as much bank cash as will support the pyramid of credit which the banks' participation in deficit financing demands. Apart from this the past year's changes in bank assets contrast sharply with those of the previous year. The most notable difference is the much reduced increase in the banks' holding of investments. The past twelve months' increase in this item, £63 million, is by far the smallest yearly increase since the first year of the war. It compares with an increase of £157 million in the year to September, 1942, and of £242 million in the year to September, 1941. The banks' direct participation in the various savings campaigns has been on a much reduced scale during the past year. This

is a matter on which congratulations may be handed to all concerned. There should be a saturation point to the banks' holding even of medium-dated Government issues, whether the position be viewed from the angle of the nation as a whole or of the banks and their depositors. Even allowing that the banks are protected by maturity dates and that there is little serious danger to cheap money "in our time," medium-dated Government stock is far from the ideal counterpart to deposits repayable on demand or comparatively short notice, and when the investments dominate the balance sheet as they do today and represent no less than 31 per cent of these deposits, the purist may be forgiven a frown.

Loans and advances continue to decline over the past year, but at a much slower pace than that maintained in any comparable period of the war. The drop of £41 million in this item over the twelve months to last September reflects the further contraction in the private sector of the industrial front and, at the same time, the smoother running of the progress payments system by which the various supply departments provide war industry with the bulk of its requirements of working capital. The drop in bank advances would have been sharper during the past year had a certain type of advance, that granted to finance tax payments, not increased relatively to the whole. This development must be connected with the wording of the Finance Acts defining EPT standard profits. In so far as bank loans are held to be "capital employed in the business" for the purpose of arriving at the standard profit, firms liable to EPT have been encouraged to meet their tax liabilities at the earliest moment, even anticipating them as far as possible, and doing so with the help of bank finance. There have also been cases of firms liable to EPT accumulating tax reserve certificates and, though not doing so directly with the help of bank loans, nevertheless showing some expansion in these loans concurrently with their acquisition of these new securities. In such cases, the borrowing firm will have borrowed from its bankers in the normal course of business, but by so doing will have financed with bank credit requirements which it could have financed from its own internal resources had it not at the same time acquired these highly attractive Government securities. The more fundamental and long-term factors making for a contraction of bank advances have, however, more than neutralised these rather spurious stimulants.

With bank credit continuing to expand, with invest-

banks have little to say. In view of this special character of what is now much more than half of their liquid assets, the banks have been compelled to enhance the liquidity of their other quick assets—bills and short loans. For some time past it has been evident that the banks have been buying bills of increasingly short currency. Before the war when the banks entered into their self-imposed ordinance not to buy Treasury bills from the discount market until these bills had run for one week of their three months' currency they set what was at the time not only the maximum, but the minimum currency of the bills they purchased. Discount houses, in those days, automatically assumed that they would hold for one week the bills they tendered for and would then resell them to the banks. This accepted practice was only broken in the case of exceptional maturities which the discount market wished to keep for special reasons. It continued until TDRs became the preponderant item in the banks' quick assets. Since then the banks' appetite for bills has waned and their purchases have revealed increasing fastidiousness in the matter of the currency of the bills purchased. It is now the general experience of market houses to run Treasury bills for four to six weeks before these become sufficiently short to tempt the clearing banks. If the banks buy bills having on the average, six weeks to run instead of twelve weeks as was the practice until 1941, they will have twice as great a flow of maturities from a given holding of bills. It is this fact and the greater possibilities it gives the bank of adjusting their cash position by manipulating their bill maturities and purchases which is responsible for the changed practice in the banks' bill operations. Another factor favouring the holding of shorter dated paper is the new technique of open-market operations by the Bank

* 95 per cent. of figures in preceding column

Although TDR's are always included in quick assets, their claim to that position must be hedged with certain reservations. The first is on the score of their non-negotiability. The fact that they cannot be transferred from bank to bank must detract somewhat from their

WILL London after the end of this war resume its rôle as an international financial centre? It is very much to be hoped that it will, for the nation will urgently need the foreign exchange income represented by banking services before the war. But while there can be little difference of opinion on the desirability of recapturing this credit business, there may be more serious doubts about the ability of this country to command the foreign exchange resources and to expect the freedom of foreign exchange dealings which are essential pre-requisites to any claim to be an international financial centre. There is perhaps a tendency to exaggerate the damage which has been done to the British foreign banking machinery and therefore to be unduly frightened of the task of reconstruction. The mechanism is still there and largely intact. The merchant banks and acceptance houses may be marking time, but, for the most part, their resources are intact, their personnel, though now largely engaged in Government work, can be rebuilt at comparatively short notice, and contacts with their specialised overseas markets are likely to be restored with a minimum of delay after the end of the war. The joint-stock banks have maintained their foreign departments, and though these may be but a shadow of what they were before the war, they are capable of rapid expansion. Most of the overseas banks which were represented by branches in London still have their offices here. Some are concerned with little more than the care-taking of blocked resources, others, like some of the Empire banks, probably handle a larger turnover of money than has ever before passed through their hands. The discount market retains its machinery intact, and possesses a capital structure stronger than it has ever seen in the past. The flair for commercial paper may have to be re-learned, but there are old hands in the market to whom the tradition has been safely entrusted.

Not only is the structure intact, it is still employed on overseas finance, though on a scale that must seem very modest in comparison with pre-1939 and, even more markedly, with pre-1931 standards. The intrusion of the Government in foreign trade has, to some extent, ousted the normal machinery for the financing of that trade. The bulk purchase of the Australian wool clip,

During the past year, therefore, the fall in advances and the slower rate of accumulation of investments—the first phenomenon lying outside the banks' initiative and the second within it—have compelled the banks to concern themselves increasingly with problems of liquidity. Thanks to the steady expansion in the volume of bank credit, the increased diversion of resources to the more liquid assets has probably had little effect on banking profits. By their decision not to plunge too deeply in the gilt-edged market and thus to stabilise their earnings (though these are still well short of their EPT standards) the banks have given evidence not only of sound financial judgment but of good and farseeing political sense.

is thus allowed to proceed with its operation. Two main types of foreign credits are barred by the regulations. The first is "clean credits," that is, acceptance or overdraft facilities to which no commercial transaction is definitely related. The second is the credit financing trade between two foreign countries. No unnecessary tears need be wasted on the first type. Too often it belied its "clean" name. It was responsible for much of the debasement of the acceptance credit in the inter-war period and for a great deal of the bad and frozen debts left by the 1931-32 defaults. The second loss is more serious, though perhaps inevitable in the present circumstances. London's greatness as an international financial centre was best symbolised by this ability to finance trade which never approached the shores of this country—wool from Australia to Japan, timber from Canada to Chile, rubber from Malaya to the United States, cereals from the Argentine to the Continent of Europe. That type of credit is so obviously incompatible with control of exchange, and with the accompanying physical control of the underlying commercial transactions, that it must be regrettably turned down for the duration. Another reason for its temporary abeyance is the impossibility of fitting it into the exchange controls operated by the two overseas countries directly concerned in each of the commercial transactions in question. The loss of this business is as much the result of other countries' exchange controls as of our own.

The prospects for post-war recovery of this financial business are conditioned firstly by the character of the foreign trade which will prevail, and secondly by the system of sterling exchange control which will have to be extended into the years of peace. As to the first, it is difficult at the moment to predict with any confidence. It is clear that a system of foreign trade in which large bulk transactions were left to Governments or their agents would provide a less fruitful sphere of operations for international banking than a system wholly operated by private enterprise, even though, as present experience shows, it would not altogether remove the need for private bank facilities in the financing of international trade. The type of sterling exchange control operated after the war will to an appreciable extent determine whether or not sterling is to be superseded as the dominant currency of international commerce. It should be possible to make the control of capital movements compatible with freedom for recognised banks to engage in international credit business, without having to submit each operation to the prior approval of the authorities. It is certainly the intention of those now operating exchange control that this compromise of freedom with control should obtain. The gradual application of sterling exchange during the early months of the war was held back by what was perhaps excessive concern for the reputation of sterling as an international currency. The recent relaxations in the control show that this concern is still very much alive. The authorities realise that no bank indulged in foreign credit business unless drawn to it by the fairly confident hope of gain. There is no intention to sacrifice that profit merely for the bureaucratic pleasure of saying "No." It is thus probable that as the need for the present rigours of control over exchange operations declines, authorised banks will be given increasing freedom to engage in foreign credit business.

This, however, assumes that this country will have the wherewithal to grant short-term banking credits after the war. The actual current surplus required for this purpose need not be substantial, as the previous experience of the London money market has shown that an international centre tends to attract as much in foreign deposits as it makes available through acceptance and other short-term credits. But a certain margin of claims on other countries is essential, and in order to ensure this margin after the war it will be essential to fund or otherwise deal with the abnormal sterling balances of overseas countries which will be among the more striking financial relics of the war. Even without the surplus which Britain commanded in its heyday as a financial power, the mechanism of the London foreign banking

system could still be made to work with the help of external resources. There is no reason why the accumulated knowledge of its specialist banking houses and the mechanism of its discount market should not be used, to the advantage of all, for the distribution of credit originating from American banks—or from the reconstruction bank, of which the outlines have already been sketched by the US Treasury experts. This mainly redistributive function might not prove so remunerative as business done by London on its own account, but it would be better than nothing, and it would keep in being one of this country's most efficient assets.

The type of credit that should be made available must to some extent depend on the character of the trade which it will be called upon to finance. In particular, it must depend on whether Governments or private firms handle the trade, and on the duration of the self-liquidating transactions comprised in it. The main contest will be between cash advances and acceptance credits. Both have their points, but the acceptance credit has the great advantage of being ultimately carried by the discount market, one of whose functions it is to collect the surplus funds of foreign banks. The typical bill on London may be shortened from three months to one, given the accelerated tempo of foreign trade, but it is to be hoped that even in this shortened form it will return. Special care will have to be taken to ensure that the credits granted underlie genuine commercial operations. The "clean credit" now barred by the exchange control regulations should be barred for good. Closer supervision over the way in which the proceeds of foreign credits are used should be one of the objectives of closer collaboration between the central banks of the countries concerned.

If there is to be a concerted effort to rehabilitate London's preeminence as an international banking centre after the war, to which institutions should the main effort be entrusted? To the specialist merchant banks and acceptance houses, or to the joint-stock banks? The task will probably call for an all-out effort on the part of all banks with the requisite machinery and tradition. In this matter the Bank of England might give a clear lead. There is still a tradition in this country which holds that a joint-stock bank's overriding responsibility is to its depositors and that, therefore, it should avoid all external entanglements. A hint of that attitude is still apparent in the Bank of England's treatment of banks which operate overseas. The fact that until quite recently such bills were not regarded as eligible for discount at the Bank held an implied disapproval of foreign entanglements which might be reconsidered in the light of the task that lies ahead. It is to be hoped that the specialist institutions will be in the van of the return to foreign banking. Their knowledge of foreign markets, their close relations with local banks, the larger proportion of their own resources with which they work, fit them especially for this type of banking. But the defaults of 1931, the losses on standstill bills taken in 1939 and four years of comparative inactivity since then may have affected the ability of these firms to shoulder the whole responsibility of reconquering the lost ground. The joint-stock banks should be expected and encouraged to play their part, though with a discretion greater than was displayed in certain isolated instances between 1925 and 1931. The opportunities provided by the return of foreign banking will be great. The effort to secure them should match the prize at stake.

In normal times *The Economist* published a **BANKING SUPPLEMENT** twice a year. Although many of the more important topics were dealt with in both supplements, the Spring Supplement was chiefly concerned with banking in the British Isles and the Autumn Supplement with overseas banks. This precedent will no doubt be re-established after the war. In the meantime, the present Supplement has to do duty for both. Even so, it has been found necessary greatly to curtail both the articles and the statistical tables and to omit advertisements altogether.
