Germany's Frontiers

IN this war, the United Nations appear to have avoided the practice which was a very severe embarrassment to the Allies of the last war—they have made no secret of their policy embodying territorial promises. Yet there is always the danger that policies and plans can gain, even in the course of discussion, such a hold on people's minds, and such a validity of their own, that they come to have the effectiveness of commitments. Whenever such a clear line of thought about post-war policy begins to emerge, it is essential to fit it into the general framework of the peace. Is it compatible with the kind of settlement the United Nations are fighting for? Will it hinder or help the establishment of a civilised international order?

One policy for post-war Europe has been gaining clarity and support in recent months. It is that the frontiers between Poland and Germany should be drastically redrawn. There is a minimum policy—that East Prussia should be permanently separated from Germany (but without any insistence on the form its future government should take). Thus, the Conservative Members Post-War Policy Group demands that:

East Prussia, as geographically and historically a separate entity from the rest of Germany, and as the headquarters of the Junkers, should not form part of Prussia or Germany.

There is a more drastic version that looks to the bodily incorporation of East Prussia in Poland. General Sikorski gave voice to this view a day or two before his death.

Then there are still more far-reaching claims made by different unofficial Polish groups as well as the Soviet-sponsored Union of Polish Patriots. They demand the incorporation, in Poland, not only of East Prussia, but of all Silesia. Finally, there have been claims from Polish and Soviet quarters that Poland's post-war frontiers with Germany should be set still farther west on the Oder. These maximum proposals can perhaps be ignored; but it is clearly the intention that some territory that was left to Germany at Versailles should, at the end of this war, be ceded to Poland.

These proposals cannot be judged in the abstract; they must be seen in the framework of the general principles of the settlement that is to come. What kind of peace do the United Nations want to make? There are only two feasible approaches to the ultimate problem. On the one hand, the United Nations may envisage a permanent assertion of force by themselves to keep the vanquished down—a policy that would impose upon the victors the material burden of maintaining huge armaments and armies of occupation for an indefinite period, the political burden of maintaining constant and permanent unity among themselves, never to be relaxed even for a year or two, and the moral burden of maintaining without lapse the conviction that a policy of inequality is right. The democratic peoples have, no doubt, learned a number of lessons in this war. But there is not the slightest sign that they have made the gigantic adjust-

ments in their whole outlook on the world that this would require. The only policy that has a chance of permanent success is thus one which looks forward to some future date when Germany will once more be accepted as a free and equal member of the society of nations, no more addicted to aggression than others. The date at which this happy consummation is expected may be put a long way off, and much may be done in the meantime to restrain and re-educate the German people—always subject to the proviso that no programme is entered upon which does not stand a chance of being carried out by virtue of its duration or of the burdens it imposes on the resources and single-mindedness of the victors.

It must be determined now, before emotions and interests have been mobilised behind it, whether the policy of transferring large sections of German occupied territory to Poland fits into the framework of a settlement that will be indefinitely upheld. There can be no doubts about the answer. The policy of transferring East Prussia, all Silesia and the territory east of the Oder to Poland cannot be justified on any ground, save that of reprisal. It is the first step in a policy of dismembering Germany—it is no coincidence that the Post-War Policy Group also demands that

The Rhineland, including Rhenish Westphalia, should be separated from the rest of Prussia and made an independent German State,

or that recent Russian broadcasts should have spoken of the Rhineland's historical and cultural unity with France. On the question of population, the policy entails one of three solutions: the handing over of a German minority, millions strong, to Polish rule; or the forcible expulsion of millions of Germans from land they have occupied for centuries; or massacre.

No one can deny that a policy of dismemberment is possible. If the Poles gain the full support of Soviet Russia for one or other of the solutions suggested above, then in the period immediately after the war they have a very good chance of securing their settlement. The difficulties inherent in a severe and vindictive peace do not arise at the time it is made—dismemberment of Germany will be easy and, possibly, for the moment, the popular solution. The difficulty is that of maintaining such a peace years afterwards when the passions of war have died away among the victors, but are kept alive among the vanquished by their sense of outrage. Then the vengeance of the settlement will be the Germans' best weapon against it. The British and the American peoples will lack that passionate conviction of rightness which will alone induce them to shoulder the burdens of enforcement. They will be weak and hesitant before an outraged and resurgent Germany.

Many Poles and probably many other European peoples may be inclined to argue that, provided the policy is vengeful enough—*delenda est Carthago*—there will be no chance for Germany to rise again, and that therefore the question of whether or not Britain would appease a resurrected Germany is academic. But is this conceivable? Germany is not a single city. The systematic massacre of ten million Germans—can even that figure be envisaged?—would leave sixty million more. Is it likely that these sixty millions would never in the future seek to throw off the settlement that had dismembered them? If the Poles could keep alive their sense of national unity through a century of total control and perpetual persecution, do they suppose that the Germans would do less? And if not, then the time would come when once again the question of using force to maintain the peace settlement would arise and the troubled conscience of Britain and the United States would inhibit them from action. The Poles may, of course, be looking only to Russia for Great Power support. Yet the policy advocated is not compatible with Marshal Stalin's statements on Russia's attitude towards Germany nor with the general terms of the Atlantic Charter. Nor have the Poles a tradition of seeking Russian support.

The difficulty about the alternative line of policy—a peace, not without its initial severity, but of a nature

that Germany can eventually be expected to accept—is that in the first place it seems much more difficult to secure and involves a much less "tidy" solution; in the second, it is thought to have been tried in 1919 and to have failed. In territories where the races are as inter-mixed as Eastern Europe it is tempting to solve the problem by wholesale transfers of population. Transfer has taken place on so vast a scale in the last few years that people are tending to forget what a ghastly and inhuman process it is. The analogy of the Greco-Turkish exchange of populations is often used to justify mass deportations. It was a political success; but it involved massive human misery. And, in any case, it is no precedent for what is proposed in respect of East Prussia. The Greco-Turkish exchange was a genuine exchange; it was administered internationally; it took over a decade to accomplish; it was liberally conceived and supported by an international loan. If transfers of population are to be used to "clean up" Germany's frontiers after this war, the conditions must approach those under which the Greco-Turkish exchange took place. For example, it might be possible to exchange the eastern part of East Prussia against the Polish Corridor—but the chances of Poland even considering this are negligible. Such exchanges should be as limited as possible, and as well financed as possible and undertaken over a period of years. Above all, they should come into consideration only in the last resort; and there should be no forcible removal of people—Pole or German—who are prepared genuinely to accept the authority which will afterwards govern their land. Unless a large measure of national self-determination is incorporated in the settlement and policies incompatible with it are accepted only for exceptional reasons in very exceptional cases, then there is little chance of a settlement that the peoples of the West will ultimately fight to maintain. And their willingness to fight to maintain the peace is the real condition of security.

This is the fact which is forgotten by those who argue that the policy of reconciliation was tried last time and failed, and that therefore the peace must this time be a savage one. The trouble about the Versailles Treaty, and the League system which it established, was not so much the terms of the settlement as the lack of will among the victors to enforce it. So long as it functioned with prestige and vigour—between 1924 and 1929—the Germans were ready, if not eager, to make it work. Nor was it they who broke it. The Nazis found it broken, economically through the Great Depression, politically through the Manchurian incident. Even after 1933, it would still have been possible to hold the Germans down, if the first breach of the treaty—rearmament—had been met with war. It was not met by war because the British people were morally uncertain—had they not also promised to disarm? Then, was it not intolerable to keep the German army off German soil in the Rhineland? Then, did not Austria after all want the Anschluss? Each weakness sprang from conscience trouble. Yet those who support a vindictive peace now expect the British in ten years' time to be tough about a treaty which will play ten times the havoc with their moral sense. The experience of Versailles would lead more logically to the conclusion that the new treaty should be still less vindictive if it is to be enforced in the long run.

The plea for a just peace is not part of any desire to "let the Germans off." It is based on the knowledge that since no settlement based on repression of Germany will last without force behind it, only a "lenient" peace has any chance of enduring. The deserts of the Germans hardly enter into the argument at all—except as they will bear upon the future willingness of the British and American peoples to put their strength behind the maintenance of the settlement. If dismemberment, mass transfers of population, massacre, the permanent oppression of minorities are to be part of the settlement this time, let it be plain from the start that neither Britain nor America will in ten years from the signing of

The Ownership of Land

THE question of the ownership of land has returned to the forefront of political discussion. This is not surprising, because every project for the improvement of the life and work of the people of this country comes back at some remove to the land, which is the scene of every activity and is limited in extent. Full employment means making the most productive use of all the nation's resources, including the land. Better use of the land is demanded for the rebuilding of bombed or debased towns, for the preservation of efficient farming and for the siting of manufactures to suit social as well as economic needs. The re-equipment of industry and transport in the immediate post-war period is only possible if the right land is available in the right places.

For the moment, the discussion is focused on re-housing. The only certain item in the Government's reconstruction programme is a ten-year building plan to erect, among other things, more than four million houses. Before the war, a distressingly large part of the population was overcrowded or underhoused. During the war, while building has ceased, overcrowding has grown with evacuation and bombing. After the war, the demand for decent standards of housing will be immensely strong. After the last war, there was a similar need, a similar demand and a similar programme. Great numbers of houses were built, but, too often, they were the wrong houses in the wrong places at the wrong rents.

These were the hopes and fears that excited the Conference, largely of representatives of local authorities, which was organised last weekend in London by the Town and Country Planning Association. Another housing crusade is clearly in the making; but the apprehension that the houses may be too costly or that vested interests may stand in the way of their proper design and distribution evidently goes very deep. Obviously, this is not simply a question of land use or land ownership. The size and nature of the post-war building programme depends in the first place on considerations of national economy, on the proportion of the nation's resources that can be devoted, against other claims, to building. It is also a question of industrial efficiency. Within the limits of the resources allotted, the cost of housing, in both real and money terms, will depend upon the efficiency of the building trades, that is, upon their output per worker. Finally, the fate of the building programme depends upon state policy. Is there to be planning? Is the Government to act upon the proposals of the Barlow Commission in order to prevent the congestion of cities and the depression of industrial areas by controlling the location of industry and by fostering the decentralisation of town life? Are the

Scott Committee's proposals for the preservation of rural Britain and the protection of farming to be accepted?

Yet, whatever policy is adopted, the use of the land will be the crucial factor in its application.

Our present problems of the ownership and control of land are surely very close to those of the roads 100 years ago. Shall we attempt to make individual ownership compatible with public service by a system of rules and regulations and planning bodies? Shall we piously hope that, where necessary, communal ownership will be developed, not by the state as representing the community, but by the communal spirit of individuals outside the machinery of state, embodied, for example, in the National Trust? Or shall we encourage the state to act as organiser of this communal service?

These words of Mr. Austin Robinson, in the April issue of *The Economic Journal*, state the problem. It is not the vice or malice of landowners that puts their property in question, but their peculiar position at a crucial bottleneck in public policy. As was said in the Uthwatt Report,

Fundamentally, the problem arises from the existing legal position with regard to the use of land, which attempts to preserve, in a highly developed economy, a purely individualistic approach to land ownership.

An attempt was made between the two wars to make private land ownership "compatible with public service" by local planning, local compensation and local purchase. It was a negative policy; the local authorities attempted to prevent bad uses of land, but they had no power to command good uses. And it failed; this was the gist of the findings of the Barlow Commission. Local regulation was ineffective because local finance was inadequate to meet claims for the compensation of landowners, which included over wide areas large prospective development values. Much land was scheduled for planning. Little was actually planned, even negatively, and the use of land was left to the processes of dealing and to the cumulative pull of town markets and urban concentration. Pelion was piled upon Ossa. The Barlow Commission proposed a solution: that there should be a positive policy to encourage the best use of land; that there should be a central planning authority to apply it; and that some means should be discovered of overcoming the obstacle of compensation. The expert Uthwatt Committee was appointed to find a way out of the compensation dilemma. It suggested the global purchase of development rights in rural land; the *ad hoc* purchase of "reconstruction areas" in towns and cities; and a levy in urban areas on values enhanced by public policies.

The Barlow proposals have been approved by the Government in general terms. A Ministry of Planning has been established. No plan or policy has yet been

made, though the presumption is that it is now intended to plan the use of land in a positive way. The knot of compensation has yet to be cut. No action has been taken (apart from the prevention of interim development) on the Uthwatt recommendations. In short, the Government has not yet been able to make up its mind to face the large and drastic measures that are plainly needed if the solution of the problem is to be thorough. The problem can be simply stated. If there is to be a positive plan, there must be public control over the areas affected, and the need to compensate private owners one by one for the restrictions that planning may place upon their property rights must not be an impediment to planning. If the plan is to be national, control must be nation-wide; possession is at least nine points of the law in planning. The question arises whether the drastic solution is not, in the end, the simplest—that is, whether the ownership of land should not be vested in the community. If nationalisation is ruled out, then the somewhat complex Uthwatt proposals are by far the best solution produced so far. But should nationalisation be ruled out? The Uthwatt proposals are, admittedly, an attempt at a compromise. The Committee was presented with the compensation problem as “a matter of urgency,” and rejected nationalisation because of the time it would take to carry through a national valuation and because of its great political and administrative difficulty. As the months pass, these grounds for compromise plainly become less and less substantial. The Uthwatt proposals have not in fact been dealt with as a matter of urgency, nor have they proved politically or administratively easy. Moreover, the Uthwatt solution is only partial. It regards the problem too exclusively as one of preventing the wrong development of rural land. The problems of urban and industrial areas, of the opening out of cities and the decentralisation of industry and town life are by no means solved. Despite the excellence of the Uthwatt Report and the shrewdness of its proposals, the case for nationalisation stands.

Indeed, the case for nationalisation has gained in strength by the difficulty the Government has experienced in applying the Uthwatt proposals. As Lord Samuel suggested a few weeks ago, failure to implement the Uthwatt Report promptly has made it certain that nationalisation will be a central issue in post-war politics. There is, however, no reason why policy should wait upon

controversy. It is argued against nationalisation that it would be too vast an operation and that it would involve the state in bureaucratic estate management. Neither of these criticisms need hold. The essential requirement is to vest actual possession of the land in the community when, and only when, development or re-development is imminent. It would be neither necessary nor wise to take over all the land at once. What seems called for, as *The Economist* urged some eighteen months ago, is an Act declaring the Government's intention to purchase all property rights in land as and when it becomes needful, and pegging all land values (with allowance for improvements and for changes in the value of money) at a set date. Then properties could be purchased *ad hoc* to permit their development or re-development according to the national plan, while those not so bought might perhaps revert to public ownership, by purchase, on the expiry of leases. Similarly, it would be unnecessary and unwise for the state to enter itself upon wholesale estate management. Land bought for the nation should, for the most part, be neither developed nor managed by the Government. It should be developed by private or public enterprise according to the needs of the plan; and it should be managed by bodies of public trustees with the same outlook and objectives as the best of the perpetual corporations which have played so notable a part, throughout the centuries, in British land management—“by the communal spirit of individuals outside the machinery of state.”

This is an issue that should be regarded without political passion or prejudice. There is no virtue in nationalisation for its own sake. For its own sake, indeed, it would be vicious. But it is a means that should not be excluded from public policy. It seems plain that, if there is to be a plan to make the best use of the land in the interests of the community as a whole, the rights and claims of private owners must be bought out. The Uthwatt proposals go only half way to the solution which the logic of the Uthwatt Report shows to be necessary. Halfway house might perhaps have been acceptable if it had been built with the utmost speed. But the time has been lost; and there seems no reason to be satisfied with a makeshift solution when it will be very little, if at all, more difficult and vastly more effective to accept and act upon the full implications of the fact that national planning of the land requires national ownership.

Employment Policy—I

STEADY progress is being made with the urgent task of working out, by public discussion, the main outlines of a practical policy for securing reasonably full employment after the war. Many of those whose contributions to this discussion would normally be most valuable are, for the present, silenced, though it is to be hoped that at least some of them are hard at work on the problem within the Government machine. But there are enough whose lips are unsealed to provide a discussion of surprisingly large volume and high quality. Three recent pamphlets in particular deserve the attention of the public, both for their agreements and for their disagreements.* To attempt a detailed critique of these documents would require too much space, and it must be enough to say that they broadly represent the main trends of opinion. The first, the report issued by Lever Brothers and Unilever Ltd., has the advantage of being the views of a single firm and, perhaps, the product of a single pen. As might be expected, it is the least radical of the three reports in the changes in industrial structure

* “The Problem of Unemployment.” Published by Lever Brothers and Unilever Ltd. 38 pages. “Employment for All,” *Planning*, No. 206. Published by P.E.P. 31 pages. “Employment Policy and Organisation of Industry after the War.” Published for Nuffield College by the Oxford University Press. 70 pages. 2s. net.

that it advocates—though some of the views it contains, especially upon the industrial responsibilities of the state, would be accounted very radical by large numbers of business men. The second, a broadsheet issued by P.E.P., is, like all that organisation's work, thoughtful and well-documented; unlike the P.E.P. publications in the past, it takes up what is now the orthodox Socialist standpoint. Thirdly, there is the “Statement” published as the result of a number of conferences of economists, business men and Civil Servants at Nuffield College. Like all committee documents, this report is an attempt to state the highest common factor of agreement among divergent views. It also deals with industrial organisation more amply than with full employment and (again like most committee documents) spends vastly more space on describing the Boards, Ministries, Committees and other mechanisms that are recommended than on saying what they are to do. For these reasons, the Nuffield report, which had been eagerly awaited, makes a disappointingly jejune and old-fashioned impression. The elements of a policy are there, but it requires considerable excavation in some places, and even more reading between the lines in others, to arrive at them.

What is important, however, is not to award prizes in a competition but to record what can be accepted as common ground and to isolate for further discussion the

standing points of disagreement. One surprising point of agreement—if these three documents can be taken as a guide—is the unimportance of the international aspect of full employment policies. The Unilever report, it is true, has a section entitled “International Aspect of the Trade Cycle,” but it is very largely concerned with methods of stabilising the prices of raw materials—an important subject, indeed, but considerably smaller than the title under which it is placed. The other two documents defer the subject for discussion on some other occasion. It is a little alarming to find that it is precisely this important section of the problem that has, in each case, been put at the bottom of the priority list. There are, it is true, much greater possibilities of independent action than in the old gold standard days, but it is very questionable indeed whether the international repercussions of a full employment policy, or the limitations imposed on such a policy by international considerations, can be quite so cavalierly treated.

On the main outline of the economic analysis of the causes of trade fluctuations there is now almost unanimous agreement. The main cause is to be found in what, with some sacrifice of economic purism, can be called the periodic divergences between Savings and Investment. There is agreement, too, on the remedy. If the trouble arises because the community is, in loose language, not spending the whole of its income, the remedy should be, equally loosely, to spend more. Moreover, since these divergences arise from the unco-ordinated actions of individuals—the Investors spending less than is being retained by the Savers—only the central authority of the state will avail to achieve the necessary balance. The financial operations of the Government should therefore not be confined to the raising of revenue to meet its own expenditure, but should have the additional object of ensuring that the total flow of expenditure by the whole community is stabilised at a high figure. And, as a symbol of this new approach to Government finance, there should be two Budgets, one to cover the normal operations of the Government, the other to cover its stabilising activities. All this is now accepted doctrine. There is nothing in it that is very novel—the basic theory goes back to Lord Keynes's “Treatise on Money” of 1930, and many of the implications for public policy were drawn in the Liberal Yellow Book of 1927—but it is very new to have got this body of doctrine agreed by all but a fraction of responsible opinion.

There is a further substantial point of agreement between all three of the present reports. A sound and stable economy, it is agreed, cannot be achieved merely by regulatory action at the centre. It requires also a general willingness to make the economy flexible and to remove all obstructions to the free movement both of capital and labour. The passages in which this requirement is set out are, perhaps understandably, rather vague, and this is one of the departments of economic policy on which detailed work of exploration needs to be done. The three great objects of economic policy, as has often been said, are to increase the national income, to make its flow regular, and to improve its distribution. The Beveridge Plan is at least an approach to the third object, and a Full Employment policy would be designed to meet the second. The first object is no less essential, and it is time that minds began to be turned to the outline of a Productivity policy, of which the provisions for flexibility would be a very large segment.

These points of agreement on the essentials of a Full Employment policy are substantial and important. But the points of disagreement are hardly less so. One of these relates to the proper place to be ascribed, both in the causation of trade depression and in its cure, to consumption and to capital investment. The P.E.P. document takes the consumptionist view.

Underinvestment is largely the result of underconsumption. How then can consumption be increased? This is the vital question. An appropriate policy to raise consumption should, therefore, be the first front of attack on unemployment.

The Unilever report takes the precisely opposite position.

Underconsumption is in reality a consequence of the interruption of productive activity caused by the trade cycle and therefore a symptom rather than a cause of the depression.

Some sorting out of ideas seems here to be necessary. It is perfectly clear, in the first place, that a level of consumption which, from year to year, on the average, is low does not give rise to unemployment. It is the rich countries, not the poor ones, that suffer from the deepest depressions and the severest unemployment. When P.E.P. says that underconsumption is the cause of unemployment, it must mean by underconsumption the sudden periodic dips in a level that is high on the average. It is a truism that, in time of depression, the declining consumption of the public adds to the volume of unemployment. But the public does not reduce its consumption because it has a sudden fit of asceticism; it is compelled to do so because its income is falling; and the cause of the fall in income is to be found in the failure of capital investment to absorb the total of savings. There cannot be very much doubt that Unilever is right and P.E.P. is wrong in the analysis of the cause of depressions.

It does not necessarily follow that the cure should follow the analysis of cause. The depression is caused by the inequality of two magnitudes, and it can, in theory, be cured as well by a reduction of saving as by a rise in capital investment. A reduction in savings is, of course, the same thing as a rise in consumption. It may be, for example, that there is a shortage of productive or desirable capital projects. Indeed, it has been suggested that this is the chronic situation of Great Britain in the modern age—that there is no satisfactory means of investing the savings of the British people, and that they will consequently be well advised to consume a higher proportion of their total output and to save less. This argument should certainly not be uncritically accepted. It would involve an assumption that the age of expansion was coming to an end and that the British standard of living could no longer expect to increase as rapidly as that of other younger and still capital thirsty countries. Paradoxically, it is the P.E.P. Report which make the strongest case against accepting this somewhat defeatist view. But only if it is accepted is it necessary, from the Full Employment standpoint, to try to persuade the public, by redistribution of income or by subsidies in aid of consumption, to reduce their rate of saving. (These things may still, of course, be justifiable on other grounds.)

It is thus doubtful whether, even in the long run, it can properly be argued that an increase in the proportion that consumption bears to total output would be the best way of avoiding unemployment. In the short run, as a method of tackling any particular trade cycle, there are additional practical objections to a consumption policy. Any balancing weapon must be one that is capable of being reversed when occasion requires; the tap must turn on and off. But if subsidies to consumption are once given, they can hardly be withdrawn or diminished. Secondly, a policy of giving direct subsidies to the consumption of the people would open up most uninviting prospects of political demoralisation beside which the opportunities for improper influence in diverting the flow of an investment policy would be tiny in comparison. And lastly, if democratic principles have any economic meaning, it is surely better that the state's policies should be founded on an attempt to execute the wishes of the public, as between consumption and investment, than to frustrate them.

In this dispute between the consumptionists and the investment party, the verdict must therefore go to the latter, though on practical and political rather than on theoretical economic grounds. It is by influencing the volume of capital investment that the state can best carry out its Full Employment policy. Does this require substantial intervention by the state in the ownership or management of industry? Or can it be done by an indirect system of incentives and hindrances? This is the second main point of disagreement, which will be discussed in a concluding article.

NOTES OF THE WEEK

General Sikorski

With the tragic death of General Sikorski, an outstanding Allied statesman and soldier has been lost. General Sikorski started his political career some years before the last war as an organiser of military bodies in the struggle for Poland's independence. The independence of Poland remained his life aim. After the German invasion in 1939, he went to France to organise the remnants of the Polish army into a new fighting force; and after the collapse of France, he moved on to Britain with his troops, there to continue the struggle. He never believed for an instant that Britain would be defeated. Among the Allied statesmen who have been brought by the war to London, General Sikorski was the only Prime Minister who had held office continually since 1939, and he had come to be regarded as the living symbol of the continuity of the Polish state. To his countrymen in Poland itself, he was the flag bearer of their struggle and the embodiment of their hope. In exile, his remarkable achievement was to base his Government on a genuine coalition of all the Polish parties, from Right to Left, which had opposed the dictatorship of Pilsudski and Rydz Smigly; and he maintained this coalition intact during the many crises to which Polish policy in exile has been exposed. His death will be acutely felt in the sphere of Poland's foreign relations. General Sikorski's desire for a reconciliation with Poland's eastern neighbour, Russia, was genuine and sincere. For many years before the outbreak of war, he advocated a policy of collective security and of alliance with both the Western democracies and the Soviet Union. In his military writings, he gave not only a correct forecast of the strategy and tactics of the Second World War but also a correct appreciation of the military potential of Russia and the fighting capacity of the Red Army. The rupture of Soviet-Polish relations was a grievous and bitter blow which sorely troubled his last days.

* * *

The Polish Government

The death of General Sikorski will cause a reconstruction of the Polish Government. The present acting Prime Minister, M. Mikolajczyk, who speaks on behalf of the Peasant Party, the most influential group in Polish politics, is almost certain to be confirmed as his successor. He is a man of the centre and may be able to keep the Sikorski coalition intact. The Government is to be strengthened by the inclusion of new Ministers from among the Peasants and the Socialists, which will give a more democratic aspect to Polish policy and underline its essentially civilian character. It is possible that the Ministry of Foreign Affairs may now be taken over by the last Polish Ambassador to Moscow, M. Romer, an appointment which would stress the importance that the new Government, like General Sikorski, attaches to an honourable resumption of relations with Russia. M. Romer was the only Polish politician to discuss this problem with General Sikorski a few days ago, when the Polish Prime Minister received a letter about it from President Roosevelt. An interesting suggestion is that a Ministry of Polish Minorities should be set up in the new Government. National minorities accounted for over one-third of Poland's pre-war population, and the creation of such a Ministry would be an encouraging sign that a serious attempt is at last to be made to tackle the minority problem. The most difficult and the most controversial point in the reconstruction is the post of Commander-in-Chief, which General Sikorski held together with the post of Prime Minister. The candidate suggested in some quarters is General Sosnkowski, known for his opposition to the Polish-Soviet Treaty of 1941. It is an unfortunate fact that in the Polish Army in exile, overstuffed as it is with officers, the Pilsudskists, who in Poland itself form only a small and compromised group, exert a disproportionately large influence; and it would be disastrous if the policy of the Polish Government were to be exposed to the pressure of a military junta, especially if the post of Commander-in-Chief were used for this purpose. Actually there is no compelling constitutional reason for the appointment of a new Commander-in-Chief, and if the appointment raises political issues which may further complicate the dispute between Poland and Russia, there seems no reason why it should be insisted upon.

British Production

Mr Lyttelton's broadcast last week-end had the double purpose of giving some indication of the achievements of the British munitions industry and of explaining once again that reduced activity in some lines of production was only part of a programme which, as a whole, was still expanding. This latter point was also illustrated in a speech made on the same day by the Parliamentary Secretary to the Ministry of Works, who revealed that the ordnance factory building programme is now finished. Great Britain, in fact, is now reaching a stage that was never attained in the last war. The phase of building the factories is finished, and the phase of providing the capital equipment of an enormously expanded army is nearing completion. From the first source the release of resources is complete; from the second source it is very large, since the task of maintaining an army that is no longer expanding and has all its equipment is very much smaller than that of equipping and expanding it at the same time. In the first part of his speech, Mr Lyttelton was, quite properly, less than perfectly explicit. Nevertheless, the figures he gave help to fill out the picture of the truly astonishing achievements of British industry and labour. In the last war the country's total output of civil and military goods together fell; this time it has risen, in spite of the mobilisation into the armed forces of a number of men and women who cannot fall much short of a quarter of the total labour force. This production has, of course, been accomplished only by the most complete mobilisation of manpower; Mr Lyttelton stated that 90 per cent of the 3,250,000 unmarried women between 18 and 40 are now engaged in full-time war work, in the armed forces, in civil defence and in industry; 500,000 workers have been released by clothes rationing and 250,000 by the concentration of industry. Moreover, British output has been supplemented by Lend-Lease deliveries, which in finished weapons, in ships and in components will this year be the equivalent of 1,500,000 additional workers. Against this there is British aid to the United States and Russia, which, Mr Lyttelton said, amounted (though not presumably in munitions alone) to a high proportion of the aid received. These facts are glimpses into the very impressive record that will one day be unfolded.

Food Policy

It is welcome news, though not surprising, that (as Lord Woolton announced on Tuesday in the House of Lords, and Mr Eden in the Commons) the British Government accepts the resolutions of the recent Food Conference at Hot Springs, Virginia, and recognises the obligation to give effect to them. It is welcome because the resolutions, directed to the task of feeding the world's peoples amply and suitably by means of expanded output, efficient farming, the international division of labour, easy international exchange and the raising of consumption level in every country, were sound and shrewd. It is not surprising because the decisions of the Conference were very largely in agreement with the "body of coherent and constructive ideas, based on no narrow interpretation of British interests" with which, as the Minister of Food pointed out on Tuesday, the British delegates to the Conference were equipped. It is incidentally imperative that the British representation on the permanent international organisation proposed by the Conference should be equally as expert and as authoritative as the delegation to Hot Springs. The complaint of Lords de la Warr and Beaverbrook that the upshot of the Conference has been further discussion instead of action is natural—but hardly fair. In its composition and terms of reference, the Conference was purely advisory; it did not, and could not, possess any executive authority. But the call for action stands. In the short term, there is need for the utmost concerted output of food and the continued "co-ordination of the procurement of food supplies" in order to feed stricken nations in order of their need. In the longer term there is need for a pattern of world agriculture that will make the most of the world's resources by the exchange of produce and the concentration of each country's efforts on growing the crops for which they are best suited. The British Government, say Lord Woolton and Mr Eden, recognises its obligations. The best test of this in practice will be the post-war agricultural policy produced by Mr Hudson.

The Battle of the Salients

After the long lull on the Russian front, the past week has seen heavy fighting along the two salients of Orel and Kursk. The curious feature of the battle is that neither the Germans nor the Russians admit having started an offensive. This may well be true in so far as neither side regards the clash as the prelude to a large-scale operation which would extend to the whole central front. It is most likely that the purpose of the present fighting is merely to "straighten the line." The German-held salient of Orel is a thorn in the Russian front, and the Russian wedge around Kursk presents a potential danger to the Germans. Both sides have for some time been concentrating heavy forces on the flanks of the two salients; the fighting has been very violent on both sides, and it may be expected to become even more so. The Germans have so far gained some slight initial successes on the northern fringe of the battlefield; and the Russians have reported heavy losses inflicted on the enemy's tanks. The tactical strength of the Russian anti-tank defences is an established fact, though the extent of the actual damage inflicted on the attackers may be uncertain. The battle of the two salients may acquire much more importance than is attached to purely local operations. This is the first test of forces since the great winter battles, and the results of the test may well influence the further course of the fighting. Should the present phase reveal some major weaknesses on the one side or the other, the fighting—though probably planned on a local scale only—may even yet develop into a more ambitious operation.

* * *

An Abortive Bill

It was incorrectly stated in *The Economist* last week (page 9) that the Pensions Appeal Tribunal Bill was withdrawn for redrafting when an amendment in favour of giving every applicant for a pension the benefit of the doubt was on the point of being carried against the Government. Actually, this amendment, like many others on which members had very strong views, was not discussed. Only one amendment had been debated, when Mr Eden moved "to report progress," and this was one which, in the words of its mover, was "a comparatively minor amendment," not fundamental to the Bill. The first clause of the Bill, dealing with the rights of members of the armed forces to appeal against decisions of the Minister of Pensions, specified that claimants should have the right to appeal where any claim was rejected on the ground that the cause of disablement was not directly attributable to military service, or was not materially aggravated by such service. It was said that these latter words, defining the right of appeal, either meant nothing at all, or else were intended to limit the right to appeal, and the amendment proposed that they should be omitted. This would give a general right of appeal to all applicants whose claims had been rejected, and the grounds of rejection would not enter into the matter at all. Possibly the words complained of were unnecessary to a non-legal mind. But since, under the present Royal Warrant, a pension can be granted only if the disablement is directly attributable to military service or materially aggravated by it, it follows that the Ministry of Pensions, when it rejects a claim, does so on the ground that it does not satisfy either of these conditions. Consequently, though the words which were the subject of the amendment apparently limited the right of appeal, in practice they would only have excluded frivolous cases. (It is true that the Ministry can reject claims on the ground of serious negligence or misconduct, but the right to appeal in these cases was granted in another clause.) A better reason for omitting the words is that as they were part of the present Royal Warrant, the Bill would have been made out of date if the Royal Warrant were amended in respect of "attributability" and "material aggravation." This contingency was, however, provided for by a clause giving the Minister power to amend the relevant clauses of the Bill to bring them into line with the new Royal Warrant. But the House determined otherwise, and when the Bill is reintroduced, it will have been drafted to include any amendments that may be made in the Royal Warrant. Sir Walter Womersley's statement is expected about the middle of this month, so that Parliament will have only a short time to debate it, and carry through the new Tribunals Bill, before the summer recess. It will be a great pity if, as a result, the tribunals are not in operation, as was originally intended, by early September.

Paying for Houses

Of the speeches made last week-end at the Town and Country Planning Association's Conference (which is referred to in an article on page 35), Mr Manning Dacey's address on housing finance attracted most notice. The delegates to the Conference, local officials, private builders and simple dwellers in houses alike, were most perturbed about the prospect of dear housing after the war. Building costs are now, according to Lord Portal, more than twice what they were before the war. One large-scale builder who spoke at the Conference was sure that post-war costs will be equally high, even if the general level of prices shows no corresponding increase. Mr T. P. Bennett, of the Ministry of Works and Building, pointing to the guaranteed pay week that is expected for building operatives after the war and to the difficulty of restoring the skill of builders demobilised from the Forces, could not envisage post-war costs any lower than sixty per cent above pre-war costs—at the very least. These were sobering, not to say depressing, views. Of the immediate post-war period, when the economic stringency of wartime will in large part persist, they may well be true forecasts. But, if they are also true of the longer period when peace economy will have been restored, they flatly deny the hopes of those who believe that, in peacetime conditions, the output per head in building could be very much increased; and they raise in an acute form the problem of post-war housing finance. It can be assumed, as Mr Dacey argued, that the financial environment will, under Government direction, be more favourable than after the last war. The intention to hold the general price level steady has been declared. Resources will be allocated according to priorities so long as they are scarce and so long as particular needs command special priority. Cheap money will be preserved by the devices employed in the years before the war, and interest rates are obviously of great importance in the finance of housing. But the problem will not be solved by these general circumstances. Costs, even if the worst is not to be believed, will have risen more than the incomes of those who most need housing, and the necessity for subsidies will be correspondingly great. Various suggestions were made at the Conference for alternative methods of assistance, for tax remis-

"Here's Luck!"

What does the connoisseur ask for in his whisky? He asks for a delicate bouquet, a velvet softness and a genial afterglow—in fact he, asks for

WHITE HORSE

MAXIMUM PRICES: Bottles 25/9;—Half-Bottles 13/6

sions, cheap capital and the stabilisation of building material prices. But, as Mr Dacey rightly said, all these devices have the defect of being proportionate to the value of the houses built, and therefore of giving most aid where it is least needed. The demand after the war will be particularly for small and low-cost dwellings. Moreover, in any department of finance, subsidies outright are to be preferred to disguised subsidies. It is therefore impossible to disagree, if the future aim is to be—as it should be—to build the largest possible number of small houses in the shortest possible time, with Mr Dacey's claim that the best form of subsidy will be one at a flat rate, offered both to local authorities and private builders. Whether building should be done by public or private enterprise must depend, not on doctrine, but on the degree of real enterprise and efficiency that is shown in practice. Between the wars, private building provided three-fifths of the houses built. As Mr Dacey pointed out, the ability of local authorities to borrow at virtual Government rates and to spread re-payment over forty years or more should have enabled them to build houses at lower rents than private builders. In practice, over the whole field, private builders mostly showed better results—and not always because of jerry-building.

The New Education

In a recent speech, Mr R. A. Butler, President of the Board of Education, called for more public discussion of educational problems. He said that there should be "more education about education." Perhaps Mr Butler will consider taking the lead in this valuable work. The fact that discussion of the promised educational reforms has so far been mainly in private is very largely his fault—or rather that of his Department. Too much of the necessary preliminary discussion of the coming Bill has been behind the scenes. The Bill itself has been too long a secret. It is a good thing that a White Paper is now to be issued; but a bad thing that the promised Bill has apparently been postponed until the autumn. Education is peculiarly a subject that lends itself to broad and admirable generalisations, which for a time create a widespread impression that something new and excellent is about to emerge. The same thing happened twenty-five years ago. Even the Bill will only be a first step. The failure of a large part of the programme embodied in the Fisher Act of 1918 is a warning of the wide gap even between policy and performance. As in so many other spheres—public health, housing, and the rest—the same precepts are being sworn to as were sworn to at the end of the last war; the same old problems are being solemnly canvassed by committees and eminent men. Practice is the test. This time there must be effective action or else it will be definitely demonstrated as a characteristic of British democracy in its moments of greatest exaltation that words—and expert inquiries—are accepted as a substitute for deeds. It is surely plain enough by now what is wanted in education: elementary schools fit to learn and teach in, and with classes small enough for teachers to teach; teachers with the ability, the desire, the remuneration, the status and the self-esteem to do their jobs properly at every stage in the educational process; higher schools of sufficient independence and variety to cater for all talents and inclinations; technical colleges with the equipment and the personnel to fashion the skills that British commerce, industry and agriculture will urgently need; and universities which are in a position to put their special educational aims before considerations of finance, staffing and apparatus.

The bottlenecks in the present system are largely due to the social snobbery that is so unfortunate an adjunct of British democracy. It is this snobbery that creates, not only a fantastically narrow avenue to positions of responsibility in the community, but also a damaging sense of inferiority in most branches of the educational system below the highest and most esteemed. There are too many elementary school teachers who are disappointed because they are not teaching in secondary schools; too many secondary school teachers who are disappointed because they are not teaching in colleges; too many technical college teachers who are disappointed because they are not in universities; too many teachers in provincial universities who are disappointed because they are not at Oxford or Cambridge; and so on. In part, the problem of making each branch of teaching seem worth while in itself, and so of attracting the best talents and the best will, can be

solved by the Committee which is now sitting on the Training of Teachers. But at bottom, it can be solved only in two ways: by giving every child an equal opportunity to learn; and by giving every school and college an equal opportunity to teach.

Pacific War

It is a long way from Chungking to Rendova Island; but as the Chinese enter the seventh year of their war with Japan, they are gaining a little comfort from General MacArthur's new offensive in the Pacific. The enemy they have withstood so long alone is at least being attacked by others on another front. The skies above China are more peaceful for the phenomenal losses sustained by the Japanese air force in the South-West Pacific. The strain of maintaining armies of occupation in China—and indeed throughout the South Seas—grows steadily greater as the sinking of Japanese ships exceeds Japan's capacity for adequate replacement. Nevertheless, it is much too early to maintain, as some enthusiastic commentators are maintaining, that this new offensive in the South-West Pacific is the first step in a grand chain of reconquest. Its aim appears to be strictly limited: to push back a little further the Japanese forward posts which threaten Australia. At the moment there are four of these sea and air bases, Munda in New Georgia Island in the Solomons Group, Salamaua and Lae in New Guinea, Rabaul in New Britain. It is from these bases that the Japanese still hope to cut Australia's communications with America or even to effect landings on the Australian mainland. It is possible that

General MacArthur's offensive is still only in its preliminary phase. By taking Rendova Island, the Americans now have the airfield at Munda under shell-fire, and by capturing Viru Harbour, they have a base for the attack on Munda. In New Guinea, the landing of American troops unopposed on Trobriand and Woodlark Islands and, after some resistance, at Nassau Bay, ten miles south of Salamaua, has been followed by an Australian advance from Mubo. The Australians have now joined up with the Americans and cleared the south bank of the Bitoi River. Thus the Allied forces are in position to launch the attack on Munda and Salamaua. The question then will be whether General MacArthur commands enough men and material to undertake the much more ambitious operation of attacking Rabaul. Munda and Salamaua would provide him with bases for a concerted pincer attack, but Rabaul is some 400 miles away. It is to be hoped that however successful the Allies may be in deflecting the Japanese threat to Australia, the pattern of this stepping-stone attack will not be adopted for the re-conquest of the whole South Seas area. It is too costly and too slow. However skilfully the tentacles may be lopped off, it is the octopus itself in Japan that must be attacked.

Scorza's Ten Points

A new phase opened in Fascist politics when, at the end of April this year, Carlo Scorza was appointed General Secretary of the Fascist Party. Immediately after his appointment three of the four Party Vice-Secretaries were also changed, and of the three new Vice-Secretaries, Leonardo

Gana and Alfredo Cucco were both over fifty, and had been Party Members since 1919. The only Vice-Secretary to keep his office, Tarabini, was also a Fascist of the first hour. Since that time a steady purge of the Fascist Party has been in process. In face of the crisis of Africa and the growing threat of invasion, the old organisation was seen to be inadequate. As Farinacci put it, rather naively, in the *Regime Fascista*, "the Party must not be a jungle of wild beasts, nor an association of cliques." This phrase sums up the chief complaints against the old Fascist Party: that it was full of young men with their eye on the main chance; and that it was a mutual aid society, especially in the matter of black markets. Since April Scorza has been making a vigorous effort to strengthen and popularise the Party machine. The fact that old soldiers and fascists of the first hour are the basis of the reorganisation has been widely commented on in the British press. Less notice has been taken of the interesting provision that as far as possible officials shall be sent back to work in the districts where they received their first experience as Fascist leaders. This provision can only mean that Scorza is trying to ensure loyalty and reliability among the local hierarchy against the day of invasion. In the name of this reorganised Party, Scorza has now sent ten demands to the Duce. They reveal strikingly the weak points in the Italian system. The first demands ruthless repression of "all attempts to cause a rift in the moral and material solidarity of the people"; the second and third deal with the rationalisation of production and distribution; the fourth and fifth with the fight against bureaucracy; the sixth with the suppression of the black market; the seventh with drastic measures against speculation; the eighth with the abolition of all luxury establishments; the ninth with the repatriation of foreigners; the tenth with "the strict and complete application of the law on compulsory labour." Mussolini's reply to this ten point statement shows that the Duce has very few illusions about the amount of drastic re-organisation possible at this stage of the crisis. There is a note of almost humorous tolerance in his comments on Scorza's drastic demands. He admits the existence of grumbling, but asks the Party not to over-estimate it—"one can really ask no more from our people." On agricultural and industrial organisation, he reminds them that better men are more important than better institutions. For the re-organisation of supply and of the bureaucracy, he contents himself with saying that things are coming along quite nicely, that "red tape is not confined to the State," and that "the Italian civil service is the least numerous, the worst paid and the most honest." As for the black market, every nation, he says, has a black market in war, and the only way to beat it is to increase the people's basic rations. On the point of labour mobilisation, he asks the leaders of the Fascist unions to go and live among the workers, where they will find that "when they are not spoiled by Bolshevik phantasies they are good people, educated and calm, who only want their work to be appreciated, and to be told the facts." Finally the Duce states his faith that

today, when the enemy stands on the sacred borders of the fatherland, 46 million Italians, with negligible exceptions, are in fact 46 million combatants who believe in victory and in the eternal strength of the fatherland.

The easy tone and underlying confidence of Mussolini's speech deserve attention. He does not believe that the Allies will find Italy, in American parlance, "a push-over"; and it is at least possible that he is right.

The Committee at Work

Observers in Algiers speak of a better atmosphere and closer collaboration within the French National Committee. A good deal of work has been got through in the last week—appointments, administrative and judicial re-organisation and a wholesale cleaning out of the remnants of Vichy legislation. The military committee has also started its meetings, and reports speak of a high degree of unity on necessary reforms and reorganisation. The Committee's greater effectiveness is due in part to the normal process of the members growing more familiar with their work and with their colleagues. But it also springs from the Allied intervention to secure the position of General Giraud as Commander-in-Chief. It was done in such a way that resentment was not confined to the de Gaullestes. The ten political groups of the Left Centre and Left who issued a press statement on France's "inviolable sovereignty" represented the attitude of many shades of French opinion. It is not surprising, therefore, that the crisis has actually

strengthened General de Gaulle's position. His nominee for the key post at Dakar, M. Courmarie, has been appointed. The civil authority in Algiers, exercised by the Commander-in-Chief during the state of siege, has been transferred to General Catroux. General Bergeret, Giraud's Deputy High Commissioner until March, has been dismissed from his West African air command. This week's trend may represent a real growth of collective responsibility or simply a predominance in voting strength on the side of General de Gaulle. Whatever the case, the fact of the Committee functioning on an anonymous and collective basis is a gain, and its democratic character could well be reinforced by the setting up, as soon as possible, of some kind of provisional assembly. Provided it contained men of real quality and proved democratic reputation, it would greatly reinforce the arguments in favour of a speedy Allied recognition of the National Committee. The settlement of the Martinique question, which brings the last part of the French Empire—apart from the areas occupied by the Japanese—under the control of Algiers, is an added reason for recognising the Committee's authority. It is possible that General Giraud, on his way to Washington, personally supervised the arrangements for the transfer of authority from Admiral Robert.

Second Thoughts in Argentina

In one of his first official statements, President Ramirez declared that "This regime has not come to perpetuate itself as a military movement, but only to clean up and reconstruct"; and in general, the people of Argentina are giving their new Government the benefit of the doubt. The press is friendly and a "wait and see" atmosphere prevails in the capital. There are, however, some disturbing signs that the Ramirez regime means to develop along the old lines of South American politics—nationalism laced with *personalismo*—and that there is no real intention of restoring constitutional and democratic government. The first danger signal was the dismissal of nine out of the fourteen Provincial Governors and their replacement by Army officers. Then the elections for President and Vice-President, fixed for September 5th, were cancelled and work on the voting lists ceased. The Government gave the excuse that "the objects of the military movement of June 4th must be achieved before elections can be held." This statement marked an advance on the original and more modest programme of "cleaning up" the country. What exactly these "objects" are, no one quite knows, but a suggestive article appeared recently in *El Pampero*—a Buenos Aires paper said to be subsidised at one time by the German Embassy—declaring that the *coup d'état* of June was the result of the Nationalist Movement and that the Movement had complete plans for setting up a Corporate State with a National Council of Corporations in place of Congress; political parties would be abolished and "economic discipline" introduced. All this fits in quite well with the only slogan so far produced by the Government—"Order and Tranquillity." Some Argentine observers see in these developments the danger of closer relations with the Axis. The new Mayor of Buenos Aires, Basilio Pertine, who is said to have been Director for many years of a number of black-listed German firms, including Siemens Schuckert, the big electrical trust, is believed to be bringing a number of Axis sympathisers into municipal jobs. However, these accusations are hard to check, and for the time being at least there is no suggestion of Argentina modifying its neutrality in favour of the Axis. Quite the contrary: the Foreign Minis-

ter has gone out of his way to stress Pan-American unity and his country's ties of friendship with Brazil. One of the chief reasons for the June *coup d'état* was the fear of military and naval men in Argentina that Lend-Lease supplies were making Argentina's neighbours too strong; and there is some talk of a military mission going to Washington. But here there is a definite possibility of deadlock, for the Americans are unwilling to discuss military supplies until Argentina has broken off diplomatic relations with the Axis, and the Argentine Government is unwilling to break off relations until it knows the amount of supplies it will receive.

Communists in Conference

Far from being downhearted at the Labour Party's rejection of its application for affiliation, the Communist Party, at its National Congress last week-end, was ebullient and confident. And far from accepting Mr Morrison's invitation to dissolve itself, the party decided to launch a big drive for new members, and, at the same time, to continue to work for affiliation to the Labour Party. There is very little in the present Communist programme which the Labour party could not fully endorse. In its popular and patriotic appeal it is in many respects reminiscent of French Communist propaganda at the time of the *Front Populaire*. The conference declared its support for national unity, rather more emphatically perhaps than some of the Labour rank and file would do. Mr Harry Pollitt's suggestion that at by-elections the constituency parties should meet to nominate the most suitable candidate, irrespective of party ties, is ingenious and constructive, though it might be difficult to find a mutually acceptable candidate. The party pledged itself to work for maximum production—a high proportion of its 400 delegates were skilled munition workers—and for the Second Front; it urged the strengthening of Government controls and the ending of dual control in the coal industry. It called for an extension of trade union membership, and passed a resolution demanding improvements in social standards and living and working conditions (not as a hypothetical post-war blue print, but as immediate policy). It called for such measures as the adoption of the Beveridge report, better housing, legislation on the lines of the Barlow and Uthwatt reports, the raising of the school-leaving age to 16, a national medical service, the application of the Atlantic Charter to India and the colonies, higher service pay and allowances, bigger service and old age pensions. It declared its long-term objective to be the "complete reconstruction of society on a socialist basis." The difference between Labour and the Communists, at the moment and on the surface, arises not on policy and aims, but on methods and tactics. To Mr Morrison's charge that, at bottom, it is a question of democracy versus dictatorship, Mr Pollitt rejoined that the Communists would only advocate force if force were used against the working people. Some people will regard this as begging the main question, that of democracy within the party organisation. There is no doubt that the Communist Party, whether inside or outside the Labour Party, is in a position to act as a galvanising influence. Its membership is young—no other political parties, especially in wartime, when so many young men are otherwise engaged, can boast such a low average age as 33 at their conferences—and well-disciplined membership and its energy and zeal give the Communist Party an influence out of all proportion to its numerical strength. At the moment, the umbrella of national unity in the interest of winning the war may be large enough to cover all shades of political opinion. The testing-time will come when the difficult post-war period begins. Will the Communist leopard change his spots again?

Rations for Pregnancy

From July 25th, Lord Woolton announced this week, an expectant mother will be entitled to a second ration book which will enable her to obtain extra supplies of food. She will be allowed a priority supply of seven pints of milk plus her ordinary ration; two shell eggs at each allocation; three packets of dried eggs at each allocation; a ration and a half of meat; oranges as they are available; and orange juice and cod-liver oil compound. Actually there is very little

new in this arrangement. An expectant mother already gets a priority supply of seven pints of milk a week—as much as most women will want—so that the addition under the new scheme is only her ordinary ration, which in the winter is as little as two pints a week. She will get one shell egg less than she does at present, and as for dried eggs, the Ministry of Food's problem is how to popularise them—at present the demand for them does not equal the supply. She already gets orange juice and cod-liver oil compound. In fact, the only real additions to a pregnant woman's diet will be the extra 7d. worth of meat a week and a few fresh oranges if they happen to arrive in this country during the nine months of her confinement. If the new arrangement is meant to be part of an official population policy, it is not likely to have much effect. Women who have not had babies are not likely to have one for the sake of a pork chop. If, however, it is really meant to improve the health of expectant mothers, and therefore of their babies, it would surely be more effective to give larger and definite rations of fats and cheese, which are available all the year round, than to promise priority supplies of shell eggs and oranges, which are very seasonal. What is much more likely is that the issue of a second ration book for extra supplies is administratively more convenient than the present system. This is borne out by the statement that an expectant mother will obtain both her second ration book and her extra clothing coupons from the food office on the production of a single medical certificate of pregnancy.

Trial in India

An important exercise in internal cooperation has been going on in India, and it has produced mixed results. Because of serious local food shortages, the Government has attempted to distribute grains according to need by pooling supplies over the whole of India. The attempt has been only partially successful because of the reluctance of many Provinces and States either to put their supplies into the pool or to permit free trade from area to area. On the other hand, the All-India Food Conference which has been meeting in Delhi this week is reported to be in favour of still tighter Government control, over prices as well as supplies. The food position is still serious in Bengal, Cochin, Travancore and several other districts, while food prices are generally higher than they should be at this time of year. The immediate task of the Conference is to advise the Government how best it can tide over the period between now and when the harvest will be on sale, and to secure local support for an agreed central policy. It is one of the many ironies of the Indian situation that the Government will be blamed for the shortages and the Provinces and States which have impeded the Government's policy will go unblamed. In fact, the Government will be blameworthy if it does not proceed more firmly to the total control that is required of both prices and supplies. It will not escape Lord Wavell's notice that here, in such material matters as the supply of food, there should be solid rallying points for Indian opinion and self-help. But, tentatively, the Viceroy-designate is bound to reach the conclusion from what has happened that mutual aid is not yet so well developed in India as the independence of the country, which is now assured, will require.

Shorter Notes

Sir James Grigg announced in Parliament this week that an independent inquiry, conducted probably by a High Court judge with assessors, some of whom will be military, will be held into conditions at Navy and Army detention barracks. In the meantime, the military court of inquiry into conditions at Fort Darland, where Rifleman Clayton met his death, is proceeding.

In an article entitled "Towards Inflation in Belgium," in *The Economist* of May 8th, 1943, mention was made (on page 591) of "the Belgian Government." It should have been made plain that this referred to the administrative orders, and not to the real Belgian Government, which is, of course, in London.

AMERICAN SURVEY

War Industry in the North-West

(From a Correspondent in Oregon)

Portland, June 7, 1943

THE Pacific North-west of the United States is largely occupied with four contributions to the war: cargo ships, bombers, lumber and aluminium. In terms of manpower, shipbuilding leads the others. Approximately one-fourth, or 200,000, of the country's merchant-ship builders are employed in the States of Oregon and Washington. Shipbuilding in the Pacific North-west has been centred in the Portland area on the Columbia River and in the Tacoma-Seattle area on Puget Sound. Portland has been assigned the greater share of shipbuilding because much of Seattle's labour must be reserved for aircraft manufacture. In the immediate Portland area the number of shipyard employees is greater than the entire number of wage-earners of all occupations prior to the war. The Pacific North-west's largest yard, Henry J. Kaiser's Oregon Shipbuilding Corporation, employs 33,000.

Labour turnover is the shipbuilders' most acute problem. Oregon and Washington yards are attempting to solve it by hiring thousands of women. The previously mentioned Oregon shipyard reports that 21 per cent of its labour force is female, the highest such percentage among US yards. But the loss of men has been so rapid that even the hiring of these thousands of women has served only to keep the total payroll stationary. The situation in the northern Pacific states is much more acute than in southern California, where the staff of one large shipyard is only 1½ per cent female. Most of the women in the Pacific North-west yards are working as welders. Local shipbuilders believe that their ability to use women to fabricate the hulls of welded ships, owing to the fact that welding is relatively light work, gives them an important advantage over British shipyards, where ships are riveted.

The principal cause of the high turnover in labour is the drafting of men for the armed services. Originally the shipyards were heavily staffed with young men, a high proportion of whom were unmarried. This age group is being pressed into the services at a rapid rate. Many of the older men, unaccustomed to the Pacific North-west's heavy rainfall and chilly winters, have left the shipyards to take "inside" jobs in other war industries. Illness has been high, partly on account of the makeshift housing facilities that thousands of newcomers have had to take. Many have spent the wet winter in small shacks and automobile trailer-houses, relying on primitive sanitary facilities.

The US Government has sought to relieve this situation by spending more than \$90 millions for housing in the Portland area. The most spectacular feature of this programme is the creation of an entire new city, which is the largest single war housing development in the US. Officially it is named "Vanport," but popularly it is known as "Kaiserville." Vanport, built to accommodate 35,000 persons, is the second largest city in the state of Oregon. The city is self-contained, with Government-built elementary schools, theatres, recreational centres, shopping centres, post-office, hospital, and other community buildings. Government planners provided for every aspect of social life except for religious worship.

"Native" residents of the Pacific North-west, accustomed to one of the highest average standards of living in the US, are inclined to take a condescending attitude toward newcomers from the deep south and middle-west. Teen-age Vanport youngsters, who are sent to secondary schools in Portland, often find school social activities closed to them. Old residents resent the affluence of many ne'er-do-wells who now receive, in the shipyards, an average of \$1.40 an hour, including overtime payments. Many of the newcomers have an awkward time adjusting themselves to local conditions. For example, some new settlers, baffled by the devices in their Vanport kitchens, have built wood fires in the ovens of the electric stoves.

The second great contribution of the Pacific North-west to the war is the production of four-engined Flying

Fortresses. Boeing's main plant in Seattle employs as many workmen as does a large shipyard, and the company is completing a new plant, of comparable size, a few miles away. In the past twelve months the main Boeing plant has suffered a 100 per cent turnover in labour, which means that for every 1,000 workers employed at the beginning of the year it has had to hire and train 1,000 new workers to maintain the same size labour force. In the same twelve months, Boeing has more than doubled its rate of production.

Losing men, Boeing has added so many women that they now make up more than one-half the entire payroll. Two years ago, only 3 per cent of Boeing workers were women. The mere hiring of female mechanics does not solve the labour shortage. The women show a decided inclination to "shop around" for war jobs, sampling first this factory and then another. Many stay in one place only a few weeks.

Work is continuing on the successor to the Flying Fortress, which Mr Charles E. Wilson, executive vice-chairman of the War Production Board, recently announced is "scheduled for production." Details may not be given, but it will be recalled that Major-General Ira C. Baker, commander of US Army Air Forces in Britain, stated several weeks ago that the new American bombers will carry three or four times the bomb load of the present Flying Fortresses.

The third principal contribution of this region to the war effort is lumber. Timber industries normally provide more than one-half the total manufacturing payrolls of Oregon and Washington. Forest and mill workers in these states are producing a heavy proportion of all US wood products. The coastal zone of Oregon and Washington produces more than one-half of Great Britain's aircraft lumber, including a high proportion of the Sitka spruce employed in the manufacture of Mosquito bombers. The western mountain zone of the Pacific North-west is yielding billions of board feet of Douglas fir, which is being widely used for wartime structural purposes and for the manufacture of plywood. The pine forests of the eastern portion of the Pacific North-west supply nearly one-half the boxing and crating lumber required by war agencies.

Especially noteworthy is the logging operation proceeding in the Tillamook Burn region of western Oregon, where, ten years ago, fire killed ten billion feet, board measure, of timber in an area of 400 square miles. Logging concerns, engaged in the country's largest single logging operation, have been shipping 3,000,000 feet, board measure, of logs from the Burn each day. The outer surfaces are charred, and much of the sapwood has been destroyed by boring insects and rot, but the heartwood of the larger trees is sound. Some three billion feet, board measure, of logs has been reclaimed, and operators expect a total salvage of four billion. From this Burn region comes much of the extra-long timber required by shipbuilders for keels and spars.

The region's fourth main contribution to the war is aluminium. Reduction plants in Oregon and Washington are now supplying approximately one-third of all the aluminium produced in the United States. The reduction plants were located in the Pacific North-west in order to be near the generators of two dams on the Columbia River which have been financed by the Federal Government. The first of these is Bonneville Dam, which is now generating 400,000 horse-power. The second is the gigantic Grand Coulee Dam, a structure measuring 550 feet above bed-rock and 4,175 feet long, whose present five generators supply 525,000 horse-power. Three additional generators, of 140,000 horse-power each, are being installed. These will raise the total power installation to one-third of Grand Coulee's ultimate capacity.

The dams were begun near the nadir of the Great Depression, largely as make-work projects to relieve unemployment. It was long feared that they would prove little more than engineering monuments, on the scale of the great pyramids, but they have proved to be "life savers" during the critical war years, when there is no time to build such facilities.

Pay as You Go

[FROM A FINANCIAL CORRESPONDENT]

LAST year, when the 1942 Revenue Act increased the number of taxpaying Americans to 44 millions, the more thoughtful legislators realised that difficulties would arise unless payments were systematised on a new basis. Except for the five per cent "Victory" withholding tax, the 1942 Act ignored the pressing problem of how collections were to be geared to wartime taxation.

Four general considerations, bearing in varying degree on broad fiscal policy, entered into the subsequent discussions on the modernisation of tax collections from which the Current Tax Payment Act of 1943 has now emerged:—

1. The prospect of perhaps widespread defaults brought on by the combined impact of lowered exemptions and wartime wage receipts, both bringing numerous new taxpayers under the law. This prospect gathered increased force with the approach of the March 15th payment date, when legislators felt more and more uneasy about the fact that the 1942 Tax Act, which had imposed \$9 billion of taxes retroactively on the full year's income, had been passed very late in the year.

2. Concern for post-war unemployment, when individuals experiencing sharp drops in income would have to meet taxes on the previous year's higher wage level.

3. The problem of (a) opening the way for still higher war taxes indicated in President Roosevelt's Budget message request for \$16 billion new revenue over and above that to be collected under existing law, and (b) enabling the individual to budget his tax payments so as to be in a position to sustain a higher investment in war bonds.

4. The increasing threat of inflation—week to week collections made under a withholding-at-source system would serve to draw down consumer purchasing power and decrease the broadening gap between ready money available from a \$135 billion total of income payments to individuals for 1943 and \$75 billion worth in available goods and services.

"Pay-as-you-go," as originally projected by the Treasury Department, would have meant a mere percentage withholding from the individual's pay-check of a part of his tax liability. It took the Ruml "daylight savings plan for taxes" to dramatise the necessity for thoroughgoing modernisation and give it, so to speak, box-office appeal. Unfortunately, in gaining this impetus, the problem developed into one of the most bitter partisan feuds of modern times.

Two factors served to solidify the cleavage which developed around the "forgiveness" or "non-forgiveness" of the "skipped year" proposed by Mr Ruml, whose plan was to pay 1943 taxes on 1943 rather than 1942 income. Secondly, Republicans took the view that a pay-as-you-go Bill should precede the general revenue Bill.

Had the request for added revenue not confronted Congress, or had the Republicans not pressed for a separate pay-as-you-go measure, there might have been little hesitation in adopting the essentials of the Ruml plan. As part of a general revenue measure, 1942 taxes could have been erased to achieve pay-as-you-go at the same time that new levies, together with adjustments, were put on. But taken separately, with a time lag between present forgiveness and the new tax Bill (on which work has not yet been started), the Ruml proposal faced additional opposition. One ground for this feeling was that with present taxation in the upper brackets already at a high level, new funds equivalent to the "skipped year" taxes could only be recouped from lower bracket groups. By the CIO, "forgiveness" was sharply opposed as a "grab for the rich."

Having at first urged the combination of pay-as-you-go collection with a general tax measure, the Treasury then perceived revenue possibilities in the Ruml plan, and caused indignation among its adherents by proposing that the year-behind payments be retained rather than skipped. This "doubling up," adjusted to relieve hardship, would reduce the amount of added revenue required in a later tax bill. The Treasury's argument that \$10 billion in expected taxes on 1942 income should be retained insofar as possible was persuasive in the main to Democratic tax leadership in the House.

To-day pay-as-you-go is law. A hybrid measure combining current collections, total "forgiveness" in some cases, "doubling up" in others, together with some added revenue, the Current Tax Payment Act of 1943 is the product of a desperate last-minute compromise. It applies the Ruml plan of a full year's tax forgiveness to all indi-

viduals owing no more than \$50 for either 1942 or 1943 taxes. Others are forgiven roughly 75 per cent of the tax for 1942 or 1943, whichever is the lower. The remaining 25 per cent is carried over and paid in addition to current instalments. Payments are to be in equal amounts, one on March 15, 1944, the other on March 15, 1945. Of the nation's 44,000,000 taxpayers, about 17,000,000 will have no carryover; about 27,000,000 will have to meet the carry-over instalments and hence will be only partly on a current basis until March 15, 1945.

Meanwhile, from July 1st, 20 per cent of wages and salaries of over \$12 weekly for single persons, \$24 for married couples, plus \$6 for each dependant, will be withheld by the employer at the source toward discharge of the current year's tax liability. For 30 million taxpayers this 20 per cent (which absorbs the previous "Victory Tax") will discharge their entire tax obligation. Others earning more than the basic liability will have to supplement deducted amounts by quarterly payments. Individuals whose incomes are not derived from wages or salaries will pay currently each quarter; the amount of income will be estimated, in advance, but a revision of faulty estimates will be permitted. (Estimates more than 20 per cent too low will be penalised by an added assessment.)

For business, Government and individuals, pay-as-you-go means more red tape, more forms, more work, more expense. At the same time, Government revenues will come in faster; the taxpayer will in the main keep abreast of the obligations; consumer purchasing power will be weekly and monthly drawn down by the amounts withheld; less ready money will be available to the individual for inflationary spending; and the likelihood of tax defaults and bond redemptions will be reduced.

However, the problems left unsolved are tremendous. Congress has spent some five months on an essentially non-revenue measure. This is about two months less than it took last year to raise about \$9 billion in additional taxes. While the 1942 carry-over, plus the application of 1943 rates to the higher income levels of 1943 will increase the yield of tax on individual incomes for the fiscal year 1943-44 from \$13 billion to \$16 billion, this added \$3 billion is a mere drop in the bucket when compared with the President's request for \$16 billion additional revenue.

While there will be no carry-over of the "skipped year" liability for 17 million taxpayers, the fact that 27 million taxpayers will have a "doubled up" tax liability complicates the prospect for individual income-tax increases. In the course of the recent debate, it was said that if the 25 per cent two-year carry-over were adopted, this carry-over would be substituted for rate increases, resulting in a two-year rate stabilisation. However, subsequent to this assurance, total forgiveness of all taxpayers with a \$50 liability was grafted on to the carry-over proposal. It is highly possible that the Administration and Congressmen alike may come to regret that they did not, as Ruml plan advocates proposed, "wipe the slate clean" for later increases by dropping the "skipped year" payments altogether.

The prospect for compulsory savings is similarly complicated by the 20 per cent withholding tax, which is a current out-of-pocket expense to the individual. Many legislators will hesitate to impose any substantial compulsory savings programme which, added to the withholding tax, might merely serve to shift over savings now voluntarily made, without yielding any increase in revenue. While the Treasury Department has taken a position opposed to compulsory savings, Congressmen have up to this time believed that any substantial added revenue must come either from compulsory savings or from a general sales tax. The sales tax, as distinguished from selective excises, is also opposed by the Administration.

The problem of the inflationary gap remains, except for the current withdrawals by collection at source. Actually, the withholding tax involves no added assessment, hence the gap, save for the timing of payments, remains essentially what it was—some \$45 billion of excess purchasing power with no outlet except possibly inflated prices.

With taxpayers discharging their liability currently, the old system whereby Congress could, as in 1942, write a tax bill in late October, imposing higher rates retroactively to the first of the year, is now a thing of the past. This is of paramount importance to the Government at this particular time. With prospects such that a new tax Bill will not be completed until the autumn, the Government will in all probability have to rely on borrowing for added funds during the remainder of the calendar year. Small gains in additional or increased excises would be the exception; increased corporate levies could, of course, still be applied retro-

actively, but small added revenue is looked for from this source.

In the face of this situation, war deficit financing has already turned to the individual. The first broad break with traditional policy came recently when Mr Morgenthau, Secretary of the Treasury, announced that commercial bank borrowing will be divorced from future major financing campaigns. This throws the burden of the big borrowing drives directly on the public, in particular on the individual investor. How will the Government stimulate individual investors, who accounted for only \$3,300 million of the \$18,500 million April borrowing drive, to greater participation? Through some system of tax credit for added war bond purchases? A form of expenditure rationing? Perhaps. These problems pay-as-you-go obviously does not solve.

American Notes

Presidential Counter-Attack

Mr. Roosevelt's veto of the Bill to extend the life of the Commodity Credit Corporation can be regarded as the beginning of a White House counter-offensive against the spirit of Congressional irresponsibility that has been so much in evidence in recent weeks. The Bill itself was not of outstanding significance. The Commodity Credit Corporation is one of the agencies by which Federal funds have been used for ten years past to support the market in agricultural products. The Bill renewed its life and its financial powers, but with a number of complicated conditions attached whose general effect was to ensure that any public money available went to increasing the price received by the farmer and not to reducing the price paid by the consumer. What was significant was the speed with which the President returned the Bill unsigned and the vigour of the language in which he denounced the selfishness of the farm bloc. The House of Representatives voted by 228 to 154 to override the veto, but, the majority being less than two-thirds, the Bill died. It is difficult to derive

very much consolation from the fact that the inflationist majority is only 1½ times, and not twice, as large as the President's Congressional supporters. Nevertheless, it may be that Congressmen now realise that they have gone too far. They are soon going home to meet their constituents, and some of them have an uneasy feeling that the President may have the bulk of the voters on his side.

* * *

Internecine Warfare

The open and bitter feud between two of the President's chief lieutenants—Mr Henry Wallace, the Vice-President, but appearing for the moment in his appointive rôle as chairman of the Board of Economic Warfare, and Mr Jesse Jones, Secretary of Commerce and Federal Loan Administrator—is not calculated to raise the stock of the Administration. Mr Wallace took the initiative, charging Mr Jones with impeding the operations of the BEW. This is not merely a clash of personalities, or even a conflict of policies, between Mr Wallace's openhandedness and Mr Jones's careful banker-like administration of the funds committed to his charge. It is a breach between the two wings of the Democratic Party. The Vice-President is one of the philosophers of the New Deal, the prophet of "the century of the common man," a contemner of narrow finance. Mr Jones is the chief representative in the Administration of the Southern Conservatives who are so strong in Congress and in the party machine—and in revolt against Mr Roosevelt. The President has mildly rebuked both parties for taking their quarrel to the public instead of to him—to which the answer is that he has known about it for months and, if he is able to settle it, could have done so long ago. A shrewd guess would be that his sympathies are with Mr Wallace, but that Mr Jones is too powerful a figure to be either coerced or removed. But if Mr Jones is the winner, even if only on points, his victory will be an open incitement to the anti-Roosevelt factions to be found even inside the executive department of the Government over which the President is nominally supreme.

THE WORLD OVERSEAS

France Impoverished

WHEN the men of Vichy signed the armistice in June, 1940, some Frenchmen hoped that, by staying out of the war, France would at least be able to make up for political and military defeat by economic recovery. The record of the three subsequent years shows instead a picture of utter impoverishment. The French economy has been reduced to a level from which its reconstruction in the post-war years will be extremely difficult. France's industries have been crippled or starved by the lack of raw materials. In consumers' goods, which used to play so decisive a part in the industrial life of the country, productive capacity has been kept largely unemployed. Lack of raw materials, fuel and lubricants has condemned the machinery of textile, silk, leather and other light industries to idleness, and every year of idleness increases the depreciation of capital assets. The position of the heavy industries has been equally critical, though for different reasons. German policy has been to exploit these industries as mere appendages to the German war economy. The overall output of the French heavy industries, excluding those of Alsace and Lorraine, amounts to about 50 per cent of its pre-war volume. The output of pig iron declined from nearly 4,000,000 tons in 1938 to 1,500,000 in 1941 and to about 1,400,000 tons in 1942. The corresponding figures for steel are 4,000,000, 2,300,000 and 2,000,000 tons. The table below gives indices for the output of coal, electricity, iron, steel, machine construction and for goods traffic on the French railways:

INDICES OF FRENCH PRODUCTION*

	Coal	Electrical Power	Iron	Steel	Machine construction	Goods traffic
1938	100	100	100	100	100	100
1941	107	115	39	57	61	83
1942	106	104	36	50	61	77

* The output of Alsace-Lorraine is not included.

The output of coal has been slightly expanded. An important increase has taken place in the production of electrical power. These are the only two branches of French industry in which there has been no decline. The expansion in the domestic output of fuel has been due to the necessity of covering a part of the fuel deficit which has arisen because of the cessation of coal imports from abroad. It should, however, not be forgotten that the comparison with 1938 does not provide a very accurate picture of the position. In 1938 French production had not regained its pre-depression level. If the figures of, say, 1930 were taken as the basis, then the index for coal output in 1941-42 would be no more than 60. The output of electrical power, on the other hand, would then stand at 140, a figure which would more accurately reflect the massive expansion of electrical capacity. The indices for iron, steel and machine building would be substantially lower.

The decline in goods traffic on the railways reveals only part of the actual position. Motor traffic, which played a very important part in French transport, has come to a complete standstill. Again, the indices show the total volume of output—they do not reveal the proportions diverted to the production of arms and munitions for the Germans and left for civilian consumption. In the case of coal, it is known that only 40 per cent of the total output has been available for private and civilian industrial consumption. In the other branches the civilian allocation has been substantially lower. Such branches of industry which possess no domestic raw materials (such as the rubber industries which have been entirely dependent on German supplies of *buna*) can work only for German needs.

Loss and No Gain

The state of French industry can be described as one of peculiar war-time scarcity. The negative features of a war economy are present in the picture—the exhaustion

of the country's stocks as well as the intensive and unreplaced wear and tear of its industrial equipment. What is lacking is the relative advantages of other war economy—the expansion of old productive capacity and the building of new industries. Great Britain will emerge from this war with new and large aircraft and radio industries more or less convertible to civilian uses. So, probably, will Germany and so, to a lesser extent, will many of the occupied countries. The German policy of shifting essential war production from likely theatres of Allied attack and invasion has led to industrial expansion in Austria, Bohemia, in the northern parts of the Balkans and, to some extent, even in Poland. This tendency to shift industrial production from the Atlantic has largely deprived France of any similar advantages. One consequence of the three years can therefore be clearly foreseen: France will emerge from the war with a diminished industrial potential, weakened both absolutely, in comparison with the pre-war capacity, and relatively, in comparison with the industrial capacities of other nations.

Has France saved its men, if not its machines, by the surrender and armistice? No definite conclusion is possible yet. Towards the end of June, 1943, the number of French workers deported to Germany under the *relève* was approaching the 1,000,000 mark. Together with the actual prisoners of war and such prisoners who have been released for work in German factories, the number of Frenchmen in Germany amounts to between 2,000,000 and 2,500,000. A relatively high percentage of these is likely to return to France as invalids.

Among the other economic developments which have taken place in France under the Vichy regime, the following major changes are bound to affect the economic and social outlook for some time to come: the shift in the distribution of the national income in favour of the peasantry; the enormous growth of the national debt and the inflation of currency; and the pauperisation of small proprietors as well as of rentiers. The shift in the distribution of the national income has been due to the shortages of foodstuffs and the ever-growing rôle of the black markets. (To what an extent black markets have expanded is indicated by the official statement that not less than 200,000 people were prosecuted for illicit trading in 1942.) According to a German estimate, the total money income of the French peasantry has grown by about 1,000 per cent since the outbreak of the war. The price of land has increased six times compared with pre-war prices. The industrial wages bill has diminished during the same time by one-third. Out of a decreasing national income, an ever higher proportion has been going to the countryside. The enrichment of the peasantry has, of course, been merely nominal to a very large extent. Grain crops in recent years have been some 30 per cent less than the pre-war average; and there have been considerable losses in agricultural machinery and in cattle. Even so, the peasantry has undoubtedly been much better off than any other section of the French population—a fact that is likely to accentuate the traditional French antagonism between town and countryside.

The Fall in the Franc

The national debt has, according to the well-known French economist M. F. Jenny, grown fourfold in the course of the war. Medium and short-term loans which, at the beginning of the war, accounted for 25 per cent of the national debt, have now risen to 55 per cent. The currency circulation has been trebled—it now amounts to more than 410 milliard francs. Out of this total about 100 milliard have been hoarded by the peasants. Hoarding on so massive a scale has had a dual effect. On the one hand it has weakened the impact of inflation. But, on the other hand, it has diminished the supply of credit to the Government a fact which forces Vichy to resort, via the Bank of France

to the printing press in order to cover the costs of German occupation. Some Vichy economists have recently tried to measure the present purchasing power of the franc; but the attempt has, for obvious reasons, been given up. Yet an approximative estimate can perhaps be made. If it is assumed that the mass of commodities available in the channels of trade amounts to 50 per cent of what it used to be four years ago—an assumption which it seems safe to make—and if the mass of currency has in the meantime grown three times, then the franc should have fallen to at least one-sixth of its pre-war value. This estimate may appear to understate the actual degree of inflation, because it does not take into account the increased velocity of the currency, especially its velocity in the towns. On the other hand, the relatively low prices for rationed goods must also be considered, a factor which tends to keep up—in spite of the notorious inefficiency of Vichy's rationing system—the purchasing power of the franc. It is significant, in connection with this calculation, that the rise in land prices is sixfold.

The sharp fall in the purchasing power of the franc indicates the degree of pauperisation suffered by the small rentiers. The purchasing power of their fixed incomes was already diminished in consequence of the devaluations of the Popular Front period. But it is the *Révolution Nationale* which has carried the virtual expropriation of the French rentier to the end. This has been the combined effect of the devaluation of money and the policy of low interest rates, which has reduced the nominal income of rentiers. The large scale conversions of securities and rentes in 1942 allowed Vichy's Minister of Finance to cut the debt services by about one milliard francs.

The impoverishment of small rentiers goes hand in hand with and supplements the progressive elimination of small enterprises. It is estimated that towards the end of this year about 50 per cent of the small industrial and commercial enterprises will be liquidated, either because of the concentration of enterprise or because of the lack of raw materials or because of the conscription of labour for Germany. It is still difficult to gauge all the implications of this process in a country in which 60 per cent of the industrial population drew its incomes from small enterprises, and in which the small shop accounted for about 90 per cent of the total number of trade establishments. The small shopkeeper and the artisan—for whom Vichy promised to act as trustee—have been the main and the most pathetic victims of the *Révolution Nationale*.

The Irish Elections

[FROM OUR DUBLIN CORRESPONDENT]

June 28th

THE general election which, in the opinion of many experienced politicians, should have been postponed has resulted in confusion and indecision. Before the election the Government commanded a majority in the Dail, and presumably possessed the support of a majority of the people. As a result of the election it has forfeited both. Proportional Representation has again produced a deadlock. In the early days after the Treaty, when the first Irish Constitution was being drafted, the Government was warned by some of its advisers that it is difficult to combine the British method of an Executive responsible to Parliament with Proportional Representation. That advice was ignored, but its correctness has been proved by experience. Irish politicians are strong party men who abhor coalitions. Yet it is only in exceptional circumstances that a Proportional Representation election gives any party even a small independent majority. The election of 1938 succeeded in doing so, and was followed by five years of stable government. The election of 1943 has failed to do so, and nobody knows to what evil consequences this failure will lead.

The results of the two elections were as follows:

	First Preferences		Seats	
	1938	1943	1938	1943
Fianna Fail	667,996	555,113	77	67

The poll was unexpectedly large in view of absence from home and transport difficulties. Curiously enough, it was in the towns that the greatest abstention occurred. Appar-

3% Savings Bonds

1960—1970

A FULL TRUSTEE SECURITY.
GOOD FOR THE COUNTRY—
GOOD FOR YOU.

Post Office and Trustee Savings Banks Issues

- Purchasable in multiples of £5 with minimum first subscription of £10. Maximum subscription £1,000.
- Interest paid half-yearly.
- Income Tax not deducted at source.
- May be sold at any time through your Savings Bank.

Bank of England Issue

No limit to holdings. Purchasable in multiples of £50. Minimum first subscription £50. Tax deducted at source where interest exceeds £5 per annum.

2½% National War Bonds

1951—1953

A medium term security with interest payable half-yearly at 2½% per annum. In all other respects they are similar to the Savings Bonds summarized above.

*
Prospectuses and Application Forms
obtainable from all Banks
and Stockbrokers.

Issued by the National Savings Committee.

ntly, the town voter relies on being driven to the polling booth to a greater extent than his country cousin. The Government party lost 20 per cent of its supporters, but he main Opposition party lost 30 per cent, while Labour gained 60 per cent and the new Farmers' Party made an impressive showing. The Government received the votes of only about 40 per cent of the voters. In spite of the claims of its advocates, PR did not prevent a discrepancy between the votes cast and the seats won. The Government party obtained 42 per cent of the votes but 48 per cent of the seats, while the Labour party obtained 15 per cent of the votes but only 12 per cent of the seats. The result must be disappointing to all parties. The Government has clearly lost much support and the main opposition party has lost even more. Labour hoped to win 20 seats, and has failed to do so. The only party that should be satisfied is the farmers'. The single candidate who stood as a monetary reformer secured election.

Lack of Stability

From the point of view of maintaining a stable administration the new Dail is obviously inferior to the old, in which Mr de Valera possessed an independent majority. Many people who are not political supporters of Mr de Valera are willing to admit that his record as head of the Government has been in many respects excellent. If he is to continue in that position, it is definitely preferable that he should be master in his own house rather than dependent upon members outside his party. Nor can it be suggested that the inferior distribution of seats in the new Dail has been compensated for by any striking improvement in the quality of its membership. On the contrary, some of the most useful members of the old Dail have lost their seats. Nobody in Ireland has a longer record of unselfish public service than General Mulcahy, who failed to be returned for a Dublin constituency. Two other ex-Ministers of the Opposition party and at least one very useful independent were rejected. The elimination of these experienced and educated members of the opposition benches will weaken the quality of the Dail as a deliberative assembly. Some of the newly elected members may, of course, prove worthy substitutes for these losses. As far as present knowledge extends, however, the new Dail is poorer in ability and personality than its predecessor.

It is impossible to penetrate the mind of the electorate, but a few suggestions may be offered to explain the results of the election. In the first place, a Government that has been eleven years in office always suffers to some extent from the swing of the pendulum. It is noteworthy that the Government lost more heavily in rural than in urban constituencies in spite of the fact that the town-dwellers have suffered more from the shortages and inconveniences of the war. The reason is probably that the towns are more afraid of bombing, and that the urban voter believed, rightly or wrongly, that Mr de Valera would preserve neutrality more tenaciously and more successfully than any of his rivals. If this be correct, it follows that the Government party would lose more support if the war were at an end or even if its end were in sight. The losses of the Cosgrave opposition seem to indicate that their party has nothing to offer that cannot be achieved by the Government. The fact that both the big parties lost to Labour, farmers and independents suggests that the people are getting tired of the old split over the Treaty which was the origin of the party division in Irish politics for the last 20 years. Whether another general election will take place soon is a matter of speculation, but it may be safely stated that, whether it takes place sooner or later, it will be conducted on new lines. This election will figure as the last of the contests fought around the rights and wrongs of the Treaty. Forty years ago Ireland was divided into Parnellites and anti-Parnellites, but this division faded away as the memory of the Parnell split grew dimmer. A similar fading-out of the Treaty issue is taking place to-day. Future elections will be fought on policies of the present generation instead of on the quarrels of the last.

★

[Since this article was written, it has been announced that Mr de Valera has been elected Prime Minister, securing 67 votes against the 37 obtained by Mr Cosgrave. His new Cabinet includes all his former Ministers, with the addition of Mr Moylan, Minister for Lands. During the debate on the motion to approve the new Cabinet, Mr de Valera stated that he was dissatisfied with the results of the

election, and hinted that there might have to be another election if "a good Government" were to be secured.—EDITOR.]

Bolivia's Good Neighbour

[FROM A CORRESPONDENT IN LA PAZ]

June 9th

THE first sign that the present anti-Labour trend of Bolivian domestic politics is being reversed was an editorial of *Ultima Hora*, published on May 13th, when President Peñaranda was already in the United States:

If, in the opinion of the Minister of the Interior, the revolutionary forms of Communism threaten the stability of our institutions, the nazifying forces, disguised in an apparent nationalism, are a much more immediate threat to democracy in Bolivia and to its national security. They constitute a more immediate and concrete peril because, protected by the passivity of the Government—which is scared only by the red flag of Communism—they work underground and penetrate deeply into all social classes. Their pernicious influence reaches the working masses, the intellectuals, the University, the Civil Service and even the Army. . . . Nazism in its nationalist mask should be fought with more resolution. . . .

This was an unequivocal reference to the Movement of the National Revolution. The leaders of this Movement emphatically deny that they have anything in common with Nazism, but their anti-Semitism and the violent kind of nationalism they preach lead many observers to this conclusion.

Meanwhile, in the United States, Martin Kyne, CIO delegate on the US Labour Commission which visited Bolivia in March of this year, gave an account of his personal experiences, and charged the present administration with the deaths of the tin miners in Catavi. Then José Antonio Arce, leader of the PIR (Party of the Revolutionary Left), addressed an open letter to President Peñaranda, demanding the re-establishment of civil liberties, freedom of association and freedom of the Press for Bolivian labour, the urgent improvement of the living conditions of Bolivia's working class; otherwise, he said, no repressive measures could prevent a violent outbreak of discontent.

The report of Kyne was adopted by the CIO, which sent a delegation to President Peñaranda on behalf of Bolivian labour. In addition, the CIO, impressed by recent events in Bolivia, created a Latin American Committee which may be a landmark in the relations between North American and Latin American labour.

On May 21st, Arce published President Peñaranda's reply to his open letter. The PIR was promised that it would enjoy the same conditions of liberty as all other democratic political parties, including wireless propaganda and freedom of the Press. It will be given the right to summon its Congress on condition that no foreigners are invited. The provisions of the new Labour Code are to be put into effect with the co-operation of Bolivian labour. The President will ask for funds from Congress to give pensions to the families of the tin miners who lost their lives during the strike at Catavi.

President Peñaranda's reply has far-reaching implications. It was so contradictory to the trend of domestic politics in Bolivia that it could be explained only on the assumption that it was pointed out to him that in North America democracy in Bolivia is considered a necessity. It is certain, however, that it did not occur to anybody to call this intervention in the domestic affairs of a sovereign country unwelcome. On the contrary, everybody felt that North American "intervention," when it works in favour of democracy and progress, is highly desirable.

Already at the beginning of this year the US Board of Economic Warfare and the Metals Reserve Corporation agreed with the Bolivian Government an increase in the price of tin by 10 cents per lb. on condition that it should be employed entirely in improving the living conditions of the miners. The enforcement of this labour clause was, of course, opposed by the big mining operators, but some arrangement of this kind seems to have been adopted during the stay of President Peñaranda in the United States.

There is no doubt that if such a provision is put into effect, it will make the good neighbour policy much more popular with the people and initiate a trend which might be followed up subsequently in other Latin American countries.

Germany at War

The Manpower Paradox

A SHORT time ago a German newspaper stated that, at the end of May, 1943, the total number of workers employed in Germany had increased to 28.1 millions. This figure includes foreign civilian workers and compares with 1.1 millions, German and foreign, in February, 1942. There is no way of checking these figures during the war on the basis of pre-war statistics. The suggestion is that, in 14 months, in spite of very large recruitment for the *Wehrmacht*, the total number of workers has increased by 27 million. Various statements, notably one by Dr Funk, Minister for Economic Affairs, have estimated the additional number of workers (mainly women) employed since February, under the "total mobilisation" order, at one million. But, if it is assumed that, during the same period of 14 months, at least a million more men were recruited for the *Wehrmacht*, the working population, to give a net increase of 4 millions, must have actually increased by 5 millions; that is to say, in addition to the one million Germans "totally mobilised," some four million additional foreign workers must have been brought in.

Figures have occasionally been published in Germany since the beginning of the war purporting to show the successive changes in the total number of employed workers. Between July, 1939, and December, 1940, a decrease of 1,800,000 was reported. Between January, 1941, to February, 1942, an increase was claimed of 1,500,000. Now it is said that, between February, 1942, and May, 1943, there was a further increase of 4,000,000. These figures include foreign civilian workers, but, naturally, make no mention of the men called up from industry for the *Wehrmacht*. If it is assumed that, since the beginning of the war, at least 8 million workers have been recruited for the *Wehrmacht*, then (if these claims are true) roughly 12 million additional workers have been found for industry in four years of war. (Between 1914-18 the total number of employed workers fell by at least three million.)

The Weight of Numbers

Are these figures at all plausible? Or is this just another case where Nazi propaganda is deliberately misleading? The propaganda has been extensive. It is suggested, on the basis of the census figures of all the occupied and dependent countries, that the labour force available to the three Axis powers is only slightly smaller than the combined total of the gainfully employed in Great Britain, the United States of America and the Soviet Union. The impression is sedulously fostered that Germany can absorb unlimited numbers of workers. In Germany's totalitarian economy before the war the tendency to declining productivity was countered by greatly increasing the number of persons employed. Under war conditions this process has been intensified; the most difficult problem has been the need for more workers. It is not only the losses sustained in Russia that have forced this tremendous increase (whatever its size may really be) in the number of workers in Germany since February, 1942. Another cause is the familiar fact that technical skill has had to be replaced by mere numbers. Semi-skilled workers can be replaced in industry by unskilled ones after the rationalisation of processes. But, of course, this process of rationalisation, if executed on a large scale, requires very considerable initiative and ability on the part of key engineers and highly skilled workers; only by these means can large numbers of unskilled workers be brought in, especially when the production of machine tools and other machinery is restricted by wartime necessity.

Minister Speer has given a small group of engineers unlimited powers to carry rationalisation to the limit, that is, as far as the available machinery allows. An elaborate system of "efficiency" competition between factories has been introduced. Bonuses have been paid for suggestions leading to increased output. The exchange of inventions and methods of production has been made compulsory. All these devices have had one aim—to arrest the decline in output. The so-called "total mobilisation" was decreed; but, at the same time, the demand for more workers was increasing. It is just conceivable that the total number of workers employed in Germany has risen to 28.1 millions. A considerable number of prisoners of war, who were already employed, may now have been given the status of civilian workers, which would largely explain the

over-all numerical increase. In Greater Germany, it is possible that eight or even nine millions out of the total of 28.1 millions are foreign workers—roughly one-third. Official statements have suggested that at least four million foreign workers are employed in the armament industry. But it seems almost incredible that nearly half of the total number of workers employed in the armament industries proper should be foreigners. Thus the Nazi employment figure may not be far from the truth; but it indicates not growing strength but growing weakness. The Germans are in desperate need of more workers of the right sort; but they have too many of the wrong sort. In relation to the productive capacity available, and to the number of key skilled workers, Germany's economy would seem to be saturated, quantitatively, with labour. For some time, the factories have been filled indiscriminately with workers. During the "total mobilisation" women were hastily registered in great numbers and sent to factories, and there was undoubtedly overcrowding. There are many signs that output suffered. Shifts had to be changed to suit women; working processes had to be broken up into still simpler operations; skilled workers who had received their call-up notices hastily trained other workers to take their places. Changes in the production programme increased the number of orders in some factories and left other factories without enough work for their workers to do. There were the workers and there were the orders, but the workers were in the wrong places, and for the most part lacked the necessary discipline or skill to do the work.

The situation is still confused. There are signs that an effort is made to redistribute the labour force. The basis of this redistribution is the high mobility of the foreign workers, who are mostly housed in barracks. They can be moved in large numbers at a moment's notice, like an army. German women are as a rule directed to factories near their homes, while foreigners are moved to other districts. Russian women who have been deported to Germany in great numbers take the place of called-up German workers in heavy industry. They are removed from light work in textile, clothing and light engineering factories where their places are taken by German women. In all factories German workers are trained in quick courses to take the place of skilled workers called to the colours. German apprentices in their second and third year, that is, boys aged 16 or 17, are made foremen over gangs of unskilled foreign men and women—mainly over the so-called "east workers" from occupied Russia. But all these changes cannot get rid of the "deadweight" of these millions of unskilled and unwilling foreign workers. Shifting them from place to place is no solution. The overcrowding of factories with unskilled workers remains.

The Nazi authorities are, of course, well aware of this problem. To increase willingness, the nominal wages of "east workers" were raised by from 17 to 20 per cent; since May 1st, "east workers" may be paid piece wages. To increase skill foreign workers go through psychological and vocational tests under the direction of the Labour Front; and according to the results "suitable" persons are trained for skilled and semi-skilled occupations. At the same time, there seems to have been a change in the treatment of foreign workers outside factories. Political propaganda seems to be used where there was formerly only brutal compulsion. For this campaign to increase the willingness and skill of foreign workers, and to lighten the deadweight in German industry, to be successful, a longer period of relative quiet at the front is imperative—and not perhaps very likely. If it did succeed, German industry might again be able to absorb still more workers, and perhaps even to start on a new programme of expansion to replace the industries that are being destroyed in the Ruhr-Rhine area. But at present, simultaneously with an acute shortage of labour, it is undoubtedly weighed down by too many workers of poor quality.

THE BUSINESS WORLD

Kaffir Shares

OF all share markets, there is none which caters for investors of catholic tastes more completely than the South African gold mining share market. From the well-established dividend-paying mine with a long "life," high-bearing ore reserves, strong finances and settled mining policy, at the one end of the scale, to the newest "developer," safely but only recently past the prospecting stage, at the other, the market presents a continuous gradation of "risks" which is hard to match in any other single industry. Investors, to suit their own choice and circumstances, can ring the changes at will on old mines and new, rich and poor, high cost and low cost, with unexampled facility. From the conservative buyer, who wants a security not unfairly comparable with, say, a good average home industrial share, to the out-and-out gambler who is looking for something that may double—or halve—its price in a few weeks or months, there is something for everybody.

In normal times, income yields, even after reasonable allowance for amortisation, run relatively high—as some pre-war Unit Trusts discovered. Special risks, of course, attach to mining ventures of every sort, but in the case of South African gold mines, one can with care have as much or as little of them as one likes. And the further one moves away from the "developers" towards the "dividend-payers," the more the individual "speculative" risks of given enterprises tend to merge into broader "investment" factors which, because they apply to the industry as a whole, are much more readily calculable. Finally, the quality of management, which with most industrial company shares is a crucial but unknown factor that the investor must take on trust, can be assessed with some accuracy for any "Kaffir" share. Both finance and technical administration are, in most cases, under the suzerainty of one or other of a limited number of firms of established reputation, ample resources and long experience. Even the market itself is cared for. Here, as elsewhere, the buyer must use his discretion, but, while investment interest may wax or wane, the market never "dries up." There is no day when Kaffir shares cannot be bought or sold at a price; for it is part of the recognised duty of the large finance houses to meet demand by replenishing or reducing the floating supply of stock—for a consideration, naturally.

If, in spite of all this, South African gold shares have never won the same exclusive investment interest in Great Britain as in the Union itself, the reason lies, partly, in London's wider choice of stocks of all kinds and, partly, in the fact that the conditions governing the fortunes of the industry as a whole have been proved by experience to vary, perhaps, rather more widely—and often more unforeseeably—than those applying to many British manufacturing or distributive trades. The basic factor, of course, is the price of the commodity, gold, which is far more stable over short periods than the prices of most other commodities and, over long periods, has had a steadily rising trend. Here, the chief risk is the future of world demand, since the chief use of gold is non-industrial. The world's largest buyer for currency purposes—the United States—has of recent years been acquiring the metal only to bury it, and ingenious planners elsewhere have gone some way in showing the world how gold, for international exchange purposes, could be economised to the point of being dispensed with.

The Kaffir share market, however, remains firm in its belief that the metal will remain, after the war as before, the ultimate currency and exchange medium, and that its long-term price trend will continue, if anything, to be upward. The South African gold mining industry's trials and difficulties reflect more immediate conditions. Its position, as much the most important revenue-producing industry in South Africa's economy, has both advantages

and disadvantages. It ensures that the relations between the Union Government and the industry will be on a basis of recognition of mutual interests. But it also encourages the South African Treasury to look in the industry's direction whenever demands for higher Exchequer receipts are pressing. Mining taxation has increased steadily since 1932, when mining profits were benefited by South Africa's decision to follow Britain's example and devalue the pound. The process, however, has been accelerated, for obvious reasons, since the war. A much more serious difficulty, however, has been the physical limitation imposed on mining operations by inability to import new materials and stores on anything like the pre-war scale and—recently and more particularly—by a growing shortage of labour, especially native labour. Expenses have increased, also, and the incidence of higher charges has, naturally, been heavier on the lower-grade mines. New development has not been entirely arrested, but serious work on many new propositions (especially lower-grade ore projects) has, perforce, been suspended for the duration of the war.

* Assuming payments for second half-year maintained at June, 1943, levels.
† Gross, before income tax and S. African non-resident tax.

Stock Exchange activity in Kaffir shares, nevertheless, has increased, recently, to the dimensions of a boom. Both the movement and its causation seem the more difficult to locate and explain the more closely they are examined. Undoubtedly, much of the buying has been "speculative," in the sense that buyers have had in mind not present but future benefits—either by way of high post-war returns from developing companies in the newer areas or the resumption (at least) of pre-war payments by established producers. But the evidence suggests that the main motive force behind rising prices has come from South Africa rather than London, and that it derives less from any shrewdly calculated estimate of real future possibilities than from a general feeling of optimism about the war and political prospects, in a market whose choice of speculative investment media is somewhat closely circumscribed. The

correlation between Kaffir share activity and the popular expectation of a victory for General Smuts in the elections which have just been held in South Africa has been suggestively close. For that reason alone, the indefinite continuance of the upward movement is a matter of doubt.

At the moment, the trend of net earnings and dividends is definitely downward. Total dividends for the first half of 1943 were £7.5 million, against £8.6 million for the first half of 1942. The most formidable difficulty—shortage of native labour—is virtually certain to become more pronounced the longer the war lasts. Thereafter, improvement will be steady rather than spectacular. Meanwhile, the suggestion has already been made that some measure of voluntary "telescoping" should be sponsored by the Transvaal Chamber of Mines, to economise labour supplies by putting the lowest grade mines on a care-and-maintenance basis.

The market, again, may conceivably be right in its assumption that, after the war, the greater part of the Government's special levy on working profits—now as high as 22½ per cent—will be rescinded. But experience of Exchequer needs and methods the world over suggests that the lightening of the mines' taxation burden may well be less rapid than the market appears to be assuming. Costs,

further, will fall, but not to the pre-war level. Outputs will increase, but only gradually in most cases.

The yield figures in the table on page 50 show that the present return on the majority of established Rand shares is not over-generous, to say the least, by normal market canons. The figures, incidentally, have been calculated before allowing for amortisation, income tax (at less than the British standard rate; owing to Dominion Income Tax relief) and the objectionable 7½ per cent "non-resident" tax imposed by the Union Government. Particularly low yields on shares like Marievale, Grootvlei, Venterspost, Luipaards Vlei and others, reflect pre-discounting of the probability that these mines will be quickest off the mark in expanding production, owing to favourable features in their technical position. The average yield (so far as an average can be struck in this very mixed market) is around 5 to 7 per cent.

All in all, present evidence would seem to suggest that, on their own merits, South African gold mining shares have some claim to be regarded as among the more promising "recovery" counters which the Stock Exchange offers to-day. But existing prices represent a not particularly conservative valuation of prospects—in the earlier post-war period at any rate.

Standardised Accountancy

IT is no accident that the growing prevalence of monopoly and of state intervention in industry have been accompanied by an increasing realisation of the need for some criterion, other than the financial results achieved, of the efficiency of those engaged in manufacture, trade, distribution and finance. Under a system of pure competition and freely fluctuating prices, there are daily indications as to what makes for prosperity and what does not. In the measure that conditions depart from this ideal, the indications become less valuable, or are lost entirely. They must be replaced by alternative criteria which can only be supplied by detailed costing of all operations on a strictly comparable basis. It is therefore not surprising that an autarkic Germany with an industry already highly cartelised and a single aim in view, should have evolved a system of cost accounts aiming at complete standardisation. A description of this system and its background, together with some idea of its contribution to the planning of the war economy, has been compiled by Dr H. W. Singer for the National Institute of Economic and Social Research, who publish it as the fifth of their *Occasional Papers*.*

Although much had already been done on similar lines by individual cartels, the system discussed was imposed on German industry, trade and handicrafts from above. Finance and public utilities had efficient schemes in operation which required only minor adjustments. Each of the sections named has to base its whole cost accounting on a *model chart*. Each main section is divided into a number of groups, and then into sub-groups, for each of which a more detailed *plan of accounts* is drawn up so as to provide the material for the *model chart* of the section. As membership of the sub-groups is compulsory, this system provides figures which are uniform in broad outline for the whole industry, and in detail for each sub-division. Some simplification is permitted for small concerns, and there are special arrangements for companies making products which fall in different sub-groups and for vertical combines. There is, however, little evidence that these exceptions interfere with the complete standardisation which is one essential aim of the system.

Apart from this factor, the originality of the plan lies in two features: the complete separation between workshop and financial accounts, the former being expressed at fixed prices throughout, and the relation of all particulars to the unit of production. The original plan was to make these accounts supplementary to the old cost accounts. In practice the cost accounting is done on the new system, and these figures are then incorporated in the financial accounts by some system of adjustments. Little is said of these adjustments. It will be seen that the workshop accounts are really statements of quantities of material, manpower and other factors employed expressed in standardised terms of money.

* *Standardised Accountancy in Germany*. Cambridge University Press. 68 pages and tabular appendices, 6s.

As they are carried down to individual units of production, it is possible to determine which firm is the more efficient in real terms, and also just what the cost of any firm is in real terms. Costs are divided into those which are essential for actual manufacture and those which are not, while, to secure strict comparability, such items as managerial salaries to manager-owners and interest on capital are included for all units whether these are, in fact, paid or not. Further, in contrast to the British practice of restricting allowances for failure to use plant to those sections which are out of production for an extended period, account has to be taken, under the German plan, of each hour's idleness of every unit of production. This makes it possible to determine how real costs compare, and consequently, to decide what firms should do any given amount of work. Under conditions where current production may be more important than efficiency, this also determines the "marginal" firm, while, in the necessary adjustments, it shows what price should be paid to any given firm. It need hardly be added that, for the plan to work, centralisation and uniformity of practice by those responsible for giving orders and determining remuneration is equally necessary.

Obviously such a system would lose half its value if it had to wait on an elaborate system of audit. Actually, the workshop accounts are kept "as-you-go"; are presented monthly, and may, apparently, be called for at any time. As no audit is possible, it was found necessary last year to make the manager providing the return individually responsible, any reporting of misleading information, whether deliberate or inadvertent, being punished by heavy fines.

MONTREAL & TORONTO

Under war conditions it has not been possible to determine the exact effects of the new system. Apart from the points already mentioned, it has provided accurate evidence of the physical amount and location of stocks and work in progress. It has, however, been necessary to warn firms that the workshop accounts offer no information about their own financial results, while the authorities have found it necessary to take market prices into account—where these exist—in a large number of cases. The system has been of little value in price-fixing, and it has not made it possible to evolve any single recipe for obtaining the results desired. It has, however, been an essential element in all the numerous policies adopted by the central administration.

The question naturally arises whether the German experience provides any lessons of value to this country. Up to the outbreak of war, the British Government had confined its concern with company accounts—other than those of certain utility undertakings—to ensuring a system of audit, designed to prevent the issue of dishonest or misleading financial accounts. With cost accounting it was scarcely concerned at all; auditing and cost accounting have grown up almost as two quite separate matters. "Fixed-price" cost accounting—that is, the comparative cost accounting of different varieties of industrial activity—has existed in this country only within a few of the large vertical combines; the nearest approach to the German system has been costing at standard prices, the standard being a target figure often based on time studies and subject to adjustment for any more than quite temporary change in the underlying factors. Further, there was no uniformity among industrial firms or Government departments. A dozen or so industrial groups had evolved uniform costing systems, but these were not mutually comparable.

There cannot be any doubt that the absence of a uniform system of cost accounting has been a serious embarrassment in wartime. Many of the familiar difficulties of determining the size and location of new capacity, the magnitude of stocks and of securing agreement and understanding between Government departments and industry would have been avoided if there had been comparable figures accepted by all parties, and a uniform system of terminology and practice. Had there been uniform standards, several of the problems which have called for the evolution of an elaborate regional organisation would scarcely have arisen. Equally, much of the negotiation on matters of contract prices and tax liability would have been greatly simplified. The war effort would have been mobilised with much less expenditure of time, and, probably, with a substantial economy in manpower.

Peacetime Requirements

It does not, however, automatically follow that a uniform system of cost accounting would have equal value in peacetime, when there is not a single buyer, using public funds, for the greater part of the output of industry. Nor do the arguments directly apply to financial accounts. Nevertheless, a strong case for at least a modicum of uniformity can be made out. It rests on two main arguments. First, if the state is to undertake the primary responsibility for seeing both that the resources of the country are fully and continuously employed, and also that they are employed to the best advantage, it must have the fullest information as the basis of its policy. If a census of production could be justified in the very different conditions of 1907, a continuous system of reports, in uniform style, on the operations of industry will be necessary in the future. Secondly, in the execution of its policy it will clearly be necessary for the Government to evolve a subtle and complex policy of giving inducements to greater activity, especially in capital expenditure, at some times, and putting the brake on at

others. Such a policy will be impossible unless words and figures in company accounts are given the same meanings throughout the country.

In wartime, it is the physical basis of cost accounting that is of the greatest value. In peacetime, especially in an economy governed by comparative freedom of choice in consumption, financial accounting becomes of at least equal importance. Only the relation between costs and receipts—the measure of financial success or failure—can indicate *which activities should be carried on*, while physical cost accounting measures relative efficiency in carrying out *any particular activity*. Obviously, some combination of the two is necessary. How far complete duplication should be carried is a matter for further enquiry. What is quite clear is that expenditure on exact information is not only necessary in the national interest, but is a productive outlay for those who undertake it.

Even though much further thought needs to be given to the question of the exact form of accounting best suited to British conditions, there is a great deal to be said for an authoritative endorsement of the general principle of uniformity. Only then will it be possible to overcome the objections which will always be raised when changes of system are suggested. Uniformity for each industrial subgroup ought, in the ideal state, to extend to both cost and financial accounting, and it is worth having even before the perfect system has been evolved. Indeed, the actual practices adopted as the standard should be subject to continuous review in the light of changing requirements and the development of instructed opinion in all accounting circles. This should make it possible to achieve a compromise to which all can work. The adoption of any such system of standardised accounting would not mean that there would be no place for a skilled and highly trained industrial accountant. He would still be concerned with systems for dealing with particular refinements required by his firm, but not yet standard practice, with suggestions for improvement of the existing standard, and with the hundred and one matters, outside accountancy proper, which tend to occupy the more highly trained accountant and auditor in industry.

Advantages to Industry

The advantages of a uniform system of accounting in all its manifestations are so great that it is surprising that more numerous and effective efforts have not been made to achieve it. The explanation lies, probably, in an inherent distrust of "scientific" methods by the average business man. That is passing in the newer industries, and the change should be made general. Uniformity means, after the initial difficulties of change-over, a substantial reduction in the cost of account keeping. Because the decisions are all taken in advance, the staff can be trained centrally, and the actual records can be mechanised. This in turn means that a continuous supply of comparable figures is available to provide a check on efficiency and performance. The system, even if not applied in full detail, would be of tremendous benefit to the small firm. Under present conditions, such a firm cannot afford to evolve a suitable system of costing in detail for itself, and this is one of the reasons impeding the grant of direct Government contracts to small firms.

Further, a uniform system of accounts would provide a really sound basis, not only for central planning—insofar as that may be necessary—but also for a policy of industrial taxation of a more logical and helpful character than has so far been attempted in this country. It is essential that Government departments should draw their information in part at least from a centralised statistical service, and uniform accounts would go a long way towards supplying the information required for such a service. Different rates of taxation could be levied on different sources and dispositions of industrial income if there were an assurance that standardised definitions of terms were in use. Finally, accounts of this sort would be a sound basis for granting finance at long and short date, and should mean that the efficient firm, even if small, obtained, on more favourable terms than in the past, both finance and other services in which the status of the firm was an element.

It is probable that there would be considerable initial objection from both managements and accountants to the degree of uniformity required for national purposes. The principal advantages of the change to concerns with an efficient system would flow from the establishment of a central statistical office for the information of Government departments as well as of the public. Therefore, this reform and an improvement in the system of taxing industry should go hand in hand with the reform of company accounts, both in the matter of greater uniformity, and in that of providing more, and more accurate, information in published figures.

Business Notes

The Circulation

The Bank of England note circulation has for the past eleven weeks acquired a stability without precedent for any comparable period since the outbreak of the war. Between April 21st and July 7th the active circulation has shown a net increase of £1,735,000, while over the corresponding period of last year it rose by £40,292,000. Does this indicate a definite change in the secular trend? The evidence so far available does not allow a definite answer to this question. Wage rates are still increasing, though it is probable that the aggregate wages bill has shown little change over the past six months. Something approaching full mobilisation has been achieved, and the effect of recent increases in rates of wages has to some extent been offset by the steady intake of the newer classes and of de-reserved men into the armed Forces. On this score, therefore, the

NOTE CIRCULATION, JULY 1939—JUNE 1943

Based on monthly averages of weekly Bank of England returns.

recent flattening in the note circulation curve is not altogether surprising. But there are two special factors which have contributed to the movement, and may even account for the larger part of it. The first is the Wings for Victory campaign. This savings drive has undoubtedly caught the public imagination more effectively than any of its predecessors. Throughout the country, it probably induced a substantial number of notes to emerge from their hoards. In the second place, the period of stability in the note circulation began with the Bank of England's announcement that notes of larger denominations were no longer to be issued. Since the last week of April, when this announcement was made, appreciable quantities of these larger notes have come back from circulation. Some have made the return journey by devious and insalubrious channels, where they have been changing hands at discounts ranging up to 30 per cent. These are the notes which had provided part of the stock in trade of the black marketeers and tax dodgers, who, in order to rid themselves of them without leaving incriminating evidence, have been prepared to sell them at less than their face value. Bookmakers are one of the agencies through which such business has been conducted. The fact that a £1,000 note has changed hands at £700 to £800 betokens a very bad conscience, or a very imperfect market, or, more probably, both. These two special factors have now spent their force, and the course of the circulation over the next few weeks—allowing for the inevitable holiday expansion—should provide a more valid indication of the real trend.

Post-War Shipping

Before the war, the world's merchant shipping tonnage—steamers and motorships exclusive of American Lake vessels—was 66 million gross tons; less than half of this total—30.4 million gross tons—were classified by Lloyd's Register of Shipping as ocean-going tonnage "available for general cargo and passenger purposes." Although the shipping tonnage of the United Nations is now growing as a

result of the great expansion in American production and the decline in sinkings, it has been heavily depleted during the past three years. There is little information about Japan's position, but the tonnage controlled by Germany and Italy must be appreciably smaller than three years ago. In sum, the present world tonnage is probably well below the pre-war figures. It is impossible, at this stage, to forecast the total tonnage likely to be available at the end of the war. But it is significant that the rate of construction in American, British and Canadian shipyards already exceeds the combined rate of the sinkings of United Nations' vessels by the Axis and of Axis ships by the United Nations, as well as ordinary marine losses. The world's total tonnage, in fact, is growing again and, if the war lasts long enough—say, another two years—it will end with a global tonnage as large as at its beginning, though not with the types in the proportions required for peace. Whatever the assumptions about the size of the world's tonnage at the end of the war, there can be no doubt that the deficiency—at least in cargo vessels and tankers—could be made good fairly rapidly. The United States alone hopes to construct some 12½ million gross tons this year; together, the United States, the United Kingdom and Canada should be in a position to build ships at the rate of more than 15 million gross tons a year. The building capacity of the world as a whole will be still larger. Any conceivable shortage in freighters could therefore be made good in two years or less, though the provision of an adequate tonnage of passenger and other specialised vessels would take longer.

America's Place as a Shipowner

The geographical distribution of the world's shipping tonnage will be very different at the end of the war from what it was at the beginning. The United States is already the biggest shipbuilder and on the way to becoming the biggest owner. Continental fleets will be depleted; a heavy toll may still be taken of Japan's merchant tonnage, and Great Britain's may have shrunk severely. This does not mean that the United States will be able, or even anxious, to retain the position of the biggest shipbuilder and shipowner after the war, when the deficiency of the world's merchant fleet has been made good. Naturally, the proportion of America's trade that should be carried in American bottoms after the war is high on the list of post-war shipping problems now being examined by the United States Maritime Commission. True, there was a time when America carried nearly all its foreign trade in its own ships. In 1825, when the American clipper was the fastest craft afloat, American ships carried nine-tenths of American trade; at the beginning of the present century the proportion was less than one-tenth, but it began to rise again during the Great War, reaching three-tenths in 1940. Some Americans hold the view, partly for reasons of defence, that the United States should aim at carrying half the total of its imports and exports in its own vessels; on the basis of pre-war trade, this would involve an American gross tonnage of about 15 millions, against 9 millions in 1939, when Great Britain owned 18 million gross tons. Others, however, point out that the application of this principle would injure other countries, such as Britain and Norway, a substantial part of whose national income is derived from shipping services rendered to other nations. The importance of the "defence" argument will depend largely on the nature of the peace settlement that will be concluded. But, if that settlement appears to hold out prospects of an enduring peace, the financial considerations involved in the maintenance of large shipbuilding and shipping industries will scarcely be overlooked. It can be taken almost for granted that the United States will be anxious to have a bigger merchant fleet than before the war; Congress may be willing to pay a subsidy for that purpose (which will not otherwise be achieved), but it is unlikely that America will wish to carry a large proportion of the trade of other countries below cost.

Pacific Gamble

The movements in stock market prices which attract attention continue to be concentrated in the more speculative markets, where the chance of a marked increase in profit and turnover in the post-war period is most evident.

**OVER 1,000 FIRES

YOU CAN'T BE TOO CAREFUL!

Diamond shares were bought, largely for their war-time attractions, which had not been fully realised, but partly on post-war prospects. The transfer into South African gold mines was almost entirely dictated by considerations of recovery once the conflict is over. This week both these sections are rather out of favour, and rubber shares have been brought into prominence by the re-opening of the offensive in the Pacific. Shares have in many cases risen to levels which suggest a belief that recovery of states may not be very far off. This movement is premature, to say the least. The stock market deserves attention for quite other reasons than the rise in rubber shares. Monday last was the best day for a number of weeks and the increase in bargains received and, probably, in actual turnover occurred in no small measure in the commercial and industrial list, while there has been a distinct improvement in gilt-edged stocks of all types. There are signs of reviving interest in genuine investment stocks and shares. As happened last year, July may see a resumption, but on a modest scale, of the rise which was reversed during June.

Uniting the Francs

The difficulties which have been experienced in the political and military negotiations at Algiers have had their counterpart on the financial front. The rapid unification of the monetary regimes in the de Gaulle and Giraud territories, which had been expected to follow as a matter of course from the hard-won political unification, has yet to be announced. For the time being, therefore, the territories controlled by the French Committee of National Liberation have a dual currency. The former de Gaulle territories have a franc based on sterling, and quoted at 176½ to the £. The North African franc has no specific exchange allegiance, but is quoted at 200 to the £ and 50 to the dollar. Thus de Gaulle continues to be quoted at a premium on Giraud and, now that the two generals have been assured of supreme military command in their respective territories, fears have been expressed that the monetary unification for which most people had been waiting may be deferred *sine die*. These fears should prove groundless since the arguments in favour of currency unification could hardly be stronger than they are. In undertaking unification of the two currency systems those responsible may be prepared to effect a fundamental revision of the rate. Recent reports from North Africa suggest that, measured by wage rates and the cost of living, the franc is considerably overvalued even at 200 to the £. In the black market, a pound note sells for 700 francs. On this evidence it would certainly be difficult to unify the two currencies on the basis of the de Gaulle rate of exchange.

Fixing the Lira Rate

It was reported this week that the Allied military authorities had fixed a rate of exchange of 480 lire to the £ in the occupied island of Pantellaria. Questioned on the matter in Parliament, the Chancellor of the Exchequer refused to be drawn and promised a statement on the problem of the sterling-lira exchange "at a convenient opportunity," adding that in fixing the proper rate of exchange the basic consideration of the Government must be to take account of the relative economic factors, "including local prices, wages and other elements." The decision, which can hardly be of any great practical importance in the case of Pantellaria, lies wholly with the appropriate authorities at the War Office, though any rate fixed by the military must obviously establish a strong precedent for the more permanent arrangements that may subsequently be made. The rate of 480 lire to the £, apparently fixed in the occupied Mediterranean islands, follows the precedent created by the British military authorities in the various territories of Italian Africa. It is, however, significant that this rate should have been chosen to apply to the first part of metropolitan Italian territory to be occupied, and thus provides an obvious point of departure for the larger scale exchange decisions that may have to be taken in the future. In the early months of the war, when Italy was still non-belligerent, the lira was officially quoted at about 78 to the £. This, however, was a decidedly unrepresentative rate, and in the black markets rates of up to 400 lire to the £ were quoted for sterling bank notes. Vatican City could formerly provide the best facilities for such exchange operations, and its unique status, since Italy entered the war, must have enhanced its advantages as a

centre for exchange arbitrage. The rates recently quoted for sterling notes and dollar bills in this neutral Italian enclave do not suggest that the British military authorities have unduly depreciated the lira in giving it an exchange value of 480 to the £ in the occupied Italian territories.

Treasury Deposit Receipts

Since April, 1942, the monthly debt returns have indicated how much of the total Treasury deposit receipt redemptions represented pre-encashments and, by subtraction, how much of the TDRs repaid during the month had been held to maturity. The revelation of the pre-encashments has been made retrospective to the beginning of the TDR issue by the Chancellor of the Exchequer, who recently gave the information in a written answer in Parliament. With this complete data on TDR pre-encashments, it is now possible to give the accompanying table showing for each quarter and half-year since July, 1940, the segregation of TDR redemptions into pre-encashments and receipts held to maturity. The percentage figures shown in italics in the second column measure the TDRs held to maturity in any particular half-year as a proportion of those issued in the previous half-year. The TDRs held to maturity up to June 30th last represented 76.5 per cent of the total issued up to the end of 1942. The amount of quarterly pre-encashments will be seen to have varied widely and to

have reached their peaks during the big savings campaigns, particularly during the first quarter of 1942, which included the bulk of the Warships Weeks when pre-encashments were actually heavier than the redemptions of TDRs held to maturity. To complete the table, the holding of TDRs by the clearing banks has been contrasted at the end of each half-year with TDRs outstanding on these dates. This week it was announced in the Commons that of the TDRs encashed up to June 30th last the proceeds of about £525 million had been subscribed to the Government's 2½ per cent National War Bonds and £225 million to the two 3 per cent loans. As the total of pre-encashments up to that date amounted to £1,095,500,000, this would leave £345,500,000 to be accounted for, mainly by the conversion of TDRs into tax reserve certificates.

National Union of Railwaymen

The main issues which the National Union of Railwaymen discussed at their annual conference this week have

been, first, the wages increase; secondly, post-war control of the railways; and thirdly, the union organisation of railway workers. The acceptance by the unions' executives of a 4s. 6d. increase instead of the 10s. originally asked for has, as might be expected, proved unpopular with the rank and file. The union leaders were criticised for not having done better, and the view was strongly expressed that as the Government and railway stockholders had done so well out of the wartime arrangement, it was only fair that railway workers should derive an equal share of the cake. In fact the rent paid by the Government to the railway companies is only slightly above average pre-war net revenues, while the wages bill rose by 44 per cent between 1938 and 1942, with a slight decrease in the numbers employed. Nevertheless, from the point of view of the public interest, the unions' action in not pressing for the full demand at this stage is both realistic and patriotic. The conference passed a resolution calling for the nationalisation of all forms of transport at the earliest possible moment. While it is obviously reasonable to view the transport system as a whole, doubts may well be raised about the practicability of nationalising the multiplicity of road transport organisations. The NUR has recently been active in pressing for a reorganisation of the trade union movement, in order to avoid overlapping and divergence of policy. The railway unions have themselves taken practical steps to implement this policy—their claim for a wage increase was presented jointly with the Railway Clerks' Association and the Amalgamated Society of Locomotive Engineers and Firemen, and a national joint committee of the three unions has been set up to consider further action. Negotiations are still going on, but it seems unlikely that a complete merger will be reached of the three unions. The NUR itself has a membership of over 400,000, against the railway clerks' 78,000 and the locomotives' 61,000, and there may well be a desire on the part of the smaller, more specialised, unions to preserve their independence.

Weakness of Preference Shares

The June figures of *The Actuaries' Investment Index* show a fall in the value of industrial equities, the second in twelve months. This leaves the total index still above the end-April level, and it is probable that a considerable fraction of the June loss will already have been made good by this time. The features of the industrial list are sharp falls in aircraft and iron and steel shares and rises of corresponding importance in gas and oil. More interesting is the fact that there is a much sharper recession in

industrial preference shares. The decline in fixed interest stocks, which began with long-term gilt-edged in February and spread to industrial debentures in March, only commenced in preference shares in May. In two months, however, the fall has sufficed to put back the index to the level of mid-February. Despite a number of considerable rises in certain Government stocks—mainly short-dated—during June, this index shows a continuance of the steady decline in this section, a movement since reversed.

What is Revenue?

Study of the judgment in the case of the *Imperial Tobacco Company v. H.M. Inspector of Taxes*, recently decided against the company in the Court of Appeal, suggests that there exists a striking discrepancy between the legal definition of revenue and that which would seem desirable in the public interest. The essential point of the case was that the company had bought dollars to pay for tobacco leaf. Before the purchase was made, the Treasury requisitioned the dollars at the new price, which gave the company a profit in sterling. They claim this is a capital profit; the Master of the Rolls decided that it was a revenue profit, and he made it clear that his judgment would have been the same had the profit been made on a purchase of any commodity. Apparently, the reason for so deciding was that the purchase of dollars was made in the course of a transaction on revenue account. In the course of his judgment, the Master of the Rolls referred to, and endorsed, the findings of the *McKinlay* case, in which a profit, made on a purchase of lira, was deemed to be a speculation and, as such, a capital transaction. These two cases provide a fairly clear definition, on very high authority, of what is a capital and what a revenue profit. Both were tax cases, and it is possible that it was only with the question of whether the receipt should rank for tax in their minds that the judges concerned reached their decision. However that may be, the result is not desirable. In the case of *Imperial Tobacco*, it is clear that the "profit" on the sale of the dollars is not a sum which ought to be considered to be at the disposal of the directors for any purpose they think fit. Without attempting to assess the post-war value of the dollar, it is clear that the company must regard the profit on the sale as a reserve which may very probably be needed to enable them to purchase adequate stocks of leaf, whereas in the *McKinlay* case the profit could have been distributed to the extent that the operation was a speculation and not one undertaken in the course of financing a normal business which involved trading with Italy in lira. Some accountants would contend that all is well if the money capital of a company is intact. A sounder view is that the funds of the company should be maintained at a level which will permit the maintenance of physical turnover despite a fall in the value of money. Even those who hold the former view would, probably, not be prepared to advise Imperial Tobacco to distribute the profit under consideration. It is essential that the legal and Inland Revenue definitions of what is revenue should be brought into much closer relationship with the sums which a prudent business man would regard as being available for distribution or addition to free reserves.

Canadian Holdings

The figures of British holdings of Canadian securities, given by Mr J. L. Ilsley, Canadian Minister of Finance, reach an impressive total of \$586,900,000 and £107,700,000, that is over £250 millions in all. These are at market prices at the end of last year and they include, besides some equities which are household words, the bonds of cities, some in default which stand well below par. It has been suggested in the past that these securities might be "vested" after the war in order to redeem the interest free loan which arose from the funding of Canadian holdings of British Treasury bills, but there is apparently no such intention on the part of Mr Ilsley. He regards the line taken by Canada in the matter of taking over securities as similar to that of India and South Africa and it will be welcome news to holders of such shares as International Nickel that he considers the continuance of British holdings of Canadian stocks as in the mutual interest of the two countries. This is no doubt the proper view to take of the matter, especially in view of the Dominion's increased ability to export after the war, but it is not every country which sees even its own interest as clearly as does Canada, possibly because few are prepared to take so much account of the other fellow's point of view. It seems probable that the British investor will continue to hold a considerable stake in the Dominion after the war, but the question remains of how the interest-free loan is to be settled. That, however, must be left for treatment in the final clearing up of commitments which should follow the end of the present hostilities.

Debate on Forestry

On Tuesday the House of Commons debated the 50-year plan for forestry prepared by the Forestry Commissioners and published as a White Paper (Cmd. 6447) last month. The plan, which was summarised in *The Economist* on June 12th, provides for a forest area of 5 million acres—2 millions from existing woodlands and 3 millions by the afforestation of bare ground—to be attained during a period of 50 years. The net outlay for a "desirable programme" of planting 1,100,000 acres in the first decade is estimated at £41.2 millions; an alternative and more modest programme of planting 875,000 acres during the first decade would involve an outlay of £32 millions, compared with a net outlay of £13.8 millions on a corresponding pre-war basis. Sir William Jowitt, Minister without Portfolio, encouraged the Forestry Commissioners to take such steps as are now open to them to prepare for an extension of planting, for the reserve of standing timber is likely to be negligible at the end of the war. At the same time he informed the House of Commons that the Government had not yet reached a decision about the scale of planting, but that, in view of other commitments, the "desirable programme" may have to be pruned. The considerations which should shape the forestry programme are the same as those which should determine agricultural policy. A reserve of standing timber is no doubt desirable, indeed essential; but the problem is to decide, on economic grounds, how much should be invested in it and whether timber could be secured more cheaply from abroad in exchange for goods and services.

Aircraft Production

In the House of Commons on Wednesday Sir Stafford Cripps referred to the rumours now "being put about, perhaps by people who are interested in the old management" of Short Bros., to the effect that production had decreased since the assumption of control. These are in flat contradiction of the Minister's statement a week ago that output had shown a marked increase during the past month, though it was too early to form a considered judgment. It is to be hoped that a definite statement will be issued as soon as possible, since ill-informed gossip can only be harmful in its effects. There is another matter which MAP might investigate—the shop stewards of a group of aircraft factories in Greater London which is engaged on the manufacture of a heavy bomber, have made serious allegations about defects in the organisation of production in the group. They complain that in most of the factories in the group there is a complete lack of co-operation between the management and the workers, and a consequent failure to make the joint production committees function effectively. One factory, the key to the whole group, is said to be causing a serious bottleneck, and is thereby holding up production in the remainder. The shop stewards allege that only 15 per cent of the machine shop capacity in this plant is now being utilised, and that there is an excessive amount

of idle time; they complain about the absence of proper progressing and planning; the lack of effective supervision; a lack of balance in the machine shop resulting in persistent shortages and excessive scrap, and a misuse of skilled labour, and many other defects. They claim that output could be doubled, since other firms engaged on the same bomber produce twice as many a week, with the same number of men. While it is impossible for the layman to judge the merits of the case, it is apparent that the shop stewards are restive, and that dissatisfaction is spreading throughout the workers of the group. Their allegations should be investigated, and it seems reasonable, as they suggest, that there should be better co-ordination between factories engaged on the same product, and a joint production committee to cover the entire group. If it is not possible to increase production, then the workpeople should be given the reasons—in general, if not in detail. Sir Stafford Cripps himself has often acknowledged the value of the joint production committee machinery, and welcomed the workers' interest and initiative in production. If this interest is not encouraged, a sense of frustration may well set in.

Workers' Incomes

The partial census of the earnings of workers, taken by the Ministry of Labour in respect of the last pay-weeks in January and July, reveals changes in the absolute and relative money earnings of men, women, boys and girls in the majority of industries. Among the industries not yet covered by the census, agriculture, coal-mining, railways and merchant shipping are the most important. The table at the foot of this page summarises the results of the census taken last January, and it shows the percentage changes in earnings since October, 1938, and since July, 1942. In order to overcome the statistical difficulty arising from the fact that the returns cover a higher proportion of workers in some industries than in others—the total number of workers included in the census is about 6½ millions—the returns have been adjusted on the basis of the estimated number of persons employed in each industry. The figures tell their own story. The general trend of earnings has continued upwards, but the earnings of women have risen appreciably faster than those of men. The decline of earnings in the building industry and among boys requires comment. The one is due to the shorter working week in winter and to the new restrictions on overtime and Sunday work; the other may be ascribed, apart from the shorter working week in some industries, to the reduction in the average age of youths caused by the lowering of the age of call-up. The rise in average earnings since October, 1938, is the combined result of a number of factors. The transfer of workers from industries and occupations in which wage rates were relatively low to others with a higher level of wage rates played an important part; if workers had been employed in January, 1943, in the same proportions as they were employed in the various industries in October, 1938, the rise in earnings would have been 54 per cent for men, against 64.9 per cent;

* In calculating the averages for women and for all workers, given in this table, women employed as part-time workers for not more than 30 hours a week have been included. on the basis of two part-timers taken as representing one full-timer.

† The number returned in this group was very small.

SEEING

YOU are using your eyes now to read this. Your sense of sight is in use all day long, every minute you are awake. Have you ever realised how dependent you are on it? Reading or writing, walking or driving, recognising friends, choosing and eating your food, you are using your eyes to see all the time.

If the light is not good you will be uncomfortable, you will not be able to do any of these things as well—but of course you would not put up with it, you will soon have that lighting improved.

But if it affects you it also affects your workers. If their lighting is poor they will not be able to work as well,

they will waste the materials you have provided, your machines will not work so efficiently as they should, your money will be wasted.

Of course you will not allow your works to be badly lit, any more than you will put up with poor lighting in your own office. You need the best lighting for your workpeople to suit their particular requirements. That means Benjamin Lighting.

Benjamin are specialists in industrial lighting. For more than a lifetime Benjamin have studied lighting in theory and in practice, in every kind of factory. Benjamin know how best to serve your needs.

COMPANY MEETINGS

AMALGAMATED PRESS,
LIMITED

INCREASED PROFITS

The annual general meeting of the Amalgamated Press, Limited, was held, on the 1st instant, in London.

Viscount Camrose, the chairman, in the course of his speech, said: The trading for the year has resulted in a profit of £973,000, an increase over the previous year of £223,000. Obviously, a great deal of this increased profit is due to the circumstances of war. Apart, however, from what can be described as the regulated economy of war-time production, there is another factor which, as I noted last year, has contributed largely to the profits—namely, the abandonment of peace-time policies of a doubtful economic nature. I instanced the question of unrestricted returns, which cost the industry many hundreds of thousands a year; and the distribution of contents bills on such a wholesale scale that a large percentage were just sheer waste of material and labour. These were two definite savings which have most materially affected the results of every publishing house in the country, newspaper and periodical.

I repeat the hope which I then expressed that when peace comes we shall have too much sense to resume these wasteful practices.

While our profits have risen by the substantial sum which I have just mentioned, the provision for tax has likewise sharply increased. Whereas last year we put aside £350,000 for this purpose, the accounts before you show that we have now to provide £562,000. This is in addition to the tax on the debenture interest, which is shown in the accounts as a gross figure. The increase in profits therefore goes almost entirely to the Government. We have, however, been able to increase the ordinary dividend to its pre-war figure of 11 per cent, and once again place £100,000 to the general reserve. The carry-forward is £221,000 against £218,000 brought in.

PERIODICALS' WAR-TIME SERVICES

The improved results have been achieved despite a further reduction in the amount of paper available and a substantial increase in price. There is no immediate prospect of any increase in the ration allowed to the industry, but there is reason to hope that we have now reached rock bottom in this matter of supplies.

Much has been said of newspapers in war-time and the essential contribution they make to the prosecution of the national cause. After nearly four years' experience few will be found to dispute this estimate. In the same way there is a great deal to be said for the value of the periodical. Just as people flock to cinemas and theatres and to other entertainments which give relief from the everyday strain of life under present conditions, so do the public turn to periodicals of all kinds with a similar object in view.

It must be noted, however, that most periodicals to-day do not exist for entertainment only. A large proportion of their contents is devoted to information and advice on subjects connected with the war effort. They also supply their readers with valuable and, indeed, essential information on foods, cookery, fuel and other special difficulties encountered in the homes of our people at the present time. Amalgamated Press editorial departments are in almost daily touch with the Government departments concerned with home affairs, and I am sure that they would willingly endorse what I have said of the value of the periodical Press to the nation to-day.

Our large investment in Kelly's Directories, Limited, after starting the war badly, has made an excellent recovery. During the year the company has resumed its practice of interim dividends and paid 5 per cent. in December last.

The report was adopted.

HAWKER SIDDELEY
AIRCRAFT COMPANY,
LIMITEDMR T. O. M. SOPWITH'S
STATEMENT

The annual general meeting of the Hawker Siddeley Aircraft Company, Limited, will be held, on the 15th instant, at the May Fair Hotel, London.

The following is an extract from the statement of the chairman, Mr. T. O. M. Sopwith, C.B.E., F.R.Ae.S., circulated with the report and accounts:—The board is satisfied with the liquid position of the company. Interim dividends of 15 per cent., less tax, and 17½ per cent., less tax, have already been paid, making a total for the year of 32½ per cent., less tax. This total is the same as that distributed last year, and it is not proposed to pay any further dividend for the year. The amount to be carried forward is £316,760.

The contribution made by the products of the operating companies to the equipment of the Allied Forces continues to be of increasing value and greater importance. Their names—Hurricane, Gladiator, Anson, Whitley, Lancaster, Typhoon—are household words, and the list of achievements to their credit is legion. I would instance one in particular, the assault on the Mohne and Eder dams, carried out by Lancaster aircraft—an outstanding achievement of the year, and one which has dealt the enemy a blow from which recovery is doubtful before the end of the war.

The restrictions so necessary under to-day's conditions make it impossible for me to give you a complete picture of the activities of this group and the exact nature of its products.

POST-WAR POSITION

That the aircraft industry cannot continue at to-day's level under post-war conditions is apparent. I do not, however, anticipate a falling off to the extent recently indicated in the Press.

As a group our principal interest is in aviation. Our military types are among the best in the world. I cannot contemplate any authority acting otherwise than to ensure a strong air arm.

The future of civil aviation, or, as I prefer to regard it, air transport, has been prominent of late. It is a subject which is of primary importance to the British Empire, and the need for an official statement of policy cannot be over emphasised. The difficulties are appreciated, but a broad indication is nevertheless essential if plans to deal with post-war conditions are to mature successfully. Our immediate interest is as producers, not operators, but our concern is mutual.

THE AVRO-YORK

We have now in production—and some passing reference has been made in other places to the type—a transport machine which I believe will form the main equipment of British operators in the immediate post-war years. I refer to the Avro-York. It is not permissible to supply details, neither may we release photographs, but the York, although based on the technical merit of the famous Lancaster bomber, has been adapted for transport work. It can operate economically over short or long routes on passenger, freight or special purpose duties, and in my opinion is the best of its type in the world to-day. It will be available to potential post-war operators immediately hostilities cease. Meanwhile, more advanced types are in development, and the knowledge gained under war conditions of assisted take-off, glider towed freighters, and high altitude operation will be turned to advantage.

Not only have your board considered these projects. They anticipate a demand for certain of their pre-war products—including the Armstrong-Siddeley car, which it is anticipated will be available with new and attractive features—and arrangements are in being to meet such demand.

"SHELL" TRANSPORT AND
TRADING COMPANY,
LIMITEDDEMAND FOR PETROLEUM
PRODUCTS

The annual general meeting of the "Shell" Transport and Trading Company, Limited, was held, on the 6th instant, in London, the Rt. Hon. Viscount Bearsted, M.C., presiding.

The following is an extract from the chairman's statement circulated with the report and accounts:—

The mounting increase of offensive operations by the United Nations in the air, on land and by sea has naturally affected the demand for petroleum products both in quantity and quality. The Group is playing its full part in meeting these demands and additionally, as a result of our research operations over so many years, we have been able to place at the disposal of the United Nations certain special processes which are of great importance to the war effort in providing some of the finer and more valuable petroleum products. Our research continues along the broadest lines and I have no doubt that the future will prove the wisdom of our having maintained these comprehensive organisations.

I am still not in a position to reveal any details of the operation of the Group's fleets, but I am sure you would not wish me to let this annual review go by without once again recording our appreciation of what the Group's fleet has done and is continuing to do. Nothing could illustrate more clearly the magnificent behaviour of our officers and men than the number of decorations awarded to them. Our Marine department is keeping fully abreast of the times. Research is constantly going on to ensure that such new vessels as we are building now and those we hope to build after the war shall be of the most up-to-date type.

In the United States in 1942 industry was geared to produce the maximum quantities of war materials, the demands for which were of such magnitude as to challenge its resourcefulness to the fullest extent. The oil industry has carried out its part of the war programme with vigour and efficiency, and in this connection the Shell Union Group of companies has been able to make a notable contribution to the war effort. Shell Union's trading results for 1942 are comparable with the previous year, in spite of the many difficulties it has had to face.

In Venezuela those companies in which we are interested have recently been carrying on negotiations relative to a proposed new Petroleum Law and to modifications in the terms of existing concessions. Those negotiations have been concluded and the new Petroleum Law passed. Whilst the cost of Venezuelan production will certainly increase, the Venezuelan Government on their side will grant new concessions with extended life.

The report was adopted.

WM. CORY AND SON,
LIMITED

The forty-seventh annual general meeting of Wm. Cory and Son, Limited, was held, on the 8th instant, in London.

Sir Arthur Cory-Wright, Bart., the chairman, said that the accounts showed a net profit of £675,587, an increase of some £9,000 compared with the previous year. After payment of the final dividend of 15 per cent. on the ordinary and employees stock, making 20 per cent. for the year £1,121,446 remained to be carried forward to next year's account. The accounts revealed a position of outstanding financial strength.

The supply of fuel of all description for the needs of industry and the mercantile marine, at home and overseas, was a task which had been carried on with unremitting attention under conditions which become increasingly difficult.

The report was adopted.

(Continued from page 56)

58 to 59 per cent for women, against 80 per cent; 65 per cent for youths and boys, against 72.8 per cent; and 66 per cent for girls, against 73.4 per cent. The relatively bigger advance in the earnings of women and youths than those of men is due largely to the fact that many of them are doing a "man's job." Next wage rates in the industries covered by the census rose by 26-27 per cent. But this still leaves the more than half of the rise in earnings unaccounted for. The difference is the result of fuller employment, with longer working hours and an increase in night shifts, and the extension of the system of payment by results. Much the greater part of the increase in the earnings of workers since 1938 is, in fact, ascribable to factors, some of which will cease to operate after the war. But the average increase in wage rates alone has been of the same order as the rise in the official cost of living index.

Bowater-Lloyd Payments

The Boards of the Bowater-Lloyd group of companies are to be congratulated upon having abandoned their idea of proposing a scheme for funding the arrears of dividend on the various preference capitals of the group. As has been pointed out on many occasions when dealing with schemes advanced by other boards, no scheme can be drawn up under existing circumstances, when the vital question of turnover cannot be assessed with any degree of accuracy, which does not risk doing grave injustice to one class of shareholder or another. The fact that schemes have in some cases received a wide measure of acceptance despite the fact that the future could not be gauged reflects a weakness on the part of the shareholder for certainty in the short run. The Bowater directors have decided that, instead of holding all earnings in reserve they will commence distributions in cash on account of arrears as soon as the accounts for September 30th are available. The dividends are in arrears for, approximately, four years and the sum involved is of the order of £1,000,000 gross. In the cases of Bowater's Paper Mills and Edward Lloyd senior preference payments of £52,000 and £84,000 gross, respectively, have to be cleared before the junior preference holders can receive anything. Payments are likely to be modest, unless there is a draft on past accumulations, and it seems probable that a funding scheme will eventually be necessary. The preference shares were marked down a trifle on the announcement, but there is no indication of any selling.

Correction

In a Note on page 22 of *The Economist*, last week, it was stated that the original preference shares of Messrs King and Shaxson bore interest at 15 per cent. This should have been 5 per cent, and the new capital consists of an additional 200,000 preference shares, which rank *pari passu* with those originally issued.

COMPANY RESULTS

Definitions of terms used in these tables are as follows:

Net fixed assets include everything from land to loose tools, less any distinguishable provision for writing them down.

Net inter-company items include holdings in, and loans and advances to, subsidiaries and associates, plus trade investments, minus all sums, other than dividends of the company, due to subsidiaries and associates.

Net liquid assets include all other assets less current liabilities, bank loans and profit and loss appropriations not retained as additions to reserves, carry forward, or other established funds.

COMPANY MEETINGS—continued

LONDON ASIATIC RUBBER
AND PRODUCE COMPANY,
LIMITED

MR H. J. WELCH'S SPEECH

At the annual general meeting of the London Asiatic Rubber and Produce Company, Limited, held, on 5th instant, in London, the chairman, Mr H. J. Welch, said: "We have unfortunately no news of what has been happening on the company's estates since they were occupied by the Japanese invaders. Doubtless tapping, on smallholdings and

on estates, has been continued sufficiently to supply all the rubber which could be put to any sort of use by the Japanese, including perhaps a considerable reserve stock. Our European estates staff numbered twenty men, of whom six are serving in the Forces, seven have been reported by the Japanese as prisoners of war, and three as civilian internees. We fully expect that the names of the other four men will be added. Expenditure includes the provision made, as authorised at our meeting of a year ago, for the Estates staff and their dependants.

The Revenue account shows a debit balance of £4,797, which falls to be deducted from the balance of £100,437 brought forward, leaving a credit balance

of £95,640. The net total of the liquid assets is £294,427—more than 30 per cent of the issued capital. This net figure is arrived at after deducting known liabilities (including liabilities in the East) and what we believe is ample provision for United Kingdom taxation. To provide for the reconditioning of the estates after we resume occupation and for other contingencies which cannot yet be foreseen, we have created the "Reserve for Special Contingencies" which stands at £106,646. We look forward to the time when our estates will again be earning profits from the production of rubber, which will remain an indispensable commodity.

The report and accounts were unanimously adopted.

Indices calculated by Wholesale Textile Association in collaboration with Bank of England.

Purchase Tax is not included; figures are therefore comparable throughout.

Source: Board of Trade Journal.

* Publication of Indices of Export Sales suspended in September, 1942.

Dried Eggs.—Grocers are being compensated for any loss incurred by the reduction in the price of dried eggs from 1s. 9d. a packet to 1s. 3d., which was made from June 27th. For one packet in every eight of their current allocation they will pay 9d. instead of the new price of 1s.

Points Changes.—The points value of biscuits and condensed milk was altered from the beginning of the new ration period on June 27th. Unsweetened biscuits are now two points per lb. instead of one; sweet and semi-sweet biscuits six instead of four; and chocolate biscuits twelve instead of eight. The points values of standard full-cream sweetened condensed milk are lowered by a quarter, and those of skimmed condensed milk doubled. There is no change in the individual points ration, which remains at 20.

Nuts and Bolts.—Alterations in the present controlled maximum prices of certain types of bolts and nuts are contained in the Control of Bolts, Nuts, Screws, Screw Studs, Washers and Rivets (No. 2) Order (S. R. and O., 1943, No. 884), issued by the Minister of Supply. The price list has also been extended to cover some types of aircraft bolts and nuts. The Order came into force on July 1st.

Leather for Shoes.—It is reported that special priority is to be given to shoe leather, although the shortage will not be relieved until next year. In the meantime, 40 per cent of women's shoes and 20 per cent of men's will be made with wooden soles.

Cotton Export Allocations.—Export allocations for cotton piece goods for the period July 1st to September 30th have been sent out by the Cotton Board. West Africa's share has been somewhat reduced to meet the essential needs of some other markets, notably Australia. While there are no basic alterations for most markets, quantities vary somewhat compared with the last period. It has once more been necessary to limit part of the production for certain markets to fabrics made from fine yarns (counts 50's or finer). This is due to the heavy demand for coarser yarns for the manufacture of direct war fabrics.

Alloy Conservation.—A new Direction has been issued by the Controller of Iron and Steel to all alloy steel ingot makers, the object of which is primarily alloy conservation. The main

reason for this is the enormous increase in the demand for alloy steel, which means that available supplies of alloying elements now have to be spread over a bigger tonnage of steel. The effect of this Direction is to limit the number of compositions available. The permitted compositions are practically all steels which have been made for some time. The basis of the new Direction consists of a table showing which steels are permitted for any given range of tensile strength and size. The new Direction is restrictive only in respect of alloy steels and it is hoped that both steelmakers and users will utilise carbon steels to the fullest possible extent.

Headwear Quota.—The headwear quota for the present period has been increased from 15 per cent to 25 per cent by value of supplies in the year 1941. The reason given is that it will provide employment for residual labour (mainly older workers) in areas where the proportion of withdrawals has been lowest. No manufacturer will be permitted to take on any labour other than that agreed with the Ministry of Labour local offices; the industry will be required to make frequent and full labour returns.

THE CHARTERED BANK OF INDIA AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

CAPITAL (PAID UP) - £3,000,000
RESERVE FUND - £3,000,000

Branches and Agencies throughout INDIA and the EAST
AFFILIATED BANK IN INDIA

THE ALLAHABAD BANK LTD., with 15 Branches & 30 Sub-Agencies
The Bank offers a complete Banking Service and provides exceptional facilities for financing every description of trade with the East.

Deposits for Fixed Periods or repayable at call or at short notice are received at rates which may be ascertained on application. The Bank also undertakes Trusteeships and Executorships.

LLOYDS BANK LIMITED

EXECUTORS AND TRUSTEES

The appointment of individuals as Executors and Trustees imposes on them heavy burdens and duties which they are not always in a position to fulfil. Especially is this the case in wartime, when life is so uncertain and so many difficulties arise in the administration of estates.

When the Bank is appointed, continuity is assured and a Testator can rely on his estate having the benefit of skilled and experienced management in connection with his investments and with the many other matters incidental to its administration.

The services of the Bank's Executor and Trustee Department are available to customers and non-customers of the Bank. A pamphlet giving terms and particulars will be sent free of charge, on application to any Branch.

Head Office: 71 Lombard Street, London, E.C.3

Good Intentions in Education

MR. R. A. BUTLER is to be congratulated on having produced an excellent White Paper on Educational Reconstruction. The achievement, so far, is a literary one only; the White Paper is charmingly written, it is inspired by the most admirable intentions and it outlines a number of desirable steps in educational reform to none of which any exception can be taken and some of which are highly welcome. A White Paper, however, is supposed to be more than a tract for the times; it is a declaration of the policy that the Government intends to carry out. It is one stage short of a Bill, two short of an Act, three (or three hundred) short of an achievement. Whether Mr Butler is in earnest is a question on which the White Paper sheds no light at all—except the rather disappointing light shed by the fact that it is a White Paper and not (as was promised) a Bill. If, as must be hoped, it is the first step in a real policy, and not merely a paper ideal to be retreated from, then at least it can be said that the first step is a longer one than seemed likely only a few months ago.

For an understanding of the reforms proposed, a reading of the White Paper is to be recommended. They can be only very briefly summarised here:

1. The school-leaving age is to be raised to 15 (with-out exemptions) as soon as possible after the war, with a further increase to 16 "at a later date." In addition, there is to be compulsory part-time attendance (in working hours) at "Young People's Colleges," for children

between the leaving age and 18. "Part-time," to begin with, is to be the equivalent of one day a week.

2. Primary education is to end, for all children, at the age of about 11. Secondary education is thus to be compulsory for all children between 11 and 15 (later 16), and free both for these children and also for those who stay on beyond the leaving age. Secondary schools are to be of three varieties—"grammar schools" (i.e., the present secondary schools), "modern schools" (developing out of the present central schools) and "technical schools." These three varieties are to be of equal social and educational standing.

3. The present power of local authorities to provide nursery schools for children from 2 to 5 is to be changed into a duty to provide them wherever the Board deems them to be necessary.

4. The school day is to begin with "a corporate act of worship," and there is to be religious instruction in all schools on the basis of an agreed (undenominational) "syllabus." It will be open to the parent to withdraw his child from all or any form of religious worship or instruction. In schools wholly owned by the local authorities, children may be "withdrawn" for specified periods of such denominational religious instruction as the parents wish. Only in exceptional cases will this instruction be given on the school premises. There is a complicated set of provisions for the further integration of "non-provided" (i.e., church) schools into the national system. The general purport is that unless the owners can find half the cost of necessary alterations and improvements, they are to lose their majority on the managing body, and their right

to appoint and dismiss teachers; but they will retain the right to be "satisfied" as to the appointment of a limited number of "reserved" teachers.

5. There are to be somewhat vaguely defined developments in technical, commercial and art education; in adult education; in youth service; in the school medical service, and the provision of meals in schools; and in assistance to poor scholars in reaching the university.

6. All private schools are to be inspected and registered. If they do not reach the required standards, they may be closed.

7. No local authority other than a county council or a county borough council is to be a local education authority, and every LEA shall have jurisdiction over the whole range of education. Boroughs and urban districts may (and if they have a population of 60,000 shall) have district education committees exercising such powers as are to be delegated to them by the county. There is to be power to amalgamate small county and county borough areas for education purposes.

All these are steps in the right direction. Some of them seem a little timid—the indefinite deferment of the raising of the leaving age to 16; the definition of "part-time" schooling for the 15-18 group as one day, with a similarly indefinite deferment of any increase; the failure to remove all qualification from the duty to provide nursery schools. But, to offset these imperfections, there are several items in the programme that will cause very general satisfaction. The chief of these is the announcement of universal, compulsory and free secondary education; and hardly second is the beginning—even if it is only a beginning—of part-time education for older children. When these two reforms have been enacted, the country will be within sight of the goal of this section of educational reform—namely, that all minors should be regarded as citizens in training. The religious proposals seem reasonable to the layman, even though (or perhaps because) they will not please either extreme of opinion. The provisions for the church schools, if fully enforced, should serve to end the scandal of the "black list," about which there is some commendably frank writing in the White Paper. Very few of the Anglican schools will be able to find the money necessary to retain their independence; and, if they do not, the appointment and dismissal of teachers—the most important point from an educational point of view—will pass to the education authority. When it is remembered that the overwhelming majority of village schools are still "non-provided," the significance of this reform will be seen to be considerable; in many parts of the country it means that efficient and modern education will, for the first time, be available in rural areas.

The proposed concentration of educational powers in the county and county borough councils is also a badly needed reform. The present system suffers from the double defect that, in many areas, two different authorities are responsible for primary and secondary education, and that many of the areas are far too small for efficiency. The former defect will be removed by the proposed reform; but not the latter. In England and Wales as a whole, there were, at the time of the 1931 census, 145 administrative counties and county boroughs, with an average population of 276,000. But the average is deceptive, since it is swollen by such giants as London and Lancashire among the counties, Birmingham and Liverpool among the county boroughs. Even if every county or county borough with a population of less than 75,000 (there is a hint in the White Paper that this is the minimum) were merged in a larger area for the purpose of education, the median population would still be as low as 303,000 among the English counties, 157,000 among the Welsh counties (half of which would have to be merged) and 122,000 among the county boroughs. To secure a fully efficient educational system, with sufficient choice of the different varieties of schools, a population of 400,000 should probably be regarded as the minimum. There are only a score of these. The areas will thus remain too small—though it would be impractical to hope for any larger areas so long as education continues to be administered through local authori-

ties and so long as the county and the county borough remain the largest units in existence.

The items on Mr Butler's programme can thus, with some qualifications, be given a sincere welcome. But it is a sound rule to look all political gift-horses very closely in the teeth—and experience would advise that those of the educational breed be inspected with the utmost scepticism. From the policy outlined in the White Paper there are three large and admitted omissions. Very little is said about the supply, training and status of teachers, on which every hope of reform and advance necessarily rests. Even less is said about the content of education—the curriculum of the schools and their integration with the universities. And almost nothing is said about the very vexed question of the public schools—which is not really educational at all, but social and political. The reason for the omission is the same in each case—that a committee is sitting on the problem. The report of Sir Cyril Norwood's committee on the curriculum is almost ready; Sir Arnold McNair's committee on the training of teachers is expected to report later in the year, and a report is also awaited from Lord Fleming's committee on the public schools. It would have been equally improper for the Board to have pronounced on these questions before receiving the reports or to have delayed the rest of its policy until they had been received. But the effect is none the less unfortunate, for the White Paper is left announcing a performance of "Hamlet" without any assurance that there will be a stage manager, or that the Prince of Denmark will mix with the other players, or that there will be an agreed version of their lines. Before it will be possible to judge whether or not there is likely to be any real advance in British education, it will be necessary not merely to observe what happens to the proposals in the White Paper, but also to await both the appearance of three separate reports and the action, if any, that is taken upon them. There are, unfortunately, infinite possibilities of mutual obstruction in this procedure.

If this comment seems unnecessarily cynical, the jaundice must be ascribed to the lessons of British educational history in the past thirty years. Education Bills have an unhappy history, and even when they have become Acts, they lack enforcement. There is no other sphere of public policy where there is such an enormous gap between the politicians' promises—even those they have written into the statute book—and actual performance. The chief reason for this—but not the only one—is to be found in the fact that education policy is administered through the local authorities, who have to find over half the total cost (£48.3 million out of £93.8 million in 1938-39). Except for the minority of authorities who have both the will and the means to take pride in their schools, the Board's minimum standards tend to become maximum standards, and the powers that successive Acts have conferred upon the local authorities in such matters as nursery schools remain largely unused. The White Paper shows some realisation of this difficulty. In a number of cases, powers are to be converted into duties—though usually with some qualification to the language or ambiguity in it. In the education—it is provided that each authority is to prepare a scheme, on the basis of which the Board will make an order, embodying a time-table. It is also provided, in connection with compulsory part-time education, that "to obviate one of the causes of the previous failure to operate the Act of 1918," the Appointed Day shall be the same for the whole country—though this might mean an unduly delayed Appointed Day.

It is not recalcitrance among the local authorities that is the chief difficulty. Their slowness to move arises from poverty. Before the war, education represented about a quarter of the total burden on the rates. The Appendix to the White Paper shows that the £48 million spent out of the rates in 1938-39 will have risen to £56½ millions after the war before any additional cost arising out of reforms. It is part of the present scheme that the Exchequer grant shall be increased to a maximum of 55

per cent; but even so the burden on the rates will increase to £67.6 millions in the seventh year of the reforms and to £79.9 millions "ultimately." In other words, if local authorities are to play their part, the rates will have to be increased by an average of 16 per cent for this purpose alone—to say nothing of the further burdens that are to be imposed for town and country planning, medical services, housing and the rest. It simply cannot be done. If the financial aspect of the proposals remains as outlined in the White Paper, the scheme will never come into existence, no matter how brave the words of the Board or how mandatory the terms of its Act. Every possible loophole for failing in their duty will be sought by the poorer authorities, and the Board will be forced, in spite of itself, to use its discretion in favour of leniency and delay. Mr Butler can hardly be blamed for failing to secure a complete reform of local government finance as a side-line in his White Paper; but he ought to realise (as should the town planners and the medical reformers) that until there is such a reform none of their plans can hope to be more than moderately successful.

Financial realism would greatly improve the outlook for the White Paper proposals. But something more is needed

before the cynical smile will be removed from the spectator's face. Rightly or wrongly, the Board of Education has acquired the reputation of being a lackadaisical department which seldom succeeds in delivering the goods. It is not only the local authorities who need to be held down to a time-table worked out in advance, but the Board itself as well. Not everything, of course, can be done at once; there are schools to be built and teachers to be trained. Nor is it possible to foresee when, with victory, the whole procession can start. But it should be possible to work out in advance, and to embody in the Act, how long each stage should take after the single Appointed Day when the starting button is pressed. The financial estimates in the White Paper are clearly based upon a time-table; it should be embodied in the Act. Escape clauses there would have to be; but it is essential that the difficult and embarrassing initiative of issuing a special Order should be needed to escape from the time-table, not to keep to it. If Mr Butler can, first, repair the omissions in his White Paper and, then, pilot through Parliament a Bill which unambiguously commits him and his successors, he will be, beyond question, the most effective President the Board has ever had. Until then, a certain scepticism will be in order.

Colonial Development

EDUCATIONAL advance and economic development, according to the Colonial Secretary, are the twin pillars upon which any sound scheme of political responsibility in the colonies must be based. There is nothing epoch-making about this statement. For some time now there has been very wide agreement that the major fault of British colonial policy in the past has been the neglect of the material progress which is essential to political progress; "development and welfare" is a phrase which has won a wider vogue even than "trusteeship and the dual mandate." Where disagreement arises is how development and welfare; but particularly development, is to be achieved.

Official pronouncements have been disappointing in this respect. Successive Secretaries of State for the Colonies have pointed to the new Colonial Development and Welfare Fund, but not even they have ventured to suggest that its resources and scope are adequate. Even Colonel Stanley, in his speech in the House of Commons last week, which came far nearer than those of his predecessors to dealing with realities, was less specific when he came to the application of principle in economic development than he was when discussing education. He said that the objective is to make the colonies self-supporting—not, he hastened to add, self-contained. He reiterated the predominant importance of agricultural development. He dealt at some length with the develop-

ment of air communications. Finally, he gave his blessing to more industrialisation of the colonies—not, with another hasty addition, "a rash, mushroom industrial growth fostered by high protective tariffs . . ." but industries processing natural products for home consumption or for export, and simple manufactures which are not dependent on large quantities of imported raw materials.

This is good as far as it goes. A welcome must also be given to Colonel Stanley's view that the expansion of secondary industries in the colonies would in the long run be beneficial to British export trade. Under the Ottawa regime the colonies were deprived of the right to buy in the cheapest market. Now they are to be encouraged to make their own cheaper necessities, which will allow them a wider margin for the purchase of goods requiring skill in their manufacture—a class of goods in which the British export trade "will be able to compete on fair terms." But if the end of the Ottawa duties is implied by this statement there are still other questions fundamental to economic development which the Colonial Office has not answered. It has not said whether it still approves as strongly as ever of restriction schemes for raw materials and intends to allow them to be operated by international groups of producers. Such raw materials as copper, tin, tea, cotton and rubber will, in spite of "economic development," continue for

some time to be the mainstay of many colonies. Again, in the whole of Sir Frank Stockdale's long, detailed and, on the whole, encouraging report on development and welfare in the West Indies, no attempt has been made to solve the difficult but fundamental problem of land tenure. Or again, is the monopoly which the United Africa Company has in the trade of British West Africa to continue? Private capital is, according to Colonel Stanley, to be welcomed in post-war colonial development, provided that it is under proper control. Does this mean that the greater part of the wealth derived from the exploitation of a colonial asset will continue to be lost to the colony, as Northern Rhodesia now loses so large a part of its copper income through the payment of dividends and taxes in the United Kingdom? If the secondary industries are owned by private capital, will "proper control" ensure that the colonial peoples will be allowed to do skilled jobs?

Possibly the Colonial Office considers that as development is pursued questions such as these will settle themselves. This attitude would be in keeping with the empiricism with which it pursues colonial development in general. The alternative is development by a super board, distinct from the Colonial Office, which would undertake colonial development on the basis of a long-term plan. In recent months this proposal has won many adherents. Its latest advocates have written a book* in which it is worked out in detail. The authors have clearly a first-hand knowledge of many of the colonies, and the great merit of their book is that they have thought large. Whether their roving eye alights upon sparsely populated and deforested British Honduras or the dust bowl in Kenya their remedy is the same: development on a grand scale by an authority which can work to a long-term programme without having its day-to-day work subject to Parliamentary review, which can co-opt people from the Dominions in its tasks, which might with advantage eventually grow into a world development authority with all the undeveloped corners of the globe within its scope.

The great drawback of their scheme—and it applies to similar proposals for central development boards—is that they have forgotten the people. The authors realise, indeed, that development must be broken down to fit the needs of individual colonies, and they suggest local development authorities with directors appointed by the colonial governments concerned. They even, in one short paragraph, talk about associating the colonial peoples in the working-out of the policies adopted. But the whole book is pervaded with the idea that the poor, backward people of the colonies must be improved at all costs, and if they do not know what is good for them the development authority does.

Very likely many of the colonial peoples do not know what is good for them. But this does not, surely, mean that development is to be imposed upon them without their consent. If it does, it is contrary to the whole spirit of British colonial policy, which has always aimed at leading, not coercing, along the path of progress. The advocates of a central development board forget that the backwardness of the people, which they wish so passionately to cure, is often based on an old and very strong culture and social structure that cannot be swept aside in a day. If, therefore, a development board distinct

from the Colonial Office were set up, a time would come when there would be a clash between its policies and those of the Colonial Office. How would the deadlock be resolved?

There might be a place for such a board if it devoted itself exclusively to impersonal development, such as the building of roads and bridges and the combating of soil erosion. But wherever it is a question of dealing with people, of starting secondary industries or improving agricultural production, the plans cannot be churned out from London or elsewhere. They are a subject for delicate manipulation by the man on the spot.

At first sight this seems a disappointing conclusion. Contrasted with the large ideas of the authors of *Wealth for Welfare*, the Colonial Office's policy of development seems a poor thing indeed. What has the introduction of ginger cultivation among the pagan tribes of Zaria, in North Nigeria, or the establishment of a factory for drying vegetables at Kerugoya, in Kenya, which employs over 900 Africans and deals with the products of some 6,000 native growers—what have these to do with the large problems of poverty, hunger, disease and illiteracy among the colonial peoples? Is the establishment of an Institute of West African Arts, Industries and Social Science, which will aim at reviving native craftsmanship and turning it to modern production, the best way to achieve the expansion of secondary industries?

Fundamentally, the answer is yes. There is more than a difference in methods between those who plan on the large scale envisaged by the supporters of a colonial development board and those who work from small beginnings in isolated areas, who consider the development of co-operatives as important as the opening up of a new mineral asset. There is also a difference in objectives. The development board planners look upon development and welfare as an end in itself. Official British policy looks upon it, as Colonel Stanley said, as a basis for self-government. It is an essential basis, but the ultimate aim of British colonial rule, in spite of the new trends of the last few years, is still to proceed from benevolent despotism, not merely to benevolent development, but to responsible government and independence. That is why colonial development must begin and end with the people.

This is not to say that the makers and agents of official policy could not learn much from the supporters of the opposing view. They could learn to think large, even if they have to act small. The comparatively trifling cost of a new market in an African village should not make them draw back from the need to spend many millions in the colonies as a whole. They can still work to a plan, even if it has to be constantly adapted. There are also colonies where they have no need to be inhibited, and colonial welfare can be pursued everywhere without restraint. Above all, the exercise of infinite patience and encouragement should not be allowed to blind them to the fact that what is needed more than anything else in British colonial rule is a sense of urgency, of a great task that has to be done even if its completion takes many generations. The change in British colonial policy, after all, has been comparatively sudden, and it may be that the various colonial administrations and their outlying officers have not yet fully realised that their duty is not, indeed, to depart from the principles of economical administration but to seek out every way in which the application of capital can raise the economic welfare and productivity of the colonial peoples. It may be that something in the nature of a development board—provided it were responsible to the Colonial Office and closely integrated with it—would serve a useful purpose in speeding-up the tempo of development. Something more than a fund to be passively drawn upon is needed; there should rather be a department of the Colonial Office itself and of every colonial administration (or at least in each group of colonies) whose active duty it is to advance the new policy. Something of the same vigour that has been put into waging war is needed for the colonial effort.

Post-War Shipping Policy

DURING a debate in the House of Commons on Wednesday last week Mr Noel-Baker, Joint Parliamentary Secretary to the Ministry of War Transport, laid down the three principles which are to guide the Government's shipping policy after the war. First, Great Britain "must continue to serve the world with a large and efficient mercantile marine." Secondly, His Majesty's Government will be

prepared to collaborate with other like-minded Governments in establishing conditions in which the shipping of the world can be efficiently and economically carried on.

Thirdly, the officers and men of the merchant navy are to be provided with "the best attainable conditions of employment." The first principle, as Mr Noel-Baker rightly remarked, "governs all the rest." Ships are vital to this country in peace and in war. They are the conveyor belts feeding the huge industrial assembly plant of this island with raw materials and foodstuffs. In peace, they take Britain's finished goods to the four corners of the world and, in war, its armies and munitions to the battlefields. But shipping is also the most important export industry; before the war British ships carried two-fifths of the world's seaborne trade, and their earnings abroad paid for more than a tenth of the country's total merchandise imports.

The Government's statement was timely, and one can hardly quarrel with its decision to refrain at this stage from naming the "official" target for the size of the post-war British merchant fleet. As was pointed out by Sir Arthur Salter, the other Joint Parliamentary Secretary to the Ministry of War Transport, any categorical statement about the future size of the merchant navy and the methods by which it is to be secured and maintained might prejudice negotiations with other Governments and render international collaboration more difficult. But this caution need not extend to an expression of private opinion. As the General Council of British Shipping said in its report on post-war shipping, entitled "Freedom and Efficiency Policy,"

this country must not be afraid to say to its allies that a strong British mercantile marine is just as necessary to this country as its navy, army and air force.

In any case, there has been no lack of precedent; across the Atlantic, for example, the view has been freely expressed that the United States should aim at a peacetime merchant fleet big enough to enable that country to carry half the total of its imports and exports in its own vessels. On the basis of the volume of trade before the war, this would mean a fleet two-fifths larger than then existed.

There are, perhaps, special reasons justifying so large an increase in the American merchant fleet—an even larger increase will actually exist at the end of the war. There will be no question of America's deliberately building up to an arbitrary standard; it will be a question of how much of the American fleet that will exist at the end of the war should be retained. It would be very foolish if British policy were to insist on a fleet larger than pre-war merely because this is to be the American policy. But, equally, there is no reason why Britain should be content with a fleet smaller than it was before the war. In 1936, according to a "fact-finding" inquiry carried out by the Chamber of Shipping and the Liverpool Steam Ship Owners' Association, the sea-going steam and motor tonnage sailing under the British flag (UK and Dominions) represented 36.7 per cent of the world total and carried 40.2 per cent of the world's seaborne trade. The total of United Kingdom tonnage, excluding vessels of under 2,000 gross tons, was then 15,084,000 gross tons, and the Dominions owned 1,934,000 gross tons, making an Empire total of 17,018,000 gross tons. In the same year, the seaborne

trade of British countries wholly among themselves amounted to 19.4 per cent of the world total; trade between British countries and foreign countries amounted to 37.4 per cent. If we take the whole of the purely British trade and half of the British-foreign trade, we reach a figure of 38.1 per cent of the world's seaborne trade which might reasonably be regarded as the appropriate portion to be carried in British ships—in fact, almost exactly the portion that actually was carried before the war. (It does not, of course, follow that all British trade was in British ships, nor that British ships carried no wholly foreign trade; convenience dictates the utmost elasticity in this respect.) Thus a policy of restoring the pre-war position could be expressed either as that of once more carrying 40 per cent of the world's seaborne trade in British ships or as that of having a fleet large enough to carry the whole of purely British and half of British-foreign trade. These two magnitudes may diverge after the war, and it is the second that forms the sounder basis for policy.

There is no inherent reason, however, why "back to pre-war" should be the aim. In particular, there would seem to be a strong case for adding to the minimum, as defined above, a margin in the nature of a war reserve. It has once again been demonstrated that the survival of this country depends absolutely on its merchant navy, and so long as the nations of the world take any precautions at all against the perils of war, a British war reserve of merchant ships is amply justified. It might not be possible to keep the reserve fully employed in peacetime—indeed, it is in the nature of a reserve that it should not normally be needed—and Government shipping policy will have to take into account the necessity of maintaining it in usable condition. As for the size of that reserve, a figure of 3,000,000 gross tons would represent about a year's sinkings of British ships at the maximum rate of the present war. The target might therefore be defined as a total for all the British countries (perhaps differently distributed than hitherto between the United Kingdom and the Dominions) of about 20 million gross tons plus or minus the equivalent of any changes in the overseas trade of the British countries after the war.

How is the target to be attained? The post-war position cannot be foreseen with any clarity. But unless the war ends very quickly indeed, the world will end the war with more shipping (and more modern ships) than it had at the start. It is probable that the total of shipbuilding in the United Nations alone (excluding anything that may be accomplished in German, Italian and Japanese yards) will this year equal about a quarter, or even more, of the pre-war total, and the volume of construction in earlier years has not been negligible. Unless there is a great increase in the volume of world trade there will be a glut of shipping just as soon as the requirements of demobilisation and relief have been attended to. On the other hand, the British merchant fleet will end the war substantially smaller than at the start; no figures of the shrinkage are available, but those who speak of a halving of the total British tonnage are probably erring on the pessimistic side. The task will therefore be to reconstitute a British fleet of the desirable size at a time of worldwide glut, which will indeed be intensified by any British building. In these circumstances, there will inevitably be suggestions that the policy of building up the British fleet to anything like 20 million gross tons would be harmful. The position will indeed be uncomfortable, but it is most unlikely that the British Government or the British public will be deterred from their purpose, which rests not so much on economic considerations as on the essential elements of national safety.

There will, of course, be the enormous volume of American tonnage built during the war, which is likely to be far in excess of American peacetime needs. It is

INDEX TO VOLUME CXLIV

The Index to Volume CXLIV (January to June, 1943) is now available and has been sent to all those who have asked for the Index to be regularly supplied to them. Any other readers who wish to receive the Index (post free) are invited to apply to The Publishers, THE ECONOMIST, Brettenham House, Lancaster Place, London, W.C.2

most unlikely that there will be any question of the outright gift of ships for use in peacetime competitive trade. Any suggestion of sale would raise difficult questions about both the price and the method of payment. It is, however, just possible that some long-term lease (or even lend-lease) of these ships to Great Britain could be arranged. If so, the immediate needs of the British merchant marine for standard cargo vessels could be met and the British rebuilding programme could turn its first attention to special types such as tankers and refrigerated vessels. Any American ships obtained by these means would almost certainly have to be retained in Government ownership, though they could presumably be hired out on long agreements to shipping companies.

The difficulty about any programme of rebuilding is that it will almost certainly have to be carried out at a time when shipping, owing to the glut, will not be a very profitable industry. It may be that some international arrangements for the stabilisation of freight rates both could and should be made. This is a complex and difficult problem which cannot be discussed here. But it would take very considerable optimism to assume that there is any form of international regulation which can perform the miracle of converting conditions of glut into conditions favouring, on strictly commercial principles, the construction of new ships. If there is to be a large British programme of rebuilding, the Government will have to take the initiative and bear the risk.

This inevitably raises the question of the nature of the relationship between the Government and the shipping industry. It stands to reason that no Government department can be expected to engage in the actual management of shipping in peacetime conditions. Liner

shipping might conceivably be so managed (though not with much prospect of efficiency); tramp shipping is one of the last forms of economic activity that anyone in his senses would put under a bureaucratic organisation. But shipbuilding—or rather, the placing of orders for new ships—is something different. The Ministry of War Transport has apparently decided against nationalisation and therefore, by inference, in favour of a policy of Government subsidies in aid of privately-ordered new construction. This policy, Mr Noel-Baker said, would be adhered to unless Parliament decided otherwise. It may be asked whether Parliament would not be well advised to decide otherwise. The future development of British shipping must obviously be in accordance with an overall policy laid down by the Government, and public money will be needed in carrying that policy out. There would seem to be great advantages—including those of regularity of employment for the shipyards—if the Government itself were to place the orders, to own the ships and to let them out on long contracts to the shipping companies (who would obviously have to have a very large say in the design). Among other benefits, the maintenance of a reserve fleet would fit into such a policy very much more easily than into one of purely private ownership. There is, of course, no suggestion that any shipping company which wished to order a ship for its own ownership should be prohibited from doing so. But the balance of argument would seem to point to the assumption by the state of the direct initiative (since it cannot dodge the ultimate responsibility) for the post-war reconstruction and for the permanent maintenance of that merchant fleet on which the life of this island depends.

NOTES OF THE WEEK

Sicilian Advance

The second week of the fighting in Sicily has brought successes not less striking than those of the first. The advance has been steady in all sectors. The British and Canadian positions have moved north from the Ragusa-Augusta line to a line running roughly from Piazza Armerina to the outskirts of Catania. The Americans have extended their control of the south coast to Agrigento and beyond; indeed they have occupied the mining region of Caltanissetta and taken Enna. The capture of Enna marks a turning point in the campaign. The town lies on the only important railway across the island from Catania to Termini. The western part of Sicily has been practically isolated—the distance from Enna to the northern coast is only about forty miles. The Axis forces in the west of Sicily have no escape but to retreat hastily along the northern coast before that way of retreat, too, is cut off. The possession of Enna may also allow the Allies to envelop the Catania plain from the west and to isolate the defenders of Catania itself. Only at the approaches to Catania has the defence succeeded in temporarily holding the advance—owing to the difficult nature of the country and to the concentration of the bulk of the German forces in Sicily in this sector. The battle of Catania cannot now be regarded as part of a design to save the island for the Axis; its importance has been reduced to that of a stubbornly fought rearguard action. The only reward the enemy can expect here is a gain in time which might allow him to withdraw part of his forces across the Straits of Messina. The defenders of Catania have two possible lines of retreat: one along the western slopes of Etna and the other along the coastal road from Catania to Messina. The first line may well be denied to them by an Allied advance from Enna; and the second is exposed to Allied bombardment both from the air and from the sea. The fighting has once more revealed the familiar rift between the Italian and German soldiers; and the next days may bring a swift and sudden breakdown of the defence similar to that which marked the final phase of the Tunisian campaign.

— And After ?

At their meeting in northern Italy, which was made public on Tuesday, Hitler and Mussolini presumably took

the loss of Sicily for granted; and the defence of the Italian mainland itself must have been the subject of a somewhat strained discussion. German reinforcements in Sicily have proved inadequate to save the Italians; but they have been large enough to place an additional strain on German resources. Can more reinforcements be found for Italy itself? The prospect will be decisively affected by the new turn of events on the eastern front. The German High Command cannot possibly afford any weakening of its strength in Russia. The German attempt to flatten the Kursk salient has failed, and, for the first time, the Russians have mounted an effective counter-offensive in the summer. It is perhaps still too early to judge the scope of their intentions; but both Axis and Soviet commentators agree that the present operations "are tending to develop into major battles." The Russians are within striking distance of the Orel-Briansk railway; and if they succeed in cutting it, Orel is lost to the Germans. On the Donetz, the Russian objective—at least at this stage—is to regain the ground lost in March, after the second fall of Kharkov. If the Germans commit themselves further in Italy, the weight of the Soviet offensive is likely to grow. If not, the impact of the British and American assault may well knock Italy out of the war. Italy may, of course, be reinforced by German contingents drawn, not from the eastern front, but from southern France or from the Atlantic Wall. But this would merely invite fresh Allied blows against the denuded flanks of the European fortress. Under such conditions, Hitler may tend to regard the Italian mainland as merely the terrain of a rearguard action—a prospect which spells the doom of Mussolini.

Reactions in Italy

By all accounts, the Sicilian peasants have received the invaders with considerable calm. Fascist broadcasts in Italy have conjured up vivid pictures of Sicilian partisans and their heroic wives knifing the invading soldiery, but the Allies have obviously had no trouble from the inhabitants. Some correspondents comment in amazement, perhaps forgetting many similar incidents in the last war, on the nonchalance of harvesting farmers who hardly take cover as the battle zone moves on towards their fields. Does this

attitude mean that the Italians are weary of Fascism and are ready to throw off the Government which first ruined and has now disgraced them? Such an inference lies behind the appeal made to the Italian people by Mr Roosevelt and Mr Churchill to throw off the yoke and choose "whether Italians shall die for Mussolini and Hitler—or live for Italy and civilisation." But reports from Sicily do not speak of opposition either to the Fascists or to the invaders. They speak simply of passivity. This is hardly a traditional Sicilian attitude, for the Sicily of the vendettas had the reputation of being not the least but the most violent region in Italy. Is it rather an index of the political mentality of a great majority of the Italian people? This possibility is borne out by reports from the Italian mainland. It is over two years now since Ansaldo accused the Italians (in his "Woe, woe," speech) of preferring football to the fight for Abyssinia. Now the correspondent of the *Stockholms Tidningen* writes:

The Italians are quite calm, in spite of everything, and life on the mainland is so normal that it is almost impossible to realise that the country is being subjected to the most gigantic military attack . . . The cafés are full, some new Italian films are being shown, and people continue bathing at Ostia in spite of recent bombings.

The Fascist Party secretary, Carlo Scorza, confirms this picture in his dramatic appeal to the people, which, opening with the words "Resist, resist, resist," went on to urge the Italians that

We must not adopt the fatalistic viewpoint that it is enough to be able to bear the enemy's blows. We must give blow for blow. We must exchange attack for attack.

This torpor, from which the Fascists are now trying to rouse the people, is of their own creating. For twenty years, ordinary men and women have been excluded from all responsible participation in public life. Lack of political interest has been taught as a virtue. Political decisions rested with the minute group of governing men. Below them was a great cumbrous obedient party machine; under the machine, the inchoate mass of irresponsible citizens. In the hour of crisis, it is useless to look for initiative in a population trained to its opposite. This is the supreme failure of totalitarian rule. It has no inner resilience. Implicitly at least, Scorza recognises this. In his latest appeal he pleads that

All the people—I repeat all the people—must form one single army gathered round the symbols of Italy's eternal glories, the Catholic Church and the House of Savoy.

Fascism is not even mentioned. But Italian apathy has a lesson for the Allies, too. It is probably useless to expect an uprising to turn the Fascist Government out. The apathy which is not stirred by the prospect of invasion will not be moved to a great effort of civil war.

Amgot

The political passivity left by Fascism should in some ways simplify the Allies' task of administration as they invade. They are not likely to have their efforts sabotaged and may be able to count on a good measure of practical collaboration. Thus the ground is favourable for the first experiment in Allied military government of occupied territory. The new administration in Sicily is, of course, military. The Governor, General Alexander, has Major-General Lord Rennell of Rodd as his chief political officer; Brigadier-General Frank McSherry, of the United States Army, is Lord Rennell's deputy. Their work is organised in six departments—legal, financial, civil supply, public health, public safety, and the administration of public property. These departments are staffed by British and American officers and officials who have been specially trained for the work at the School of Military Government in Virginia and the Civil Affairs Centre at Wimbledon. Some of the British officials have probably gained practical experience already in the Occupied Enemy Territory Administration which has been functioning in Britrea and Cyrenaica for some time past. Lord Rennell himself served in East Africa as political officer. The success of the experiment will depend on the degree of co-operation between the British and the Americans and the Italians. The general experience has been that when British and Americans have met to accomplish a clearly defined piece of work the results have been excellent. The framework of collaboration between the Allies and Italy has been outlined in General Alexander's first series of decrees. Provided they respect the authority of the occupying power, Italian citizens are free to go about their

normal business. Their property and liberty are guaranteed. All Italian administrative and judicial officials are to continue in office under the authority of the military government. The *status quo* is in fact to be maintained except for two important exceptions: "the exercise of the powers of the Crown of Italy shall be suspended during the period of military occupation"; and "the Fascist party will be dissolved and all discriminatory decrees and laws annulled." These two decrees show that the Allies are wisely looking beyond the immediate issues of pacification. They have their eye on a later day when, it is to be hoped, an Italy will emerge which can take a respected place among the liberated nations of Europe. Such a renaissance would be hampered if the Allies were to compromise in any way with the discredited Fascist administration. Italians must be found with whom the Allies can work. If they collaborate, will they not become quislings in the eyes of their own people? By only suspending the powers of the Crown and underlining the purely military character of their Government, the Allies are doing all they can to emphasise the temporary nature of their authority, and to direct the Italians' attention to the day when the powers of the Crown—in other words, the full sovereignty of the people—will be restored. In such conditions the collaboration of Italian officials can hardly be twisted to mean a betrayal of their country's interests. There remains the problem whether, having dissolved the Fascist party, General Alexander will have any officials left with whom to collaborate. The whole political superstructure of Italy was, after all, Fascist. In all probability, the military authorities will not experience this difficulty. The Fascism of thousands of Italian officials was purely nominal. Indeed, the compulsory party badge with its motto *PNF—Partito Nazionale Fascista*—was usually said to mean *Per Necessità Familiare*—"by family necessity," or "I have to do this to keep my children fed." There were, of course, cells of convinced Fascists and also party spies and agents. But the Allies will get some help from Italians in rooting out these long-detested personalities. For the rest, the Italian official, like the Italian peasant, will be quite glad to carry on with his work.

Bombs on Rome

No one can take much pleasure in the thought of bombing Rome. The fact that it is the headquarters of the Fascist Government is only a very temporary and trifling incident in its long, and, on the whole, magnificent history, and damage done to anything in Rome, apart from military and industrial objectives, and some of the monstrous modern Fascist buildings, is a loss for Europe and for the world. This is true equally of Wren's City churches or Cologne churches or the ancient buildings of Rotterdam or Lübeck. The emotions aroused are stronger in the case of Rome because there is more beauty in Rome to destroy. Bombing is a hideous business. So is war. The justification of the one horror is that it shortens the other, and it is only in the light of military necessity that the question—should the Allies bomb Rome?—can be answered. Two arguments have been brought forward, the first that Rome is a great railway centre for all Italy, secondly, that the city is the administrative nerve centre of Fascism, and that neither the efficiency nor the morale of the Italians could stand an attack upon this vital point. The first argument can be accepted, with the rider that it does entail continuous bombardment. Marshalling yards are quickly restored, and the raids will have to be frequent to secure a permanent interruption. As for the second, bombing on a scale sufficient to wreck Rome as an administrative centre would mean such a destruction of universal works of art, quite apart from damage done to the neutral Vatican City, that the harm done to Allied opinion—particularly in America—might far outweigh any beneficial effects in reducing the courage or efficiency of the Italian people.

Organisation and Efficiency

The latest contribution to the defence of what he describes as big business was provided by Sir Malcolm Stewart in his comments to the shareholders of the Associated and British Portland Cement companies. What Sir Malcolm is really defending is monopoly, secured not by limiting access to raw materials, but by organisation of the industry to fix prices and, effectively, to prevent new entries. It is stated that between 1925 and 1938, when prices, but not production, were mainly controlled by the Cement Makers' Federation, costs fell by 32 per cent and prices paid by the consumer by 34 per cent. This, Sir Malcolm contends, was achieved as a result of the elimination of "cut-throat competition." The temporary increase in margins enabled the group to engage in research, while organisation made it possible to concentrate production in the most efficient works, to modernise those which were out of date and to move those whose geographical situation was unfavourable. It was then possible to reduce prices and so to expand production without impairing financial stability. This, he says, is true efficiency, which is the object of the whole process. No one will wish to deny that there has been progress in the cement industry, but with little chance of new entrants and a controlled price—even if that price is progressively reduced—how is it possible to judge whether the concerns are efficient or not? There is nothing absolute about efficiency, unless complete stagnation in the matter of technological improvement is postulated. Efficiency is relative to the performance of someone else. With differences in the raw materials and equipment available, in the wage rates and the standard of work and in the type of finished product, it is only possible to say whether a firm is efficient by comparison with some independent producer. Sir Malcolm is evidently not quite happy about the existing arrangement, for he admits that price fixing should be subject to some outside check, and suggests the setting up of a Price Survey Council responsible to a Minister of the Crown and charged with the duty of assessing what was a fair price for the products coming within their purview. But there is no means of discovering what is a fair price merely by *a priori* excogitation. Price depends upon quantity sold. The only way of determining whether a given price is fair to the consumer is to see whether someone can produce the article more cheaply. A Government control cannot pass judgment except by reference to the past. For a short period one might assume a given elasticity of demand, based on past experience in a free market, but after a period of controlled prices even that very imperfect criterion would be lacking. The fact is that, while there is much that is attractive about Sir Malcolm's ideas, the elimination of risk of loss, which is his real objective, can only be obtained at the price of risking stagnation. It is all very well to say that over a

decade there has, in fact, been progress. Sir Malcolm had to fight to reach his position. A new generation, nurtured in security, will not have his energy or initiative.

Chemicals and Cartels

Three weeks ago three American chemical companies were indicted by a Federal grand jury, under the anti-trust laws, for creating a worldwide control "in conspiracy with German, British, Italian, Japanese and other foreign interests." The indictment alleged that the defendants and the foreign companies had divided the world into extensive non-competitive areas, and obtained monopolistic control in the United States by the pooling of patents. The cartel, it was said, embraced titanium compounds used in the production of strategic war materials, and, it was added, the British Titan Products Company, Ltd., owned jointly by Imperial Chemical Industries, Limited, the Titan Company, Incorporated, and other British companies, was allocated the British Empire market. The wording of the indictment, as reported in the British press, has given rise to misinterpretation in this country, owing to the difference in the laws governing business transactions in Great Britain and in the United States. Under the anti-trust laws of America, which have no counterpart in this country, contracts, combinations or "conspiracy" in restraint of trade are illegal. As Lord McGowan, chairman of Imperial Chemical Industries, pointed out in the House of Lords on July 15th, cartels, which he likened to a system of trade agreements, are perfectly legal in this country. Some of them date back to the very beginning of the chemical industry, and have, without doubt, "greatly helped in the scientific development of that industry." The underlying principle of ICI, Lord McGowan said, has been to retain as far as possible the Empire market for the Empire. The Lord Chancellor confirmed the legality of cartels in this country, and emphasised, very properly, that there is nothing to suggest that ICI has been guilty of practices contrary to British law. Thus the debate in the House of Lords was useful in clearing ICI of unfounded charges. But it also emphasised the need for a re-examination of the legal framework within which British business operates. Monopolies are not conspiracy in this country; but the time has surely come for a fact-finding enquiry into business methods which could serve as the basis of a new legal framework in which the restraint of trade by any means would be condemned.

Coal Production

The operations in Sicily and the imminent invasion of Europe foreshadow a demand for many million tons of coal exports. They add a sharp point to the important proposals for increasing the production of coal, which were discussed by the Miners' Federation at its annual conference this week. The Minister of Labour told the conference bluntly that the coal crisis is the only thing that may prolong the war, and that desperate remedies to meet the manpower situation have already become necessary. By the end of this coal year (that is, by March, 1944) the labour force will have fallen to about 690,000—Mr Arthur Horner places it at 660,000, with the loss of some 30,000 men a year through injury, disease or death—and the Government has estimated that this figure will have to be raised to about 720,000 or 750,000 to meet the nation's coal requirements. Mr Bevin created something of a sensation when he announced that he would have to direct youths of 16-18 into coal-mining. Many delegates were apprehensive about the reactions of the miners in their own area, and they know the reluctance of parents to send their young sons into the pits. It is, of course, only logical to apply the same powers of compulsion to mining as to the Services, since coal is vital to the war effort. But boys of 16 are not conscribed for fighting or for any other work. On the other hand, no men from other industries, or from the scheme for allowing youths to opt for mining, which has yielded such disappointing results, only about 3,000 boys having chosen mining since last autumn. This step may be unavoidable. But the addition of more boys and youths to the industry will make it more important to improve the conditions, status, remuneration and prospects of juvenile entrants. The Miners' Conference called unanimously for the immediate adoption of the recommendations of the Forster Committee on juvenile recruitment.

Government's failure to organise the industry on an effective "basis of national service," as promised in its own White Paper; it was alleged that compulsion had been a one-sided affair; an end was demanded of the present divided control, whereby the Government has operational control without financial responsibility. The Conference agreed that the district bonus scheme had failed to provide an incentive to production, and called for the adoption of a pit basis. These points are all pertinent, for the failure to reorganise the coal industry to meet the needs of war has been conspicuous and blameworthy. But the Conference might have said much more about the contribution of their own rank and file to the failure—absenteeism among the young, active and reserved. It is wrong and prejudiced to put all the blame, or even most of it, on absenteeism. Failure to reorganise has been more important. But absenteeism has played a big part—the bigger because there has been no reorganisation and the manpower position in the industry has reached a crisis.

World Trade

"The failure of distribution has been the greatest problem in the past." This, significantly, is the keynote of a scheme composed by Sir Edgar R. Jones for a World Trade Alliance to "regulate the distribution of the main export products of all countries." On what basis the apportionment of markets is to be made—1929, '39 or '49, 1933, '43 or '53?—is not stated, but is clearly of critical importance. The general objectives of the scheme—satisfactory levels of employment and steadily improving standards of living in every country—are unexceptionable. The specific proposal that, after the success of the Hot Springs conference on food production and distribution, a similar conference should be called on raw materials deserves strong support (the multitude of commodities included in the term of raw materials would, incidentally, make this subject vastly more difficult than food to deal with at a single conference). It is not certain, however, that the sponsors of the Alliance have either grasped the nature of the long-term problem (as distinct from the immediate short-term problem of relieving the war-devastated areas of the earth) or understood the basic ideas of the Hot Springs proposals. How the scheme would actually work in practice is not quite clear, though at the inauguration of the Alliance on Monday one speaker, Lord Davidson, made a remark that is suggestive:—

Unless there is some system of agreement by which the prices of essential raw materials and products are stabilised at a fairly high level, we and the United States will be unable to maintain our standard of life.

This is neither true as a statement of fact, nor is it what was proposed at Hot Springs. Since the agreed objective is to increase consumption, it is fairly low not fairly high prices that are needed. Primary producers should indeed be guaranteed a greater stability of prices in the future than in the past, but only to prevent disastrous fluctuations, not to raise the average reward to efficient producers over a period. At Hot Springs, the problem was clearly and rightly seen as one, in the first place, not of distribution (as Sir Edgar Jones contends) but of production. Looked at from one end, the real task is to increase the selling power of producers by enabling them to produce more efficiently and so to sell more at lower prices; looked at from the other end, it is to increase the buying power of consumers by enabling them also to produce more efficiently and so to buy more in exchange. It is a problem, fundamentally, of productivity, and cannot be solved by the surface manipulation of export quotas or price levels. The main proposals made at Hot Springs went to the heart of the matter. They were, first, that output per head should be increased to the utmost, in both industry and agriculture, by efficient specialisation; and, secondly, that a fair world distribution of the product should be secured by freedom of exchange and investment, with the supplementary aid of direct inducements to consumption. If the World Trade Alliance, which is to be run by business men and not, *horresco referens*, by bureaucrats, will throw its weight in these directions, it will find worthy work to do. If, on the other hand, it concentrates on the old devices of sharing out markets and fixing prices, then—however high its motives may be—it will find the old paradox of over-production and under-consumption still unresolved, and the very "anarchy" it seeks to escape will still persist.

The Cost of Reconstruction

The answers to two crucial questions are omitted from the remarkable Plan for reconstructing the County of London. How much will the proposed programme of rebuilding cost? And how will the cost be met? It was not, of course, possible for Mr Forshaw and Professor Abercrombie, who prepared the Plan, to solve either of these problems themselves. The first would require foreknowledge of the course of prices, wages, interest rates and building technique for 50 years ahead; the second can only be solved within a national framework of reconstruction finance put together by the Government. The two questions are obviously not unconnected; the greater the expense of building projects, either in terms of money or in terms of the labour and material resources employed, the greater the burden to be shared, as the Government decides, between rates, taxes and loans. The authors of the London Plan are no doubt right when they say that the cost of developing London during the next 50 years would have to be incurred in any case, and that the choice is between money well or ill spent, resources well or ill used. So, too, up to a point, are the people who say, with all the contemporary scorn for financial considerations, that, if the labour and materials are available, the job can be done. But the questions of cost and payment stand unshaken by these general truths. To ask the question "Will the labour and materials be available?" is just another way of asking "What would it cost to make them available?" and "Who will meet that cost?" It is for the Government to decide, first, what share of national resources, what proportion of national investment, is to be absorbed by building—and, in particular, by urban reconstruction—in competition with other claims; and, secondly, how the price of securing and using these resources is to be apportioned between individual, local and national pockets. At this stage, two things, at any rate, are certain. On the one hand, a decisive factor in determining what is possible will be the productivity of the building industry—that is, the cost of building in terms of output per man. On the other, the lion's share of the cost must come from the national purse, because neither individual nor local resources are likely to be capable of taking the strain. It is true that building projects, apart from public works, directly recoup a part at least of their cost through rents and rates; but the war-time spread between building costs and average incomes suggests that working-class house dwellers will be less able than ever to cover the economic cost of their dwellings; and, as an article on page 97 suggests in another connection, the system of local rating will be entirely incapable of coping with all the charges that are likely to be placed upon it after the war.

The Population Debate

It was a wide and on the whole useful debate that took place in the Commons last week on the trend of population. Members of all parties showed themselves concerned at the future size and age structure of the population, and though some emphasised the predominance of one factor in

INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

influencing the birth-rate and some another, the general impression was that the motives are deep-seated and complex. It was consequently very unfortunate that the only complacent speech should have come from the Government Bench. Not that Mr Ernest Brown admitted that he was satisfied with the trend of population—in fact, he took care to point out that he was as concerned as anyone. But he wrapped his concern in such negative phrases—for instance, "I do not want to say that the check [in the rising birth-rate] has not gone too far—indeed, I would not say that it has not gone perilously far . . ."—that it is impossible not to feel that he, the Minister responsible for the health of the nation, is unaware of the full implication of the present trends in the birth-rate. Why else should he have been at such pains to labour the fact that, if the nineteenth-century trends had continued, the population of this country would have risen to 111 millions by 2001 and to more than 300 millions by 2101? People are not concerned with such would-have-beens. They want to know, first, the likely size of the population at the end of another generation if the rate of reproduction continues at its present level and, secondly, what steps can be taken to prevent it from becoming a declining, ageing population. Mr Brown said that the Government intends to institute an enquiry on the broadest basis into the whole question of the birth-rate and the population. This is at least a positive step, but its usefulness will depend partly on the speed with which it can be completed—at present its terms of reference are not yet drawn up—and largely on whether it will be conducted in the same spirit of complacency that seems to inspire the office of the Registrar-General in these matters—to judge by the White Paper on population that appeared last year.

War Pensions in the House

On the whole, considerable approval was given by the House of Commons to the new scheme of pensions for disabled ex-Servicemen and their dependants. Members welcomed particularly the accident concession—which allows any accident sustained by a man in his spare time, while travelling to and from home on leave or short pass, while travelling to or from duty, or sustained when actually on leave if he is serving overseas, to be attributable—and also the concession allowing an unemployable disabled man to be given family allowances if he marries after his disability occurred. Most of them, however, urged that this latter concession should be granted to all disabled men, and there are certainly strong practical reasons why it should be. There will be great difficulty in determining a man's unemployability. The regulation will say unemployable because of his disability, but Sir John Anderson made it quite clear that he need not be 100 per cent disabled—in the pensions classification—to be unemployable. This is evidently intended to allow as much latitude as possible in bringing cases within the scope of the concession; but when the present state of the labour market is reversed, it may be hard to decide whether a man who is refused work because employers prefer someone completely fit is unemployable on account of his disability or not. In fact, the Ministry of Pensions' counter-slogan to "fit for service, fit for pension"—"pensions plus employment"—will be seriously tested for the first time after the war. It is very gratifying to learn that only a minority are totally disabled, that even these can sometimes undertake insurable employment and that the majority of disabled are able to return to a normal occupation—which in no way affects their receipt of a pension. It is a great tribute to the Ministry of Pensions, which has for long been a pioneer in the rehabilitation of the disabled, whether pensionable cases or not, that so many ex-Servicemen are medically employable. It is the Ministry of Labour's job to see that this good work is not lost.

The Liberal Dilemma

The meeting of the Liberal Party Assembly last week reflected the dilemma in which Liberal politicians find themselves to-day. There are at least three broad divisions within the party itself. On the extreme right are the diehards, diminishing both in numbers and influence, who moved a resolution (which was heavily defeated) calling for a return to unfettered freedom of trade and enterprise. They tend to think in terms of pre-1914, rather than pre-1939, and to look upon the Milk Marketing Board as a greater enemy to

mankind than Hitler. At the other extreme is the Radical Action Group represented by Mr T. L. Horabin and Mr Clement Davies, with a programme for complete economic planning and state control which was too strong meat for the Conference. In the centre stands the main body of the Liberal Party, though with many internal cross-currents even here, pulling both to left and to right. On the fringe, outside but knocking at the gate, are Mr Ernest Brown's Liberal Nationals. At the Assembly, Sir Archibald Sinclair welcomed the overtures that Mr Brown has made for reunion. The Liberal Executive now accepts increased planning and continued control after the war—that is, it has repeated more explicitly the constructive approach to public policy which produced the Liberal Yellow Book of 1928, the most sane and realistic political programme of the inter-war years. It has never been true for over a generation, except of a minority, that Liberals are merely individualists and no more. The Executive now advocates a Minister for Industry, with an Economic General Staff, and a National Investment Board, with broad powers to take the necessary measures to overcome slumps, and it recognises that the aim of social security and higher standards of living can only be secured by planning. Like Labour, the Liberals support the electoral truce as a *pis aller*, and, like Labour, they want to be free of Conservative domination after the war. It may be that the Liberal programme, which is in essence the programme of 1928, does not set a pace sufficiently speedy for the post-war electorate. But it is not entirely without importance, as has been pointed out by Mr Roger Fulford, that the Liberal party will enter the peace, not only as the party least compromised in the making of the war, but also as the only party which, before the war, had a constructive and positive programme of the kind that no party will be able to do without after the war. On the other hand, it remains a doubtful question whether the party is capable of impressing these truths upon the electorate.

Shorter Notes

The court of inquiry into detention barracks will consist of Mr Justice Oliver as chairman, with the Bishop of Reading and Lord Moran (formerly Sir Charles Wilson), President of the Royal College of Physicians, as the other members.

The following table gives the number of civilian casualties in air-raids since September, 1939:

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept., 1939-Aug., 1940.	1,494	1,980	3,474
Sept.-Dec., 1940.....	22,282	28,522	50,804
Total, 1941.....	20,863	21,839	42,702
Total, 1942.....	3,221	4,149	7,370
1943:—			
January.....	328	507	835
February.....	252	347	599
March.....	293	439	732
April.....	172	205	377
May.....	584	733	1,317
June.....	201	284	485

Totals to date.... 49,690 59,005 108,695
Of those killed in June, 118, were men, 67 were women, 15 were children under 16 and one was unclassified.

Extract from *Hansard* of July 16, 1943, reporting the population debate:

Sir Francis Fremantle: . . . I propose that there should be legislation to control the sale of Conservatives [Laughter].

The Deputy-Chairman: I think that that would be too definite.

Sir Francis Fremantle: I meant, of course, the sale of contraceptives. I withdraw any reflection I may have made on any one political party . . .

In a parliamentary answer this week, Sir Kingsley Wood stated that the cost of stabilising the cost of living will amount to £210 millions in 1943, including the cost of the special health schemes for milk and vitamins. The subsidies are now applied to clothing, but to a much smaller extent than to food where subsidies are now given to bread and flour, potatoes, sugar, milk, meat, bacon, eggs, canned fish and tea. From figures given in the Budget White Paper, it appears that the cost of stabilisation has risen considerably this year, for in 1940, 1941, and 1942 it was only £70 millions, £142 millions and £150 millions respectively.

AMERICAN SURVEY

Planning in the Rockies

(From a Correspondent in Colorado)

Denver, May 31

TO a greater degree than most other sections of the United States, the Rocky Mountain area must look to the reconstruction of its economy at the end of the war. What is popularly described as the Rocky Mountain area embraces eight of the forty-eight states (Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah and Wyoming). The region contains barely three per cent of the nation's population, yet covers thirty per cent of its area. Within the span of three generations it has witnessed the rise and decline of economic empires, in which British capital has played no insignificant part.

A century ago, whole communities deserted their homes in the Eastern states to seek the fabulous wealth of the Western mountains, where only a pick and shovel were needed for capital in mining the gold, and where investments in silver, copper, lead and zinc proved the foundation of many a celebrated American fortune. Within a few years after the first gold rush of the 1850's, the farmers of the older states were earnestly pleading for protection against the menace of the Western Plainsmen, who were raising their cattle and grains on free homestead land so cheaply that the established breeding farms along the Atlantic Coast could not compete. The British Government was even persuaded in 1879 to prohibit the entry into the British Isles of meat from the Western prairies because their cattle were allegedly infected with Texas fever.

By the turn of the century, it was evident that the economy of the Rocky Mountain states had completed a cycle of feverish exploitation. The free range of buffalo grass for grazing was gone. The semi-arid soil, diverted from extensive grazing to relatively intensive farm uses, crumbled and became the Dust Bowl. Ghost towns of abandoned structures testified to the story of frontier settlements that had grown into cities overnight, enjoyed a boisterous heyday, and ceased to be when the rich veins gave out. Far Western agriculture and industry had begun to feel the competition of still newer lands beyond the boundaries of the United States, and in due course sought tariff protection against that competition. Now the cattlemen of the inter-Mountain plains are publicising the menace of foot-and-mouth disease in Argentine cattle, though their fathers were the victims of the earlier propaganda against Texas fever.

To-day the familiar symbols of the economy of the Rocky Mountain states—upon which their social and economic stability is deemed to depend—are sugar beet, livestock, wool and silver. None of these has been able to withstand the strain of competition unaided by protective legislation. To keep them alive, and to keep alive the scattered communities which serve as distributing points for the vast area, the population of the Western mountain country has had to look to the united strength of its representatives in Congress. The Silver Bloc in the Senate has made certain that the silver of the Rockies is continuously bought by the Government at a fixed price high enough to justify the continued extraction of the ore. The same bloc, trading votes as needed with the manufacturing centres of the Atlantic Coast and the agricultural states of the Middle West, provides by national legislation for the tariffs, bounties, quotas and subsidy payments whereby the markets of American-grown sugar-beet, wool and cattle are supported. Should the combined voting strength of the sixteen Senators—one-sixth of the voting strength in the Senate—become divided, the extractive bases of the region's present economy would be gravely threatened.

The more forward-looking citizens of the Rocky Mountain area realise that a future depending largely upon such uncertain props, however necessary for the present, is not one to be bequeathed serenely to the post-war generation. The outlook of the region in its physical aspects is promising. The immediate problem is the familiar one of overcoming the drag of those "best citizens" of the area who, having made their mark and grown tired, would concen-

trate their remaining energies on the preservation of the status quo.

The thinking of those who are assuming responsibility for post-war planning in the Rocky Mountain states takes two lines. First there is the problem of increasing the efficiency of the already-established key industries, so that they may justify their existence with less dependence upon legislative protection and its resultant tendencies toward sectionalism and non-co-operation with the outside world. The other is the inauguration of a new stage in the exploitation of the still unutilised natural resources of the area.

An example of the consideration given to increasing the efficiency of specific industries is the attention now focused upon the area's production of sugar from beet—a leading cash crop valued at approximately \$60 million. In the growing of the crop, simple mechanical means have been

devised which promise to eliminate the tedious hand labour of weeding and topping—a work that otherwise involves the low-paid help of women and children, and accounts for the importation of Mexican labour. In the refining of the sugar, attention is being given to all-year-round utilisation of the refineries which are now kept busy only during the three months of the post-harvest period. The possibilities look favourable for utilising the sugar refineries as dehydration plants. The wide development of dehydration is favoured not only to provide employment for the remainder of the year, but also to extend the market for local farm produce.

A more ambitious programme concerns the correction of hit-and-miss land-use by a long-range land policy. In view

For the Child's future —

of the tendency of the former grazing areas to powder into desert dust under forced crops, a new land policy contemplates the gradual restoration of the natural buffalo grass to those areas which are unfit for intensive cultivation. The programme also contemplates a grouping of the farm population for dairying and suitable truck crops in the rich oases with which the generally semi-arid country is dotted.

In the minds of those familiar with the natural resources of the Rocky Mountain area, rich new frontiers are awaiting conquest in the post-war period. The coal deposits just east of the Rockies, in the states of Colorado and Wyoming alone, have been estimated by the Department of the Interior at 958 billion tons; this would mean the equivalent of thirty tons per year for each family in the United States, taking its present size of population, for a thousand years. In the total known reserve of eighteen billion barrels of crude oil in the entire United States, the Rocky Mountain states account for about five per cent of the liquid total. But in the corner where the mountain states of Colorado, Wyoming and Utah meet, there is an estimated reserve of oil shale equivalent to 40 billion barrels of crude oil, or more than twice the known liquid reserves in the entire country.

Looking at the trend of present research, those interested in the area do not limit their vision of the uses of the resources in carbon to consumption for fuel. They look to the day when these resources, like the rich deposits of gilsonite and gypsum on the western slopes of the Rockies, will be important sources of a new galaxy of plastics and synthetics.

Implicit in the consideration of both old and new industries is the problem of determining which of the hastily developed but important new plants for military fabrication, which have come to the Rocky Mountain communities because of their safe distance from possible coastal warfare, can be profitably retained for post-war industry. The manufactures in these plants include small arms ammunition, chemical warfare products, armour steel, precision instruments, engines and even warships transported by rail in sections for assembling on the Pacific coast.

What these new plants have meant in the sudden industrialization of rural areas like the Mormon state of Utah

THE COMING TREND

The trend in business furniture after the war will be more than ever towards the precision and permanence of steel. Sankey-Sheldon, in preparing to meet this growing trend, have realised that to this efficiency of steel must be added beauty—the beauty of soft contours finished in harmonious colour schemes and warm, caressing coverings. Sankey-Sheldon's post-war programme will provide a wide range of furniture and equipment, clean and hygienic, fire resisting and practically impervious to damp, dirt and deterioration. There is something inevitable about Sankey-Sheldon steel furniture.

Makers of Shops

may be illustrated by simple statistical comparison. In the census of 1940, the total assessed valuation of the property in the state of Utah amounted to approximately \$560 million. It required almost exactly a hundred years for the state to accumulate this total. Yet in the past two years, another \$560 million has been added in new plants. A single steel mill established near a small Mormon college town alone accounts for a new investment of nearly \$180 million for the production of pig iron and steel in one of the few areas of the Far West where iron ore and coal are available in close proximity. It can only be surmised what the importation of skilled labour from the East and from the surrounding farms to man the new plants will mean in the way of social and economic transformation of the area.

Tied to the post-war economic planning of industry in the Rocky Mountain area is a consideration of its future in the transportation picture. Many lines of manufactures, in foods, paper boxes, textiles and metal products, have awaited a more equitable position for the Rocky Mountain area in the structure of railroad freight rates; the Coastal states have had the further advantage of water competition at the expense of the inland Rocky Mountain states. The Rocky Mountain area looks to an emancipation from this disadvantage as it prepares for the age of air-borne cargo along an already operating south-to-north highway of the air, from South America through Mexico City, El Paso, Denver and northward into Canada.

While the trade associations of individual communities are busily engaged in mobilising their resources for the post-war period, an effort is under way to join their findings in a region-wide plan.

American Notes

Presidential Bombshell

The open strife between Mr Wallace, the Vice-President, and Mr Jones, the Secretary of Commerce, was reported in these columns two weeks ago. It caused some stir at the time and provided the text for a great deal of head-shaking among the habitual critics of the Administration and its goings-on. But the affair was dying down, when the President suddenly, on Thursday of last week, turned it into a political sensation of the first magnitude. He issued an Order taking away both from Mr Wallace and from Mr Jones the whole of their functions relating to foreign purchasing and economic warfare generally, which had been the subject of the quarrel. The Board of Economic Warfare was abolished completely, and the whole of its functions, together with those relevant functions hitherto performed by Mr Jones's Reconstruction Finance Corporation and its subsidiaries, were transferred to a new Office of Economic Warfare under Mr Leo Crowley, hitherto Alien Property Custodian and before that head of the Federal Deposit Insurance Corporation. With this Order there was issued the text of a letter sent by the President to the heads of all administrative agencies, instructing them that if they, or any of their subordinates, henceforward wish to air in public policies, they must first resign. That strife and back-biting action can be expected to have any effect is common ground among all commentators, and on this aspect of the affair long ago. The political aspects of the matter, however, are rather wider. Formally, even-handed justice has been meted out to both miscreants. Actually, the punishments are very uneven. Mr Jones is still Secretary of Commerce and administrative functions, and left only with the decorative Moreover, Mr Crowley is much more of the Jones than of the Wallace stamp. It looks, therefore, as if Mr Roosevelt has deliberately snubbed his own chosen running mate of New Deal, in order to favour a couple of conservative businessmen. This may not turn out to be the true interpretation, but for the moment it holds the stage, and the incident has not escaped notice. The new OEW is formally Byrnes, the Director of the Office of ex-Senator and ex-Justice thus adds to his already very extensive powers. Mr Byrnes is hardly a conservative, but he is a Southerner, and he is popular in the Congressional wing of the Democratic party.

July 24, 1943

If Mr Roosevelt is going to run again in 1944, and if he has decided to have a new running mate, a popular Southerner would be a logical choice. Meanwhile, the country is being edified by the spectacle of the New Dealers attacking Mr Roosevelt.

Republican Fissures

The Democrats are not the only party with internal fissures in evidence. The conflict between Mr Willkie and the ex-isolationist leaders of the Republican Party is becoming daily more open. The convention of a body calling itself the Republican Postwar Policy Association, and containing among its members a number of Republicans of unimpeachable loyalty and standing, such as Senator Austin of Vermont, has openly advocated Mr Willkie's re-nomination. Isolationist organs such as the *Chicago Tribune* and the New York *Daily News* are no less openly saying that this would be a disaster hardly smaller than a fourth Roosevelt term. Mr Willkie has challenged the famous Colonel McCormick, of the *Chicago Tribune*, to contest with him the Republican Primary in the Colonel's own state of Illinois. The Colonel has declined, saying that his man for 1944 is General McArthur. The whole situation is puzzling the prophets. Mr Willkie is anathema to the professional politicians, who would like to nominate Governor Dewey or Governor Bricker or someone else of the same stamp. Mr Willkie will not have very many supporters among the delegates to the nominating convention from the states where the selection is in the hands of the party machines. On the other hand, there are a number of states where delegates to the convention are chosen by a primary election, and no one can tell how much strength Mr Willkie may have among the Republican voters. There is every indication, however, that it will be very large.

Food Figures

A speech made by Mr Roy F. Hendrickson, Food Distribution Director of the War Food Administration, contained a number of figures which give the measure of the food problem. The production of food, with the assist-

ance of favourable weather, was very high in 1942, and some decline is almost inevitable. Some 3,000,000 farm workers had left the farms either for the armed Forces or for industry, by the beginning of 1943, and though a further 3,000,000, still on the farms, have been protected by deferment, an acute labour shortage remains. The main difficulty does not, however, arise on the supply side. The shortage of food is fundamentally due to the fact that the American public is eating—or, rather, is trying to eat—much more than it ever did before. For example, the average meat consumption in the years 1935-39 was 126 lb. per head per year. This year, if there were no limit to supplies, the demand at the prevailing ceiling prices would be 160 lb. The prospective supply is still about 126 lb., but the "shortage" leads to rationing. Similarly, in the case of fats and oils: the pre-war consumption was 48 lb. per person, and the prospective supply is 46 lb., but unrestricted demand would amount to 55 lb. It is unlikely, however, that Mr Hendrickson's figures will dissuade the American public from talking about a "shortage," or from believing that exports of food have something to do with it. Of the total food supply over the next twelve months, Mr Hendrickson said that 75 per cent would go to civilians, 13 per cent to the armed Forces and war services, 10 per cent would be exported under Lend-Lease, and 2 per cent would go to American overseas territories and special needs. Whether these estimates can be adhered to will depend largely on the success that the Office of Price Administration makes of the rationing system. That agency is currently going through another of its recurrent crises. Mr Lou Maxon, a former Detroit advertising man, who has been serving as general manager of the OPA, has generally been regarded as the advocate within the OPA of the food industry's policies, and as less fearful of inflation than some of his colleagues. He was instrumental some weeks ago in forcing out of the agency a number of executives who were left from Mr Leon Henderson's regime, and who retained their belief in the necessity of strict control. His victory, however, was apparently incomplete, as he has now resigned with many high words about the academic incompetence of the Office. He has been replaced by Mr Chester B. Bowles, another advertising man. The policy of the Administrator, Mr Prentiss Brown, is to appease Congress, which involves appeasing the industry. Whether such a policy can produce a workable rationing system is growing daily more doubtful.

THE WORLD OVERSEAS

Polish Cross-Roads

FOR the first time since Marshal Pilsudski's *coup d'état* in 1926, the Poles have formed a purely civilian Government. M. Mikolajczyk's Cabinet has the backing of the four largest Polish parties, from Right to Left—the National Party, the Labour Party, the Peasant Party and the Socialists. Between them the Nationalists, the Peasants and the Socialists commanded an overwhelming majority of votes in Poland between 1919 and 1939; and, at the moment, they control the main bodies of underground resistance there. Only the extreme Right, the Pilsudskists and the Communists, have remained outside the new coalition in exile, though the spokesman of the Pilsudskists, General Sosnkowski, has been appointed Commander-in-Chief. The new Prime Minister is a member of the Peasant Party, which fits in well with the peasant character of the Polish nation.

The new Government takes office at a moment when Polish policy is confronted with a number of difficult and critical problems. In the solution of these problems, the Poles will no longer benefit from General Sikorski's political experience and from the moral authority which the late Prime Minister commanded both among his countrymen and the Allied nations. A great personality and a great name have disappeared from Polish politics. The new Government can only prove itself by great wisdom.

The problems with which it is confronted are twofold, domestic and foreign; and one central domestic issue has already emerged. After the death of General Sikorski, there was a difference of opinion between the new Prime Minister and the President, when, on behalf of the coalition which he

leads, the Prime Minister objected to the appointment of General Sosnkowski as Commander-in-Chief. The appointment was nevertheless made, because the President was able to make use of the prerogative which he enjoys under the constitution of 1935. This constitutional point is of considerable political significance. The Polish constitution of 1935 was passed by the Polish Diet a month after the death of Marshal Pilsudski. Marshal Pilsudski himself had ruled in an authoritarian fashion without changing the democratic constitution of 1921. He could afford to do this, because his dictatorship was based, not simply on the use of force, but also on the personal authority he enjoyed, rightly or wrongly, as the founder of Polish independence. His successors possessed no such asset; and, in order to secure their dictatorship, they devised a new and highly authoritarian constitution. Even in the Diet of that time, however, which had been "elected" by all manner of devices, the Pilsudskists did not possess a majority sufficient to pass this new constitution. The deed was done by a minor *coup d'état*. Shortly before the vote, a number of deputies belonging to the Opposition were arrested; and the vote itself took place after the representatives of the Opposition had been tricked out of the Diet.

The Constitution of 1935

The constitution which was thus introduced, and is still in force, has a number of striking features. It disregards the rights of citizens in the democratic sense; and it establishes irresponsible government. Perhaps it can best be

judged by a scrutiny of its more important articles. Article I says that "it is the duty of each generation to increase the power and authority of the state by its own efforts." Article VII says that "the right of a citizen to influence public affairs will be valued according to the worth of his efforts and services to the common good." Article XV declares that "the President of the Republic is not responsible for his official acts." Article XVI, which provides for the election of the President by a small and carefully chosen college of electors, lays down that the choice must be between two candidates only, one proposed by the Assembly and the other by the retiring President; the Presidency takes on a semi-hereditary character. Article XXVIII states that "the Prime Minister and other Ministers are politically responsible to the President and may be dismissed by him at any time." Article XXIX allows the Diet to ask for the resignation of the Cabinet without making such a demand mandatory. Article XXXI permits the Diet to approve but not to reject the annual budget.

At first, all the parties of the Opposition, Right and Left, refused to recognise the legal validity of this constitution. Later, they had to bow, not so much to the constitution, as to the military and police power behind it. After the fall of Poland in September, 1939, the leaders of the authoritarian regime set up many years before handed over the Government to the Opposition; but the transfer was carried out within the framework and on the basis of the constitution of 1935. The result was highly anomalous. The parties which make up the present coalition Government all denied the legality of the constitution in 1935; yet they have all adhered to it since 1939. The dilemma with which they are confronted is one which is likely to arise, and in some cases has arisen, in many other European countries. It is the conflict between considerations of constitutional continuity and the need for genuinely constitutional government. In several instances already continuity has had to be sacrificed for the sake of liberty, the letter of the law for the sake of the spirit. The Czechs in exile do not recognise the Hacha Government. The French in exile have repudiated the claims of the Pétain regime to legitimacy. So far, the Poles have sacrificed the content of constitutionalism for its form. There is, of course, a difference between them and the Czechs or the French. The unconstitutional constitution of the Poles was made four years before the outbreak of war and not under the pressure of a foreign invader.

A Wide Issue

The problem is of much more than merely academic interest. There is a contradiction, still unresolved, between the political outlook of the Polish Government and the prerogatives of the Polish President; the appointment of the new Commander-in-Chief was the first, but probably not the last, expression of this contradiction. Moreover, the constitutional issue has a critical bearing on the future government of Poland. If the Poles in exile return to their country with the constitution of 1935 they will go back with the legal framework of an authoritarian regime still intact; if, however, their new Government re-enacts the constitution of 1921, the ground will be prepared for a liberal system of government. The matter is of great importance for the people of Poland. Nor can public opinion in the Allied countries view it entirely with indifference, for Poland's position in the world after the war must depend to some extent on the amount of public support and sympathy it can maintain in the countries which have been its wartime Allies. Poland has won the deep sympathy and unbounded admiration of the Allied nations for its sufferings and its contributions to the common struggle. But the degree to which this sympathy will continue after the war will inevitably be influenced by the choice Poland makes between authoritarian and constitutional rule.

The foreign and diplomatic problems that confront the new Polish Government are centred on relations with Russia. The Minister of Foreign Affairs, M. Romer, has declared his Government's determination to follow the lines of General Sikorski's foreign policy. More is going to be needed than the restatement of general principles. While General Sikorski was still alive the expression of a real desire for understanding with Russia, together with adherence to the Atlantic Charter, did not break the deadlock in Polish-Soviet relations. What is needed now is a definition in realistic terms of Poland's future foreign policy.

Poland cannot be expected, on any ground, to accept the Molotov-Ribbentrop frontier of 1939 as the basis of an agreement. So far, however, they have not put forward any constructive alternative to serve as the basis for discussion.

In practical terms, it is useless—and inconsistent—on the one hand, to say that "We will not give up an inch of our territory in the East," and, on the other hand, to claim East Prussia and the whole of Silesia or a frontier on the Oder. It is not possible for Poland to have the cake of the *status quo* in the East and to eat it in the West.

The difficult but very pressing task of the new Minister of Foreign Affairs is to find some workable compromise as a solution for the problem of Poland's eastern frontiers; and there is some reason to believe that proposals of this kind would not fall on entirely deaf ears in Moscow. In his conversations with General Sikorski, for instance, Marshal Stalin suggested the return of Lvov to Poland. If there is a reluctance to consider any compromise, then Polish policy and Polish prospects will be exposed to grave risks. In diplomacy, as on the battlefield, time is a factor of supreme importance, and it is by no means certain that time is still an ally of Polish diplomacy.

"Full" Employment in Denmark

[BY A CORRESPONDENT]

THERE are only 30,000 unemployed left in Denmark against 150,000 shortly after the occupation. Compared with other occupied countries, the number of 40,000 to 50,000 persons who are employed outside Denmark, that is, mainly in Germany, is relatively small; even before the war, at least half of this number worked in Germany. Numerically, this is full employment. Yet a considerably greater labour force, and therefore a greater amount of man-hours, are needed to produce less than was produced in 1939. The index of industrial production in monthly averages has been as follows (1939 = 100):—

	Total Index	Capital Goods Industries	Consumption Goods Industries
1940	81	76	84
1941	77	74	78
1942	77	81	73

In May, 1943, the total index increased to 83, largely because of a further advance in the production of capital goods. Over the whole period, peat cutting increased from 400,000 tons to 4.6 million tons in 1942, and is intended to reach some 6 million tons in 1943. The production of lignite rose from 20,000 tons to 1.8 million tons. Under public works schemes, the construction of roads increased by 60 per cent, and since the end of 1942 large numbers of workers have been directed to work on fortifications, particularly on the west coast of Jutland. In the manufacturing industries, greater numbers of workers are needed because of the extensive use of substitutes. During 1942, the leather industry processed 12 million fish skins, but only one-third could be turned into fish-leather. The rubber and the textile industries are now entirely dependent on synthetic materials. The largest bicycle factory has had to close down because of the lack of materials. The glass industry has been severely restricted, and the margarine industry is practically at a standstill. Much capital expenditure was necessary for the construction of a steel works and rolling mill based on scrap as raw material, with an annual capacity of 40,000 tons of rolled material. It is reported that the mill is partly in operation, but it is very doubtful whether production can be maintained because of the lack of fuel. Even if it were possible to reach full production in these works, the annual output would cover not more than 8 per cent of the pre-war steel imports.

The heavy cut in the production of consumption goods is accompanied by a decline in quality. The once prosperous agricultural industry, largely dependent on imported cereals and oilseeds, shows a similar picture. During 1942 proper cent, eggs by 43 per cent, and beef by 9 per cent. The better harvest of 1942 caused an increase in the number of pigs to 1,874,000 in March, 1943, or 48 per cent above 1940. In June, 1943, the number of pigs was reported to have reached 1,930,000. In March, 1943, the number of cattle was only 85 per cent of pre-war stocks. The number of laying poultry in March, 1943, was 5.6 million, against 14 million in July, 1939. In 1942, animal production was one-half of the production in 1940.

Denmark thus provides a proof of the fact that overseas imports cannot be replaced by more work and enthusiasm.

In spite of a greater labour force, production has declined alarmingly, and the hope that the bottom of the decline of agricultural production had been reached by the beginning of this year was an illusion. The change has come about in a relatively short time. At the end of 1941, the remaining stocks of overseas materials were distributed, and in 1942 the volume of total imports had fallen to 35 per cent of the imports in 1939.

Detailed statements about Denmark's foreign trade are no longer published, but the value of imports and exports has been as follows:—

FOREIGN TRADE (In Million Kroner)		
	Imports	Exports
1939	1,740	1,578
1940	1,376	1,517
1941	1,311	1,278
1942	1,205	1,038

The actual decrease in Denmark's foreign trade is much greater than is shown by these figures. The wholesale price index (1939 = 100) rose to 93 on the monthly average of 1942, and it may be assumed that the total volume of foreign trade had been reduced in 1942 to one-third of the volume of 1939. In 1940, there were exceptionally heavy exports of foodstuffs to Germany. As is the case with other countries, Germany monopolises Denmark's foreign trade. It is estimated that Germany's share reached 80 per cent in 1941 and was still two-thirds in 1942. The composition of Denmark's exports to Germany is now different from its make-up in 1940 and 1941. The share of agricultural products has fallen considerably, and industrial exports have grown in importance. Next in importance to Germany in Denmark's foreign trade are the other northern countries. In accordance with the so-called "Northern Triangular Clearing" Denmark exports foodstuffs to Norway and Finland against imports of timber and industrial goods. Separate agreements have been concluded recently with Slovakia, Roumania, Hungary, and France, but the actual volume of trade with these countries is small and fixed by quotas.

Germany's Debt

Germany has become the largest single debtor to Denmark. The clearing debt has now reached Kr. 1,376 millions and appears as "Foreign Credits" in the return of the Central Bank. The costs of occupation are carried under the item "Sundry Debtors" and have risen steeply during recent months to Kr. 1,674 millions. The financial situation can be judged by the following items:—

End of Year	Central Bank		Private Banks		Savings Banks
	Notes	Deposits	Advances	Deposits	
1939	600	2,455	2,115	2,179	
1940	742	2,615	1,916	2,116	
1941	842	3,116	1,754	2,333	
1942	983	3,552	1,883	2,589	

There is the familiar increase in the notes in circulation and in deposits of private banks, set against the fall in advances. During the period from March, 1940, to May, 1943, the Central Bank granted credits for financing exports and for the costs of occupation amounting to roughly Kr. 3,000 millions. Financial policy is, therefore, mainly directed towards neutralising this extraordinary liquidity. Last year, Kr. 1,100 million were neutralised by the issue of special bonds and by freezing deposits held by banks in the Central Bank. At present, new measures are being discussed, including an increase in the war profit tax from 75 per cent to 90 per cent. Compulsory saving is also debated, and the taxes on tobacco and alcohol are to be increased.

In the financial year 1942-43, total revenue exceeded Kr. 1,000 millions for the first time, compared with a fairly stable pre-war revenue of Kr. 500 millions. In the last two years, the budget was balanced with a slight surplus. There has been a considerable rise in the nominal national income. During the period 1938-40 farmers almost doubled their nominal income, but it declined in 1941 and, during 1942, costs of production increased considerably. At the end of 1942, the cost of living index was 55 per cent higher than at the outbreak of the war; and it is estimated that retail trade turnover decreased during the same period by 12 per cent in volume. It may be assumed, however, that the actual decrease in the standard of living has been much greater. After the sharp rise in prices during 1940-41, price control became effective in 1942, and the rise in the wholesale price index and the cost of living index amounted to only 5 and

3½ per cent, respectively. Nevertheless, the increase in wages has lagged far behind the rise in prices, which suggests a considerable decline in the standard of living of industrial workers. The period when exports to Germany and the costs of occupation could be financed by drawing on pre-war stocks and capital is over; German demands can now only be met by a further reduction in the standard of living, which until recently compared favourably with that of other occupied countries.

Commissions for Air Crew

[FROM OUR OTTAWA CORRESPONDENT]

June 8th

THE measure by which the Royal Canadian Air Force still falls short of the avowed aim of Air Minister C. G. Power that all air crew should be commissioned is seen in the daily casualty lists of the Canadian Force. The lists show that between 50 and 75 per cent of the casualties, almost all of which are suffered by air crew, are non-commissioned ranks. A sharp, but friendly, difference of opinion has developed between the Canadian air authorities and the British Air Ministry over the policy of commissioning graduates of air training schools. It has been of long standing. The issue was aired, in the first instance, in the Canadian Parliament in May, 1942.

The original agreement on granting commissions was reached by the partners in the Commonwealth air training plan in February, 1940. The first air crew class did not begin its course until April, 1940. The plan relating to commissions was that 33 per cent of all graduating classes of pilots and observers, representing those with highest standing, should be commissioned immediately. A further quota of 17 per cent would, on graduation, be recommended for commissioning on active service. The quotas for wireless operators and air gunners have been 20 per cent, part granted on graduation and part in the field.

To the Canadian way of thinking, it is an incongruous state of affairs in which one bomber in a flight is piloted by a sergeant pilot, while another is piloted by a commissioned officer, in which one goes to the officers' mess once they reach the ground, the other to the sergeants' mess, and if they are captured, one goes to one camp, the other to another. It may happen that the captain of an aircraft is a sergeant, while an officer serves as one of the crew. The debate in the Canadian Parliament on this situation, on June 2nd and 3rd, discloses only one member who dissented from the Power thesis that all air crew should be officers. The dissenter was Thomas L. Church, the veteran parliamentarian and maverick imperialist from Toronto.

At the Ottawa air training conference in May, 1942, Mr Power proposed that all Empire partners of the air training plan should grant commissions to all who qualify for "wings" as air crew. On failing to carry the conference, he proposed, alternatively, that air crew be granted an intermediate rank, of ensign or flight officers, as in the US army air corps. This was also turned down. But a clause in the new agreement recognized Canada's right to grant commissions according to standards approved by the Canadian Government.

OVER
1,000 FIRES A DAY
ARE HELPING HITLER.

Most of them are caused by matches
and cigarette ends.

YOU CAN'T BE TOO CAREFUL!

As a result, Canada has now abandoned the quota system, and established its own merit system. All air crew classes are required to write examination papers, in the style of a Canadian university examination. One paper deals with ground subjects, another with flying, and a third is designed to test qualities of leadership and character. A man receiving 60 per cent marks on each paper, and an average not less than 70 per cent, is automatically granted a commission. Under this system, recent graduating classes have been granted commissions in ratios of 80, 90 and even 100 per cent.

In effect, there are two systems in use in the air training plan. The RAF schools in Canada, representing most of the elementary training of that force, adhere to the quota system. As Mr Malcolm MacDonald, the British High Commissioner in Canada, pointed out, this imposes no restriction upon opportunities of obtaining commissions in the field later. In schools where student flyers from other Dominions mingle with Canadians, some embarrassment arises because the Canadians are commissioned according to the examination system, and others according to the quota system.

The RAF view, as stated by Mr MacDonald, in a letter incorporated in parliamentary records, is that not more than about half of air crew posts need to be filled with commissioned officers. "Experience has shown," he wrote, "that no more than 50 per cent qualify for commissions in practice." The Canadian view is that air force standards are so high, in relation to physique, intelligence, background and training, that all who qualify are entitled to officers' rank. Since Canada has exceeded the United Kingdom in training air crew, the contention is that the weight of experience is now on Canada's side.

Different Viewpoints

But it is obvious that the RAF looks at the problem more from the viewpoint of a professional and permanent air force, while Canada follows the line that its airmen are non-professional citizen-soldiers, in which the officer class rates somewhat less in importance. The quota system, Mr Power said, had been found in Canada's experience as "a most illogical way" of selecting officers. He declared, in a letter to the British Air Ministry, that "however well it may operate with RAF personnel, it definitely militates against initiative, ambition, and, consequently, efficiency in our men." He said that the English position, in which 25 or 30 per cent of the population possessed higher cultural and educational standards than the rest, did not apply in Canada, where 80 or 90 per cent of all air crew possessed the same class background.

This is a straight difference of opinion. The only sour note in the discussion was provided by a British Air Ministry official, unidentified in the correspondence, who wrote that Canada's action might lead the RAF to believe that "the RCAF are adopting a substantially lower standard of commissioning," that the result would be "a lowering of prestige of commissioned rank in the RCAF." Mr Power's comment was: "So what!" Nothing in the discussions which have been going on between British and Canadian air authorities on commissions has provided an argument to change Mr Power's mind. He promised to continue his efforts to secure a commission for all air crew in the RCAF. Significantly, the Canadian House of Commons supported him overwhelmingly.

One serious source of complaint exists on the Canadian side, and it is the sole point at which the dispute becomes acrimonious. Since quotas of commissions are granted, in part on graduation and in part in the field, hundreds of Canadians who have been recommended for commissions have been assigned to RAF units on active service where long delays exist in forwarding the commissions. A list of 900 names submitted by the RCAF to the British Air Ministry in November, 1942, finally brought the reply in January, 1943, that 172 of those listed were already casualties and 200 had not been traced. Since June, 1942, Canada has exercised the right to grant a commission to a Canadian assigned to service in the RAF without the endorsement of his RAF commanding officer.

It is obvious that the RAF, like the British or Canadian army, operates closely to the line that nothing is done except on consulting a man's record and then on a slow, ascending progression from officer to higher officer. This is what is called in Canada the "red tape" system. A Canadian on duty in the RAF is likely to serve under an officer who has never seen his record, and would normally never see it. To remedy this, the RCAF has convened a selection board at its London headquarters to consider commissions not granted through normal RAF procedure in cases of Canadians carried on RCAF rolls.

Monopolies in Palestine

[FROM OUR JERUSALEM CORRESPONDENT]

April 9th.

A rapid expansion of Government economic activity has been the sequel of wartime conditions in Palestine as in other countries. Expenditure on extraordinary public works, now mainly fortified police stations and strategic roads, has doubled since the war, totalling £P3.4 millions for the last three years; and much larger sums have been expended in the country by the military authorities and by the Railways Department. In the same period, loans from public funds, mostly for agricultural purposes, reached £P2.5 millions. The regimentation of local trade and industry has advanced by leaps and bounds; the administrative apparatus has increased to twice its pre-war size; and the Controllers of Light and of Heavy Industries, the Food Controller, the Labour Department, and so on are playing an ever increasing rôle in the economic life of the community. By this policy the conversion of Palestine into a strategic supply base has been greatly facilitated, though deficiency of experienced staff still causes a great deal of delay.

Direct Government intervention has been supplemented by the establishment of Government agencies of a monopolistic character. The first step in this direction was made at the outbreak of war, when Barclays Bank (D C and O) was appointed authorised dealer in foreign currencies. Later on, a growing number of articles were put on the list of restricted imports, for which no import licences are issued to private traders; and it has been estimated that at present about two-thirds of total imports are being purchased on Government account, by the United Kingdom Commercial Corporation (imports from overseas and from Turkey, as well as exports to Turkey), Steel Bros. Ltd. (foodstuffs from the Middle East countries), and ICI (fertilisers, medicines, and so on). Moreover, Steel Bros. Ltd. have been entrusted with purchasing, on Government account, the local cereal crop and other agricultural produce (cattle and citrus fruit); and they also serve as the sole distributor of most commodities, purchased by Government agencies. This policy, combining commercial experience with central planning, was actually imposed by the individualistic attitude of local traders; though some import syndicates and approved associations—for hardware and building materials, engineering goods, automobiles and spare parts—had been established voluntarily. The local trading community claims, however, that in many instances local firms of good standing and ample experience were eligible for the same purpose; that the Government distributing agency is often a superfluous link; and that even official patronage is no valid guarantee for obtaining the goods, nor for efficient manipulation of the stocks at hand. As a matter of fact, the purchase of local crops proved a failure, and Palestine's supply position has been getting worse during the last months.

Steel Bros. Ltd. have also been appointed "to organise, supervise and manage" the Government Transport Department, set up as a war measure, with two objectives; to establish a central organisation for placing transport contracts on behalf of both the Government and the Army, thus putting an end to the previous position, in which "Government, the Services and Army contractors, and even individual branches of the Services, were competing with each other for the limited amount of road transport available"; and "to ensure the existence of a reserve of trucks, which will be available at all times for Government and Army emergency transport." This reserve has been formed partly by requisitioning imported trucks, and partly from trucks released by the Army authorities, and it comprises at present about one-sixth of the whole fleet available for civil purposes. However, apprehension has been caused by the fact that the actual status of the new Department begun catering for loads in the private market, too. More-misadventures in the obtaining of supplies of petrol, no new trucks will be released to private carriers; and co-owners has been refused. After a three days' strike, preliminary agreement followed, which at last led to a preference in case of scarce demand for transport facilities, civil loads; spare parts, tyres, and so on will be allocated to organised owner-drivers, is to be recognised for the distribution of the contract work to its members.

THE BUSINESS WORLD

Banks and the Deficit

THE combined statements of the eleven London clearing banks, showing their position on June 30th last, when compared with the figures for June 30, 1939, reveal the following changes in deposits and in the principal banking assets over this four-year period:

	(In £ millions)		
	June 30, 1939	June 30, 1943	Difference
Deposits.....	2,247.5	3,630.4	+ 1,382.9
Cash.....	234.5	386.6	+ 152.1
Short Loans.....	150.8	165.0	+ 14.2
Bills.....	235.3	236.0	+ 0.7
Treasury Dept. Recpts.....	...	858.5	+ 858.5
Investments.....	596.5	1,159.0	+ 562.5
Advances.....	1,010.0	743.9	- 266.1

The expansion of £1,382.9 millions or 61.6 per cent in the banks' deposits has been wholly the product of their increased holding of Government paper. The new TDR asset has contributed £858.5 millions, while investments have increased by £562.5 millions, nearly doubling themselves during the four years and establishing themselves in the undisputed lead among the different categories of banking assets. On balance, the banks' holdings of bills and short loans have shown remarkably little change, though the composition of the bill cases and of the securities underlying the short loans has altered considerably. The volume of bank cash has dutifully kept pace with the expansion of credit, the influences bearing on this item, apart from the withdrawals of currency from the banks by the public, lying wholly within the initiative of the banking authorities and being welded with the sole purpose of providing a basis of cash just sufficient to underpin the desired expansion of banking credit. To complete the picture, mention must be made of the fall of £266.1 millions in loans and advances, the one declining item in this framework of general expansion.

It is interesting to contrast this growth of banking credit with the movement in a comparable four-year period of the last war. Between the end of 1913 and the end of 1917, bank deposits in the United Kingdom rose from £1,033.0 millions to £1,705.8 millions, or by 65 per cent, a figure closely approaching that for the past four years. Over that earlier period the accompanying changes in assets bore strong resemblance to those shown in the above table. Treasury bills took the dominant place now occupied by TDRs and rose from £168 millions to £368 millions, investments increased by about the same amount, namely from £231 millions to £432 millions; while short loans rose from £146 millions to £215 millions. The main contrast with the

experience of this war is that in the earlier period bank advances increased by £43 millions to £549 millions and easily kept their lead as the most important banking asset. The disparity between this movement and the sharp fall in advances during this war illustrates the greater encroachment of the Government on the economic life of the country which has occurred in the past four years. It is also partly due to the fact that, on this occasion, unlike the last, there has been no encouragement to the public to take up Government loans with the help of bank credit.

The fall in advances during the present war would have been even steeper than it has been were it not for the fact that, owing to the wording of the relevant clauses in the Finance Acts, EPT payers are encouraged to pay their tax as early as possible with the help of bank accommodation since such loans are counted as part of "capital employed in the business." Owing to this technical factor and to the heavy encroachments which taxation makes on the liquid resources of companies, the proportion of bank advances designed to finance tax payments is probably greater to-day than it has been at any previous period in the history of British banking. Thus the extent to which the activities of the banking system are engrossed in financing the Government is even greater than appears at first sight.

The steadiness in the banks' bill holding over the past four years veils very considerable changes in the composition of this item. Commercial bills have largely disappeared and as between June 30, 1939, and June 30, 1943 the banks' holdings of commercial paper probably fell by between £80 millions and £100 millions. To this extent, therefore, the banks have taken additional Treasury bills into their portfolios. If an increase of £80 millions in Treasury bills is allowed for and the increase in investments and the newly acquired TDRs are added in, it will be seen that the banks' direct acquisitions of Government paper over the past four years reach the round sum of £1,500 millions.

Reference to the accompanying chart will show how exceptionally even has been the expansion in bank credit and in investments, if divided between the two halves of the four-year period. Between June 30, 1939, and June 30, 1941, deposits increased by £698 millions and over the subsequent two years by £685 millions. Over the same periods investments rose by £284 millions and £278 millions, respectively. Viewed on a large scale, however, the changes in bank credit have been far from even, the curve reflecting the incidence of periods of heavy tax collections and the effects of savings campaigns. In particular, it will be seen how the curve of expansion in bank deposits flattened during the first half of 1942 and again in the

half of this year. The two phenomena are not altogether similar, because of the different effect of the issue of Tax Reserve Certificates on each. This can best be illustrated by the following table showing the issue and redemption of these securities for each completed half year since the issue began:—

	Gross Issues	Redemptions	Net Movement in Half-Year	Outstanding at end of Half-Year
1941: Dec.	16,800	—	+ 16,800	16,800
1942: 1st half ...	271,100	6,121	+ 264,979	281,779
2nd half ...	233,750	45,596	+ 188,154	469,933
1943: 1st half ...	252,950	208,977	+ 43,973	513,906
Total to date	774,600	260,694	+ 513,906	

This shows that in the first half of 1942 not only had bank deposits to take the strain of the customary concentration of tax payments, but they had to finance subscriptions to over £271 millions of Tax Reserve Certificates, against which redemptions were negligible. In the first half of this year, the drain on bank deposits of tax payments was eased to the extent of £209 millions by Tax Reserve Certificate redemptions, and though this factor was rather more than offset by subscriptions to new certificates, the volume

of deposits did not have to bear the double burden which fell on it from this direction in the first half of 1942, before the Tax Reserve Certificates were operating in both directions. If this fact is taken into consideration, the stability of bank credit over the first half of this year is rather more significant than the comparable phenomenon in the first half of 1942. Equally welcome is the fact that the banks' investments rose by £39 millions only in the last half year as compared with an increase of over £60 millions in the first half of 1942. This suggests that the public participation in this year's savings campaign has been greater than it was in the 1942 campaign. It would, however, be wrong to suggest that war finance will no longer require the resort to bank credit which was needed up to the end of 1942. The flattening of the curve of bank credit over the past six months, welcome though it be and even though it may be a more genuine movement than that revealed over the same period of 1942, is still no proof that the climb will not be resumed at something like the former gradient. The proportion of Government expenditure covered by taxation remains approximately the same as a year ago. It will need more conclusive evidence than has yet emerged that genuine public subscriptions to Government loans have established themselves at a permanently higher level before it can be assumed that the need for recourse to the banking system in financing the deficit has appreciably diminished.

Business Notes

Back to Industrials

As was expected, the turn of the year has brought a modest revival in stock market activity, in addition to the rise in purely speculative activity. There has been a considerable increase in the volume of transactions; much of the business which attracts most attention is still speculative. But there has been an expansion in the number of bargains done in the general commercial and industrial list. Brokers complain that many clients are interested only in capital appreciation and are not concerned with dividends as such. In the sense that capital appreciation must depend on the expectation of higher dividend payments, such an attitude on the part of investors is ridiculous; but if all that is meant is that they want tax-free capital appreciation now rather than dividends, of which at least half will go to the Government, that is a very intelligible, and indeed an inevitable, reaction to the current scale of taxation. Against this background it is probable that the Allied successes in Sicily, in Russia and, to a less extent, in the Pacific, have determined the choice of shares to buy. There can be no question but that attention is being concentrated more and more on those securities which are expected to benefit soonest from the cessation of hostilities. Naturally enough, however, there is a good deal of difference of opinion about the shares likely to benefit most. The investor, like the industrialist, has to ask himself how far the accent will be on exports, how far on consumption goods and how far on particular types of capital goods. In the circumstances, it is rather remarkable that the ordinary share index of *The Financial News* has risen almost 2½ points in a week to 101.6, the highest since November, 1937, and two points above the recent peak of May 11th. The rise in the index appears to owe something to the frankly speculative buying associated with plastics and, to a less extent, with cotton. It is the more impressive since there has been a good deal of talk of substantial sellers waiting for a better market. Even though it has appeared probable that the next major movement would be upward, the undertone has been rather weak of late. If the supplies of stock are lifted the tone may improve, although it will never be very strong if there are numbers of recent buyers waiting to snatch a quick profit.

Amgot in Action

Among the more immediate tasks of the Allied Military Government of Occupied Territory (whose establishment is described in a note on page 103) will be the provision of banking and financial machinery in the occupied areas of Italian metropolitan territory. The problem is one of some difficulty. Sicily may not be highly dependent on a credit mechanism, but it requires currency to keep the wheels of trade going and to provide the wherewithal to

finance transactions between the occupying forces and the local population. The Allied forces have taken with them their own military notes—sterling and dollar—and the rate at which the lira is convertible into these two currencies has been fixed at 400 lire to the £ and 100 lire to the dollar. The rate of 480 lire to the £, fixed in the Italian North African territories, has not been altered as it has proved satisfactory. Experience in North Africa, however, suggests that this introduction of military currency is regarded as only a temporary stop-gap, and that the authorities prefer to make arrangements as soon as possible to finance their operations in local currency. The ultimate intention is no doubt to use the local banking system in Italy, but the difficulties will be those of dealing with organisations whose head offices will be in enemy territory and which will be unable to restock their holdings of lira currency. The question of trading with enemy organisations is bound to create difficulties, as may be gauged from the fact that nine months have had to elapse after the Allied landings in North Africa before the restrictions of the Trading with the Enemy regulations could be removed from that territory. In Italian African territories, this problem has to some extent been solved by importing British banking services, namely, those of Barclays Bank (DC and O). This can hardly serve as a precedent for the Allied course of action in metropolitan Italy. It looks, therefore, as though Allied military currency may have fairly considerable and extended circulation in the newly occupied areas.

Exchange Rates

The rate of exchange to be applied will be decided on the spot by the military authorities, who, no doubt, will have experts to guide them. The personnel of Amgot is well sprinkled with City bankers, and there will be no lack of informed advice on these problems. The main aim of the authorities, as recently defined by the Chancellor of the Exchequer, will be to fix rates of exchange which are in accord with local prices, wages and costs. But this line of policy is more easily defined than translated into action. In a country such as Greece, for example, where essential commodities are either lacking or in dismally short supply, there is no price level, and such transactions as survive are largely a matter of crude barter. The problem does not arise with equal acuteness in Sicily, but its elements are none the less comparable: shortage and the control of prices and the exchanges have to a large extent destroyed the basis on which economic exchange parities could be calculated. In the circumstances of war, the occupying Powers have a certain, quite legitimate, interest in deciding questions of reasonable doubt in favour of their own currencies, but there should be no question of the Allied

authorities taking the easy way out by fixing rates of exchange at which the local currencies would be obviously and grossly undervalued. To do so would be to compete with the Germans in the devices applied by them in bleeding the occupied countries. But the other extreme must also be avoided. The occupied countries should not be given the very mixed blessings of an overvalued currency. This has already been done in North Africa, where the official rate of 200 francs to the £ is now found to be well out of alignment with local prices and wages and to be causing serious losses to those engaged in export trade. In fixing the rates of exchange, the authorities cannot ignore the measure of inflation to which the local currencies have been subjected. In the case of France, for example, the expansion in currency and credit based on the enormous costs of occupation paid to Germany will make a rate of 200 francs to the £ impossible to bear after the war. Nor can the authorities altogether ignore the guidance of black market rates for the currencies with which they are called upon to deal. Especially is this so in the case of Italy, where the black market could more properly be referred to as the free market. For many years it has handled a considerable and recognised volume of business, not only officially winked at, but officially used and recommended when such recourse to it was deemed opportune.

More Light

Question time in the House of Commons last Tuesday brought a positive orgy of information on what had hitherto been regarded as the deepest recesses of national debt secrets. Answering a series of questions on treasury bills and ways and means advances the Chancellor of the Exchequer made the following points: the rate of interest on ways and means advances from the Bank of England has moved within a fixed range of ½ to 1 per cent since the beginning of 1939; the normal rate on treasury bills issued through the tap is ½ below the average weekly

WAYS AND MEANS ADVANCES (£'000)

tender rate; there are no interest-free tap bills, but in special cases (of which, on grounds of public interest no details can be published) the rate is nominal; tap bills are issued for three months or shorter periods as may be convenient; ways and means advances from Government departments are in part interest bearing and in part interest free; the amount in each category outstanding at the end of each quarter since the beginning of 1939 and the interest payable on the interest bearing advances is shown in the appended table; that table also contrasts the ways and means advances from the Bank of England outstanding at the end of each quarter with the daily average amounts of such advances in each quarter; this last item reveals the increasing recourse of the Treasury to direct borrowing from the Bank since the beginning of the war. This feast of revelation deserves congratulations all round: to the questioner, to the replier and, last but not least, to the prompter.

Industrial Demobilisation

British industry has been fully mobilised for some time; the process of concentration in industry was virtually completed a year ago. For some time the main task has been to adjust production to the changing needs of the war, to reduce output of some munitions and to expand that of others, and to substitute new designs and specifications for those hitherto produced. Some time ago the Board of Trade began preparing plans for switching over from war to peace production and, to this end, the various industries have been asked to submit their plans and certain relevant data. The Government's decision was timely, for the compilation of reports by the industries concerned, and their detailed examination by the Board of Trade will be a lengthy business. The problem of ensuring a smooth transition from war to peace production is fraught with difficulties. There is the physical problem of priorities which involves an estimate of the rate at which labour and materials will become available for the production of the goods of peace. The inevitable lack of information upon this subject renders it difficult for industrialists to lay their plans. There is the problem of the legal framework within which industry will be expected to operate after the war, and about which industry has as yet been given little guidance. Then, again, there is the specific problem of "deconcentration," which has been made doubly difficult by the Government's promise to assist in restoring the *status quo* as far as possible. It is obviously impossible for the Government at this stage to answer all these questions; on some of them Parliament has yet to reach a decision. Nevertheless, the time has come when the Government will have to lay down broad principles if confusion is to be avoided after the war.

A Plastics Boom

There was some reason to hope that the very cautious statements of Mr B. C. Westall, chairman of De La Rue Plastics, and of Mr S. S. Lambert, chairman of the parent company would lessen popular misconceptions concerning plastics. Instead, something of a boom has developed in a few of the plastic shares, notably De La Rue and British Xylonite. Mr Lambert claimed that De La Rue Plastics is the leading company in the plastics industry, but he stated that plastics were very far from being the main source of revenue of the group. Mr Westall, while confident of his company's ability, with the aid of a large research department, to do well in plastics, reiterated the plain facts that plastics have to compete with wood and metal. It is well known that many new alloys will be available after the war, and some of these materials may well become formidable competitors. Further, there is the fact that the necessary equipment is costly, and that the demand for products must be correspondingly large and continuous. But this is not all; there is, on the one side, the tendency for large firms to put in a certain amount of plastic moulding equipment, and, on the other, the fact that a number of concerns, ICI, Distillers and, in all probability, Courtaulds, are either in, or likely to take part in, the industry. There is a distinct danger, not only that there will be a speculative rush for shares in this industry, but, worse still, that there will be a speculative rush to take part in it. Presumably, control of new issues will damp this down, but it will not

prevent those with funds going into it. Competition here, as elsewhere, is highly desirable, but plastic moulding is a highly technical business. It is to be hoped that investors, whether private or institutional, will preserve a sense of proportion.

Wages of Pit Boys

During a speech at the annual conference of the Mineworkers' Federation on Tuesday, Mr Bevin, Minister of Labour, emphasised the shortage of manpower in coal mining and the need to direct young men to the industry this year in order to meet essential requirements. But the problem of recruitment is also a long-term one, and it has been examined by the Forster Committee on the Recruitment of Juveniles. The proposal for the introduction of a national minimum wage scale is the first to be considered by the new National Conciliation Board for the industry. The Forster Committee regarded the establishment of a scale providing for measured progress in earning capacity from entry to adult status as an essential condition of improved recruitment, but after expressing its preference for the principle of linking juvenile minimum rates to those of adults, it left the determination of the actual scales to the new conciliation machinery. Hitherto boys' wages have been regulated on a district basis, and they have varied considerably. Thus, at the entrance age of 14 years current minimum rates for boys are: for those employed underground from 5s. 5d. to 8s. 4½d. per shift, and at 20 years of age from 10s. 4d. to 16s. 11½d.; and for surface workers from 4s. 11d. to 6s. 7d. and from 9s. 2½d. to 14s. 2½d. respectively. In three districts, Scotland, South Staffordshire and the Forest of Dean, the adult rates are applicable to youths after they reach 18 years. Towards the end of last May the Mineworkers' Federation submitted proposals for a minimum weekly scale for underground workers ranging from 42s. for boys of 14 to 79s. 6d. for youths of 20½ years employed underground, and for surface workers from 40s. to 75s. It is not yet known definitely to what extent the Federation considers these weekly rates convertible into shift rates, but on a working week of six shifts they are understood to be substantially higher than the minimum shift rates under consideration by the colliery owners before submission to the National Board. For youths between 17½ and 18 years of age the Federation scale would secure minimum weekly earnings of 47s. for surface workers and 60s. for underground workers. These rates compare with the average wage of 45s. 1d. per week last January and 46s. 2d. in June, 1942, for the boys and youths included in the Ministry of Labour's half-yearly inquiry into the wage levels of surface employment in the United Kingdom. Apart from the actual amounts to be fixed as minimum scales the most important of the controversial problems to be decided are: (1) whether the scales should be based on shift or on weekly rates; (2) whether they should be stepped up yearly or half-yearly and by what amounts; and (3) the measure and period of the differentials between surface and underground workers in order to encourage recruitment for underground labour. The principle of a national minimum has been accepted by the coal owners, and an effort is being made to reach an agreement through the machinery of the Joint National Negotiating Committee, but failing agreement by that body the National Tribunal will automatically intervene.

Planning the Clothes Ration

To honour the clothes ration, the Board of Trade has to arrange for the production of clothing at the rate of 750 million separate items of clothing a year. It has before it the problem of directing labour and materials to the making of the various articles in the quantities and proportions demanded. The proportions in which the different items of clothing are bought are changing, and consumer demand must be estimated in advance. To assist these

estimates, surveys of how clothing coupons are spent are made regularly. The results for the first year of clothes rationing, and of the first ten months of the second period, are given in the accompanying table, in the form of percentages of the total spent on the different items of clothing. The cut in the ration for the next period will have an effect on demand different from that of a stable or larger ration. Nevertheless, the survey is a factor in estimating future demand. On these estimates the production programme is planned on the basis of the stocks and resources available. A new tendency is making itself felt, which must

PERCENTAGE OF COUPONS USED ON VARIOUS ITEMS OF CLOTHING

	June, 1941, to May, 1942		June, 1942, to April, 1943	
	Men	Women	Men	Women
Suits, jackets, trousers, skirts	21.8	5.9	19.6	6.0
Dresses	6.8	8.2	11.1	9.2
Overcoats and raincoats	17.4	11.1	6.9	14.2
Footwear	15.3	15.8	16.3	15.1
Hose	14.5	18.2	15.5	18.6
Shirts	12.2	18.9	14.5	15.1
Underwear and nightwear	2.8	11.8	2.4	11.1
Cloth and knitting yarn	9.2	12.1	15.4	12.5
Other items				

be considered in planning production. The smaller second ration, and the prospect of an even smaller one for 1943-4, has resulted in a search for quality, and the money spent per coupon has steadily risen, despite the falling prices of cheaper clothing. There is a danger that the continued production of clothing of inferior quality will in the end prove wasteful, if it is not purchased.

Richard Thomas Payment

The decision of the board of Richard Thomas to pay a dividend on the ordinary and "A" ordinary capital of 10 per cent for the year ended March 31st, against half that amount a year ago, justifies the views of those who recently bid up the price of the 6s. 8d. shares to 10s. 3d., more than double their value at the worst of 1942. For 1941-42, the amount earned on the ordinary capital was 13.3 per cent. No figures are so far available for the latest period, but it seems safe to assume that there will have been an increase. Without attempting to forecast actual payments, it seems extremely probable that the existing management, for which the Bank of England is largely responsible, will aim at stability rather than liberal distributions. Granting, as one must, that the sacrifices of the holders of the equity at the time of the 1938 reconstruction were necessary, a return of 10 per cent is not unreasonably low. In any case, it has to be realised that an enterprise such as Richard Thomas which relies for its pre-eminence on being up to date, will have to spend considerable sums in keeping pace with improvements in rolling mill technique. The shares, which had fallen back some pence from the best of the year, were bought on the announcement, rising to 11s. The resultant yield of £6 5s. per cent suggests a belief that the outlook is better than for the general run of heavy industrials.

Company Reconstructions

Apart from the numerous points which concern the protection of the public and the general body of shareholders, it is hoped that the Cohen Committee will address itself to the problem of securing reasonably equitable arrangements between different classes of shareholder. This need is particularly evident as between the holders of the equity and those with preferential rights in cases of company reconstructions. The usual case is one where a part of the capital has been lost and the payment of dividend is dependent upon writing off this loss. The whole of the conception of what constitutes a capital loss needs careful reconsideration. It seems very desirable that, in future, one should look to the physical assets and not to their money value. A company is set up with a given amount of fixed capital and a given working capital, estimated to be sufficient to enable it to carry on business. It needs first to be decided whether it is incumbent upon the board to maintain the ability to sustain a given volume of trade in the

July 24, 1943

THE ECONOMIST

117

face of a rise—or it may be a fall—in prices, or whether all that is necessary is that the money value should be maintained, although that would correspond to a reduced—or increased—ability to trade. The basis being established, any surplus is available for distribution as dividends, and there should be no question of payment being dependent, either in law or in practice, upon a writing down of capital. One of the principal factors contributing to misunderstanding in this matter is the insistence that all shares must have a par value, in contradistinction to the American practice of no par value shares for the whole of the equity. The Cohen Committee might, therefore, go so far as to look into the American practice and see whether the NPV share could not be introduced in this country. Once that were done, it would only be necessary to raise the question of writing down when the whole of the ordinary capital was lost. Further, the idea that the equity holder was in some mysterious way entitled to some proportion of the nominal value of his holding would probably disappear with the disappearance of the nominal value.

French Gold

The political problem of Allied recognition of the French Committee of National Liberation has suddenly crystallised in the issue of French gold at Martinique. Some \$40 millions of gold was sent to Martinique in a French cruiser at the time of the French collapse in 1940, and the metal has remained there intact for the past four years. When Martinique made its belated obeisance to the French Committee, it was rather assumed by the latter that the various assets to be found in the island would be available to finance its needs. Messages from Martinique, sent when M. Henri Hoppenot took over the Government abrogated by Admiral Robert, spoke confidently of the \$40 millions of gold being transferred to the French Committee. At this point, however, Washington appears to have intervened in no uncertain manner. The State Department announced that the French gold in Martinique could neither be trans-

ferred nor dealt with without the approval of the United States Government. This embargo follows the line laid down regarding the disposal of gold and French balances and securities held in the United States. These assets are being held until a fully representative French Government has been set up and recognised *de jure* by the United States. Meanwhile the Martinique gold will be held under the supervision of the United States, which will act as trustee for the peoples of France. By way of contrast, the Polish Government, which recently discovered some \$65 millions of gold which had been shipped from Paris to Dakar in 1940 and which was found to be intact, will have complete freedom to deal with that metal as it thinks fit.

India Fights Inflation

While the working of the financial agreement between India and Great Britain continues to pour new currency into India, the Government of that country is attempting, like King Canute, to order the tide back. The latest word of command is a Defence of India rule forbidding the making of advances against such commodities as may be specified by the Government. The list includes bullion on which much of the recent speculative orgy has centred, and the immediate effect of the order was to cause a slump in the prices of both gold and silver. Over the past week, the Bombay quotation for silver has fallen from Rs. 118 to Rs. 103 per 100 tolas. Less than two months ago the quotation stood at Rs. 138. While the order will serve a useful purpose in checking speculative activity in the precious metals and has undoubtedly been responsible for unloosing a fair volume of weak speculative selling, it will do nothing to prevent the persistent hoarding of silver and gold which has provided the basis on which the rise in the price of the two metals has been built. That hoarding is a direct product of the currency inflation which goes on unchecked. Over the twelve months to July 2nd last, the note circulation in India has risen from Rs. 446,80,00,000 to Rs. 733,60,00,000. The basis for this expansion in circulation is provided by

the increased holding of sterling securities and balances of the Reserve Bank. Over the same period these have increased from Rs. 347,00,00,000 to Rs. 649,60,00,000. As long as this inflation continues, the effect of Defence Rules can only prove temporary. The recent reaction in bullion prices may, therefore, prove short-lived. On a longer view, which embraces the post-war removal of international restrictions on movements of silver and gold, the existing premia on the prices of these metals in India seem more than precarious. But, given the economic forces to which the country is now being subjected, it would be surprising if these premia were not to reach fresh records before the post-war adjustment of the situation becomes feasible.

Halifax Bomber Production

Some of the problems involved in the switch-over from peace to war production are illustrated by the experience of a group of factories in the Home Counties, whose normal activity is the manufacture of motor vehicles and coaches and which are now engaged on the production of Halifax bombers. Between the eight factories which comprise the group the entire plane—except for engines which are made elsewhere—is produced, assembled and tested and equipped with spares. At the same time, some of the factories carry on a certain amount of coachbuilding work, servicing and repairing both passenger transport and army vehicles and research into producer gas vehicles. The factories concerned are divided into two distinct portions for this purpose. Three years ago the group did not exist and, being somewhat late in the day, it experienced exceptional difficulties in securing skilled aircraft labour. Indeed, at the outset it had not more than a dozen toolmakers and had to build up its organisation from scratch. Not more than one in eight of its personnel had previous experience of engineering work. The proportion of women employed in aircraft production, including the final erection of the plane, is now as high as 50 per cent, and the firms have gone far in breaking down skilled work into simpler and more routine jobs so that they can be performed by comparatively untrained labour. But the women, a high proportion of whom are married, have shown themselves remarkably adaptable and quick to learn semi-skilled and skilled jobs. It is something of an achievement, in view of the initial organisation difficulties and the high degree of dilution, that the first plane should have been delivered and flown within fourteen months of the inception of the group.

Corporate Profits in USA

According to *The Survey of Current Business*, 1942, corporate profits in America before tax rose from \$13.9 billion in 1941 to \$18.8 billion in 1942. The 1942 figure is more than double the 1929 peak and some three and a half times the figure for 1939. Although the percentage increase on the year varied widely from industry to industry, every main group appears to have made its contribution. Profits after tax tell a very different story. Net profits rose a trifle on the year, but most main sections show declines, and the rise in total is due mainly to the fact that railway gross profits were more than doubled, and that there was a very sharp rise in the profits of firms making equipment for transport concerns. No figures of appropriations are given, but there was a considerable fall in net dividends paid. These increased for transport, and were the highest since 1931, but for all industry they were little above the 1939 figure, and for manufacturing as a whole, below it. Net profits, none the less, create a new record since the boom year of 1929, and it is evident that, although the new taxes have been effective in checking the rise in net earnings, they have fallen far short of "taking the profit out of war," if they were ever designed

million in 1942. The fall in dividend payments in 1942 must not be construed as an accurate measure of the return to equity holders. Of the drop of 10 per cent in distribution, an appreciable proportion is due to the fact that arrears of preferred dividends were liquidated in 1941.

More Food in Less Space

In 1942, three quarters of a million tons of shipping space, the equivalent of the cargoes of 75 10,000-ton ships was saved on imports of meat, eggs and milk. It is probable that the saving was not an absolute one, but that the effect was rather to make better use of the space allowed for food in the allocation of tonnage. Every effort has been made to pack more and more food into the permitted space, and many new methods of packing are now in use. Beef is imported boneless and moulded, mutton and lambs are telescoped, enabling half as much again to be imported in a given space. By importing eggs dehydrated and milk powdered, 23.5 million cubic feet of space were saved. Experiments are being made to concentrate more foods, in methods of packing and in the use of alternative packing materials. Meat is being dehydrated in small quantities and has the advantage of not needing refrigeration. Its weight is reduced to one-fifth, and compression reduces its volume still more, as well as doubling its storage life. Dried egg, vegetables and cheese can be successfully compressed. Bacon is being packed into less space, and it is hoped to bale it instead of packing it in boxes. A bale weighs only 5 lbs compared with the 70-lb. box. Packing butter in kraft containers instead of wooden boxes saves 9 per cent in weight and 17 per cent in space. Space can be saved in importing tea by making the chests of jute coated with low-grade shellac (both available in India). Some 145 lbs of broken tea, or "fannings" takes the same space as 120 lbs of leaf tea. Experiments in reducing packing materials to the minimum are of the utmost importance, since three per cent of food shipments consist of tares.

Eire's Central Bank

The first Report of the Central Bank of Ireland relates to a year—namely, that ended March 1, 1943—in which the former Currency Commission was in operation for 10 months and in which the new Central Bank was in existence for only two months. On February 1st the business of the Currency Commission was transferred to the Central Bank, together with all the functions, assets and commitments of the Commission. The capital of the Bank was subscribed by the banks to the Currency Commission was repaid. The volume of the legal tender note issue fluctuated during the year between a minimum of £18,390,379 on June 30, 1942, and a maximum of £24,427,915 on December 22, 1942, the latter being the highest amount ever reached. The average amount of legal tender notes outstanding on Saturdays rose from £10,087,431 in 1939 to £20,841,335 in 1943. This expansion in the circulation was caused mainly by rising agricultural prices, as farmers

hold a good deal of cash, especially in the present circumstances of restricted outlets for expenditure. One result of the increase in circulation was an expansion of the earning capacity of the legal tender note fund; its surplus income was £298,180, compared with £265,788 in the previous year. The assets of this fund are held in gold, sterling and British Government securities. On March 31, 1943, the securities of a maturity exceeding twelve months amounted to £7,838,000.

Coin Holdings of the Banks

Although no actual census of coin is ever taken, details of the various kinds of coin held by the banks are obtained from each half-yearly balance on June 30th. The figures are supplied to the Royal Mint, and those for the last few years are given in the following table:

30th June	Day of Week	Silver	Nickel 3d. Bits	Bronze
1938	Thursday	18,443,949	171,758	2,833,344
1939	Friday	16,690,920	224,461	2,847,271
1940	Saturday	16,671,820	244,486	2,656,536
1941	Monday	19,939,042	285,809	2,247,879
1942	Tuesday	19,135,444	638,337	2,106,824

The 1942 figures cover the returns from thirty-two banks, including the Bank of England, but silver coin in the issue department of the Bank of England is not included. Allowance must be made for the varying days of the week on which the returns are made. On Fridays and Saturdays, for instance, the coin holdings are usually lower, owing to withdrawals for wages and for week-end spending. During the four years ended June 30, 1942, the quantity of silver held by the banks showed little variation, but, as the silver issued by the Mint during that period was about £24 million, it looks as if the whole of the additional coin went into circulation. The fall in the holding of bronze, in spite of mintings of about a million pounds, shows that the banks have reduced their day-to-day till money to alleviate the shortage of pennies—no new pennies have been struck since 1940. The holding of nickel threepenny bits is relatively high, and represents roughly one-third of the total minted.

‡ £7,950,000 of debentures repaid during 1941. Excludes balances held in European countries of £127,764 in 1940, £129,620 in 1941 and £129,854 in 1942.
§ This reserve is consolidated with General Contingencies Reserve in 1942. The figure given is based on supposition that this reserve remained at £1,500,000.

Sir Percy Bates, chairman of the company, sees no special reason for alarm as to the outlook for 1943, but gives no forecast as to results. The £1 shares of the parent company, Cunard Steam Ship, improved 3s. 1½d. on the increased dividend of the operating company to 22s. 9d. No dividend was paid for 1942, but an interim of 2½ per cent has been paid for the current year.

COMPANY RESULTS

Definitions of terms used in these tables are as follows:
Net fixed assets include everything from land to loose tools, less any distinguishable provision for writing them down.

Net inter-company items include holdings in, and loans and advances to, subsidiaries and associates, plus trade investments, minus all sums, other than dividends of the company, due to subsidiaries and associates.

Net liquid assets include all other assets less current liabilities, bank loans and profit and loss appropriations not retained as additions to reserves, carry forward, or other established funds.

COMPANY MEETINGS

BLEACHERS' ASSOCIATION, LIMITED

PROBLEMS OF RE-ADAPTATION TO POST-WAR TRADING

SIR ALAN SYKES' REVIEW

The forty-fourth ordinary general meeting of Bleachers' Association, Limited, was held on the 16th instant at the Houldsworth Hall, Deansgate, Manchester.

Sir Alan Sykes, Bt. (the chairman), presided. In proposing the motion for the adoption of the report and accounts, Sir Alan said:—

Ladies and Gentlemen.—Printed copies of the Directors' Report and of the Accounts have been circulated, and as they have been in your hands for some days I will, with your permission, follow our usual practice and take them as read. (Agreed.)

You will have noticed that the profit and loss account and the balance sheet show little variation in comparison with last year's accounts, and that is characteristic of the conditions under which our trade has been carried on during the past 12 months.

The value of land, buildings and plant, after deducting the balance of the Depreciation and Obsolescence Fund, appears on the assets side of the balance sheet at £6,691,472, which is about £118,000 less than the corresponding figure last year. We have set aside, as usual, a sum of £140,000 for Depreciation and Obsolescence, and the charges against that Fund have amounted to £203,092. This represents the expenditure incurred during the year on development and on the renewal and replacement of plant, as well as the amounts written off in respect of obsolescence.

The value of shares in subsidiary companies shows practically no change at £1,324,148, and there is only a small decrease of about £30,000, to £865,760, in the amount of advances to subsidiary companies. This item, together with that which follows of stock on hand at £74,203, represents the working capital of our branches. Sundry debtors at £79,662 are slightly lower this year, and War Damage Insurance premiums, which now amount to £139,043, show an increase of £38,000 on account of the payments made during the year. This last item represents the accumulation of premiums paid which, as you will know, are required by the War Damage Act to be treated for all purposes as outgoings of a capital nature, although, of course, the payment has to be made out of profits. We, therefore, prefer to carry the expenditure forward and to show the provision for the liability on the other side of the balance sheet. In due course, when the risks no longer obtain, the items will disappear from both sides of the balance sheet. You will no doubt appreciate that the figures before you do not represent the full cost to the stockholders since the premiums, although payable out of profits, are not allowed to be charged against profits for income tax purposes.

Cash with bankers at the end of the year amounted to £160,902, which was £114,000 less than the previous year's balance, but against this you will notice that we now hold £200,000 of Tax Reserve Certificates which are available for the payment of our tax liabilities and which, in the meantime, earn a small amount of tax-free interest.

Investments at £939,501 show an increase over last year of about £10,000, and the figures which appear in the balance sheet are based on cost prices or less. Against this item you will see a reserve for contingencies of £54,651 on the other side of the balance sheet, and this we consider to be adequate to provide for any normal depreciation in value.

On the liabilities side of the balance sheet there is no change in the amount

of issued capital or debenture stock. Credit balances at £637,237 are about £60,000 lower than last year, but the fluctuations under this heading are largely governed by the relation between our payments on account of taxation and the provisions made to meet those payments.

I have already referred to the War Damage Insurance Premiums Reserve, and the General Reserve Fund shows no alteration. The Superannuation Fund is lower this year by the amounts paid out to old employees with long service, and the balance now is £138,909. The Fire Insurance Fund stands at practically the same figure as last year, and I have previously explained the Investments Contingency Fund.

TRADING PROFIT UP

This brings me to the Profit and Loss Account, in which you will see that our total Trading Profit amounted to £365,890, or rather more than £12,000 above the corresponding figure last year. The charges for Directors' Fees, Depreciation and Debenture Interest are the same as usual, and this leaves a balance of £122,030 to be carried forward to the balance sheet.

If you will turn to the Directors' Report you will see that the balance of profit brought forward from last year's accounts was £80,862. To this is added the net profit for this year of £122,030, making a total available sum of £202,892.

From this the directors propose the payment of a dividend on the Preference Stock at the rate of 5½ per cent. per annum for six months in respect of arrears to September 30, 1935, and a provision of £40,000 for War Damage Insurance premiums, leaving a balance of £94,486 to be carried forward to the next account.

In making this recommendation the directors have taken into account that the net profit available from the past year's trading was insufficient to meet a full year's dividend on the Preference Stock, and that it is necessary to make provision out of profits for the payment of War Damage Insurance premiums. Having regard to the uncertainty which must attend any estimate of the future under existing conditions of trading, the directors felt that they could not recommend any departure from the practice which they have hitherto followed of paying each year as much of the arrears of Preference Dividend as the balance of the year's profit permits.

It has been suggested that under the conditions revealed by the Balance Sheet we should have recommended the payment of at least a full year's dividend on the Preference Stock, and I can assure you that that is a matter to which your directors gave the fullest consideration before deciding on the recommendation which we have made. I think that you are entitled to know the reasons which influenced the board in reaching its decision. In the first place, we have not yet been able to secure a final decision with respect to our liabilities for taxation, and, although we believe we have made adequate provision for those liabilities, we do not feel justified in diminishing the company's liquid resources until any uncertainty in this matter is removed. A further point which we have to keep in mind is that our liquid balances to-day are increased by the reduction in working capital which has followed the closing of some of our works under the Board of Trade scheme for the concentration of industry. We are entitled to hope that in due course circumstances will permit the reopening of those works and that the funds now temporarily released will again be required for trading purposes. You

may rest assured that the directors are guided solely by what they consider to be in the long run the best interests of the company and its stockholders, and they do not at the moment feel justified in recommending the distribution of more profit than is available from the year's earnings.

TRADING REGULATED

Present regulations do not permit me to tell you much about our work during the past financial year, but as I said in the earlier part of my speech, the similarity of the results reflects the conditions which have governed our operations.

Our trade is almost entirely regulated by production for Service orders, by the Board of Trade Utility Cloth Scheme for the Home Market, and by the strictly controlled and relatively small volume of exports. Our contribution to each of these spheres of work is limited by the volume of trade allocated or permitted, and similar limitations extend to the works which we are permitted to operate and the number of employees we are allowed to retain.

Unfortunately, Government orders for textile fabrics do not make as great a demand upon the Bleaching Trade as they do on other sections of textile finishing, and therefore we have not as large a volume of trade from this source. The restrictions imposed on civilian consumption also tend to diminish the proportion of the trade in bleached goods. Quantitative limitation such as that imposed by clothes rationing, coupled with the absence of other desirable objects of expenditure, encourage consumers to concentrate on more expensive lines, and the demand for coloured and fancy fabrics is proportionately increased to the detriment of white goods. Wholesale and retail distributors, who are now compelled to deal at controlled rates of profit expressed as percentages of cost or selling price, naturally endeavour to promote sales of the highest priced fabrics and thus to exclude all but the most essential white goods.

This is a defect in the present system of control which is tending to defeat one of the major objects of that control, and it might well receive the attention of the responsible authorities.

RESTRICTIONS ESSENTIAL

These restrictions are essential to the diversion of the maximum volume of our National resources to the prosecution of the War, and we make no complaint in respect to them except that limitation by quantity rather than by value tends to vitiate the principal object of restricting expenditure and, incidentally, discriminates to some extent against our trade. I believe, however, that those who have the somewhat thankless task of enforcing these limitations are discharging an onerous and often unpleasant duty with conspicuous success and, as far as possible, with due regard to a fair distribution of the burden and of the maintenance, as far as is practicable, of our existing commercial channels and practices.

There have been mistakes, of course—it is a marvel that there have not been more—but the adaptation of our industrial system to a war economy is a performance of which this country has every right to be proud, and we are proud to have made our contribution to it—a contribution which, although perhaps small in relation to the total, represents a very large part of our present activities.

If we could be sure of something of the same enthusiasm and spirit of sacrifice, both nationally and internationally, in approaching the problems of readaptation to post-war conditions, we could look forward to the future with every confidence.

I am sure that you will wish me, on your behalf, to convey to the managing directors and to the other members of our board, and also to the managers of our branches and all of our employees, our thanks for their untiring efforts

BOOTS PURE DRUG COMPANY, LIMITED

RECORD SALES FIGURES

VALUE OF PRIVATE ENTERPRISE

LORD TRENT REPLIES TO CRITICS

The annual ordinary general meeting of Boots Pure Drug Company, Limited, was held, on the 21st instant, at Beeston.

The Rt. Hon. Lord Trent, chairman of the company, presided.

The following is the chairman's statement, circulated with the report and accounts:—

Owing to the restrictions imposed by the paper control, our report this year has to be cut down to approximately half our usual length. The appropriations recommended are set out in the report and the figures are clearly shown on the balance-sheet. Although our sales are easily a record and show the largest increase we have ever recorded, both in number and amount, practically the whole of the profit on this increased business has gone in taxation. Over 6,000 of our staff have joined the Forces, and I regret to say that 96 of them have been killed in action and 63 are prisoners of war, whilst 17 civilians have lost their lives through enemy action; to all their relations we offer our deepest sympathy.

RESEARCH WORK

The past year has been an important one for our research department, as, in addition to the pooled research undertaken in conjunction with other members of the Therapeutic Research Corporation, we have done a great deal of work on medicinal, agricultural, and horticultural products. Especially significant has been the progress made in the research conducted under the direction of Dr Pyman. Thanks to his unceasing work, in collaboration with his staff and that of the fine chemical department, we have been enabled to make striking progress in many directions, details of which, however, cannot be given at present.

Prescriptions.—We have again a record increase to show in the number of prescriptions dispensed, and it is clear that this company, together with its competitors, will be quite capable of coping with any extension of the medical services which the Government may decide upon.

It is, in my view, essential that the multiple chemists, and I here include the many co-operative pharmacies, which represent such an important and progressive section of the industry, should be given the opportunity to place their views before the Government, if the public is to be given the best and most efficient service. There should be no need to set up any new organisation or machinery of control to meet the dispensing and pharmaceutical requirements of the National Health Service now in contemplation.

THE PATENT SYSTEM

I come now to another question in which the Government is concerned. We are to-day supplying many vital and important drugs which, prior to the war, were a monopoly of the Germans, thanks to a patent system in this country which afforded them protection even though they did not manufacture here. Too much importance cannot be attached to the value of research, and when the work of the researchers produces results they are entitled to the due reward of their labours. It should be realised, however, that so long as research, experiment, and inventive genius are encouraged and financed by a reasonable system of royalties, it is contrary to public interest for the State to permit under its system of patents any monopoly of manufacture.

The licence to manufacture should be

granted to any firm that can provide satisfactory assurances of its competence to do so. If international arrangements on these lines could be adopted, there would be a freer exchange of ideas and a wider availability of products, instead of an unnecessary and often uneconomical dependence upon others.

MONOPOLIES AND PUBLIC CONTROL

The mention of monopoly brings me to an even wider question. We have heard a good deal lately from politicians who advocate Government control of industry about the alleged shortcomings of the large private enterprises. This criticism contrasts strangely with the urgent representations that were made to British firms before the war to organise on a larger scale and work in closer association with one another in order to compete effectively with the foreigner. Much of this talk has been superficial and wide of the mark. When politicians venture into theories about industry they are on unfamiliar ground, and their conclusions often bear little relation to the practical facts. Certainly the assumption that the State could produce better results for the community than private enterprise is far from being borne out by the evidence that is available to us.

Expenditure is incurred every day by private enterprise in peace-time on a scale that no Chancellor of the Exchequer would contemplate. Apart from certain utilities, and then usually those locally controlled, I do not think that anybody can seriously suggest that public enterprise has shown evidence of any capacity to replace the existing system from which the nation has derived ever-increasing advantages and a very definite improvement in the amenities available to the masses of the population.

BUREAUCRATIC INTERFERENCE DEPRECATED

I have digressed on this important topic because it vitally affects the future of our community and it is, in my view, imperative that a halt should be called to the wild talk that is indulged in by doctrinaires on such matters. We must all recognise to-day that it is the duty of the State to protect the community against abuses, whether they are committed by private enterprise or by Government Departments. But in a freedom-loving democracy such as ours it is clear that the less State regulation we have the better, and strict limits must be placed on the intervention of bureaucracy in business and private affairs.

WORK OF THE STAFF

It is with particular pleasure this year that I record our appreciation of the work of the staff. The cheerful and willing service which is given in branches subject to frequent raids is a source of great pride to us all. Our senior and permanent employees have had to spend much time and effort in training and helping part-time and inexperienced people, and the directors are pleased to report that this co-operation has reduced to a minimum the dislocation usually associated with frequent staff changes.

As to the future prospects of our company, it is clearly impossible for me to offer any predictions. We function under many conditions over which we have no control, and I can do no more than repeat the words that I used last year when I said that so far as our fortunes lie in our own hands, we have every cause for confidence.

The report and accounts were adopted.

THE DISTILLERS COMPANY, LIMITED

CHAIRMAN'S STATEMENT

The sixty-sixth ordinary general meeting of the company was held in Edinburgh on the 16th instant. Lord Forteviot (the chairman) presided. The following is an excerpt from the chairman's statement sent out with the directors' report and the accounts:—

The profit for the year, arrived at after charging depreciation on the company's fixed assets, a further sum to reserve for investments, and provision for deferred repairs, taxation and contingencies, amounts to £1,947,221. This compares with the figure of £1,962,168 for the previous year. The board have agreed to appropriate and to apply the following sums:—

To reserve fund £500,000, making the fund £3,000,000; to fire insurance fund, £75,000, making it up to £1,000,000; to war contingencies fund £100,000, bringing this up to £200,000. After giving effect to these allocations there is a sum available sufficient to enable the board to propose the maintenance of the dividend and bonus to the ordinary stockholders at the same figure as for the previous year.

With reference to the balance-sheet, I have to report that, during the year under review, the company invested a further £500,000 in National War Bonds. At May 15, 1943, the company's holdings in gilt-edged securities, mainly short term, amounted to £13,000,000.

I do not think the other items in the balance-sheet call for any special reference.

DISTILLING POSITION

While the grain distilleries, due to Government decree, were idle throughout the year, the malt distilleries were allowed a restricted production. A small number of the malt distilleries were thus able to operate for a short period.

There is no prospect of distilling—either grain or malt—during the current year, as, after a review of the cereals position, the Minister of Food has decided that no material can be made available from the 1943 harvest for such a purpose. Stockholders will be glad to know that it is anticipated our stocks should, with care, be capable of bridging the gap until the resumption of normal distillation.

BURDEN OF WHISKY DUTY

In the 1942 Finance Act there was an increase of 40s. per proof gallon in the duty on whisky, and recently there was a further increase—this time 20s. per gallon—bringing it up to 157s. 6d. per proof gallon. This latest increase necessitated an adjustment in the price per bottle, now fixed at 25s. 9d. for standard brands. While at the present time a bottle of whisky will sell in the home market at this price, taking the long view, there is no doubt that the position is alarming. If the duty is not substantially lowered when the present national emergency ends, the home trade will be seriously reduced, with a consequential effect on the export trade. One cannot emphasise too strongly the paramount importance of our export trade to the country in the post-war period. Meanwhile, on the whole, during the past year export trade has been well maintained in the markets still available to us.

YEAST FACTORIES

The yeast factories have again worked at full production, and the established high quality of the company's product has been maintained throughout the year. Last year I referred to our Vitamin B₁ Yeast Tablets, and I am pleased to report that the demand from Government departments and the general public has been decidedly encouraging. The sales campaign is being developed so far as this is possible under present conditions.

CHEMICAL AND PLASTIC ACTIVITIES

Our activities in the chemical and plastic fields, coupled with the ever increasing

OLYMPIC PORTLAND CEMENT COMPANY, LIMITED

IMPROVED RESULTS

The thirty-second annual general meeting of the Olympic Portland Cement Co., Limited, was held, on the 15th instant, in London. Mr. John Lawson (chairman of the London board) presided.

The Chairman, in moving the adoption of the report and accounts, said: "The better trading profit of £82,518 is mainly accounted for by the increased quantity of cement sold during the year—766,517 barrels, against 497,479 barrels in 1941. Rather less than 7 per cent. of the improvement was derived from higher cement prices, now controlled by Government order. The demand for cement was only met in the latter part of the year by drawing heavily on raw material and manufactured stocks. Cement production, for instance, totalled 747,355 barrels, against deliveries of 766,517 barrels, while the production of clinker, at 588,000 barrels for the year, compares with a consumption for cement manufacture of 722,080 barrels. The factory output as a whole, therefore, reflects an appreciable expansion over the previous year's operations, but the kilns could have been worked to full capacity had it been possible to ensure adequate supplies of coal. The directors are pleased to recommend the maintenance of the dividend at 10 per cent for the year, leaving a slightly smaller carry-forward to 1943 of £32,197."

When we met last year I drew your attention to the incidence of double taxation on the company, and when I tell you that the sundry creditors' figure of £53,062 stated in the balance-sheet contains provisions of some £33,657 for American taxation, both Federal and State, you will quickly grasp how real is the tax burden. The outlook for the current year is favourable on the whole, although trading results will not be as good as last year.

The report was adopted.

BEECHAMS PILLS, LIMITED

PROFITS AGAIN HIGHER

The annual general meeting of Beechams Pills, Limited, was held, on 22nd instant, in London.

Mr. Philip E. Hill, the chairman, in the course of his speech, said: "For the eleventh successive year your directors are able to report increased profits, this year's trading profits being £94,119 up at £1,269,334."

From a perusal of the accounts it will be seen that we made a profit of £51,512 on the sale of investments of which your directors considered it prudent to dispose in view of the favourable prices obtainable. The profit on these transactions has been added to the carry forward. "The year has not been an easy one, as the raw material position has been more difficult than last year, and quotas and other restrictions have militated against sales expansion. However, sales of the group's products were substantially in excess of those for the previous year."

Our new subsidiary companies, which were acquired in continuation of the board's policy of extending the business of the group beyond proprietary medicines, have all done well and have contributed satisfactory dividends.

Our export trade has suffered somewhat severely from increased Dominion and Foreign taxation and from the stringent shipping restrictions. We have held our own in the major markets, and are ready to follow our policy of expansion as soon as times are favourable. New lines have been put on the markets, and their successful exploitation is only a matter of time.

It is impossible for me to prophesy what the next year's results are likely to be, but I am glad to be able to tell you that so far sales show an increase over last year.

The report and accounts were unanimously adopted.

demand for research, have been fully maintained during the past year, and I should like to report that, subject to the inevitable restrictions of war conditions, satisfactory progress continued to be made in these branches of our organisation. Our investments in the field of plastics are extensive and increasing, but it is somewhat early yet to say how these will develop.

With regard to the current financial year, I can only say that it is impossible to give any indication of the prospects.

ANGLO-DUTCH PLANTATIONS OF JAVA, LIMITED

The thirty-third annual general meeting of this company was held, on the 20th instant, in London, Mr. W. H. Daukes, chairman and managing director, presiding.

The following is an extract from the chairman's statement circulated with the report and accounts:—"You will note with satisfaction that the company's liquid position improved during the year and to the extent of about £20,000. You will see on the asset side a note showing two substantial sums due to the local company to be paid as soon as we are in a position to start work again in Java and as soon as the Netherlands East Indies guilder currency is reinstated. The first of these sums, amounting to 752,183 United States dollars, is the proceeds of shipments made prior to the invasion of Java under an agreement with the N.E.I. Government that the dollars should be placed at its disposal for war purposes. The equivalent amount in guilders will be refunded to the company in due course. The second item is our balance on current account in Batavia from the last available records."

The report and accounts were unanimously adopted.

POWELL DUFFRYN STEAM COAL

POWELL DUFFRYN ASSOCIATED COLLIERIES WELSH ASSOCIATED COLLIERIES

The annual general meeting of the Powell Duffryn Steam Coal Company, Limited, was held, on the 21st instant, in London, Mr. Edmund L. Hann (the chairman) presiding.

The following is an extract from the chairman's statement issued with the report and accounts:—"The accounts of the operating company, Powell Duffryn Associated Collieries, are in the usual form, and I would draw your particular attention to the references in the report to the acquisition of the shares of Cory Brothers and Company, Limited, and to the issue of £500,000 debentures for the purpose of providing part of the amount required for this cash transaction. Your directors look upon this purchase as one of considerable importance, for many reasons. Its assets include colliery properties which will increase the productive capacity of the group by more than two million tons per annum. The depots and distributing facilities abroad, added to those already controlled by your company, will place the whole organisation in a position unique in the coal trade of this or any other country, whilst at the same time offering opportunities of substantial economy in the administration of the affairs of the united companies. The business includes the ownership of marine oil bunkering depots, oil storage facilities and leases upon lands in the oil-bearing area of the island of Trinidad."

The report was adopted and a final dividend of 6 per cent., making 7½ per cent. for the year, was approved.

At the annual general meetings of Powell Duffryn Associated Collieries, Limited, and Welsh Associated Collieries, Limited, the respective reports and accounts were adopted.

Trading With French Africa.—The Board of Trade made two Orders on July 15th under the Trading with the Enemy Act, 1939, relating to transactions with French North and West Africa (S.R. and O., 1943, Nos. 821 and 822). The effects of these Orders are that commercial and financial dealings with persons and concerns in those territories are no longer an offence of trading with the enemy; and that certain restrictions on dealings with their property in the United Kingdom are removed. While communications on business matters with persons in these French territories need not now be referred to the Trading with the Enemy Department for approval, trade between the United Kingdom and French North and West Africa must continue to be conducted through Government channels.

Utility Furniture.—The consideration of applications for permits to buy utility furniture was suspended from July 20th, and will not be resumed until September 1st.

Food Supplies and Consumption.—The Combined Food Board is investigating statistical records and data concerning food supplies and consumption in the United States of America, the United Kingdom and Canada. Dr. John M. Cassels, Dr. Montell Ogden and Dr. L. A. Maynard, all of whom are associated with the United States Department of Agriculture, are taking part in discussions with officials of the Ministry of Food. The Canadian Government is also participating in this inquiry, which will supplement the full exchange of information on food matters which is already taking place through the established channels of the Combined Food Board.

Home Flax Production.—A comparison between output of flax and tow in the period October, 1941, to March, 1942, and October, 1942, to March, 1943, shows that the output of flax has been multiplied about three and a half times; and the output of tow about four and a half times; quality has been considerably improved; and the average cost of production has been greatly reduced. According to the Ninth Report of the Select Committee on National Expenditure, it is apparent that the early difficulties of the Flax Department have now been largely overcome, that remarkable progress has been achieved, particularly during the past six months, and that a further steady improvement may be expected.

GOVERNMENT RETURNS

For the week ended July 17, 1943, total ordinary revenue was £51,102,000, against ordinary expenditure of £114,878,000, and issues to sinking funds of £275,000. Thus, including sinking fund allocations of £2,680,958 the deficit accrued since April 1st is £1,024,759,000, against £878,937,000 for the corresponding period a year ago.

After decreasing Exchequer balances by £132,505 to £2,684,224, the other operations for the week (no longer shown separately) raised the gross National Debt by £61,665,764 to £17,885 million.

MONEY MARKET

THE MONEY MARKET.—The banks were called upon to pay £50,000,000 in TDR's this week, and as this went against nominal maturities of £15,000,000 and slightly lower effective maturities, the strain on cash resources has been considerable. The banks consequently avoided purchases of bills in the early part of the week, and the discount market had to receive some assistance from the authorities through special purchases of bills on Tuesday. The position has eased somewhat since then, and some of the clearing banks have turned buyers of bills, but the margin of surplus credit has at all times been extremely narrow. The Bank return shows that the circulation has resumed its upward trend, though the latest weekly increase of £3,065,000 is slightly smaller than the corresponding movement a year ago. The main movements in the return are increases of £26,290,000 in Government securities and £21,635,000 in other accounts. A small part of the former may reflect special assistance given to the market, but in the main the two movements are complementary and reflect a

Fall of a Dictator

IN the sixtieth year of his life and the twenty-first of his regime, Benito Mussolini has slipped from the Italian political scene with little more fuss than an outgoing French Prime Minister. The last days of his public career can be quickly retold. On July 19th, he met Hitler at Verona. On his return, the Fascist Grand Council met, and, after a debate lasting many hours, it decided, on the motion of Count Grandi, to restore the supreme Command to the King. Mussolini then resigned, and Marshal Badoglio was entrusted with the task of forming a new Government. After a day or so, spent in collecting a team of non-party men and civil servants, he dissolved the Fascist Party and repealed the powers of the Fascist Grand Council. At the same time, he has declared that the fight will continue.

These are astonishing events. For years now, people inside and outside Italy have been saying "Why doesn't the King abdicate or dismiss Mussolini or do something?" And now he has done it. Yet if now, why not before? Why stage this reassertion of the royal will in the closing scenes of an irreparable catastrophe? The reason is clear enough. So long as Fascism delivered the goods in the shape of empires and colonies and easy success, neither the King-Emperor nor the Army were at all anxious to be rid of the Duce. The Italians might not be fanatically devoted to the regime. But it was there, and there was no overwhelmingly powerful reason for getting rid of it. To-day the situation is reversed. Fascism has nothing to offer. It is obvious to King, Army and

people that the Empire is lost; Sicily is all but lost; so, indeed, is the war. If Mussolini had been able, after his meeting with Hitler, to produce one last trump card in the shape of a German commitment to defend all Italy, then he might have survived a little longer. Presumably he could not, and, faced with the decision of the King and the Army and with his total lack of popular support, he had to go.

The intentions of the new Government are still to be announced. The obvious inference is that after a decent interval they will ask for peace terms, hoping that the departure of Mussolini will soften the hearts and the terms of the Allies. However, Mr Churchill has stated that so far no overtures have been made, and clearly the choice before Italy is not an easy one. The chief anxiety of the Italian leaders at this stage of a losing war is to keep the Italian mainland from sharing the fate of Sicily. If they do not capitulate, southern Italy will become a battlefield. But if they do capitulate, what will the Germans do in the north? The German High Command is not likely to give up the line of the River Po or abandon the plains of Lombardy to become bombing bases for the United Nations unless it is compelled to do so. The Italians might wish to exert pressure on the Germans to leave, but could Badoglio get his troops to fight? The issue is thus one of German manpower. If the Germans are strong enough to hold the north of Italy, even in the face of Italian non-co-operation, it is not certain that the Italians in these conditions would wish to surrender.

To press the Germans might mean that a nation which entered the war unwilling to fight on either side ended up by fighting against both sides simultaneously.

If the Germans are still the masters of north Italy, what has Italy to offer the Allies? The Italian mainland below the Po is a liability, not an asset. It can hardly be used for operations against Germany, and only small portions are useful for operations aimed elsewhere. If occupied, it must be fed and fuelled—the Labour Director of the Ministry of Fuel is already talking of the 5,000,000 or 6,000,000 tons which will be needed from British mines to keep Italy going. The military prospect seems on the whole so unattractive that one may well ask whether the Germans have not hoped to use the disappearance of Mussolini as a bait to involve the Allies in a complicated and fruitless occupation of the strategically useless parts of the Italian peninsula.

These are questions which the layman cannot decide, but it can be said, with great vigour, that only considerations such as these should determine the Allies' policy. What is the military value of an Italian surrender? What strategic advantages would accrue to British and American arms? Until these questions can be answered with certainty, then the only right procedure is the one laid down by Mr Churchill in his speech to the Commons:

We should let the Italians, to use a homely phrase, "stew in their own juice" for a bit and hot up the fire to the utmost in order to accelerate the process until we obtain from their Government, or whoever possesses the necessary authority, all the indispensable requirements we demand for carrying on the war against our prime and capital foe, which is not Italy but Germany.

If, however, the Italians are in a position to make an unconditional surrender—which means of course not a surrender without conditions but a surrender in which the Allied conditions are accepted without question—the Allies will have to determine their attitude towards the Italian Government which makes the surrender. Is the right policy to set it aside and to take over the direct administration of the country? Should Amgot be carried over from Sicily to the Italian mainland? Mr Churchill is undoubtedly right in insisting that an administrative job of such a scale would be a preposterous strain on the Allies' resources.

We certainly do not seek to reduce Italian life to a condition of chaos and anarchy and to find ourselves without any authorities with whom to deal. By so doing we should lay upon our armies and upon our war effort the burden of occupying, mile by mile, the entire country and of forcing the individual surrender of every armed or coherent force in every district into which our troops may enter. An immense task of garrisoning, policing and administering will be thrown upon us, involving a grievous expenditure of power and still more time.

The Allies may, then, have to make use of the Badoglio Government. Many people see in this the unpleasant possibility of a new Darlan episode. It must be said at once that the Badoglio regime marks no particular ideological advance on the Duce's. The Italians themselves must decide how far the House of Savoy is compromised by its twenty-year tolerance of Fascism. But the Allies can say here and now that they do not accept as the leaders of post-war Italy the General and the Army responsible for the attack on Abyssinia, Spain, France and Greece. However, to deal with the Badoglio administration as a military convenience so long as the war against Germany lasts does not entail any political compromise. The analogy is not the Allied handling of Darlan but Hitler's handling of Pétain. And there is also much to be said for allowing the Badoglio Ministry to bear the unpleasant responsibility of winding up an unsuccessful war while other, uncompromised political leaders reserve themselves for the period of peace and reconstruction.

Some critics maintain that there is a third alternative—the setting up of a democratic parliamentary regime now. Is this really so? The Italians have had no organised

political life for twenty years. There are no recognised leaders, no agreed policies. It is also very questionable whether a Government, however democratic, established under the aegis of a foreign invading army, would enjoy lasting prestige once the first enthusiasm had passed. But even if a change of regime now is not practicable and might be harmful, it is very necessary to begin at once the popular processes which underlie democratic parliamentary government—the restoration, for example, of full civil liberties, the right to meet and discuss, the right to speak and write. How else are the recognised leaders and the agreed policies to emerge? There are signs enough already—for example, the Five-Party Milan Manifesto published in *La Stampa*—to show that many Italians are anxious to end the state of political passivity to which Fascism reduced them. The Allied authorities must do nothing either through Amgot or through any temporary arrangements with Badoglio, to suppress the liberties which the Italians firmly believe the Allies are bringing with them. As in Britain at war, no interference with the war effort or disturbance of public order can be permitted, but in other respects political energies should be allowed to flow again. Otherwise the Allies will, after all, find themselves involved in another Darlan episode, and the newly awakened interests and desires of the Italians will be driven underground towards just that "condition of chaos and anarchy" Mr Churchill rightly deplored.

Italy is only the first step. The disappearance of Hitler's chief lieutenant and the possibility that Italy will sue for peace have swung the searchlights to the writing on the wall. The satellite Powers of Europe have known for months past that the Germans might lose the war. Now the Italians have given them a lead in the conviction that the Germans have already lost it. There is bound to be a concerted movement to tumble off the German band wagon. The situation in the other satellite countries will not be very different from the situation in Italy. Their ability to get out of the war will depend on Germany's ability to keep them in. If the Italians withdraw their garrisoning troops from the Balkans, then certainly it may be difficult for the Germans to hold Greece and parts of Yugoslavia, but they may still have strength enough to hold the vital areas—Bulgaria, Roumania, the Hungarian plain. Allied policy in such matters as unconditional surrender, political relations with the capitulating governments, reactions to the movement of popular opinion, must follow the general pattern suggested for Italy. The situation in re-occupied Allied countries—in Greece and Yugoslavia for example—will obviously follow a different model, not without difficulties of its own.

And now, leaving on one side at last the political and military problems raised by the Duce's downfall, let it be said that this week has seen one of the greatest events not only of this war but of Europe's long and often melancholy history. For the war, the event is great because it is the first absolutely clear and unequivocal sign that Germany is beaten and that the "sentence of the watchers" has gone forth on Hitler's brief and bloody empire. But for Europe as a whole, indeed for the world, there is another, deeper reason for content. Looking back over the chronicle of men's affairs, how often the proud and the treacherous and the cruel have continued in their power, glorious and unshaken to the end. How rarely it is that justice is visited upon the oppressors while they are still living. How many empires founded on violence and aggression have survived triumphantly to oppress the grandchildren and great-grandchildren of the men they first enslaved. But with Mussolini's empire, it is not so. Few men of such unbridled pretensions have been dismissed so quietly from the stage of history.

How art thou fallen, O Lucifer, son of the morning! . . . They that see thee shall narrowly look upon thee, and consider thee, saying, Is this the man that made the earth to tremble, that did shake kingdoms; that made the world as a wilderness, and destroyed the cities thereof?

Public Service for All

THE Report of the Norwood Committee on the curriculum of secondary schools is discussed elsewhere in this issue of *The Economist*. There is, however, one brief passage in the report, almost incidental to its main purpose, which deserves more extended comment. In arguing that there should be a brief gap between the last examination of school life and entry to the University, the Committee writes:

If after the war some form of public service were to be required, we can foresee educational values resulting from a period of six months given by boys and girls drawn from varying circumstances of life to work of national importance—in industry and agriculture, at sea, in the social services and in similar fields no less than in the armed forces. Such a period so spent might do much to fuse the country into a single whole with a common purpose and a common understanding.

The Committee, as is proper, is concerned with the educational value of such a period of universal public service—though a hint of a wider purpose appears in the last sentence. But there is no reason why discussion should be restricted to this aspect of the matter, important though it is. It is not only education—and not only education plus national defence—that would be served by such a principle, but a far wider set of values. Indeed, it may well be that the principle of universal public service is one of the most essential ingredients of the new Society towards which the British people, as others, are groping their way.

The most obvious and familiar form of public service is in the armed forces of the Crown. After the last war, conscription was abolished. After this war, circumstances will be different in two respects. First, there will be far less confidence than there was in 1919 that victory for the Allies means the end of force in international affairs; it seems probable that the general view will be in favour of the maintenance of considerable and efficient forces. Secondly, the supply of young citizens of the most eminently military ages will be smaller and declining. It is so probable as to be almost certain that forces of the required size will require conscription for their maintenance. Whether conscription of women will be maintained is more doubtful, but young men will almost certainly have a period of compulsory national service in the armed forces.

The Norwood Committee, however, is not thinking of the armed forces alone, but of public service in other fields. If education is a training for life, then the idea of service to the community deserves a place in it as well as the cultivation of the individual personality and training in mental habits. Even from the severely educational

point of view, the Committee is unquestionably right in bringing forward this proposal.

The argument, however, is wider. It is not concerned only, or even chiefly, with citizens in training, but with citizens in full enjoyment of membership in the community. The mental training of the school is wasted if it is not used after the child leaves school. And training in public service would be pointless if, after the nineteenth year was past, there was no public service to give. A general and continuing system of Public Service is a necessary counterpart to the universal and embracing system of Social Security that is now under construction. The argument that Social Security *à la* Beveridge would undermine individual initiative is nonsense—the more so when it is urged by comfortable persons who have never known the timidity and numbness of initiative that come from fear of insecurity. The danger is not lack of initiative but lack of responsibility. There have been examples in this war of countries where the individual has been so fully encouraged to look to the state for the assurance of his rights that he has thought of himself solely as recipient—and where, when the crisis came, it was difficult to persuade him that his duty to the community of which he was a member not only overshadowed all his rights, but was the only ultimate safeguard for them. Not all these countries speak foreign languages and not all are on the Continent of Europe.

It is a matter of the most vital importance to underline the fact that the state has a power to organise individuals, but no power to create wealth. It can assure the rights of any one individual; it cannot assure the rights of the mass of individuals without their co-operation. The Government cannot be a universal Santa Claus and, if it could, it would merely create the servile state. Emphasis on these truths is the more necessary now at the beginning of an era of vast extensions of social guarantees. When social services were on a small scale, it could plausibly be argued that "the rich will pay." But they will clearly soon be on a scale far beyond the much diminished capacity of the rich alone to support—even if such a policy could be accepted. Social Security henceforward will have to be a co-operative venture, dependent, broadly speaking, on the efforts of those who benefit from it. If then, there are to be rights from the cradle to the grave there will have to be a parallel extension of duties—and not merely of duties in the abstract, but of duties closely related to the rights. Public service and social services should be the obverse and the reverse of the very same medal. The ideal is that the social services should be largely manned by citizens rendering their public service.

This is a statement of principle—of an important

principle which it is vital should receive recognition. But it would be foolish not to recognise that there would be many practical difficulties in the way of its application. The first arises from the fact that the needs of the defence forces must have priority. It is unlikely that the six months of which the Norwood Committee speaks would be enough either to provide a thorough training for the individual or to man the necessary forces. If a full year were needed for this purpose, it would obviously be difficult to find still more time for other forms of public service. Two years out of three score and ten may not seem, on an absolute comparison, too much to give to the community in return for all that the community gives, or is to give, in return. But it would obviously require a considerable change in present ideas—and involve considerable reorganisation in the Universities and the professions—before so long a gap could be required.

Secondly, there would be the difficulty that not many forms of public service can be performed by unskilled boys and girls. The continuous period of service at the age of 18 or 19 would inevitably be largely a period for training and for the acquisition of skills. The answer to this problem, if the community is bold enough to face it, is the answer that is given to precisely the same problem in military service. The skill once acquired, the citizen would have to be required to practise it, in the public service, for a brief period every year. A full system of public service would require not merely a long period in youth but two or three weeks a year throughout life. If every gainfully occupied adult were to put the equivalent

of two weeks a year (it might more conveniently be two months every four years) at the disposal of the community, there would be about 800,000 persons available at any one time. It is these, not the youths in training, who could man the services.

This is, of course, asking a great deal. But it is the human equivalent of the financial cost of a Social Service state. To assume—as is assumed now—that the whole cost of the effort to abolish poverty and insecurity can be measured and paid in money terms is to harbour a dangerous illusion. Money alone can no more buy security than it can buy victory.

Thirdly, there would be the manifold and formidable problems of practical organisation. It would not be easy to organise efficient services with a fluctuating and amateur labour force—even though every one would have had training in his youth, and even though every citizen with special qualifications for any one service were assigned to it—doctors and nurses, for instance, to the medical services.

It is not the purpose of this article either to ignore the existence of these practical problems or to attempt to resolve them. The intention is simply to suggest that the principle should be stated and accepted and that every practical opportunity should be taken, through the years, to implement it. The intention, indeed, is rather more than that; it is to assert that without the implementation of such a principle, democratic society, as it is at present beginning to be conceived, cannot long or soundly endure.

New Houses for Old

LAST week might have been called Building Week. The report of a conference of representatives of local authorities drew the attention of the Minister of Health to the present growing overcrowding and the progressive deterioration of housing conditions. In the Commons there was a heated debate on building costs; and the Building Industries' National Council held a two-day conference to hear the views of a pride of Ministers about building policy. The net effect of these proceedings was summed up this week in a letter to *The Times* from the President of the National Federation of Building Trades Employers.

The recent muddle over the building of a mere handful of agricultural cottages has alarmed the building industry and alarmed the country. It is as nothing compared to the muddle there will be in the housing of the people after the war if wiser counsels do not prevail in high quarters and prevail quickly.

At first glance, perhaps, it is surprising that there should be this alarm, for building is the only department of post-war policy which already has a definite plan. The recent White Paper on the training of building workers envisaged the raising of the industry's labour force to 1,250,000 after the war; the Minister of Health has said that half the post-war effort will be concerned with housing as distinct from other forms of construction; and has interpreted this to mean the erection of 3,000,000 or 4,000,000 dwellings in just over a decade. The trouble is, however, that, though there is this plan, there is still no policy; and by itself, the plan probably raises more problems of policy than it solves. There is no indication of the framework into which building, both residential and industrial, will be fitted; certainly none was given at the BINC Conference. The Government has still to make up its mind about the planning proposals made in the Barlow, Scott and Uthwatt Reports. No official guidance has yet been given on the crucial question whether the building programme implied by the White Paper will in fact be compatible with the other urgent claims on the nation's limited stock of resources. Local authorities in bombed and other areas have still no notion of the likely distribution of reconstruction costs between

rates and taxes. No spokesman, either of the Government or of the building industry, has really come to grips with the question of how much these millions of houses are to cost, either in real or money terms, and how they are to be paid for.

The fact is that the problem, in its broad economic context at any rate, has not yet been fully analysed and understood—by the industry any more than by the Government. It is a problem, first, of demand and, secondly, of cost. The immediate demand for houses is very pressing. There are bombed areas to be rebuilt, slums to be cleared and arrears of maintenance and repairs to be made up; and, in addition, there is a special wartime problem of overcrowding due to the redistribution of the population in search of safety or work. This demand will be greater, not less, immediately after the war, when the Services and the war workers will be demobilised, families will be re-assembled and, in general, the population will again be redistributed. This much is generally appreciated. The Government is taking steps to make damaged and empty dwellings habitable and available; and the first priority in the use of building labour and materials as soon as the war ends is to be to make every possible dwelling fit for use. The only dispute here is the pace at which the Government can now make labour and materials available for these purposes—an issue which raises the wider questions of the allocation of resources between war and civilian requirements, the celerity or otherwise of departmental action and the efficiency of the industry itself, which varies very much from firm to firm.

What is not so clearly appreciated is the next stage in the development of post-war demand, when the prospective overcrowding have been made good. Here the only guide, apart from the general, genuine and commendable desire to see every family in a decent building employment and 3,000,000 to 4,000,000 houses in ten to twelve years. Admittedly, nothing less than an effort of this magnitude can realise the very proper aspirations of the planners and the reformers; but, in

material terms, it is a very ambitious programme. It involves the rebuilding of at least a quarter of the nation's stock of houses in little more than a decade; and the employment, indirectly as well as directly, of something like one-sixth of the nation's labour force in connection with construction work of all kinds. It is imperative, to avoid recrimination later on, that the Government should work out and say whether in fact this can be done—whether, that is, it can be "afforded" in terms of real resources, during the critical reconstruction period when there will be pressing claims upon those resources for industrial re-equipment, education, health and transport.

There is, moreover, another sense in which the questions "Can it be done?" "Can it be afforded?" are apposite. The building done between the last war and this one was mainly done to house a growing number of families and to make up building arrears. This time, the situation will be quite different. Apart from non-residential building, there are six possible sources of demand for dwelling-houses. The first of these is the replacement of houses destroyed by bombing—which will require less than a year's output at the planned rate. The second is houses required to remove overcrowding. The third is to provide houses in replacement of the slums—that is, of unhygienic houses. The fourth is to house the annual national increment of families—now very small. The fifth is to house the local increment of families, due to any redistribution of population. If one thing is certain, it is that these five categories of demand will not add up to anything like 3,000,000 or 4,000,000 houses in the decade after the war. The standards of what constitutes a slum house or overcrowding would have to be raised far above the present levels for the sum of these five categories to amount to as much as half the planned building. It follows that, if the plan is to be carried out, the overwhelming part of the demand must be sought in the sixth category—the replacement by new houses of houses which, however old and inconvenient, are perfectly sanitary and habitable—and which also have a substantial value. The problem was well put a few weeks ago by Mr. F. J. Osborn, of the Town and Country Planning Association:

Remember that in this period we shall not be building mainly for an additional population or to make up building arrears as we were from 1919 to 1939, when we added suburbs to all our bigger towns. We shall be mostly replacing existing buildings with better ones, for much the same population, though a slightly increased number of families. That means wholesale demolition and rebuilding in our existing urban areas and villages.

Nothing is more desirable than this wholesale building of a better Britain, if it is possible. About 8,500,000 of the 13½ million houses in this country date from before 1914. Even if, say, 3,000,000 houses were pulled down and replaced in the first post-war decade, 5,500,000 of the remainder would be over a generation old; and the problem of the obsolescent house is of critical importance to a nation in search of higher housing standards. But the implications of such a large-scale replacement should be carefully weighed. When the war started, the kind of demand which had motivated the building of houses between the wars—that is, middle-class demand and working-class demand assisted from public funds according to set standards of overcrowding and under-housing—was within measurable distance, at any rate, of being satisfied. The goal of one dwelling (of some kind) for every family was in sight; and if there had been no war, either there would have been an early slump in building or the state would have been compelled to raise its standards of overcrowding and slum accommodation—and to increase the amount of money it was prepared to pay in subsidies to make working-class demand effective. In effect, the White Paper, by setting this target of 3,000,000 to 4,000,000 houses, despite the short distance that has to be travelled to reach the satisfaction of demand on the pre-war basis, assumes a dramatic change in public policy—and a dramatic increase in public expenditure.

This is where the question of cost (assuming for the

purpose of the argument that the value of money will be kept steady) is crucial. It will only be possible to engage half the expanded labour force of the building industry in putting up houses if a demand on a large scale for new houses in place of old can be created; and such a demand can only be created in one of two ways. The first way is to get the price of new houses so low that a spontaneous demand for them will spring up from those who are now living in old houses. This is difficult enough to achieve at any time, since the prices and rent asked for old houses can be reduced a very long way before it pays better to pull them down—indeed, demolitions will not be privately undertaken until the value of the land unencumbered and available for new building is greater than encumbered by an old house. But if the cost of new houses is high, there will be no private replacement at all. The second method of securing rebuilding is for the state to subsidise the whole process—including the payment of compensation to the owner of the old houses removed, which, not being condemnable still retain some value. Thus high costs put a threefold burden on the state. By making non-residential building unattractive, they compel residential building to take up a greater part of the task of keeping the building trade occupied. By choking off private replacements, they compel the state to finance a higher proportion of the total number of dwelling houses built. And they increase the cost per unit—that is, the real cost, measured by the alternative uses of resources that have to be forgone.

Lord Portal was right when he told the building industry last week that cost is the key. The higher the cost of building, in real terms, the smaller the amount of building construction that can be included in a properly balanced investment programme. "High cost," the Minister said, "will kill the building trade," and he might have added that it will cripple rehousing. At present, building costs are more than double the pre-war level. Experts anticipate that immediately after the war they will be anything from 60 to 100 per cent higher than they were. It seems certain that building costs at the moment the war ends will have risen by considerably more than middle and working-class incomes. People will not pay more than half as much again for new houses when they already have a habitable old dwelling. Even if the state is prepared to step up its standards of national accommodation and increase the money it is prepared to pay to make working-class demand effective, there is a limit; and the widening spread between building cost and private incomes threatens to make the burden of subsidies, even on the pre-war basis, insupportable.

These are the problems which, within the framework of the national plan and policy that the Government has still to produce, will determine the extent to which the vision of a nation properly housed and sheltered can be brought to earth. It is a sobering thought that almost every expert appears agreed that building cost will continue to run very high for a considerable period after the war, while the 300,000 workers who are expected to return from the Forces and munitions work will have to reacquire speed and dexterity and while another 200,000 craftsmen are being trained. On the other hand there are gleams of light. The Minister of Works has sent an expert mission to the United States to report on new building methods; specialists are busy at the Ministry on an investigation of more economical forms of construction; and some building firms have made notable advances in technique. It may be that the pessimists will be proved wrong. War-time building costs when the industry is working under abnormal conditions in the supply of labour and materials and doing work very different from its normal peacetime jobs, give no precise guide to the trend of costs when more normal conditions are restored. If there is a responsibility upon the Government, as there is, to produce a clear-cut policy for the planning and financing of post-war reconstruction, there is a responsibility not a whit less pressing upon the industry to show itself capable of building houses economically and cheaply.

NOTES OF THE WEEK

Unity in Attack

The German National Committee, which has been set up in Moscow, is composed, like the Union of Polish Patriots, of former Communist deputies and non-party Army officers. The chairman is the German poet and "fellow traveller," Ernst Weinert. Among the ex-deputies are Wilhelm Pieck, Wilhelm Florin and Walter Ulbricht. The two vice-chairmen are Army officers, Major Karl Hertz and Lieut. Graf von Einsiedeln, Bismarck's grandson. If its composition and its terms of reference are examined closely, they do not suggest that the Russians are committing themselves irrevocably to any one set of men or to any one set of principles. The Committee may be useful in the process of winning the war: it is not necessarily a commitment for the post-war period. The terms of its Manifesto seem to have been designed to avoid any kind of ideological divergence between Russia and the Western Democracies. The phraseology runs altogether on the lines of liberal democracy, civil liberty and the rights of man. Nevertheless, the fact that a Committee has been set up in Moscow, without the prior knowledge of either the British or the American Governments, proves that there is a dangerous vacuum in the United Nations' policy at the highest level. To judge by the Russian reticence on Amgot they, too, have been left out of the discussions of a major decision in Allied strategy. This is a very serious situation. The tide of war is flowing now towards victory. Collapse stares many of Hitler's satellites in the face, and, as the quisling regimes disintegrate, the problem of what will take their place becomes a burning political issue. The dilemma has been perfectly clearly stated by the *New York Herald-Tribune*:

If Britain and the United States enter Germany at one end with Amgot, and Russia enters the country at the other with the new Committee, the situation will be embarrassing, to say the least.

Just over seven months ago, when the arrangements concluded with Darlan had shown how far the Allies were from possessing a co-ordinated policy, *The Economist* wrote:

The reoccupation of Europe may well be a converging movement from all three sides of Hitler's fortress. It is essential that as the English-speaking armies advance from the south and west and the Russian armies from the east, the terms of reoccupation should have been discussed and agreed between them in advance.

Now that the armies are on the march and the converging movement has indeed begun, the urgency of this plea is reinforced a hundred times.

The German Reaction

There have been some suggestions that the departure of Mussolini was an elaborate put-up job, jointly concerted by the two dictators at their last meeting and designed to involve the British and the Americans in a wasteful occupation of the Italian mainland. Such a suggestion is inherently improbable, for the disastrous effect of the disappearance of a fellow dictator on both German and satellite opinion could not but be obvious to one as skilled as Hitler in mob psychology. Besides, the reaction of the German propaganda services since the event shows that the Nazis had not expected the Italian coup. No line, no policy, had been evolved in advance—now almost a week after the change of regime, Dr Goebbels is still floundering. At first, the news was given without comment, either on the home or foreign services. Then both services took up the theme that, militarily speaking, the change made no difference. Every Italian statement on continuing the war has been stressed. Every Allied statement on unconditional surrender has been taken up, including Mr Churchill's speech to the Commons. This throws an interesting light on the Germans' anxiety about a possible Italian exit from the war, which might well be the first in a mass defection from the German side. *Einkreisung*, the sense of being encircled by enemies, has long been one of Germany's nightmare terrors. The falling away of their European allies would expose the German people to a formidable war of nerves. In the foreign broadcasts, one or two other lines have been tried out—for example, the explanation that Mussolini is in bad health.

Another interesting attempt at an explanation was the blunt statement that since Fascism could no longer be counted on to rally the total forces of the nation behind the war effort, Fascism had to go—presumably to make "total mobilisation" possible. So far neither explanation has appeared on the German home services. Indeed, no explanation seems to have been attempted. This cannot last. No totalitarian regime can allow a friendly totalitarian regime to disappear without finally explaining why. Otherwise people must argue, "If there, why not here?" The explanation, when it comes, may well take up the "total mobilisation" line with which the Germans were made thoroughly familiar last winter. But even this explanation is a boomerang. What if Italy does after all go out of the war?

Balkan Repercussions

The downfall of Mussolini, Germany's satellite in chief, has come as a tremendous shock to all the other satellite countries. In Budapest only have genuine tears been shed for Mussolini; the press reminded the public that Mussolini had been the first statesman among the politicians of the Entente to recognise the "injustice of the Trianon Treaty." But even in Hungary there seem to be few illusions about Italy's true position. Of all the Balkan countries, Hungary has been the closest associate of the Italian satellite; and the latent but obvious crisis in Hungarian politics is now very likely to come to a quick climax. The Prime Minister resigned from his post as Foreign Minister a day before Mussolini's dismissal; and wholesale changes in the Diplomatic Corps are imminent. Some of the Hungarian papers are referring more and more frequently and hopefully to the Atlantic Charter—which only a short time ago they derided as a worthless scrap of paper. Reference is made in particular to those points of the Atlantic Charter which refuse to recognise territorial changes that have not been carried out in accordance with the freely expressed wishes of the nations concerned. A requiem mass for General Sikorski in Budapest was attended by several former Prime Ministers, all former Hungarian envoys to Warsaw and many political personalities. If there were a change in the Hungarian regime, it would be greatly facilitated by the fact that the country has succeeded in preserving the framework of Parliamentary institutions; and in recent months Parliament—which is now in recess—has become, significantly, very restive. The reaction to the Italian crisis in Roumania has so far been rather confused. Bulgaria is taking the new position soberly; and the downfall of Mussolini is acknowledged to be the end of the Fascist system. More than any other satellite country, Bulgaria will be affected by the new military position. Bulgarian armies have done police work in the Balkans for some time past. The withdrawal of Italian troops from this area, which will now be speeded up, will place an enormous burden on the 40 to 45 Bulgarian divisions. Germany cannot possibly hope to replace the Italian forces by Hungarians or Roumanians; and Bulgaria's prospects will to a very large degree depend on the extent to which Germany itself fills the gap by its own reserves. So far, reports speak of about 15 German divisions stationed in the Balkans. In all the satellite countries the tendency to desert the New Order is very marked. It is now a question of timing. Much depends on the speed of developments in Italy itself. Will there be a quick collapse of Italy, like that of France in 1940? Or will there be a protracted crisis more like the breakdown of Russia in 1917, when the Lvov-Miliukov-Kerensky Governments managed to carry on the war for several months before the final collapse? Should events in Italy follow the French pattern, then the Balkan dictators may be left with very little scope for manoeuvre. If events should move more slowly, they may hope to secure better bargaining positions.

Manpower Measures

Mr Bevin's latest statement on manpower is a timely reminder of the hard work still to do before victory is finally won. Shortage of manpower is by no means confined to the coal-mining industry, and as the war reaches its climax even more stringent demands are being made

upon the nation's reserves of men and women, already severely strained. Mr Bevin outlined in the House of Commons on Thursday some of the steps he is proposing to take. A prime need is for the expansion of the labour force in aircraft manufacture; recruitment for the women's Services will be suspended in favour of bringing more women into aircraft factories. The age up to which women must register for direction into national service is to be raised to 50; and fresh adjustments will be made in the allocation of resources between other industries and services. The purpose is to speed the offensive in the air and in the field. Labour in the building and civil engineering industries will be set to construct more airfields for the Americans. The return of seagoing engineers now employed ashore is to be sought; and certain skilled men are to be recalled from the shipyards to locomotive building. But the most critical situation remains that in the coal-mining industry. As Mr Bevin said at Blackpool last week, the labour force must be brought up to 720,000-750,000 from the present 706,000; and to do this, as well as to offset the normal wastage of 20-30,000 men a year, the Minister may have to resort to "desperate measures." The House was relieved to hear that Mr Bevin will only use his powers under Regulation 58A, to compel boys, down to as early an age as 16, to enter coal mining if other measures fail. At present young men called up can choose coal mining instead of military service, up to the age of 25. Mr Bevin proposes to remove this age limit; and if an insufficient number opt for mining (as only 3,000 youths have chosen to go into the pits since last October, no great results can be expected from this cause) he will compel men of 18-25 who would otherwise be called up for the Forces to enter the industry. Mr Bevin emphasised the need for adequate training facilities now and for post-war opportunities for training. In this connection, it is important that the Government should implement the proposals of the Forster Committee. These included provision for an initial training period for juvenile entrants into coal mining, with further training for juvenile face workers; suggestions for leisure time schemes and for the health, safety and welfare of juveniles; the continuation of the guaranteed-pay week, and the adoption of a national minimum wage scale for juveniles. At the same time, the Government should press on with its effort to maintain the level of production by every other possible means, so as to render unnecessary the conscription of young boys—which is unpleasant to contemplate and very naturally regarded by parents with reluctance and alarm.

Farming in War and Peace

It is common practice nowadays, it seems, for Ministers of the Crown to sail under sealed orders. "Thinking aloud behind closed doors" is the apt description that has been given to the tortuous negotiations which the Government is conducting about the constitution and functions of local authorities; and the phrase is not inapplicable to present policy-making at large. This week a number of Members of Parliament expressed indignation that the new Workmen's Compensation Bill came cut and dried to the Commons some time after all its final details had been divulged, in confidence, to the interested parties. More resentment still was shown during Wednesday's debate on agriculture when Mr Hudson revealed that he is "under instructions" not to talk about post-war agricultural policy—to Parliament, at any rate. The "four year plan" which he expounded is not designed for peacetime proper, but for the period of relief and emergency after the war, when many of the conditions of wartime will remain. During this period, he said:—

Our chief aims must be to maintain the high level of production we have already reached. . . . The basis of our plan during the next four years must be to maintain our present production of food for direct human consumption, while at the same time taking steps to ensure that the fertility of our soil is not undermined, which necessarily involves also an increase in livestock and livestock products.

Mr Hudson paid a high tribute to the Hot Springs conference, and has plainly taken its proposals for the first peacetime stage of relief economy very willingly to heart. Unfortunately, he is apparently not allowed to say whether its proposals for the second stage of economic and specialised farming, with the world's crops grown and drawn from the most suitable and efficient sources of supply, are to be equally well received, in practice as well as verbal tribute. The process of adjustment from emergency national farming to stable international trade (with primary producers protected, as everyone is agreed, against sudden slumps)

will be most critical of all. Without undue criticism, it must be suspected that the longer the duration of quasi-war farming, which has such obvious advantages for the farming community, and the more protracted the delay in stating a long-term policy, the less willing—and the less able—will the Government be, when its lips are unsealed, to make the necessary change-over. British farming has notably improved in efficiency during the war; and the cost of farming in other countries may well be higher in the future than the past. But it is certain that if British farming continues indefinitely to be run in peacetime on war lines, in quantity and kind of product, it will be uneconomic and expensive to maintain.

The Content of Education

The Norwood Report, which is published this week, is the first of the three whose absence made such large gaps in the Government's White Paper on Educational Reconstruction. Its subject is "Curriculum and Examinations in Secondary Schools," and if all three gaps are filled with as much wisdom and sense as this one the country will be very well served. The Committee accepts the proposed threefold division of secondary schools into Grammar, Modern and Technical Schools, though its chief concern of the present report is that Grammar schools, which are again divided into three sections—the Lower School from 11 to 13, the Main School from 13 to the statutory leaving age (15 or 16), and the Sixth Form thereafter. The Committee was bombarded with suggestions for additions to the secondary curriculum. These suggestions came from two sources. The first consists of those people who think that education should be "useful," by which they mean vocational. The second consists of those who hold the opposite view, that there are a number of subjects that the intelligent citizen "ought to know something about" and which consequently ought to be taught in the schools. The first argument is obviously inimical to good education. The second is more specious, but the Committee very wisely rejects it, partly because the school week is already too full, but mainly for a more fundamental reason. This is their

Voice of the North

ASK TO SEE IT AT YOUR CLUB, LIBRARY OR NEWSAGENT

belief that the child is being forgotten, and that education is not at present sufficiently "child-centred." Their contention is that it is not the contents of the mind that matter, but its shape; not knowledge acquired, but the "qualities of spirit and habits of mind" with which the child is endowed by his education, and for this purpose "we would urge that the best approach is through the existing subjects." Their main object, so far from adding new subjects, is to get away from the excessive tyranny of the existing subjects, as now arranged. There is, the report says,

A tendency to regard subjects as having claims in their own right both absolutely and in relation to others, without real regard for the supreme consideration, which is the special needs and special aptitudes and abilities of the pupils themselves.

The aim, the Committee thinks, should not be "knowledge" of any "subjects," but "sound learning"; and as for the method of acquiring this, they quote with approval the parent who said "that he does not care what his boy is taught so long as he is well taught." It does not follow, of course, that the curriculum should be quite shapeless, and the Committee indicates what subjects should find a place upon it. They think, as is reasonable, that there should be a fairly wide range in the Main School. In the sixth form, they acknowledge the difficulty of the choice between breadth and depth, but vote for depth in a comparatively narrow range. But at all ages, their main prescription is for more freedom—more freedom for schools to be different from each other and more freedom for children in each school to be different

These ideas involve some radical re-casting of the present examinations system. The most difficult problem is at the age of 15-16. The Report points out all the anomalies of the School Certificate examination, which now rules supreme at this age. In form, it is a university entrance examination; but it is set, two or three years before the age of entry to the university, to children most of whom end their education with it. Nevertheless, its required subjects and, within each subject, its syllabus and "set books," dominate the secondary school curriculum. The Committee recommends that it should move in the direction of being an internal examination, conducted by the teachers in each school, but, for a transition period, it proposes that the examination should still be set by the university bodies, without, however, there being any compulsory subjects or combinations of subjects, or syllabuses. The Certificate given to each child would state what standard he had reached in what subjects, and would add an estimate of "the way in which he had used the opportunities offered to him by his education, using the term in its widest sense." The headmaster of Leeds Grammar School reserves his position on the extent to which the examination should become wholly internal and it is true that the opposite danger to too much rigidity is a complete lack of all objective standards. Subject to this reservation, the proposed reform is obviously wise and timely. At 18, the Committee recommends three tiers of examinations. Every December, the universities and colleges should hold their scholarship examinations. In March, there would be an examination, held by the universities, to select State scholars. Both these examinations would, of course, be competitive, but, in the latter, qualities other than the purely intellectual would count. Finally, there would be a School Leaving Examination, which would provide evidence of competence to enter a university (other than as a scholar) or to pursue professional studies. Most boys and girls would, of course, take only one of these examinations; very few would take all three. It is obviously impossible in the compass of a single column to give more than a brief review of the main provisions of a report which, if adopted, and if applied by sufficient teachers of the right standard (the province of the McNair Committee) will make possible an immense advance in the quality of English education.

Exports Debated

Tuesday's debate on export policy showed the Commons divided into two groups, the Pessimists and the Optimists. The Pessimists were best represented, in familiar FBI vein, by Sir Patrick Hannon and, in a more esoteric fashion of argument, by Mr Shinwell, both of whom based their apprehensions about the future of British exports upon fear of the productive capacity of the United States.

Sir Patrick Hannon put what now appears to be the orthodox view of organised industry in this country—that is, that it will be impossible to maintain the competitive power of British industry unless the Americans agree to share their world markets with Britain. Mr Shinwell's solution is somewhat different. He does not accept the simple division of markets by agreement, because he does not believe that "45 million people can talk on terms of equality with 130 millions." Therefore, he suggests that Britain should take the lead in planning production and trade in two international alliances—the British Commonwealth and a European Federation—to stand up against the vast export drive which he expects from across the Atlantic. The one believes in appeasing the challenger, the other in ganging up against him. Neither paid much attention on Tuesday to the simpler, more straightforward, more effective and less perilously irresponsible alternative proposed by Mr Summers, who drew attention to the need to improve the efficiency of British industry by re-equipment and modernisation, assisted by a positive and constructive taxation policy. In this, Mr Summers followed the lead of Mr Burgin, first man in for the Optimists, who had picked out skill and productivity as the decisive factors in export prospects; and it is a fact that Britain's external trade after the war, like its internal economic activities, will depend—as it did in the old days—whatever system is adopted of sharing out markets or planning production—on the comparative amounts that can be produced per unit of labour and capital.

The Terms of Trade

Mr Shinwell's speech in the export debate did not altogether ignore the basic economic verities, by any means; it was not all of one colour. First, he suggested, apparently to tantalise other speakers, that exports do not matter at all, because, "if we are going to develop the standard of life of our people, it must be in the main by our internal industries" (which is, of course, quite true). Then he recognised, handsomely, that exports do matter, because we must sell in order to be able to buy imports (the sole reason, as he said, for exporting). Finally, he admitted, more handsomely still, that "when you get goods coming into the country that cost less than it would cost to produce them at home, the advantage that is derived is in the increasing of national income"—which is the whole point. It is, in fact, the point which both the Optimists and the Pessimists of last Tuesday's Commons debate would do well to get together to consider. The key to standards of living is productivity. As a country's productivity rises, so does the power of its people to buy and sell, both at home and abroad; and international trade, however it is organised, free or controlled, competitive or planned, must, if it is to advance the wealth of nations, be simply the exchange of goods which cost less in terms of real resources to produce than to buy, for goods which cost less to buy than to produce. Whether one is an Optimist or a Pessimist must depend, first, not on calculations of trade organisation, whose importance, though undoubted, is nevertheless secondary, but on an estimate of the relative productivity of British industry after the war. It is, of course, essential, as Lord Southwood insisted in the Lords on Wednesday last week, to provide the conditions of trade; to agree upon a flexible plan for currency and the exchanges; to prevent "catastrophic changes" in the prices of primary products; to expel restriction by monopoly or other means; and to pursue the development of backward areas by joint and ample investment. But to the individual producer, trader or nation, it is the terms of trade that matter most, the comparative costs, in labour, plant and materials of what is sold and what is bought.

Minister of Productivity?

The Minister of Production, Mr Oliver Lyttelton is unashamedly an Optimist. The speech he made at Oxford a week ago was ostensibly to pay a well-deserved tribute to the development of welfare in industry under the guidance of Mr Bevin, to the growth in the number of personnel managers, welfare officers, canteens, factory doctors and nurses, and to the work of the Joint Production Committees, which Mr Lyttelton, like the Minister of Labour, regards as properly "a permanent part of the country's industrial life." But the Minister of Production did much more than pay this tribute. He looked at the

broad future of British industry in its economic and technical aspects.

Over the whole field (he said), we must be imaginative and audacious. We must realise that it is possible to bring in a far more prosperous era than we have ever seen.

This was a challenging and timely statement. The record of the past 43 years shows that "our power to reproduce, to re-create our wealth" is not less but greater than the "power to destroy," which is so much in evidence to-day. But, potentially can only become practice by policy. The plainest obstacle, as Mr Lyttelton said, is unemployment; curing unemployment means not simply the statistical trick of taking idle workers off the unemployment register by putting them in uniform or to useless tasks, but rather employment means more than work for all; it means the most productive work for every worker and every machine. National productivity is the mainspring of national wealth, international productivity the mainspring of the wealth of nations. The obstacles to the best use of resources are well known: restrictive practices by both capital and labour, by workers, industrialists and merchants alike. But it is not possible to take off these brakes if the wheel is not capable of going round even without them.

You will not persuade the workman that when labour is in over supply, he is doing an economic wrong by preventing the dilution of his trade, and you will not persuade the employer and the capitalist that he is doing something anti-social by preventing redundant production from bringing bankruptcy to a whole industry. . . . It is to the causes that give birth to restrictive practices that we have got to address ourselves.

Mr Lyttelton turned to the instruments of a policy of expansion: "It is towards the creation of demand and to the use of inventions that the economic thought of our specialists must be directed."

I believe that in peacetime in this country through our whole economic system we have been too orthodox, too anxious to balance budgets in times of slump, too unwilling, that is, to believe that we can catch up again in times of prosperity, too inclined to restrict credit when the sky is darkened, too intent on balancing our accounts instead of looking to the economic realities that lie beyond them.

Mr Lyttelton's plea is for a financial policy that will ensure that, nationally and internationally, the financial means will never be lacking for any tasks that are physically possible, that is, for which the resources of labour, plant and capital are available. His argument ended as it started—on the note of productivity and efficiency in work. The "creation of demand" must in fact be done by the "use of invention," by increasing the three-fold power to produce, to sell and to buy, both at home and abroad, in the vast regions of the Empire, Russia and China. It is perhaps a pity that Mr Lyttelton's speech was not made in the House of Commons during the debate on export policy.

Curtin vs. Fadden and Menzies

The election campaign has begun in Australia, and it is already running a characteristic course. Both sides are seeking the working majority that no Australian Government has had for several years. All the 74 seats in the

House of Representatives are involved, and 19 out of the 36 seats in the Senate. At present, the Government and Opposition each have 36 seats in the Lower House, and Mr Curtin has had to depend precariously on one or another of two Independents. In the Senate, the Opposition has a majority of two; and of the 19 seats which come up for re-election this year, 14 are held by the Government. It is by no means sure that this uneasy balance, which has made government very difficult, will be ended by the forthcoming elections. Even if Mr Curtin gains a small majority in the House of Representatives, which is far from certain, he is very unlikely to gain control of the Senate. Now that the acrimonious echoes aroused by the unfounded attack made by one of his Cabinet on his predecessor as Prime Minister are dying down, Mr Curtin is taking his stand on the Australian war effort during the past 20 months. During that time, both the total number of men in the armed forces and the number of volunteers for Service anywhere have doubled; 820,000 men are in arms and the number of volunteers for unrestricted service exceeds half a million. Civilian production, which engaged two-thirds of Australia's industrial capacity when Mr Curtin took office, now takes not more than one-quarter. It is, of course, true that the Japanese outburst 20 months ago made a transformation of this order imperative in Australia, whatever the colour of its Government; but Mr Curtin is entitled to the highest praise for the achievements that have been recorded, both at home and abroad, during his leadership. The complaint of the Opposition is that this national effort has been tinged too much with sectional politics. Mr Fadden is in favour of an all-party Government and wishes to take the war out of politics. He has expressed himself implacably opposed to both strikes and inflationary finance, and accuses Mr Curtin and his Ministers of using the war as an excuse for Socialist measures. But Mr Fadden's case—and electoral chances—are somewhat weakened by his failure to prevent politics and personalities from dividing the ranks of his own supporters. Within the last few days he has had a bitter battle of words with Mr Menzies, who claims that Mr Fadden's plan for the refund after the war of one-third in all (ranging from three-quarters in the case of the lowest incomes to one-twentieth in the case of the highest) of the taxes collected in and after the financial year 1941-42 is bound to cause post-war inflation, whatever Mr Fadden's views may be on inflation in wartime. There is an edginess and testiness on both sides of Australian politics which does not auger well, on the face of it, for undivided attention by any party to the real issues of Government. Both sides, in addition to seeking a majority now, are jockeying for post-war position, and reconstruction projects in the most general of terms are staple items in their election platforms. On the other hand, it must be said, without any reservation, that, in spite of the high-strung nature of Australian politics, the Australian contribution to the war in both human and material terms has been, and continues to be, astonishingly and increasingly large. The only problem is whether, in the present mood, the Australian politicians will be equally capable of solving the considerable problems that will appear as soon as the war has been won and the Japanese menace, which has evoked so noble a response in Australia, has been brought to an end.

Milk Policy

The House of Lords this week debated the Government's recent White Paper on improving the quality of the milk supply. There has been general approval of the proposals, but doubts are felt about the wisdom of allowing "accredited" milk to be sold unpasteurised. It is contended that tubercle bacilli are frequently found in the milk from accredited herds, although they undergo a general inspection every three months. The White Paper proposed that where accredited milk is not heat-treated, the herds should continue to be inspected quarterly, but though glaring cases of TB infection may be revealed thereby, the only safe policy is to pasteurise all milk that has not passed the tuberculin test. Shortly after the public heard that its milk was to be made safer, it was told that its milk ration was to be reduced to 2½ pints a week from the beginning of August. This reduction is being made three months earlier this year than last, and it is said to be due to the special demands for manufactured milk products from the armed forces. It is not said, as was emphasised a year ago, that the milk shortage is due only to greater consumption, and that actually more milk is being produced than in peacetime. It is possible, therefore, that production is falling off or is at least not keeping pace with the estimates. Farmers have certainly little incentive to increase production, for it is easily the least profitable of the different branches of farming, and so early a reduction in the ordinary ration seems to forecast smaller supplies of milk this winter than last. The best remedy would be to reduce the margin between the profitability of dairy and other farming by making other farming less profitable, not by making milk production more so. This, however, is a counsel of perfection, and if Lord Woolton is to have his milk, Mr Hudson will have to increase the price—and the subsidy—still further. But Lord Woolton could also with advantage examine the working of his scheme for distribution. It seems to be only the towns that have had their rations cut. From the country come stories that people are still allowed as much milk as they want.

Conditions of Full Employment

Sir William Beveridge has often defined in broad terms what are, in his view, the main conditions for the fulfilment of Assumption C of his report—the maintenance of employment. Last December, in Manchester, he said that there must be national planning machinery, fluidity of labour and a policy for exports, and that the Government should show speed and determination in the preparation and execution of these measures. In a speech at Leeds, last week-end, he advanced the argument a stage further. He suggested three lines of attack for avoiding cyclical depressions after the war: first, financial incentives to private enterprise to increase, repair and replace capital; secondly, public investment to counter fluctuations in private investment; thirdly, the influencing of consumer demand by increasing or decreasing taxation. It is difficult to do more than state these problems and tasks in general terms unless and until something more is known of the Government's intentions about the policy and machinery of planning. On mobility of labour, little has hitherto been heard about the trade union attitude. Mr Bevin at the Miners' Conference last week, did give some indication of his own view, but his very important remarks were completely overshadowed by his statement about the recruitment of boys. The Minister of Labour repeated what he has frequently stressed, namely, that if the workers are to maintain the benefits they have secured as a result of the war, and, further, to improve their standards, they must be prepared to accept continued responsibilities, since they cannot expect rights without corresponding duties. Mr Bevin hopes that the guaranteed week will become a permanent feature of industry, and he suggested that the second great wartime innovation—the principle of direction to work—might also be continued with advantage after the war. The acceptance of this principle by the trade unions would contribute enormously to the movement of labour, within the framework of a policy of full employment, to the work and places where they can be most judiciously employed. There is still no indication of the unions' attitude towards the question of compulsory training of the unemployed, which is an equally fundamental factor in mobility; and it will be more than interesting to see whether the Trades Union Congress, at its September meeting, is prepared to define its attitude towards these very vital matters.

Redistribution of Seats

The Home Secretary recently announced the Government's intention to bring in legislation for preparing a continuous register in each constituency and for enabling members of the Forces to vote either by post or by proxy. Last Thursday, Mr Morrison stated that the Government is now preparing to follow up this measure with its logical corollary—the redistribution of parliamentary seats. The existing maldistribution, with some constituencies depleted and others swollen far beyond their original size, is just as anomalous as the present out-of-date register, but is an even more difficult matter to adjust. The last distribution of seats took place in 1917, and there were very large movements of population during the inter-war years, while wartime mobilisation and evacuation have complicated an already difficult problem. It is, of course, impossible to lay down a precise basis for parliamentary representation without any knowledge of the likely location of industry and distribution of population after the war. Probably the best empirical solution would be to effect redistribution on the basis of the 1939 population—which is certainly a better criterion than that of 1917, whatever changes may have occurred during the war—and then to arrange for periodic readjustments. Mr Morrison did not enter into detail about the basis to be adopted. But he said that the legislation would follow the principle laid down by the Speaker's Conference in 1917, that "each vote recorded should, as far as possible, command an equal share of representation in the House of Commons"; and that a standing body of Boundary Commissioners would be appointed to keep the state of constituencies under constant review and prepare schemes for parliamentary approval. The House received with gratification the news that legislation on the lines of the Vivian Report on electoral machinery is being prepared and that the Government hopes to introduce a redistribution scheme before the first post-war general election is held. But many Members remained disappointed that there will be no opportunity for a general discussion of electoral reform before the recess, and the feeling was widespread that many of the wider issues have still to be solved.

Croats and Serbs

If in their extremity the Italians withdraw their troops from the Balkans, and the Germans are thus compelled to shorten their defence lines drastically, then the Adriatic coast may become a potential entry point into Europe for the Allied armies. True, the topography of coast and hinterland is exceptionally difficult—rocky shore, narrow valleys, bad lines of communication. But if the mountains are occupied by trained and vigorous guerrilla fighters who are prepared to co-operate fully with the invading armies, then Yugoslavia can become an attractive military proposition. It is therefore all the more unfortunate that the breach between General Mihailovitch's Serb Chetniks and the Croat Partisans is still unhealed. The Germans have referred to a number of occasions on which they have come together in local actions, but in general the feud remains; and it is certainly not lessened by the passion with which the supporters of either race in other lands are taking a hand in the controversy, using the term "traitor" so freely that not even Dr Matchek, a central figure in Croat resistance, has been spared. It should be the task of the new Yugoslav Government in London to counter these polemics and to neglect nothing that could restore unity. Unhappily, the Trifunovitch-Jovanovitch combination is pan-Serb in the uncompromising tradition of Pasitch, and the fact that the Ustasi Croats have co-operated with Germany is being used as an excuse for dismissing the claims of the anti-German Croats—of which the Partisans are the fighting wing. Behind all these failures lies a fact which people abroad have perhaps been slow or unwilling to accept. The picture usually painted of Europe is one in which common resistance to Hitler has created a united front between minorities and majorities which were formerly at daggers drawn. This is unhappily far from the case. There is no country in which the Germans have not known how to encourage one racial group at the expense of some other. In Yugoslavia, the Ustasi Croats received "most-favoured-nation" treatment and took advantage of this to massacre the Serbs living in Croatia. This fact exasperated pan-Serb feeling, and now the two races are probably further from unity than they were when they signed their agreement in August, 1939. Left to themselves, they may not be able to reach a solution. It is the responsibility of outside Powers

to create a framework within which some sort of settlement can be worked out. The Minorities Treaties were such an attempt after the last war. Similar but much stronger guarantees will be needed after this.

Shorter Notes

Complete results in the South African election are not yet available, but it is clear that the victory of the Smuts Government is likely to be even bigger than was expected. The course of the war has handsomely vindicated the policy of the Prime Minister and invalidated the Opposition's case for neutrality and no commitments to Britain. Deeply divided among themselves, the Opposition parties have been heavily defeated in an election which they never hoped, or really tried, to win; and their chance will not come again until the problems of peace supersede those of war—when South African politics will once more be in the balance.

M. Maisky has been appointed Assistant Commissar for Foreign Affairs, without any indication so far of what this implies for him personally. If this appointment means

that M. Maisky will not return to London, there will be widespread regret. Much in the future of Anglo-Russian relations will depend on the quality of his successor.

The Rushcliffe Committee has now issued its report on the salaries of midwives. The Minister of Health has accepted its recommendations, which include a national scale of salaries to all certified midwives, whether employed in hospitals or in the domiciliary service, the adoption of a uniform which only state certified midwives may wear, and the institution as soon as possible of a 96-hour fortnight with 28 days of paid leave a year.

The US Office of War Information has been rebuked by President Roosevelt for a broadcast which referred to the King of Italy as the "Moronic King." Some three years ago, it will be recalled, the BBC incurred the public displeasure for including the same King in its list of birthday greetings.

The Pensions Appeal Tribunals Bill has now passed through all its stages in both Houses.

AMERICAN SURVEY

The Small Farmer

(From a Correspondent in Colorado)

Denver, July 5th

THE paradox of the smallest of the three general farmers' organisations of the United States is that it has always been counted as the most radical and as the organ of the "little" farmers; yet it has become big business, whose members and affiliates share in co-operative enterprises worth \$100 millions, with a \$400-million volume of business yearly.

This is the Farmers' Educational and Co-operative Union of America—the Farmers' Union for short. The paradox was recently pointed up when its huge, five-year-old Farmers' Union Grain Terminal Association of St Paul, Minnesota, bought the big St Anthony and Dakota Elevator Company of Minneapolis, and the Brown Grain Company, a commission house, thus becoming by far the nation's largest grain-handling organisation. Now it has a net worth of \$13 millions, will handle almost half the durum wheat crop and large fractions of other types, has 450 country grain-elevators all the way from the Great Lakes to the Pacific Coast (plus 38 lumber yards owned by St Anthony and Dakota), and a capacity in terminal elevators of more than 10 million bushels of grain. (One of its elevators alone, built in 1941 at Superior, Wisconsin, has a capacity of 4,500,000 bushels.)

The Union has other large business enterprises aside from the Terminal Association. The Central Exchange, also at St Paul, has one of the largest assembly plants for farm machinery in the United States, and has recently bought a refinery at Laurel, Montana, for refining petroleum products, with a capacity of 6,000 barrels a day. Since the Union is a federal organisation with no central check or reports at headquarters from the co-operatives organised by members, there is no central estimate of the economies realised by operations. But the Grain Terminal Association was said to be clearing \$1,000,000 yearly even before its latest acquisitions; the Central Exchange is said to return \$350,000 yearly to members; and there are some 20 other co-operatives which return \$100,000 a year each, or more. Union Security Association, a life insurance company also five years old, now has \$17 million in policies in force.

On the general business front, the 1,500 co-operatives owned by Farmers' Union members and affiliates buy and sell almost everything produced or needed on the farm or in the home. They buy insurance and hospital care and electric current and seed and tools and lumber for their members; the first co-operative hospital in the United States

was that founded by Dr Michael Shadid in 1934 for an Oklahoma Farmers' Union unit. They sell virtually every farm product—there is even a co-operative in the South that sells lily bulbs. The expressed goal of the Union is that, together with all other genuine co-operatives, theirs may some day handle 10 per cent of America's retail trade co-operatively, which, it is felt, will provide a yardstick and check on the profits of private business. If they reach this goal, who is to insure that they will stop there?

The autonomous co-operatives are all organised on the Rochdale plan, with each member having one vote in the affairs of the co-operative, regardless of how much patronage he gives it, with sales at the retail price level, and profits returned as dividends according to patronage—or ploughed into the business. One need not be a member of the Farmers' Union to become a patron-member of a Union co-operative; there are approximately 500,000 individual shareholders in the co-operatives, against a Farmers' Union membership of 126,000 "farm families" in 28 states—a gain of about 20 per cent in the past year.

The Union's national headquarters are now at Denver, where all national activities have recently been centred in a modernistic building on an 11-acre tract on the prairie outside of town.

The organisation was founded in 1902, by a Texas editor of a weekly paper, Isaac Newton Gresham, and a group of farmers who were in miserable circumstances. It is interesting that of the country's three major farm organisations the Grange rose to power in the disturbed conditions following the Civil War, the Union was founded after the Spanish-American war, the Farm Bureau after World War I.

The Union spread very fast at first and instituted many co-operatives. But some of these got away from the Rochdale plan, and failed; and the Union itself was later almost swallowed up in the flood of political farm organisations, such as the Nonpartisan League and the Farmers' Alliance, active in the Great Plains states following World War I. As a result of such experiences, it now has a rule that if a Union official wants to run for office, he must first resign his post in the Union.

But the organisation is, and always has been, a pressure-group on behalf of farmers—many of the "farmers' marches" and "farmers' strikes" of the 1920's were either led by Union members or were authorised by various union locals, and it has been of very considerable recent importance on the national scene.

To-day, the moving spirit behind the Grain Terminal

Association is M. W. Thatcher, a public accountant, who became interested in the Union while auditing the affairs of the Association's predecessor, the Equity Co-operative Exchange. He represented the Union in Washington for seven years, and in 1938 organised the Association with \$30,000 in cash invested by Union members and \$300,000 borrowed money. He is one of the two strong figures of the Union.

The other is the man under whom, on the political front, it has in the past two years intensified its efforts on behalf of the small "family-type" farmer: a big, smiling, boyish-looking, 41-year-old Coloradoan named James George Patton. He was born in a Farmers' Union family and has worked for the Union practically all his mature life, becoming its national president in 1941.

The Union's most recent political battle in Washington has been to save the Farm Security Administration, created some eight years ago as a successor to the Resettlement Administration, with the purpose of lending money to small farmers and farm tenants, and giving them other aids by which to become self-supporting. The American Farm Bureau Federation has fought the FSA as useless and expensive, and on this and many other questions the Union and the Bureau have clashed head-on.

The Farm Bureau Federation was founded in 1919, or, rather, it grew out of the county farm bureaux which had been voluntarily organised in many states, and which had paid part of the expenses of county agricultural or extension agents. State bureaux were organised, and with the national organisation added as a keystone the Bureau was powerful from the start. It has had a potent voice in Washington in the last twenty years, has shaped much of the farm legislation, and has been exceedingly strong within the Department of Agriculture, especially on such matters as the Agricultural Adjustment Administration legislation, and the soil conservation measures passed when the AAA was struck down by the Supreme Court.

The Farmers' Union charges that the Bureau has always favoured the "big" or master farmer as against the little farmer and the farm tenant; and that the AAA type of legislation, based on the philosophy of scarcity (i.e., the holding down of production in order to get a better price), with the Government benefits therefrom based on acreage and production, penalises the small farmer on the small

family-type farm as against the big farm operator and the absentee landlord.

The Union also claims that the Bureau is improperly close to the county extension agent system—most rural counties have an expert who aids the farmers in all possible ways and is paid from state and federal funds—and has used agents as recruiters; and that it has influenced the publicly supported land grant colleges, which teach agriculture and the mechanical arts, to the advantage of the "master farmer" and to the neglect of the small man.

Latterly, the differences between the organisations have widened to economic and political matters outside the field of agricultural interests. The Union under Patton has co-operated with organised labour and sought to help it fight its battles. (For instance, Patton appealed to the President to veto the Anti-Strike Act.) The Union frankly hopes for the day when farm produce, prepared and packaged by farm co-operatives, will be sold to consumers by labour co-operatives, thus entirely by-passing the private profit system. The Bureau, on the other hand, has been indifferent to the claims of organised labour or openly hostile to them; it tends to regard farmers as capitalists with interests antagonistic to those of labour.

Moreover, the two organisations are now split on support of the Roosevelt Administration. When the Bureau turned against the Administration some two or three years ago, the Administration in turn began to play up the Union as its friend in the farm-organisation field. Mr Patton was named a member of the Advisory Committee of the National Youth Administration, a member of the Economic Stabilisation Board, and a member of the Advisory Committee of the Manpower Commission. He has been one of the very few national farm leaders who have not joined in the struggle to get higher farm prices, through various measures in Congress; instead he has specifically supported the President's opposition to such prices—provided the stabilisation line is held all along and the general cost of living does not go up. He has wryly said that, because of this, the impression is abroad that the Union is a sort of "Administration company union." Some critics within and without the Union, comparing its gain with those of the Farm Bureau, have felt that it might have received more had it, also, been a little less bound to the Administration. But the Union is growing, and its members are apparently satisfied.

Interracial Adjustment in the South

(From a Correspondent in Virginia)

(The meeting described in the attached article took place while headlines were announcing race riots in several Southern shipbuilding centres and at Detroit. These flare-ups were in part expressions of economic competition, both for jobs and for off-work facilities; in part, they were expressions of social attitudes with a long history, transplanted, in the case of Detroit, by immigration from their area of origin. Immediate steps on the scenes of the disturbances, both North and South, will obviously be taken now to ensure continued war production, but the most important solvent of the problem, over the long run, is likely to be constructive measures, undertaken under Southern auspices in the South, such as proposed in the letter below.)

Richmond, June 28th.

ONE of the most significant developments in the history of interracial relations in the Southern States took place recently, when white and coloured leaders from those States met in Richmond, Virginia, the former capital of the Confederacy, and framed a programme for future collaboration and progress. Nothing exactly like it had ever happened before in this country.

The Richmond session was the outgrowth of two others. The first, at Durham, North Carolina, took place last October, and was attended by negroes only. They were the most distinguished negroes in the South—college presidents, professional and business men, newspaper editors and publishers, etc. This group of leaders produced an able statement entitled "A Basis for Interracial Co-operation and Development in the South." The statement was quite comprehensive, and went into considerable detail. It

set forth the things to which its framers felt the coloured citizens of the South could legitimately aspire. It listed objectives in the spheres of political and civil rights, industry and labour, service occupations, education, agriculture, military service, social welfare and health.

The population of the South is approximately one-third coloured. Its 10 million coloured citizens are the descendants of the slaves who were freed in the Civil War of the 1860's. They have made remarkable progress in almost every direction, but for many years there was a limit to the ability of the beaten and bankrupt South to offer them adequate opportunities for development. The victorious North made matters far more difficult by putting the over the defeated white ex-Confederates. The orgy euphemistically termed "Reconstruction" was the result. It ill-feeling between the races which had been engendered thereby.

Such is the background for the Durham statement framed by the South's coloured leaders. The statement was received with the utmost cordiality throughout the United States. The point was frequently made by commentators that the objectives it set forth should be realised as promptly as possible. There was scarcely a dissenting voice in the editorials which appeared all over the country.

Southern white leaders decided that so well-tempered and reasonable a manifesto deserved a formal reply. It seemed only proper that they should hold out the hand of fellowship to coloured citizens who had virtually invited such action. So the white leaders assembled in Atlanta, Georgia, in April and formulated their answer. It was at

once a gesture of friendship and a challenge to other whites to join with them in building a new and more harmonious era of race relations.

These two declarations were framed in an atmosphere unlike that which prevails in normal times. The slogans engendered by the war, the "four freedoms" proclaimed by Allied leaders, had caused many negroes, both North and South, to realise that they do not yet enjoy a complete equality of opportunity with white Americans. They began as unlettered ex-slaves 78 years ago, following the close of the Civil War, and it is not surprising that they have yet to reach their goals in all respects. At the same time, it also is not surprising that they should be aware of their disabilities in a war for democracy.

So it was partly with a view to allaying this feeling that the Durham and Atlanta conferences were held. After the latter gathering was over, the logical next step seemed to be a joint parley of picked representatives from the two racial groups, for the purpose of uniting on a set of objectives and framing a course for the future. These purposes crystallised at the Richmond meeting.

Thirty-three members from each race attended. Complete harmony prevailed, and there was an obvious and earnest effort on the part of both whites and negroes to produce a constructive statement and programme. The presiding officer for the gathering was P. B. Young, one of the South's foremost coloured citizens, editor and publisher of the Norfolk, Virginia, *Journal and Guide*, an ably edited weekly newspaper for negroes. All the white delegates were glad for Mr Young to serve as chairman, and their confidence in his impartiality and goodwill was fully justified.

After an all-day session, the gathering adopted a strong statement by a unanimous vote. This declaration was drafted by a committee of which Dr Howard W. Odum, distinguished white sociologist of the University of North Carolina, was chairman. It called the existing situation "a rare challenge to the leadership of the South: to the white leadership to find new ways of co-operation and to justify increased confidence of the negro leadership in the white South; to the negro leadership, to sense the difficulties involved and to meet increasing demands, without slowing down their essential efforts." It urged "the general adaptation of the Durham statement," and asked that negroes be given fairer opportunities in the various fields covered by that statement.

Especially important was the provision for setting up a "joint continuing committee" from both racial groups, charged with "affirmative action" and the "responsibility for working out methods and practical means of approach." This joint committee will meet in Atlanta on August 4th-5th. At this meeting it is expected that a permanent organisation will be established, with a chairman for each group, and biracial sub-committees assigned to work on specific phases of the problem. So this movement is no flash in the pan; it has strong possibilities for the future. There is a genuine determination on the part of those concerned to produce results and to raise living standards for the ten million Southern negroes, as well as to promote better relations between them and the whites.

It would not be at all accurate, however, to say that the negro problem exists only in the Southern States. While about three-fourths of the coloured people still reside there, several Northern cities have huge concentrations of them. Indeed, New York, Chicago, Philadelphia, Baltimore and Washington each have more coloured citizens than any city in the South. In such northern centres as these, there is a race problem of important proportions.

The chief difference between the treatment they receive there and that accorded them in the South is to be found in their greater exercise of the franchise, and in the partial lack of segregation of the races in schools and colleges, in restaurants and on transportation lines. While the negroes constitute only a small minority in any Northern or Western State, they vote in large numbers, and they hold the balance of power in close elections. Political leaders there often appeal to the coloured vote. In the South, on the contrary, where they have virtually 50 per cent of the population in one State, and from 25 to 43 per cent in seven others, the negro is in much smaller proportion to the total poll. The race is still comparatively uneducated, and the bulk of its members are disfranchised by such devices as literacy tests and head taxes of from \$1 to \$2 per year, devices which also eliminate many whites. Memories of Reconstruction under negro rule, after the Civil War, are still alive in many Southern minds, which has something to do with the limitations on negro voting,

A TRIBUTE TO THE MEN AND WOMEN WHO SERVE

CABLE AND WIRELESS

LIMITED

The all-British overseas telegraph company which operates the largest telegraph system in the world, with 300,000 miles of submarine cable and overseas wireless routes

"When the end comes, when victory is won, then history will begin to assess merit. We shall all of us be searching our conscience . . . We shall be discussing who succeeded and who failed . . . I have no doubt at all, when we come to discuss the part that Cable and Wireless has played, what the verdict of the nation will be—"Well done, thou good and faithful servant!"

COL. THE RT. HON.
OLIVER STANLEY,

*Secretary of State for the Colonies,
paid this tribute at a luncheon given
to the staff of Cable and Wireless
Ltd., on January 26th, 1943*

and also is not unrelated to the South's insistence upon the segregation of the races in public places.

The unfortunate thing about this segregation is that it results often in unfair discrimination. White Southerners in increasing numbers are coming to the realisation that if the system of segregation is to be maintained, it can never be justified unless facilities in the fields of education and transportation are equal for the two races. The white leaders who met in Atlanta and Richmond recently are determined to see that these conditions are remedied as promptly as possible.

It would not be fair to imply that the South's treatment of the negro is in all respects less equitable than that accorded him in other sections. For example, Mr Paul V. McNutt, then Federal Security Administrator, said in 1941 that prejudice against using negroes in defence industries was much worse in the North than in the South. It should also be borne in mind that since the population is from

one-fourth to nearly one-half coloured in most Southern states, the problem there is far more acute and difficult of final solution than in states where the number of negroes is so small as to be almost negligible. Some of the laws for the segregation of the races were framed with the thought in mind that the lack of such laws would tend to promote more intimate association, and hence inter-marriage, with ultimate interracial amalgamation. This may be an unsound thesis, but it is present in the thinking of many Southern legislators and their constituents.

Such, in general, is the interracial picture as it exists in the South to-day. It has its bright and dark spots, its areas of progress and its areas of reaction. But certainly there are reasons for believing that the movement, in general, is forward, and that the white and coloured leaders who have been addressing themselves intensively to the problem of late may expect to achieve important results in the coming years.

THE WORLD OVERSEAS

Post-War Thinking in Canada

(From Our Ottawa Correspondent)

July 16th

WHILE official Canadian opinion would deprecate the emergence of various blocs among nations in the construction of post-war world relations, and while informed Canadians oppose the principle of regionalism in the design of a post-war system, the lead in proposing international organisation on lines acceptable to smaller nations has been taken by the Canadian Government. The main principles of the Canadian proposal, presented to the House of Commons by the Prime Minister, Mr Mackenzie King, are twofold. Mr King proposed, first, that a continuing process of peace-making should be followed, that is, that a number of international institutions should be created to deal with specific problems, and that membership should be scaled according to the interests of various nations in such problems. Secondly, Mr King laid down the principle that membership in future world organisations should be based upon the functional principle of representation.

The statement of the Canadian Prime Minister is worth quoting. He said:

The strong bonds which have linked the United Nations into a working model of co-operation must be strengthened and developed for even greater use in the years of peace. The time is approaching when even before victory is won the concept of the United Nations will have to be embodied in some form of international organisation. On the one hand, authority in international affairs must not be concentrated exclusively in the largest powers. On the other, authority cannot be divided equally among all the thirty or more sovereign states that comprise the United Nations, or all effective authority will disappear.

A number of new international institutions are likely to be set up as a result of the war. In the view of the Government, effective representations on these bodies should neither be restricted to the largest states nor necessarily extended to all states. Representation should be determined upon a functional basis which will admit to full membership those countries, large or small, which have the greatest contribution to make to the particular object in question. In the world there are over sixty sovereign states. If they all have a nominally equal voice in international decisions, no effective decisions are likely to be taken. Some compromise must be found between the theoretical equality of states and the practical necessity of limiting representation on international bodies to a workable number. That compromise can be discovered, especially in economic matters, by the adoption of the functional principle of representation. That principle, in turn, is likely to find many new expressions in the gigantic task of liberation, restoration and reconstruction.

This is, as Ottawa sees it, a complete rejection of the process of peace-making after the last war, when the victorious nations gathered in Paris and installed, in the Versailles Treaty of 440 articles, the blueprint of a peace system which did not last long. The principle of functional representation, it is hoped, will be followed in drafting the structure of a permanent world organisation on food and

agriculture, now under way in Washington. As a result of the United Nations conference at Hot Springs, Virginia, an interim commission, summoned on the invitation of President Roosevelt, has been assigned to prepare a specific plan for permanent organisation and formulate a declaration to which member states of such an organisation would adhere.

Canadian Currency Plan

The new activity of the Canadian Government in international relations was demonstrated, a few days after Mr Mackenzie King's statement of principles, in the disclosure of a Canadian plan for an international exchange union. It was, as the Finance Minister, Mr Ilsley, said, "an integrated alternative draft proposal" based on the study by Canadian experts of the British and American plans for future currency stabilisation.

Examination of the Canadian proposal disclosed, however, that it was much more than an attempt to reconcile the British and American plans, that it, in fact, represented a definite smaller-nation viewpoint on world currency control. It would, for instance, provide for decisions by a simple majority, rather than a four-fifths majority as proposed by the White plan, except in changing the value of gold. It would provide more leeway in internal exchange policy than proposed in the Keynes plan, by extending the right to depreciate a national currency unilaterally to 10 per cent under emergency conditions, rather than five per cent as suggested in the British plan.

In devising an international unit, the Canadians followed the American proposal for an international unitas, though the Canadian description was merely "Unit." The proposed voting arrangement in the Canadian plan would dilute the voting power of bigger nations to some extent, while recognising the larger interests of great powers. The resources of the proposed union, under the Canadian plan, would be midway between the \$5,000 million fund suggested in the American plan and the operational scope limited only by international trade, suggested in the British plan; this latter, it is estimated, would be \$25,000 million. The Canadian figure was \$8,000 million, plus provision to increase all quotas if necessary by 50 per cent. The Canadian plan also suggested easier withdrawal on 30 days' notice rather than two years in the British plan or one year in the American plan.

From the example seen in Canada's action in entering directly into discussions of world currency stabilisation, it is evident that this country is prepared to discuss world organisation in fields in which Canadian interests are affected. This is, in essence, the meaning of the Canadian suggestion that the principle of functional representation be followed. It is important to notice that, in Canadian thinking along these lines, there has been no suggestion of regionalism, which many here regard as an extension of

isolationism. The memory is still fresh in Canada of the concept of western hemispheric defence that prevailed briefly in Washington in one stage of the transformation of American policy from isolationism to world participation.

At the same time, if effective decisions are to prevail in international relations in future, as the Prime Minister, Mr Mackenzie King, proposed, the lines upon which membership should be devised should be related to direct national economic interests, which in practice cannot be eliminated in any case.

Argentina's Trade and the War

[BY A CORRESPONDENT]

July 6th

WHILE the political course of the new Argentine Government remains uncertain, the country's economic outlook is clearer. Unless Argentina joins the United Nations as a belligerent, which at present appears unlikely, there will be hardly any change from recent economic trends. Shortage of shipping, together with export restrictions in Great Britain and the United States and the inflow of foreign capital, are the main basic factors that have determined Argentina's trade developments during the past two years. The shortage of shipping has set strict limits to Argentina's quantitative exports and has thus created large surpluses of agricultural produce, with cereals ranking first. It has also adversely affected imports, although in 1942 the export limitations in the United States and Great Britain curtailed Argentina's imports of consumers' goods far more heavily than did the shipping position. As a result, the volume of imports into Argentina in 1942, compared with 1941, fell by 30 per cent, while the volume of exports from Argentina in the same period declined by only 15 per cent. In the first quarter of this year, the volume of imports was 46 per cent smaller than in 1942, whereas exports were only 19 per cent smaller. While exports from Argentina appear to be approaching rock bottom, Argentina's imports in the remainder of 1943 will almost certainly experience another serious setback as the United States and Canada, which have lately been responsible for over one-third of Argentina's imports, have introduced a stiff export limitation system from the beginning of April; under this, all general licences have been cancelled, and exports to Latin America are only allowed against certificates of necessity. The serious shortage of imported goods in Argentina, therefore, is likely to grow still more acute.

The fact that imports into Argentina have declined far more heavily than the country's exports has resulted in growing trade surpluses, which, in 1942, amounted to 509 million pesos, against 188 million in 1941, and will continue to increase as long as the present trade trends prevail. In the first quarter of 1943, the export surplus, at nearly 197 million pesos, was more than twice as high as in the same period of 1941. Since the United States' entry into the war, these growing export surpluses have been greatly enhanced by the influx of foreign funds, which sought refuge in neutral Argentina. Despite the fact that Argentina repaid large amounts of foreign debt and imported gold on a heavy scale, the country, according to the annual report of the Argentine Central Bank, recorded a favourable net balance on its international payments in 1942 amounting to 503 million pesos, compared with a favourable balance of 480 million pesos in 1941 and an adverse balance of 65 million pesos in 1940. The fact that, late last April, a control over floating foreign capital was introduced in Argentina seems to indicate that the influx of foreign capital, like the export surplus, is still increasing.

Cheap Government Borrowing

The liquidity of the capital market in Argentina, as a result of the large influx of money into the country, has stimulated both private and Government spending. The Government has been able to obtain large credits and loans at favourable rates (the latest Treasury bond issues carried 2½ per cent interest) out of which expensive agricultural surplus purchasing schemes and important public works programmes, which include irrigation work, ports improvements, improvements of the road and railway systems, sanitation work and military construction, have been financed. This Government spending brought much money to the public and, in particular, has greatly increased the pur-

chasing power of the vast agricultural community. As the extension of industrial facilities constitutes the main item of private investment in Argentina to-day, there is a steady growing supply of consumers' goods of domestic manufacture. According to estimates of the Argentine Ministry of Finance, the number of industrial workers in Argentina increased by 6.1 per cent last year, with mining (including oil production), papermaking and the production of china, glass and textiles, as well as food processing, showing the main increases. The value of production has risen, mainly owing to rising prices, even more than the industrial employment trends seem to indicate, and in 1942, according to the estimates of the Argentine Central Bank, reached about 7,000 million pesos or 20 per cent more than in 1941. The increase however, remains inadequate to meet minimum demands, with the result that the price level in Argentina for all products except some basic foodstuffs has risen at an alarming rate, thus causing considerable hardship in all non-commercial classes of the community.

Economic considerations do not appear to have played any part in the recent revolt, but the economic trend clearly gives food for thought to the new Argentine Government. Within his first four weeks in office, the new Minister of Finance, Dr Santamarina, has designed a policy for lowering the cost of living, which has been approved by the Cabinet. While expressly allowing "reasonable profits" to manufacturers, merchants and retailers, it provides for the fixing of strict maximum prices for all necessities. Simultaneously, the new Government, through its Minister of Finance, has declared its aim to be to reduce expenditure and thus its budget deficit and borrowings.

Some saving may, in fact, be achieved this year in the form of reduced agricultural surplus purchases. The new maize crop, officially estimated at 1,900,000 tons against 9,034,000 tons last year, is so small that there may be no surplus left to be bought up. Lower oats, barley and rye crops have been recorded. As long, however, as the country cannot import enough consumers' goods for its minimum needs from abroad or make up the import deficiency by domestic production, it is difficult to see how economic stability can be assured. A closer political alignment with the United Nations would probably not be of much help in solving Argentina's economic problems. It would not enable the country to import more from Great Britain and the United States. Entry into the war might, in fact, force the Argentine Government to utilise a larger part of its industrial capacity for war production instead of using it for the manufacture of much needed civilian supplies. Economic considerations, therefore, do not seem likely to lead Argentina into the United Nations camp.

Germany at War

Transport Bottlenecks

THE Reichsbahn, Germany's state railway company, increased the length of line under its management from 34,100 miles in 1938 to 100,000 miles in 1941-2. The greatest density of traffic on the German-controlled network is reached in Belgium, the Rhine-Ruhr area and Western Germany, that is, within a radius (or bombing distance) of 400 miles from London.

Apart from the summary financial reports of the Reichsbahn and similar statements by railway companies in some of the occupied countries, all significant statistics about the activities of German transport have been suspended. The closest guide to the actual state of transport in Germany and Europe is the amazing number of decrees and plans which have been issued in the wake of several acute transport crises since the beginning of the war.

Reichsbahn receipts since 1938 have been as follows:

(In Million Reichsmark)			
	Passenger	Goods	Total
1938	1,432	3,356	5,134
1939	1,690	3,771	5,813
1940	2,430	4,720	7,603
1941	3,250	5,283	9,026
1942	4,033	5,186	9,797

It would be wrong to assume that these figures represent a corresponding increase in operations. There have been alterations in rates and great changes in the composition of the freight. The interest of the table of receipts lies in the changing ratio between passenger and goods receipts, and the fall in goods receipts in 1942.

Crisis to Crisis

As long as two years before the war Germany experienced a transport crisis. In the autumn of 1937 there was a shortage of locomotives and rolling stock caused by the neglect of the railways while large sums were being spent on motor-roads and waterways. A large scale programme of railway replacement and expansion was decided on in 1938, but it was interrupted by the war. For a time, depleted rolling stock was made up by equipment and even rails taken from all the countries of Europe. Most of the occupied countries were left with only half and sometimes only a third of their pre-war rolling stock.

This expansion by conquest came to an end during the war against Russia and the winter of 1941/42. Then came Germany's greatest railway transport crisis, aggravated by an exceptionally cold winter. The military situation was only saved by a ruthless reduction of the transport of foodstuffs and other goods for civilian consumption. The German railways have never recovered fully from this crisis. The manufacture of a special type of locomotive and goods wagon was included in Speer's armament programme in March, 1942; and in June, 1943, it was stated that, for the first time, the target set for the monthly output of locomotives had been reached. Current production of locomotives and rolling material must be well behind requirements, even if productive capacity in occupied countries is fully occupied. Inevitable wartime wastage and the loss of material in Russia was, and is, still great. At the same time, the railways of the Balkan countries can only be kept going by German supplies. For some time now the situation all over German Europe has become that railways are used without any regard to normal repairs and maintenance; and if an unusually large number of accidents is accepted, railways can, of course, be run for a remarkably long time without repairs. The destruction of locomotives, rolling stock and installations by bombing may not yet have outstripped the enemy's ability to make good the damage; but, coming on top of this already large accumulation of difficulties, its impact must be heavy and painful.

Germany's wartime transport is still dependent for the

major part on the railways. Before the war they accounted for roughly 70 per cent of total goods traffic. It can be assumed that during 1941 all the possible ways of increasing the railway's carrying capacity were exhausted. Every effort was then made to secure a quicker turn round of rolling stock, the elimination of unnecessary transport, and an increase of the load per truck. A quicker turn round is achieved either by fines or by premiums; it is now the responsibility of firms to load or discharge trucks on time. Special gangs of workers have been provided at most stations. This is mainly a problem of getting sufficient workers. Unessential transport is eliminated by shifting short-distance traffic to the roads and by creating transport zones for different classes of goods. Zones have been established for most foodstuffs, and for a considerable number of industrial materials, such as coal, building materials and textile goods. Where goods must be moved across several zones a zone-clearing system is attempted; a central department receives all orders and distributes them, without regard to former trade connections, according to the shortest distance from manufacturer to buyer. There is no way of finding out whether this move has been a success. Market restrictions and the effects of regimentation cause manufacturers and merchants to try to overcome shortages by buying wherever possible without regard to transport costs, and this scramble increased considerably after the beginning of the war.

Escape to Water

The solution favoured by the military planners was the shifting of the traffic of staple materials from the railways to the inland waterways. During the first year of the war, however, it was evident that there was hardly any change, although a number of new canals and locks had come into operation. During 1941 foodstuffs, fertilisers, ores, coal, timber and building material were diverted more and more to inland waterways. Water-borne transport of ores increased by 77 per cent, of timber by 33 per cent, of building material by 6 per cent and of coal by 20 per cent. It is reported that during 1942 there was a further increase. This transfer, which was gradually extended to mixed cargoes, soon created conditions in inland water transport similar to conditions on the overburdened railways. The bottleneck was simply shifted from rail to water. All the familiar measures had to be applied. First the turn round of barges had to be speeded up; secondly, loading and discharging facilities had to be improved. In some districts the transport of goods by rail is prohibited outright if the places of loading and discharge are ports on rivers or canals. Coastal shipping, particularly in the Baltic Sea, is used extensively for general goods, as well as for military transport, and on the North Sea fringe is open to effective Allied attack. Traffic on the Danube is greater than during the last war. Inland waterways can carry a considerable proportion of goods traffic. The system is well developed and there was no shortage of tonnage at the beginning of the war. During the war the number of barges has been increased by looting. But if the major canal viaducts and locks were destroyed by bombing, transport in vital areas would at once become dangerously congested.

The latest measure for coping with growing transport difficulties is the staggering of shipments over the seasons so as to ease the burden at peak-load periods. Industrialists have been told to distribute their consignments evenly over the whole year. This demands extremely careful planning and very efficient organisation; central and local authorities are working with Speer's transport commissars. But the lack of storage capacity is a serious practical obstacle to this staggering of traffic.

Cul de sac

The main feature of Germany's wartime transport position has been recurrent crises and bottlenecks. Each time the crisis has been met, or the bottleneck broken by shock methods. A totalitarian war economy can always direct plant, material and labour to threatened sectors without regard to costs. But the bottlenecks have never really been removed; they have simply shifted from one sector to another. And all the methods adopted, unsuccessfully, to remove them have entailed the use of disproportionately large numbers of workers in loading and discharging—and in planning and control. Over all has brooded, with growing menace, the ominous influence of British bombing.

THE BUSINESS WORLD

Price Control in Britain

THE test of successful price control in total war is to moderate rather than completely to avoid inflation; the achievement of complete price stability was in any case made impossible by the depreciation of the pound at the outbreak of war and by the consequent rise in the cost of imports. Compared with the last war, the rise in prices since 1939 has been appreciably less marked, whatever yardstick is employed for its measurement. This can be shown by comparing the movement of three indices, each of which is calculated on a similar basis for both periods:—

PRICE MOVEMENTS DURING THE PRESENT AND LAST WARS

	End of First War Year	End of Second War Year	End of Third War Year	End of 3½ War Years
Wholesale Prices (Statist) :—				
July, 1914=100	129	158	214	226
Aug. 1939=100	145	161	165	169
Cost of Living (Ministry of Labour) :—				
July, 1914=100	125	145	180	190
Aug. 1939=100	121	128	129	128
Weekly Wage Rates (Bowley) :—				
July, 1914=100	105-10	115-20	135-40	155-60(a)
Aug. 1939=100	113	121	130	132

(a) At the end of fourth war year the index stood at 175-80; it has been assumed that half the rise between the end of the third and fourth years took place in the first half of the year.

True, the three indices cover only part of the field. But at the end of the first 3½ years of the last war they were all well ahead of the advance registered during the same period of the present war. As the upward movement since last September has been small in wholesale prices and wage rates, with the cost-of-living index stationary, the disparity will be appreciably greater at the end of the fourth year of war.

The strategy and tactics of price control since 1939 have been empirical rather than systematic. The Government has, as it were, launched a frontal attack in two waves, first by restraining the increase in spendable incomes, and, secondly, by limiting private expenditure, supported by specific action to hold key points in the price structure. In other words, it has evolved a closely interrelated pattern of checks and balances with the object of restraining upward movements in prices rather than of freezing them at the pre-war level. The object of this article is not so much to describe the details of price control—these are well known—as to give a rounded picture of the pattern and to emphasise the complementary nature of the various lines of approach.

Broadly, the Government has limited the expansion in the volume of spendable incomes in the hands of the public and of business firms by restraining, but not entirely prohibiting, rises in wage rates and distributable profits, and by a drastic increase in direct personal and business taxation, as well as in indirect taxes on unessential goods and services. Nothing has been done to prohibit the rise in gross business profits, but the excess above the pre-war level has been effectively skimmed off by the imposition of EPT at 100 per cent, subject to a rebate of 20 per cent less tax after the war. Like gross profits, wage rates have not been frozen at the pre-war level, but their advance has been restrained by various devices, such as the stabilisation of the official cost of living index in 1941 and the maintenance of the slowly-operating machinery of collective bargaining, reinforced by compulsory arbitration. Enquiries carried out by the Ministry of Labour show that average rates of wages for a normal working week rose by only 26½ per cent between October, 1938, and January, 1943. True, average earnings advanced by as much as 65 per cent during this period; but the disparity is due entirely to longer hours of work, the movement of workers from low-paid jobs into the more

highly-paid munitions industries, and to an increase in the output of workers on piece rates. Much the greater part of the advance in the weekly earnings of workers has, in fact, been due to special causes which would have operated even if wage rates had been frozen at pre-war levels. Unlike profits, the earnings of individuals have not been made subject to an excess income tax; but higher earnings have been an incentive to higher output and may be regarded as the price of industrial peace. In any case, the sharp increases in the rate of income tax, the extension of its scope to the lower income groups, the burden of indirect taxes and the steady pressure of the savings campaign have all combined to make the rise in potentially spendable incomes much smaller than in gross incomes.

The measures taken to curb the rise in spendable incomes have been supplemented by others, designed to restrain private expenditure on consumption, chiefly by means of rationing the supplies of essential goods and services—which also made for equality of distribution—and by sustained savings campaigns. Those devices have had the effect of lessening still further the upward pressure upon prices.

The combined effect of both sets of measures is brought out in the following table, based on the Government's White Paper on the National Income and Expenditure:—

PERSONAL INCOMES AND OUTLAY

	(£ millions)	1938	1942
Personal income		4,661	6,896
Spent on :—			
Taxes		908	1,986
Savings		134	891
Consumption		3,619	4,019

Aggregate personal incomes show a rise of nearly 50 per cent, but a substantial part of the increase—perhaps as much as two-fifths—is due to higher production. The net increase in expenditure on consumption, at 11 per cent, has been comparatively small.

The general restraints upon the growth of incomes and upon private expenditure have been strongly reinforced by devices designed to limit, or prevent, the rise in the prices of specific goods and services. In discussing the Government's policy under this heading a distinction may usefully be drawn between goods and services purchased by the Government, on the one hand, and by the public, on the other hand. In its own purchases, the Government has always held that the Excess Profits Tax, while skimming off profits in excess of pre-war earnings, should be accompanied by an efficient contract system in order to keep down costs and avoid waste. Its policy was restated by the Treasury in June, 1942:

EPT . . . is to be regarded not as the instrument which was designed itself to provide a general standard of fair and reasonable profit in Government contracts, but as a reserve measure concerned with increased profits generally during the war. . . . If, however, the price of stores supplied to the Government were uncontrolled, except for the automatic operation of EPT, there would be no effective deterrent to unwarranted rises in costs of whatever kind. The machinery of the Inland Revenue is not intended, nor is it adapted in the same way as the machinery of the contracting departments, to analyse costs of production and check unnecessary expenditure; nor would it reveal, as investigation by contracting departments can reveal, the existence of uneconomic or wasteful methods of production.

In sum, since competition cannot fulfil its normal function of assuring efficiency in production in time of war, the Government has fallen back on a careful system of costing with the aim of discouraging extravagance in the use of the scarce resources without stifling initiative. During the early stages of the war, contracting Departments were handicapped by lack of data and experience, but they have carried out their task with an increasing degree of success. Interesting experiments have been made to keep down costs, as,

for example, in the iron and steel industry, where high-cost producers are subsidised from a compensation fund raised by a levy on the output of ingots.

Different methods had to be used for the control of the prices of the things purchased by the public. Broadly, the Government has steadily extended price control until it covers virtually all goods and all essential personal and household goods. Control is exercised from the raw material—whether home-produced or imported—to the finished article in the shop, generally by way of maximum prices or profit margins. In order to implement its policy of stabilising the official cost of living index, the Government subsidises the prices of many foodstuffs, but essential personal and household goods are normally sold to the consumer on a cost basis. Luxuries, as well as many "conventional necessities" have, quite justifiably, been allowed to find their own level; their prices are, in fact, increased by heavy indirect duties.

Thus, in brief outline, is the pattern of checks and balances evolved by the Government to restrain the rise in prices.

Business Notes

More Investment

The past week has brought to the stock market a sharper rise in industrial equities and a greater expansion in turnover—but not in the number of bargains received—than its predecessor. A good deal of the business is almost certainly buying in the hope of reaping a profit in the comparatively short run, but there is a new class of adherent to those exercising a genuine investment demand. This is the timid investor who can seldom be persuaded to take a risk and who, consequently, tends to buy at or near the top of the rise. These appear to have been sufficiently impressed by the change of regime in Italy to place their money in securities which have a post-war attraction, but it is symptomatic that they have frequently been able to secure what they require without causing any great rise in price. It is also interesting to note that, for what it is worth, the increase in bargains received is by no means always greatest in those sections of the market which show the sharpest improvement in quotations. This lends some support to the suggestion, advanced last week, that there were substantial sellers waiting for a rise. There is little doubt that some heavy books have been lightened during the past few days. Many of these sellers are, however, institutions which are not likely to keep large funds in cash for long. If the investor remains "on the feed," there may be considerable further rises in post-war favourites, with a modest decline in some other sections. The authorities, however, are not disposed to leave the field to existing securities, and a new savings drive is to be launched immediately, to run for some three months. It seems that the new drive is to be directed more to individuals and less to institutions, and, if that is so, it may bring fewer of those temporary disturbances to the markets that were a marked feature of the Wings for Victory campaign.

South Africa's Capital Autarky

Cabled reports of the annual address of the Governor of the Reserve Bank of South Africa to stockholders gave prominence to the plea of Mr Postmuss for the greater self-sufficiency of the South African capital market. He reminded leaders of mining houses of his earlier request that, when considering the development of new mines or the extension of existing mines, they should explore the possibility of raising local capital instead of waiting for the London market to be opened to them.

To-day (he added), I feel justified in extending this request to all other concerns which put before the public new undertakings which are both economically justified and financially sound. I am sure the Treasury will raise no objection to some flotation of capital, knowing as it does that its own requirements under all circumstances will be easily met.

There are abundant capital resources in the South African market, and the trend of the South African balance of payments since the outbreak of the war has been such as to render the further import of capital not merely unnecessary but positively injurious to the economy of the Union. Thanks, largely, to the increased price of gold, the

It illustrates the complementarity of the general measure designed to limit the pressure of purchasing power upon a dwindling supply of goods and services and of the devices designed to prevent, or slow down, the rise in the cost of specific groups of commodities and services. To suggest even now—as M. Kalecki does in an article in the *Bulletin* of the Institute of Statistics for April 24th—that the fight against inflation is being waged not by the Treasury but by the Ministry of Food and the Board of Trade, and that, in the ration book, they have at their disposal the most effective weapon, is equivalent to arguing that because the aeroplane and the tank have been the most effective weapons for some purposes the rest can be scrapped. In the conditions of total war, provided public opinion is not suppressed or the search for equity abandoned, no one measure or set of devices can be pushed far enough to accomplish the object by itself. Only a concerted advance on all fronts has a chance of success. The degree of success attained by the British Government's policy is not complete; but in all the circumstances it is adequate.

Union during the war has balanced its current international payments account; repaid over £80 millions of sterling debt; repatriated South African mining and other shares to an amount probably exceeding £50 millions; and, in addition, added some £82 millions, at current market price, to the Reserve Bank's gold reserve. The case for discouraging South African enterprises from raising capital outside the country is, therefore, an exceptionally strong one. But the position is complicated by the fact that most of the developing mines, which in due course will require additional capital, are partly owned by shareholders in the United Kingdom, and that since new issues of capital are usually made on bonus terms, these external shareholders would be deprived of valuable rights if the South African capital market were to become an entirely closed and self-sufficient unit. The principle of discrimination which this would involve has already received its precedent in the case of South Africa by the imposition in the Budget of 1942 of a special tax on interest and dividends paid to non-resident holders of South African securities. This tax was imposed not for its revenue-producing attributes, but in order to accelerate the repatriation of South African capital held outside the Union. Given the conditions which exist in the South African capital market, with its abundance of resources and paucity of demand, any requirements that make an appearance will naturally be satisfied in the local market, for the obvious reason that it will offer better terms than could be obtained elsewhere. It will not be necessary to institute a rigid autarky of the capital market to achieve this objective. But it should be made clear beyond all doubt that there is no intention of depriving non-resident shareholders of their rights to participate in increases of capital by existing ventures or in the flotation of subsidiaries.

Floating Debt Policy

An interesting stage has been reached in the floating debt position. This week, for the first time since the weekly tenders for Treasury bills were raised to £90 millions last April, the maturities have equalled payments for new bills. Over the past three months the amount of Treasury bills issued through the tender has risen from £990 million to £1,170 million, this last figure being the product of 13 consecutive weekly issues of £90 million. The question which has to be decided by the authorities now is whether the tender issue of Treasury bills is to be temporarily stabilised at this new level—as it has been stabilised at lower figures for considerable periods since the outbreak of the war—or whether this element in the floating debt is to remain elastic. The fact that the bills to be taken up next week will again amount to £90 million, and thus be equal to the corresponding maturities seems to suggest that the authorities intend to leave the issue stable for a time. But the present period hardly provides an adequate test of floating debt policy since the Exchequer is sufficiently flush with funds, owing mainly to the heavy seasonal income-tax collections, to dispense with floating debt borrowing. Thus this week no Treasury Deposit Receipt call was made on

the banks, and, as there were no TDR maturities, there was no net borrowing under this head. It is only after the end of the present short period of stability in the floating debt issued to the market that the real test of the authorities' intentions will come. The latest phase of expansion in the tender issue of Treasury bills was clearly meant to raise the amount of bills available for the banking system. It synchronised with a considerable increase in the capital resources of the discount market, on the basis of which the market syndicate's global tender for bills has been duly adjusted. Even assuming that the weekly applications from the market have amounted to no more than the amount of bills on offer, the average allotment for the past thirteen weeks has been no less than 41 per cent., or some £37 million per week, compared with weekly allotments of £30 million in the corresponding period of last year. The banks have not during the past three months increased their purchases of bills from the market to an extent commensurate with the expansion in the tender issue, and the market is probably carrying rather bigger holdings than for some time past.

In Defence of Big Business

In contrast to the United States, whose anti-trust laws have engaged the public attention for 50 years, and where the Department of Justice is required by law to keep a lookout for any monopolistic practices, their growth in Great Britain during the inter-war years excited little comment, either by the public or the Government. It is only recently that the extent of such practices and their evil consequences have been revealed and widely condemned, and, in view of the secrecy in which many enterprises are shrouding their transactions, it is hardly surprising if some of the popular criticism has been misdirected. Lord McGowan, chairman of Imperial Chemical Industries, Ltd., who, in an article in the *Sunday Times* of July 25th, took up the defence of big business and international cartels—he calls them international trade agreements—in general, and of his company in particular, missed the point of the criticism. The apprehension voiced by members of both the Labour and Conservative Parties has been directed less at big business units as such than at monopolistic practices in all their guises, and, in particular, at what Mr Herbert Morrison called last April

the great assortment of cartels, price rings, federations, price-fixing combines and so forth . . . which have monopolised the control of their industry and its market, and are in a position to impose their terms of trade on their customers and on the community.

Large-scale business units as such have come under fire, not because they are large, but to the extent that they pursue restrictive policies when they succeed in establishing monopolies. A fully integrated concern has at least the opportunity to achieve the maximum of economies and pass them on to the consumer. The state would be right to insist on means of making certain that the big concern does its duty; to oppose it merely because it is big would be silly. The British chemical industry and market is probably dominated more strongly by ICI than is the industry in the United States by any single concern. Lord McGowan may be right in asserting that a strong British combine was necessary to

stand up to foreign combines which were threatening to divide the world, including Britain and the British Empire, among them.

But in the long run, and as a matter of principle, the existence of such combines can only be justified if they deliver the goods—that is, if they demonstrate their ability to keep pace with the industries in other countries in technical progress and economic efficiency, and if they do not have to rely for their bargaining strength abroad on Government aid for domestic restriction. Lord McGowan was undoubtedly right in recommending that

in future every international trade agreement should in Great Britain be duly communicated to and registered with the Board of Trade.

Indeed, "communication" and "registration" (both apparently *post facto*) are not enough. After all, "international trade agreements" are the business of the Government. If, in addition, ICI could give greater publicity (in peacetime) to the details of its activities, any unfounded charges made against it will fall to the ground.

Increasing Profits?

There is a suggestion in the latest industrial profits figures that three years of stable profits are about to give place to a period of rising earnings. The detailed returns relating to the accounts published in the second quarter of this year (which are given in the usual tables on pages 154-5 of this issue) show that 535 companies have increased their gross profits from £78.3 million to £78.9 million. This latest figure for the second quarter companies is nearly £4,000,000 higher than the gross profits earned by the same companies two years earlier, and within £2,000,000 of the total for the notional second quarter of 1940. These are modest changes in magnitude, but are they significant in direction? The answer is complicated by the necessary adjustments to the figures in order to smooth out the arbitrary transfer from carry forward to taxation reserve made by Cable and Wireless. Nor does the analysis of profits by industries (Table VI) show much consistency in the degree of improvement. Some industries (hotels, newspapers and textiles) report substantial increases in gross profits; but the consumption trades generally are static, and the armament and heavy industrial groups display an inconclusive trend. The improvement, if it is improvement and not a mere quarterly caprice, is evidently a very modest affair. Expressed in terms of accounting periods (as in Table II), 1,929 companies whose accounts are so far available achieved a 1.3 per cent increase in gross profits between 1941 and 1942. Nor is the movement reflected in the smoothed index figures in Tables III and IV. The gross profits index fell from 100.9 to 100.0 in the first quarter (both figures provisional) while the net profits index (based on figures as reported by the companies) showed a slight decline from 93.8 to 93.5 in the second quarter. It is true, as Table VI shows, that the reported net profits for second quarter companies are about £1,000,000 higher at £48.0 million, despite the further losses recorded by rubber companies; but this increase is probably due, mainly, to somewhat less austere policy in setting aside hidden reserves. Measured in terms both of gross and net profits, the latest quarter's results are not very impressive evidence that a change in direction of company earnings has set in; such changes as are shown seem to arise rather from slightly modified provisions for EPT and depreciation. Companies are not earning more profits, but their accountants have a clearer idea of the magnitude of necessary wartime reserves.

Workmen's Compensation

Some of the details of the Government's new Workmen's Compensation Bill were disclosed prematurely at last week's annual conference of the Mineworkers' Federation of Great Britain; the Bill has now been introduced in Parliament. Under it the liability for compensation remains entirely on employers, but the disability benefits are to take a different form. For example, compensation (other than for single persons for the first thirteen weeks of incapacity) is to be related partly to pre-accident earnings and partly also to marital state and family responsibilities. Among the new administrative principles introduced are a differentiation between benefits covered in the first thirteen weeks from those payable after that period; the granting of a supplementary allowance in respect of a wife; and the application of an over-riding maximum of 66½ per cent of pre-accident earnings in all cases, exception being made for low-paid workers who, under the existing law, are entitled to percentages up to 87½, and married men with children, in whose case the children's allowances may be added so long as they do not bring the total benefit beyond seven-eighths of earnings as at present. The proposed scale of benefits continues the maximum benefit of 35s. to single persons for the first thirteen weeks, but introduces a supplementary allowance of 5s. thereafter, thus raising the maximum from 35s. to 40s. A married man without children is to receive an additional benefit of 5s. in respect of his wife during the first thirteen weeks, and a further 10s. afterwards, thus raising the maximum from 35s. to 50s.; while a married man with children is to receive a flat rate of 5s. for each child instead of the present benefit of 4s. for the first two children and 3s. for each child thereafter. In fatal cases, the payment to the widow is to be £300, or three years' earnings, whichever is the larger, up to a maximum of £400, instead of the present maximum of £200 to £300; because of this increase the total compensation payable to a widow with dependent children is increased from £600 to £700. The following table illustrates the effect of the proposals in the case of a married man with two children:

PRESENT AND PROPOSED DISABILITY BENEFITS

Pre-Accident Earnings	First 13 Weeks Present*	Proposed	After 13 Weeks Present*	Proposed
50/-	38/-	43/4	38/-	43/4
60/-	43/-	50/-	43/-	50/-
70/-	43/-	50/-	43/-	57/8
80/-	43/-	50/-	43/-	60/-
90/-	43/-	50/-	43/-	60/-
100/-	43/-	50/-	43/-	60/-

* Inclusive of the supplementary allowances under the 1940 Act.

These increases, particularly the improvements in children's allowances, are welcome as far as they go. But there seems to be undue discrimination against the lower-paid single man, as in the first thirteen weeks of his incapacity he will receive no increase on the present rate; over three-quarters of the accidents in coalmining are of less than 13 weeks' duration. It is understood that the Miners' Federation are pressing for a further increase in the single man's rate, and also in the amount of the benefit for fatal accidents. The new Bill will meet some of the grievances in workmen's compensation, but it can only be regarded as a stop-gap measure. A fundamental overhaul of the legislation is still needed.

British Rayon Federation

On Wednesday, Mr Samuel Courtauld, president of the new British Rayon Federation—its constitution and functions were described on page 23 in *The Economist* of July 3rd—outlined a programme of study and research which, in his view, the Federation should undertake. At the head of the list, he placed the need for the industry to equip itself with the best types of machinery; to this end, he suggested a visit of experts to America to study machines and methods on the spot, and an examination of the financial aspect of replacements. He urged a careful study of markets at home and abroad, and the preparation of a "properly co-ordinated" export policy. Further, Mr Courtauld emphasised the importance of research, of improving the technical qualifications of the personnel of the rayon industry, and of securing the collaboration of workers with managers and employers. Mr Courtauld's programme of collective study is one which is not merely essential to the progress of the rayon industry, but one for which a trade association is eminently fitted.

Note Issue Profits

The Chancellor of the Exchequer has recently given further information on the profits on the note issue of the Bank of England. Before February 28, 1939, the net profits of the issue department were received by the Treasury and paid into the Exchequer, and consisted of the net income from the securities held by the department after taking account of any profit or loss on periodical revaluation. Since that date, under the Currency and Bank Notes Act, 1939, the assets of the issue department have been valued weekly, and transfers arising from such valuation have been made to and from the Exchange Equalisation Account; the income of the issue department has also been paid into the EEA. The sums transferred by the Issue Department in each of the past 10 financial years have been as follows:

Year to March 31			
1934	£ 2,660,000	1939	Nil
1935	2,754,848	1940	6,078,262
1936	1,448,000	1941	8,892,648
1937	985,000	1942	7,637,031
1938	Nil	1943	9,070,697

NORANDA MINES LIMITED

DIVIDEND NOTICE

Notice is hereby given that an interim dividend of One Dollar (\$1.00) per share, payable in Canadian funds, has been declared by the Directors of Noranda Mines Limited, payable September 15, 1943, to shareholders of record at the close of business, August 13, 1943.

By Order of the Board,
Toronto, J. R. BRADFELD, Secretary.
July 21, 1943.

The sharp fall in the note issue profits in 1936-37 and their complete disappearance in the two subsequent financial years is probably due in large measure to the extent to which the note issue department, together with other public departments, was used to carry issues of Government stock made at prices higher than those prevailing in the market. These "underwriting" operations caused losses which are reflected in the above table. They were part of the price paid for supporting the gilt-edged market in that period. The later increase in these profits reflects the rise in gilt-edged values and the larger volume of securities held against the circulation—partly because securities have replaced the gold formerly held by the issue department, partly because the circulation has expanded.

Burnt Bank Notes

A large number of claims for Bank notes burnt or otherwise destroyed during air raids on this country have been lodged and met in the past three years. At one time, the special department of the Issue Office of the Bank of England, considering such claims, numbered as many as 50 employees. The treatment of claims in respect of lost or destroyed Bank notes falls under two types of subdivision. The first is for notes of £5 and over and for those of 10s. and £1. The second distinguishes between complete destruction or loss and partial destruction. Claims for 10s. and £1 notes that have been lost or wholly destroyed will under no circumstances be considered. Where such notes have been burnt, the amount which can be recognised from the ashes will be duly paid by the Bank. The task of recognition is usually a great deal easier in the case of ashes of notes of £5 and upwards, owing to the exceptional care taken with the printing and the quality of the paper. In no case will claims for lost or completely destroyed notes be considered if the number of the notes cannot be given. The claimant has to swear an affidavit, giving the exact circumstances of the loss or destruction of the notes, and must send it to the Bank with an indemnity from a bank or insurance company. Most insurance companies will readily grant such indemnities at a small premium, as they know that the Bank is unlikely to meet any claim for lost or destroyed notes until it is completely satisfied that the notes in question are most unlikely to turn up at a later date. Having completed these formalities, the claimant then has to wait for some time—it may be as long as five years. If at the end of that period the notes in question have not returned to the Bank, the claim will be met. Claims for partially destroyed notes depend wholly on the experts' analysis of the "remains." In some cases which occurred after the raids on London, the test of the fragments of notes sent in to the Bank actually resulted in payments of more than the amount claimed.

Unilever Stores EPT

The preliminary statements of Home and Colonial Stores, of Lipton and of Meadow Dairy had demonstrated that a substantial revision of the basis of EPT assessment had been secured. The full accounts and, in particular, Sir George Schuster's comments, make it clear that the change is due to the acceptance by the Inland Revenue of the company's claim that the payments made on account of goodwill, when acquiring subsidiaries, should be considered as capital ranking for EPT. It is evident that this is a matter which has to be decided afresh in each case, but there can be little doubt that value was given for goodwill in this instance. The company's claims were not admitted to the full, but, compared with the previously adopted profit standard, the concession means approximately £180,000 gross per annum to the group. The net taxed profit of Home and Colonial rose by £96,600 on the year, which made possible the resumption of dividends with a payment of 3 per cent. The accounts are dealt with on page 150. No credit has been taken in the accounts for 1942-43 for the adjustment of earlier appropriations, but the figures for 1941-42, given in the latest balance sheet, show considerable alterations from those originally published a year ago. The pre-tax profits of the group show a decline of, approximately, 15 per cent on the year. This is attributed by Sir George to two factors: the transfer of more and more articles to "points," and without any increase in the number of the latter.

process of rationing on the choice of shops by customers. Many of the group's stores are highly specialised and do not obtain some of the semi-luxuries whether on or off the ration. Since both non-rationed luxuries and many of the articles on points are given mainly, or solely, to registered customers, the latter naturally tend to gravitate to the general grocer rather than to the specialised stores of the group. This factor is, probably, without effect on net profit of the group for the time being, although it will affect the EPT refund, and Sir George has no doubt that, as conditions return to normal, the customers will come back to the group.

Deconcentration

The time has come for the preparation of a plan for "deconcentration" as part of a wider scheme of industrial demobilisation after the war. Mr Oliver Lyttelton, then President of the Board of Trade, announced the Government's industrial concentration policy on March 4, 1941, he made it clear that it was merely a temporary expedient, designed to economise labour and factory space, and that the Government would take all measures open to them to assist in restoring the *status quo* after the war. Since then nearly 3,000 establishments have been closed and some 250,000 workers set free for the Services or for work in other more vital industries. But the specific promise to assist in the reopening of establishments closed by concentration, a distinction has been made between them and factories which have been closed as a result of the curtailment of production or used for work other than that on which they were engaged before the war. True, in giving a specific undertaking to the former, the Government has accepted a special responsibility towards them, but in practice it can hardly divest itself of responsibility for the re-instatement of the latter. In other words, it will be difficult to draw a clear distinction between factories closed as a result of concentration and factories of the same industry transferred to war work or closed because of the reduction in output. If the production of the goods of peace could be resumed on anything like the pre-war scale immediately after the war, the difficulty would resolve itself. But, in practice, the resumption is likely to be gradual and it may often be impossible to provide work for all the closed factories at the same time. In some industries, there is likely to be a queue of factories waiting for the resumption of work. What is to be the order in that queue? This is a problem for the Government to solve.

ABP Developments

The report of Associated British Picture Corporation, which controls a very large proportion of the cinemas not included among the Rank interests, throws little light on the future of the group. The information about the reasons for the resignation of the chairman, Mr A. G. Allen, is largely negative. It is stated that it is not connected with any transfer of a major holding, that it involves no change of control or policy, and that the vacancy is not to be filled at the moment. In fact, the board have decided not to disclose what may lie behind the resignation, but they leave the shareholders with the impression that there is something behind it. The report reflects the sale of the holding in Metropolis and Bradford Trust in a fall in trade and sundry investments of £612,951 to £17,078. The money has been used to acquire the remaining shares in Union Cinemas, with the result that investments in subsidiaries are up by £1,215,368 to £3,415,835. In this connection, the board is considering an adjustment in the financial year of Union Cinemas to March 31st and the ultimate inclusion of its assets in the consolidated statement. Short of a complete transfer of all assets to the parent company, this procedure is to be recommended. The immediate outlook for the group appears excellent, and will be improved by the recent conversion of the debentures. Recent results are set out on page 150. On the important film production activities comment is restricted to the phrase that it has been maintained on a satisfactory basis.

Hudson's Bay Reserves

In view of Canada's great war effort, it is to be expected that both trading and industrial concerns operating in the

Dominion will earn increased gross incomes. The accounts of Hudson's Bay Company for the year to January 31st, which include results from the Fur Trading Districts for the season ended May, 1942, show a jump in trading profit before tax from £846,853 to £1,411,352; the net profit is the highest since before the war, and the amount earned for ordinary the best since 1937-38, owing to repayments of preference capital in the meantime. A further repayment of £200,000, or 10s. per share, is to be made this year. The ordinary dividend is raised by one point to 4 per cent, less tax, but, as the tax free payment from the land account is cut from 2 per cent to 1½ per cent, there is no immediate benefit to the proprietors. The most important development of the year is the freeing of certain earlier appropriations, probably as a result of the final settlement of the Canadian EPT standard. Reserves available for general purposes are increased on the year from £2,335,790 to £3,752,288, while depreciation account and provisions for replacements are reduced from £3,858,291 to £2,889,313. The way is now clear for the British EPT appeal and it is permissible to hope that provision in this respect will prove at least fully adequate. Three other points deserve mention. First, the investment in Job Brothers has been finally liquidated, with small loss to the company; secondly, despite the demand for agricultural products, there is no sign of a marked improvement in prices for West Canadian farmlands; finally, some of the company's liquor interests have been rearranged in the hope of maintaining the profitable business in whisky because supplies from Scotland are likely to be difficult for a number of years.

Utility Furniture

The demand for utility furniture has outrun the supply—largely because of the general approval of designs and the comparatively low prices at which the furniture is sold. As a result, it has become necessary to resort to the temporary suspension of the issue of permits. The scheme and the system of priorities adopted for the distribution of the furniture are praiseworthy. In a sense, the scheme has been too successful; the demand from the categories of persons eligible for buying permits appears to have exceeded the Board of Trade's expectations. Unfortunately, the issue of permits was started before production was under way. The Board of Trade appears to have fallen into the same error as other Government Departments early in the war when they issued buying permits for steel, for example, well in excess of the supplies available within a reasonable period. The solution must be sought in a better adjustment of supply and demand. The issue of permits should be limited to the amount of furniture which can be delivered within a reasonable and specified period which is adhered to. If supplies cannot be increased, or, at any rate, not appreciably—a decision with which one could hardly quarrel at this stage—the conditions in which permits are issued must be tightened.

The Rate for the Job

An important test case, which may have repercussions on the whole structure of engineering wages and the industry's negotiating machinery, is being heard in private this week in Glasgow by a court of inquiry under Lord Wark, appointed by the Minister of Labour. The dispute

concerns an aircraft factory near Glasgow, which employs 24,000 workers, of whom 15,000 are women, and where the proportion of skilled craftsmen is only 4½ per cent. The question at issue is whether or not these women are employed on work "hitherto performed by adult male labour," or on work "commonly performed by women," as defined in the Extended Employment of Women in Engineering Agreement of May, 1940 (the terms of which were described in *The Economist* on May 29, 1943). The claim of the Amalgamated Engineering Union, which is conducting the case on behalf of the workpeople, is that although women are doing jobs commonly regarded in the industry as men's jobs, working beside men, to the same time schedule for piecework on exactly the same jobs and therefore should come under the relevant clause of the Agreement, yet they are paid as if they were all unskilled, doing work commonly performed by women, and receive only the women's basic rate and bonus. Thus, a woman on a certain process which is doubled by a man receives a basic rate of 24s., plus a bonus of 27s. compared with the man's basic rate of 40s. and bonus of 33s. 6d. The case for the employers is that the factory concerned is a new one, and that the jobs have been broken down into simpler processes to such an extent that they can be performed by unskilled female labour. Dissatisfaction has been so great at the factory that the workers had given notice to strike, and sympathetic action had been threatened at an associated factory in the south. The dispute has gone through the normal negotiating machinery, and this Court of Inquiry was set up after the matter had been referred to the Ministry of Labour. It would be improper to pass any judgment before the Court's decision is known, but on the face of it if women are, in fact, employed on the same work as men, and under identical conditions, it is anomalous and unjust that they should not receive the same rate of pay as the men.

Natural and Synthetic Rubber

The future relation between natural and synthetic rubber on the world's market is exciting a good deal of interest. The overall demand for rubber can reasonably be expected to resume its expansion after the war. How far and on what basis is synthetic rubber to participate in the satisfaction of demand? The United States is at present engaged in the formidable task of building up a synthetic rubber industry large enough to take care—with such amounts of natural rubber as are still available—of the enormous requirements of the United Nations. After the defeat of Japan—provided the rubber "forests" in the countries now occupied by that country will still yield anything like the pre-war quantities—the combined productive capacity of natural and synthetic rubber must appreciably exceed world demand. One way of adjusting supply to demand would be to allow the two kinds of rubber to find their own production and price levels in competition. But this solution will hardly commend itself

either to the producers of natural rubber or to the Government of the United States, which will doubtless be anxious to maintain at least part of the synthetic rubber capacity after the war as a strategic reserve. Moreover, since the large-scale production of synthetic rubber in the United States has barely started, the possibility of surprises in the downward trend of costs cannot be overlooked. It is therefore probable that a solution of the problem of excess capacity may be sought by bringing synthetic rubber within the scope of the existing international rubber agreement. This may be the solution, provided a satisfactory formula can be devised for sharing the world market between natural and synthetic rubber, and provided the price of this essential raw material will be no higher than necessary to ensure efficient producers a reasonable return on their capital. But a world-wide rubber cartel could only be justified if it were operated by a body responsible to the Governments of the producing as well as the chief consuming countries.

The 4s. ordinary shares of Home and Colonial Stores, standing at 6s. 10d., yield £1 15s. per cent on the 3 per cent distribution.

The following notes by the chairman accompanied the directors' report to be submitted at the ninth ordinary general meeting of the company.

The profit and loss account and the balance-sheet show the combined effect of three factors: (1) reduction of the company's fleet; (2) variations in the company's agreement with the Ministry of War Transport; and (3) a change in the depreciation policy. The latter two factors are directly connected. Up to this year, the depreciation policy had been that agreed with H.M. Treasury so far back as 1938. Now it has been agreed with the Ministry of War Transport at not less than 5 per cent. on the values which are the basis of the company's remuneration. The resulting figure, £1,196,162, has been employed to produce the balance-sheet item "ships at cost, less depreciation, £11,457,177."

In the balance-sheet, "ships replacement reserves" has been merged with the "general contingencies reserve" under the title "reserves for ships replacement and general contingencies." The combined figure is now £6,960,844. To-day it is not possible to forecast in what manner, or on what sort of ships, the company will need to spend money in order to re-create or maintain its trade, goodwill and revenue. New construction and reconstruction may be interchangeable; they may also have to wait on one another. For ton for ton replacement, insurance is inadequate. The company is in effect already carrying part of its own insurance, as on some ships it is not possible to obtain values to cover replacement. Post-war circumstances may render it advisable to extend this enforced practice into a deliberate policy. Advertising, organisation, and perhaps the Air factor, will need expenditure. Taking all things together, it seems better to bulk these reserves into the single heading.

As regards 1943, I can only write provisionally. Clearly, our revenue is determined by our ships in service. Any reduction in their numbers would reduce earnings, but would add to our capital resources. Our company was formed originally with a capital of £20,000,000, to correspond with the then income tax values of the ships. I see no reason why a £20,000,000 company should not earn and pay out £500,000; it is but a very modest return on the real money that went into it. We are doing this for 1942, and so far as 1943 has gone I see no special reason for alarm. But I would make no forecast; there are the imponderables, especially those of this war.

PERCY E. BATES,
Chairman.
14th July, 1943.

GLOBE TELEGRAPH AND TRUST COMPANY, LIMITED

The seventieth ordinary general meeting of the Globe Telegraph and Trust Company, Limited, was held, on the 28th instant, in London, Mr. F. Alexander Johnston (the chairman) presiding.

The following is an extract from the chairman's statement circulated with the report and accounts: The income of the company, after deduction of income tax, was £196,026. The changes in the investments in which our company is interested during the year have been immaterial. In the uncertain conditions which at present obtain, and which will assuredly obtain when peace returns, we may, I hope, regard the picture with not unreasonable composure. The appreciation of investments over book value amounts to the large sum of £2,238,943.

We have been able to maintain our dividend at 5 per cent., tax free, and the carry forward to another year has been increased by £32,136. That has been due to the very satisfactory result of our auditors' negotiations with the Inland Revenue which has substituted a National Defence Contribution for our Excess Profits Tax liability. The report was adopted.

REPORT OF THE AUDITORS TO THE MEMBERS

We have audited the above Balance Sheet. We have obtained all the information and explanations we have required. In our opinion such Balance Sheet is properly drawn up so as to exhibit a true and correct view of the state of the Company's affairs according to the best of our information and the explanations given to us and as shown by the books of the Company.

GENERAL ELECTRIC COMPANY, LIMITED

CONSTANT EXPANSION

The annual general meeting of the General Electric Company, Limited, was held, on the 29th instant, in London, Mr A. H. Railing, the chairman, presiding.

The following is an extract from the chairman's statement circulated with the report and accounts: My first duty is to refer to the grievous loss which our company has sustained through the death of Lord Hirst, who, as chairman, has presided over this meeting for 33 years and who has guided our company since its inception 56 years ago. We mourn in him a great man, an industrial leader who, with his team, built up a great national undertaking, a friend with deep human understanding and sympathy for all his co-workers. We who have worked with him for so many years shall ensure that his and our life's work stands—the mission of the G.E.C. as a national institution, a great and creative industry and a great and progressive employer.

Our profit and loss account shows that the profit, after providing for taxation, stands at £1,748,917 as compared with £1,725,137 last year, an increase of £23,780. After providing for depreciation and pension fund, we are left with a net profit of £1,195,741 against £1,180,946. We recommend a dividend of 10 per cent. and a bonus of 7½ per cent. on the ordinary stock, both less income tax.

HELP TO WAR EFFORT

Our company is at present engaged entirely on work essential for the prosecution of the war. We have done our utmost to respond to the many calls made upon us both to increase production in our own field and to meet the many new demands which have arisen. Our works, constantly expanding, have largely increased their output during the past year and still further increased their order book. Our research laboratories are engaged to their utmost limit on work of the highest national importance. The necessity to secure the greatest possible efficiency from management, staff, workpeople and machinery is fully realised. Every effort is made to attain it in a spirit of mutual understanding and co-operation.

We are mindful of the problems which will confront us after the war and of the important part which our company must be prepared to play in the post-war world. We are trying to plan for the time when the present catastrophe will have found its solution so that we may play the part which we owe to the nation and to ourselves both during the reconstruction period and afterwards. Some of the conditions cannot yet be clearly foreseen, as, for instance, the degree of international co-operation for the marketing and exchange of goods, the relative importance of replacing capital goods or providing consumers' goods immediately after the war, the spending power available for various countries and the measure of expansion allowed to various industries. It is self-evident that some clarification on these points will have to take place before definite decisions can be made.

LONG-TERM POLICY ESSENTIAL

One factor stands out clearly. Given a degree of security to plan for a period of years, there are unlimited possibilities in our industry to expand and provide employment. A long-term policy is the first essential. The Prime Minister pleaded in another sphere for a four-years' plan. We, as well, must be able to organise not on the basis of a yearly budget but for a much longer period. This alone will enable the management to plan on a comprehensive and far-sighted scale and thus assure continuity of employment, a reasonable return for the capital invested and an efficient and economic service for the nation and for the world.

The report was unanimously adopted.

THE METAL BOX COMPANY, LIMITED

DISTRIBUTION OF 17½ PER CENT.

MR ROBERT BARLOW'S REVIEW

The twenty-second annual ordinary general meeting of the Metal Box Company, Limited, was held, on the 29th instant, at the Connaught Rooms, Great Queen Street, London, W.C.

Mr Robert Barlow (chairman of the company) presided.

The secretary (Mr John Cartner) read the notice convening the meeting and the report of the auditors.

The chairman's review, which had been circulated with the report and accounts, and was taken as read, was as follows:

The work of the year covered by the accounts having made greater demands than ever upon the executive staffs and employees of the company's factories and offices at home and overseas, the board wishes me to express its thanks for the consistent hard work and loyal support given by all staffs and workers. The accounts now presented show an increase of £8,512 in the balance of profit available; the figure of £218,881 comparing with £210,369 a year ago. The debit in the profit and loss account of £250 for patent rights written off refers to those acquired during the year. No value is put on patents in the company's books.

RESERVES EXCEED £1,940,000

The board has this year resumed its practice of making an appropriation to reserves by transferring a further £100,000 to development and reorganisation reserve. This has had the effect of reducing the balance carried forward to next year in the parent company's accounts to £140,922. As will be seen from the consolidated balance-sheet, the total undivided profits and reserves now amount to £1,941,737. The reductions in stocks and debtors and in current liabilities have been made notwithstanding a further increase in turnover and have been brought about in the main by better collections and easier financial conditions.

It will be seen that the cash position has improved—bills payable have been reduced, and the bank overdraft of a year ago has been converted into a credit balance. Current assets now exceed current liabilities by over £2,500,000. Following our usual practice, expenditure on ARP and in respect of war damage premiums and contributions has been written off, and provision has been made for all taxation liabilities on profits to the date of the balance-sheet. An interim dividend of 5 per cent was paid on the ordinary stock on January 1, 1943, and your directors recommend, for the sixth year in succession, a final ordinary dividend of 10 per cent and a bonus of 2½ per cent.

FUTURE PROBLEMS

We regard consideration of the problems of the future as an immediate duty to be carried out without relaxation of our war effort, and with this in mind we have made the further transfer this year to development and reorganisation reserve.

Finally, we again send our greetings to the large number of our employees on active service with the Forces in many parts of the world who are so often in our thoughts.

The report and accounts were unanimously adopted.

A final ordinary dividend of 10 per cent (making 15 per cent for the year), together with a bonus of 2½ per cent, both less income-tax, was declared.

Mr H. W. Cramer and Mr F. W. Rankin were re-elected directors of the company, and the auditors (Messrs Hodgson, Harris and Co.) were reappointed; and a vote of thanks to the chairman, directors, staff and employees concluded the proceedings.

THE MINING TRUST, LIMITED

STRONG POSITION

The fourteenth ordinary general meeting of the Mining Trust, Limited, was held on the 27th instant, in London, Earl Castle Stewart, M.C. (the chairman), presiding. The following are extracts from the chairman's statement circulated with the report and accounts:

Profit after deduction of tax amounted to £56,432, which was applied to reducing the debit balance on income and expenditure account.

MOUNT ISA

Until April of this year Mount Isa continued to produce lead silver bullion and zinc concentrates, but latterly there has been a change-over to copper production. This change has been partly dictated by wartime needs for copper and in part by shortage of skilled operators and tradesmen. It is hoped that before long the authorities in Australia may be able to deal with the question of manpower satisfactorily and thereby enable Mount Isa to enter upon a period of full-time production of lead bullion, zinc concentrates and copper.

By a recent arrangement between Mount Isa Mines, Britannia Lead, and the Mining Trust, Limited, a capital repayment of \$800,000, on account of advances made to Mount Isa under an agreement of March 4, 1935, was made to the American Smelting and Refining Company.

OTHER INTERESTS

New Guinea Goldfields has not been operating its properties since the Japanese invasion early in 1942. The directors did not feel justified in recommending the payment of a dividend.

Gold-producing operations have also ceased at Big Bell, and are likely soon to cease at the mine of the Saudi Arabian Mining Syndicate.

The Britannia Lead Company has operated continuously and efficiently throughout the year, and although the production of lead bullion has temporarily ceased at Mount Isa, there are sufficient stocks of bullion to keep the plant in operation for some considerable time.

FINANCIAL POSITION

Cash at bankers at the end of the accounting year amounted to £384,264, being some £75,000 less than the corresponding figure for last year, but this decrease is more than accounted for by the increase in advances to subsidiary companies amounting to £158,500. Of these advances, £110,000 was loaned to Britannia Lead Company pending the realisation of 10,000 tons of Mount Isa lead silver bullion sold to Metals Reserve Company America. This loan was duly repaid January, 1943. A further amount of £48,500 was loaned to Britannia Lead Company under an arrangement by which the Mining Trust agrees to advance up to 90 per cent of the value of the silver content of Mount Isa bullion purchased by Britannia Lead f.o.b. Townsville. These advances, which were formerly arranged through ordinary banking channels, are fully secured and enable us to use a considerable portion of our liquid cash resources profitably. At to-day's date we hold £404,740 in cash, £40,000 in Government securities, and secured advances against silver to Britannia Lead Company amounting to £144,689. This makes a total of £589,429 in liquid resources.

In view of the restrictions on production at Mount Isa and the cessation of current operations at New Guinea, Western Australia and Saudi Arabia, your directors feel that for the present all cash and other liquid resources should be carefully conserved. However, the position of the Mining Trust is one of substantial strength, which has been considerably fortified by the repayment of \$800,000 owing by Mount Isa to the American Smelting and Refining Company.

The report and accounts were adopted.

July 31, 1943

CENTRAL MINING AND INVESTMENT CORPORATION, LIMITED

DIVIDEND MAINTAINED

STRONG LIQUID POSITION

The thirty-eighth ordinary general meeting of the Central Mining and Investment Corporation, Limited, will be held on August 5 at 1, London Wall Buildings, London, E.C.

The following is an extract from the statement by the Chairman (Sir R. Sothorn Holland, Bt.) circulated with the report and accounts:

The profit for 1942 amounted to £687,150, which is about the same as that of the previous year. There are some variations, however, in the items giving rise to this figure. It is arrived at after allocating £75,000 to inner reserves, compared with an allocation of £30,000 in 1941. Further, the amount received in dividends was rather less, but interest receipts and the net amount from share-dealing were higher, while on the debit side of the profit and loss account you will notice that general expenses showed a reduction. I should mention that the total of this item for 1942 was somewhat lower than what we regard as normal.

Your directors propose that the same dividend distribution be made as for the year 1941, and also that similar amounts as last year be placed to reserves. It is the policy of your board steadily to build up the corporation's reserves, including the investment reserve account established last year which is now carried under the heading of creditors in the balance-sheet. In this policy I am sure we shall have your complete approval.

BALANCE-SHEET ITEMS

The items in the balance-sheet show some changes compared with last year, arising out of the normal course of business, but there is no special point to which I think I need call your attention. A feature of the balance-sheet is the highly liquid state of the corporation's finances. This is a matter for satisfaction, but it also reflects the lack of opportunities for undertaking any major new business consequent on the control necessarily exercised in the national interests on new issues of capital. The necessity for the continuation of control during the war period is, of course, well understood. Your board, however, is not unmindful of the part that the corporation can play in constructive developments in the post-war period, and while no definite plans can be made, your board has the subject under consideration.

CONDITIONS IN SOUTH AFRICA

The effect of war conditions on industry in South Africa has in many respects been similar to that in this country. The call for man-power for the Services and war production has reduced both the white labour and native labour strength available for the gold mining industry. The industry has, indeed, been a reservoir of highly trained men, from which the country has been able to draw skilled technicians for the manufacture of munitions for the country's needs, apart from the men who are actually serving with the fighting forces. Manufacture has been carried out at mine workshops, and the industry has naturally been glad to provide all the facilities of which it is capable.

The supply of stores from overseas has presented a serious problem, but in this respect the tradition of co-operation which is characteristic of the gold mining industry, acting through the Transvaal Chamber of Mines, has contributed to the continuation of operations. Increased taxation has also been imposed. The combined effect of these factors is shown

in the tables in the directors' report, namely, a reduction in tonnage milled, in development footage, and in dividends. These results were to be anticipated. You will not need to be assured that constant attention is being devoted by the mining industry to meeting such difficulties as may arise in the conduct of operations and of overcoming them with, I hope, the success achieved up to the present.

OIL INTERESTS

As regards our oil interests, Trinidad Leaseholds declared a dividend of 15 per cent, the same as for the previous year. In Venezuela, the North Venezuelan Petroleum Company has elected to convert its concession to a 40-year concession under the new law recently enacted, and is now engaged on a geological re-examination of the concession area. The Mercedes Company, in which Ultramar Company, Limited, is largely interested, has proved by drilling the extension of the promising oil sands previously located. The corporation subscribed for its proportion of the new share capital recently issued.

With regard to the current year, our results in the aggregate are satisfactory, but I feel it would be unwise, in view of the uncertainty of the times to commit myself to any forecast at this stage.

GUEST KEEN AND NETTLEFOLDS, LIMITED

SIR SAMUEL BEALE'S STATEMENT

The ordinary general meeting of Guest Keen and Nettlefolds, Limited, was held, on the 28th instant, at the Queen's Hotel, Birmingham.

Sir Samuel R. Beale, K.B.E., chairman and managing director, presided.

The secretary (Mr E. C. Drake) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman, which has been circulated with the report and accounts for the year ended March 31, 1943, and was taken as read:

Within the restrictions imposed on the consumption of paper, it is not possible to do much more than assure you that the appended accounts show the results of another year of hard work by all concerned.

There have been no appointments to the board, but Mr J. H. Jolly has been appointed a deputy-chairman.

The board accepted an offer for the shares of the Santa Rosa Company. This company manufactured bolts and nuts and wood screws in Brazil. Your board have no doubt that in existing circumstances the acceptance of the offer received was in your best interests.

The accounts follow the usual form, but on this occasion the previous year's figures are given for comparison. I should like to say how much we appreciated the assurances given by the Chancellor of the Exchequer in his Budget speech of giving the most careful consideration to the incidence of war-time taxation on the stability and efficiency of industry, so that it may be able to adapt itself energetically to the problems of reconstruction.

It is with great pleasure that I again record our appreciation of the very fine contribution to national production by the management, staff and workpeople.

The report and accounts were adopted. The retiring directors—Mr Edmund L. Hann and Mr W. R. Lysaght—were re-elected and the auditors, Messrs Carter and Co., reappointed.

A vote of thanks to the chairman, directors and staff concluded the proceedings.

BARRY AND STAINES LINOLEUM, LIMITED

The ordinary general meeting of Barry and Staines Linoleum, Limited, was held, on the 28th instant, in London, Sir John N. Barran, Bt. (the Chairman) presided.

The following is an abridgment of the Chairman's statement, circulated with the Report and Accounts.

The profit for the year is £70,286, against £65,524 for 1941. This result, your directors venture to hope, is not unsatisfactory to you in view of my warning of last year against easy optimism. In securing it the proceeds of our Canadian investment and economies in our domestic administration, which are being carried further in the current year, have played their part. A rearrangement of our staffs has made for smoother and easier working. The deferment of an interim dividend was, in our view, a prudent act, and the dividend now proposed, though smaller than twelve months ago, has been entirely earned within the year under conditions in which you will approve our having placed National Service before profit-making. Were I at liberty to explain more fully, you would appreciate the peculiar difficulties which have stood in our way. In recommending it we keep steadily in view the anxieties, duties and opportunities which await us when the fighting ends. The ever-rising spiral of costs is bound to be a grave problem to every exporting industry; so will also be the questions of machinery, staffs and raw materials; we must be ready for them and for that purpose must husband our strength.

The year's figures have been arrived at after charging our usual full rates of depreciation. Following on the previous year's figures without any great variation, they explain themselves in the main and illustrate what I have already said. Our subscriptions to war appeals and allowances to our employees away on the country's service have continued.

CENTRAL COMMERCIAL PROPERTIES, LIMITED

INCREASED REVENUE

The fifteenth annual ordinary general meeting of the Central Commercial Properties, Limited, was held, on the 27th instant, in London.

Mr W. Stanley Edgson, F.S.I., F.A.I. (the chairman), said that shareholders would be gratified to see the upward trend of both the gross and net rental revenue, which was the acid test of their prosperity. To have raised the former to £96,600 and the latter to £76,454 was no mean achievement, particularly having regard to the number of properties destroyed by enemy action and the concessions granted to assist their tenants.

They were increasingly feeling the adverse effects of war-time legislation. War Damage Contribution for the year had amounted to £3,224 and as at present contemplated two further instalments would be due, bringing the total to some £42,000. Those sums had to be found in cash clear of tax and would prove a severe strain on their liquid resources. That annual contribution represented a tax-free dividend of no less than 5½ per cent. on their ordinary capital, or a capital levy equivalent to approximately 30 per cent.

One of the most gratifying features of the year had been the steady return to a pre-war standard of the capital value of shop property investments.

The conclusion of the moratorium had enabled them to consider the distribution of a dividend on the preference shares and, having regard to the satisfactory increase in the net revenue available, and the fact that throughout the moratorium sufficient revenue had been earned each year to meet the preference dividend, the directors had felt justified in recommending that one full year's dividend, for the year ending June 30, 1941, should be paid.

The report and accounts were unanimously adopted.

HARLAND AND WOLFF, LIMITED

ANNUAL MEETING

The fifty-eighth annual general meeting of Harland and Wolff, Limited, was held, on the 28th instant, at the Grand Central Hotel, Royal Avenue, Belfast.

Mr. C. J. G. Palmour, chairman of the company, presided.

The secretary, Mr. A. T. Marshall, having read the Notice convening the meeting and the report of the auditors, the chairman stated, as pointed out in the report of the directors, that he was unable under existing conditions to make any general review of the company's activities. He therefore formally moved the adoption of the report and accounts.

Sir Frederick Rebbeck seconded the resolution, which was carried unanimously.

The retiring directors, Mr. Atholl Blair, Mr. L. V. Dunlop, Mr. J. Morrison, Mr. F. V. Spark, and Mr. C. J. G. Palmour; also Sir John Craig, Mr. H. P. Harland, and Mr. F. G. Dunlop, who retired by rotation, were re-elected; and the auditors, Messrs Price, Waterhouse and Company, were reappointed.

Insurance Share Index.—The Economist index of insurance shares at June 30, 1943, with comparative figures at half-yearly intervals since the middle of 1941, is shown in the accompanying table. The index is compiled on the basis of an investment of £1,000 in each of 24 representative securities in 1913. After

an upward movement in the first two months of the year prices receded in March, but recovered again towards the end of the half-year, with the result that the index records an appreciation of nearly 4 per cent. This appreciation is fairly evenly spread over the various securities, 18 showing gains, four remaining unchanged, and only two registering declines. The slackness in Prudential shares is doubtless associated with the likely prejudicial effects of pending social legislation on the business of the company.

THE ECONOMIST PROFIT FIGURES

The defects of company accounts and the complications of income-tax make it impossible to present statistics of profits in a simple, standardised form. The following definitions may assist the reader:—

(a) **Gross and Net Profits.**—Gross profits are profits before payment of standard income-tax (but after such other taxes as EPT and NDC). Net profits are profits after tax. In many cases, figures of gross profits can be calculated only by adding back what appear to be the appropriate amounts of tax to the net figures published.

(b) **Accounting Period and Reporting Period.**—Company reports are published some time after the end of the period in which the profits were earned. The figures can be grouped by the quarter in which they are published (i.e., by the reporting period) or by the quarter in which the company's financial year ends (i.e., by the accounting period).

(c) **Old Basis and New Basis.**—On the old basis the net profit consisted of preference and ordinary dividends as published, whether gross or net, plus actual allocations to free reserves. Total profit was the largest figure of the profit and loss account, excluding capital profits and transfers from reserves. The figure was struck before depreciation if that was disclosed. On the new basis no net profit figure is provided. It can be obtained by deducting from the gross the appropriate rate of tax. The gross profit is the gross total of interest and dividends plus additions to free reserves and other savings, both grossed up at the stated rate of tax.

TABLE V

FINANCE AND BANKING

THE MONEY MARKET.—The pressure of heavy tax payments has made itself apparent on credit conditions this week and has been accentuated by the fact that some of the clearing banks have been making up for their July statements. The credit stringency had to be eased by special open market purchases of bills earlier in the week, and by Wednesday the position had eased appreciably. The Bank return shows the circulation to have risen by £12,127,000 to a new record of £968,116,000, and this

GOVERNMENT RETURNS

For the week ended July 24, 1943, total ordinary revenue was £56,183,000, against ordinary expenditure of £91,774,000. Thus, including sinking fund allocations of £2,975,958 the deficit accrued since April 1st is £1,060,646,000, against £920,706,000 for the corresponding period a year ago.

GOLD AND SILVER

The Bank of England's official buying price for gold remained at 168s. 0d. per fine ounce throughout the week.

In the London silver market prices per standard ounce have been as follows

Date	Cash	Two Months
July 22	23½	23½
" 23	23½	23½
" 26	23½	23½
" 27	23½	23½
" 28	23½	23½

The New York market price of fine silver remains at 44½ cents per ounce throughout the week.

The New York market price of fine silver remained at 44½ cents per ounce throughout the week.

INDUSTRY AND TRADE

Talc Control.—The Minister of Supply has made the Control of Talc and Pyrophyllite (No. 1) Order (S. R. and O., 1943 No. 960), which took effect from July 19, 1943. The Order makes it necessary, except for quantities smaller than 7 lb. to obtain licences for the disposal and acquisition of talc and french chalk, steatite, soapstone and pyrophyllite.

British Standards Institution.—At the annual general meeting of the British Standards Institution, which was held last week the chairman said that 230 new and revised British Standards were issued during the past year. The total number of British Standards now in use number 1,500.

Apple Prices.—The Minister of Food has made the Home Grown Apples (Maximum Prices) Order, 1943, prescribing maximum prices for apples from August 1st. Prices are fixed at 4½ pence per lb. for the first 100 lb. and 3½ pence for the remainder.

Leaving a Void Behind

"HE has the guiding light of his genius, which frequently illumines his mind like a stroke of lightning, while we sit in darkness and scarcely suspect the direction from which daylight will break upon us." Thus Goethe wrote of Beethoven; and thus, at a more earthly level, history may write of Winston Churchill, the organiser of victory. This is the hour of his triumph; his defence of Egypt has become the assault upon Europe; his Transatlantic diplomacy has filled the seas with ships and the skies with aircraft; the Russian ally, whom he was the first to acclaim, has blunted and splintered the Wehrmacht; and Italy is ripe for the reaper. The Germans are still strong and will fight hard; but, east, south, west and north, they can see no relief; their cities are being devastated; their sea offensive has been foiled; and everywhere they are mastered in the air. It is perhaps hard when the night has been long to believe that the dawn is near; but the end of the war in Europe, provided there is no major breakdown in Allied diplomacy, cannot now be far off. What next? There is a school of thought, Ministers and sycophants, which contends, in answer to anxious calls for preparations to be made for the coming peace, that success in battle is enough. What the Prime Minister did yesterday in war, he will do to-morrow in peace. Till then, they say, let all be silence, and they quote their master's voice: "Back to the job"; it is "unseemly" to look while the fighting lasts for deeds or decisions outside the fields of battle.

There is perhaps a plausibility about this application of the doctrine of one thing at a time. Yet those who so apply it might well consider some other words of Mr Churchill's. The Prime Minister has recorded in noble phrases what happened twenty-five years ago: how he stood at the window of his room, at the eleventh hour of the eleventh day of the eleventh month, and heard Big Ben telling that, after fifty-two months of battle, all was over; how the vast organisation of war vanished at a stroke, "leaving a void behind"; how his mind turned at once to the great problems of demobilisation and reconstruction that would require the same foresight and discipline and courage as war itself; and how in he glimpsed a people casting its burdens and responsibilities away. Only a few days ago, at the National I Club, he transposed the same theme into a contemporary key:

There will be great tasks of rebuilding. There will be great tasks of securing the advance of ideas and not letting it be swept back by mere tides of lassitude, exhaustion or reaction—the reconstruction and consolidation of our country in the gains which we will have made during this hard and long trial.

He told the nation in a broadcast last March of the four year plan for social security, public health, education, rebuilding, full employment and stable values that will be needed when this war is over; and he recalled "that horrible devastating slump" and "that squalid epoch of bickering and confusion which mocked and

squandered the hard-won victory we gained a quarter of a century ago." Yet if the peace comes soon, will the Prime Minister and his Cabinet in fact be prepared and fully armed to prevent a monstrous iteration of the disasters that he remembers so well? Last time, this country drifted into a peace it could not keep and into a prosperity it could never firmly find and hold; and it is the view of many people belonging to all parties that this will happen again unless decisions are made and plans laid before the war ends.

What is the Government's answer? Mr. Churchill has said "No promises but every preparation." What this slogan means in practice was disclosed in May in the House of Lords by the Minister of Economic Warfare:—

The blunt fact is that Cabinet Ministers, when the whole of their energies are devoted to winning the war, . . . simply have not got the time to go into these numerous and immensely complicated questions with the thoroughness and care with which they will have to be gone into one day. The civil servants and experts can of course do preparatory work. An immense amount of preparatory work is going on . . . but there are matters which must come before leading members of the Government in such considerations of policy, and it is physically impossible for them to give the requisite amount of time to these problems at this juncture.

The meaning of this is clear enough. Decisions are not being made for post-war agriculture, trade, taxation, finance and physical planning because those who have the power to decide—in the main Mr. Churchill himself—have not the time to do so. The situation was well put last week in a letter to *The Times* by Mr. Molson, MP.

Departments are keeping little study groups busy working on hypotheses, but so far practically no decisions of principle have been taken by the War Cabinet.

A month ago, in the House of Lords, Lord Nathan drew the attention of the Government to "the importance of the time factor in the preparation of schemes for post-war reconstruction"; and he was very indignantly rebuked by Lord Cranborne. The Lord Privy Seal's reply was perhaps the fullest statement so far of the *non possumus* attitude of the Government. Of agriculture, he said, with surprising levity, that no immediate decisions are called for because war conditions are likely to last until 1947—which promises a Pyrrhic victory, by default, for the agricultural interest. Of the planning of land use, upon which the whole future of national rehousing depends, he said that it raised issues of great complexity that require considerable further investigation—which means that post-war building, however ample, may be botched as badly as it was twenty-five years ago. On housing and education he pointed to the Government's White Paper policies. But there are still no decisions, and Lord Selborne has said that there can be none. Civil servants and local authorities are busy as beavers preparing they know not what. Much work of preparation must indeed be done; but without the decisions that Mr. Churchill has no time to make, it is evasive action. This war was prepared for by committees of "co-ordinators"; and the results in 1939 and 1940 are well known. Now the peace is being prepared by "study groups." While they study, the Minister of Agriculture is "under instructions" not to talk about post-war policy; the Ministers in charge of trade at home and abroad have nothing to say of any plan of action; the Beveridge Report has been cut into a score of fragments for further scrutiny; and the Reports of Barlow, Scott and Uthwatt are ceaselessly thumbed by dutiful officials.

"Leaving a void behind": that is the most striking of Mr. Churchill's phrases about November 11, 1918. The Prime Minister knows better than any man how impossible the long and tremendous process of preparing a military campaign would be without a firm decision at the outset about the campaign's precise objectives; how foolish and futile it would be to mass armadas of ships, armies of men and fleets of aircraft to strike at some point and some time unknown to the planners and organisers. Yet this is precisely what is happening in the preparation of the peace. The parallel is valuable. The

single common factor in all the theatres of war is the massive air mastery of the Allies. The single common factor in the campaign of reconstruction can be the new economics. Reconstruction requires the same homogeneous pattern and the same specific goals as war-making; the translation of the aim of full employment into concrete projects; a programme to ensure that the yield of full employment shall be divided fairly and productively; and a guarantee that the subtle and flexible instrument of finance shall consistently serve a definite policy of making the most of everything that is available for the benefit of everybody. Within the framework of this great campaign, there are decisions that can and should be made in the short space that lies between now and the end of the war, decisions in Bills, not White Papers, in Parliamentary statements, not platform or wireless orations. It is not enough for crucial questions like demobilisation to be given, as they must be given, "the necessary, detailed attention" (Mr. Bevin's phrase) by the Government. The Government must also make up its mind in time. Of course these issues are difficult and complex to decide; but this is what Ministers are for—to make the difficult and complex decisions that cannot be avoided or postponed.

Mr. Churchill's apologists reply to these protestations with many voices. One says that all the necessary work is being done; another that, since it is impossible to plan anything without reference to everything, nothing can be planned—that the safest way not to rob Peter to pay Paul in the schedule of reconstruction priorities is to pay neither. But all are agreed upon one point. This issue is a matter of confidence. They point to the way in which victory has been organised, and to the many criticisms of the conduct of the war that were made before the tide turned. They appeal for trust in Mr. Churchill, who has won the war; he is their plan, their policy, their all. Such an argument strikes at the very roots of democratic government. The implication is that criticism is always wrong because, behind closed doors, the Government may always be doing what the critics want. It is a fantastic argument. Throughout the war it has been the duty of those critics who put their country before their personal vainglory to speak their minds about the conduct of the war; and now that the struggle is proceeding to a successful issue, largely by the means that they have pressed for, they have been proved right, not wrong. Mr. Churchill himself has paid tribute to "prods" and to the stimulus and support that the Parliamentary process has given him throughout the ordeal; of all men, Mr. Churchill would not wish, in war or in peace, to be a Fuehrer, with his critics silenced to murmur underground until a day of reckoning. This is at least as true of planning for peace, when it is not necessary, and indeed quite wrong, for the Executive to conceal from Parliament its designs and intentions. It would be a betrayal of trust for Parliament to sit silent, hoping for the best, when it knows from its own experience the great standstill and sense of frustration that, for lack of Government decisions, is creeping over the preparations for peace. Members know of the cynicism that is abroad about the post-war period, of the men who say, "Of course, nothing will be done," and of those others, better off and more highly placed, who say, "Of course, nothing can be done."

The onus is upon the organiser of victory himself. It is his choice and his character to govern with a minimum of delegation; and, after many trials and desperate escapes, he has grandly vindicated his methods. But the bottleneck is still there on his desk, shifted from the planning of war, which he has accomplished, to the planning of peace, which he has set aside. The time has come now when for peace, too, he must decide or delegate. The Prime Minister is one of a brief band of great British leaders who have led their country to success against great odds. He can be the first to win the peace after war. Chatham resigned before the war was over; Pitt died; Lloyd George stayed to fail and fall. It would be a melancholy epilogue for Mr. Churchill, in his turn, to go down as the Prime Minister who won the greatest war in British history, and then

Inside the Fortress

THE curtain has gone up in Italy. The actors who played the leading parts for twenty years have departed; and temporary successors now move across the stage like shadows of the past, to return again soon to obscurity. The real actors in the new drama have not yet stepped to the front of the stage, but linger in the dim background or the wings; and, after so many years of silence, the ring of their voices is not yet clear. But there can be no doubt about their identity: they are Underground Italy. For nearly two decades the audience has doubted whether these submerged men would ever again get a chance to intervene in the performance; some even doubted their existence. Now their faces have been seen in the photographs of enthusiastic Italian crowds celebrating Mussolini's downfall, and their voices have been heard, demanding freedom and peace, in the manifesto of five Italian parties.

The collapse of Fascism in Italy is the vindication of the whole European underground movement. To-day Italy is showing to the other countries of Europe the picture of their own future. The interplay of factors needed to bring about the collapse of a totalitarian tyranny has been displayed: the impetus which the military defeat of their rulers can impart to the underground opposition, and the capacity of this opposition to speed up the process of political disintegration, begun by reverses in the battlefield. It might be said that the picture is not at all new. Tsarist Russia, in 1917, collapsed under similar circumstances. So did the monarchies of the Hohenzollerns and of the Habsburgs. But there is one important difference. None of the regimes which collapsed in 1917-18 was totalitarian. Each of them tolerated some internal opposition. (Tsarist Russia, even under Stolypin, who had crushed the revolution of 1905-1907, was a mild and almost humane autocracy compared with Fascism.) Mussolini spent twenty years in ridding Italy of all anti or non-Fascist organisations. The job, it seemed, was done thoroughly, and the political life of Italy, outside the ruling party, appeared to have been reduced to nothing. Even many of Mussolini's adversaries, in their despair, came to believe in the omnipotence of the totalitarian state. This is even more widely believed of Nazi Germany—and possibly with greater justification. Events in Italy, however, have disproved a myth. The sudden collapse of Fascism shows that the removal of all safety valves did not make the Italian totalitarian state immune from the effects of high pressure, but only made the eventual explosion more sudden and catastrophic.

Events in Italy have already thrown some light on the possible array of social and political forces there and

elsewhere in rising Europe. Reports speak of the formation of a united anti-Fascist front by several political parties. That these parties may at present be united on a minimum programme of peace and the restoration of civic liberties seems very likely. But there are lines of division within the *bloc* which seem very reminiscent of the divisions that existed in pre-Fascist days. Reports have mentioned Liberals, Catholics, Socialists and Communists—the parties of the old parliamentary era. The fact that, after twenty years, the old political framework seems to have reappeared is significant. In Germany the totalitarian interval has lasted only ten years; and it is not unlikely that in Germany, too, if and when the hard totalitarian crust is broken, there will appear below, not a complete political vacuum, but some array of forces more or less in keeping with the politics of the pre-Nazi period.

So far, however, all is supposition. The situation in the two Axis countries, Italy as well as Germany, is still uncertain and unclear. But the situation in the occupied countries is more definite. Everywhere the war and the occupation have temporarily blurred the political division between Right and Left. A year ago *The Economist* summed up the politics of the underground movements in the following words:—

Ideological divisions have, in fact, been blurred and hidden by the fog of Nazi cruelty and oppression. And this lack of an ideological backbone accounts for the strength and weakness alike of the underground movement. It has helped to mobilise the sentiment of the widest possible range of social groups in invaded nations against the invaders, when many might have been scared away by political and social dogma. On the other hand, it has perhaps hampered the crystallisation of any distinct ideas or programme for the future of Europe.

This is, broadly speaking, still true. The fog of Nazi cruelty has thickened; and considerations of national solidarity against the invaders still dominate the underground scene. Yet some changes have taken place. The underground movement has outgrown the phase in which organisation, and not politics, was its primary concern. The period of difficult and costly apprenticeship in illegal activities has been left far behind. This is true, not only of eastern Europe, where an old tradition of illegal political struggle helped to organise resistance against the Germans. It is also true of France, Belgium and Holland, the countries which at the beginning were handicapped by the absence of any tradition of underground resistance. Indeed, there is some evidence that, during the past year or so, resistance has become even

better organised in western than in eastern Europe. (The incomparably more brutal terror in the east has not permitted the organisation of strikes or mass demonstrations. In the west the German terror has been sufficiently brutal to provoke such reactions but not brutal enough to suppress them altogether.) But precisely because the underground movements have overcome their initial weaknesses, the old issues of domestic policy have tended to come again to the fore, and with them the old political divisions. The military events of the past year have had a similar effect. As the prospect of German defeat has come nearer, the minds of the underground leaders have turned more and more to the problems of peace; and somewhere deep in the labyrinth of resistance a preliminary manoeuvring for position is already taking place among the various political factions. Nowhere have the old social and political lines of division lost their validity.

Thus, the new "spring of the nations" promises to be not entirely unlike its forerunner in 1918-1919. Yet some important differences can be foreseen. After the last war the broad masses of the people tended to look for guidance to the organisations they had known from long political experience, which confined the spontaneity of mass reactions within narrow limits. This time, the position may be very different. Clandestine organisations usually embrace only small numbers of people—the cadres of resistance. To the broad masses they remain more or less anonymous. The man in the street on the Continent has lost much of his habit of waiting for the call of his party or organisation; and there is the likelihood of more spontaneous and spasmodic political reactions during the transition from war to peace. In the occupied countries the Allied Governments, return-

ing from exile, will have a fair chance of establishing themselves as centres of authority to which their peoples will look for guidance. In the Axis countries the transition from war to peace, which will at the same time be a transition from one regime to another, cannot be expected to take place in as organised a manner as in 1918 and 1919.

Some reports from Italy have spoken of the appearance of a workers' council in Milan. How much truth there is in these reports it is difficult to say. The workers' council in Milan, if it exists, may be a purely local phenomenon. But the collapse of a totalitarian regime does make the appearance of bodies of this sort very likely. A workers' council is elected by the workers of a factory. In a country where labour movements have been suppressed, and where workers are not accustomed to look for a lead to parties or trade union, the factory becomes automatically the nearest and most convenient ground for political organisation; and that organisation takes the shape of a workers' council. This was the case in Russia in 1917. True, in 1918 similar councils sprang up in all the central and eastern European countries, in Warsaw, Berlin and Vienna; but in those countries the councils were unable to assert themselves against the old-established parties and trade unions. Only in Russia, where the liberal and socialist parties were illegal under the Tsar, did the councils (or Soviets) become the apparatus of the revolution. The important difference between now and 1917-1918, however, is that no political group in the European movement—not even the Communists—has advanced a programme of Soviets. No new Lenin seems to be emerging from Underground Europe this time.

The Coal Question

WHEN Jevons wrote his famous book on the "coal question" seventy-eight years ago, the main concern was for the conservation of coal resources. Today the prime concern is the maintenance of the coal industry's labour force, which is steadily declining. Between the wars coal-mining was a depressed and shrinking trade. Its old overseas markets had dwindled. There were new, rival fuels; and the industry's long agony left bitter memorials in the pit villages of Wales and north-east England. Now time has brought its revenges. The demand for coal is rising to a new peak when the last act in this grievous contraction has not yet run its course; and there is a real possibility that both the war effort and liberated Europe will go short of coal for lack of British manpower. The Government has set out to increase the number of workers in the industry to 720,000-750,000; and on July 29th Mr. Bevin told the House of Commons of some of the proposed measures, including the direction to mining of men between 18 and 25. These measures may achieve an immediate increase in the labour force. But the "coal question," in its new guise, will persist. Will even these numbers of men be sufficient to produce enough coal to meet the immediate demand? And, in the longer run, what effect will their recruitment have on the future of the industry?

The needs of home industry and the Forces will not abate in coming months; and as the pace of victory quickens and more and more territories are freed, the call for exports will grow. Italy alone (according to the Director of Labour at the Ministry of Fuel and Power) will have to be supplied with some 5,000,000-6,000,000 tons of British coal—about half its normal requirements. As the invasion proceeds, coal will be needed to keep Europe's transport systems in operation; supply ships will have to be bunkered, essential civilian needs to be met and, as soon as possible, industries restarted. Stocks of coal in France and Belgium have been denuded. And when the enemy has been beaten, and the war is

over, this demand for British coal will become not less, but much greater.

Some idea of the magnitude of the post-war problem can be gathered from the figures of the production and imports of various European countries in the year before the war.

1938	Production '000 Tons	Imports '000 Tons	British Share Per Cent.
Italy.....	1,480	11,915	19.2
France.....	46,502	18,685	33.9
Belgium.....	29,585	4,494	14.9
Greece.....	—	897	17.6
Norway.....	—	2,270	62.4
Denmark.....	—	3,856	76.8
Netherlands.....	13,488	4,915	15.0
Germany..... (not including lignite)	186,179	4,970	74.3

The coalfields of Northern France, other occupied countries, including Russia, and Germany itself, will be partially and temporarily out of action. British coalfields will almost certainly be the only ones in Europe in full working order, and on them will fall the brunt of making good the deficiencies. Inevitably, wartime economies in domestic and industrial consumption will need to continue; perhaps it may even be found necessary, at long last, to introduce coal rationing. The figures tell their own story. Judged by the production figures of 1938, exports for Europe immediately after the war may require an increased annual production in this country of between 30 and 40 million tons. Taking an output of 300 tons per man per annum, and assuming no rapid increase in productivity through improved technique, this would necessitate the recruitment for coal-mining of another 120,000 men, over and above Mr Bevin's 30,000-50,000. Precision is not possible in estimates of this sort, but it is clear that the demand for British coal in the immediate post-war period will be colossal, and that there will be an unprecedented demand for labour. Will the men be forthcoming? Mr Bevin's measures are intended to recruit miners for war production. Once the war is

over, will he be able to persuade these men to stay in the industry, without the continued application of the Essential Work Order, let alone to recruit still more men—unless his powers of direction are carried over from war to peace?

All the available evidence suggests that there may be strong reluctance on the part of the younger miners to stay in the pits and on the part of ex-miners now in the Forces (not a very considerable number) to come back. Speaker after speaker at the recent conference of the Miners' Federation stressed the unwillingness of parents and school-teachers to send boys into mining, because of its dangers and lack of prospects. The miners remember their experience during the depression, hanging about street corners or labour exchanges, eking out a miserable existence on the "dole"; and as the Forster Committee on juvenile recruitment and training said:—

If boys are to be attracted in adequate numbers to the industry, it will be necessary to provide a greater sense of economic security and a firmer assurance of a progressive career.

Much obviously depends upon what can be done to raise the dignity of the industry and improve the miner's working and living conditions. The miners have put forward a Boys' Charter, in which they ask for national minimum rates of pay for juveniles; improved training facilities for youths and for colliery craftsmen; holidays with pay; retraining facilities for men displaced by the closing of pits; and retirement pensions at 60. This Charter has, in the main, been incorporated in the Forster Report, the adoption of which is the first step to the reconstruction of the industry's labour force. A lot has been done in the last few years, but much more still is needed. The accident rate is still appallingly high in terms of both man-hours lost and human suffering. Compensation for disablement and death is still extremely inadequate in an industry where such a high proportion of workers are liable to accidents. Housing conditions in the mining villages of South Wales and Durham are often very bad, and almost invariably drab and dreary.

In the circumstances, it seems certain that the financial inducements to labour will have to be considerable if the tide is to be turned, and the immediate needs of the next period met. It is significant that young men prefer the battlefield to the coalfield; they choose 2s. a day under military discipline before much better pay and guaranteed work at the pits. Even now, the level of wages in mining compares unfavourably with those in engineering and munitions. If men are to be attracted to the coal industry, mining will have to compete with other demands for labour—at a time, immediately after the war, when there may well be a general employment boom.

After the last war, too, there was an employment boom—followed by the painful shrinkage that lasted so long. It was the fear of a repetition of this experience that lay behind the demand of this year's miners' conference that there should be no "reparation coal" after the present war. But history need not repeat itself. Two stages must be distinguished. In the first, immediately after the war, when other producers are out of the field, there will be a swollen demand for British coal, and it seems very likely that labour will be in short supply, even if all steps are taken to attract new entrants. However, in the second stage, that is, in the longer run, a new situation may develop. Europe's coalfields will return to full work again; and there may be great advances in the production and use of coal derivatives and coal substitutes. It seems on the face of it unlikely that the Government will succeed in bringing up the manpower to the strength necessary to meet the needs of the first stage—850,000-900,000 men, but to the extent to which they succeed in the short period, a contraction may follow in the second stage. Then the British coal industry operating with a contracted labour force (say of 600,000 men) will have to stand on its own feet in competition with other coal-producing countries, and rely on productivity rather than on abundant labour.

There is clearly room for increased efficiency in coal-

getting. Admittedly, many British seams do not lend themselves easily to mechanisation, which renders comparisons on this score with German and American pits only partially sound. But on balance, in spite of the progress just before and during the war, the British industry is still backward, and more machines could be used in cutting, loading, conveying and stowing coal. As long as miners regard machines as enemies, remembering how they displaced pitmen in the past, they will resist mechanisation, although machines could greatly lessen the arduousness of their work. As long as the mines are organised on their pre-war basis, uncontrolled, individualistic and financially self-contained, there will be resistance by owners to concentration on the most efficient pits. The Samuel Commission advocated amalgamations on a voluntary basis as the best solution, but little was achieved under the Coal Mines Act of 1930. The owners were given an opportunity, which they missed. Wartime experience has revealed the difficulties of achieving reorganisation (as promised in the 1942 White Paper) while the fundamental basis of ownership is left unaltered. The task of improving efficiency, which the contraction of the labour force will both accelerate and render more than ever necessary, can best be discharged under unified, national control. Indeed public control of the mines—in the sense that the Government should exercise a general oversight over the process of production—is a step that cannot be long postponed. There is also scope for greater efficiency in the utilisation of coal and for more attention to research. The Parliamentary Scientific Committee in its recent report showed that, in 1938, the useful recovery of energy from coal was only 30 per cent, and that less than 1 per cent of the nation's available scientific personnel is engaged on coal research, and the industry only spends about £200,000 a year on research. The improvements in utilisation which have resulted from the war fuel efficiency campaign must be carried over into the post-war period.

It would be stupid to be pessimistic about the future of the coal industry. Without coal, as the President of the South Wales Miners Federation put it, Britain would sink to the level of a third-rate agricultural country, and could not support a population of more than 12 millions. Industrial and economic activity have in the past depended upon the production of coal, which has been relatively cheap, and it will continue to be the foundation of British industry. The need now is for coal to be recognised more as a raw material and less as a product for use in its raw state. Electricity, cheaper and cleaner, will be used increasingly for domestic purposes and by industry. Coal is an important source of chemicals, and there is a responsibility upon the Government to see that the chemical industry, based on coal, is rapidly and efficiently developed; and that this coal-based chemical industry is integrated with the petroleum-based chemical industry, still largely non-existent in this country. Coal can play an important part in the development of plastics, of synthetic rubber, soaps and fertilisers. Future possibilities are considerable. As in every aspect of British industrial life, it is all a question of efficiency; and the nation cannot afford or tolerate impediments to the best use of its only raw material. It will demand boldness, planning and foresight, under national control, and a just reward, economically and socially, to the men who work in the mines.

THE ECONOMIST: 1843-1943

The Economist will be a hundred years old on September 2nd. A Special Centenary Volume has been prepared by the editorial staff and a number of distinguished collaborators, reviewing the history of the paper and its part in public affairs during the century.

This book is being published by the Oxford University Press and copies, price 7s. 6d., will be available in September. They should be ordered from a bookseller and not from The Economist or the Oxford University Press.

people, who have shown in Sicily by their co-operation, and in Italy by their lack of it, that they are wholeheartedly for peace. If the Allies, by political bungling, lose the support that would so gladly be given them, they will find themselves faced with maintaining long and arduous lines of communication without Italian co-operation. If, on the contrary, they can win over the Italians, the Germans, wherever they hold a line, will be harassed by riots and revolts on the scale of the recent disturbances in Northern Italy.

Italy in the Commons

What could stand in the way of so obvious a policy as that of mobilising Italian support for the Allied advance? One thing only—the fear of loosing an avalanche of revolution. It might be possible, either by using Amgot to enforce an over-rigid discipline or by giving some sort of *de facto* recognition to the Badoglio régime after its capitulation, to become implicated in a widespread attempt to damp down popular enthusiasm in Italy, and to force underground the spontaneous uprisings which are bound to accompany the coming of peace. A major question of policy is involved here, and the Commons were therefore justified in debating the question even in face of the War Cabinet's disinclination to allow the discussion—and despite Mr Bevan's needlessly intemperate opening speech. The real point at issue is whether the Allies should welcome the support—sometimes violent support—of the Italians in liberating Italy. Or whether this clamour is the preliminary rumble of a violent social upheaval, and must in the interests of order—military and social—be firmly repressed. The House was divided on this issue, the more Conservative section supporting Mr Pickthorn's claim

that it is not proper to use a war, to use military occupation of territory, to try to alter social arrangements.

Liberal and Left opinion took the opposite view that the danger facing the Allies was that they might use military occupation not to alter social arrangements, but, on the contrary, to prevent them from being altered by the people themselves. Mr Ivor Thomas asked

that these forces shall be given a fair chance and that by some action by the present ruling forces in Italy we do not nip this revolution in the bud ;

and offered as an alternative policy that

there should be for some period a military occupation, during which the organs of democracy shall be allowed to function again.

This is surely a wiser and safer approach than to try to throttle down popular passions under some quasi-Fascist dictatorship. The cleavage of opinion dividing the House was a real and profound one. It turns on the question: who are the Fascists? Mussolini and his lieutenants only, or also the social groups who supported him? Conservative thinkers limit Fascism to the former category; radical opinion—together with the mass of the Italian people—adopts the broader definition. Badoglio is acceptable judged by the former category, unacceptable according to the second. The divergence here is so sharp, and so fundamental for the future of Europe, that Mr Kenneth Lindsay was justified in calling for a general debate on the first principles of foreign policy. Meanwhile, it is surely essential to point out that it is an error to think of two extreme categories only—Fascists and Revolutionaries. There is the middle term of constitutional democracy. The Italian people want civil liberty. But one thing is certain. Suppress their energies, discredit liberal principles, show them democracy in alliance with the leaders they have disavowed and they will inevitably turn to extremer forms. Those who wish to maintain the police state in the name of law and order are preparing the very revolution they fear the most.

The Education Debate

The White Paper on education has, on the whole, had an excellent reception, both inside and outside Parliament. As might have been expected, there was more discussion in the Lords this week than in the Commons on the provisions for Church schools, but there was no controversy, and the Archbishop's three suggestions seem, on the face of it, very reasonable. In the Commons, some disagreement was expressed about the intention to abolish the Part III local education authorities

—those responsible for elementary education, which include non-county boroughs with a population of over 10,000 in 1901, and urban districts with a population of over 20,000 at the same date. It is clear that some of these councils are going to resent the transfer of their functions to counties and county boroughs, though there will be district committees, to which the county authorities will delegate functions in respect of both primary and secondary education. Regarding the reorganisation of LEAs. Mr Butler let fall a welcome promise that the poorer authorities will be given additional financial assistance. But what came up most in the debate was the lack of teachers for putting the plan into effect, even if the other obstacles are overcome. A higher school-leaving age, smaller classes, more, and more varied, secondary schools, young people's colleges—to say nothing of an expansion in adult education, which is only summarily dealt with in the White Paper, and the large numbers of teachers that the Colonial Secretary will want for his educational schemes in the colonies—all these will create a big demand for teachers who cannot be supplied overnight. The source from which they can be recruited is small, owing to the defects of the present educational system, and the only way to attract the intelligent and the ambitious—the sort of teacher needed to instil the "sound learning" of the Norwood Report—will be a drastic overhaul of the system of teachers' pay. At present, though teachers begin on a living wage, they rise from it by depressingly small amounts to a maximum which is far too low for the ambitious, and which they reach too late in life. This would mean additional expenditure over and above the £67.4 million increase estimated in the White Paper as the ultimate cost of the proposed reforms, but it will be necessary if the teachers are to be found. The final criticism expressed in the Commons debate was not so much a criticism as an attitude of mind—a certain scepticism was apparent throughout the debate that even this Education Act, when it becomes an Act, will share the fate of its predecessors. Mr Butler himself, in his broadcast on July 30th, appealed to the country to support the Government in putting it into effect. It is not the people who need to be convinced of the need for reform—for a long time, realising that their own gravest defects, in peace and war alike, are due to educational deficiencies, they have been waiting impatiently for this plan. Now that it has appeared, their reply to Mr Butler is "Go to it. Let education have reconstruction priority No. 1."

The Mobilisation of Women

Mr Bevin's proposal to raise the age of registration for women up to 50 was strongly criticised in the House of Commons on Tuesday, and a motion of protest has been tabled by some 100 Members, mostly Conservatives, and among them many of those who welcome every opportunity of attacking the Minister of Labour. Many arguments against extending the age-limit were developed in the debate—the physical strain on elderly women; the shortage of domestic help; the break-up of family life; and the fact that, on the Ministry's own showing, no very substantial addition to the labour force can be expected from this source. All these fears are substantial and there is a considerable weight of public opinion behind them. But every ounce counts in this closing round of the war; and, in any case, the effect of registration at these ages is as much to ascertain that individuals cannot be spared from what they are doing as it is to secure their release for other work. Mr McCordale, the Ministry's Joint Parliamentary Secretary, assured the House that his department would proceed with great circumspection, and that the domestic responsibilities of the older women, who would be regarded as immobile, would be carefully examined by the local hardship tribunals. He explained that this measure was necessary in order to release younger and more mobile women for industry. The nation's reserves of labour have now run dry. Each new essential task must draw its workers from men or women who are already doing necessary work at home or in other employment; and it would be a poor end to the immense effort that has already been made if the final prize, already in sight, is victory. The enemy is being dominated from the skies over every battlefield and his own cities, and the massive output of aircraft that this entails is now to have over-riding priority in labour. To the extent that the call-up of older women will release younger women for work in aircraft factories, it is a wartime necessity. Plainly, however, the Government should see that every source of manpower, mobile or immobile, is fully combed

before it starts to recruit from either the lower or the upper age-limits (below 18 and above 45); and something more could still be done to increase the productivity of labour even further, by speeding up the training and upgrading of unskilled and semi-skilled women, and seeing that the rate for the job is generally applied as a rightful inducement.

Uncertain Alliance

The appointment of a new Soviet Ambassador to London has been announced. M. Gusef, Soviet Minister to Canada, is to succeed M. Maisky, and although Anglo-Russian relations will benefit by M. Maisky's expert knowledge in Moscow, it is perhaps unfortunate that a less experienced Ambassador should represent Russia in London during a crucial period when many political problems of first-class importance are bound to arise. At Washington, too, M. Litvinov's absence in Moscow leaves much vital business in the hands of a *Chargé d'Affaires*. Unhappily, this diplomatic gap seems to reflect a continuing lack of full co-ordination in the policies of the three Great Powers. There is still no prospect of associating Russia with Amgot or with a joint statement of political purpose addressed to the occupied peoples. Similarly, the Free German Committee in Moscow, while gaining more and more prominence on the Russian side, has not yet been linked up in any way with British and American propaganda to the Reich. And new evidence of faulty co-ordination is unfortunately evident in the attack launched in the Russian press against the idea of an East European federation, which, in principle at least, the British Government has blessed. The Moscow periodical *War and the Working Classes* goes so far as to say bluntly

Plans for the establishment of an Eastern European Federation hostile to the Soviet Union can be built up, but only with the renunciation of friendship and collaboration between the USSR and the Allies in the post-war period as the point of departure—only if the renunciation of the Anglo-Soviet treaty be considered.

Is it extraordinary that, with all this evidence of unco-ordinated policy-making, those who have put most hope in a concert of the Great Powers are beginning to wonder whether the tragic misunderstandings of 1939 may not be reappearing on the horizon?

Smuts's Triumph

The count of votes in the South African election was completed a week ago; 610,000 people voted for the pro-war parties, 347,000 for the Opposition. General Smuts's triumph is unmistakable. In the new Parliament, he will have 102 supporters, 89 of them from his own United party, against 43 members of Dr Malan's Nationalist party. His majority which, before the election was 21, is now 67. There is no doubt that the Prime Minister's patient skill in steering a Parliament and a country containing so large a proportion of opponents of the war and the British connection has now been properly rewarded; and, significantly, this vote of confidence came on the morrow of the Allied victory in Africa, which General Smuts has always regarded as being crucial for the issue of the war. It would be entirely wrong, however, to suppose that the supporters of South African independence, aloofness and national segregation have been disposed of for, say, a generation. This was a "khaki" election; and, even so, more than one-third of the votes were cast against the Government. Moreover, Dr Malan, like General Smuts, achieved in this election what he set out to do. He had, he knew, no hope of victory. He set out, therefore, to reintegrate the Opposition by killing the splinter parties which had flirted with Nazi ideas or which still pined forlornly for the late General Hertzog. In this he succeeded. The Opposition now consists entirely of Dr Malan's supporters; and the way is open for a straight fight at some future date, when General Smuts will have gone and his heterogeneous backing in the United Party, as well as in the Labour and Dominion parties, may be seeking a new orientation. The effect of General Smuts's victories in war and politics will last powerfully for a considerable time; but it would be a rash prophet who attempted to forecast the course of South African politics when the issues will be those not of war but of peace—economic development, native policy, constitutional reform, international obligations and all the aspects of independent nationhood in a new and changing world.

Unified Command

Arrangements to unify the armed forces of France have been announced. General Giraud becomes Commander-in-Chief, and in so doing surrenders most of his political and civil powers. In future he will preside over the National Committee only when military matters are under discussion, and he is no longer co-President of the Committee of National Defence, which is to become a sort of Minister of War in commission. Apart from his immediate military duties, he will be responsible for representing France in all inter-Allied discussions on joint strategy, and for supervising the distribution of armaments. The positions vacated by General Giraud have been taken over by General de Gaulle. He is now President of the National Committee in all non-military matters. Moreover, he is to be chairman of the Committee of National Defence, a position roughly equivalent to that of Minister of War. The end of the purely personal division of France's armies between two generals can be warmly welcomed, and the subordination of General Giraud as Commander-in-Chief to a Committee which is anonymous and collective in its action is in keeping with sound French democratic practice. The only anomaly is General de Gaulle's military rank. He now occupies a civilian post both as President of the National Committee and as Minister for War—the posts must be civilian, otherwise the whole point of subordinating General Giraud's military authority to them disappears. It would be suitable, and at the same time reassuring, if General de Gaulle were now to give expression to the civilian and constitutional character of the Algiers regime by abandoning his military title.

Recognition Delayed

The National Committee whose policy-making affects the lives of millions of French subjects in the French Empire, as well as the future of a far from negligible French fighting force, still meets without the official recognition of its great Allies. When it is remembered how small an area of effective authority rests with any of the Allied Governments in London, it is almost fantastic that the French, who want no more than a *de facto* recognition, should still lack this official clarification of their position. What is the reason for the delay? It can hardly be Mr Roosevelt's objection that 95 per cent of the French people are still under German control, because it would hold good for nearly all the Allied Governments. The real objection lies deeper—it is concerned with the personality and policy of General de Gaulle. It is difficult to disentangle the muddle into which Allied policy has fallen on this point. The State Department has made itself the spearhead of criticism of General de Gaulle and by doing so has ranged liberal opinion solidly behind him. The State Department's reputation is such that its bitter attack on de Gaulle is regarded in most liberal quarters as an added recommendation for the General. But the real issue is not that the State Department prefers a "Fascist" Darlan or a "Fascist" Giraud to a democratic de Gaulle. Only its clumsy handling of the situation has simplified the problem in this way. The truth is that many Frenchmen and many English people, including the highest authorities in the land, have come to make reservations about General de Gaulle, not assuredly because he is too "Left," but because they fear his ambition and the use he may make of *Gaullisme* inside France. Here, however, the question at issue is not whether or not these doubts are justified. The problem before American and British diplomacy is much simpler: if the authorities believe that General de Gaulle has dangerous political ambitions, is

their policy towards the National Committee strengthening or weakening his separate personal position? Surely it is clear that the Allies' failure to recognise the National Committee, far from countering the dangers they rightly or wrongly see, can only serve to perpetuate them. So long as the National Committee is not recognised there can be no natural growth of its own anonymous collective authority and prestige. In an unofficial Committee, the civilian members are bound to lack status. Finally, the rankling sense of injustice left by non-recognition is creating a breach between France and its Allies from which Britain, not America, will suffer most. Two steps should be taken, and taken quickly, if this critical situation is not to degenerate into a really tragic feud. The Committee should be recognised; at the same time, the military side of the French effort—which is, after all, the most important side—should be built up, partly by speeding on supplies to General Giraud's armies, partly by giving a proper place to the French High Command in the Allied War Councils. This is particularly urgent now, when the theatre of war is moving—via France's jackal enemy, Italy—towards the coasts of France.

Damage at Ploesti

On August 1st, American bombers carried out a mass low-level attack on Roumanian oil fields and refineries. Reports have since come in of very heavy damage to the most important oil refineries at Ploesti. The bombers made a round trip of 2,400 miles, which is in itself a remarkable achievement, although the bomb-load must have been appreciably lower than in raids made on Western Germany from this country. The pilots and crews were carefully trained on models before they were sent on their exploit, and no attempt was made to bomb the small oil wells. This first really big raid on this target—during which 20 bombers were lost over Ploesti and more on the way back—inevitably raises the old problem of Germany's oil supplies. Roumania's oilfields are the biggest single source of oil for Germany. They produce more than one-third of the annual output of natural and synthetic oil in Axis Europe. Rough estimates based on statistics relating to 1940 and 1941 suggest that only a fraction of the crude oil output was exported to Germany and Italy. The refining was done on the spot, and the exportable surplus of refined products may have amounted to 3,000,000 tons, of which 2,000,000 probably went to Germany. Great efforts have been made recently to reduce Roumanian home consumption by utilising natural gas, which proves that Germany needs greater supplies from Roumania. These estimates show that the destruction of a large part of the refineries would deprive Germany of valuable supplies of refined oil products—as long as the refineries remained out of production. What proportion of Germany's total supplies of refined oil products do the Roumanian supplies represent? If deductions are made for Roumania's home consumption, and for its exports to other countries besides Germany, one can roughly estimate that Roumania's exports to Germany amount to about one-fifth of Germany's total supplies. If Roumanian refining capacity were completely destroyed by bombing, this figure—one-fifth—would be the loss suffered by Germany.

The destruction cannot have been complete and lasting; but the damage done by the raid is not simply a question of the direct loss of oil products suffered by Germany. All kinds of subsidiary damage and inconvenience must be taken into account. For example, there is the strain on Germany's resources entailed by the need to repair the damaged refineries, tanks and pipelines. For some time past Germany has been delivering considerable quantities of pipes to Roumania, and it may well be that new material will not be available at once. Of course, the Germans may then divert the crude oil to those of Roumania's refineries which are not working at present—the reason for supposing that there is some unused refining capacity in Roumania is that recent regulations restricted the export of crude oil. Yet it is very unlikely that Roumania's unused capacity would be sufficient; and Germany would have to face the problem of finding tankers for shipping crude oil to refineries in Germany. Thus, given the direct loss in oil products together with the subsidiary inconvenience of repairs, transfers of oil to other refineries and strain on the transport system, the effectiveness of the Ploesti raid is considerable. The oil fields and refineries seem, from the reports and photographs, to be very severely damaged. The problem now is to ensure that the raids can be repeated often enough to make the damage permanent.

Bombing Policy

In ten days and nights a greater weight of bombs has been dropped on Hamburg than during all the raids on London in 1940 and 1941. The result has been fearful disruption, with refugees streaming from the city, whole boroughs wiped out and presumably a standstill in Hamburg's factories and dockyards. Some neutral correspondents went so far as to speak of Hamburg as having ceased to exist "as an organised city." This may be exaggerated—the RAF has returned to the attack since the statement was made—and those who speak of "unparalleled destruction" should remember that neither the ferocity of the attack nor the devastation wrought are on a scale new to war. Stalingrad virtually "ceased to exist as an organised city," and bombing cannot equal yet the damage done by bombing combined with artillery bombardment. Yet when all this is admitted, the attacks on Hamburg do mark a new and terrible stage in the intensification of aerial bombardment. The first successful and long-deliberated programme of annihilation from the air is being executed by Allied aircraft. The argument of military necessity is one which every sane person who wants to finish the war will accept wholeheartedly, if only for the lives of Allied soldiers and European civilians that would be saved should the war be brought abruptly to an end by this means. Bombing Hamburg's factories and docks obviously impedes the German war effort. The only convincing argument against this type of bombing would be to prove that the bombers could be better used elsewhere, or that the Allies' labour force and raw materials could be better used on other types of weapon. On this point, it is impossible for the layman to have an opinion. But in some quarters—particularly, gloatingly and reprehensively, in some sections of the press—two new arguments are being brought up to justify the bombing. One is that mass destruction "will bring the war home to the German people"; the other, that civilian morale will crack and bring about the disappearance à la Mussolini of the Nazi regime. This approach is in flat contradiction to any previous formulation of British bombing policy. It is an advocacy of terror bombing. It is an acceptance of unlimited warfare on non-combatants. Such an acceptance of the enemy's "total" outlook must not come to be regarded as the norm in this country. In air bombing, as in artillery bombardment, civilians must suffer when military targets are attacked, but to abandon the policy of attacking military targets only is to declare war on non-combatants.

Economic Demobilisation

At the Transport and General Workers' Conference on Monday, Mr Bevin took the broad problem of demobilisation as his theme. Too often, demobilisation is taken to mean simply the release of men from the fighting forces; in fact, it is the whole process of transition from war to peace economy, a process examined comprehensively, though in general terms, by a recent Report of the League of Nations' Delegation on Economic Depressions. Mr Bevin's starting-point was that of the responsible politician: "we want to avoid the difficulties that arose at the end of the last war." His emphasis was upon the need for equality between individual and individual or between group and group in the process of change-over. There will be a period of shortage after the war while stocks of goods are replenished and arrears of work are made up. The aim during this time, the Minister rightly contended, should be the same as during the war—to prevent "those who have time and money from getting the markets and pushing up the prices." For the same reason "every step should be taken to keep purchasing power on the same level; inflation or deflation would alike be unfair and discriminatory. For the rest, Mr Bevin had little to say, except that the Government was studying all the problems involved. The Minister rather gave the impression that, in his view, the economic future is merely a matter of manipulation and arrangement—of collective bargaining, so to speak, not only between employers and workpeople, but also between industry and the Government and between one nation and another. He announced that it is comparatively easy to produce all the goods required, and that the problem to be solved is one of distribution. Consequently, he had little to say about the basic need for economic and technical efficiency, for the output of the greatest possible quantity of goods and services per worker and per machine. He did declare that this country must supply its markets abroad "at such prices as would build up the goodwill of our trade for the future"; but he did not make as plain as two

of his colleagues, Mr Lyttelton and Mr Morrison, have recently done, that this process of selling cheap involves producing cheap, that is, with the least use of physical resources—and with the maximum degree of mobility and adjustment on the part of both labour and capital.

War and Peace

Seldom are the proper objectives of post-war economic policy so well stated as in the League of Nations' Report on the Transition from War to Peace Economy, referred to in the previous Note. The statement is worth quoting in full:

- (a) that the fullest possible use is made of the resources of production, human and material, of the skill and enterprise of the individual, of available scientific discoveries and inventions, so as to attain and maintain in all countries a stable economy and rising standards of living;
- (b) that, in so far as is possible, no man or woman able or willing to work should be unable to obtain employment for periods of time longer than is needed to transfer from one occupation to another or, when necessary, to acquire a new skill;
- (c) that in the use of these productive resources, the provision of goods and services to meet the essential physiological needs of all classes of the population in food, clothing, house room and medical care is a prime consideration;
- (d) that society distribute, so far as possible, the risk to the individual resulting from interruption or reduction of earning power;
- (e) that the liberty of each individual to choose his own occupation is respected and is promoted by equal educational opportunities;
- (f) that the liberty of each country to share in the markets of the world, and thus to obtain access to the raw materials and manufactured goods bought and sold on those markets is promoted by the progressive removal of obstructions to trade;
- (g) that the benefits of modern methods of production are made available to all peoples both by the progressive removal of obstructions to trade and by courageous international measures of reconstruction and development.

The Report is not concerned, however, with these long-term aims. Its purpose is to discuss the period of transition between the end of the war and peacetime proper. Its main argument is the need to restore economic equilibrium—between pent-up demand and short supplies; between the distorted structure of wartime industry and peacetime requirements; between the distribution of wartime indebtedness and the make-up of peacetime trade. The value of the Report is twofold. First, it is written against the background of the long-term objectives already stated; that is, it never counsels the restoration of equilibrium, in any branch of economic activity, by deflationary or restrictive means; it repudiates the methods of the last post-war period. Secondly, it is based on the belief that a prosperous equilibrium can only be secured by the courage and enterprise of Governments and individuals alike in making prompt adjustments to changing requirements; by the scrapping of redundant wartime plant, if it proves inappropriate, instead of seeking to protect and maintain it; by the replacement of military by civilian demand, *pari passu*, according to a deliberate plan; by the blending of reconstruction with relief in the devastated countries "to enable them to produce and exchange what they produce and so feed and clothe themselves"; and by the restoration of multilateral trading in the framework of financial flexibility and military security. To set these recommendations against the short-sighted policies of national *saute qui peut* or the mystical notions of international economic magic that are so common nowadays is to understand the wide gap between wisdom and nonsense—and the clear choice that the statesmen and the peoples will have to make when the war is over.

Holiday Traffic

Another August Bank Holiday has come and gone, and once again, in spite of the Government's appeals, vast crowds have thronged the railway stations. This year the crowds were greatest, at least at the London termini, on the Friday; by the Saturday they had lessened considerably. It has been said that the falling away after Friday was the result of the publicity given to the inconveniences which would-be travellers would have to endure. More probably most of Friday's travellers were starting their week or

The Role of Propaganda and Market Research in Post-War Overseas Trade

It is universally recognized that the rebuilding and expansion of Britain's export trade after the war is a problem of paramount importance. Any planning to that end which can be initiated now without detracting from the war effort can therefore be regarded as in the national interest.

The war has greatly stimulated a number of major developments in marketing technique, and it is apparent that these will play an equally significant role in the development of post-war world trade. Not only has propaganda, for example, become an indispensable weapon of war and international relations. Its new powers have not been lost upon industrialists, and it is to be expected that techniques almost unknown a decade ago will henceforth form an integral feature of export marketing.

New Methods

Again, the new problems arising out of the special conditions of war have sponsored the evolution of new methods of market and economic research on the part of both governments and private enterprise.

A considerable, and in some cases a leading, part in the development of these new techniques of propaganda and methods of research has been played by the J. Walter Thompson Company.

Until the outbreak of war, we operated fully developed organizations in almost every important world market. Today, our organizations in Continental Europe, with the exception of Stockholm, are naturally dormant, and we cannot, of course, foresee what their position will be when peace is restored. But some of our personnel have escaped from France, the Low Countries, and the Balkans, and their knowledge and experience will assist in an intelligent and realistic interpretation of post-war developments in these areas.

World-Wide Organization

In the meantime, we have continued our operations, not only in Great Britain and the United States, but also in all the Dominions with the exception of New Zealand, as well as in India, Brazil, and the Argentine.

At the moment, like every other concern, we are working with a greatly reduced staff and under considerable pressure. We are, however, still able to engage in reasonable correspondence and discussion, and some of our overseas offices are able to undertake limited research and planning. We shall be pleased to exchange views on post-war export problems.

STOCKHOLM SYDNEY TORONTO

fortnight of summer holiday on that day—always a popular day for this, since it allows the bonus of a Bank Holiday. In any case, the time has surely come for the Government to reconsider its attitude to the summer holiday question. Simply appealing to people to stay at home, without doing anything to enforce it, merely means, as it has meant in other instances of wartime appeals, that the hardship falls indiscriminately—the necessary traveller is penalised because there is no system of priority in the purchase of tickets and the grant of a seat; and the resident in a holiday resort suffers from the sudden increase in the demand for food, which it is official policy to make no arrangements to meet. If people, in this fourth summer of war, feel the need for a change to the extent that they will put up with almost intolerable conditions in the way of board and lodging to obtain it—and it should be remembered that “holidays at home” are nothing but extra work for the already over-worked housewife—then the Government should allow the extra trains to be run and the emergency food arrangements to be made. The extra fuel needed for the trains could be met by reducing the amount allocated for home consumption; in any case, extra trains were run after all, if the report that the GWR cancelled one west-bound train on Saturday because there were not enough passengers to justify it is true. If, on the other hand, the Government feels that the people do not need a change, or that the war effort cannot allow it, it should take steps to enforce its decision. The excuse that the administrative difficulties of a rationing system for travel, or a permit system, would be too great became out of date at least two years ago.

* * *

The Problem of Betterment

The compensation-betterment problem tackled by the Uthwatt Committee—its recommendations on betterment were discussed in *The Economist* on November 28, 1942—has been examined afresh in a memorandum prepared by “certain members” of the Chartered Surveyors’ 1924 Club. One of the objects of the memorandum is to eliminate the element of discrimination in the Uthwatt proposals. For non-built-up areas, it will be remembered, the Uthwatt Committee’s solution was the purchase of development rights on principles analogous to those applied to the nationalisation of coal-mining royalties. For built-up areas, it proposed a periodic levy of 75 per cent on increases in annual site values. Since all previous attempts to collect betterment, due to the action of central and local governments, have failed because of the difficulty of segregating the causes of rises in values, the Committee proposed that the principle should be extended to all cases of betterment, except where the betterment is due to the owner’s own expenditure. Admittedly, a tax on betterment, irrespective of its cause, amounts to discrimination between investments in land and investments in other forms of property. Moreover, the Uthwatt Committee’s scheme does not provide compensation for loss. Set against the wider interests of the community, the objection to the Committee’s scheme for built-up areas, which also underlines the proposal for the state’s acquisition of development rights in non-built-up areas, loses much of its force. Nevertheless, any scheme which proposes to eliminate the element of discrimination in the Uthwatt proposals deserves careful consideration, provided it does not lose sight of the ultimate objective, that is the creation of the conditions for effective planning and development by the Government and by private enterprise.

**OVER 1,000 FIRES
A DAY ARE HELPING
HITLER**

Most of them are caused by matches
and cigarette ends

YOU CAN’T BE TOO CAREFUL!

A New Scheme

The solution of the compensation-betterment problem proposed by this group of chartered surveyors is, first, that betterment should only be secured for the community if it is due to rises in values resulting from planning provisions; secondly, that compensation should be paid for worsenment, but again only in so far as it is caused by falls in values resulting from planning provisions; and, thirdly, that the principle should be national in scope, and cover all land and buildings. The scheme rests on a system of five-year plans.

Planning authorities must be required to submit to the Ministry of Town and Country Planning schemes embracing all land (both developed and undeveloped) within a limited period, so that all schemes may come into force together at a fixed date. These should be framed to conform with the central planning authority’s national plan, and should have previously been the subject of a public inquiry. . . . The schemes would become final at the fixed date, but would be subject to periodic review, new plans taking effect simultaneously every five years. . . . On the occasion of a quinquennial plan, whenever the central planning authority wished to claim betterment they would give notice to the owner, stating (a) their estimate of the value of the freehold in possession at the date of the plan; (b) a similar estimate at the date of the previous quinquennial plan; and (c) the proportion of the increase attributable to planning that they claim as betterment.

Worsenment would be claimed on the same basis, and any dispute would be settled by an official arbitrator. There would be no periodic levy on betterment or compensation for worsenment; instead, lump sums would be awarded, but these would not be payable until the increase or loss in value were realised. The scheme is ingenious, and its implications merit careful study in comparison with those of the Uthwatt proposals. But in view of past experience, any attempt at segregating the causes of betterment or worsenment is likely to meet with serious difficulties. What matters most at this stage is that there should be no further delay in the preparation of definite plans enabling the community to dispose of the land in the communal interest. Increasingly it is evident that the delays and complications inherent in any attempt to achieve this end other than by vesting the ownership of land in the community make the thoroughgoing solution by progressive nationalisation, despite its magnitude, appear the most logical and effective way out.

* * *

Poor Man’s Valuer

A new voluntary social service, which has come into being since the war and because of it, is that of poor man’s valuer. It is still in its infancy, but it promises to be a valuable addition to the other agencies for giving advice to persons without means, such as the poor man’s lawyers and the Citizen’s Advice Bureaux. The Poor Man’s Valuer Association for London recently published its second annual report, which tells of its activities in negotiating various claims for damage in 1942-43. It co-operates with the Citizen’s Advice Bureaux, to which the poor in need of advice first seem to apply. The Bureaux are the usual channels of introduction, but cases have also been submitted to the Association by the Army Legal Advice Bureaux, by local authorities and by at least one social settlement. The Association’s membership consists of 458 persons, some of whom are “attendance valuers,” who attend the weekly sessions, and some “advisory valuers” who deal with specially referred cases of exceptional difficulty. Last year, most of the cases dealt with concerned the loss of private chattels, and “several very satisfactory settlements”—in the words of the report—were achieved. Another matter brought to the attention of the Association was the difficulty experienced by persons of small means in arranging for additional repairs to damaged property by private builders after the so-called first-aid treatment carried out by local authorities. The Association has referred the matter to the Ministry of Health, and urged that local authorities should assume the responsibility for extended repairs in all such cases. In this it has the support of other bodies, such as the Chartered Surveyors’ Institution, the Auctioneers and Estate Agents’ Institute of the United Kingdom, and the Incorporated Society of Auctioneers and Landed Property Agents. The work of the Association deserves high praise; it should be a model for similar activities on a national scale.

AMERICAN SURVEY

Shortages in New England

(From a Correspondent in Massachusetts)

Boston, July 19th

NEW ENGLAND, at the end of the transportation line for gasoline, fuel oil and most staple foods, has felt war shortages more than most parts of the United States. The reaction in this region to the shortages, especially of gasoline and meat, and the exploitation of them by the Republican opposition to the Administration, may well prove determining in the alignment for the 1944 election. It is only in relation to the coming election that the onslaught in Congress and in the dominantly Republican Press against the domestic programme of the Administration can be understood. This home-front revolt reached its climax in the effort to kill the subsidy programme for “rolling back” prices.

New England is normally a centre of Republicanism, and its press is wholly Republican. Isolationism is less general than in the Mid-West, but Boston was an isolationist centre until Pearl Harbour, because of the preponderant Irish element. The region has reacted strongly to scarcities, particularly when it has been possible to claim “discrimination” against New England. This is almost always possible because of the transportation problem. Meat has been scarcer here than closer to the producing centres. In July, New England stores had only one-tenth the beef supply of the year before and less than half their normal quantity of all meats. The basic gasoline ration is cut to half that of the central part of the country because no oil pipe-lines serve the north-east sector. And the pinch in fuel oil has been felt most acutely here because of the harsh climate. Last winter was the most severe in many years, though actually the fuel problem was so handled that no suffering resulted.

The various sporadic food shortages have caused inconvenience rather than hunger. But they are without precedent in a country where very recently the central economic problem was surpluses. Both political and business opposition, natively so strong in New England, have exploited to the limit the resentment against shortages. The Administration, preoccupied with the war, has done too little to explain them. The Office of Price Administration, responsible for enforcement of price ceilings and rationing, has become enormously unpopular and has become also a symbol of Federal “encroachment” upon State and individual rights. Local police have often refused co-operation in enforcing gasoline restrictions. In Massachusetts, the State motor vehicle registrar has just refused to police the highways for violations of the Federal motor excise tax.

The regional institution of the New England Governors Conference, meeting quarterly to consider problems of the area, has provided periodic opportunities to organise grievances. Five of the six governors are Republicans, and one of them, Mr Leverett Saltonstall, of Massachusetts, is an aspirant for the Republican nomination for President in 1944. Their recent conferences have regularly drawn up bills of complaint to Washington against an alleged disproportion in the war burdens upon this region. Governor Saltonstall has conspicuously set up his own fuel and food administrator to “see that Massachusetts gets her fair share” of critical commodities. In neighbouring New York State, Governor Thomas E. Dewey, a more likely Presidential nominee, has created even more elaborate State bodies to deal with problems that are inevitably Federal in scope, and their chief product is criticism of the Federal administration. Out of the carefully nurtured disaffection with Federal handling of essential commodities, the Republicans have shaped a campaign against Federal “domination” of the States and Federal “interference” in State and local affairs.

This has its local implications. For it is a position calculated to carry many Irish Democrats along with the normal Republican strength. Their attitude toward the powers of

the Federal Government is essentially the attitude of their co-religionists of Quebec, whose disaffection with the Dominion Government on war issues is greater only in degree and in their greater numerical strength in Canada. The Irish were originally supporters of the Roosevelt Administration, following the big city political machines. But the New Deal has not slowed down its war programme to placate their prejudices—as, for instance, against employment of women or any compulsions on employment.

Consumer Politics

The marked dissatisfaction with domestic policies in this region was dramatically manifest in the opposition to the subsidies programme of the Government, even though this is a region of consumers who are already benefiting from the “roll-back” on meat and butter prices. The failure of the Administration to solidify consumer support for its subsidy programme, so well understood in Canada and Britain as essential for holding down living costs, nearly proved fatal in the last hours of Congress; the programme was finally saved by a single vote in the Senate. The Administration had simply not bothered to educate the public on the issue. That consumers were thoroughly misled by the Opposition press and politicians into blaming Government price controls for the beef shortage was vividly demonstrated as soon as the Subsidies Bill passed. Beef

“Here’s Luck!”

WHITE HORSE

MAXIMUM PRICES: Bottles 25/6;—Half-Bottles 13/6

cattle immediately began appearing in the starved stock markets. The strike of cattle interests had clearly been politically motivated to defeat the subsidies. The powerful farm bloc which has benefited so vastly from farm subsidies for a decade aligned itself with affiliated business interests, partly in furtherance of conservative resistance to further Government regulation of prices and partly as a slap at labour. By delaying the introduction of subsidies until Mr John L. Lewis had made a sharp issue of rising food costs in the coal strike, the Administration made its subsidy programme a target for all anti-labour elements.

The Administration, which began ten years ago as a Farmer-Labour Government, has now lost the support of the dominant farm groups that are most effective in politics. For the 1944 election, it will be thrown back upon the support of labour, unless it can consolidate unorganised consumer interest on its side. The subsidies programme, if successful in holding back living costs, should make a most practical appeal to consumers. But the problem of reaching them, against the screen of a generally hostile press, will take more care than the Administration has been giving to the home front.

The crucial importance of winning consumers to the Administration lies in the effect upon all post-war policy of reactionary elements if they should be in control in Washington after 1944. And the weaker the hold of the Administration, the greater chance the reactionaries will have to name their own kind of candidate for the Republican nomination. These elements have gained new strength in recent months because of the unpopularity and frequent ineptitude of domestic administration, especially where it touches the citizen most closely, through food, fuel and gasoline controls. New Englanders seethe with resentment in this vacation season that they are not allowed to take their automobiles on vacation trips, even though they have saved their gasoline coupons for this purpose. When shortages accompany the introduction of Government controls it is too easy for irritated consumers to accept the criticism that the shortages are artificially induced by "interference with the law of supply and demand." This fits perfectly the campaign of business against Government regulation of any kind at any point.

New England, where shortages have been most severely felt, has proved ripe for such incitement. The Administration failed utterly to explain to consumers the fact that it was subsidising the added cost of hauling coal, oil and gasoline by rail after the submarine cut off tanker and barge shipments, and was diverting thousands of rail cars from other areas to ensure a safe supply for the east coast.

The continued success of military operations will not placate the critics of the Administration on the score of its domestic programme. The fate of the Roosevelt Administration in 1944 will probably be determined by the extent to which it can win back consumer confidence in its handling of the domestic economy this winter.

American Notes

Pie on the Cuff

The campaign for 1944 appears to have begun with the heat which it is anticipated will be its outstanding characteristic. Mr Wallace's Detroit address, and Mr Roosevelt's adroit references in his recent speech to his plans for the protection of demobilised members of the Forces, have already drawn the Republicans. There is no assurance that Roosevelt and Wallace will again be running-mates; indeed it seems unlikely. But to Mr Landon they both represent a policy of "pie on the cuff," which roughly translated means jam on credit—to-morrow. This phrase of the Kansan stylist stands out, though through no great merit of its own, from the wail of vituperation with which the Opposition greeted Mr Roosevelt's announcement that the least the Forces could expect, on demobilisation, was mustering-out pay to cover a reasonable period between discharge and the finding of a new job; unemployment insurance; an opportunity for further education or training at Government expense; credit under the social security laws for the period of their service; sufficient pensions for the disabled; and improved provision for hospital and medical care. This evidence of the President's renewed interest in domestic affairs has been rather wildly interpreted by the Opposition as a "fourth-term bid." Mr Landon's broadcast was aimed primarily at the Wallace plan for a fuller democracy, and at his condemnation of scarcity economics and

"American Fascists," a plea which received less than its due in Mr Landon's characterisation of it as "a preview of an arbitrary bureaucracy under the New Deal gone to seed... resulting in Nazism or Fascism." There was much good sense as well as picturesque phraseology in what Mr Wallace had to say about the slaughter of baby pig iron which accompanied, but received so much less notice, than the slaughter of baby pigs in 1933. Unless the Republican party can produce a more constructive response than squeals of rage it will prove itself bankrupt of ideas.

Super-State

Despite the unpopularity of the State Department with certain groups of American opinion, recent signs have pointed to the growing absorption by Secretary Hull's department of many independent Government agencies acting in the foreign field. There has now been established in the Department, at the President's direction, a new Office of Foreign Economic Co-ordination, "to assist the operations of American civilian agencies in areas liberated from enemy control." Co-ordination of the activities of agencies like Lend-Lease, Foreign Relief, the new Office of Economic Warfare, and the Treasury, War, and Navy Departments will be achieved by OFEC—through two inter-departmental committees, of which the State Department's Mr Dean Acheson will be chairman, and through Area Directors, named by Secretary Hull, who will provide direction and co-ordination to the economic agencies in their respective areas. The individual agencies will continue to conduct their own affairs in liberated territory, but their policy and contacts will be under the single control of the State Department. A more sensational development in the affairs of the Office of War Information suggests that the time may not be far off when that organisation's foreign branch may be brought under the watchful eye of Secretary Hull. Foreign broadcasts by OWI at the time of Mussolini's resignation have caused an outburst of indignation on all sides. The President's public rebuke makes it unlikely that he will go to great lengths to protect OWI from demands for a shake-up; and it is probable that OWI's foreign service may be subjected to day-by-day scrutiny by the State Department, which may argue, with some justification, that irresponsible foreign broadcasts imperil its conduct of foreign affairs.

The Cost of War

The President's interim Budget summary, issued last week, brings up to date the basic figures of the cost of the war—and of the potential inflation. More detailed estimates, both of expenditures and receipts, for the year ended June, 1944, than were possible last January, show that total Federal expenditures will reach \$106,000 million in the coming fiscal half-year, excluding debt retirement and trust fund disbursements, with receipts, under present tax legislation, at only \$38,000 million. Total commitments for the war programme since July, 1940, amount to \$344,000 million, although so far only \$110,000 million were actually spent up to June 30th; and Congress has authorised another \$98,000 million for the coming fiscal year. The public debt, which, excluding the obligations of Government corporations, stood at \$137,000 million on June 20th, is expected to reach \$206,000 million by June 30, 1944. Such expenditures represent, as the President pointed out last January, a national effort of gigantic magnitude. But he was at even greater pains last week to point out that, without appropriate action by Congress, they might have a disastrously disruptive effect upon the home front. His warning took two forms. These gigantic estimates themselves, he said, might prove too small if wages rise or the cost of living is not stabilised, for they are based on current pay and allowances to the Armed Forces and current wage and price levels. In his conclusion, he pointed out that 1944—over twice what they were in fiscal 1940—and with declining stocks and production of civilian goods, price and wage controls would break down unless they were supported by the "truly stiff" programme of additional taxes and savings recommended last January. This called on Congress to produce \$16,000 million of additional revenue. Congress, however, at least before its recess, appeared convinced that taxes have been pushed as high as is politically feasible, and unless its contact with the grass roots produces a change of heart, Mr Roosevelt's arguments are likely to be remembered, not as a prelude to action, but merely as one more signpost on the road to inflation.

THE WORLD OVERSEAS

Adjustments in Hungary

(By a Correspondent)

AMONG the countries dominated by the Axis, Hungary has been particularly susceptible to political trends in Italy. The reaction to the fall of Mussolini seems to have been profound. In spite of the great influence exerted by Germany as well as by Italy, there emerged no totalitarian party in Hungary strong enough to suppress the activities of other parties. Political differences are still aired, and changes in Government and Ministers have been frequent, with a consequent lack of clear direction and powers in Hungary's war economy. There is no doubt that Germany's demands for military support overtaxed the country's strength. The war effort was hampered by the predominantly agricultural character of the country. Hungary's first Five Year Plan, which aimed at greater industrialisation mainly for the sake of rearmament, came to an end in June, 1943. During the five years from June, 1938, to June, 1943, the number of industrial workers increased by almost 100 per cent. Wartime necessities quickened the pace of industrialisation without allowing adequate provision for the reform of Hungary's agriculture.

During the spring of 1943, it became apparent that Hungary's economic situation needed adjusting if a serious deterioration were to be prevented. The first concession was the return of the remnants of the army that had fought in Russia. Yet, after a short time, there was talk about organising and equipping a new army, and it may be assumed that this demanded a drastic overhaul of the war effort. Ever since the beginning of the war, there had been only piecemeal regulations, apart from the general concerted drive against Jews—in agriculture, industry and trade.

During the application of the Five Year Plan, and particularly under war conditions, Hungary's economy developed considerable discrepancies, which found their expression in the growing shortage of agricultural workers, in rising prices and in widespread black market activities. Unemployment virtually disappeared, but the standard of living declined at the same time.

Against this background, the different parties in the semi-parliamentary regime were vocal in discussing all kinds of reform. The prorogation of Parliament for an unspecified time at the beginning of May was due to the need to establish a unified political and economic command. The parties, however, retained their restricted freedom, and the discussion about economic reforms continued.

The Government has now made an attempt to reorganise the control of the country's economy. A comprehensive system of decrees, regulating production, requisitioning, distribution, prices and wages, came into force on July 1st. It is, in effect, an attempt to organise a totalitarian economy centrally directed by a War Technical Committee. Szasz, the Minister for Supply, explained that the "steering of the economy" should not be considered merely as a wartime necessity, but as a permanent principle of economic policy. General economic policy thus shows a very strong German influence. The basis of this policy is the compulsory delivery of agricultural products by a system of fixed quotas. Insufficient deliveries were obviously the main cause of the black market. As compensation for the introduction of compulsory deliveries, agriculture was allowed an increase in wheat prices amounting to 33½ per cent. For three years there had been no change in wheat prices, which are at present exactly 100 per cent above the price of August, 1939. Similar increases have been decreed for all other agricultural products, with the result that new prices had to be fixed for other commodities. The most important increases are as follows:

	Percentage Increases
Bread	28
Sugar	25
Meat and fats	20-40
Milk	30
Industrial articles	30-40

These changes have been called the final measures in the recapture, for the duration of the war, of the harmony in the price system, and they led to a general increase in wages. The wages of workers in the munition industry can be increased by 30 per cent. The money wages of agricultural workers were also raised by 30 per cent, and similar rises were granted to all other categories of wage and salary earners. It seems that these changes have been fixed arbitrarily, because it is impossible to obtain a clear picture of the price level in the country. Black market prices may have given some guidance as well as the official price indices. During 1938-39, the prices indices remained relatively stable, but have risen as follows under war conditions:

		(1929=100)		
		Wholesale Index		Cost of
End of Year	Total	Agriculture	Industry	Living
1938	85.0	72.1	92.6	87.0
1939	89.2	77.8	96.0	87.1
1940	108.7	108.1	108.7	100.1
1941	137.4	129.4	139.6	120.7
1942	159.2	151.8	167.0	131.2

By April, 1943, the wholesale price index had reached 167.6 and the cost of living index 156.9. The new prices will probably bring the index to roughly 200, that is, an increase amounting to more than 100 per cent since the beginning of the war. It will be seen from the table that the main problem has been the so-called price-scissors between agricultural and industrial products. In 1940, agricultural prices advanced to such an extent that the difference diminished considerably, but the scissors opened again, and now another attempt is being made to close them. There is no doubt that the former programme of industrialisation, which aimed at the expansion of heavy industries, and war conditions, leading to a steady decline in the supply of industrial articles, will soon destroy the new and arbitrary price harmony.

Decline in Real Wages

According to the index, wages have kept pace with the increasing cost of living, and it is estimated that, since the beginning of the war, wages have increased on an average by 60 per cent. Even official sources, however, admit that real wages are appreciably lower. This is the result not only of smaller agricultural supplies, because of a series of bad harvests, but also of the inefficient rationing system. Workers in big towns have been told that the increase in the price of bread is really to their advantage because it allows a bigger bread ration—seven ounces per day, against only 5.6 ounces before July. This, it is stated, will put an end to the need to buy additional foodstuffs in the black market.

The so-called reforms do not end with simple price and wage increases. It is the admitted aim of the greater increase in prices to prevent the accumulation of excess purchasing power, and it is bluntly stated, after a long period of steadily declining real wages, that further sacrifices are necessary. At the same time, taxes and excise

THE MINISTER OF FUEL & POWER SPEAKS TO FACTORY MANAGEMENTS

"New battle fronts mean new fuel consumers. We must make even greater economies in the next twelve months. Industry's contribution may well prove decisive because Industry can make the biggest savings."

HERE IS AN INDICATION OF WHAT CAN BE DONE:

THE MANAGER, THE TECHNICIAN and the OPERATIVE are the three partners in the industrial machine. Each is essential to its operation. But the Manager is the driving force; the others cannot act without him. It is he who must start the industrial machine moving. If you have any part in the management of an industrial enterprise, your duty is clear. You must secure the maximum fuel economy by

★ instituting a fuel watcher system.

- ★ overhauling the use of fuel in your works.
- ★ asking for the help of the Ministry's experts.
- ★ arranging for your engineers and operatives to attend the Ministry's lectures and demonstrations.

Write to the Secretary of the Fuel Efficiency Committee in your Region for technical information, for details of fuel courses, or to arrange for the inspection of your works by an expert. All these services are free.

The Ministry's Regional Offices are at:—

READING AND LONDON

ISSUED BY THE MINISTRY OF FUEL & POWER

duties have been considerably raised, and in addition to a rise in passenger rates, the railways have advanced freight rates by 25 per cent. All this is done with the declared purpose of preventing inflation. The actual situation is, however, so confused that at the same time official sources explain that this decreed reduction in the "value of money" will lead to a return into circulation of hidden capital and hoarded banknotes. It would be more appropriate to say that prices are entirely arbitrary without regard to the cost of production. If the economy were organised effectively, if the administration were able to enforce these arbitrary prices, then economic activities could be maintained for some time. Actual conditions are, however, very different. The official price level has been moved nearer the prices of the black market. The greater restrictions placed on political activities consequently led recently to the interesting phenomenon of the political parties, particularly the party of the small holders in agriculture, trying to organise the peasants by rival co-operatives. The Government, on the other hand, is forced to assume direct control of the harvest as well as the threshing of the grain in order to ensure a minimum supply for the towns.

Labour Policy in Palestine

[FROM OUR JERUSALEM CORRESPONDENT]

UNTIL the end of 1940, the Palestine Government's relations with employers and workers were somewhat haphazard and were generally confined to the particular departments which had business contracts with industrial concerns or employed labour on a considerable scale. Labour legislation was limited to the provisions in respect of compensation for industrial accidents, the employment of women and children, the fencing of machinery and sanitation in work places; but these laws were enforced rather indifferently, so that real protection to workers was afforded only by their own organisations. The spectacular development of trade unions in the Jewish community has resulted in the building up of an important system of relations, whether between workers and employers or workers and workers, which, for all its lack of legal sanction, has acquired great force by usage and tradition. At the same time, Arab labour failed to organise, being still for the most part recruited from the fellahen in search of subsidiary sources of income. Wages of Arab workers consequently remained comparatively low and their working conditions primitive. Nevertheless, it was the Arab standard that was accepted by the Government as a basis for wages in public works. And picketing was made an offence in conflicts between workers of different nationality.

With the expansion of local industrial activity in recent years, labour matters increased in importance, and a more active policy became necessary for the maintenance of the war effort. The number of industrial accidents increased rapidly; labour disputes grew in importance from year to year—the man-days lost through them in 1942 were ten times greater than in 1938; the large demand for skilled and semi-skilled workers called for the intensification of vocational training; and Arab industrial labour became a social factor which could no longer be overlooked. A labour adviser was consequently appointed in 1941, and in the following year a special Labour Department was established, whose primary function is to be "the introduction of regular and systematic inspection of all workplaces with a view to establishing healthy and decent conditions and to reducing accidents to a minimum." A former trade union secretary was sent from England "to assist Arab labour groups to organise themselves into properly constituted associations." Under a scheme sponsored by the Labour Commissioner, some hundreds of workers are being trained for industrial jobs. Moreover, by the Trades Disputes Order, official machinery for negotiation and arbitration was established, and stoppage of work was disallowed whenever the Government intervened.

From the 150 labour disputes (with 11,800 workers involved) recorded in 1942, the first year in which the Order was in force, the Government intervened in 47 cases (with 3,110 workers involved). Of these, 28 were illegal under the provisions of the Order, and a few prosecutions took place. Fourteen disputes were passed to the Arbitration Board, while the rest were settled by direct negotiation or by non-official arbitration. In most cases, a compromise settlement was reached, and there are indications that Government intervention is now serving as a brake on trade unions' demands; at the last convention, the council of the Histadruth (General Federation of Jewish Labour) decided to

prolong its co-operation with the Government scheme for another trial period. There are, however, signs of growing opposition; and particular resentment is felt against the "freezing" of labour, engaged in essential departments and plants, which was introduced by the Government in recent months.

Wage Demands

Among the causes of labour disputes during the war years, demands for higher wages and like matters have predominated. This is small wonder in view of the continuous rise in the cost of living, which, as measured by the Jewish Agency's Index, reached 220 in March this year (August, 1939 = 100). Already in December, 1940, when the cost of living index was at 130, an agreement was signed between the Palestine Manufacturers Association and the General Federation of Jewish Labour, providing for an allowance of 20 per cent (in some industries 15 per cent) on all "basic" wages up to £P16 per month. With the subsequent further rise in prices, these allowances were also increased up to 45 per cent in January, 1942, when the index was at 175. Then, however, the War Supply Board, concerned at the effect of these rises in wages on the cost of living and the cost of manufacture, set up a committee to examine the question. As a result of this investigation, it was agreed that the allowance should be equal to 80 per cent of the rise in the cost of living index, and that the "basic" wage should be lowered to £P8.5.

This new system was evidently framed to favour the lower-paid workers, that is, the unskilled and the Arab workers, and by its tendency to equalise the rates of wages it tends to discourage the higher-paid artisans as well as the workers paid at piece rates. It has been calculated that, at the present price level, the loss in real wages is about 11 per cent for an employee receiving £P8.5 per month, but about 31 per cent for one receiving £P16, and the difference tends to increase with every further rise in prices. The discrimination is still greater for the civil employees of the Army, numbering about 50,000, and for the civil servants; both classes are subject to different schemes, in which the maximum amount of allowance is calculated not to exceed £P4.5 per month. The inroads into living standards which have been forced upon Government servants are indeed far too severe.

In view of the widespread dissatisfaction, another Wages Committee was appointed by the High Commissioner. Though a statement was published by the chairman of the War Supply Board, pointing out the dangers of further rises in wages and the threat to the future of industry in Palestine, the Committee's recommendations include some concessions to the workers' demands. They propose to increase the rate of the cost of living allowances on the "basic" £P8.5 per month (340 mils per diem) to 90 per cent of the rise in the index, and to add an allowance, at the rate of 40 per cent of the rise in the index, to wages from £P8.5 to £P10.5 per month (320-420 mils per diem). An alternative scheme of allowances on a family basis is recommended for civil servants, which provides, at the present price level, for a maximum allowance of about £P9-10 per month. The introduction of the new scheme in the Jewish industry will entail an increase of 13 per cent in the wage bill, but the Committee's report urges the Government to take "drastic action of some sort" to stop and to reverse the continued rise in prices. Meanwhile, however, both Government officers and civil employees of the Army are urging that the new allowances schemes should be put into effect and the rise of commodity prices continues unabated.

Foreign Companies in Portugal

[FROM OUR LISBON CORRESPONDENT]

June 30th

ALTHOUGH no new official statement has appeared about the nationalisation of those foreign companies in Portugal engaged in the supply of public services, or which might, under determined circumstances, affect the security of the state, there is reason to believe that this complicated matter has been, unofficially, set aside until a more convenient season. It is pointed out in commercial and industrial circles in Portugal that, even if the urgent necessity for such legislation were accepted, many of the conditions laid down in the finished draft as passed could not be put into practice without

serious harm to the very object the measure was designed to protect, namely, the regular functioning of vital public services in times of emergency or unpredictable difficulties. The tasks confronting the Portuguese Government at this present moment are many, complex, and, in a sense, delicate. Rationing, though not actually in force, is being systematically studied. It will be no easy matter to gather the data necessary to the imposition of a system at once effective in controlling stocks and equitable as regards their distribution irrespective of classes. Thus while the nationalisation scheme may have been launched with the very best intentions, many Portuguese business men feel that the time was ill-chosen and now applaud the obvious intention of the authorities to let sleeping dogs lie.

Post-War Currency

Discussion of the British and American currency plans has been followed intently by Portuguese economists. A recent article in the *Jornal do Comercio* emphasised the importance of many points in both the Keynes and the White proposals which impinge directly upon Portuguese conditions, particularly regarding the linking of foreign exchange and export prices. Until two years ago, Portugal's trade showed a debit balance; the country is the first to admit that the switch-over to a substantial credit is but temporary and due to an abnormal demand for certain export items formerly of little account in the year's balance sheet. Nor will the credit balance last very long should such items return to their pre-war valuation.

All the staple exports of Portugal are in a sense "cheap" goods. For, in normal times, wolfram and tin are negligible in value, while cork, sardines, and olive oil fluctuate considerably both as regards price and world demand. It has been suggested that emigration, fostered with due regard for both the present and future welfare of individuals and families, would in course of time establish a slowly expanding stream of invisible exports. But that is a long-term aid to the solution of what threatens to be a somewhat knotty problem. The present government has consistently lived within its income for seventeen years. Will that task be as easy when receipts are showing a sharp decline, whereas the cost of living is still near peak figures, which are at the very least 50 per cent above those ruling in the years before the world war began?

THE BUSINESS WORLD

Life Assurance

TWO White Papers of major importance to life assurance were published last year. One—the Kennet Report on manpower—dealt with its wartime organisation; and the other—the Beveridge Report on the social services—raised far-reaching post-war issues. On ordinary life insurance the Kennet committee expressed the view that, while it was desirable to maintain facilities for taking out life policies, there did not appear to be any need for special stimuli by advertisement and salesmanship; it recommended the elimination of staff engaged wholly or for a substantial part of their time in the quest for new business. A similar recommendation was made for industrial assurance, but the implications in this case were less severe, because the industrial offices (subject to certain measures for economising manpower and to restrictions on the right to engage new labour) are allowed to maintain substantial staffs of outdoor collectors, who are of course available, incidentally, for getting new business. This difference in treatment is largely inherent in the nature of the two businesses, but involves a measure of discrimination which may well influence somewhat the distribution of new business between the two groups of offices.

Apart from the proposal to nationalise industrial assurance, which Sir William Beveridge made optional, the Beveridge Report contained two recommendations which have been accepted by the Government and will tend to raise the working costs of the industrial offices in the period after the war. The first recommendation is for a universal death grant and will presumably mean the cancella-

tion of a large number of the voluntary funeral benefit policies at present in force, with a consequent spreading of fixed costs over a smaller volume of business. The second recommendation is to abolish the approved society system of National Health Insurance, and unless means can be found of retaining the industrial approved societies as agents, the new scheme will lead to a reduction in collectors' incomes, which the offices will find it necessary to make good in other ways. The consequently increased need for some rationalisation of the industry was discussed in an article in *The Economist* on May 15th.

The industrial offices have been quick to express their sympathy with the general objects of the Beveridge Report, while at the same time maintaining that these objects can be better secured through existing channels than by the creation of new machinery. The bracketed proposal in the Beveridge scheme for a State Board to take over the whole of industrial assurance has not, for the time being at least, been accepted by the Government, so that a further opportunity is given to private enterprise to place its organisation on a more economical basis. The ordinary life offices were not directly interested in the Beveridge proposals, except in so far as the State Board, if approved, would have had power to transact ordinary business for sums assured up to £300. How far both industrial and ordinary offices will be indirectly affected by the increased widows' and old-age pensions is difficult to say; logically these should diminish the need for life and endowment assurance, but in practice they may stimulate interest in the subject of provision for dependants and old-age, since even the increased pensions now envisaged only provide for the minimum needs of the poorest members of the community.

New ordinary life assurance transacted in 1942 showed a further recovery from the very low levels of 1940 and amounted to as much as two-thirds of the pre-war (1938) figure. This overall proportion covered variations according to the type of office organisation. The industrial-cum-ordinary offices, with outdoor collecting staffs, fared better than the ordinary offices, and within the latter group the composite offices, which have needed to maintain adequate branch offices to deal with fire, accident and war damage insurance, have been in a stronger position than the specialist life offices, which have been forced to close some of their branches. As in previous years there were also considerable variations arising from new business policy. Some offices have gone out to attract enquiries by offering to cover civilian war risks without additional premium or by issuing special savings bonds policies; others have considered that the interests of existing policy holders can best be served by discouraging new business so long as the outlook remains uncertain. That a general recovery has occurred in face of a progressive reduction in sales activity is remarkable, and may be ascribed to a number of factors, important among which have been the increasing certainty of an Allied victory in the war and the large volume of purchasing power in the hands of the public. It is believed that the recovery has been continued in the first half of 1943, notwithstanding the implementation of the Kennet Committee's recommendations. The opinion has been expressed that expenditure on life assurance of money which might otherwise find its way into war savings is undesirable. It is true that a large part of the first year premiums is absorbed in expenses; but saving through life assurance has the merit of being automatic and not subject to abrupt termination on the conclusion of hostilities, when the risk of inflation must inevitably be serious. A highly satisfactory feature offsetting the reduction in new business activity in comparison with pre-war totals has been the very low level of surrenders; this is common to both ordinary and industrial assurance and is largely associated with Government measures for meeting the fixed charges of members of the Forces.

The year 1942 also brought a further appreciation in the value of investments held by the offices as security for contracts. Many chairmen were able to point to substant

margins between market and book values, which should prove a valuable buffer against post-war depreciation. As in the earlier war years, all new funds were invested in Government securities and the ratio they bear to total assets rose correspondingly. Mr E. E. Bird, the chairman of the Legal and General, informed shareholders that this ratio, which had been 16 per cent in 1939, became 21 per cent in 1940, 28 per cent in 1941 and 33 per cent in 1942. Disappointment has sometimes been expressed because the addition of Government securities to holdings in any year is less than the annual premium income. This, however, must be so, because the amount available for investment is limited to the addition to funds—roughly equivalent to premiums and interest less claims and expenses—plus the proceeds of repayments and requisitions. In the absence of new premiums substantial disinvestment would take place.

The steadily increasing ratio of Government securities (yielding a net interest return, after deduction of income tax, of less than 2 per cent) to total assets brought to the majority of offices a further decline in the average net rate of interest earned on their funds. An aggravating feature mentioned by one office has been the repayment of loans by borrowers or their replacement by loans bearing lower rates of interest. On the other hand, one or two offices with substantial property investments have been able to show an improvement in yield. The continuous decline in the average net interest rate is a serious matter, for it is now below the rates assumed in calculating premiums on many pre-war contracts. To ease the position, Mr G. F. Hotblack, the chairman of the Atlas, made the original suggestion at the annual meeting that the Government should free income from Government securities from taxation, in so far as they exceed, say, 5 per cent of the life funds; in other words, the Government should make tax-free the income from that part of the offices' funds invested in Government issues which would normally be allocated to higher-yielding investments. An alternative proposition put forward by Mr Hotblack was that the standard rate of income tax for life funds, which was fixed in 1940 at 7s. 6d. in the £, since when the net rate of interest has fallen, should be reduced.

Of the other factors affecting the profit-earning capacity of the offices, mortality from normal causes was again remark-

ably low, both in ordinary and industrial assurance. This favourable experience was in most cases more than offset by the effect of war deaths, and some offices had to record a loss on mortality, but the majority are still able to point to aggregate deaths "within expectation." It will be recalled that nearly all policies issued before the war by the ordinary offices covered war risks; the policies of the industrial offices contained an exclusive clause, but by arrangement with the Government this has been waived. The practice in relation to policies issued since the war varies; some offices cover civilian war risks without extra premium, but the majority charge a moderate addition. The expense ratios of the ordinary offices were again slightly lower than before the war, owing to the reduced new business activity and the lower volume of surrenders; but the ratios of the industrial offices remained high on pre-war standards; the offices are making allowances to members of their regular staffs serving with the Forces and have also to meet the cost of the temporary assistants engaged.

The net effect of these changes has been a substantial and continuous reduction in the earning capacity of the offices, attributable chiefly to the decline in the average net yield on their investments and partly to a loss or diminished profit on mortality—and only slightly modified, in the case of the ordinary offices, by lower expense ratios. This has been reflected in the very much reduced surpluses emerging from valuations, in comparison with the profits in pre-war times. In the circumstances the offices have, in general, refrained from making bonus distributions, and have utilised surpluses to strengthen the valuation bases, or carried them forward undistributed until after the war, safeguarding the interests of claimants meanwhile by paying interim bonuses on death or maturity. Some offices have recently shown a tendency to depart from the stricter standards of the earlier war years and pay moderate reversionary bonuses. But in view of the downward trend in the average yield on investments and the possibility that the offices may yet have to meet serious losses on mortality, the policy of the majority is undoubtedly the sounder—especially as it carries the further justification that an addition to purchasing power remains undesirable in the national interest.

Figures that reflect CONFIDENCE

THE 1942 Report of the Canada Life Assurance Company again shows progress, expressed in terms of increased figures, in all the important aspects of the Company's activities. For ninety-six years this great office has served faithfully an evergrowing section of the community both at Home and Overseas, and to-day it is contributing to the war effort to the fullest possible extent. The following figures are extracted from the 1942 Report, a copy of which will be sent on request.

Total Business in force . . .	£157,106,000
Assets increased to . . .	£60,099,200
New Policies issued for . . .	£9,940,300
Payments to Policy holders . . .	£4,987,200
Surplus Funds & Special Reserves	£2,942,800

Britain's War Debts

THERE is little fear that the task of economic reconstruction after this war will be unduly hampered by a tangle of inter-Allied war debts comparable with that which proved so fruitful a source of economic and political friction after 1918. The devices of Lend-Lease and Mutual Aid are evidence of progress in economic education among the United Nations, and whatever method may be devised for the ultimate settlement of the colossal transactions taking place under these heads, the parties concerned have been assured that it will not be allowed to injure the equilibrium of international trade and payments or the progress of economic recovery. While this may be true of Lend-Lease and Mutual Aid transactions, it must not be forgotten that these do not by any means cover the whole of inter-Allied payments and obligations arising out of the war. It would be dangerously complacent of Great Britain to dismiss the problem of war debts as one of historical and academic interest, for this country has, since the beginning of the war, been in process of building up the largest external debt accumulated by any belligerent—not even excluding Germany and its clearing debts. This debt is made up of the sterling assets which other countries have acquired as a result of their trade and other transactions with the United Kingdom. It represents part of the overseas disinvestment which, in the three years 1940 to 1942, is estimated to have contributed £2,185 million to the sources of British war finance. Part of that disinvestment represents the loss of gold and marketable foreign investments. The part which can properly be described as Britain's war debts is the sterling accumulating here to the credit of the countries to which Britain is for the time being in debt on current account. The bulk of the amount is owed to Empire countries which are in the sterling area, and which therefore follow long-standing precedents in leaving the temporary surpluses of their balances of international payments as balances and short-term assets in London, but which now do so for another reason—namely, that they have no alternative. So far as they can be ascertained, these sterling balances and assets are given below for the latest dates for which relevant figures are available, and this growth is shown by the accompanying chart.

	£000's	Date
India	500,000	July 16, 1943
Eire	121,458	March, 1943
Canada	157,300*	Now
Egypt	71,200	Dec., 1942
Malaya	58,000	July, 1941
Australia	64,000	May 31, 1943
New Zealand	34,000	Feb., 1943
Argentina	17,500	Dec., 1942

*Interest-free loan.

When to these are added the amounts held for various Colonial currency boards, those accumulated in special accounts (other than Argentina, which is included in the tabulation) and those held for countries in the Middle East, the total of such sterling indebtedness easily exceeds the £1,000 million mark. What is more, the total is still growing, and growing faster now that the possibilities for debt repatriation by the countries concerned are nearing exhaustion. The sterling owed to India, which dominates the whole position, increased by £227 million during the twelve months to July 3, 1943, while over the same period long-term Indian sterling debt was repaid to the amount of some £105 million. This brake on the accumulation of sterling resources by India has now been virtually removed, since the repatriation of all but £12,250,000 of the sterling debt has been provided for. Given no alteration in the balance of payments and in the financial agreement between the Indian and UK Governments, these sterling assets piling up to the credit of the Reserve Bank are likely to rise by an annual increment of about £300 million.

It must not be assumed that the whole of this debt which the British Government is accumulating is in a dangerously liquid form, awaiting the first opportunity to make its getaway. For example, the Canadian interest-free loan of £157,300,000 will be treated in the spirit of reasonableness and generosity which has characterised Canada's financial relations with this country. It may well provide the counterpart for a further repatriation of Canadian securities held by British investors. In the case of India, the

total of sterling assets covers, in addition to abnormal balances and investments of the Reserve Bank's banking department, the reserve for its note issue, which is unlikely to be withdrawn. Eire's claims on the United Kingdom also represent in part the reserve for legal tender notes, and for the rest are made up of the excess of the Irish banks' UK assets over UK liabilities. This surplus can hardly be regarded as "bad money" from the UK point of view. Under certain provisions of the new Central Bank Act the Irish banks could be compelled to move part of this surplus to Eire; but this "removal" could hardly take any other form than a simple transfer of ownership of the sterling assets from the commercial banks to the Central Bank. The bulk of the Egyptian sterling assets is also the backing for the note issue. As for Australian and New Zealand sterling assets, their recent growth is a welcome evidence of financial recovery in these two countries, and has merely restored a reasonable reserve of London funds against the inevitable fluctuations of their overseas payments account.

But even when liberal allowance is made for the fact

that some of this sterling debt is of more or less permanent character, enough of it is potentially mobile and straining at least to create a serious problem—one which cannot be left out of account in considering the question of post-war exchange stabilisation. Even the more permanent part of the debt—the currency reserves of India and Egypt, for example—could under easily conceivable circumstances become highly volatile. A financially autonomous India might show a strong and inconvenient preference for gold rather than sterling as backing for the rupee note circulation.

It is admittedly no new thing for the United Kingdom to be a debtor on short-term account to the rest of the world. But in the past such debt has been comfortably covered—indeed submerged—by longer-term investments. That offset will in large measure have disappeared by the end of this war. This novel appearance of Great Britain in the rôle of an uncovered debtor on short-term account will be part of the conjuncture with which the world will be faced at the end of the war, and its implications, however unpleasant, should be faced now. The problem is considered in the British, American and Canadian schemes for post-war exchange reconstruction. Both the Keynes and the White plans propose to deal with this question as a single problem of "abnormal balances" and to provide for its solution by means of their respective international

clearing organisations. The Keynes plan admits that a country in which a large volume of foreign balances has accumulated during the war will not be able to afford the risk of having to redeem these balances in bancor on a substantial scale. At the same time, the plan adds "it is very desirable that the countries owning these balances should be able to regard them as liquid." How are these incompatibles to be wedded? It is suggested that, for a transitional period, such balances should, through the aid of the Clearing Union, remain liquid and convertible into bancor by the creditor country, while there would be no corresponding strain on the bancor resources of the debtor country. Coming from the principal debtor, this is perhaps asking rather a lot. The suggestion is certainly in keeping with the professedly expansionist trend of the Keynes scheme. But more than any other proposal in that scheme, it seems calculated to frighten and deter the likely surplus countries on which the immediate task of liquefying these debts would fall. The White scheme, however, is hardly less helpful to the debtors owing abnormal wartime balances. It goes into much greater detail than the White sweep of the Keynes plan's generalities, but the ultimate effect is the same: the abnormal balances are to be transferred to the Stabilisation Fund and then repurchased—40 per cent by the creditor and 40 per cent by the debtor over a period of 20 years. Both creditor and debtor will pay charges in gold at 1 per cent per annum on the balances still to be repurchased by them. The Canadian experts' proposals are rather less sweeping. They suggest that for two years the Union should have the right to purchase abnormal balances held within its membership in amounts not exceeding 5 per cent of the quotas of all member countries. After two years a more permanent plan for the gradual liquidation of these balances would be introduced.

It may seriously be questioned whether this "global" approach to the problem of abnormal balances—which in substance is the problem of sterling balances—is the correct one. As has already been indicated, these balances are far from homogeneous. Some, such as those held for Australia and New Zealand, even though they may be larger than usual, will in the ordinary course remain here as a sterling reserve against the inevitable fluctuations in those Dominions' balances of overseas payments. Others, such as those held on South American account, especially for countries which have been treating British capital permanently invested in them with some lack of consideration, may come in very useful in debt negotiations with the countries concerned. The debt to Canada is, obviously, in a category apart. So is that with India. It follows from this diversity that the problem of these abnormal sterling

balances could best be tackled by separate agreements with each country concerned. The process might seem less tidy and orderly than that envisaged in the British and American currency schemes, but it would certainly be more realistic.

The dominating issue in the whole problem must be that of India's sterling claims. The generosity of the financial agreement between the two Governments which has led to the present enormous accumulation doubtless reflects credit on British intentions. But its lack of realism is none the less deplorable. Not only has the operation of this agreement revolutionised the debtor-creditor relations of the two countries, but it is bestowing on India one of the most pronounced inflations experienced by any belligerent country. At the rate at which the debt to India is growing it will, within another year, get within sight of £700 million. At the end of the war there may be some scope for its reduction by further transfer to Indian ownership of British capital invested in India. For the rest there will have to be a funding arrangement allowing the British debt to India—a debt largely incurred in the defence of India—to be repaid over a number of years by the only feasible method: an excess of exports to India over imports from that country.

The task which Great Britain will face in settling the debt represented by the accumulation of abnormal sterling balances will be no light one, whatever may be the technical approach to the solution of the problem. It must not be forgotten that in the decade prior to the war the balance of payments of the United Kingdom showed an annual average deficit of £13 million. After the war the country will have been deprived of the greater part of the invisible exports represented by income on overseas investments and by merchanting activities, but for which (other things being equal) the deficit would have averaged some £200 million to £225 million more than it did. If, in those circumstances, Great Britain is called upon to build up annual surpluses to the amount of £50 million or so, required to repay a war debt of £1,000 million over a period of 20 years, the effort which this country will have to put forth will be prodigious. It will call for the allocation of priorities to export industry on a scale which cannot be without effect on the level of domestic consumption. It will also require even stronger insistence than would otherwise be necessary on fair access to the markets of the world—especially of the new creditors—for British exports. If this can be obtained, the overseas claims on Great Britain will be a powerful factor in imposing a "full employment" policy on this country; but it will be full employment on rather tighter belts than those the country would enjoy if there were no war debts to pay off.

Business Notes

Markets Recover

Observers who contended that it was mainly the Wings for Victory campaigns of the first six months of 1943 which were holding stock markets in check can point with some satisfaction to the fact that the first month in which this drain on investible funds has been removed has witnessed one of the sharpest upward movements in equities since the major recovery begun in July, 1940. The success of the initial landings in Sicily, favourable war news from Russia and the Far East, and, even more important, the resignation of Mussolini, have been responsible in a large measure for the recent gains—the arguments which were heard early in July, when the savings campaigns were already concluded, that security prices in many directions adequately discounted post-war prospects, have disappeared now that events in the Mediterranean and elsewhere have brought those prospects appreciably nearer. Market movements in July, 1943, recorded in the monthly chart of *The Financial News* indices, rank with those of November, 1942, and January, 1943, inspired respectively by El Alamein and the North African landings and the Russian successes before Stalingrad. Indeed, the advance in equities on the present occasion has been a good deal more marked—the weekly average of *The Financial News* industrial share index for the last week of July, at 104.2 (July 1, 1935 = 100), is 5½ points higher than the corresponding average for the last week of June, whereas the rise in January was only 3.7 points and in November 2.8 points. At the same time, it would seem that market activity has not on this

occasion equalled that of last November and January. Bargains marked reached their July peak on the 26th at 7,283; on January 11th, 8,323 bargains were marked, and on

FIXED INTEREST AND EQUITY SECURITY MOVEMENTS (July 1, 1935 = 100)

Financial News Indices of 20 fixed-interest securities (converted to new base) and 30 ordinary shares.

November 9, 1942, 9.119. The holidays may explain part of the difference, but it would seem that the withdrawal by the Stock Exchange Committee of the commission concession on "in and out" transactions and the enforcement of the "five-day rule" after the November upswing have had the desired effect.

Buying for Peace

Behind the broad picture of advancing equities and stationary fixed interest securities revealed by *The Financial News* indices, the detailed *Actuaries' Investment Index* figures, made up at July 27, show some sharply divergent trends. In gilt-edged, the sagging tendency in long-dated and irredeemable issues continues. The yield on 2½ per cent Consols, at 3.13 per cent, is now at its highest since June, 1941—the rise has been virtually continuous since February, 1942. Concurrently, the yield on the 159 industrial equities covered by the *Actuaries' Index* has declined from 6.04 per cent in June, 1941, and 5.17 per cent in February, 1942, to 4.36 per cent at the end of last month. The principal rises in ordinary shares during July were seen in post-war recovery issues, as is clear from the usual extract from the indices which appears on page 188. The rises in building material shares, textiles, gas stocks, motors, oil shares and stores and catering issues show, as clearly as the fall in home rail ordinary stocks and the neglected condition of the aircraft and iron and steel markets, the direction of investors' thoughts. These views may pay insufficient attention to post-war problems. But so long as such occurrences as the resumption of interim dividends by the Gas Light and Coke Company and the good Burmah Oil distribution draw attention to the scope for recovery in dividend payments, so long is the investor's appetite likely to remain keen. The extent to which he is willing to discount the future was shown at the beginning of the recovery movement of the middle 'thirties when equities were bought (in October, 1933) to yield 3.45 per cent, when long-dated British Government stocks were yielding 3.48 per cent.

The Circulation

This week's increase in the note circulation—£9,996,000—was smaller than might have been expected, since usually it is the week with Bank Holiday in it, rather than the preceding one, which shows the bigger rise. Nevertheless, it has made the total increase over the Bank Holiday period—£22,123,000—the largest increase for the August Bank Holiday since the war began, the rise for the corresponding two weeks of last year being £18,058,000. In 1940 it was only £6,079,000, but there was no August Bank Holiday that year and ordinary holidays were at a minimum. It is not thought, however, that this year's increase marks the beginning of a fresh long-term rise in the circulation, which, as was pointed out in *The Economist* of July 24th (page 53), has been more stable since the spring of 1943. There are several factors why this year there should be a higher seasonal increase. More people are going away for their summer holidays, as last week-end's queues at the railway stations show. Secondly, many firms and factories are closing altogether for a holiday period, which has meant the payment of two weeks' wages at once. Thirdly, the banks, which have paid in to the Bank of England the notes of large denominations and had allowed their till money to run down to a low level while they were doing so, are now taking steps to replenish it again. In a few weeks' time, the curve in the note circulation should have flattened out again.

Plain Words to Cotton Trade

The speech of Mr E. A. Carpenter, chairman of the Cotton and Rayon Merchants' Association, at its annual meeting on July 30th, was as sensible as it was downright.

I attend many meetings concerned with post-war planning,

ESTABLISHED 1824
SCOTTISH UNION AND NATIONAL
INSURANCE COMPANY
ASSETS EXCEED £18,500,000
FIRE LIFE ACCIDENT MARINE
Edinburgh: 35, St. Andrew Square.

and 46, Pall Mall, S.W.1.

and one senses the tendency to a false feeling of security that the industry (the cotton industry) will have the markets of the world at its feet, and that they will be prepared to accept whatever the industry offers at whatever price. The corollaries of such thinking are fixed prices and an excessive zeal for standardisation. These reflect a shortsightedness as bad as that which characterised our vision after the last war.

Nothing could be more harmful to the cotton industry or, indeed, to the prospects of any industry, than the attitude of mind which Mr Carpenter rightly condemned. If the cotton industry is to prosper after the war it must produce the kind of goods which are wanted, and at prices at which they will be bought. Mr Carpenter was no less forthright in addressing himself to the merchants:

There can be no permanent place in any industry for those who are content to take a "rake off" from it in good times, and leave it to others, whether they be fellow merchants or producers, to weather the less favourable and stormy times.

If the cotton industry, or any other industry, is not to "die comfortably on its feet," it will heed Mr Carpenter's warning.

Transport Workers

The Transport and General Workers' Union is today the biggest trade union in the world, with a membership of nearly 1½ million, of which some 300,000 are women. At its biennial conference in Edinburgh this week, great attention was paid to the problems and needs of women war workers. The union ratified an agreement with the other unions catering for women in engineering (the Amalgamated Engineering Union, the National Union of General and Municipal Workers and the Iron and Steel Trades Confederation). This agreement calls for the strengthening of trade union organisation among women, and regulates their mutual relations, in order to avoid overlapping and "poaching," which has been in danger of developing ever since the AEU admitted women in January of this year. A resolution was carried demanding the application throughout industry of the "rate for the job," and speakers confirmed the impression that this is still a matter of theory rather than practice. It is significant that the Tailors and Garment Workers' Union, at its conference, should have made exactly the same complaint. The decision of the special court of inquiry now investigating a dispute in a Glasgow aircraft factory over this very issue will be awaited with interest, not only by the AEU, which is directly concerned, but by all the unions which cater for men and women. For post-war reconstruction, it is perhaps natural that the present heads of the Transport Workers' Union should adopt their former leader's general philosophy, and the speeches of the President and the Acting General Secretary in many ways echoed the pronouncements of Mr Bevin. The President said that the post-war aims of the working-class should be to ensure, first, fair wages and a decent standard of living, and, secondly, security of employment and maintenance during unemployment. There is nothing very revolutionary about these aims, which are essentially those of gradualism and social reform. Mr Deakin was lukewarm in his attitude to the Beveridge Report, pointing out that Britain could not live by social security alone. The day before at the conference, Mr Bevin had described the plan as "state ambulance work." Unionists of this mould look to get their security by other arrangements; in other words, by direct barter with their employers; and when this is done, the weakest will still go to the wall, if they do not belong to the stronger, more fortunate unions—which is the difference between Sir William Beveridge, on the one hand, and Mr Deakin and Mr Bevin on the other, the difference between the communal and the sectional approach. But whatever reservations the leaders may make, the rank and file are quite definite. The conference passed a resolution accepting the broad principles of the Beveridge Plan, and calling for the establishment of a Ministry of Social Security.

American Ships for Britain

On Tuesday Mr Churchill read a letter in the House of Commons about the transfer of American ships to this country, which he had received from President Roosevelt. President Roosevelt recalls the arrangement whereby each of the two countries was to concentrate on doing the things it was best qualified to do. The shipyards of the United

Kingdom concentrated on the construction of fighting vessels, whereas America became "the merchant shipbuilder for the two of us." The enormous expansion of the American merchant marine tended to outgrow America's ability to man them, whereas the shrinkage in the British merchant fleet had created a pool of "trained seamen and licensed personnel." President Roosevelt points out that in order to avoid the prodigal use of manpower,

I am directing the War Shipping Administration under appropriate bareboat arrangements to transfer to your flag for temporary wartime duty during each of the suggested ten months a minimum of 15 ships. I have, furthermore, suggested to them that this be increased to 20.

Hitherto American-controlled ships have been allocated to this country on a voyage-to-voyage basis. By the new arrangements ships will be temporarily transferred to British control. Similar arrangements are being made by Canada. This temporary transfer to the British flag of 150 to 200 American ships, as Mr Churchill indicated, does not affect the post-war settlement, which is to be discussed "at a future date."

Control of New Issues

The restiveness which has been evident in the City over the control of capital issues during the war has not been lessened by the placing of 24,585 £1 ordinary shares in Arthur Lee and Co., a hitherto privately owned firm of hot and cold rolled steel strip manufacturers. It is not that this issue itself gives any grounds for criticism; what causes resentment is the seeming discrimination between this transaction and other apparently similar projects which have been submitted from time to time to the Capital Issues Committee for its sanction, but which have been turned down by that body. Added to resentment is puzzlement why Treasury consent should have been given to dealings in 24,585 ordinary shares in Arthur Lee, while another 30,000 odd shares in that company, although placed as part and parcel of the same transaction, have not been blessed with official "permission to deal." (In May, 1942, the stock exchanges acceded to the Treasury demand that

no new quotation or permission to deal would be granted except with the Treasury's permission and subject to any conditions the Treasury might impose). In the absence of any official guidance, it is assumed that the hesitations and inconsistencies apparent in the new issue control policy spring from a tardy and inadequate recognition of the power and efficiency of the closed capital market. This view certainly finds support in the history of capital issues control since the outbreak of war. It took over two and a half years to convince the Treasury that high-interest bearing, optionally redeemable municipal stocks could be converted to a lower interest basis, not only without harm, but with positive benefits to the war finance programme. Even then, there was another long delay before Dominion borrowers and public utility undertakings were allowed to rank with municipal debtors, and it was not until May, 1942, that industrial concerns were permitted to reap the benefit of present low money rates. Again, it was not easy to see how the activities of unit trusts in buying and retailing shares (which can in any case be bought quite freely by individual investors) interfered seriously with the war finance programme; yet, in May, 1941, the managements of these trusts were forbidden to create new units. Finally, there have been several cases where permission to deal publicly in the shares of privately owned companies has been refused, presumably on the grounds that subscription by the public to such placings would interfere with subscriptions to war bond issues.

Encouraging "Outside Deals"

It should be unnecessary to stress the fallacy in the belief that change of ownership of existing assets is detrimental to the finance of the war. But on the available evidence there does seem to be a lingering doubt on this point in some quarters. Not only is the belief fallacious, but the present procedure has practical drawbacks. Frequently, a placing of shares in a privately controlled company is conducted primarily to enable the proprietors to raise funds to meet or insure against Estate Duty liability, and without such placings the Revenue may well be the loser. (The odd number of shares involved in the Arthur Lee transaction

suggests that the Capital Issues Committee may now be willing to concede this point.) Possibly more important, the attitude of the authorities is causing business to by-pass the Stock Exchange, where the investor obtains the benefits of that institution's rules and regulations, and is encouraging "outside" dealings—there has been at least one instance recently where privately owned shares have been "placed" without the obtaining of permission to deal on the Stock Exchange. It would, of course, be going too far to suggest, as has been done, that since the Committee appears to be dominated by considerations which were relevant in 1914-18 (when the open-market war loan—as distinct from the present continuous "tap" issue—demanded a clear field in the capital market) it will favour a complete freeing of the capital issues market immediately after this war, as happened in 1919. But it is certainly to be hoped that if post-war industrial development is to be controlled through the capital market, as an alternative, or, more properly, a correlative, to control of raw materials—which will surely be necessary—a somewhat more realistic and intelligent policy than has sometimes been seen in the past will be followed.

Military Lire

Further details have come from Allied Headquarters at Algiers of the currency arrangements for occupied territories, which are having their first test in Sicily. The arrangements are in the hands of a new organisation called the Allied Military Financial Agency (AMFA), which for the time being is operating from Tunis. The most important of the steps taken by AMFA has been the introduction of a new currency, the Allied Military lira (amlira), in occupied Italian territory. The invading Allied troops took with them what is now termed their "spearhead currency," that is, the US yellow sealed dollar bills and the British Military Authority sterling notes. The policy of AMFA is to use this spearhead currency as a temporary makeshift, and, as soon as possible, to make use of the local currency for the purpose of paying troops and of transacting business with the population. Experience gained during the advances through Italian African territories suggested that the enemy would either withdraw or destroy stocks of local lira currency as he retreated from the invaded areas of metropolitan Italy. It was, therefore, decided to prepare substantial stocks of amlira notes. These were printed by the United States Treasury, and have now begun to circulate in Sicily. The new military currency has been given complete equality with Banca d'Italia notes. They have been proclaimed to be full legal tender. Moreover, it has been stated that one of the terms of the financial settlement with Italy will be to compel the note issuing authority in that country to recognise amlira notes as its own liability. It is only reasonable that this should be so, since the new notes merely take the place of those withdrawn from occupied areas by the Italian authorities. AMFA has confirmed the rate of 400 lire to the pound and 100 lire to the dollar at which Italian currency will be exchanged for those of the Allies.

Brazilian Debt Negotiations

The announcement by Lord Bessborough, President of the Council of Foreign Bondholders that that body is in communication with the Brazilian Government, the representatives of bondholders in the USA, and appropriate departments of His Majesty's Government, represents merely a

statement of the obvious—it is precisely these functions which the Council is expected to fulfil. At the same time, the relief which the announcement has caused is a measure of the fears which had been aroused about the impending Brazilian debt settlement—fears which were not lessened by the Companhia America Fabril incident, discussed in *The Economist* of July 17th. The existing Brazilian debt arrangement expires in March next, and Brazil has undertaken to produce a new arrangement by October this year. There has been some apprehension lest Brazil should present its bondholders with a unilateral, cut and dried arrangement, on the "take it or leave it" principle. This apprehension, it now seems, is groundless, for Lord Bessborough specifically stated that the Council of Foreign Bondholders is in communication with the Brazilian Government. Not less important is the need for co-operation with the authorities of the United States, and it is also hoped that the Treasury and the Foreign Office may be willing to do what they can to ensure the best possible terms commensurate with Brazil's capacity to pay. Although Treasury intervention in the America Fabril case was based on a technical point, the contention that such debt settlements must, in the light of Great Britain's reduced foreign investments, be viewed from the national and not merely the sectional aspect is now gaining support.

Clothing Ration Unchanged

The President of the Board of Trade has announced that the clothing ration for the five months, beginning on September 1st will be 20 coupons, the same rate as at present. Supplementary coupons for the new period remain unchanged. The decision not to reduce the ration is surprising, in view of the urgent demand for labour which is apparent in the decision to call up women of 50. Mr Dalton himself has said that one clothing coupon less per head would release 8,000 workers and 5,000 tons of raw materials. Would not this saving contribute more to the winning of the war than the maintenance of the clothing ration? Retailers have relatively ample stocks of clothing, which they are finding difficult to dispose of because of their low quality. A cut in the clothing ration would not have solved this problem, but it would have made the release of shop assistants easier. It may be that the time has come to consider a reduction in the basic ration to enable the aggregate number of coupons issued to be reduced, while maintaining at its present level the total ration of those entitled to supplementary coupons. In other trades, the production of certain non-essential goods is prohibited. There are many garments still for sale, and still being made, can in no sense be considered essential. The production of these could be suspended with no hardship to anyone. The savings in materials and labour could be used to such garments as can justifiably be included in a ration designed for the fifth year of war.

Substitutes for Mica

The introduction last April of a special Mica Control (discussed in *The Economist* on April 24th) suggested that supplies of high-grade mica have become tight enough to justify strict control by a special department. By reason of its non-conductivity and flexibility, mica is an essential material for most electrical appliances, including numerous items of war equipment. During the past few weeks reports have been current, especially in the United States, suggesting that certain synthetic substitutes for mica have been developed, which may substantially improve the supply position of the United Nations. These reports, however, appear to be somewhat premature, for the Mica-Graphite Division of the United States War Production Board has found it necessary to issue a public statement on the position to counteract unfounded hopes of consumers, and especially to prevent a slackening of production in the mica mines of the United States. According to the WPB statement, several promising new materials, each of which has some characteristics similar to those of mica, are in process of development, but it is stressed that none of them possesses the particular combination of characteristics found in mica.

Each of them may, if or when they are fully developed and their use approved and adopted by the Army Services, replace mica to a limited extent in certain applications. But none of these substitutes is as yet in actual production on any scale beyond laboratory work, and further, there has to date been very little actual adoption either by the Armed Services or by prime contractors of components containing any of these new materials as a replacement for mica.

COMPANY MEETINGS

HOME AND COLONIAL STORES, LIMITED

TAXATION POSITION CLARIFIED

EFFECT OF WAR-TIME RESTRICTIONS

SIR GEORGE SCHUSTER'S ANNUAL REVIEW

The forty-eighth ordinary general meeting of the Home and Colonial Stores, Limited, was held on the 6th instant at 179-189 City Road, London, E.C.

The following is the review by the chairman (Sir George Schuster, K.C.S.I., K.C.M.G., C.B.E., M.C., M.P.) which has been circulated with the report and accounts:—

Before reviewing the financial results I must explain the Tax position. Taxation, particularly E.P.T., has figured prominently in my recent annual statements, since our company has been one of the classic cases of severe and, I venture to say, inequitable results. This was of course mainly because in the "standard years" for E.P.T. we were reorganising, and treating profits as secondary consideration, so that a "profit standard" assessment gave us a very bad position. Then when we turned to the alternative of a "capital standard" we found that for special reasons we might fare still worse. The net result appeared to be that, although in 1938 (before our reorganisation had shown its full results) we had in fact earned enough to pay 8 per cent. on the Home and Colonial ordinary capital, E.P.T. would hit us so hard that however much profit we might make, we should be unable even to meet our preference charges without drawing on our carry forward to the extent of about £50,000 annually.

TAXATION BASIS AGREED

We have been continuously pressing the Revenue Authorities to adopt an interpretation of the position which would be less harshly inequitable. As there seemed to be no chance of getting the "profit standard" revised, we concentrated on trying to get a fairer basis agreed for a "capital standard." The main question at issue was whether the Home and Colonial Stores, Limited, could include in the computation of its capital the amount which it had in fact paid for goodwill when it acquired the Lipton and Meadow undertakings. The doubt arose because the goodwill had been acquired from the shareholders, not as a separate item separately paid for, but by paying a premium for their shares. There was the further complication that the Home and Colonial had financed this payment mainly by issuing its own shares at a premium. We have always recognised the difficulty of the Revenue Authorities in such cases and the need for them to satisfy themselves beyond doubt of the bona fides of each transaction; but, knowing the circumstances of our own case we felt confidence in pressing our claim that this goodwill should be included in the computation. We have therefore been extremely gratified that the Authorities have now recognised the substance of our contention and devised a formula which, while safeguarding them against abuse, takes account of cases like ours. This formula does not give us the full measure of our claim, but it does mean that our capital standard will be so assessed as to make our position substantially better. There are many complications and figures have not yet been all agreed, but, in order to prevent further delay, we have made up our accounts for 1942 on estimates which we consider safe. Approximately in round figures we reckon that on the capital standard now to be allowed, the annual group revenue not subject to E.P.T. liability will be about £180,000 higher than would have been the case on the "profit standard" basis

for which we had previously made provision. This extra £180,000 will of course attract Income Tax so that the net improvement can be reckoned as about £90,000 per annum.

PROFIT AND DIVIDEND

Subject to this explanation the best picture of the year's results can be got from the consolidated statement in the directors' report. This shows that for 1942 the total trading profits of the group at £1,037,594 were £221,655 less than for 1941; but that the net taxed profit available for the Home and Colonial Stores' shareholders is increased by £96,500 and amounts to £154,041. Out of this sum, after making the usual allocations and providing £10,000 for War Damage Contribution from revenue, it is possible to pay a dividend of 3 per cent. (less tax) and to add £7,245 to the carry forward.

The improvement in the E.P.T. standard will of course be applicable not only to 1942 but to the earlier years in which the tax has been in force. The effect of this cannot be exactly stated until all figures have been settled, but we have thought it right to state at once that we do not contemplate recommending any retrospective distribution of dividend. We consider that in any case the amounts by which the carry forward has been depleted in the past years (£90,000) should be made good and that any balance should be added to reserves so that we may be in as strong a position as possible to tackle our post-war tasks.

RESTRICTIONS ON TRADE

The decline in trading profits for 1942 is due partly to restrictions in supplies and partly to the operation of factors which I recounted last year. I then explained how war conditions had affected our competitive position as specialists handling a large turnover at a low margin of profit, since Government control of commodities had both reduced our power to offer the public our distinctive advantages as specialists and also operated to limit our scope for reducing costs by combining the various stages of handling goods between the primary producer and the ultimate consumer. Since last year our position has been further affected. Supplies have been still more limited and a number of articles have been put on "points" without any increase in the total number of points allowed. In addition, war conditions have tended to make the public less sensitive to price advantage and less ready to travel any distance from their homes to the main shopping centres. The Government, too, have, for public reasons, advocated the practice of shopping near home and dealing as far as possible for all commodities with one supplier. This is doubtless the right course in the public interest in present conditions; but it has had a definite adverse effect in the trade of our branches. We do not complain of results which are necessary in the public interest, but as it is frequently alleged that large companies have benefited in war conditions at the expense of the individual shopkeeper, I think it important to point out that, according to the experience of our own companies, the reverse must be the case in regard to groceries and provisions. It is regarded quite clear that the small shopkeepers—especially those with shops in residential streets rather than those in the

main shopping centres, and those that stock a variety of articles beyond the ordinary food lines—have been able to secure the registrations of many thousands of customers who formerly dealt largely at the branches of our companies.

SERVICES OF THE STAFF

The total male staff in the branches of our three main companies at the beginning of the war was 9,949. Of these, only 1,585 are still with us. The bulk of those that have left us are of course with the Forces. Many of the female staff, too, whom we recruited and trained at the beginning of the war, have left us for munition work. Nevertheless, in spite of these disturbances and the complications and difficulties caused by Government regulations, transport restrictions, movements of population, blackout and air-raids, we can feel that our staff have carried on splendidly, and have also served the public well.

THE OUTLOOK

We look forward cheerfully to the future when normal conditions are restored. We are confident that our customers who, owing to the special war conditions which I have described, have had to register with other dealers, will return to our branches when they are free to shop where they like and when we can again offer them the special advantages of our organisation and methods of trading. We have learned many lessons during war conditions and are engaged in working out plans for our future organisation which will, we believe, bring still further advantages in the way of improving the quality of our goods, increasing the opportunities for our staff and reducing the cost of distribution.

AMALGAMATED METAL CORPORATION, LIMITED

CURTAILED TRADING

The fourteenth ordinary general meeting of Amalgamated Metal Corporation, Limited, will be held, on the 11th instant, at 95 Gresham Street, London, E.C.

The following is the statement by the chairman, Mr Walter Gardner, circulated with the report and accounts:—

With the object of saving paper and unnecessary travel I am including with the annual report of the directors the very brief remarks I have to make.

Mr Charles V. Sale, who had been ill for some time, found it necessary to retire from the board. The directors greatly regret that he passed away shortly thereafter. Mr Sale was chairman of the Corporation from its inception and rendered the most valuable service. His wise counsel will be greatly missed.

The directors also greatly regret the death of Sir Edward W. Beatty.

At the request of my colleagues I have accepted appointment as chairman of the board, but have asked that this shall be considered as a temporary appointment only.

I have also to announce that Mr A. John Hugh Smith has accepted appointment as chairman of the British Metal Corporation on a similar temporary basis.

The course of the war and the necessary institution of controls have inevitably greatly curtailed the possible fields for trading. First of all the principal base metals came under control and then, on the collapse of France, all business with the Continent ceased entirely. One of our constituent companies was able to continue trading in Eastern produce, chiefly tin and rubber, but with the entry of Japan into the war and the occupation of Malaya and the Netherlands East Indies, such trading has also virtually been brought to a standstill. Tin is now wholly controlled and rubber affords only limited possibilities of earning remuneration. The reduction in both current liabilities and current assets to which allusion was made in the directors' report last year, is inevitably further accentuated in the 1942 accounts.

INDUSTRY AND TRADE

Clothing Coupons.—Between September 1st and February 1, 1944, 20 clothing coupons in the new clothing book will be valid. They are the yellow coupons on Page III marked "Series A," and the green tokens on page V marked W and X, which will be worth one coupon each. The supplementary coupons for children of certain ages and sizes and for industrial workers remain at the same level as in the current rationing period. All children born on or after August 1, 1927, have

ten supplementary coupons, which they will be allowed to use from August 15th. In addition, supplementary coupons are available to certain children as follows: children born between September 1, 1925, and December 31, 1926, ten coupons; those born between January 1, 1927, and December 31, 1929, twenty coupons; those born in or after 1930 who are 5 ft. 3 in. or more in height or weigh 7 st. 12 lb. or more on or before October 31st, an additional twenty coupons.

Dairy and Poultry Mission.—A Joint Anglo-American Mission of technical experts under the auspices of the Combined Food Board has arrived in Argentina to survey the facilities for the production of dairy and poultry products, with special reference to processing and dehydrating. The Mission is interested in the quantities of dried skim milk, butter and dried eggs that might be available to the United Kingdom under proper conditions of price and quality, but the members are not purchasers or negotiators.

Points Banking System.—From the beginning of the third rationing period on September 19th the Ministry of Food proposes to abolish the vouchers at present used by traders under the points scheme and to substitute an accounting system on a credit basis, which for the sake of convenience is being called a points banking system. The new system is not unlike the method used for transferring personal points in the personal catering establishments which will conduct their points banking business in points foods will operate their accounts at the Divisional Food Office. Orders for points foods, except in the case of sales to the public, will be fulfilled without any prior passing of points. At the close of each ration period suppliers will send to their customers accounts for the number of points due on the points foods supplied during that ration period. These accounts will be handed in to the Food Office, and the Food Office will pay to suppliers the points due to them. Each ration period the number of points he may use in that ration period, and he may not use more than these points. The balance of points available for the points coupons he collects, and in the case of a retailer by the value of the points received from Food Offices in payment for goods supplied. The accounts for points due received from who will debit the trader's points balance. At the beginning of possession will be credited to him, and he will also be given an additional credit of points, which in the case of a retailer will be equal to two weeks' turnover in points and in the case of a wholesaler six weeks' turnover in points. The objects of the new points vouchers, to provide greater security, to enable payment to be made for the exact points value of the foods supplied, and to establish satisfactory records of the movements of points at all stages in the chain of distribution.

(Continued on page 189)

GOVERNMENT RETURNS

For the week ended July 31, 1943, total ordinary revenue was £67,571,000, against ordinary expenditure of £109,850,000, and issues to sinking funds of £70,000. Thus, including sinking fund allocations of £3,045,958 the deficit accrued since April 1st is £1,102,994,000, against £973,432,000 for the corresponding period a year ago.

(Continued from page 188)

THE MONEY MARKET.—Conditions in the money market have been much easier this week. This is partly due to Government dividend disbursements at the beginning of the week; another factor is that the discount houses have been taking up a smaller amount of Treasury Bills. The banks' bill purchases have not been large, which reflects the fall in their deposits at the Bank of England. The Bank Return shows that they have fallen by £21,304,000 over the week. This is a far bigger drop than can be accounted for by the week's rise in the note circulation, commented on in a note on page 182, and its counterpart is a drop of £16,285,000 in "other securities."

MONEY RATES, LONDON.—The following rates remained unchanged between July 31st and August 5th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days 1½%; 3 months, 1½%; 4 months, 1½%; 6 months, 1½%; 12 months, 1½%; Treasury Bills: 2 months, 1½%; 3 months, 1½%; Day-to-day money, 1-1½% (July 28, 1-1½%). Short Loans, 1-1½%. Bank deposit rates 1%. Discount deposit at call 1%; at notice 1%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between July 31st and August 5th. (Figures in brackets are par of exchange.)

From Strategy to Politics

THESE last weeks have brought a rip-tide ebb in the military fortunes of the Axis. Catania has fallen. Orel and Bielgorod have fallen. Kharkov is threatened. At home, Hamburg is in ruins and a million Germans are to leave Berlin. The Allies are beginning to reap the harvest of military decisions taken months and years ahead; and the results are not only military. The disappearance of Mussolini was the first sign of havoc on the political front. Even if the rot has not yet spread, it has begun, and the end of Fascism has put an end to the exclusively military phase of this war. The United Nations can now hope to achieve as much by political means as by military attack. The question is whether the political decisions necessary to meet this new phase are in fact being taken.

The parallel with the harvesting of military victory is extremely exact. Wrong decisions, half decisions or no decisions at this stage endanger peace just as bad military preparations, bad training and faulty strategy nearly lost the United Nations their war in 1940—before two of the greatest were even in it. The chief political decisions on which agreement must be reached are fairly obvious. What is the policy of the United Nations towards governments of the Badoglio type, which, having already appeared in Italy, may appear in other satellite countries and even in Germany? Since it is almost certain that these "shadow governments" will

prove to be temporary phenomena, what type of government will the United Nations accept as part of their final settlement? Again, although it is impossible at this stage of hostilities to come to any detailed decisions on the future territorial settlement in Europe, it is essential to agree on the general principles which will govern those decisions. In the wider field of the United Nations, taken as a world-wide confederation, what kind of international institutions—economic and political—are to be built up to express their abiding purpose of working together? Lastly, underlying all local political, economic and territorial arrangements, what general outlook or philosophy of life is to underlie the settlement?

This is the wide range of topics on which some kind of preliminary decision is essential—just as, ten or five or two years ago, decisions had to be taken in the military sphere; or, to give perhaps a closer analogy, decisions on such matters as finance, compensation, industrial location or land policy are needed now on the home front before any more detailed plans of reconstruction can be drawn up. It was difficult to get the necessary military decisions. It is difficult to get the needed decisions in home politics. But in both, it is a question of one of at the most two governments. The outlook for international agreement on political questions is far more delicate. The United Nations—28 of them—have to reach some measure of unity; and within that general

framework three Powers—Britain, the United States and the Soviet Union—have an especial responsibility to act together. This means, in effect, that Mr Churchill, Mr Roosevelt and Marshal Stalin should formulate a common policy. The major decisions rest with them.

What are the signs of an emerging political strategy? At the moment, very few. Of the three leaders, Mr Churchill and Mr Roosevelt have hitherto preferred to think of the war in military terms. Marshal Stalin, on the other hand, is thinking in military and political terms, but it would be difficult to say from external evidence what those political terms may be and whether they are capable of mutual adjustment with American and British ideas. Thus, with two of the great Allied leaders skirting the political problem and the third keeping his own counsel, there does not seem to be any good general ground for hoping that a joint political strategy will be carried out.

The lack of plan is confirmed when one turns to concrete problems. On the British and American side preparations for the reconquest of Europe have been mainly concerned with training British and American officers and civilians for administering the reoccupied territories. There may be agreement between the Foreign Office and the State Department on the procedure to be adopted, first with "pre-surrender" governments of the Badoglio type and later with the governments which will appear after occupation has occurred; but the evidence suggests that little has been done to expand or modify the military approach. On the Russian side tentative organs of political government have been set up, not representing the Russian military authorities but claiming to speak for the peoples themselves. The cleavage between the military and political approach seems absolute. Yet the situation can surely be clarified. The practice of dealing with Fascist or autocratic governments as an incident in a developing military strategy is not unknown at the Kremlin, while, on the longer view, there is nothing in the official line adopted by such bodies as the Union of Polish Patriots or National German Committee to suggest that they will be imposed on the liberated peoples as their future government. The divergence between the Russian and the Anglo-American approach is negative rather than positive. It lies in an apparent failure to agree on methods and areas of occupation, and on procedures for ensuring the emergence of popularly chosen governments. The danger is lest the negative approach of non-agreement should lead, as Europe collapses, to a positive clash of rival practices and ideas. There is, therefore, a most urgent need to reach at least preliminary agreement with Soviet Russia on the main lines of political principle and to associate the Soviet Government with the political agencies which are beginning to emerge. In spite of the usual ignorant clamour that can now be heard *crescendo*, it may be taken for granted that the desire for collaboration with Soviet Russia is nowhere felt more strongly than by the British and American Governments. If three-party integration both of military and of political strategy has not yet come about, the main obstacles are certainly not to be found in London.

The need for a joint approach is equally great on all problems concerned with territorial readjustment. In the last war the principle of self-determination as the norm for deciding what changes were justified was at least clearly established and accepted in advance. The position in this war is much more doubtful. Yet it is obvious that without some preliminary agreement on procedure the frontier problem may, by itself, wreck the peace. It ought to be possible to agree now on the principle that, save in certain cases which may have to be recognised as exceptions and therefore specified in advance, the frontiers of the United Nations as they were in 1937—before the Nazi upheavals—are to be regarded as the basis for discussion and that any changes from those frontiers shall be negotiated, not unilateral.

The outlook for joint agreement in the sphere of international organisation is perhaps more hopeful. Here, at least, a good deal of the preliminary discussions has been carried out in common and the recommendations

so far published bear the signatures of all the United Nations. The Food Conference at Hot Springs established certain agreed principles and made recommendations for some kind of international machinery. The United Nations Relief and Rehabilitation Administration is a joint structure and if it is used imaginatively, both by making full use of such existing instruments as the Combined (i.e. American-British) Boards, and by striking out boldly into such spheres as European transport and public utilities, it can provide the reoccupied areas with a number of functioning economic institutions planned on an international and regional basis, through which the energies of the victors and the liberated peoples can be turned at once to constructive work. At best, however, these are still only possibilities, and too much, in the sphere of economic plans, is still indefinite. For example, no agreed currency plan has yet emerged, and in the field of international capital development, no plans have even been published for discussion.

On the side of international political organisation there is little progress to report. By this stage of the last war, the general outline of the League of Nations had been sketched in, with collective security as its basis. What kind of security system is to underpin the victory of the United Nations? Is there to be any form of international military force? A United Nations General Staff? Regional agreements for pooled defence? Joint bases? International control of strategic points? It may be that more detailed plans have already been worked out on this fundamental problem of security. If so, it would be reassuring to have a hint of them at least as concrete as the reiterated pledge to disarm the aggressors.

Ambiguities shroud the future shape of political collaboration. In his March broadcast, Mr Churchill was at least more specific than the other leaders of the United Nations with his suggestion of continental and regional councils; but semi-official comment in Russia has dismissed some of his proposals under threat of dissolving the Anglo-Russian Treaty—a reaction which does not suggest that the plans outlined by Mr Churchill were drawn up jointly or are, in their present form, particularly acceptable as a basis for further discussion.

There is, finally, the problem of the colour or ideological bias of the Allies' political strategy. In 1918, it was clear, self-confident and remarkably effective. The alternative to the authoritarian regimes was put in terms of full democratic government. The imaginative pull of this ideal was a vital factor in the disintegration of the Central Powers in the summer of 1918. To-day, the people of Italy are showing that, after twenty years of total authoritarianism, the fundamental liberties of a constitutional and democratic way of life have not lost their appeal. Men still want to be free and want it with a passion which may well disconcert the British and Americans who have come to take it for granted. The danger is that the military approach which is still predominant in Britain and the United States may lead to an exaggerated emphasis on "order" and an equally exaggerated tendency to see "anarchy" in any popular civilian expression of the people's revolt against absolutism. Yet if the High Command or the authorities of Amgot use their power to check the expression of popular opinion and have neither the vision—nor the instructions—to canalise it into constitutional channels then undoubtedly the swing away from authoritarianism will carry the peoples of Europe far beyond the central position of a progressive and revitalised democracy. Yet this is the only position which could command both American and Russian support.

The outlook is not encouraging. It is of course possible that out of the joint meetings between Mr Roosevelt and Mr Churchill in Canada, a more positive and vigorous political line will emerge. It is unfortunate that their meeting will not be reinforced by the presence of the great absent and enigmatic third, Marshal Stalin. Yet the eleventh hour is sounding. If the decisions are delayed much longer, will they ever be taken. And if they are not taken, can there be much doubt that confusion, deception and even chaos lie ahead?

The Future of Broadcasting

DURING the debate on the adjournment of the House of Commons last week, the Minister of Information invited "a complete examination of the whole set-up of the BBC," whose charter is approaching its end. Among the subjects that are on the public agenda for reconstruction, there has been little mention of broadcasting. This is strange, for its present state can hardly be left alone. Far-reaching decisions will, in any case, have to be taken when the war is over. Broadcasting's period of early growth and experiment was hardly over by 1939 and the record of the BBC has not been very happy since then. So far as internal organisation is concerned, the BBC has not really settled down since Lord Reith left it. Its relations with the Government, which are not without complications in peacetime, have been frankly difficult in wartime—not necessarily by the fault of either party. And the service rendered to the British listener has not been good.

To these problems, which the war will bequeath for settlement to the peace, there should be added a number of difficult decisions arising out of technical development. How much effort, for example, should be devoted to television? At first sight, it might be supposed that the demand for television, however great the technical improvements that will be possible after the war, will always be less than for audible radio. But radio itself was officially pronounced, only twenty years ago, to have no future except as an enthusiast's fad, and if television were to succeed, for example, in bringing the cinema into the home, there might be an enormous future for it. There is another, even larger, technical problem ahead. It is the opinion of many experts that the broadcasting of the future, certainly in crowded areas like this island, will be brought into the homes of the people by wire, not by radio waves. The basic reason is that the ether is getting too crowded. It is already difficult to find wave lengths for all the programmes that are necessary to give a fully balanced service, and as the development of radio for purposes other than broadcasting continues, it may be necessary to relieve the overcrowding by putting the main programmes on to wires. The capital expenditure would be considerable (though probably much less than the capital that has gone into the telephone network), but the advantage would be great. The listener would get a greater number of programmes without interference. And the ether would be cleared for services which cannot use wires—among which, overseas broadcasting and a general service for remote country districts would have to be included. This possibility is not very generally known, but it has to be taken seriously.

The chief public interest in broadcasting, however, lies not in its technique but in the programmes. The present standard of BBC programmes for the home listener is low. For this it may be unfair to blame the BBC. War limits the wave lengths that can be used and compels a concentration on overseas and propaganda services. The home programmes are starved both of money and of effort. But there are further defects which cannot be explained in this way. Far too much of the output is mediocre (the news bulletins are the chief exception). Few of the comedians are really funny, the average standard of the musical programmes is not high, the talks are almost without exception banal. Partly this is due to mass production, to the difficulty of finding enough to put on the air for seventeen hours a day. This might excuse a low average, but not the absence of anything outstanding. The great vice of the BBC is timidity. The BBC is a monopoly, but it is in the opposite position to the traditional monopolist. It cannot defy the public; just because it is fair game for everybody, it cannot afford to offend anyone. If the churches want more religion, if the Welsh want more Welsh, if the Tories want less Socialism, if the internationalists want more pacifism, if more Russian and less German music is demanded on political grounds, if each of the United Nations has to have an equal measure of broadcast "salutes"—the BBC must listen to them all. It may not be able to gratify their positive wishes, but at least it can avoid offending their mutually offsetting phobias. The only way by which it can give tongue for 120 hours a week (which is one service only) without dangerously offending anyone is to take refuge in timid mediocrity. The BBC, in fact, exhibits all the vices that might be expected from a state-run cultural institution. It should not be blamed; it is doing its best.

This timidity does not emerge solely from the fact that the BBC is a Government body about which questions can (within limits) be asked, and motions made, in the House of Commons. Any monopolist broadcasting body would be in the same position. So long as it cannot, in the last resort, say to its critics "Programmes are a matter of judgment, and if you don't like our judgment, you can listen to somebody else's programmes," it must be a compromising body. Nevertheless, the element of political control, however much diluted, does reinforce this general tendency, and any attempt to increase it would make matters worse. If the BBC were made responsible to the House of Commons, if it were open to criticism by the House on the details of its activities, to which it could reply only through the mouth of a Minister who might, or might not, be sympathetic—in

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

such conditions, its programmes would become even more anodyne than they are.

If the test of a broadcasting system is the excellence of its programmes, the prescription should be not more public control, but less. But this issue is less important than that of monopoly. To continue with the present system would be to condemn broadcasting to the fate that would have attended the press if, from its birth, it had been nationalised, or the stage if there had never been more than two or three state theatres, or art if the only commissions were those to be obtained from public bodies. There will be no excellence without competition.

One preliminary recommendation can be made with some confidence. Foreign broadcasts should be completely separated from the home services. There are two main reasons for this. The first is that all foreign broadcasts have a tincture, large or small, of propaganda. Their purpose may not be to deceive, but it must be to persuade. They may tell the truth, but they can hardly tell all the truth, or emphasise the many-sidedness of truth. But there should be no element of propaganda whatever in the programmes provided for the British public in peacetime, and the only way of making certain of the distinction is to put the two programmes in the hands of separate bodies. (The Empire programmes might possibly remain with the home service, since their purpose is, or should be, information and entertainment, not propaganda.) The second reason is that the home listener's money ought not to be used to support overseas programmes, from which he derives no benefit. Overseas services should be run by a separate body, controlled and wholly financed by the state.

As for the home programmes, the qualities they chiefly lack and most badly need are life and variety. Variety is not met merely by serving up two or more basic programmes each of the same general nature. The listener should have available to him at any time—or at least in the chief listening periods—a choice between programmes of different kinds, so that he can have serious music, dance music, comedians, drama or talks as his taste dictates. An indication of the advantages of such a variety can be shown by the pleasure that it is to thousands of music-lovers to be able to listen to good music every evening during the Promenade Concert season—or, rather, the pleasure that it would be if the programme did not always have to be cut off just before the most interesting item. A varied broadcasting service would aim to provide those listeners whose chief interest is in good music with a programme to meet their taste every night in the year. Newspaper readers are not compelled, even in wartime, to read a single composite sheet, whether their preference is for *The Times* or the *News of the World* and radio listeners should have a similar choice, at least in the main centres of population. The requirement of life, or liveliness, is harder to define, but

no less conspicuously absent at present. Part of the remedy lies in encouraging the growth of personalities on the air, instead of doing everything possible to prevent it. Individual broadcasters should be allowed to do their best to interest, to please, if necessary to annoy—but, above all, to get some positive reaction out of their unseen audience, instead of being neutral voices reading scripts from which anything calculated to offend anybody has been carefully removed.

One obvious question is whether the financing of broadcasting by advertising would achieve these results. The chief example of this system is in the United States, and American broadcasting has much more to be said for it than might be thought on *a priori* grounds. It certainly has life and more variety than the BBC, and the advertiser's influence does not drag the programmes down to the lowest common denominator. But, on analysis, the virtues of American broadcasting are not due to its advertising sponsorship (except perhaps in respect of the ample funds that are thereby made available to the programme-builder) so much as to the fact of competition. The four big networks compete most fiercely and directly for the listener's and the advertiser's favour, and both liveliness and variety are due to that. Competition might achieve them without advertising—advertising without competition certainly would not.

The future basis for British domestic broadcasting should, therefore, be one of licence-financing combined with competition, thus including the best features of both the present British and American systems. If licence revenue alone cannot provide adequate funds, then (and then only) a certain minimum of advertising might perhaps be admitted in off-hours. But the essential thing is to secure competition, which would not only rescue the BBC from its present exposed position and remove the causes of timidity, but compel attention both to life and to variety.

This result would not be difficult to achieve. Let the state own the physical apparatus (whether by radio wave or by wire) and apportion its use to the competing broadcasters on an equitable basis. Let, say, three competing programme companies be chosen. If more than three otherwise qualified groups offer, let there be a competitive bid for the right to use the physical facilities. Let the contract include conditions which would specify the hours of broadcasting and the number and type of separate programmes to be transmitted. Let 25 per cent of each listener's fee go automatically to each of the programme companies. And let each listener, on paying his fee, nominate one of the three companies to receive the final 25 per cent of his fee. These details are, of course, only illustrative of a general principle, by which the interests of the state could be combined with a healthy liberty of development for the youngest art.

The High Cost of Milk

LORD WOOLTON is a popular Minister of Food, and his Ministry has probably received fewer kicks and more bouquets than any other Government department. The organisation and maintenance of food supplies, the rationing system, the priority scheme for mothers and young children, the establishment of British Restaurants—these and other measures have all contributed to the health and morale of the civilian population in wartime. In handling the food problem, the Ministry of Food has relied mainly upon securing the co-operation of the food trades, and its declared policy is "to avoid interference with the normal machinery of food distribution." This policy has its obvious advantages—the wheels of distribution have run smoothly, the men with experience and knowledge of trading have remained in charge. But it has its disadvantages also. Quite apart from the inherent dangers of allowing businessmen to exercise legal powers over the trades in which they them-

selves are interested, it may tend to perpetuate inefficiencies or excessive costs, which the war should have provided an opportunity to reduce.

An outstanding example is the distribution of milk. The organised distributors are pleased with the Government's policy, and with good reason. As the *Financial News* has pointed out, "it leaves the pre-war channels of distribution virtually intact." The producers are not pleased, but with less reason, since the cost of milk is still high—the legacy of the days of the Milk Marketing Board, when the producers were in sole charge and preferred to divert milk to manufacturing purposes rather than let it endanger the high structure of liquid milk prices. The consumers are neither pleased nor displeased, not being organised or vocal, and not having been so fortunate as the producers in enlisting Lord Beaverbrook as their champion.

The high cost of milk, owing to the expensive methods

of distribution and to the wide margin between the farmer's price and the ultimate price to the consumer, has been the subject of criticism by countless commissions and committees. The monotony of their conclusions is depressing. One and all were impressed with the "unnecessary elaboration and waste of effort" and the "excessive cost" of the distributive organisation. But in spite of their recommendations for securing economies, no action was taken either by the Government or by the trade itself. In September, 1940, the Perry Committee confirmed the findings of the pre-war bodies of investigation. It cited the example of certain co-operative societies to show that milk could be distributed cheaply. For instance, the Northern Co-operative Society, in Aberdeen, operated at a cost of less than 6d. per gallon, about half that of the large distributors in London, while four co-operatives in different industrial centres of England had an average cost of 6.85d. per gallon. Although these low margins may be exceptional, they show that there is room for considerable reductions in the cost of distribution, through the adoption of block selling and the elimination of unnecessary "service" competition. Lord Perry suggested that a margin of 8d. per gallon would be adequate; this would cover the costs of processing and bottling, the expenses of administration and selling, and wages, and would allow for a net profit of 1d. per gallon, which rate (according to the Food Council's 1937 report) would "certainly be liberal and probably more than liberal."

Like its predecessors, the Perry Report was relegated to obscurity. The Government, after nine months' delay, decided that "owing to the altered conditions obtaining since the date of the report," it was unable to adopt its proposals. The suggested margin of 8d. a gallon was considered insufficient, in view of the increased costs of operation, and recently the chairman of the Express Dairy Company said that it had been proved to be inadequate to the extent of over 3d. a gallon. Instead, a new scheme was introduced. In May, 1942, the Government issued a memorandum, setting out the proposed arrangements for marketing and retail distribution, and encouraging distributors to prepare rationalisation schemes on a voluntary basis. A cost structure was evolved which came into operation on October 1st, and was to be reviewed every six months. The details of the price structure are somewhat complex, but the salient features of the scheme are that the Ministry of Food has become the sole buyer of milk, utilising the Milk Marketing Board as its financial agent. It pays the producers a flat rate, fixes the basic retailers' margin, provides varying depot allowances and allowances for self-wholesalers (retailers who carry out wholesale services to their own retail branches) which increase with rising turnover. The amounts of the margin and the self-wholesaling allowance have been reduced as a result of the first six-monthly review, as is shown below:

	1st Oct., 1942	1st Apr., 1943
	Per gallon	
Depot allowance.....	1½d.	1½d.
Wholesale margin.....	2d.	2d.
Self-wholesale margin:		
Daily turnover, below 750 gallons.....	3d.	3d.
750-999 gallons.....	1d.	1d.
1,000-1,249 ".....	1½d.	1½d.
1,250-1,499 ".....	1½d.	1½d.
1,500 and over.....	1½d.	1½d.
Retail margin:		
London.....	11d.	10½d.
Provinces.....	10½d.	9½d.

The reductions represent a saving at the rate of £24 million a year and will be used to reduce the Treasury subsidy (amounting to £17 million a year) for the National Milk Scheme and the milk-in-schools scheme.

The present price structure is open to criticism on many grounds. The producers' objections have been strongly expressed both by Lord Beaverbrook and by Sir Thomas Baxter, the Chairman of the Milk Marketing Board. The producers resent the disappearance of the

"level delivery" premiums (i.e., premiums for regularity of supply), which has meant a loss for them of about £200,000 a year. But the fundamental basis of their opposition is that they have been pushed into the background by the distributors, and that the producer-retailers, who number about 60,000 and distribute some 20 per cent of the milk supply, not only receive less favourable treatment than the larger retailers, but are gradually being squeezed out of business.

The disappearance of the multiplicity of small producer-retailers need not in itself be regarded as an unmixed disadvantage. Many of them are of questionable efficiency and, owing to the absence of facilities for pasteurisation, their milk is not always up to the desired standard of cleanliness. But their elimination and the consequent strengthening of the larger distributors is being brought about without any direct benefit accruing to the consumers. The discrimination in the rate of allowance, which rewards the big concern not on the basis of service but on the basis of size, is peculiar. Though the big firms operate in the large cities, where costs might be expected to be higher, it is also true that the economies of large-scale operation apply in the case of milk distribution, where costs can be spread over a larger turnover. One effect of the present scheme is to increase the size of individual businesses, in order to secure the higher margins that result from an extended scale of operations. Another is to lengthen the chain of distribution. More milk is passing through the wholesalers' hands and Sir Thomas Baxter has stated that many retailers are now buying from wholesalers instead of from the farm, as they did before. The co-operative societies, which handle about a third of the nation's milk supply, are in a special position. They obviously benefit from the present high margins, but any advantages they receive thereby are returned to their consumers in the form of dividends.

The arguments of the distributors are that, although their costs have risen enormously since the war, there have been no corresponding increases in their margins, and that the increasing self-wholesaling allowances are in fact justified by the greater expenses of wholesaling for a number of different branches. They point out that considerable savings in manpower, petrol and mileage have resulted from their rationalisation schemes. Indeed, these savings and the reduction in the distributive margins are surely the most complete admission that costs were excessive before, and lead to the conclusion that considerable further reductions could be made. It should be possible to use the savings to reduce the retail price of milk, which has increased by 32 per cent since September, 1939, more than practically any other basic food.

The current controversy about milk distribution is, of course, of very great significance for the future. The representative body of the distributors, the Central Milk Distributive Committee, last week submitted to the Government its policy for the milk industry. The Committee recommends the setting up of a Milk Industry Council, under an independent chairman and vice-chairman, with nominees of the Ministries of Food, Agriculture, Health and the Board of Trade, and representatives of the producers' and distributors' boards. It would be responsible to Parliament for the determination and execution of a national milk policy. It would purchase all the milk from the producers and dispose of it to distributors and manufacturers at prices which would be fixed on the basis of agreed estimates of costs. Prices to the consumer would also be fixed. The Council would deal with marketing control and standards of cleanliness, and it would operate the milk-in-schools scheme and other social service schemes. The statutory producers' board would deal with such matters as the methods of increasing production and quality, and the distributors' board with rationalisation of deliveries and transport arrangements.

The acid test of this scheme must be its probable effect on the consumer. The Committee's statement that the Milk Council would determine such a price structure as would give "a reasonable return to producers, distributors and manufacturers, thus ensuring a fair deal

to the consuming public" (our italics) seems altogether a non-sequitur. If the various sides of the industry can get together and produce a plan which results in the maximum supply of milk of the highest quality at the lowest possible price to the consumer, there can be no complaints. But if the scheme results in the perpetuation of a price structure such as the present one, then it would not be acceptable. It would have all the disadvantages of the old Milk Marketing Board, and more, since the distributors and not the producers alone would be represented. It is argued that the responsibility of the Council to Parliament, and the presence of Ministerial nominees would provide an adequate safeguard for the consumers' interests. Government pressure on trade bodies has not been very effective in the past in reducing the cost of milk, and Members of Parliament would have to develop qualities they have not hitherto possessed if they were to succeed in seeing that producers and distributors did not enforce a price for milk which served their own ends, but was unduly high to the consumer.

The nutritional value of milk does not need to be stressed. It is by far the best single food available, and it is essential for growth and health. Indeed, if the aim of post-war policy is to be to support an increased population at higher standards of living, then the provision of

milk must be the first consideration. The Government are subsidising milk, particularly for mothers, infants and children, and the continuance and extension of this policy after the war was one of the most important recommendations of the Hot Springs Conference. This would probably involve a continued subsidy, and it is right and proper that the state should bear a proportion of the cost of such schemes. But apart from the priority classes, there needs to be a truly enormous increase in the consumption of liquid milk by ordinary consumers. The objective should be the provision of abundant, clean and cheap milk for the consumer. This is really a very simple object of policy, which can hardly be challenged. Yet in the past ten years the state has lent its assistance to schemes which have kept milk off the liquid market, which have steadily raised its price and have made entirely inadequate efforts to ensure its cleanliness. It needs to be said with all due emphasis that further proposals along the familiar lines of organisation of the trade, by the trade, for the trade—whether "the trade" means the producers or the distributors or both—are most unlikely to satisfy the elementary requirements of a rational milk policy and may lead to further back-sliding. There is an urgent need for an entirely fresh approach to a problem which is the touchstone of all nutrition policy.

NOTES OF THE WEEK

Germany at Bay

It is tempting to compare Germany's position in August, 1943, with the state of the Reich in the summer of 1918. On July 16, 1918, Marshal Foch counter-attacked on the Marne, and on August 8th the British launched their offensive at Amiens. These actions proved to be the beginning of the end. They delivered the final blow to an economy which was already breaking under the exhaustion of an all-out war effort and to a morale which the blockade had seriously undermined. That there is an analogy, no one will doubt. The British and American victories in the Mediterranean and the vast Russian counter-offensives might well be the military counterparts of the Allied summer offensive of 1918. The German economy now, as then, is overstrained. Morale is weakening, not so much from blockade as from the far more terrifying weapon of the bomber. There are signs, too, of hesitation and breakdown in the present political leadership in Germany. Hitler fell silent after the disaster of Stalingrad and it was Goebbels' task to take up the propaganda of "total mobilisation." Now in this new series of disasters, Goebbels is silent. He even failed to write his regular article in *Das Reich*. No explanation of the Mussolini debacle has yet been given to the German people, and it is obvious that in recent weeks the Germans, who in the last ten years have been accustomed to having every event interpreted to them, have been left without any sort of clear political guidance. The difficulty is, of course, that the Nazi regime was a success regime and now that the only two alternatives facing the German people are a fairly rapid collapse or a long drawn out phase of defensive warfare, faced with bombing and culminating in defeat, the Nazis have really nothing to say. As the reactions of any nation show in wartime, there is only one good medicine when a people is on the defensive and that is the belief that the hour of the offensive will surely come. It is interesting to notice that the only German spokesman who in the last weeks has given any sort of constructive leadership to the German people is General Dittmar, who has tried to prove that the defensive phase is only temporary, that Russia is more exhausted than Germany, and that the present "lull" is being used to muster overwhelming forces for the final settlement.

Does all this confusion and discouragement amount to an imminent Nazi collapse on Mussolinian lines? It is both difficult and dangerous to prophesy, but the evidence from Germany suggests that the political crisis there is not nearly so highly developed as it was in Italy. The meeting of all the military and civil leaders at Hitler's headquarters is not a parallel of the meeting of the Fascist Grand Council. On the Home Front, the Nazi Party, through its control of the *Gestapo*, is in an infinitely stronger position than the

Fascists ever were. It is significant that the Nazis are preparing the large scale evacuation of big towns and launching a big programme for air raid shelters. This does not suggest a Party which is acquiescing in its own defeat. Moreover, the alternatives to Nazism in Germany are far less clear. There is no king. The rationalisation and control of industry have gone much further. There is no single, influential Church; and the Army, although it is clearly the only immediate alternative source of authority, is itself in rather an equivocal position. If the *Wehrmacht* dropped Hitler as Badoglio dropped the Duce, where would the centre of authority lie? With the Old Guard Generals such as Brauchitsch, Halder, Bock or von Blomberg? Or with the strong and privileged Pretorian Guard of the *Waffen SS*, who are at this moment self-confident enough to be conducting a vigorous recruiting drive all over Europe? In the last analysis, it is only when the conviction of defeat has been fully accepted by Army and Party alike that the manoeuvring will really begin. The German authorities probably do not now expect victory, but they are still unconvinced that the coalition ranged against them can bring them to defeat.

The Russian Offensive

The present Russian offensives are, in a sense, the resumption and continuation of the great winter offensive which came to a standstill in February. The tempo of the Russian advance is perhaps less sweeping now than it was in the winter; but tactically the present Russian achievement is much more remarkable. This time the advance is being pushed home not against an enemy who had overstretched his forces in a reckless offensive, but against very solid and well-prepared defences in depth. In the course of the past week, the Russians have moved forward from Orel along the Orel-Briansk railway, and they have reached Khotinetz, roughly half way to Briansk. In the south the advance has been even more spectacular. Bielgorod is now 50 to 70 miles behind the front, and Kharkov, enveloped from the east, north and west, can be expected to fall in the near future. German reports speak of renewed heavy fighting in the Vyazma sector and on the Donetz. Thus the local offensives on the various sectors are tending to merge into a general offensive along the whole length of the front. The Russians seem to have lost no time in accumulating sufficient reserves for a determined bid to regain Smolensk and the Ukraine east of the Dnieper "before the leaves of autumn fall." The recapture of Kharkov would again place the railways of the eastern Ukraine at the disposal of the Russian High Command, and thus improve their transport facilities for a sustained and decisive offensive. Yet the recapture of Kharkov cannot be properly consolidated before the

Germans have been driven from the Donetz basin. So far reports suggest that the Germans are withdrawing from the Kharkov area, but not from the Donetz. Incidentally, the whole offensive has been powerfully helped by supplies under Lend-Lease. It was announced recently that more than 100,000 lorries have been supplied to the Russian fronts. This amount of motorised equipment would give a high degree of mobility to about 100 divisions, and there can be little doubt that many of the grave transport problems involved in mounting the present offensives have been mitigated, if not overcome, by the use of imported lorries and trucks.

Programme for the TUC

The agenda for next month's meeting of the Trades Union Congress reflects the very great interest which the trade union movement is taking in problems of post-war reconstruction. The Amalgamated Engineering Union has put down a long and comprehensive resolution, based on the decisions of its annual conference, which calls for the intensification of war production. But the main interest of the Congress will be centred upon the resolutions dealing with the future control of industry and the part which the unions can play in the reconstruction of the nation's social and economic life after the war. The Miners' Federation invite the General Council to examine the methods of wartime control, with an eye to the desirability of extending such wartime legislation and regulations as benefit the workers. This resolution strikes at the root of the matter, and it will be interesting to see whether the unions will be prepared to accept continued responsibilities in return for continued benefits, and, if so, which. The demands for nationalisation are worded in an original form. The National Union of Public Employees, believing that "the failure of private enterprise and the proven advantage of State control in the war industries will, if properly explained and portrayed, do much to convince the British people of the desirability of instituting the social ownership of our industry," calls for the formulation of an industrial programme, and suggests a levy of 3d from each of its own members to finance a campaign. The Mental Hospital and Institutional Workers' Union are putting forward a "Home Charter" on the same lines as the Atlantic Charter, which would guarantee to every British citizen the four "decencies" of a job, a home, social security and education. The most controversial topic will, perhaps, be the question of the post-war treatment of enemy peoples. The National Union of General and Municipal Workers declares that the German people cannot escape responsibility for starting the war, and for the army's crimes; it calls for the disarmament and re-education of Germany after the war. If the big unions support this motion, the TUC, like the Labour Party, will be committed to a policy which sounds like undiluted Vansittartism, and may do as much harm in the long run as the "war guilt" clause in the Treaty of Versailles did after the last war. It will be interesting to see what reply the General Council will give this year to the demand that has been made by several unions for a review of trade union structure, so as to avoid overlapping and competition. Last year Sir Walter Citrine rejected a similar proposal from the National Union of Railwaymen, on the ground that it would be impracticable and would interfere unduly with the autonomy of individual unions.

The Older Women

The Government's announcement that there will be no call-up of the women aged 47-50 before the House of Commons reassembles and can discuss it further has had the effect of temporarily silencing the critics. There is no real concession involved. It so happens that arrangements have been made to register the 18 and 19 year olds in August and the 47-50s in September and October; thus the House will have reassembled by the time the latter are summoned for interview, and an early debate on the whole manpower situation has been promised. This will allow Mr Bevin's opponents to air their grievances over a wide field—the basis of the opposition to the mobilisation of the 47-50s is now tending to shift from the hardship that will be caused to the women concerned, and their households, to the waste of manpower and manpower in the Civil Service and to the under-employment of women in the Services. There is a certain amount of substance in these criticisms. The comb has not been fine enough, and in the armed forces the replacement of men by women has

not gone so far as was originally planned, partly, no doubt, owing to the obduracy of local commanding officers. But these are no reasons for exempting any older women who are available for war work. Mobilisation of manpower and the efficient use of manpower are not alternative policies; they are complementary. It has been officially said that most of the 47-50s will be considered immobile, but even within this restriction there is much that they could do to make the manpower, or rather the womanpower, that has already been mobilised more efficient. At present, a vicious circle has been reached. More younger women would be free for part-time work, and more part-time workers could take up full-time work if domestic difficulties such as the care of children could be solved. Yet the very completeness of mobilisation leaves little labour available for staffing day nurseries, for home helps or for keeping such essential services as laundering on an adequate basis. It is for these sort of tasks, which oil the wheels of manpower policy, that the services of the older women are most needed.

Delay in Italy

The Italian situation is confused. At the centre, the Badoglio Government is trying to manoeuvre its way towards a negotiated peace, so that the Italian mainland shall not become a theatre of war. There have been rumoured offers of "strict neutrality," with the Italian mainland as a species of buffer state between Sicily and the Brenner. Unfortunately for Badoglio, there is no offer he can make to the Allies which will not involve him in hostilities with the Germans. If he gives an "unconditional surrender," he evacuates his troops from the Balkans, and throws open Italy's ports and airfields to the British and Americans, the Germans will retaliate in the north of Italy, where they are quite firmly established. If, on the other hand, he does not give an unconditional surrender, the Allies will go on attacking until he does. So far, he has opted for this second alternative, and Allied raids on Italy have started again. It is doubtful whether Badoglio will be in a position to decide on peace or war for very much longer. The x in his complicated equation is the mood of the Italian people, and they are coming out more and more clearly for peace at any price. He has tried to conciliate them with political sopas such as an investigation into the fortunes of Fascist leaders, the reinstatement of the Jews, and the abolition of Fascist education. But the evidence of strikes and riots accumulates. Peace and peace only is the people's aim. It follows that the Allies must do all in their power, by direct propaganda and by their policy towards Sicily, to encourage the forces of popular protest.

Arab Federation?

The Prime Minister of Iraq, General Nuri es Said, has left Cairo after preliminary discussions with the Egyptian

Government on the possibility of an Arab confederation. The talks are described as encouraging and the Egyptian Government hopes to hold a pan-Arab Conference at Cairo at a later stage and carry the discussions out into a wider field. The difficulty facing Arab statesmen is the plain fact that while they have something to unite against—in general the continuance of direct British and French colonial rule and the problem of the Jewish minority in particular—they have nothing to unite for, and possess no positive aims with which to transcend their own local political and economic rivalries. Here the British Government has an undoubted opportunity for creative leadership. Mr Eden has blessed in general terms the idea of an Arab federation, and it is obvious that, both politically and economically, only some larger unit in the Middle East can provide a framework wide enough to permit a proper development of the region's resources and a reconciliation of the various minority interests. The Arab nations, without considerable encouragement, assistance and guidance, are almost certainly not in a position to bring the federation about. The British and the Americans are, however, in the unique position of having already forged an economic and social instrument of unity. The Middle East Supply Centre, if it can develop the positive side of its work through capital investment, technical advice, the fostering of joint projects, the improvement of agriculture and so forth, can cover and provide for a wide range of common economic interests. Under such conditions, a clear lead in the direction of federation from the Great Powers would not run counter to local interests. It would reinforce them. Without a functioning Supply Centre in the Middle East, there is no nexus of interests round which Arab unity can be formed. With it, a scheme of federation is possible and very desirable.

A Canadian Election

The defeat of the Canadian Liberal party in the Ontario elections is possibly the most significant event in the politics of the Dominion since the beginning of the war. There is, it is true, a plausible superficial reason for it. The Liberal Government had been in a precarious position ever since Mr Mitchell Hepburn resigned the Premiership last October. He had split his party by his opposition to the Federal Government—to which, as a Liberal, he should have owed allegiance—throughout his eight years of office, and, without his colourful and dominant personality, the remnants of his Government could hardly hope to survive. But there were also more fundamental factors at work. The Liberal party was defeated because for the first time in recent years there was a prospect of an adequate alternative Government. Mr Mackenzie King's sweeping victory in the Federal Election of 1940 was partly due to the fact that there was no real alternative to his policy—there was little difference, save in name, between Conservatives and Liberals. But, even then, the Co-operative Commonwealth Federation—Canada's Socialist party—was beginning to emerge as a political factor to be reckoned with; and three years of total war, with the emergence of Canada as a first-class industrial power, have strengthened its position. The CCF is not, however, now the only alternative to the Liberals. Mr John Bracken's election as leader of the Conservative party last December, his change of the party's name to Progressive Conservative, and his determination to carry his party along with him on a new programme, whose nature can be inferred from the change of name, may have given the Conservative party a new birth. Its triumph in Ontario is not quite conclusive evidence, since the Conservatives are traditionally strong there. But, nevertheless, it begins to look as if, from now on, the issue in Canadian politics will not be the false one between Liberals and Conservatives, but a straightforward one between Conservatives and the CCF, with the Liberals, unless they, too, can find new leadership and new ideals, withering away. The Ontario elections are indecisive as a first round of the new fight. The Conservatives, with 39 seats, are now the largest single party in the province, having almost doubled their representation, but the CCF now has 34 seats, where it had none before, and the Conservative Government will be dependent on Liberal votes—which it will probably get. What is more interesting, however, is the impetus that the elections in this largest and most powerful province will give to the belief that the end of the Liberals' long tenure of power in Federal politics is approaching. This view has been confirmed by the loss at by-elections of four Federal seats by the

Liberals—two in Quebec to members of smaller parties and two on the prairies to the CCF. The Liberals' only remaining asset is the prestige of Mr Mackenzie King—and that may not last much longer.

The Doctors Reply

The Council of the British Medical Association has submitted for consideration by the local divisions of the Association a statement of the principles which, it considers, should govern the organisation of the health services. Many of these principles will be acceptable to all concerned. That the medical services should be directed towards the achievement of positive health and the prevention of disease, as well as to the relief of sickness; that they should be co-ordinated by the application of a national health service; that the health of the people depends primarily upon their social and environmental conditions; that there should be no economic barriers to impede the utilisation of the medical services; that there should be a reform of medical education, with facilities for post-graduate study—these principles find a place in all official and unofficial pronouncements on the health services. Many people, too, will agree with the principles that free choice of doctor should be preserved, and that "it is not in the public interest that the state should invade the doctor-patient relationship," but that the state should confine itself to the co-ordination of existing services, augmenting them where necessary, and securing that they are available without economic barrier to all who need them. Where there will be controversy is over the principles which the Council of the BMA lays down for the benefit of the doctors: "that the state, while assuming responsibility for the organisation and provision of medical services, should not assume control of doctors rendering individual or personal health service. It is not in the public interest that the state should convert the medical profession into a salaried branch of central or local government service." This is in answer to the Ministry of Health's original proposal to the representative committee that general practice should be based on health centres, run by the local authorities and staffed by doctors working as their whole-time salaried officials.

Whatever the rights or wrongs of the principle, it is difficult not to sympathise with the doctors' reluctance to serve under the local authority. Some local authorities are a by-word among the medical profession for their indifference in respect of those branches of the health services within their jurisdiction. It is hardly surprising that a doctor is unwilling to become the paid servant of a local authority which neglects the environmental factors causing disease among his patients. And even the efficient local authorities interfere quite needlessly with their doctors' treatment of a patient. The question of a doctor's remuneration is more debatable. Some doctors hold that a salaried profession would be bad for the lazy; others that good doctors should be indifferent to the money incentive. From the point of view of the public, however, there is a danger that with a salaried profession it would be impossible to preserve free choice of doctor. If two doctors are working side by side on the same salary, one would hardly be willing to see twice as many patients as the other. In fact, the conclusion seems irresistible that the only way to encourage the efficient doctor and yet remove the economic barriers to treatment is by an extension of national health insurance. That it should include the dependants of the insured, and others of equal economic status, and cover consultant and specialist services and laboratory and hospital facilities, is recommended by the Council of the BMA for immediate application. It also proposes, as an immediate measure, that by arrangement between the Government and the profession organised experiments in group practice, including health centres of different kinds, should be undertaken. Thus, the disagreement between the BMA and the Ministry really boils down to, first, whether the central government or the local authorities should be responsible for the administration, the BMA favouring the former, the Ministry the latter; and, secondly, the remuneration of doctors. Neither obstacle to agreement should be insuperable.

Production Statistics

Some very interesting figures were given by the Minister of Production in reply to questions in the House

of Commons two weeks ago. The first question asked for information on the increase in the volume of munitions production in the United Kingdom since 1940. Mr Lyttelton, in reply, said "the total production of munitions" had risen from 100 in the first half of 1940 to approximately 300 in the first half of 1943. He also stated that the proportion of women employed in the engineering and allied industries has risen from 16.3 per cent in 1940 to 34.6 per cent in 1943. A second question asked for a comparison of the total munitions output of the United Nations and of the Axis powers and their satellites. Mr Lyttelton said that the best estimate he could give was that the total munitions production of the United Nations was, in the second quarter of 1942, little more than twice, and in the second quarter of 1943 more than three times, that of the Axis countries, and that in the same quarter of 1944 it will be more than four times the present Axis output. He added the very interesting estimate that of the present munitions output of the United Nations (including Soviet Russia), the United Kingdom contributes 17 per cent, and the rest of the Commonwealth and Empire about 5 per cent (of which the greater part must come from Canada). He did not give figures for other countries. But there have been statements from American sources that American output per head is now higher than British. If (as is possible) American output is about 60 per cent of the United Nations total, the output of Soviet Russia and the other United Nations comes out at about the same as that of the United Kingdom. All these figures, it must be presumed, are subject to a wide margin of error. But they are valuable as indications of the orders of magnitude involved.

Future of Air Transport

The latest contribution to the rapidly growing literature on the future of air transport comes from a committee of four Conservative Members of Parliament—Mr Ronald Tree, Mr W. R. D. Perkins, Wing-Commander J. A. Cecil Wright and Sir Alfred Beit. While their report contains nothing new, it is a concise formulation of some of the ideas which have found many adherents among business men in this country. On the subject of international relations in the air, the four MPs make three recommendations. First, they advocate an international convention regulating the conditions of air transport. The "right of innocent passage" and of emergency landing should be absolute and universal; the operation of air lines between two points in the same country or between related geographical areas should be a matter of domestic policy; the operation of international air lines between two nations or groups of nations should be arranged on the basis of freedom of entry. Secondly, they recommend the establishment of an international authority for the technical regulation of air navigation, that is, for the formulation of standards of technical practice affecting aircraft, personnel, air ports, navigation. Thirdly, they suggest the adoption of an agreed course of procedure for the promotion of air transport. As a preliminary to translating these three recommendations into practice through international negotiation, the committee emphasises the need for an agreed Empire policy—a need which was also emphasised in a statement issued last week by the Joint Air Transport Committee of the Association of British Chambers of Commerce and the Federation of British Industries. To this end the latest report suggests that the functions of the Air Registration Board should be enlarged and made analogous to those of the US Civil Aeronautics Board, to include the general duties of planning air routes and of hearing and deciding on applications of would-be air line operators. Moreover, it proposes that the Government should invite the Dominions to adopt a similar policy and to join with this country in constituting an Empire Air Board which would represent the British Empire in international discussions and facilitate the development of Empire air transport. Finally, the committee sets out its views on the conditions in which British air lines should be run. It holds that only one air mail contract should be awarded for any one route; that no "chosen instrument" should operate more than one route; that shipping, railway, road transport and other interests should not be debarred from tendering for mail contracts; that, in an emergency, all air lines should be controlled by the Government; and that all flying personnel should be in the Air Force reserve. As an alternative to complete internationalisation (which it is now clear is unattain-

able), the recommendations of the four MPs might form a useful agenda for discussion, possibly by an imperial committee. The final decisions, however, are a matter for international discussion, and care should be taken to avoid any binding commitments within the Commonwealth which might obstruct an international agreement.

New Fire Guard Regulations

The new fire guard orders both tighten up the former regulations and relax them in some respects. The provisions for enrolling men are tighter. The age limit for exemption has been raised from 60 to 63; no woman will be liable for duty at her place of work until every available man is doing 48 hours' duty a month; and men will now be liable for duty anywhere in the local authority area in which their place of work is situated, even if they live in an area where there is no compulsory enrolment. A woman will henceforward be exempt from liability to do fire guard duty at her workplace if she does a minimum number of hours of work there, and, in addition, keeps house for at least one other person besides herself. Economy of manpower will be secured by the extension of schemes for guarding blocks rather than individual buildings, and by making available for local authority requirements the number of people in excess of the "fixed team" required for each business or Government premises. A particularly sensible new provision is the power given to the Minister to allow, in less vulnerable areas and in lull periods, all fire guards on duty to be asleep at the same time. This provision touches on the fringe of what is really the problem of fire guard duty at the present time—the fact that very few of the members of the fire guard believe that they will ever be needed. They know that there has to be an insurance against air-raids, and they are prepared to put up with a certain amount of discomfort once a week in the belief that "it won't be for long now." But anything that the Ministry of Home Security can do to reduce to a minimum the discomfort and inconvenience imposed, while preserving the efficiency of the Fire Guard, will be wise and welcome policy.

Requisitioning of Empty Houses

Although local authorities have long had the power to requisition houses for evacuated and bombed-out families, and for transferred war workers, their authority apparently did not extend to the requisitioning of dwellings to alleviate the hardship of families living in overcrowded or insanitary houses. This anomaly has now been removed. On the recommendation of a conference of local government representatives, Mr Ernest Brown, Minister of Health, has sent a circular to local authorities authorising them to requisition houses, either furnished or unfurnished, "for the purpose of improving the conditions of families at present inadequately housed." It is expected that

the local authority, with their full knowledge of the conditions of their area, will use the wider powers to secure out of the accommodation available the greatest amount of benefit to those in need.

Capitalism, Socialism and Democracy

JOSEPH A. SCHUMPETER

In this brilliant and impartial survey of Capitalism, Socialism and Democracy the author discusses such questions as: Can capitalism survive? What is the relation between democracy and the capitalist order of things? Can socialism work? Is it compatible with what we usually mean by democracy? What form of society is likely to emerge from this war? Certainly this book gets down to essentials and lays a firm groundwork for constructive thinking and planning. 15s. net

GEORGE ALLEN & UNWIN LTD.
40 MUSEUM STREET . LONDON . W.C.1

While there are no statistics showing the number of unoccupied houses, their number must be substantial, especially in the middle-class residential districts in central London. Many of these Victorian houses could be made ready for occupation by one or more families with a minimum of expenditure. Care has been taken to avoid any abuse of the powers now given to local authorities. Before requisitioning, the intention of the owner or tenant is to be ascertained, and he is to be given a reasonable opportunity for letting or re-occupation. Each requisitioning notice must have the approval of the Senior Regional Officer of the Ministry of Health. The rents charged are to be equivalent to those that tenants might reasonably be expected to pay if they had made their own arrangements in the districts concerned. If a local authority incurs an excess of expenditure over receipts, the approved deficiency will rank for reimbursement by the Ministry. The new arrangements for ensuring a better utilisation of the available stock of accommodation are as sensible as they were overdue.

Shorter Notes

The Yugoslav Cabinet of M. Trifunovitch has resigned after six weeks of bitter altercations between the Croats and the Serbs. Reconciliation between the representatives of the two nationalities proved impossible, and now King Peter has appointed a "non-political" Government consisting of officials. The new Prime Minister, Dr Puritch,

Jugoslavia's former Ambassador to France, is a professional diplomat. The only member of the old Cabinet to stay in the new team is the Minister of War, General Mikhailovitch. But his appointment is primarily symbolical, and, in his absence, the Prime Minister himself will act as Minister of War.

The ban on the export of the *Daily Worker* has been lifted.

The Government issued a statement on Wednesday warning the Union of Post Office Workers, and any other Civil Service union which became affiliated to the TUC, that their members would be disqualified from the Civil Service, that is, they would lose their establishment and pension rights. A special meeting of the TUC General Council and the Executives of the Labour Party and the Parliamentary Party will be held next week to consider the situation, which is both critical and embarrassing, not least to the Labour Ministers.

As a consequence partly of an official Norwegian protest on July 15th, partly of the general change in the outlook of the war, the Swedish Government has cancelled the agreement with Germany, concluded in 1940, which empowered the Germans to make use of the Swedish railways in sending troops and supplies to and from Norway.

Letter to the Editor

International Wheat Agreement

TO THE EDITOR OF THE ECONOMIST

SIR,—The leading article in your May 8th issue entitled "A Hungry World" contained inaccuracies regarding the International Wheat Agreement which I would be grateful if you would correct.

1. You state that "... it is difficult to understand how British signatures came to be put to a document, even as a draft, committing the British Government to the maintenance of prices in the fixing of which it could be outvoted by the producers."

Paragraph 7 of the Memorandum of Agreement states that "in taking any decisions under this Memorandum and the arrangements of the Draft Convention which it brings into operation each of the five countries will have one vote and a two-thirds majority will be required for decision except as otherwise provided herein." The exception referred to is embodied in Paragraph 6 of the Memorandum: "The determination of prices required to be made in accordance with those arrangements" (i.e. the provisions of Article V of the Draft Convention) "will be made by unanimous consent."

The Washington Wheat Meeting considered various suggestions regarding provisions for voting. All shared the view that the same number of votes should be given to the importing countries as a group as was given to the exporting countries as a group. The decision taken was that the Draft Convention should contain no provisions for voting, as those to be included in the comprehensive international wheat agreement would be decided by the proposed fully representative international wheat conference.

2. You quote with approval a statement by the Food Research Institute that "... the Draft Convention for wheat ... is conceived in a restrictive spirit that is persistent and powerful. ..."

It would be difficult to substantiate this statement in the light of the voting provisions and the following additional facts:—

(a) The Agreement envisages an August 1st "ever-normal granary" in the four chief exporting countries of not less than 367 million and not more than 962 million bushels. In none of the 17 crop-years prior to the present war did the prospective August 1st carryover in these four countries reach anything like the maximum allowed under the Agreement; the nearest approaches were 730 million bushels in 1932-33 and 679 million bushels in 1933-34. In eight of the 17 crop-years prior to the

present war the prospective August 1st carryover in the four principal exporting countries fell below the minimum required by the Agreement.

(b) Under the provisions of the Agreement, the export quotas are automatically increased by whatever quantity the Council may decide to increase its estimate of prospective international trade in wheat and flour. Moreover, the Council is free to allocate to other countries any part of any country's export quota which the Council considers unlikely to be exported.

3. You state that "the price that the 'Big Four' producers wanted in 1939 to stabilise, with British assistance, was no less than 46 per cent above the open market price."

The draft international wheat agreement circulated to governments in February, 1939, by the Preparatory Committee (comprising the representatives of the governments of ten countries, including that of the United Kingdom) tentatively suggested a basic minimum price of 33s. 6d. per 480 lb. quarter for No. 3 Manitoba Northern c.i.f. London.

A revised draft drawn up by the Preparatory Committee in April, 1939, suggested a basic minimum price formula which represented at that time a price of about 31s. 5d. as compared with the August-March, 1938-39, actual price of 23s. 9d. per 480 lb. quarter c.i.f. UK ports—an increase of about 32 per cent.

The difference between 32 per cent and your figure of 46 per cent is significant, but, as I do not know the basis of your calculation, I do not wish to make an issue of the difference. The point I wish to stress is that "the open market price" upon which you base your comparison is not a representative price.

In an analysis of the price provisions of the Wheat Agreement in your issue of July 11, 1942, you stated: "The proper principle is plain enough. No control scheme must make the average price of wheat over a stretch of years, taking in a period of boom and a period of slump, any higher than it would have been in the absence of control."

During the 17 crop-years (August-July) prior to 1939-40 the price of imported wheat in the United Kingdom varied from minima of 22s. 4d. and 23s. 9d. respectively in the slump years 1933-34 and 1938-39 to a maximum of 62s. 8d. in the boom year 1924-25—the average during the seventeen-year period being 38s. 7d. c.i.f. per 480 lb. quarter. The comparable basic minimum price suggested by the Preparatory Committee in April, 1939, was 31s. 5d.—81 per cent of the average market price during the seventeen crop-years prior to the present war.—Yours faithfully,

A. CAIRNS.

International Wheat Council, Washington,
June 30, 1943.

AMERICAN SURVEY

Congress Adjourned

[FROM A CORRESPONDENT IN GEORGIA]

Atlanta, July 12th

AMERICANS have been suffering from a politico-emotional upset, due in part to the fact that displeased men are relatively noisy. Over a stretch of months Washington has been hearing, mainly, the voices of the angry, the disappointed and the confused; and Washington became a sounding-board for those voices. Thus, displeased Americans have influenced our representatives, and our representatives, by re-broadcasting what they believe to be the voices of the whole people, have influenced the rest of us. This situation has created an appearance that is more discouraging than basic facts justify.

A brief, cool analysis of the American political scene, as presented on front pages, will add to one's understanding.

The Congress has been in session a long time and has fought many hot legislative battles preceding America's active participation in war, and since. Members of the Congress are weary. They have not had their normal contacts with normal life at home. Because of their preoccupation with great tasks, and their exposure to pressure groups and to pressing individuals, some of them have been unable to appraise the home front accurately. Only occasionally have our national legislators had a few days off, and in the course of those days they have been rushed by home folks wanting jobs, wanting public projects, wanting changes in the operations of war agencies, wanting everything. They heard from and met only part of the public, but it seemed to them they had heard from and met all of the public—and that the public was deeply displeased.

An examination of congressional mail discloses the situation. Hundreds of thousands of tenants have been protected, by Government action, from rising rents, but no tenant writes to his Congressman to thank him for this protection. Landlords, who believe they have been unjustly handled, do the writing. Men who receive gasoline rations sufficient to carry on say nothing; but many men whose driving is severely restricted say much.

All this is natural. The man who has what he wants, who believes conditions are fair enough, goes on his way with no thought of thanking his representative; but the man who wants what he does not have, who believes he is unjustly treated, says plenty. This normal manifestation of human nature, and of liberty, is fundamentally good, though temporarily it may be disturbing in its apparent consequences. Immediate, superficial judgments often are insubstantially supported by *ex parte* showings.

But the representative's attitude is understandable. He has been away from home, overworking in Washington. He has received scores, hundreds, perhaps thousands, of letters from home, and these letters have presented the viewpoint of the men who are not getting what they want and what they believe themselves entitled to. Inevitably a man away from home who hears the same story from many sources believes it. And the story may be true. But it is not necessarily true. It may be, and probably it is, incomplete.

Most Americans were prepared, at the outset of war, to suffer seriously. Generally, it was conceded that "this war is different," that "this time people will not make money out of war," that "casualties will be enormous." But great suffering has not yet come to Americans as a whole. Money is being made out of war. Therefore, grim, quiet, united determination is not as evident as it would be if the war were harder, and as it will be if the war becomes harder. In these circumstances, men react to annoyances as if they were sacrifices. Human nature again.

But this brief analysis should not be interpreted to mean that any one believes all is sweetness and light on the political and economic front at home. It is presented merely as a balancing viewpoint, to be set against the disturbed viewpoint generally presented. It is a kind of cartoon essay; and a cartoon, as everyone knows, presents only one facet of fact or belief.

American Notes

The Arsenal Complete

Mr Nelson reported last week the completion of 82.5 per cent of the \$14½ billion Government-financed war facilities programme, and 90 per cent of the \$4½ billion privately financed expansion. The arsenal's plant is very nearly complete. The most striking gains have been made in the construction of plants to produce raw materials, which earlier were showing disastrous tendencies to fall behind the munitions facilities. The reallocation of materials, which was the subject of so much public rancour at the beginning of the year, has justified itself. The progress in synthetic rubber facilities is particularly striking; a year ago they were 3 per cent complete; at the beginning of this year the proportion had risen to 15 per cent, but at the end of June it had reached 61 per cent. Plants producing high octane gasoline have advanced from being 1 per cent complete at the beginning of the year to 39 per cent finished on July 1st, and the privately financed expansion was 63 per cent complete. Similarly encouraging figures come from the iron and steel expansion programme, and the chemical industry. As Mr Nelson pointed out, the decline in the volume of construction releases a corresponding number of men and amounts of materials for direct production of munitions. It is perhaps for this reason that so much disappointment emanates from official circles over the failure of war production to reach the monthly goals set for 1943. Mr Nelson has called for a supercharged effort to increase production 30 per cent a month for the remainder of the year. Extraordinary efforts will be necessary to push the totals higher; and the wave of belief that the end of the war is now in sight threatens to remove the stimulus of urgency.

Calling Up Father

The political resistance to the Administration's long-delayed decision to make available to call-up for the Services the 7,000,000 men between the ages of 18 and 37 deferred because they had children born before September 5, 1942, illustrates only too well the difficulties of putting into operation an effective control of man-power. Mr McNutt's directive to Selective Service boards to start reclassifying these men, who are now in class IIIA, was hedged about with provisions to minimise hardship. Fathers whose induction would cause extreme privation were to continue to be deferred. All other available manpower was to be exhausted before the nation's fathers were drafted. Under the Servicemen's Dependents Act of 1902, allotments and allowances amount to \$50 a month for a dependent wife, \$62 a month for wife and child, and \$10 additional for each other child. Nevertheless the resistance from public opinion, as expressed in the conservative press, and from the draft boards themselves, has been so strong that another month's delay is said to have been granted. According to General Hershey, probably less than 2,000,000 of these men would pass the physical requirements of the Services, and at least that number is needed by the Forces during the next year. Industrial manpower in certain spots—for example aircraft factories—is becoming so strained that Mr Bernard Baruch has been called in by the War Mobilisation Board to make a special survey of the problem. According to the Board, at least another 58,000 workers are needed every month for aircraft manufacture alone during the next year. It is plain that with the increasing stringency the emotions connected with the preservation of the family, not to mention its vote-getting appeal, will have to go by the board. But their persistence into this stage of the war shows only too clearly what a hornets' nest the Administration would have about its ears if it attempted to institute a genuinely compulsory National Service Act. The difficulties and dangers of its administration in a country the size of the United States would be great, but before

it ever reached the operational stage the opposition could be counted upon to exploit it as the last step toward domestic tyranny. Nor would the opposition be deterred by the reflection that, in Britain, it is not the fathers in their 20s (who were called up years ago) but women in their late 40s, whose mobilisation is causing concern.

Willkie at Work

Mr Willkie's indefatigable labours in the field are impressing many observers in the United States. At his home in Indiana he is holding a continuing stream of interviews with pro-Willkie Republicans, and he has even gone so far as to intimate the conditions under which he would be willing to assume for a second time the Republican nomination. One of these is the adoption by the party of a liberal and constructive programme, both for domestic and foreign affairs, and a purge of the Isolationists and die-hards; another is the holding of the party convention in Cleveland, rather than Chicago, which is so closely identified with the Isolationist wing of the party. The popularity of Mr Willkie's principles outside the ranks of the machine has been strikingly proved by the sales of his book, "One World." Whether it is a political asset or not, he has recently secured an amazing degree of commendation from the left-wing press. As things are now moving, it may not be impossible for Mr Willkie to scoop up much of the radical support which has recently lost faith in the President. That this will be sufficient recompense for a failure to conciliate the party machine is unlikely, but it looks as though by hard work Mr Willkie were hoping once more to swamp the Old Guard. That a repetition of his former

success would constitute a kind of minor political miracle does not necessarily rule it out.

Guns on the Right

Suggestions that the State Department is in a parlous way now that its left-wing critics have been reinforced by the heavy guns of the *New York Times* and *Fortune* need not be taken too seriously. Last week the former, formerly one of the staunchest supporters of the State Department and its French policy, underwent a belated conversion, and published a severe dispatch from a Washington correspondent charging the department with internal dissension, the lack of any coherent policy, and consequent inefficiency at a time when new burdens were daily being thrust upon it. These charges are not new; they have been the theme of the left-wing press for a long time. The only surprise is their source. But even the disfavour of the *New York Times* is unlikely to perturb the State Department. The truth is that, despite the rising chorus of criticism, the department has never been more powerful or influential. To begin with, it is one of the permanent and abiding institutions of government, unlike the majority of agencies which have been established to meet specific emergencies. It is the only organised repository of experience in the sphere of foreign relations, which is growing daily in importance in American affairs. And despite its less than perfect public relations, the conservatism of the State Department is in tune with the swing to the right which undoubtedly characterises the American political scene. Mr Hull may be ready to fight back, but it is hardly necessary at the moment.

THE WORLD OVERSEAS

Who are the Canadians?

(From Our Ottawa Correspondent)

THE population of Canada, which has been recently indexed and analysed in reports based upon the 1941 census, has become older, more mature and more closely attached to its own country than ever before. From these facts important influences upon future Canadian policy may be expected. To understand Canada one needs to know who the Canadians are.

The population of Canada is 11,506,655, as counted on June 2, 1941. In ten years the population had grown slightly more than one million, and this rate of growth was the most moderate in the country's history. Since 1867, Canada has taken eight complete censuses, and the latest was the first in which persons of British Isles origin have not been in a majority. The population is 49.7 per cent of British Isles origin, 28.2 per cent of French origin, and 17.8 per cent other Europeans. Scattered minorities of Asiatics, Indians and Eskimos account for the remainder.

In 1931, 51.9 per cent of all Canadians were of British stock. The fact that the percentage has now dropped below the half-way mark is probably of great importance in the development of Canadian viewpoints. The element of filial affinity with England and Scotland, not to mention Wales and Ireland, is a diminishing factor in Canadian life. But

it is notable that the spiritual allegiance to British traditions has in no way declined. In the last war, one way of accounting for the response made by Canadians to recruiting was to point out that a majority of the population had been born in the United Kingdom or were of recent descent from British stock. In this war, the predominant factor in an even greater response has been a sense of peril to Canada and of identity of interests with Britain and other allies.

Few countries have a less homogeneous population than Canada, and in the distribution of racial strains in different parts of Canada less uniformity could hardly be imagined. Prince Edward Island is 83 per cent of British stock, and Quebec is 81 per cent French. The biggest province, Ontario, is 72 per cent of British Isles origin. On the prairies, Manitoba is 49 per cent of British stock, Saskatchewan is 44 per cent and Alberta is 50 per cent. European racial strains, omitting United Kingdom and French, account for 47 per cent of the population of Saskatchewan, 41 per cent of the population of Alberta and 40 per cent of Manitoba.

The relative number of persons of French origin has increased slowly in all provinces. In the western provinces and in Ontario, similar increases have been reported in other European strains. In Canada as a whole, persons of British Isles origin increased from 5,381,071 to 5,715,904, or by 6.2 per cent, in the last decade. In comparison, the rate of increase of French population has been 11.9 per cent, from 2,927,990 to 3,483,038, in the past ten years. The population of Quebec is 3,319,000 persons, of whom 2,689,000 are of French origin. The traditional British character of Ontario is changing under an influx of French people and of other European stocks.

Possibly a more significant fact than the racial origins of Canadians is the fact that 82.5 per cent of them were born in Canada. The great migrations of the early years of the century are over, though there may be migrations again. But, meanwhile, the census shows that four out of five of Canadians were born in Canada and naturally regard Canada as their home. Their spiritual affinities with any other country must be declining progressively. In the 1931

census the proportion of Canadian-born was 77.8 per cent. In Canada now there are 1,003,171 persons who were born in other British countries and 312,472 persons born in the United States. The preponderance of the population born in Canada explains the change that has been occurring in the nature of Canadian nationalism. No longer does nationalism in Canada mean a form of isolationist French-Canadian sentiment. The most ardent Canadians are not the French-Canadians alone, but the generation, which, of course, includes French-speaking Canadians, that has grown up with no other allegiances than Canada.

Decline of the Frontier

Another fact emerging from the census compilations indicates that the Canadian population has begun to settle down and may be expected to develop strong local attachments. The turmoil of the frontier, attracting population from all other regions of Canada as well as from other countries, is no longer the disturbing influence it was. It may find a revival in the new north-west now opening up, but the frontier as a factor in Canadian life is declining rapidly. The 1941 census showed that 72 per cent of the population of the country had always resided in the province in which it was registered for the census. In the eastern provinces, of course, the proportion of people reporting continuous residence was higher than in the west. In Quebec, it was 88 per cent. In Ontario, it was 72 per cent. In Manitoba and Saskatchewan, it was 60 per cent, and in Alberta it was 50 per cent. In British Columbia, only 38 per cent of the population had reported continuous residence there.

The rural element of the Canadian population has declined both absolutely and proportionately in the past ten years, a fact that will undoubtedly influence national policy in due course. In 1931, the rural population was 3,289,140, and this was 31.7 per cent of the whole population. In 1941, the rural population was 3,163,268, and this was 27.5 per cent. Some racial elements are almost entirely urban, such as the small Italian, Jewish and Chinese elements of population. About two-thirds of the German, Netherlands, Russian, Scandinavian and Ukrainian populations of Canada are rural, but in two cases these groups have begun to develop a trend to urban localities. Russians and Ukrainians are steadily leaving the land for city life, and nearly 40 per cent of each group now lives in urban localities.

In 1931, only 38 per cent of the Canadian population was enumerated as married, but in 1941 the proportion had risen to 41 per cent. This was due mainly to the changing age structure of the population. The number of widows in Canada was 525,121 in 1941, an increase of 20 per cent in a decade. Among the provinces, Quebec showed the largest proportionate number of single persons. In Quebec only 35.7 per cent of the population was married. Out on the west coast, 47.8 per cent of the population was married, and this was the highest proportion in any province.

The age structure has shown some significant changes. In 1941, children and young persons under 20 years of age constituted 38 per cent of the population. In 1931, the figure had been 42 per cent. Those between 20 and 64 years made up 59 per cent. Persons over 65 years of age constituted 6.7 per cent of the population in 1941, compared with 5.3 per cent in 1933. A tendency for the population to increase at a faster rate in the age groups from 45 to 64 years than for all other ages was true in all provinces. The population of Canada is steadily ageing.

On the economic side, the census disclosed that in Canada there are 2,668,710 households, divided almost evenly between rural and urban localities. The average number of persons per household was 4.3. Fifty-four per cent of households in Canada live in their own homes and 46 per cent in rented homes. In rural areas, three times as many householders own their homes as in the cities.

China's Food

[BY A CORRESPONDENT]

August 3rd
A FEW days ago, the "United Nations Interim Commission on Food and Agriculture," which will continue the work of the Food Conference at Hot Springs, was formally organised. The part Free China will play in the deliberations of the Commission has been stressed by the fact that Tsou Ting-Wen, China's delegate, has been elected one of the Commission's two vice-chairmen. Although the world's largest agricultural country, China has probably

A TRIBUTE TO THE MEN AND WOMEN WHO SERVE CABLE AND WIRELESS LIMITED

The all-British overseas telegraph company which operates the largest telegraph system in the world, with 300,000 miles of submarine cable and overseas wireless routes

★

'When the end comes, when victory is won, then history will begin to assess merit. We shall all of us be searching our conscience . . . We shall be discussing who succeeded and who failed . . . I have no doubt at all, when we come to discuss the part that Cable and Wireless has played, what the verdict of the nation will be—"Well done, thou good and faithful servant!"'

COL. THE RT. HON.
OLIVER STANLEY,

*Secretary of State for the Colonies,
paid this tribute at a luncheon given
to the staff of Cable and Wireless
Ltd., on January 26th, 1943*

The Bank undertakes general banking business and with its numerous branches offers special facilities in Canada, Newfoundland and the United States.

the lowest average standard of living of all. The country, therefore, is likely to see outstanding changes in its agricultural policy as a result of the work initiated at Hot Springs, and now to be continued through the Interim Commission.

Meanwhile China has more immediate food problems. It has to feed from its own soil its armies and its population under war conditions. This task has already resulted in considerable changes from the traditional Chinese practice of food growing and food distribution, which will help to place China's agriculture and nutrition on a more progressive basis. The Chinese statement before the Hot Springs Food Conference gave the total area of farm land in China at 232 million acres, which, it was stressed, supports a population of 450 million. Both this area and the population include all areas now under Japanese occupation. The arable area at present under the control of Chungking accounts for only about half the above total, and it does not include a number of the richest agricultural districts of the north and east. In all parts of China, however, the average size of the farm holdings is small, while the peasant families, which number 60 million, and account for three-quarters of all Chinese families, are large. The surplus produced by the average farmer, therefore, is usually very small. Moreover, communications in China have always been a weak point, and the areas at present controlled by Chungking include some of the least developed areas of the whole of China. Owing to the poor transport system, food cannot be distributed over wider areas; nor, for the same reason, can it be imported from overseas except in some coastal areas. Most districts of China used to support themselves from their local crops, and in the early years of the war this territorial self-sufficiency greatly helped to solve the country's food problems. Since then, however, the armies have expanded—which means a corresponding reduction in the number of people working on the land—and in the National Government area there is a great influx of war refugees from the districts controlled by the Japanese. Food, therefore, has become scarce in parts of Free China, and the Government is confronted with the problem of feeding its fighting forces as adequately as their needs demand, and at the same time of preventing famine among the civilian population.

Production Changes

This task has been tackled from the production and distribution ends. Food production in Free China is undergoing considerable changes. Rice and wheat have always been the country's staple foodstuffs, and soya beans, kaoliang, millet, barley, maize and potatoes are grown in most parts. There is, however, but little consumption of eggs, fruit and vegetables, as well as of fish and meat. In the past, the diet between district and district used to show considerable differences, which the large movements of population during the war have tended to obliterate. The west is now beginning to grow more vegetables and fruits, and poultry farming is making progress in a number of provinces in the interior. Simultaneously, the National and Provincial Governments have started to plan agricultural production on a more modern basis. The past few years have seen increasingly important projects of land reclamation, of irrigation, of pest control, and of training in the use of fertilisers and machinery. The Ministry of Agriculture and Forestry in Chungking, through a National Agricultural Research Bureau, is also undertaking development work aimed at improving seeds, especially rice and wheat seeds, and the Government-controlled Farmers' Bank of China has begun to grant loans for the financing of farm extension and improvement work. Despite the fact that agricultural production in Free China has greatly fluctuated since 1937 as a result of the changing climatic conditions, both land under cultivation and production, especially of winter crops, have increased. With territorial and temporary exceptions, such as the great Honan famine, which still affects some 10 million people, serious problems of food supply have not arisen in Free China during the long war.

Nevertheless the need to feed its growing armies, as well as to prevent excessive rises in food prices and food hoarding, led the National Government, in August, 1940, to impose a control over the trade in some basic foodstuffs, rice, wheat, flour, maize, kaoliang and some other cereals, and over their distribution. This control was originally exercised by a National Food Administration which was under the direct control of the Executive Yuan. In July, 1941, it was taken over by a Ministry of Food, which was given the tasks of planning the supply of food to the Army and public officials, and of balancing supply and

economy rather than to withdraw from the economic field.

But the fundamental weakness of Bertolini's programme is its vagueness on the crucial point, namely, on how to meet the budgetary deficit. The new Minister has promised to increase revenue. Yet the scope for heavier taxation is very limited. Agriculture—he has pointed out—cannot be expected to pay more in taxes, because it has already been overburdened. The tax on buildings cannot be raised because of air-raid damage, fixed rents, etc. Income-tax might be expected to yield higher sums than hitherto (it has risen only by 74 per cent since 1940, so that there may be a slack to be taken up), but mass evacuations, destruction from air-raids, and call-ups prevent any expectation of notable increases from this source. The main increases are expected from indirect taxation, and from taxes on war profits. It is, however, doubtful whether the general conditions now prevailing in Italy will allow any normal func-

tioning of the financial and tax collecting machinery at all. The prospects of improving the state's credit do not look any better. Bertolini has announced that the Public Debt bequeathed by the Fascist regime "is sacred," and that the savings of the public will be safeguarded by the state. His frank report about the financial position was made in the hope of regaining the investors' confidence. But it may be doubted whether so much frankness and so many reassuring statements will really allay the anxiety of the lenders. The fact that Italy's inability to go on waging war arises not only from military and political causes but also from economic and financial weakness is all too clear to everybody. This is the inevitable conclusion which follows from Bertolini's report—no less clearly because he himself refrained from drawing it. The main, if not the only, financial weapon with which Badoglio's Cabinet can still for a time prolong the war is the printing press.

Fire and Accident Insurance

FULL recognition of the need for maintaining adequate fire and accident insurance facilities in wartime was accorded by the Kenner Committee in its Report in October, 1942. The Committee found that these classes of insurance are essential to the community, that facilities should be maintained on a sufficient scale—particularly the use of the technical experience of the fire companies in fire prevention, storage and salvage—and that the personnel available to administer the various war damage schemes, handled by the fire offices, should be sufficient to ensure the reasonably prompt settlement of claims. A further point made by the Committee was that the position of British insurance in foreign markets should be maintained at any reasonable cost, since it represents a substantial and economical invisible export. The only concrete suggestion advanced for economising manpower was that transfer of business from one insurer to another should be suspended. Recommendations were, however, made for periodical reports on economy measures to the Board of Trade by representative bodies of the industry, and it was considered that it

should aim at releasing from 10 to 20 per cent of its deferred staff. On the subject of inter-office concentration, the Committee found the weight of evidence against any immediate saving of manpower from such a process. Steps have been taken to implement the Committee's recommendations.

The Kenner Report dealt only with the wartime organisation of the companies. It was followed a little later by the Beveridge Report on social services in the post-war period. This Report makes proposals which impinge on the activities of accident departments on at least two points. The most important change contemplated is the supersession of the present scheme of workmen's compensation, based on voluntary insurance with proprietary or mutual companies, and substitution for it of provision for industrial accidents and disease by inclusion within a unified social insurance scheme. This project is still under examination by the Government. The commercial companies transact only a small proportion of the business, chiefly the small, isolated risks; it is estimated in the Beveridge Report that but 15 per cent of the total compensation is paid by them. The mean premium income from workmen's compensation insurance in the United Kingdom of companies belonging to the Accident Offices' Association amounted in 1938-39 to £4,600,000, or only about 8 per cent of their combined world-wide accident incomes. The importance to the offices of the change should not, therefore, be overestimated, though they would regret to relinquish a business which has been developed over nearly 40 years, and possible repercussions overseas would also have to be taken into account. More vitally affected are the mutual specialist offices of various kinds, together responsible for some 70 per cent of the total compensation, of which about half is accounted for by offices transacting a mixed business, and the other half by offices catering exclusively for one industry. The second recommendation of the Beveridge Report that affects accident insurance is the proposal that the law of civil wrongs should be amended to reduce the amount of any injured person's claim against a third party by whatever sum he can claim as social insurance benefit (the point is discussed in the Report under "the problem of alternative remedies"). Such a change in the law would naturally influence strongly the conduct of motor and other forms of third party insurance.

Apart from some preoccupation with these reports, the companies enjoyed a good year in 1942 in both the fire and accident departments. Higher fire premiums were the general rule, due mainly to increases in sums assured on buildings and contents to conform with the rise in values. This process is still far from complete, and the consequent application of the "average" principle—that is, paying only that proportion of the loss which the sum insured bears to the full value—has inevitably brought its difficulties in the settlement of losses. Some further falling away in premiums from Far Eastern and other sources was offset by revenue from territories recovered from the enemy, where the offices follow closely in the wake of the advancing armies. A heavy loss experienced at home in the first half of the year was alleviated by a considerable improvement in the second. American business fortunately brought no repetition of the unfavourable results of the two previous years, and business in other foreign countries was free from serious losses. For these reasons, the final profit ratios were the best for some years.

The nation-wide fire prevention campaign of the Fire Offices' Committee was launched early this year, and is now well under way. The dislocation of the war effort, which loss by fire involves, needs continuous emphasis; destroyed buildings and machinery mean loss of productive capacity, and wastage of stocks may necessitate their replacement at the cost of shipping and the lives of sailors. In the meantime the estimated cost of home fire losses in the first half of 1943 remains high at £4,832,000—considerable improvement, it is true, on the catastrophic figure of £8,552,000 for the first half of 1942, but still in excess of the total of £4,373,000 for the same period of 1941.

In the accident departments, premiums were lower. In view of the increased restrictions on motoring imposed in this country in July, 1942, resulting in the laying-up of many additional cars, and of the 20 per cent reduction in premiums put into effect in respect of private cars remaining on the road, it is a matter for surprise that the decline in income was not greater. No doubt the loss of motor income was partly offset by additional revenues from workmen's compensation policies, where higher pay-rolls automatically bring higher premiums. It is expected that accident departments will have to bear a sharper fall in income this year, since, in addition to a full year of reduced motor income at home, reductions from overseas sources, especially from the United States, will make themselves increasingly felt. In 1942, however, the profit ratio in accident business, as in fire, was one of the best on record. The main reason for this is that the offices were enjoying the benefit of the time-lag between the lighter claims experience on motor policies and the consequent reduction in charges. The usual release of unearned premiums reserve on a fall in income will also have assisted the accounts. More than one chairman has emphasised the exceptional nature of the profit and the certainty of a return this year to ratios more in line with customary expectations. Notwithstanding the lighter claims experience, accidents on the road remain at an inordinately high level relatively to the volume of traffic, and particularly unfortunate has been the marked rise in child fatalities. There seems to be scope for more energetic measures to mitigate this scourge, and in these the accident companies, like the fire companies in fire prevention, might usefully play

a part. The agreement between the Accident Offices' Association and the Home Office regulating the costs of workmen's compensation insurance was again modified, the ratio of expenses and profit to premiums being reduced from 32½ per cent to 30 per cent; this change, which applies to the whole of the calendar year 1942, was made possible by the increase in premiums resulting from higher wage levels, the working costs of the offices not being affected proportionately.

The burden of taxation made itself increasingly felt in the accounts for 1942. This is partly due to higher profits, but is chiefly associated with the substantial additions to taxation in the United States, and in many other overseas territories, particularly in the Dominions. The cumulative effect of this increased overseas taxation and high taxes at home has been remarkable; the chairman of one office pointed to an aggregate taxation cost over 50 per cent above that for the previous year, and representing no less than 11.5 per cent of the combined fire, accident and marine premium income. This higher taxation has almost completely offset the increased profits of 1942, and may well prove a formidable load to carry in the current year.

A great deal of work continues to be performed by the offices on behalf of the Government on a non-profit basis. Besides the issue under the commodity, business and private chattels schemes of war damage policies—no less than 4½ million policies were issued during the year ended March, 1943—the offices have through local committees been carrying the responsibility for settlement of losses under the commodity and business schemes. Similar help has been afforded to the Governments of certain of the Dominions and other overseas countries, including the United States, in the administration of war damage schemes. Through technical aid in fire prevention, food salvage and the inspection of industrial plants, and in a multitude of other ways, assistance is still being freely rendered. The arrangement whereby current interest earnings and trading profits in the United States are placed at the disposal of the Treasury for service of interest and amortisation on the Reconstruction Finance Corporation's loan has worked satisfactorily, and current earnings on operations in other parts of the world continue to be placed at the disposal of the Government.

Dividend Limitation

Mr Mander and the Chancellor of the Exchequer in the House of Commons last week between them said either too much or too little on the subject of limitation of company dividends. To Mr Mander's question whether "it was still the wish of the Government that companies should not pay dividends in excess of their pre-war rates," the Chancellor merely replied, "Yes, sir." Thus on the face of things, many important companies, including the main-line railways, are flouting the Government's known views. In fact, of course, what Mr Mander intended to ask was whether the Government still wished industry to observe the spirit of the Limitation of Dividends Bill, which died on the introduction of the Emergency Powers (Defence) Bill and of 100 per cent EPT in the spring of 1940. The Limitation of Dividends Bill had three main provisions. First, it sought to limit payments (by amount and not percentage) to the highest paid between June 30, 1936, and July 1, 1939. Secondly, it empowered companies which had not in the base period paid any dividend to distribute up to a maximum of 4 per cent. And thirdly, it allowed for higher distributions than those specifically provided for, provided that the Treasury, working through the Capital Issues Committee, was satisfied that these were justified by "exceptional circumstances." Viewed against the first two of these provisions, it is clear that the great majority of companies has abided faithfully by the spirit of the Bill, while if the saving "exceptional circumstances" clause be invoked (and in the absence of Treasury judgment, the directors concerned must themselves decide about this) it might be claimed that industry stands before Mr Mander and Sir Kingsley Wood with a completely clear conscience. In reality, of course, 100 per cent EPT, as *The Economist's* analyses of industrial profits have shown, has effectively curbed both profits and dividends. "Moral dividend limitation," in other words, remains a political refinement to an already efficient statutory control.

Richard Thomas

From an accounting point of view the Richard Thomas statement—analysed on page 217—is praiseworthy; not only is there a consolidated balance-sheet, but a profit and loss account for the group as a whole discloses trading profit before deduction of income-tax and EPT. The total tax charge, at £1,527,526, is some £102,000 higher, and this increase, combined with a depreciation provision £78,000 larger at £899,500, offsets the improvement from £3,541,611 to £3,719,803 in the gross trading result. Thanks, however, to a reduction from £95,000 to £44,013 in war damage contributions, the net surplus is up from £585,422 to £633,881, an advance which is reflected in the present company's own net profit of £632,439 against £580,226 (or £480,226 if the provision made a year ago for writing down old coke ovens is reckoned as charged before profits are struck). That expansion goes only part of the way towards meeting the cost of £121,875 involved in raising the ordinary dividend, as already announced, from 5 per cent to 10 per cent. But as there are no special write-offs this year, there is still room for a transfer of £113,522 to general reserve, and an addition of £119,150 to the carry-forward, thus raised to £374,781. On these figures, earnings for the ordinary shares are equivalent to 19.6 per cent, but this is reduced to 15.5 per cent by allowing for the fact that £100,000 of the reserve allocation is obligatory so long as any of the prior lien debentures are outstanding. The chairman dismisses the idea of applying any of the present liquid resources to accelerating the repayment of this stock, of which £3,354,734 is outstanding. That process will be helped in a mild way as one result of the voluntary reduction in the rate of interest on this stock to which the holders have agreed, for the interest saving—the difference between 4½ per cent and 4 per cent—is being applied to increasing the already quite substantial sinking fund. Mr E. H. Lever mentions the possibility of the stock being repaid "at a later and more appropriate date" by the issue of a junior security or more share capital, and it is to this development that shareholders must look for an eventual lightening of the burden of debenture service, relief from the obligatory provisions respecting reserve allocations, and release of the undertaking from

supervision by the Control Committee which was established when the bankers came to the rescue of the Ebbw Vale project in 1938.

The progress made at Ebbw Vale since that time has been very considerable, as is evident from the chairman's verbal insistence—which, it may be hoped, will be reflected in the management's practice—upon the ultimate necessity of passing on to the consumer some of the benefits of the efficiency and economy achieved in manufacture, and his declaration that most of the tinplate trade now acknowledges the urgent necessity of changing over to the modern process of manufacture. The introduction of the continuous strip process has rendered obsolete and redundant many of the old-type mills. So far as these are owned by Richard Thomas itself the situation has been met by heavy depreciation write-offs, but South Wales as a whole has still to tackle this twin problem of amortisation and reconstruction. The management of Richard Thomas hopes that this can be achieved on a co-operative basis. The importance of the matter is emphasised by the company's decision to instal an electrolytic tinning unit, thus falling into line with modern practice in the United States. Electrolytic tinning brings a big saving in material and labour costs, and an improvement in the quality of the product. But it involves substantial capital expenditure—the Richard Thomas unit may well cost £250,000, and will still be able to handle part only of the Ebbw Vale output—and is designed for use, primarily at any rate, with the continuous strip process.

The Clearing Banks in July

In the second quarter of this year, clearing bank deposits rose only by £88.5 millions, compared with £191.2 millions in the corresponding months of 1942. The July returns do not confirm this indication of a check to the rate of credit expansion. On the contrary, a somewhat greater expansion in "effective" deposits than that of July 1942 is masked by a decline of £34.2 millions in cheques and balances (against £25.4 millions last year), nominal deposits on each occasion showing little change. The indications are that the rise in effective deposits was still greater if allowance is made also for items in transit. Only two of the banks, unfortunately, separate this entry, but the con-

	July 1942	Mar. 1943	Apr. 1943	May 1943	June 1943	July 1943

Total assets	3,495.6	3,776.4	3,780.2	3,799.8	3,868.4	3,873.2

traction of £3,434,000 in this item suggests a contraction of the order of £15 millions for the banks as a whole compared with an estimated decline, on the same basis, of about £11 millions last year. The remaining banks presumably include items in transit in their advances total, which, in turn, suggests that the small fall of £1,225,000 in advances (against a decline of £4,374,000 in July, 1942) masks an appreciable increase in "effective" advances. Though investments reached a new peak figure of £1,162.1 millions the addition is a small one, an increase of £41.0 millions in Treasury deposit receipts providing the chief counterpart for the increase in effective deposits.

Fiduciary Issue Regularised

An order has been made extending for a further two years until September 5, 1945 (or the date on which the Regulation ceases to be in force, whichever is the earlier), the period for which the Treasury may authorise increases in the fiduciary issue. Under the Currency and Bank Notes Act of 1928, the large increase in the fiduciary issue from £300 million to £580 million at the outbreak of war would have required Parliamentary authorisation on September 5, 1941. To avoid constant applications to Parliament to regularise this and the subsequent wartime increases, a Regulation was made in 1941 extending the Treasury's authority until September 5th next; the latest Regulation merely repeats this procedure. Unless previously revoked, the Regulation will remain in force until the expiration of the Emergency Powers (Defence) Act, 1939.

Future of Road Haulage

Mr Roger W. Sewill, director of Associated Road Operators, has published an interesting scheme for the future organisation of road haulage. In his view, neither the nationalisation of all forms of transport nor the setting-up of a grandiose public utility corporation would achieve the object of securing the cheapest and most efficient transport possible in this country. He suggests two alternative forms of organisation for the road haulage industry. The one, a road haulage board, would be modelled on the Milk Marketing Board, and the other, a road haulage association, would be formed by the proposed amalgamation (if necessary by compulsion) of all the existing hauliers' organisations. The second alternative might require statutory powers to enforce rates agreements, but the association "would be controlled entirely by members of the industry." Whatever organisation is set up, it would involve "a national rates structure." There would be two sets of rates, a standard charge per ton mile, based on a simple classification, payable by the consumer, and a variable rate, based on the average cost of haulage, with an agreed addition for profit, payable to the haulier. The detailed work in preparing a national rates structure and standard conditions of carriage might be entrusted largely to the Road and Rail Conference. To cap the proposed set-up there would be a Road and Railway Rates Tribunal to which traders could appeal if they are dissatisfied with the rates they have to pay and hauliers if they are dissatisfied with the rates they are receiving. Mr Sewill's scheme is as ingenious as it might be dangerous without proper safeguards. It really involves the establishment of a road-rail transport monopoly, with the Road and Railway Rates Tribunal as the only safeguard against abuse.

Trebling the Output of Munitions

The output of munitions in this country has trebled in the past three years, and this has been achieved with less than half the quantity of raw materials normally imported into this country. The cutting down of civilian consumption goods to the barest essentials is not by itself enough to enable this quantity of war material to be produced. Savings have to be made even in the production of munitions. Scarce raw materials have to be spread thinly over a variety of uses. Substitutes have to be used wherever possible and labour has to produce more. The imposing array of warlike stores massed at El Alamein, in Tunisia and now in Sicily is constantly replenished for new battle fronts; the accumulation of these stores has been made possible by the constant efforts of Government departments and industry. Some examples of how material and labour have been made into "more from less" are shown in a well-arranged and carefully planned exhibition held in London, but unfortunately not open to the public. These examples include small and large savings, and some of them are summarised below:—

Timber.—Consumption has been cut by 60 per cent, and home production, which amounted to 4 per cent of consumption before the war, now accounts for 60 per cent. In building, concrete has in some cases entirely replaced timber. Tent pegs, which were made from hardwood, are now mechanically cleaved from waste wood and have saved 700,000 cubic feet of wood. Textile rollers and lapping boards made from waste paper and wood saved over 50,000 tons of wood.

Paper.—The proportion of home-produced paper has risen from 18 to 76 per cent, and the cuts in the size of newspapers and civilian consumption have enabled it to be used as a substitute for scarcer materials in a variety of war goods.

Iron and Steel.—Different methods of production have eliminated waste. Electric forging saves 60 per cent. Wastage in the making of bolts has been reduced from 60 per cent to 5 per cent by the introduction of new methods. Ammunition of all calibres 400,600 tons of steel have been saved since the war began. In the Bofors gun, 80 per cent the weight of iron and steel has been saved.

Substitutes.—Great ingenuity has been exercised: glass is substituted for steel; paper and fibre for metals, light alloy and wood; lead for tin; plastics, fibres and textiles rubber—the list is endless.

Labour.—Processes have been split up in some cases, and others combined, so that one operation does the work of two especially in inspection. New methods save labour, as well material; important among them is welding instead riveting.

Salvage.—Every scrap of material possible is used again. Every 100 unserviceable battle dress, 70 are repaired, which 10 are reissued and 60 are dyed and used by industrial and agricultural workers. The remaining 30 become "shoddy" and are used in the making of new material. Army boots are remade, and over-shoes and slippers are made of pieces of fire hose.

The use of substitutes has in some cases produced articles better than the old, and in most cases the savings have been well worth the small sacrifice of efficiency involved. Although the exhibition is a tribute to the inventiveness which has made it possible, its purpose is not self-congratulatory. Manufacturers and Government officials have been visiting it. They can compare what others have done with their own efforts; many of the ideas can be adapted for use in their own spheres of work, and contact with what others are doing can stimulate them to produce more material and labour saving ideas. A spirit of complacency about what has been done—great as the achievement has been—would be disastrous. But if the exhibition acts as a spur to bigger output with more economy it will itself be a great contribution to the war effort. Lessons can be learned, too, for peace. Every unit of material and labour saved in the production of essentials can add to the production of luxuries and semi-luxuries to raise the standard of living.

Coal Commission Stock

As a sequel to the passage, early in July, of the Bill to amend the Coal Act, 1938 (which on July 1, 1942, vested all the coal seams in the country in the Coal Commission), came the announcement by the Chancellor of the Exchequer on August 5th that within the next four months

the Commission is likely to make payments totalling some £30 million to the former owners of coal royalties; the total amount payable to owners of coal royalties is £66.5 million. To finance the immediate payments, £35 million 3 per cent Coal Commission Guaranteed stock 1950-2016 has been issued to the National Debt Commissioners at 97½ per cent; some £4 millions of the proceeds will be required to repay temporary advances by the Bank of England to finance payments on account. The forthcoming payment of compensation to royalty owners has several interesting investment aspects. First, it is to be expected that a substantial part of them will find their way into the stock markets, where—if the experience of the security vesting orders is any guide, and given the right technical background—they may have a more than negligible effect on prices. Secondly, the new stock, which the National Debt Commissioners will presumably place on the market as and when opportunity offers, will be the “longest” dated stock on offer in the gilt-edged market, and will, indeed, mark only the second occasion on which the range of dated stocks in the gilt-edged market proper has extended to the twenty-first century. The Irish Free State 4½ per cent issue, guaranteed by the British Government, is the only existing dated gilt-edged stock which may outlive the present century—its final redemption date is in 2004. Outside gilt-edged stocks proper, the Metropolitan Water Board has two issues which need not be redeemed until 2003; London Transport “A” and “B” stocks run finally to 2023, and for the really far-sighted investor who is willing to go to the colonial railway market there is the Toronto Grey and Bruce Railway 4 per cent First Mortgage Bonds, which are redeemable on June 14, 2883. The nearest comparable issue to the new Coal Commission stock is Redemption Threes, 1986-96, issued to redeem tithes, now quoted at 99½. Judged by this issue, the price of 97½ for the new stock appears just about right. Finally, the payment of compensation to coal royalty owners will affect several colliery companies owning freehold properties, but the effect on their position is difficult to assess; if they elect to become “freehold leaseholders,” the compensation is returnable to the Commissioners in exchange for a lease on a peppercorn rental.

Managements and Production Committees

A great deal has been heard from the workers' side about joint production committees. It is therefore interesting and timely to have the management angle. The June and July issues of *Business* contain the results of a survey conducted among managements, which covers very much the same ground, and raises many of the same points as the recent production enquiry of the Amalgamated Engineering Union, but it is not limited to engineering works. The difficulty in making any appraisal from this survey is that there is no indication of the total number of firms that sent in replies to the questionnaire, and that the percentages of an unknown total are apt to be meaningless. But in spite of this omission, the enquiry is valuable, and revealing of the management attitude. It is significant that all the big firms, employing over 2,000 workers, expressed themselves in favour of production committees, but in the smaller concerns there would still seem to be some antagonism among managements to the idea of workers sharing responsibility in production matters. Many of the same difficulties and criticisms emerge as in the A.E.U. enquiry. Thus, it appears that the main opposition is encountered from the junior executives, foremen and chargehands, and there is also evidence of apathy among the body of the workers. In order to break down this apathy, it seems essential that firms should adopt more effective methods of publicising the work of their committees. Many have arrangements for special broadcasts or for shop stewards' meetings for reporting back decisions, for the publication and posting of minutes, for special newspapers and articles in works magazines, but more than half the firms covered provided no special facilities. In order to save time, an increasing number of committees are developing the system of co-opting specialists to deal with particular technical problems or of appointing special sub-committees. In over 65 per cent of the firms, absenteeism is dealt with by a sub-committee, and it was unanimously agreed that the workers were far more severe in dealing with offenders than any management would have been. It is satisfactory that a high proportion of the managements should report that their committees had been instrumental in securing improved efficiency and increased production, since this is

their *raison d'être*. Many attributed this to better all-round co-operation and to the increased interest taken by the workers in production; some gave instances of workers' suggestions which had led to improvements, such as suggestions for improving internal transport and the maintenance of machine tools, simplifying drawings, improving stores control, and new ideas for punchers and conveyors. The report leads to the conclusion that production has benefited from the joint works committee machinery, and it also shows that there is a considerable degree of flexibility in adjusting the practice and methods of the various committees to suit the circumstances and requirements of individual firms.

Germany to Repudiate Clearing Debts?

A recent statement by Dr. Landfried, Herr Funk's second-in-command for the German economic front, fore-shadows discrimination between frozen reichsmark claims created in connection with the war and those arising through normal commercial transactions. This has given rise to the impression that Germany intends to repudiate what it regards as its war debts to the satellite states and occupied countries. The object of such a move is to reduce the amount of its clearing debts, which are growing at an alarming pace. At the end of last year their total was about 12 milliard reichsmarks, and it was increasing at the rate of over 6 milliards per annum. Neutral countries, and even satellites, have of late shown themselves increasingly reluctant to sell goods against frozen clearing balances. Since in some instances Germany has been experiencing difficulties in inducing neutrals to accept its looted gold, and since its exporting capacity is at a low ebb, it hopes to be able to resume imports through clearing arrangements if the outstanding total is cut down by means of repudiation. Never at a loss to provide a theoretical foundation for arbitrary action, German spokesmen have lately been inclined to argue that since Germany is fighting for the sake of Europe it is entitled to expect the other European countries to help at least with goods. This will presumably be the excuse for repudiating the debts arising from deliveries made for the purposes of the war. It seems highly doubtful, however, whether neutrals would consider that a reduction of Germany's external floating debts by the repudiation would increase her creditworthiness. With the military situation decidedly in favour of the Allies, neutrals and even satellites are meanwhile likely to insist more and more on being paid in goods instead of either gold or clearing balances.

French Financial Unification

M. Couve de Murville, Commissioner of Finance in the French Committee of National Liberation, paid a visit to London recently, to discuss, among other problems, the unification of the franc. As is well known, the rate in force in the French colonies formerly under the control of General de Gaulle is the pre-war rate of frs. 176.60. On the other hand, the rate of frs. 300 was fixed last year for the territories formerly under the control of General Giraud. Subsequently it was decided at the Casablanca Conference to lower that rate to frs. 200 to the pound or frs. 50 to the dollar. The anomalous situation by which the franc stands at frs. 175.60 to the pound in French Equatorial Africa and frs. 200 to the pound in the adjoining French West Africa calls for adjustment, and now that all French territories not under Axis control have been politically unified, the adoption of a uniform exchange rate should logically follow. The question is which rate will be adopted: frs. 200, frs. 176.60 or something between the two figures? Usually well-informed quarters hold the view that frs. 200 is the most likely choice. The rate of frs. 176.60 is of purely historical interest, like, for example, the old sterling-dollar rate of \$4.86. There appears to be no economic reason for its adoption in French North Africa and West Africa, where prices have adjusted themselves in a large degree to the rate of frs. 200, so that the adoption of the rate of frs. 176.60 might entail disturbing cuts in wages and falls in prices. The Allied Governments, especially the United States Treasury, favour round figures for territories occupied by their troops, in order to simplify the conversion of sterling and dollars into local currency. (It may be noted, for instance, that the dollar-lira rate of 100 makes the lira equivalent to one cent.) While some French circles would prefer frs. 176.60 for sentimental reasons,

there appears to be no unduly strong feeling among them on the subject.

Mexican Hustle

Among the many objectionable features of the Mexican debt proposals—which would exchange external currency obligations for peso securities, scale down the original interest obligations substantially, reduce the nominal amount of the debt by 75 per cent and cancel arrears of interest for a token compensation—was the fact that the assent of only 20 per cent of bondholders was required to enable the Mexican Government to declare the “agreement” operative. This is a case of the tail wagging the dog with a vengeance, but just that seems to have taken place, for the Mexican Government has now announced that the necessary acceptances having been received, the plan is operative. The agreement was negotiated between the Mexican Government and the International Committee of Bankers in Mexico. The Council of Foreign Bondholders took no part in the negotiations which, in the words of the Council,

have been conducted in the joint interests of British as well as US and other bondholders by the Committee, which has since December, 1920, been recognised by the Council and by His Majesty's Government as being . . . the most appropriate body for protecting the bondholders' interests.

In making this announcement last December, the Council said that no complete information had yet been made available about the nature of the proposals, so that although the Council considered some of the principles involved objectionable, it refrained from final comment. A few weeks later, the Chancellor of the Exchequer stated categorically in the House of Commons that no offer had been made and considered by the Council of Foreign Bondholders, so that the question of any official approach to the Mexican Government would be premature. It would now seem that both the Council and the Chancellor have been caught on the wrong foot and that a plan which has been universally condemned as unjust and inadequate is now, in the absence of energetic and early action, to be foisted on to bondholders who are opposed to it. In all such negotiations, the prime requisite is for a united front by all creditors, backed, if possible, by support from the creditors' Governments. This appears to have been singularly lacking in the case of the Mexican proposals. Incidentally, it would be interesting to know whether repatriated Mexican bonds have “assented” to the plan, and if so what proportion of the 20 per cent such bonds represent.

Coal Mines Equalisation Fund

Further progress was made in the second quarter of this year in translating into practice the Government's policy of evening out disparities between the trading profits of the various coal-mining districts through the Coal Charges Fund, a central pool created in June, 1942. The fund, which is under the control of the Ministry of Fuel and Power, is financed by a levy on each colliery at the rate of 5s. per ton of commercially disposable coal. Out of this fund payments are made to coalfields whose ascer-

tained credit balance does not reach the amount agreed between the industry and the Ministry. The district standard credit balances range from 6d. per ton in Cumberland to 2s. 9d. per ton in Warwick and Somerset; the average for the industry as a whole is 1s. 9d. per ton. In the March-June quarter the allowances ranged from 3d. per ton in Leicester to as much as 7s. 7d. per ton in the anthracite coalfield of South Wales. Differences in working costs and the unequal incidence of war conditions on the trading activities of the different coalfields are mainly responsible for these wide disparities. With the help of the allowances there was only one district which showed a debit balance in the three months ended May; the average credit balance for the industry as a whole was 1s. 7d. per ton. The outstanding feature of the alterations in the allowances for the September quarter is the reduction of the payments in those areas where the standard balances were either reached or exceeded in the quarterly accounting period ended May. In Scotland, except for certain bituminous pits in Lanarkshire, the allowance has been reduced from 1s. 1d. to 6d. per ton; in Northumberland from 1s. 3d. to 1s. 1d.; in Derbyshire (excluding South Derby) from 1s. 2d. to 11d.; in Shropshire from 2s. 10d. to 2s. 1d.; and in the Forest of Dean from 3s. 8d. to 2s. 8d. The larger coalfields continue to lag behind the smaller in profit-making capacity. In Durham the allowance has been increased from 2s. 6d. to 2s. 10d. per ton; in Yorkshire from 2s. 3d. to 2s. 4d.; in South Wales from 2s. 8d. to 2s. 9d. for large steam coals and from 1s. 2d. to 4s. 3d. for sized grades. The payments made in the three months ended last May converted an average debit balance of 2d. per ton into a credit balance of 1s. 7d. per ton; the adjustments made in July are designed to raise the average credit balance to 1s. 9d. per ton during the third quarter.

Man-power in Coal Mining

The Minister of Fuel and Power, replying to a Parliamentary question on Tuesday, August 3rd, gave the current figures of employment in the coal-mining industry. The total number employed at the present time is 706,000, of whom 545,000 are underground workers and 161,000 are surface workers. Major Lloyd George also gave the figures for the number of boys and youths below 18 employed in mid-December, 1942, and the extent of the decline in juvenile recruitment can best be seen by a comparison with the figures for 1938:—

Under 16:	1938	1942
Below ground	15,362	8,803
Above ground	11,726	10,960
	27,088	19,763
16-18:	1938	1942
Below ground	29,088	21,225
Above ground	11,246	12,396
	40,334	33,621

These figures serve to emphasise the need for additional recruits, especially for underground mining, and some of the manpower problems which affect both the immediate outlook and the future of the coal industry were discussed in an article last week. A juvenile recruitment branch has been set up at the Ministry of Fuel, under Mr T. F. Turner, K.C., who is investigating the problems in the coalfields. The Minister of Labour is hoping to raise the labour force from its present level to 720,000 or 750,000, which will mean the recruitment of another 30-60,000 men, since he estimates that by the end of the coal year (that is, March, 1944) the number may have shrunk to 690,000. Actually, in view of an annual wastage of about 30,000 through death, injury and sickness, the total by next March, unless the tide can be turned, is more likely to be in the order of 660,000. It is a shortage of man-power, with a rising average age among miners and fewer productive workers, has, more than anything else, contributed to the present decline in coal production. It is not, as a series of articles in last week's *Daily Telegraph* affirms, "the pervading indiscipline which is at the root of the coal trouble." The author cited the example of strikes at two South Yorkshire collieries to prove his point. He also said that it was necessary "to explode once and for all the myth" that voluntary absentees were a minority. He submitted that they were a large majority, and that Major Lloyd George had grossly underestimated the loss to production which voluntary absenteeism had caused. Again, this argument was based solely on the experience

of two more collieries in South Yorkshire. It is perfectly true that voluntary absenteeism is higher than it should be, and, whatever the causes, it is indefensible at this critical stage of the war. But surely the Minister of Fuel, with statistics covering the whole of British coal production, should be in a better position to judge than an observer of two collieries in a single district. Mr John Armstrong, the Ministry's Labour Director, said at the Miners' Conference that the average was far too high, and that it should be brought down at least to the level reached in one region (employing 100,000 men) of 2 per cent. He also said that between September, 1942, and May, 1943, out of 86,000 interviewed for indiscipline, 3,000, or less than 3½ per cent, had been prosecuted.

Workers' Incomes

The census of the earnings of workers in a representative sample of industries—employing some 6½ million operatives—for the last pay-week in January this year revealed an average rise of 65 per cent in weekly earnings since October, 1938. (The results for individual industries were given on page 56 in *The Economist* of July 10th.) The increase is the combined result of a number of changes whose individual effects have been analysed in the latest *Bulletin* of the London and Cambridge Economic Service.

RISE IN AVERAGE EARNINGS

(Percentage Increase between Oct., 1938, and Jan., 1943)

1.—Rise in average weekly earnings	65
2.—Assuming no change in relative numbers in various industries but allowing for change in age and sex distribution	52½
3.—Assuming no change in relative numbers by industry and sex	55½
4.—Assuming no change in sex distribution but allowing for change in relative numbers in various industries	67½
5.—Rise in weekly wage rates	26½

These calculations are interesting. They show that the difference between the rise in wage rates and actual earnings is due mainly to the effects of overtime, bonuses and upgrading, but that the redistribution of workers—that is, the movement from many of the relatively low-paid occupations into the more highly-paid munitions industries—was also an important factor.

Cocoa Regulations

The Government is reviewing the post-war future of the cocoa industry in the Colonies. Outside West Africa, the Empire produces small quantities of cocoa in Trinidad, Grenada and Ceylon. It is possible that the Colonial Office is looking again at plans for an international cocoa scheme which were prepared shortly before the war. The wartime West African cocoa scheme includes supplies from Belgian and French Africa. Thus conditions for a world marketing agreement appear to be not unfavourable. The only other important supplier whose support is essential is Brazil, where at present there is no major surplus problem. Meanwhile the immediate situation in West Africa is acute. Sales are proceeding slowly; up to the end of June only just over one-third of the crop had been sold, in contrast to the normal disposal of about four-fifths in the first four or five months of the season, which begins on October 1st. The opening of the Mediterranean shipping route may have an adverse effect on cocoa shipments, although, according to Colonel Stanley, "substantial shipments are expected to continue." Although export prices are higher than the prices paid to the native producers by the West African Produce Control Board, they can hardly be high enough to prevent serious financial loss to the Board if half the crop remains unsold. Brazil has shipped almost all its last crop surplus to the United States, so that cocoa requirements for relief purposes could be covered by West Africa. This may compensate for present losses, but in the absence of special storage facilities, cocoa is perishable when stored in the tropics. If processing facilities cannot be provided at present and the shipping position does not allow greater exports, the provision of suitable storage facilities in West Africa deserves the immediate and urgent consideration of the Government.

Company Results

Richard Thomas.—One of the largest groups in iron and steel industry, normally specialising in tinplate and sheet bars.

Consolidated figures:	Mar. 29, 1941	Mar. 28, 1942	April 3, 1943

(Continued on page 219)

COMPANY RESULTS

Definitions of terms used in these tables are as follows:
Net fixed assets include everything from land to loose tools, less any distinguishable provision for writing them down.

Net inter-company items include holdings in, and loans and advances to, subsidiaries and associates, plus trade investments, minus all sums, other than dividends of the company, due to subsidiaries and associates.

Net liquid assets include all other assets less current liabilities, bank loans and profit and loss appropriations not retained as additions to reserves, carry forward, or other established funds.

INDUSTRY MUST MAKE EVEN GREATER FUEL ECONOMIES THIS YEAR

Management is asked to take the lead

A large proportion of the fuel consumed by Industry is used for heating factories. Therefore you are urgently requested to plan now to eliminate waste from the heating of your works. The need to save fuel is even greater this year. We must not expect that the coming winter will be as mild as that of 1942.

HERE IS ONE EXAMPLE OF WHAT CAN BE DONE:

"Thermostatic control of factory heating has reduced my fuel consumption from 4.5 to 3.2 cwt. per piece manufactured" says the Head of a large Textile Company.

MAKE CERTAIN NOW

- * that the heating system in your factory is suitably controlled.
- * that you are not blowing steam to waste that could be used to heat your factory when the cold weather comes.
- * that any new buildings you are erecting are properly insulated.
- * that your fuel watchers know how to prevent heat losses through open doors and windows.
- * that the brickwork and lagging of your boiler plant are in good repair.

If you have not already received copies of the Bulletins on Thermostatic Control, on the Insulation of Buildings and on the Maintenance of Boiler Plant, write to the Secretary of your Regional Fuel Efficiency Committee for them.

The Ministry's Regional Offices are at:

GLASGOW, NEWCASTLE, MANCHESTER, LEEDS, BIRMINGHAM, NOTTINGHAM, CAMBRIDGE, CARDIFF, BRISTOL, READING and LONDON.

ISSUED BY THE MINISTRY OF FUEL AND POWER

COMPANY MEETINGS

RICHARD THOMAS AND COMPANY, LIMITED

TINPLATE TRADE DEVELOPMENTS

The ninety-fourth ordinary general meeting of Richard Thomas and Company, Limited, will be held in London on the 20th instant.

The following is an extract from the statement of the chairman (Mr E. H. Lever) circulated with the report and accounts:—We have, this year, undertaken a complete review of our provisions for depreciation, and as a result we are applying in respect of the whole combine £899,500 for this purpose against £821,500 last year.

The marked increase in the contribution to staff pension and similar schemes is due to the payment of £31,330 in respect of our guarantee of the old pension fund, a valuation of the fund having disclosed a deficiency. Since the close of the financial year a new pension scheme, also based on assurance contracts, has been established to meet the needs of certain of the staff who were not covered by the existing arrangements.

PRIOR LIEN DEBENTURE STOCK

As you will have learned from the announcement in the Press, the Prior Lien stockholders have agreed to a reduction in their rate of interest from 4½ to 4 per cent. Your directors have had constantly under review the question of accelerating the repayment of the Prior Lien stock, but are more than ever convinced that until the future can be more clearly foreseen it would be in the highest degree imprudent to use any of the present liquid resources of the company for this purpose. This, however, does not exclude the possibility of the Prior Lien stock being repaid at a later and more appropriate date by other means, such as the issue of some junior security or share capital, if this can be done on advantageous terms or shareholders themselves choose to find the money.

You will see from the accounts that the current year's trading has again been satisfactory, but it is very important to bear in mind, when considering the profit-earning capacity of the company from its short-term aspect, that whereas an adverse turn of events can cause profits to fall, there is very little likelihood of any appreciable upward trend in trading profits while control of prices and profits remains in its present form. Moreover, while Excess Profits tax continue at 100 per cent., there is, in effect, a ceiling to disposable profits.

From the long term point of view, it is obvious that other limitations of profits will impose themselves for some time, not the least of which will be the necessity of passing on to consumers some of the benefits of the efficiency and economy that we are achieving in manufacture. The best interests of shareholders are indissolubly linked with those of consumers and employees, and no company will have a right to survive in the future which does not have proper regard for all three of these aspects of the community's interest in its affairs.

While giving full weight to the foregoing considerations, your directors have decided upon an ordinary dividend of 10 per cent., because they consider that there is a reasonable hope of maintaining it.

FUTURE DEVELOPMENTS

As befits a company of our standing, we are taking a leading part in attempting to solve, in collaboration with the rest of the tinplate trade, the two outstanding problems of redundancy and reconstruction. Meanwhile, we are paying close attention to our own plant and neglecting no opportunity of increasing its efficiency.

Your directors have also had recently under review the vital question of research. It may be anticipated that in the future there will be increased expenditure under this heading.

McDOUGALLS TRUST, LIMITED

HIGHER TRADING PROFITS

The tenth ordinary general meeting of McDougalls Trust, Limited, was held, on the 6th instant, in London. Mr Kenneth A. E. Moore, the chairman, presided.

The following is an extract from the chairman's statement:—

The accounts of the operating company, McDougalls, Limited, for the year ended March 31, 1943, show hardly a ripple on the surface—the profit of £256,382, which corresponds approximately with the pre-war standard for excess profits tax purposes, being a thousand or two higher than in recent years.

The business has, in fact, earned profits substantially in excess of £250,000 in each year since the imposition of excess profits tax and since the inception of Government control of flour milling operations, but such excess is for Government account either in terms of excess profits tax or by adjustment of remuneration under the Government agreements with the milling industry. Throughout this period the dividends paid by McDougalls, Limited, to McDougalls Trust, Limited, have been stabilised at £202,000, enabling the latter company to maintain the customary dividend of 10 per cent. on its ordinary shares.

PRODUCTION MAINTAINED

The rationing of all the principal articles of food, other than flour, has not unnaturally led to an increase in the consumption of flour, not only in the form of bread but also in the form for which McDougalls self-raising flour has always been pre-eminent—namely, home-cooked puddings, pastries, cakes, etc. In this and other ways (for example, the increased consumption of potatoes) no one in this country has yet gone short of what is required for the maintenance of health and energy—in fact, statistics point to a definite improvement in public health, showing that the combination of rationed and unrationed foods available to the public is adequate.

The demand for McDougalls self-raising flour has been almost insatiable, and our management and workpeople can take credit for having achieved and maintained a very substantial increase in production.

When war was threatening, and in good time, we took all practicable steps to increase our stocks of wheat, raising ingredients, packing materials, etc., and to increase our packing facilities elsewhere than in London. Looking back it is interesting to note that the one thing we have never been short of is wheat, and for that (except for the first few months of the war, for which we ourselves had provided) we have to thank the arrangements made by the Government and the efforts of the Royal Navy, Merchant Navy, and farmers. It is rather in the unspectacular but essential details such as paper, cardboard, string, and even gum that our material difficulties have at times seemed formidable. In the end none has proved insuperable.

ZONING SCHEME

So far as distribution and transport are concerned, it has recently been necessary in the national interest for "zoning" to be applied to the self-raising flour trade. In the preparation and initiation of the zoning scheme (and, indeed, in many other ways) it has been both our duty and pleasure to co-operate to the full with the Ministry of Food. The zoning scheme, which is now in operation, inevitably involves some disturbance of our trade in view of its national distribution. Fortunately we have mills and packing plants in various parts of the country, and, thanks to these and to reciprocal arrangements which we have made with certain of our friends and competitors, whose help and co-operation in this regard I desire to acknowledge, the disturbance is unlikely to assume major proportions.

The report was adopted.

LISBON ELECTRIC TRAMWAYS, LIMITED

INCREASED TRAFFIC

The forty-fifth ordinary general meeting of Lisbon Electric Tramways, Limited, will be held, on the 18th instant, at No. 4 London Wall Buildings, London, E.C.

The following is a summary of the statement, by the chairman, Mr A. N. Rye, M.I.E.E., which has been issued to the shareholders with the report:—

The revenue shows an increase of £183,144, but the increase in expenditure amounts to £188,954. Included in this figure is not only the enormously increased cost of coal and all the supplies we need to maintain the system, but also the provision we have thought it necessary to make for deferred maintenance and provision for the total taxation which will ultimately have to be paid on the profits of 1942.

The profit and loss account shows a balance to the credit of £58,948, to which is added the balance brought forward of £30,891, together amounting to £89,839. The board recommends the payment of a final dividend of 2½ per cent. net, which, with the interim dividend, will make 5 per cent. net for the year, this being the same as the dividend paid last year.

On April 13, 1943, the Portuguese Government enacted a law for the nationalisation of companies operating public utility undertakings in Portugal. We are advised that this law does not become fully operative until after the issue of regulations which have not yet been published; consequently it is not possible at this stage to say to what extent, if any, this company will be affected.

In accordance with the findings of the Wages Commission, set up by the Portuguese Government, increases of wages and improved conditions of employment have had to be granted as from January 1, 1943, which will cost the company about £65,000 per annum.

HUDSON'S BAY COMPANY

RECORD PROFITS

The 274th annual general court of the Governor and Company of Adventurers of England Trading into Hudson's Bay was held, on the 6th instant, in London. Mr P. A. Cooper (the Governor) presiding.

The following is an extract from the Governor's statement circulated with the report and accounts:—

The outstanding features of the accounts are the financial strength of the company, the record trading profits, and the high level of taxation which absorbs the bulk of these profits. The expanded purchasing power in the hands of the public contributed to record sales and profits in our retail stores. Great credit is due to our managements for what has been achieved in face of difficulties of all kinds.

Supply difficulties also affected the wholesale operations, dealing as they do largely with imported commodities such as tea, coffee, blankets, and Scotch whisky. Owing to restrictions, further business in the United Kingdom was still at a low ebb. The profits, though less than those of last year, were substantial.

Improved incomes from crops, increased livestock sales and other sources assisted Land Department collections. They also stimulated sales of land, though substantial sales of low-grade lands, partly for non-agricultural purposes, lowered the average price obtained during the year. However, there is no sign of a marked improvement in prices of West Canadian farm lands.

In the midst of a great war it is difficult to say much about the prospects of the company as a whole. Our most important task at the present time is to strengthen it so that it may be able both to overcome difficulties and to take advantage of opportunities for profitable developments.

The report was adopted.

IMPERIAL BANK OF IRAN

WARTIME CONDITIONS AND PROBLEMS

SIR HENRY McMAHON'S STATEMENT

The fifty-fourth ordinary general meeting of the Imperial Bank of Iran will be held, on the 25th instant, at the Institute of Chartered Accountants, Moorgate Place, London, E.C.

The following is the statement of the chairman, Col. Sir A. Henry McMahon, G.C.M.G., G.C.V.O., K.C.I.E., C.S.I., circulated with the report and accounts:—Our Iranian accounts this year have been converted at 128 rials to the pound sterling, which has been the official buying rate since May, 1942.

Transactions in sterling, dollars, rupees and Iraq dinars have been unrestricted in Iran throughout most of the year, and all operations in foreign exchange by the Banque Mellie and ourselves have been for account of the Iranian Government Commission for the Control of Foreign Exchange. The business of exchange settlement has, however, now been assumed by the note issue department of the Banque Mellie, which will carry the risk of uncovered positions and will receive the greater part of the difference between buying and selling rates.

INFLATIONARY INFLUENCES

The rise in prices of labour and commodities has proceeded apace, but with substantial British and American requirements of Iranian currency, and the increased difficulty in importing goods to Iran, there has been no occasion to disturb the welcome stability of exchange rates notwithstanding the heavy fall in the purchasing power of the rial. Traders and property owners have continued to make abnormal profits, and their financial resources are much increased.

These inflationary influences, and the parallel movement in Iraq, are reflected in our balance-sheet, where the total of deposits has risen by 75 per cent. to over £16 million. The latter figure, however, is exceptionally swollen by some large deposits against which advances appear on the other side of the account. The greater part of the increase of £800,000 under bills payable is in items in transit, these amounts being increased by postal and telegraphic delays.

On the other side of the account we have increases of £5,400,000 in cash, £700,000 in investments, £1,700,000 in discounts and advances, and £250,000 in bills receivable. It will be seen that we hold 55 per cent. of our deposit liabilities in cash and money at call or short notice. The amount of £6,358,000 shown under discounts and advances includes some £4½ million secured by sterling and dollar balances or held on

our account by correspondent banks in America and India in respect of our customers' business. Bills receivable are increased by items in transit for the reason already given. Acceptances reflect a small reduction in our documentary credits outstanding.

PROFITS FOR THE YEAR

Our profit for the year, after ample reservation for taxation, shows an increase of £7,672, which enables us, besides providing for the usual dividend, to place £50,000 to reserve account and to increase the carry forward by £500.

Iran is faced with the same present and post-war problems as beset other such countries where the restraints arising from an international conflict are not made acceptable, nor its opportunities controlled, by the stark needs of active warfare. The budget, strained by greatly increased administrative costs, is not balanced by compensatory increases in direct or indirect revenue, and control of speculation and of the supply and distribution of essential commodities has not been adequately effective. The Savings Bank has made progress, but there has never yet been an issue of Government bills, bonds or stock for internal public subscription. To assist in meeting these difficulties, the Iranian Government has repeated its policy of 1922-1927 by calling in an American financial adviser to whom wide powers have been given. The immediate prospect has been much improved by hopes of an excellent harvest.

BUSINESS IN IRAQ

Business in Iraq has shown the same features of active employment and trade, shortage of imported goods, high prices, and good crop prospects. Wholesale prices in Baghdad last spring were about six times the pre-war average, which is about the same increase as in Iran. Contraband export of wheat and barley over the wide frontiers to Iran and Syria was nevertheless extensive. The lion's share of trade with both Iran and Iraq has again gone to India. Much of the import trade from India to the Persian Gulf is now carried in native sailing craft owing to the shortage of ordinary cargo steamers.

The resumption of commercial transport through the Mediterranean will help to restore the trade of both countries with Britain and America. The Iraq Government budget, like that of Iran, again shows a deficit owing to higher administrative costs. Oil revenues are an important con-

tributory to the resources of both countries. The Iraq exchange has maintained its admirable record of stability. The note circulation, like that of Iran, has continued to expand.

THE KUWAIT OFFICE

Our office at Kuwait has justified its establishment. This port is a valuable emporium for trade with the hinterland of North-Eastern Arabia, mainly in goods imported from India. The countries we serve in the Middle East have not suffered the direct shock of war, though they have felt its repercussions. With wise administration, supported by the growth of public spirit, they should take an increasing share in the comity of nations, and in the beneficial exchanges of international trade, when the world's highways reopen to peaceful traffic.

LUNUVA (CEYLON) TEA AND RUBBER ESTATES, LIMITED

RECORD CROPS

The thirty-sixth ordinary general meeting of the Lunuva (Ceylon) Tea and Rubber Estates, Limited, was held, on the 12th instant, in London, Mr H. J. Welch, the chairman, presiding.

The following is an extract from the address of the chairman, circulated with the report: After writing off £11,134, the net amount expended during the year on buildings, machinery, etc., and providing £75,000 for Ceylon taxation and £55,000 for excess profits tax, the net profits amounted to £112,730. The final dividend of 6 per cent., less income tax at 6s. 4d. in the £, makes for the year 10 per cent., less income tax at an average of 6s. 7d. in the £. The low rate of income tax deducted is attributable to Dominion tax relief. The dividends paid are equal to 13.46 per cent. for the year if income tax had been deducted at the standard rate of 10s. in the £.

The tea crop manufactured—over 7,500,000 lbs.—was a high record for the company, and averaged 824 lbs. per acre. Any saving which might have resulted from the increased output was more than offset by increases in the cost of production. The price realised was 1d. per lb. higher, but the profit per acre was lower at £14 15s. 7d.

The rubber crop of 2,177,000 lbs. (over 970 tons) was also a high record, and averaged 477 lbs. per acre tapped. The price realised shows an increase of over 2½d. per lb. and the profit per acre was £7 9s. 6d. Copra manufactured from our coconut crop amounted to 632½ tons and yielded a profit of £2 10s. 5d. per acre. We estimate during the current year to produce larger crops of tea and rubber, but at increased cost in each case.

The report and accounts were adopted.

RECORDS and STATISTICS

INDUSTRY AND TRADE

Tea Purchase.—The Minister of Food has bought all the 1943 tea crops—amounting to 700,000,000 lb.—available to the United Nations, on behalf of the United Nations. The Empire crop has been increased to offset losses from the Netherlands East Indies and China. It is likely that the tea ration in this country will be maintained at its present level throughout 1944.

Farm Workers' Wages.—The application for an increase in the national minimum wage for farm workers to £4 a week was rejected by the Agricultural Wages Board on Wednesday, but a motion for an increase of 5s. a week was carried. The Board will meet again on September 21st.

Coal Output.—The output of saleable coal in the four weeks ended July 10, 1943, averaged 3,579,700 tons a week compared with 3,936,600 tons in the previous four weeks. These figures are, however, not comparable with the previous four weeks owing to the incidence of the Whitsun holiday.

WEEKLY OUTPUT OF SALEABLE COAL (Weekly Standard Tonnage 4,161,800 tons)

FINANCE AND BANKING

THE MONEY MARKET.—At the beginning of the week there were signs of a tighter credit position in the money market. By the middle of the week, however, supplies of credit, though not abundant, were adequate; the banks were readier buyers of bills, and the market had no difficulty in taking up its Treasury Bills, especially as its allotment at the previous tender had been comparatively low. The Bank Return shows a further small contraction in the credit base. The holiday season is still influencing the note circulation, which shows a rise of £1,596,000. On the other hand, Government securities and other securities are down by £3,115,000 and £2,524,000 respectively, and the net effect on bankers' deposits is a fall of £8,374,000 to £140,259,000.

MONEY RATES, LONDON.—The following rates remained unchanged between Aug. 6th and Aug. 12th:—
Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days 1½%, 3 months 1½%, 4 months 1½%, 6 months 1½%, 1 year 1½%. Treasury Bills: 2 months 1½%, 3 months 1½%, 6 months 1½%, 1 year 1½% (Aug. 6-9, 1-1½%). Short Loans, 1-1½%. Day-to-day Discount deposit at call ½%, at notice ½%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between Aug. 6th and Aug. 12th. (Figures in brackets are par of exchange.)

United States. \$ (4.86) 4-02½-03½; mail transfers 4-02½-03½. **Canada.** \$ (4.86) 4-43-47; mail transfers 4-43-47½. **Switzerland.** Francs (25.22) 17-30-40. **Dutch West Indies.** Florin (12.11) 7-58-62½. **Portugal.** Escudos (110) 99-80-100-20; mail transfers 99-80-100-30. **Panama.** \$ (4.02-04) (buying). **Brazil.** 83-64½ cr. (buying). **Uruguay.** 7-6597 p.

Fixed Rates for Payment at Bank of England for Clearing Offices. Spain. Peseta 40-50 (Official rate). Turkey. Piastres 520. Italy. 71-25 lire.

Market Rates.—The following rates remained unchanged between Aug. 6th and Aug. 12th:

Egypt. Piastres (97½) 97½-1. **India.** Rupee (18d. per rupee) 17½-18½ p.d. **Belgian Congo.** Francs 176½-1. **China.** National \$3-3½. **Iran.** Rl. 128-130.

Special Accounts are in force for Chile, Peru, Bolivia and Paraguay, for which no rate of exchange is quoted in London. Rate for payment into Argentine special account is 16-00 pesos (Aug. 10th).

Forward Rates.—Forward rates for one month have remained unchanged as follows: **United States.** 1 cent pm-par. **Canada.** 1 cent pm-par. **Switzerland.** 3 cents pm-par. **Sweden.** 3 ore pm-par.

GOVERNMENT RETURNS

For the week ended Aug. 7th, 1943, total ordinary revenue was £48,923,000, against ordinary expenditure of £99,581,000, and issues to sinking funds of £205,000. Thus, including sinking fund allocations of £3,250,958 the deficit accrued since April 1st is £1,153,858,000 against £1,014,619,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £153,491 to £2,967,880, the other operations for the week (no longer shown separately) raised the gross National Debt by £49,845,336 to £18,008 million.

Printed in Great Britain by ST. CLEMENTS PRESS, LTD., Portugal St., Kingsway, London, W.C.2. Published weekly by THE ECONOMIST NEWSPAPER, LTD., at Brettenham House, Lancaster Place, London, W.C.2—Saturday, August 14, 1943.

stances is it surprising that they interpret the Allies' hesitation over a blow in the West as a refusal to take any risk at all for a common and speedy victory?

Much that has been equivocal and disturbing in Russia's recent policy springs from this fundamental distrust. The apparent lack of co-ordination between the political strategy of East and West is a function of the Russians' fear that they have been manoeuvred by Britain and America into bearing more than their share of the suffering and the loss. The absence of Russian delegates from the Quebec Conference and the sharp tone with which the Tass agency denied that an invitation had been issued or that participation was contemplated reflect Russia's impatience with the military situation. A closer brotherhood in arms is almost certainly a condition of clearer political understanding. The Quebec Conference is unlikely to lay the foundations for a joint policy with Russia unless it proves possible to take a favourable military decision on opening a new and effective front.

That is the first task. The political decisions follow from it. Allied policy towards the Badoglio Government must depend to a large extent on the direction taken by the next offensive. The recognition of the French National Committee becomes a matter of much greater urgency if France is soon to be drawn into the fighting zone. The policy of the three Great Powers towards the various Allied Governments has still to be clarified. It is the wish of most of these Governments to enter Europe with the occupying troops. If the Allies accept the thesis that they should at once be established as *de facto* if not *de jure* governments, it is vital that the three Great Powers should recognise the same authority. This is not certain in the case of Poland and possibly of Yugoslavia. It is important, too, that general agreement should be reached on the procedures necessary for securing the people's consent to their restored governments. King George of Greece has promised a general election within six months. It would be wise if safeguards such as these were generally registered at once.

Whatever local authorities are recognised by the

Allies, agreement on the practical working of UNRAA—in such matters as the appointment of officials or liaison between the Powers—needs to be speeded up to cover all liberated territories. And, for enemy territory, spheres of occupation, the association of Russia with Amgot, and decisions on the establishment or recognition of national authorities cannot be delayed much longer if a converging invasion of Europe is planned for the autumn. The equivocal status of the Russian-sponsored German National Committee is a reminder that these problems will not, if they are left alone, solve themselves. Joint political understanding must be sought if the actual methods of occupation are not to frustrate the achievement later of a genuine settlement.

The fact that both Mr Eden and Mr Cordell Hull are attending the Quebec Conference is a guarantee that the political implications of the next military phase are not being neglected. Provided the British and the Americans reach clear military decisions and can speak with one voice on their political strategy, it would obviously be a great reinforcement of the common effort if one or two of the leading statesmen could, as has been suggested, go on from Quebec to Moscow and draw the other great partner into a joint military and political strategy.

Quebec marks a turning point in the collaboration of the United Nations. It is perhaps the last occasion on which the compelling need to defeat Germany will hold together all their potentially divergent aims and policies. If in the course of the next weeks, a new foundation of interests and loyalties cannot be laid to replace the old bond of common fear, the outlook for order and security is not reassuring. That Mr Roosevelt, Mr Churchill and Marshal Stalin have shown themselves to be military leaders of superb quality is also not in doubt. But the task ahead of them now is far more difficult and arduous than any they have achieved so far. The ordinary people of this world, whose future depends upon their decisions, can only hope that they will bring to their making the necessary wisdom, tolerance, judgment and mutual trust.

Commonwealth Counsels

FROM both of the senior Dominions of the Commonwealth attention has been directed in the last few days to the relations of the British nations among themselves. The first few days of Mr Churchill's stay in Quebec were devoted—with perhaps a touch of deliberateness—to a series of Anglo-Canadian conferences as preparation for the British-American discussions to follow. The presence of Sir John Anderson as well as of the Prime Minister made it possible to hold a joint session of the United Kingdom War Cabinet with the War Committee of the Canadian Cabinet. These indications have given great pleasure in Canada, and it is right that it should be so. They have been taken not only as a symbolic acknowledgment of Canada's very great part in the war but also as a graceful attempt to repair an omission in the Prime Minister's previous transatlantic relations. In Australia, Mr Curtin's election speeches have made several references to Australia's relations with the United Kingdom, and one of them has put forward proposals for closer association. Mr Curtin is quoted as having said in a speech at Adelaide that an imperial consultative body would emerge from war-time international relationships. Some imperial authority, he said, had to be evolved so that the British Commonwealth of Nations would have, if not an executive body, at least a standing consultative body. Thus in Australia an authoritative voice is raised for the creation of organs of association, while Canada takes pleasure from the convening on her soil of just such an instrument, none the less powerful for being impromptu.

In all the essentials, the war has strengthened the ties between the British nations. The spontaneity with which these communities, remote from the centre of disturbance, sprang to arms in 1939 and have stood together ever

since demonstrates the reality of their association and gives the most emphatic contradiction to the separatist prophecies of so many of their own intellectuals in the years between the wars. The exception to the rule—Eire—proves no less conclusively that the unity of the others is unforced. This is the main issue, and it should never be forgotten. But there is also some tincture of dissatisfaction with the details of relationship between the United Kingdom and the Dominions. In Australia in 1941 these complaints were vocal, but two years of further reflection and of further experience have brought a better understanding on both sides of the necessities that underlie grand strategy. Australia no longer believes she was deserted or neglected; but there remains a desire for means by which the understanding could be reached before the crisis and not after.

Canada has officially voiced no complaints. But in ordinary conversation in Canada there is a deep undertone of dissatisfaction. Canada is conscious that in this war she has come to power in her own right. She has sent large armies abroad; she maintains a navy and an air force; in munitions she is the fourth largest producer of the United Nations, as an exporter of food the first or second. Not merely as the senior of the British Dominions, but as the largest of the smaller United Nations, she knows that she is entitled to a voice in the councils of the alliance. Yet she does not feel that she is given her place. Mr Churchill's portrait is to be seen the length of the Dominion—far more frequently than in London—and his character and attainments are nowhere more highly esteemed. But Canadians are hurt by the way in which (they think) he repeatedly passes them by to concert with the American President plans by which Canada is expected to be bound. Mr Churchill's action

two years ago in signing the Atlantic Charter, in North American waters, with the head of what was then a non-belligerent nation, without consultation with Ottawa, gave great offence. So did the establishment of British-American Combined Boards, without Canadian knowledge. So did the proposal to create a United Nations Relief and Rehabilitation Administration, of which Canada—who will have to provide as much relief as any other country—was not to be admitted to the inner ring. It is as well that Englishmen who know that neither slight nor disrespect nor lack of appreciation was intended should know that harm was done. It in no way affected Canada's place in the Commonwealth; every item on the list has been settled with good will on both sides; but there remains a certain residue of Canadian watchfulness lest her claims be further disregarded.

With the point of view of the Dominions there is probably far more sympathy in London than the Dominions themselves know. Mr Churchill's methods are very direct—it is one of the facets of his qualities—and it may be admitted that there has perhaps been an insufficiency of diplomacy. What it would be wholly wrong to admit is that there is any unwillingness anywhere in the United Kingdom to treat with the Dominions on the basis of the utmost frankness and the fullest equality. If, in respect of the Dominions, the colonial mentality lingers anywhere, it is certainly not in London or among the British public. One of the tendencies which causes alarm in Ottawa and Canberra is that of discussing the post-war settlement in terms of the three—or four—Great Powers, and the Dominions are apt to deduce from it a forgetfulness on the part of the United Kingdom of the rights and values of small nations, including small British nations. But this is a misapprehension. There are, it is true, many reasons why the Great Powers will be compelled after this war to assume an even greater share of responsibility, and it will be a gain if the post-war arrangements make it clear where the responsibility lies. But the more fully the British member of the Concert of Great Powers represents the whole Commonwealth, rather than only the United Kingdom, the better the people of Great Britain will be pleased. More than ever before, they realise the limits of their own autonomous strength and wish to be members of a wider unity.

To this the Dominions might well reply that they know the advantages of unity, but that it must be based on something more than formal equality of status. That they have had for a decade in law and for longer in fact. But (so they might continue to argue) what has happened has been "consultation," which is something less than the formulation of policy as between equals. The United Kingdom Government evolves a policy through its own agencies and, when it is in finished shape, invites the concurrence of the Dominion Governments with it. This may or may not be a caricature—no one without access to the documents can tell—but it is the complaint that is

often made, and the basis of the claim that something is still lacking to give full actual meaning to the phrases of the Statute of Westminster. The Dominions wish to play as large a part as the United Kingdom itself in the formulation of policy from first draft to finished document.

This claim, too, would be very widely accepted in Great Britain. But before it can be embodied in working practice, two provisos must be made. First, the formulation of policy cannot be done by cable. It requires personal contact and, sometimes, the utmost dispatch. As Mr Curtin said at Adelaide, "Unless a decision is made quickly, delays will produce inertia or complete inaction, and when the decisions are ultimately reached, they will be too late to be fully effective." The fullest co-operation in the formulation of policy requires that there be an imperial body in fairly constant session. It need not always sit in London, but London is probably a more convenient centre than most. If the United Kingdom has acted in the name of the Commonwealth without proper consultation, it is as much because of the absence of such a body as through any desire to ignore the Dominions' views. Constant session raises, of course, the most difficult issues; but it is obvious from the experience of the war that statesmen cannot in future expect to stay at home. If the British Cabinet can post one of its members in Washington, it should not be impossible for a Dominion Cabinet to post one of its members in London.

The second proviso is (to adapt a famous phrase) that there should be no representation without taxation. This is not, of course, meant in the literal financial sense; there is no suggestion of financial contributions in peacetime from any one member of the Commonwealth to any other, and the Dominions can best bear their share of the common burden of defence by raising and equipping their own forces. But it does mean that a full share in the formulation of policy should be taken positively as well as negatively. It is not enough for the Dominions to state their wishes at an early stage; they should be ready to assume responsibility for the finished policy and to shoulder commitments in respect of it. This is not always fully realised. Some of the Australian demands for an Imperial War Cabinet in 1941, for example, seemed to envisage a body that could control the actions of the United Kingdom Government but without committing Australia. No one, of course, would suggest that any country should be committed against its will. Irish neutrality is a proof of the right to contract out. But if a Commonwealth policy—Commonwealth in origin and Commonwealth in execution—is to become a positive reality, all the British nations must be ready to take commitments in common council. With anything less, the United Kingdom will be compelled, whatever her wish to seek and take advice, to act on her own with such *post facto* assent as the Dominions will give.

EQUITY & LAW
LIFE ASSURANCE SOCIETY
Established 1844

PROTECTION IN WARTIME

• Civilian War Risk Cover without additional charge is normally granted under new Whole-Life and Endowment Assurances—whether With-Profit or Without-Profit.

• A Guaranteed Bonus each year until 1946 inclusive is provided under all new With-Profit Policies—thereafter Bonuses are dependent upon Profits.

Head Office: 163/4, STRAND, LONDON, W.C.2
(temporarily transferred from 20, Lincoln's Inn Fields)
Telephone: TEMple Bar 0381

These are the considerations that will have to be borne in mind in discussing the machinery of association. Anything in the nature of a federation can—at least for the present—be dismissed from consideration, since few, if any, of the British countries would accept it. Perhaps something in the nature of a standing Imperial Conference would best meet the needs of the case, and it would certainly be more in accordance with British tradition to adapt an existing institution than to create a new one. Whatever the exact form it takes, it should carry the full authority of the constituent governments, so that the British representative in any international gathering (who need not always be drawn from the United Kingdom alone), having received his instructions from the Imperial Conference, can speak, and be known to speak, with the voice of the whole Commonwealth. Britain is a natural member of the Concert of Great Powers; but "Britain"

should mean the Commonwealth of Nations, not the United Kingdom by itself.

The Dominions, in asking for the fullest equality, are knocking at an open door. There is no desire in the United Kingdom to infringe their sovereignty or to degrade their status. If sovereignty must be abridged, the necessity arises from the very fact of association, not from London's desire to command. And if London must on many occasions take the initiative, it is only because the United Kingdom is still the largest and the strongest of the Dominions of the Crown. Any institutions which emphasise the organic character of the Commonwealth while widening the opportunities of the Dominions for initiative and responsibility will be welcomed in this country. As for the exact form of the institutions, provided it meets the inescapable necessities of the case, the Dominions can write their own ticket.

The Aircraft Industry

THE manufacture of aircraft is to-day Britain's biggest industry. Enormous though its current output is, its immediate task is to speed up still further the delivery of aircraft to the battlefronts. A report of the Select Committee on National Expenditure contains a number of valuable suggestions—discussed on page 231—designed to extract the "last plane" from the industry. But the time may not be far distant when, with victory, the industry will be faced with a sharp decline in orders and when it will have to adjust its manufacturing capacity to the smaller peacetime demand. In view of the disintegration of the industry after the last war it is not too early to prepare plans for its orderly contraction. The two most important problems that will have to be considered are the probable magnitude of the peacetime demand for aircraft and the shedding of the industry's surplus capacity after the war without detriment to its enterprise and efficiency. The maintenance of Great Britain's sea power involves a large and efficient navy and mercantile marine, backed by a large and efficient shipbuilding industry. Similarly, the maintenance of its air power requires a substantial fleet of the best military and civilian aircraft, backed by a substantial and efficient manufacturing industry.

It is impossible, at this stage, to forecast the total demand for aircraft after the war with any degree of precision; but it is not wholly impossible to set down the sort of considerations which must enter into any realistic calculations. If the maintenance of a strong and efficient air force and the creation of a strong and efficient air transport system are accepted as the basis of British policy, there can be no doubt that the demand for military aircraft will be larger than it was before the beginning of rearmament in 1936 and that the demand for civilian aircraft will be larger than ever before. But to say this does not shed very much light on how the total post-war demand is likely to compare with the present rate of output.

Nothing has been revealed of the Government's idea of the appropriate size of the post-war RAF. But, by way of illustration, it may be supposed that, with all its world-wide commitments and with the generally increased size of air forces that will result from the war, the permanent peacetime first-line operational strength of the various branches of the RAF may be as much as 2,500 aircraft. Let it be assumed, further, that the maintenance of a first-line strength of this magnitude involves the creation of a reserve, inclusive of trainers, of five aircraft for each first-line plane. On this basis the total strength of the air force would have to be maintained at 15,000 units. But in aircraft quality is even more important than numbers, and technical progress is likely to remain rapid—though, probably, less rapid than in war; a substantial proportion of the total military fleet will have to be replaced every year. Moreover, the rate of wastage—though much smaller than in war—is considerable even in times of peace. It may

therefore be not unreasonable to assume that at least one-fifth of the total air fleet will have to be replaced every year if its quality and strength are to be maintained—this would mean that the average age of the aircraft of the RAF at any time would be 30 months. The peacetime demand for military aircraft would then be at the rate of about 3,000 units a year, comprising all types of operational, military transport and training aircraft. This would be equivalent to rather more than double the output in 1935, when it was probably between 1,200 and 1,500 units. No figures have been released of the present output, but a rate of 3,000 a year could not, at the most, be more than one-eighth of the industry's present capacity.

There are equally few data on which to base any accurate estimate of the future demand for civilian aircraft. While it is safe to forecast a great expansion in civil aviation after the war, it is easy to exaggerate the increase in the demand for aircraft. So far as the regular transport services are concerned, the total number of aircraft used before the war on the internal lines in the United States—the most highly developed network—was fewer than 500, and the number employed in the whole world was probably only about 1,200. Even if the capacity of the regular air transport lines is multiplied fivefold a few years after the war, and the whole fleet of 6,000 air liners is replaced every five years, the world's annual demand would amount only to 1,200 air liners, of which British manufacturers might reasonably expect to receive orders for about 300 a year. True, there is also scope for air taxis and for a substantial expansion in private flying. But these activities require mostly small aircraft costing a tenth or a twentieth as much as a big air liner. Most of the 1,666 aircraft registered in this country before the war fell into this category. If their number were to increase to, say, 4,500 after the war, the annual replacement demand would hardly be more than about 500, since this type of plane has an average life of more than five years. True, there may also develop a considerable export business in small aircraft (and in military aircraft), but it might be wise to think in terms of hundreds rather than thousands, during the years immediately following the war; perhaps 300 to 500 units would be a reasonable expectation under this heading. On all these assumptions, the annual requirements of civilian aircraft, both large and small, would be of the order of 1,100 to 1,300 units a year, against an output of, perhaps, 300 to 600 in 1935.

Counted in bare numbers, without any differentiation for size, the combined annual demand for military and civilian aircraft thus adds up to rather more than 4,000 units a year. In so far as this figure deserves the name of an estimate, it is an estimate of the upper limit of the range of probability, since all the assumptions made in arriving at it have been uniformly generous. This may explain why its proportion to the probable present output is rather higher than the ratio of one-tenth mentioned

by Sir Stafford Cripps in a recent speech. But the figure will serve to show that, even on the most optimistic assumptions, the peacetime requirement of aircraft will be only a very small fraction of the present output. There will, it is true, be a transitional period during which civil aviation will be building up its stock of aircraft and the demand may then be higher than in later years when it goes on to a replacement basis. But this period will also be one when the RAF will have an enormous stock of modern aircraft and will be unlikely to be placing orders on the permanent scale.

Whatever the precise extent of the cut in output, it will have to be very substantial, involving a major readjustment of the industry's capacity. How is this to be achieved without impairing the efficiency and enterprise of the aircraft industry? The process by which the industry was expanded seems to point the way to a partial solution of the problem. Under the "shadow" factory scheme, devised before the war, the Government constructed at its own expense large numbers of factories, managed for a fee by aircraft, automobile and engineering firms. When war came, the automobile and engineering firms taking part in the scheme were able to add part of their own manufacturing facilities to those of the aircraft factories; productive capacity was subsequently enlarged still further by sub-contracting small components to numerous minor establishments.

After the war, this process will be reversed automatically—but only partially—by the resumption of the production of motor-cars and peacetime engineering products. But the degree of automatic deflation will hardly go far enough. The firms whose main peacetime business is the construction of aircraft—what may be called the established industry—have added to their own capacity; and there will also still remain the large number of plants built by the Government. There will hardly be enough orders to employ all this capacity. Mr Thomas O. M. Sopwith, chairman of the Hawker Siddeley Aircraft Company, Ltd.—the biggest aircraft manufacturing combine in Great Britain—suggested in his statement to shareholders in July that

with the probable cessation of work in shadow factories and the normal recession of labour to pre-war occupations, the established industry will be on a stable basis.

The implication of this statement is that the capacity of the established industry will be of the right size to meet post-war demand, and that the shadow factories will be the measure of the excess capacity that will need to be eliminated. Since Mr Sopwith takes by no means a

pessimistic view about the post-war demand for aircraft, the problem will be that of eliminating, not necessarily all the Government-owned shadow factories—some of them may be more efficient than some of the plants owned by the professional industry—but capacity equivalent to that of these plants.

The fate of the shadow factories raises interesting and difficult questions. In theory, there is a case for maintaining them in being. If it is the case, and is likely to remain so, that the requirement of aircraft in time of war is from eight to twelve times the peacetime output, the retention of a number of shadow factories would seem to be an obvious insurance device. But it would be a very difficult matter to maintain them in a state of efficiency during long years when, by definition, they would have no work to do. If the shadow factories are to be scrapped, it would be sensible to allow the established industry—including any newcomers whose efficiency has been proved during the war and who wish to remain in the business—to buy such plant as they may require; the remainder would go to swell the general problem of surplus plant and machine tools, which, as an article on page 243 shows, is likely to be another headache. A policy for permanent shadow factories, if practicable, would serve the double purpose of providing insurance and of relieving the pressure on the machine tool market. But it is most unlikely that all, or even most, of the shadow factories can be treated in this way.

The future of the established industry will also require careful consideration. There will be those who will advocate nationalisation. On a balance of the facts known to the outsider, it would seem to be a mistake to bring the whole industry under Government control and ownership though there may well be a strong case for one or more Government factories, on the analogy of Woolwich Arsenal and the Royal Dockyards. The manufacture of aircraft calls for a high degree of initiative and enthusiasm, and for enterprise of the type that gave Great Britain the famous types that are winning the war. If, as seems most suitable, the bulk of the industry remains in private hands, there is no way of avoiding a "list of approved contractors," for standards of construction and efficiency and continuity of design are essential. But it will be equally necessary to ensure that the list of approved contractors does not become the basis of a restrictive "Ring." The Government has a right and a duty to be most fully informed of all that goes on in the industry, and, in particular, both to remove inefficient firms from the list and to add efficient newcomers.

The Neutrals' Part

ON August 5 the Swedish Government announced its intention to abrogate the transit agreement which, since June, 1940, has given the Germans the right to transport men and war materials to and from Norway over Swedish railways. It is too soon to say whether the other European neutrals will similarly stiffen their attitude towards the Nazis; but in any case Sweden's action clearly marks a new phase in the history of the neutrals during this war.

For the last three years, neutral policy—in Sweden, Switzerland, Turkey, Portugal and Spain—has, broadly speaking, been determined by the Axis. If they were not invaded and enslaved, it was because the aggression was not worth Germany's while. They lived under the threat of invasion—Germany's chief sanction in dealing with them. Military pressure was backed by economic pressure. With the conquest of Europe, all overseas trade which the Germans did not approve was cut off for Switzerland and for Sweden. The maritime neutrals lacked shipping and exchange. At the same time, there

were some raw materials—coal in particular—which they needed to keep their economy functioning at all. In all these circumstances, it is not surprising that they increased their trade with Germany and supplied vital sectors of the Axis war effort. Sweden has provided iron ore, wood pulp and machinery, Turkey chrome, Portugal urgently needed wolfram, Spain iron ore and pyrites, Switzerland precision tools and armaments. In some cases, the Germans have even been able to obtain their supplies on credit. Turkey, enjoying a more advantageous strategic position, stood out for direct barter.

The Allies could not prevent this trading with domestic resources. They could and did prevent the shipment of goods to Germany from abroad by way of the neutrals. They were able, too, through the British Statutory List and the United States Proclaimed List, to affect the policy of individual neutral firms and traders. These Black Lists covered enemy-controlled firms and neutral firms known to be trading with the enemy. From the beginning many of these latter firms hesitated to become declared enemies

of Britain and the United States. The hesitations have grown with every worsening of the Axis position, especially since inclusion on the Black List began in some cases to involve a great deal of personal unpopularity. As Mr. Dingle Foot pointed out in the Commons,

This weapon [the Black List] was invented simply as a weapon of economic warfare, but as the war has persisted, it has tended to become a weapon of political warfare as well.

The year 1943 has, of course, revolutionised the position of the neutrals. The military threat overhanging them has been removed. German divisions have been flung back and decimated in Russia and Sicily. All Italy's divisions are likely to be withdrawn from police work in the Balkans. Every day the tasks falling to the unaided *Wehrmacht* grow; every day its resources diminish. In these circumstances, neither the divisions nor the machine power exist to overrun Sweden, Switzerland, Turkey or the Iberian Peninsula. Sweden, Switzerland and Turkey are defended by tough, well-trained armies. Sweden has the extra protection of sitting on the far side of an excellent tank ditch, Switzerland of controlling the main tunnels through which Germany must still try to feed the Italian front. Germany's extremely mild reaction to the Swedish cancellation of the transit arrangement gave the measure of its military impotence.

While the menace of Germany to the neutrals has shrunk, their relative importance to the German war effort has grown considerably. After four years of all-out production, cut off from all outside sources of supply, Germany's war economy, as an article on page 241 describes in detail, is suffering from pernicious anaemia. Bombing and blockade together have drained away its vitality, and neutral supplies are becoming its chief means of recuperation. Take the particular instance of iron ore. The Allied winter campaigns closed down the supplies from North Africa. Bombs and torpedoes have played havoc with the iron ore ships from Sweden both in port and in transit. The bombing of the Ruhr has reduced the output of steel there very greatly. Low grade German and Lorraine ores use up an uneconomic amount of urgently needed coal and coke. Sweden's iron ore, with its high iron content, is now Germany's chief

hope of keeping up its iron and steel production. The position is much the same with chrome and wolfram. Reserves are used up. *Ersatz* products are too costly in terms of coal and wood and manpower. The urgency of Germany's need for chrome is proved by the extremely modern military equipment it is willing to send the Turks in exchange for their ore. Finally, the fact that the Swedish and Turkish and Portuguese miners are at work digging the ore, and highly skilled Swiss technicians are turning out the machine tools and precision instruments, provides Germany with a large labour force which it does not have to feed or shelter and which is not subject to bombing. In this sense, each heavy Allied raid increases the importance of the neutrals' output to the German war effort.

This double trend among the neutrals—towards greater security from the German war machine and great significance for the German war effort—will increase by a geometrical progression as the fortunes of the Axis wane. The British and American Governments—and their peoples—have always sympathised with the delicate position in which Germany's 1940 victories left the neutrals. They have understood how galling it must be for friends of freedom like Sweden and Switzerland and declared Allies of this country like Portugal and Turkey, to be compelled to take no active part in the common struggle for freedom and, indeed, by their action to impede the victory which is as much to their advantage as to the Allies. Now, happily, that period has come to an end, and the neutrals have the opportunity of showing where their genuine interests and sympathies lie. Sweden has taken the first step along the road of this new policy. It is surely not too much to hope that the other governments will follow suit. To quote Mr Foot again:

We have no doubt as to where these people's sympathies lie, but at this stage in a world war I think it ought to be said that sympathy is not enough. It surely is not unreasonable to expect that manufacturers and merchants in neutral countries, and, I would add, the Governments of those countries, should give practical expression to their sympathies by reducing as far as they possibly can the contributions which they make to the enemy's war effort.

NOTES OF THE WEEK

Italian Deadlock

Another week has passed without any radical change in Italy. The situation is at a deadlock, balanced between the contending and incompatible interests of the Italian people, the Italian Government and the Allied and German High Commands. The Italian people want peace. Although evidence of the popular temper is seeping out with difficulty through the tightened censorship, there seems little doubt that all through Italy demonstrations for peace have been widespread and angry. In the North, they are accompanied by threats of a general strike. In the cities hard hit by the renewal of Allied bombing, workers have left their factories to take refuge in the countryside, and some reports reaching Switzerland from Milan suggest that the city is almost at a standstill. The longer the Badoglio Government hesitates, the stronger the reaction against his Government and, indeed, against the Royal House. The *Lavoro Italiano* reminded the government that the Italian people were not interested in a war waged "for the victory of Fascist ideals" and warned Badoglio that he would soon have to choose between peace and revolution. Apparently the wholesale pulling down of the façade of Fascism—which is still being carried vigorously on—leaves the people indifferent. They want peace. They thought Badoglio would secure peace. No amount of liberal window-dressing compensates them for bombs and casualty lists. It is harder to say what the Badoglio Government wants. They know that the war is lost and they want to get out of it—but on terms. If the reports are to be believed, the Foreign Minister, Guariglia, and Ribbentrop met at Treviso recently, and the Germans refused the Italian request that they should be allowed

to abandon the fight. It follows that Badoglio still cannot offer any terms which the Allies would accept. Their one interest in Italy is to secure a better position for attacking the Germans, the Germans' one interest is to prevent it. The terms—such as neutrality—offered so far by the Italians represent the German, not the Allied, interest. Unconditional surrender would naturally imply an undertaking from the Italian Government not to impede in any way the Allied conduct of the war either in or around Italy. The Germans, with whom Badoglio still collaborates—rather in the manner of Finland—will not permit this and have probably threatened reprisals. Their position is perhaps strengthened by Badoglio's unwillingness as a soldier to abandon a declared ally. In these circumstances, it is not very likely that the Badoglio Government will capitulate. If the Allied High Command decides that an invasion of the Italian mainland is the next urgent military task, it will be carried out, as the Sicilian operation was carried out, with some resistance from the Axis armies and a warm welcome from the Italian people. The uncertain factor in this complicated political equation—the factor which is most likely to end the deadlock—is the mood of the Italians. An Allied invasion of the mainland or intensified bombing might be the signal for a real upsurge of public discontent. If the analogy of Germany or Russia at the end of the last war is exact, it will prove impossible to hold the mass of the people in an unpopular war which they have already lost, and it is probable that a government emerging from a popular upheaval would be ready to make an unconditional surrender, and even to co-operate with the Allied armies.

Open City?

Until the Allies know what steps the Badoglio government intends to take to make Rome an open city, they cannot accept the simple Italian declaration that Rome is, in fact, "open." Their decision to bomb or not to bomb will therefore continue to depend on their estimate of the military importance of attacking the capital. International law knows nothing about open cities. The only relevant ruling is Article 25 of the Hague Convention of 1907, where it is laid down that there must be no bombardment of places "that are not defended." Defences are defined liberally. Arsenal, war factories, barracks, military headquarters, railways used for military purposes are all included under the general term defences. Indeed, the German War Book denies the relevance of Article 25 on the grounds that there cannot, under modern conditions, be such a thing as an undefended town. To dismantle Rome's defences would mean removing the Government and the Ministries, closing all the arsenals, war factories, and virtually cutting the railway communications between north and south Italy. Is this Badoglio's intention? It would seem a curious prelude to his government's declared intention of "resisting to the end." The simplest and surest way of making Rome an open city would be an Italian capitulation. It also has the advantage of being the method preferred by the Italian people.

An Industrial Achievement

In its tenth report of the 1942-43 session, published this week, the Select Committee on National Expenditure recorded that the production of aircraft was now substantially balanced, and that, with the exception of spares, there was at present no single field of production where a serious bottleneck threatened to retard output. Behind this brief tribute lies the story of a remarkable industrial achievement, unsurpassed by any other munition industry in this country. The basis of the industry's expansion into the biggest industry of Great Britain was laid in 1936-39 by Lord Swinton and Sir Kingsley Wood as successive Secretaries of State for Air. They foresaw that the small professional industry could provide the designing and technical skill but not the enormous manufacturing capacity needed in case of war, and they devised schemes for enlisting the assistance of automobile and engineering firms in the management of factories constructed by the Government. In other words, the aircraft industry formed the nucleus around which were grouped part of the automobile and engineering industries which provided the management for many Government factories and, when war broke out, added part of their own manufacturing facilities. As it exists to-day, the industry consists of a number of groups, each specialising in the production of one type of aircraft, and comprising one of the professional designing firms and a number of automobile and engineering concerns, with a long string of small sub-contractors. Difficulties of organisation, management, labour and technique have been legion. The task of welding a heterogeneous collection of units into an efficient single industry has not been easy. It had to be carried out rapidly in difficult conditions, especially during the period of frequent air raids in 1940-41, which necessitated the geographical dispersal of production. Managements, not surprisingly, were sometimes unequal to the task, and those of some concerns had to be strengthened by the Ministry of Aircraft Production in one way or another. The majority of the industry's labour force had to be specially trained; no less than two-fifths of it consists of women, many of whom had never been inside a factory before the war. Again, the maintenance of the lead in design involved continuous major and minor charges, and a nice balance between quality and quantity. True, there have been many mistakes and errors of judgment; a quota of those was unavoidable. But it would be ungenerous to overlook the facts that the industry has provided Great Britain not only with the best aircraft in the world, but also with large numbers of them, when they were badly needed.

Still More Aircraft Needed

Great though the industry's achievement has been and enormous though the output of manufacturers now is in America, its task has by no means been accomplished. On the contrary, the successful storming of the enemy's defences requires a further speed-up in the supply of

aircraft during coming months and a still greater effort from the aircraft industry. It is to this problem that the Select Committee addresses itself. In its view the industry has reached a stage when a further increase in output "must be sought mainly by all-round improvement in efficiency." In so far as the relations between the Ministry of Aircraft Production and the industry are concerned, the Committee stresses the advantages of collective consultation on the allocation of orders in the event of important changes of programmes. The technical efficiency of some firms could be increased by bringing together more closely the design and development department, and the department responsible for planning and methods of production. Facilities should be provided for the training of scientific and technical personnel as well as for training of managerial staff of all grades in order to relieve the present shortage. The system of sub-contracting, which plays such an important part in the industry—an average of some 42 per cent of the work on an aircraft is let out—needs overhaul; the disadvantages arising from the haphazard distribution of many small orders should be eliminated; and the process of reducing the number of sub-contractors engaged on the same component and the number of different components made by the same sub-contractor should be expedited and extended. Finally, the Committee deplores the enormous labour turnover in the industry and the consequent loss in output; during the seven weeks ended May 14th the main airframe and aero-engine factories had to replace workers at the annual rate of one-third of the total employed. In its view, better personnel management might assist in reducing excessive turnover. Although the majority of the Committee's recommendations are of a minor order, taken together they suggest that there is still scope for considerable improvement.

Shipping Progress Report

The latest report on the progress of anti-U-boat warfare issued jointly by President Roosevelt and Mr Churchill last week-end shows how completely, at any rate during the past three months, the hopes the Nazis had based on their U-boat war have been dashed. The landing in Sicily in-

White Horse is a tonic when you are jaded in body or mind, and if you are in lighter mood it puts a finer point on your enjoyment.

WHITE HORSE

MAXIMUM PRICES: Bottles 25/9;—Half-Bottles 13/6

volved no less than 2,500 ships; losses amounted to only 80,000 tons, and the submarines that attempted to interfere suffered heavy losses. The total number of submarines sunk during the past three months is 90, an average of nearly one a day. This rate of loss, which reveals the success of the measures taken to combat the U-boats, must be most alarming to the enemy and to his crews. Another yardstick of the success of the protective measures is the number of ships sunk per U-boat in operation. During the first six months of 1943, the average number of ships sunk per submarine was only half that in the preceding six months, and only a quarter of the figure for the first six months of last year. The diminished toll of the submarine has not merely ensured safe passage to an overwhelming proportion of the ships of the United Nations, it has enabled them to put into commission a volume of tonnage greatly in excess of losses; so far this year the volume of merchant vessels completed exceeded losses from all causes by 3,000,000 (presumably deadweight) tons. The progress report issued by the President and the Prime Minister is encouraging. But the battle of the high seas can only be won finally and decisively by a further intensification of the anti-submarine campaign.

Slow Pacific Progress

Late in June, Allied forces in the South-West Pacific began a double offensive in New Georgia and New Guinea. The aim was to secure control of the Japanese bases at Salamaua, Lae and Munda, as part of a converging movement on Rabaul, the most important Japanese position in this area. At first, the advance was rapid. American troops got within shelling distance of Munda airfield, while the American and Australian troops in New Guinea captured Mubo, and brought the Salamaua airfield under fire. Five weeks of difficult fighting have followed since. The Japanese dug themselves in, and brought up reinforcements. The attack in New Guinea came to a standstill, and Munda in New Georgia did not fall until August 6th, and then after desperate fighting, in which the Japanese contested every yard of ground. Now they have retreated to Bairoka. This new position was thought at first to be a relatively easy objective, but enemy reinforcements have arrived, and Allied troops are struggling in vile country—thick jungles, dense thickets, gullies—against carefully entrenched Japanese positions. Clearly the scale of the original operation has had to be modified. The compensating factor for the slowness and costliness of the land fighting is the scale of Japan's losses in the air and on sea. If the reports are accurate—both sides naturally give widely divergent figures—the Allies are able to inflict on the Japanese about three times the damage done to them, and this fact is significant not simply for the fighting in the Solomons area but for the whole co-prosperity sphere, which Japan has to patrol and supply. Nevertheless, it can be argued that the latest Pacific offensive, like its predecessors, proves that slow and costly island hopping is not the ideal method of counter-attack.

Algiers and the Purge

Now that the major decisions have been taken on the division of powers between General de Gaulle and General Giraud, there is an atmosphere of *détente* at Algiers. It should be possible now to overcome the division based on the two Generals and to see emerge a new solidarity firmly grounded in the civilian elements of the Committee which, after all, include men of the ability and personality of M. Massigli and M. Monnet. Their position would naturally be strengthened by Allied recognition of the Committee, but it

seems likely that this question will be settled at Quebec. In spite of this improving atmosphere, one or two points must still give anxiety to those who hope for freedom and reconciliation in France. One of the most urgent yet most difficult problems facing the French State after the war will be the question of allotting responsibility for the 1940 *débâcle*. The collapse was so widespread and the degrees of implication—from Laval down to the smallest civil servant—so finely shaded that it will be impossible to give adequate definition of guilt or to punish all the guilty. There are some obvious criminals—Pucheu, who has been arrested in North Africa, is a clear example. There are a large group of people in every walk of life who, whether they were *attentiste* or genuine collaborationist, are sufficiently under suspicion for their removal to be a matter of public conscience. But should the purge be allowed to go much further? If it is permitted to develop in an atmosphere of *fronde* and personal vendetta, will not the French people simply perpetuate to another generation the bitterness of 1789, of the Republic of Dreyfus, of the Combes Laws which, in a sort of accumulated strength, destroyed French unity in 1940? A committee of *épuration* has been set up in Algiers. Its task is to remove from office all who have helped the enemy, hindered the Allies or betrayed the Republic. Everyone, from Ministers and deputies to newspapermen, comes within its terms of reference. This step gives a double cause for alarm. The area of responsibility is established on a dangerously wide basis. And the setting up of the Committee at all at this stage suggests an almost unhealthy preoccupation with opponents and scapegoats. Has the purge really so high a priority? Could it not have waited until France was free?

Unrest in Norway

The shadow of Quebec and of the Allies' military decisions falls darkly across the Norwegian scene. The Germans obviously think an Allied invasion is possible, and extensive preparations are being made throughout the country. Fresh German military material is arriving at key points along the coast, and there have been reports of reinforcements consisting of crack German troops. This week it was announced from Oslo that "Norway is in a state of war, owing to the danger of Bolshevik or Allied attacks," and a new law was announced incorporating the Norwegian police, Quisling's bodyguard, the Norwegian *Waffen SS* and the *Hird*, Quisling's SA, in the armed forces of the Reich. In these circumstances, it is not surprising that the Norwegian people are growing more violent and restive. In particular, opposition to the mobilisation of Norwegian workers for the Reich has shown a marked increase. Obviously the citizens are determined not to be sent away from their country in what may be its hour of liberation. A new registration of Norwegian men and women was announced at the beginning of June. Every sort of difficulty has been put in the way of the authorities. All the records were burnt at Oslo, and in many other centres the labour exchanges have been raided and wrecked. Hundreds of Norwegians are crossing the frontier into Sweden, and in all the big centres every kind of delaying tactic is being used to postpone mobilisation and departure. In Oslo this week the Germans have had to shoot the Chief of the Norwegian Civil Police for refusing to send his men to coerce a group of women who had refused to obey their mobilisation orders. Since this week has also seen the incorporation of the Norwegian Police in the German armed forces, it must be assumed that Gunnar Eilifsen was shot *pour encourager les autres*.

The UPW and the TUC

On Thursday, the General Council of the TUC, the Executive Committee of the Labour party and the Executive Committee of the Parliamentary Labour party met to discuss the application of the Union of Post Office Workers for affiliation to the Congress. The meeting had been called before the Government issued its warning of the penalties incurred by individual civil servants who remain members of a union which infringes the Act of 1927, because it had already been realised that the UPW's application might have serious political repercussions. The warning will make them think even harder. At the time of going to press, the result of the meeting is not known, but the indications are that the Government's refusal to countenance any illegality has had the desired effect. It seems likely that the UPW will be asked to withdraw its application. The attitude of the three other unions of civil servants—

the Civil Service Clerical Association, the Inland Revenue Staff Federation, and the Post Office Engineering Union—must also have had some influence. Representatives of these unions had already met the Prime Minister and Sir Walter Citrine in the hope of effecting a conciliation. They support the UPW in its wish for the right to affiliate, but not in its means of enforcing it, and after the Government's warning had been issued, they, too, issued a statement deploring an open breach between the Government and the Civil Service, fearing that the dispute might eventually involve the whole of the trade unions, and appealing to all concerned

to approach this situation in that spirit of good will and understanding which throughout the war has been the foundation of co-operation between the trade union movement and the Government.

If the UPW climbs down, it will be the Government's turn to make a conciliatory gesture.

Food Distribution Costs

Criticism about distribution costs often overlooks the fact that a pound of cheese, or a pint of milk, or a pair of boots, do not reach their final "production" stage until they are actually purchased by the consumer, and that "distribution" covers much more than retail sellers. This does not mean that distribution costs should not be criticised. And from the figures quoted by Lord Luke in the House of Commons on August 3rd the cost of food distribution certainly appears to be high in relation to its cost of production—in a pre-war year the prime cost of food at the ports and farms was £650 million, and the cost to the consumer £1,500 million, leaving a margin of no less than £850 million for distribution costs. Lord Woolton pointed out that this margin included £150 million of Customs and Excise duties on food and drink, and that the remaining £700 million included the entire cost of processing, manufacturing, packing, wastage, transport, and so on. He also gave the actual figures for 1942, exclusive of chocolate, sugar confectionery, alcohol beverages and mineral waters. The value at which food entered the chain of distribution in its finished state exceeded £900 million, and its cost to the consumer was £1,350 million, thus leaving a distribution margin not much above £400 million. In other words, the cost of making products ready for sale was equal to rather less than a third of total cost to the consumer. This margin may well be too high; but it is not in itself proof of inefficiency or high profits in the retail trade. It is certainly high enough to justify the survey of the various sections of the retail trade which has long been urged upon the Government, but has never been carried out. An overall reduction of 25 per cent would enable the whole community to spend an additional tenpence, on the average, per week on other things or on more food.

Mr. Morrison on Education

Mr Herbert Morrison has resumed his Midlothian campaign. His latest incursion into the sphere of reconstruction was at Liverpool last Sunday, when he spoke on the Government's education plans. Mr Morrison dealt in particular with the three subjects that were omitted from the White Paper because they are the subject of enquiry by special committees—the teaching profession, the content and purpose of education and, by implication, the public schools. In discussing the first, he was in some danger of mistaking a symptom for the disease. The real trouble with the teaching profession is not that its members have, and accept, an inferior social status, lack any outside interests, and become the creatures of routine, but that the conditions of a teaching career are such as to attract for the most part only the cautious and unenterprising who have no interests save their desire for a safe job and a pension. It is not a good augury for the success of the new educational policy that too many of the present recruits to teaching, especially among women, are quite frankly uninspired, uninspiring, and of but mediocre intelligence. Nor, apparently, is the campaign to find future teachers among members of the Services meeting with much success. Unless teaching is made a career worthy for the adventurous and best minds, education is not likely, except among a minority, to provide—in Mr Morrison's words—

a set of young people mentally hard-boiled, able intellectually "to stand on their own feet," form their own judgments, think for themselves, tackle the problems that life will put to them. . . .

Mr Morrison's opinion on the need for a common primary schooling for all was closely in line with the view frequently put forward in *The Economist*. It is no solution to the problem of secondary education to admit a few more poor boys to the rich boys' schools, but all should attend the same primary school whence promotion to the best, that is, the independent, schools should depend solely on intelligence and personality. If the Fleming Committee, whose report is expected shortly, reaches the same conclusion, the second gap in the White Paper will have been properly filled.

The TB Scheme

By the beginning of this month, the Minister of Health stated in Parliament before the recess, 28 counties and 48 county boroughs had made arrangements for putting into force the system of allowances to persons suffering from pulmonary tuberculosis. (The scheme was described in *The Economist* of May 8th, page 587.) More recently, he told the annual conference of the National Association for the Prevention of Tuberculosis that the cost of the scheme to the Exchequer would be about £3,000,000 a year. In relation to the total real cost of the disease to the community this sum is small; if it were doubled, it would not compensate the waste of manpower and loss of efficiency caused by tuberculosis, especially among the younger age-groups—in the 15-24 group, TB causes more deaths than any other single disease, and about one-half of the total deaths from all diseases. Yet, the Ministry of Health is apparently so alarmed by this £3 millions that it has decided to exclude from the new scheme of allowances the chronic active cases; that is, persons in whom the disease is stabilised but still active in spite of treatment. A logical argument for the Ministry can be made out. The allowances are aimed at preventing a TB sufferer from returning to work too soon, thereby having a relapse and infecting his fellow-workers; they are to tide him and his dependants over the long period of treatment and convalescence. But chronic active cases will not benefit from further

£50,000
was paid every
working day in 1942

to holders of PRUDENTIAL INDUSTRIAL POLICIES

More than 800,000 policies, including Free Policies, became Claims by death, maturity or surrender.

The payments exceeded
£16,000,000

including bonus additions of more than
£2,800,000

The Premiums paid on these policies totalled
£14,750,000

On the average
£1.1.11 was paid out
for every **£1.0.0** paid in

"Home Service" was given throughout the
period the policies were in force.

THE PRUDENTIAL ASSURANCE CO. LTD.
HOLBORN BARS, LONDON, E.C.1

THE ECONOMIST: 1843-1943

The Economist will be a hundred years old on September 2nd. A Special Centenary Volume, with the above title, has been prepared by the editorial staff and a number of distinguished collaborators, reviewing the history of the paper and its part in public affairs during the century.

This book is being published by the Oxford University Press and copies, price 7s. 6d., will be available in September. They should be ordered from a bookseller and not from *The Economist* or the Oxford University Press.

treatment and many will never be fit to return to work; therefore, special allowances to them would not expedite their recovery or assist in preventing the spread of the disease. From the point of view of the individuals concerned, this is a most inhuman decision—which, incidentally, was not made known when the new scheme was first officially announced. It means that of two patients, treated side by side in a sanatorium and discharged together, one will receive the special allowance—which, if he is married and has children aged 9-14, will amount to 58s. 6d. a week, together with a rent allowance and discretionary payments to help meet hire purchase instalments, life assurance policies and his children's education expenses—whereas the other will have only national health insurance benefit of 18s. or, more likely, a disability payment of 10s. 6d.—plus public assistance. And the only way of convincing the latter that he is not eligible for the special allowances is to tell him quite baldly that he is incurable. Yet, addressing the conference of the NAPT, Mr Ernest Brown could say

We want to throw a light of hope upon tuberculosis, and drive away the shadows of despondency which have surrounded it for so long.

From the point of view of the community, the decision is very shortsighted, for it will mean that especially now, when manpower is scarce, many of these chronic active cases, even those with positive sputum, will, in fact, obtain employment and spread the disease among their fellow workers. The Medical Research Committee's report on tuberculosis in wartime stated that many chronic active cases "are actually engaged in industrial work under ordinary conditions" and recommended that they should

be given modified work in reserved parts of factories, with subsidised wages, or, where necessary, should be resettled in suitable employment. This is primarily a matter for the Ministry of Labour, but in the meantime there is surely no justification for excluding this particular class of tuberculous persons from the scheme for special financial assistance. It is a false economy which augurs ill for the Ministry of Health's running of a national health service.

Shorter Note

The following table gives the number of civilian casualties in air raids since September, 1939:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept., 1939-Aug., 1940.	1,494	1,980	3,474
Sept.-Dec., 1940.....	22,282	28,522	50,804
Total, 1941.....	20,863	21,839	42,702
Total, 1942.....	3,221	4,149	7,370
1943:—			
January.....	328	507	835
February.....	252	347	599
March.....	293	439	732
April.....	172	205	377
May.....	584	733	1,317
June.....	201	284	485
July.....	167	210	377
Totals to date....	49,857	59,215	109,072

Of those killed in July, 59 were men, 80 were women and 28 were children under 16.

Letters to the Editor

Man-power in Coal Mining

TO THE EDITOR OF THE ECONOMIST

SIR,—In the Note on the above subject in your issue of August 14th you say that "a shortage of man-power, with a rising average age among miners and fewer productive workers, has, more than anything else, contributed to the present decline in coal production. It is not, as a series of articles in last week's *Daily Telegraph* affirms, 'the pervading indiscipline which is at the root of the coal trouble.'" Later in the same article you add that "surely the Minister of Fuel, with statistics covering the whole of British coal production, should be in a better position to judge than an observer of two collieries in a single district."

May I, however, remind you that on the evidence of the Minister of Fuel himself output has been falling in spite of an increased number of mineworkers, not because their number is smaller?

In an address to a meeting of Fuel Efficiency workers in Bristol on April 16th last he said that although there were more than 5,000 more workers in the coalfields, the weekly production had fallen by 100,000 tons. And as recently as July 20th, in answer to a question in the House of Commons, he gave the output for the quarter ended June 30, 1943, as 1,220,000 tons less than in the corresponding quarter of 1942, and the average number of wage-earners as 900 more.

With regard to the vexed question of absenteeism, the quoting of an overall figure of 4½ per cent for avoidable absenteeism, coupled with the statement that only a small minority of men are involved, gives a quite false impression of the extent of the problem and of its effects upon production.

Apart from the fact that the overall figure among coal-getters is higher, the point is that this overall figure conceals the high figure of absenteeism among large numbers of men at week-ends and after holidays, and that this results in the disorganisation of production on other days in the week.

The reference by the Minister of Fuel and Power in the House of Commons on June 23rd to "the 4½ per cent who are guilty of voluntary absenteeism" does not bring out the fact that, as explained above, much larger numbers are involved; and the mathematical calculation which he

gave, that if the 4½ per cent of voluntary absenteeism were halved this would increase output by 4,000,000 tons per annum, fails to take account both of the high rate amongst coal-getters and of the most serious after-effects which large-scale absenteeism on certain days exercises on subsequent days.

This kind of thing is the experience not of "one or two collieries in a single district," but of undertakings all over the country. The latest evidence of it is the appeal to the mineworkers in the North Staffordshire coalfield, issued by the joint wages board of the North Staffordshire Colliery Owners' Association and the North Stafford Miners' Federation and reported in *The Times* of August 16th. At some pits in that district there were, according to the report, as many as 50 per cent of the men away immediately after the August holiday and in some instances roadmen, haulage and surface workers had to be sent home because there was not sufficient facement to provide them with work.

We are receiving constant representations from colliery undertakings in different parts of the country as to the way in which the seriousness of this question is being persistently discounted. We have no wish to engage in public controversy on the subject, but we do feel that when reference is made to it, the crucial facts—and their consequences—should be explained to the public.—Yours faithfully,

H. J. GILLESPIE.

TO THE EDITOR OF THE ECONOMIST

SIR,—I am grateful to you for thinking my last parliamentary speech worth noticing. I do not write to complain or even to correct, but a friend of mine (presumably discerning, because an old and faithful reader of yours) sent me your paragraph, marked "This needs some answer, the bare phrase implies the maintenance of fascism!" So I hope you will print this to say (a) that I never doubted that military defeat would be the end of the Fascist party; (b) that I have always been delighted to think so; (c) that I hope my speech in its entirety was sufficiently indicative of this state of mind.—Yours, etc., KENNETH PICKTHORN.
August 10, 1943.

AMERICAN SURVEY

Manipulation in Memphis

(From a Correspondent in Tennessee)

Memphis, July 26th

AIR raid precautions have lapsed in Memphis. There were only two test blackouts, and there probably will not be a third. Memphis, busy, thriving, growing, an important producing centre in the arsenal of democracy, is sure that it will not be bombed. Yet Memphis is the scene of a defeat—defeat of the cause in which the United Nations fight, the cause of liberty and democracy. For Memphis has a totalitarian government. When the oncoming of war made the people of Memphis conscious of the preciousness of liberty and democracy, they were disturbed to see how similar in character their own local government was to that of Mussolini and Hitler—though, so far, not disturbed enough to rebel or even form an underground.

The Memphis situation should be disturbing to liberals everywhere in the Anglo-Saxon world, for it offers evidence that susceptibility to dictatorship is not a peculiarity of Germans, Italians and other lesser breeds without the law of Magna Carta, but of sturdy Anglo-Saxons themselves. Memphis is predominantly an Anglo-Saxon city. True, more than 40 per cent of the population is negro, but the negroes are not in a position to make decisions, nor can their presence fairly be said to be decisive in this matter, although, voted in a vast manageable bloc, they were the means by which the machine built up its power in the first place. The condition that exists was determined by the action and inaction of the Anglo-Saxon majority. What happened here can happen anywhere in the Anglo-Saxon world.

One man, Edward H. Crump, whose power has steadily grown since 1909, until it has become absolute in the political field and unduly influential in many others, is less the traditional American political boss and more the modern dictator. He prides himself that, unlike other bosses, he has not taken, nor permitted any of the officials he controls to take, graft from the public treasury. It is only power that he has taken. He enjoys a prosperity which is legal. His large income is derived from the well-advertised insurance business which bears his well-known name. His insurance company has offices in the building which adjoins the police station, city hall and court-house, which he absolutely controls. The public, as it goes into these buildings to do business, and employees of these public offices, as they go to their work, are reminded that Crump is in the insurance business by a sign, literally as "big as the side of a house," which covers the building containing the insurance offices. And, since insurance costs no more with the Crump firm than elsewhere, and the service is good, it is not surprising that the Crump firm does a very large business.

An entire generation has grown up in Memphis, and is now fighting on all the battle fronts of the world, which has never taken part in any of the processes of democracy, for these are only nominal in Memphis. "Ja" elections are held to ratify decisions made by the Leader. The government of Tennessee, known as the Volunteer State because of its exceptionally generous contribution of fighting men to all this democracy's wars, is also under the control of this local dictator, although his control of the State's politics is not absolute, like his control of the politics of his own city and county.

Crump came to Memphis from Mississippi, a young man of attractive personality with natural gifts of leadership which won him followers without the need of fraud or compulsion. He was admirably called "The Red Snapper" because of his shock of red hair and his bright brown eye. What caused him to turn from leadership to bossism?

Was it cynicism that came when he was ousted from the mayoralty by a court proceeding—inspired by corporation lawyers, he says—because he realistically declined to enforce an early prohibition law passed by rural legislators? Did this experience cause him to make himself so strong that he could not again be upset? Or when, somewhere along the political road, he first saw fear in the eye of his fellow-man, did this gratify what was ruthless in his nature, so that he said: "Why bother to persuade men when in the mass they scare so easily?"

Lèse Majesté

He has been ruthless. His election workers have smashed cameras and imprisoned reporters. His police have beaten up CIO organisers. His police for many days were stationed outside the drug store of a negro leader who dared to be a Republican, searching every would-be customer ostensibly "to find dope," until President Roosevelt's Department of Justice sent a distinguished Assistant Attorney-General to notify the police commissioner that this attempt to destroy a business had to stop.

The dictatorship is so extreme that there is even the crime of *lèse majesté*. A young lawyer attended one of the "court revels" which Crump, like all rulers, occasionally holds. If you are invited to one of these revels it is an indication that (1) you are entirely submissive, (2) you are in favour. As the story goes, this lawyer was playing a card game known as gin, when the king desired the company to join him in some other amusement. Brushing up the cards, the young lawyer was heard to say with perhaps a tinge of sarcasm, "When the boss says you gotta go, you gotta go." His treasonable remark was reported to the king. Punishment was swift. His name was stricken from the machine's ticket for the legislature, of which he had been a docile member in the previous session. He found it expedient to resign from a leading law firm of which he was a member. That was not all; he pulled up stakes and left the city. It was not necessary that he accept banishment. He might have remained in Memphis and built up a successful career as a lawyer who was known not to be "in cahoots" with the machine. But few see what an asset machine disfavour might be; this man did not.

The people of Memphis have given up their right to take part in public affairs for "light and transient causes." For while intimidation has been the chief weapon of the machine, it is paradoxically true that people who stand against the machine do not suffer as much from the machine as they think they would. A man after expressing a positive opinion in opposition to the machine (which people euphemistically call "the administration" in order to save their faces) will decline to state the opinion publicly. "I don't want to stick my neck out; I might get a traffic ticket." * Yet the record does not show that the few who oppose the machine are more likely to get traffic tickets than the many who do not. Another fear is that "my assessment will be raised." Yet the record does not show discrimination in assessment. Professional and business men by the thousands do not dare to open their mouths; they have not noticed that two men whom Crump most hated, the late G. T. Fitzhugh, lawyer, and the living Frank Thompson, undertaker, prospered and lived happily in Memphis despite that hate. Mass fear is irrational. Opposition to the machine has been as successfully immobilised by fear of what might happen as by actual reprisals.

There is one fear, however, which is not baseless, and it is a controlling fear in the case of many. It is fear of

* Translation: a summons for a motoring offence.

public attack. Few persons are invulnerable, and Crump is a master of ruthless and effective denunciation and ridicule. Typical is this jibe hurled at an opposition candidate for governor: "He is the sort of man who would milk a cow through a crack in the fence." Some of the citizens who hate the machine but fear to criticise say that the newspapers are too scrupulously devoted to the principle of free speech; that they should not print Crump's colourful but often unfair diatribes.

Next to mass fear, carefully cultivated, as an explanation of dictatorship in an American city is the fact that Crump has given the citizens little economic, practical reason for revolt. One has to look deep and far to see the inevitable price of dictatorship in pocket-book terms. As Mussolini "made the trains run on time," so Crump gives "good government." It is not as good as the machine says it is; it is not as good as many free cities have; but it is not bad. Taxes are low. Streets are clean. The business man is not preyed on by racketeers; he must make a large contribution to the machine's "campaign fund" (which they also raise in years when they have no opposition), but that is all.

The business man does not pay much attention to the fact that the machine's effect on state government has not been good. The knowledge that Boss Crump can throw the inflated and immense Shelby County vote to any candidate he chooses has deterred the best men from running for governor. The governors elected by this controlled vote have been mediocre or worse.

Crump controls the Bar Association. Crump has named most of the judges in Shelby County. He named the federal judge. For the first time he has named a member of the Tennessee supreme court, and this judge, Frank H. Gailor, cast the deciding vote which knocked out the poll tax repeal, to which Crump had given lip service. Crump controls the schools, the American Legion, the civic clubs.

The Opposition

But there are two great forces he does not control. He does not control the churches. The Rev. Sam Howie, recently president of the Ministers' Association, who continues as an acknowledged leader, is an outspoken and militant opponent of Crumpism. He does not control the newspapers. The *Commercial Appeal* is independent of the machine, though it does comparatively little about it. The *Memphis Press-Scimitar* is aggressively opposed to the machine. Crump taunts the *Press-Scimitar* with having no political influence. But it has a good deal of influence with Crump. The *Press-Scimitar* demanded that TVA power be brought to Memphis; Memphis is the largest city in the South that enjoys TVA power. The *Press-Scimitar* called for a safety campaign; Memphis for a while was the safest city in the country. The *Press-Scimitar* called for an anti-noise ordinance; Memphis is the quietest city in the world. Ironically, the *Press-Scimitar* may have helped prolong the life of the machine it fights. Its criticisms have held the machine in check, corrected many of its abuses, and prevented it from becoming intolerable.

Crump, who will be 68 on October 2nd, is in excellent health, of which he takes great care. He goes to Battle Creek sanatorium about once a year for a stay. He issued a statement recently, urging people to eat vegetables, as he does. He has issued a good many statements urging protection of birds. Birds now rival football as his hobby. Public officials and leading lawyers, who had never before shown any interest in birds, promptly organised the E. H. Crump Audubon Society, and solemnly hold meetings, which Crump never attends. Crump does not go to meetings; people must come to him. Crump suggested that cats, enemies of the birds, be trapped, and County Commissioner Francis Andrews immediately began trapping cats.

What effect will the machine have on national politics in 1944? When Crump, who is Democratic national committeeman from Tennessee, issued a statement denouncing Boss Flynn, and the Crump-elected Senator from Tennessee, Kenneth D. McKellar, voted against his confirmation as Minister to Australia, some thought that it meant that the Crump machine was joining the second Southern secession. But the breach, if any, has been healed, for the other day Senator McKellar came out for the fourth time.

What hope is there of restoring democracy? The *Press-Scimitar* has said that it would have required only ten fairly well-known citizens, standing firmly together, to have prevented the machine from getting control in the first

place, and that such a group could restore democracy at any time. No ten citizens have yet been willing to get together. The dictator divides and rules.

American Notes

Men Wanted

It is reported from Washington that President Roosevelt has decided to support the Austin-Wadsworth national service bill when it comes up before Congress in the autumn. This measure, put forward by two Republicans, Senator Austin and Representative Wadsworth, with the support of the American Legion, would, if passed, authorise the President to prescribe regulations assigning every man between 18 and 65 and every woman from 18 to 50 to some form of war work through the Selective Service system. It is said that it would add at least 1,600,000 persons to the labour force of 10 millions already engaged in war production. The opposition to such a bill would be very great, both from organised labour, and from some less disinterested parties—so great that approval of it may be indulged in without undue risk of bringing it to pass. There is no doubt, however, that the situation demands a drastic cure upon the lines of allocation of labour if the most is to be made of American industrial and military opportunities. The frequent and impressive directives of the Manpower Commission appear to be losing their effectiveness. The WPB has reported that seven West Coast aluminium works are idle for lack of workers. Despite the authority conveyed to the Commission last March by the President's Hold-the-line order, the drift of workers to better-paying jobs continues, whether or not it serves the war effort. The critical manpower position in aircraft production is ascribed largely to the lure of higher wages in shipbuilding, although it also appears that, to meet the situation caused by the delay in the call-up of fathers, the Forces have also been making inroads into skilled workers who would be more profitably left at their machines. Mr Ickes has requested the release of anthracite miners from the Forces; and a two months' blanket deferment has had to be granted to 24,000 aircraft workers on the West Coast. This, it is said, is to allow time for the development of a new draft policy. In the meantime, Mr McNutt is issuing to Selective Service boards a list of critical skills, which must be used in essential work if they are to guarantee deferment, an extended list of non-deferable occupations or activities (one of which is "the status of idleness") and instructions designed to stimulate the transfer from less essential to more essential work, and to cut down unnecessary turnover of labour. To implement these, more effective freezing of workers to their jobs is needed. It may be that this will prove the more acceptable alternative, with the threat of a National Service Act kept in the background.

Mr. Lewis and the AFL

Mr. John L. Lewis's application for the re-entry of the United Mine Workers into the American Federation of Labour is still holding fire. Mr Lewis's attempt to smooth his path by advancing a cheque for \$60,000 to cover the entrance fees did not succeed in persuading the AFL's Executive Committee to do more than refer the whole matter, without recommendations, to the Federation's convention which meets next October. The most obvious difficulties are those of jurisdiction. After the United Mine Workers left the Federation, an AFL charter was granted to the Progressive Mine Workers' Union; and it is contrary to the Federation's constitution to grant a charter to more than one union in each industry. Nor is this all. Local 50 of the UMW, which was designed to further Mr Lewis's control over a whole series of industries as far apart as farming and chemicals, conflicts with the preserves of many more AFL unions. Mr Lewis would have preferred, of course, to be admitted first and discuss these problems afterwards, when the opportunity for forcing him to restrict his activities would no longer be present. For the moment, at least, the Trojan horse remains without the gates, but beyond this there is little agreement from observers in Chicago. Some, among them Mr Louis Stark, the *New York Times'* veteran labour correspondent, have hailed the AFL decision as a Roosevelt victory, with Mr William Green, the President of the Federation, refusing to be tempted into joining the ranks of the rebels and Republicans. Others

believe that the purpose of the delay is to allow time for the ironing out of jurisdictional conflicts to present the convention with something approaching a *fait accompli*. It is also reported that Mr Lewis, affronted by the snub, may stop both his cheque and his application. But this rumour seems more like a part of a Lewis war of nerves. If Mr Lewis is determined to lead his union back into the Federation, for whatever economic and political purposes he thinks it may serve, he will find the patience to put up with delay and, perhaps, even to turn it to his own advantage. Unquestionably there are elements in the AFL that would welcome Mr Lewis back; the convention will see the final test of strength, a test which may decide whether the bulk of labour is to support Mr Roosevelt or a Republican candidate in 1944.

On the Boil

A vigorous attack has been launched by the federal Food Advisory Committee on current food policies, particularly as they affect the provision of food for liberated areas and the United Nations. The report, drafted by a group of representatives of various agencies with an official interest in food, has been submitted to Mr Wickard, and goes to the War Food Administrator for study. Among its comments is the statement that the United States has never been and cannot ever become the food basket of the United Nations. American civilian needs, it says, should not be left until after all other claims have been met. This ties in with the report that the War Food Administration has informed the Relief and Rehabilitation Organisation that it cannot set aside food reserves requested by the agency without cutting into civilian rations at home or curtailing allocations to Russia and Great Britain. The Committee urges the development of a worldwide food programme and increased production to provide an adequate diet for 40 million extra persons in 1944 and 1945. In its recommendations on the purely domestic situation, it demands the scrapping of the "parity price" device, more efficient use of the resources of the small farm (the point on which Mr Herbert Parisius and others resigned from the Department of Agriculture earlier this year), and the creation of a single government agency responsible for the production of food for export. Food is an increasingly sore point. Although coffee is now off the ration, and sugar said to be on the way off, points values for meat have had to be increased to meet a shortened supply, and excellent though the nutritional value of soya beans may be, there are few who do not prefer steak. It is not altogether surprising to find arising what appears to be a kind of alimentary isolation.

A Policy for Transport

The realisation that early in 1944 the United States will possess more than 30 million deadweight tons of shipping, the greatest merchant tonnage in the world, has stimulated lively debate in the United States as to what use is to be made of it after the war. The Maritime Commission has announced that merchant ship construction will continue throughout 1944 at about the 1943 rate—that is, about 20 million deadweight tons. Although the programme will concentrate on slow vessels, 1944 construction will include 319 of the new-design Victory ships, and enough fast C-type cargo ships to give the United States more than 500 of these fast vessels. The Commission has announced the creation of a Post-War Planning Committee for developing long-range plans for the American shipping industry. In addition to this official committee, the Chamber of Commerce has established a special committee to investigate measures to be taken for the conversion of American world transport to a peace-time basis, and the possible alternatives are being thoroughly canvassed in the press. The fundamental issue is seen as whether the United States is going to use its new merchant marine and the power of subsidy to dominate the sea-lanes, or whether it should be content with a smaller share in order to preserve the earnings of nations that have traditionally lived by the sea, and who have suffered heavy losses during the war. An aggressive policy is attributed to Admiral Land, who is said to favour the nation shipping American and travelling American, with in addition a liberal share of all overseas traffic going in American bottoms. Some shipping men, while believing that there must be a sharing of ships and traffic, argue that there is room for a bargain to be struck, with the United States

receiving in return joint use of military bases, or predominance in certain foreign trade areas. One of the most hopeful signs is the appreciation of the fact that free and widespread exchange of goods is essential if the massive number of ships now under construction are not to be so much steel scrap; and the realisation in some quarters at least that an attempt by the United States to maintain an artificial predominance in world transport would lead to retaliatory trade barriers which would prevent not only the profitable employment of ships, but of men and plant in the United States. This is the theme of a recent able leader in the *New York Herald Tribune*, which argues that

In this field, as in all others, economic and political, the safest programme is international co-operation as a matter of national self-interest.

Shorter Notes

The fact-finding commission appointed to investigate the Detroit race riot has reported that it was not "planned, premeditated, or inspired by subversive enemy influences," but was due to "racial tension" inflamed as a result of several disconnected incidents provoked by a group of negroes. From the short accounts available it does not appear whether the committee was authorised to investigate the causes for this racial tension or to make recommendations, but it is to be hoped that the matter will not be left here. If enemy influences were not responsible, the cause and cure will have to be found in Detroit, and other cities where tension between black and white threatens to interfere with the prosecution of the war.

The War Labour Board has abolished the Shipbuilding Commission because of disagreement with its wages policy and has rejected a demand for wage increases for shipbuilding workers, arguing that, with the exception of food prices, the over-all stabilisation programme has been remarkably successful.

THE COMING TREND

The trend in business furniture after the war will be more than ever towards the precision and permanence of steel. Sankey-Sheldon, in preparing to meet this growing trend, have realised that to this efficiency of steel must be added beauty—the beauty of soft contours finished in harmonious colour schemes and warm, caressing coverings. Sankey-Sheldon's post-war programme will provide a wide range of furniture and equipment, clean and hygienic, fire resisting and practically impervious to damp, dirt and deterioration. There is something inevitable about Sankey-Sheldon steel furniture.

THE WORLD OVERSEAS

Palestine's Citrus

[FROM OUR JERUSALEM CORRESPONDENT]

July 6th

THE much improved financial result of the last citrus season, compared with the previous two seasons, has been mostly due to the further fall in the crop. According to reliable computations, the 1942-43 citrus crop did not exceed 5 million cases, against 6½ million cases in the preceding season and 18 million in 1938-39. On the other hand, the local demand for citrus fruit, stimulated by the short supply of other fruit and vegetables, has vastly increased. It has been estimated that 85,000 tons of citrus (a ton being the equivalent of about 25 cases) were consumed by the local population during the last season, including the Trans-Jordan consumption as well as the fruit used as cattle fodder, which accounted for about 10,000 tons. About a quarter of the crop was absorbed by various processing industries, which made further progress during last year, the production of concentrated juice being especially developed. In spite of trade restrictions, exports to adjacent countries have also been expanded; they exceeded 30,000 tons and again reached the volume attained in 1939-40. Purchases by military authorities decreased, on the other hand, to 30,000 tons. The result is that no fruit was buried or destroyed this year, and the proceeds of sale have been estimated at about half a million pounds, averaging about £P2.5 per ton of fruit on the tree, which is more than double the average income in the preceding season, even if the proceeds of the citrus tax, abolished since then, are included.

The average figures do not, however, convey an accurate picture, because of the wide and ever-increasing dissimilarity in the yield per dunum in the different groves. Although a minority of properly cultivated plantations still yield 80 and even 100 cases and more (4-5 tons) per dunum, there are about 50,000 dunums of groves where the trees have just been kept alive, but have lost most of their productivity; and another 30,000 dunums have been totally neglected or actually uprooted. Almost a third of Palestine's citrus plantations is thus already lost or threatened by wastage, and of the remaining groves, too, the majority have not been properly cultivated, for the prices of manure have risen to exorbitant heights, chemical fertiliser is impossible to obtain and insufficient measures have been taken to combat pests and harmful insects. Moreover, Government advances to cultivators (in 1940, £P2.6 per dunum; in 1941, £P3.2 per dunum; and in 1942, £P4 per dunum of the first 20 dunums and £P3.2 for the remaining area) have been inadequate for rational cultivation, and the total area to be covered by these advances was limited to 170,000 dunums in 1941-42 and to 185,000 dunums in 1942-43. In fact, the acreage benefiting from these loans last year was even smaller because they were only granted to cultivators who had kept up their groves to a certain minimum standard of maintenance and who could also provide sufficient securities.

The effects of this policy are illustrated by the following table, showing the condition of the citrus groves according to their different sizes, on the basis of the number of points accorded by the Government's fruit inspectors in 1942 (the maximum score being 15 points):—

CONDITION OF THE CITRUS GROVES

	Up to 8 Points	9-10 Points	10 Points and Over
Size of the Groves	%	%	%
Up to 20 dunums	36	44	19
60-100 dunums	19	41	39
100 and more dunums	15	39	49
Grand Total average	24	43	31

The consequence has been not only the reduction of the citrus area in Palestine, but also the elimination of the financially weaker cultivators, who cannot stand continual deficits and are compelled either to abandon their groves

or to sell them, mostly to commercial and industrial circles. Some lasting regional and national shifts may also arise out of this development, for the structure of Palestine's citrus industry is anything but uniform; in the Gaza district, the big groves—comprising 100 dunums and over—account for 43 per cent of the total citrus area, but in the Lydda district for only 20 per cent; the average size of a citrus grove in the Arab sector is 37 dunums, against 25 dunums in the Jewish sector and so on. It is generally taken for granted that the surviving plantations will be much better off after the war, but the question is being asked whether the price Palestine's citrus industry is paying for this consolidation is not much too high. The Government's recent decision to raise the amount of the advances for the first 20 dunums to £P5 per dunum and to abolish the limitation on the total area to be covered has, therefore, been received with satisfaction as a step in the right direction. A proposal recently adopted by the Palestine Citrus Board envisages also a comprehensive rejuvenation of the neglected plantations and a re-grafting of the old trees with varieties ripening earlier than the genuine Jaffas (e.g., Clementines) or later on (e.g., Valencias) in order to prolong the far too short shipping season for citrus. This scheme would also make possible the utilisation, for a couple of years, of the irrigated areas of the rejuvenated groves for growing vegetables and grain, thereby supplementing food supplies.

A scheme for long-term assistance to the citrus industry and for its post-war organisation has also been submitted to the Government and is now under consideration. The prospects for the near future have been somewhat brightened by the opening of the Mediterranean to Allied shipping, and it is hoped that ships coming in with military stores may be able to carry on their return journey some citrus cargo, so that a limited quantity of Jaffas may perhaps reach Britain next season.

Industry in the Protectorate

[BY A CORRESPONDENT]

WITH the growing air attacks against industrial targets in western and northern Germany, the importance of Bohemian industry to the Third Reich is bound to increase because of its comparatively sheltered position. There has been a considerable, though perhaps not spectacular, increase in the Protectorate's industry since the German invasion of 1939. The total number of workers in industrial employment is reported to have increased from 1,700,000 to over 2,000,000 during the first two years or so of the Protectorate's existence. Since then, this number seems to have remained fairly stable, but the number of industrial working hours per year may now be about 50 per cent higher than before the invasion.

The rate of increase has naturally been greatest in the munition industry. Most of the leading Czech munition firms such as the Skoda Works, the Wittkowitz Steel Works, etc., have been incorporated within the Herman Goering Trust; the only important heavy industrial concern which is not incorporated into the Goering Trust is the Berghuette, which, however, has also come under the control of German nominees. The gross profits of the Skoda Works have increased from 397 million crowns to 627 million crowns between 1940-41 and 1941-42 alone. Herr Bertsch, the German Minister for Economic Affairs within the "autonomous" Protectorate Government, has asserted that the number of working hours in the war industry proper has been doubled under German rule. Naturally, this increase in the share of the munition industries has necessitated a strict cut in various other industrial activities. Herr Bertsch himself announced, at the end of 1942, that the measures taken within the Protectorate to restrict, rationalise or cut down unessential industries have been more severe than in Germany itself; in the course of the present year, further restrictive measures, on a similar scale as in the Reich proper, have been taken. Those industries which formerly produced large quantities of consumers' goods for export such as the Czech footwear,

August 21, 1943

THE ECONOMIST

239

porcelain and glass industries, are known to have been particularly severely restricted. It has been announced that in 1941, the Protectorate still exported goods to a value of 400 million crowns to non-German countries, but that this export trade was greatly reduced in 1942. On the other hand, 57 per cent of the output of the metal industries was sent to the Reich in 1941 and a still larger percentage in 1942 and 1943.

It is very likely that the industrial restrictions within the Protectorate have had especially unfavourable repercussions on the efficiency of the Bohemian industry as a whole; for the industrial administration of this territory, though it has been remodelled on the German pattern, still lacks some of the accessories of economic control which have been developed in Germany. It has not been possible, for instance, to introduce a unified accountancy system which, in the absence of free competition, has been accepted in the Reich as the only means of measuring and comparing the productivity of individual enterprises.

The available labour resources have not been fully utilised in the Protectorate. On the contrary it has been the German policy to use Bohemia and Moravia as a labour export area; about 150,000 workers were sent to the Reich before and shortly after the outbreak of war. In 1942, compulsory labour was introduced, and restrictions were even made regarding the right of Protectorate citizens to choose their own career. It is not known what results these restrictive measures have yielded, except that the number of Czech workers in Germany must now be considerably larger than at the beginning of the war. Male workers have recently been replaced on a large scale by women, in order to make the former available for work in the Reich. There is no indication that the authorities believe in any vast further increase of the Czech industrial output as a whole, as distinct from the output of certain individual industries. Nor is it likely that any large numbers of factories are to be evacuated from western Germany to the Protectorate; the advertisements of firms looking for new factory premises, which now appear fairly frequently in the German press, mainly ask for premises in southern Germany, not in Bohemia-Moravia.

Shortage of Fuel and Power

This industrial policy may seem strange at first sight, but it can be explained by the shortage of fuel and power which restricted the growth of Bohemian industry long before a real scarcity of labour developed. Czechoslovakia, though not the territory of the present Protectorate, just managed to become self-sufficient with regard to fuel and power in the years preceding the outbreak of war. The present consumption of fuel by industry in the territory of the Protectorate is certainly much larger than formerly, while it has not been possible, according to the available company reports, to increase the output of lignite in the Sudeten area. A programme for the construction of various new dams, in order to facilitate navigation and to increase the output of hydro-electricity, was adopted in 1940-41, but it was recently admitted that most of these plans have been unexpectedly delayed. To bring up coal from the Silesian or western German districts seems to be difficult because of transport; nearly 40 per cent of the available railway facilities were already devoted to this transport two years ago. Transport is hampered, not only by the known shortage of wagons and locomotives, but also by the inadequacy of the Bohemian railway network, which was a comparatively weak link in the Czech industrial system at the time of the Republic.

Irish Agriculture

[FROM OUR DUBLIN CORRESPONDENT]

July 20th

STATISTICS published in the *Irish Trade Journal* make it possible to observe the effects of the war on Irish agriculture. The accompanying table shows the estimated value of agricultural output for several years. Agricultural output does not include any part of the produce used unprocessed for further agricultural production.

Substantial increases in every category have taken place in recent years. There has, however, been a considerable rise

ESTIMATED VALUE (£'000)

	1929-30	1939-40	1940-41	1941-42
Livestock and livestock products	52,204	46,914	48,653	52,349
Crops	6,640	10,164	14,297	16,730
Turf	3,317	3,846	5,293	7,630
Total	62,161	60,924	68,243	76,709

in agricultural prices since the outbreak of war, for which allowance must be made in calculating the volume of physical output. The index number of agricultural prices rose from 100 in 1938-39 to 126 in March, 1940, 137 in March, 1941, 144 in March, 1942, and 178 in March, 1943.

If a comparison be made between the years 1939-40 and 1941-42, it will be found that the output of wheat rose from 3,988,000 cwt. to 5,573,000 cwt., oats from 1,920,000 cwt. to 2,281,000 cwt., while barley remained stable. Sugar beet increased from 390,000 tons to 675,000 tons. There were also increases in the output of potatoes and flax and tow. Turf produced rose from 3,866,000 tons to 4,522,000 tons. These figures reflect the results of the compulsory tillage programme and the intensive drive for the production of turf. The volume of livestock has declined since the beginning of the war, but the downward trend appears to have been arrested. This is, of course, the consequence of the shortage of feeding stuffs, and represents a decidedly adverse movement in Irish agriculture, which has always relied on animals and animal products as its main source of income. When account is taken of the reduction in the number of livestock, together with the utilisation of the accumulated fertility of the soil, the conclusion is irresistible that the country has been living on capital during the war. This conclusion is supported by the fact that, whereas in 1929-30 a gross output of £62,161,000 was based upon the consumption of farm materials (animal feed, fertilisers and seed) valued at £9,924,000, in 1941-42 a gross output of £76,709,000 was obtained from the consumption of raw materials of £5,633,000. Irish soil is being, to some extent, "mined," as a result of war conditions.

The following table shows the changes that have been

Vitamins in chocolate for liberated Europe

The British Government, having examined all the ways in which sufficient vitamins could be provided to the under-nourished children of liberated Europe, have arrived at the conclusion—as Rowntrees did in 1938—that chocolate offers one of the best vehicles for carrying added vitamins. In chocolate, the vitamins retain practically all their potency.

Before the war, Rowntrees, alone among British manufacturers, pioneered the addition of vitamins to cocoa and chocolate. Their object was to enhance the protective value of these already highly nutritious foods.

Today, when the Allied Governments are faced with the enormous problem of rehabilitating each occupied territory as it is freed, Rowntree's experience of fortifying cocoa and chocolate with vitamins on a large scale is proving of great value. When the war is won, this experience will again be used for the benefit of the British public.

ROWNTREES

Splitting the mighty atom

It is recognised now that coal is a means to an end — or rather to many ends. Not merely something to burn for its heat, but a source of numerous valuable substances that will be the basis of Britain's post-war prosperity.

The carbonising industries point the way to this modern treatment of coal. The process of gas-making splits up the coal into many different parts and extracts every ounce of value from it. Every 100 tons of coal used in the gas works produce 7,500 therms of gas, 50 tons of coke, 1,000 gallons of tar, 250 gallons of benzole, 2,500 lbs. of sulphate of ammonia and 300 lbs. of toluene. And the Gas Industry carbonises over 18 million tons of coal annually.

These valuable by-products of gas-making in turn yield over 2,000 chemical substances of tremendous value. Among them are explosives; drugs such as M & B 693, novocaine, acriflavine and aspirin; sulphuric acid for electric batteries; food flavourings; baking powder and saccharine; camouflage paints; agricultural fertilisers; aviation spirit; and the chemicals from which plastics are made for use in a hundred and one ways from the ubiquitous ashtray to the essential fittings of our fighter aeroplanes.

The Gas Industry in war, as in peace, plays an important part in the national economy.

BRITISH COMMERCIAL GAS ASSOCIATION · LONDON · S.W.1

taking place in the disposal of the agricultural output:—

PERCENTAGE OF VALUE OF TOTAL OUTPUT				
Disposed of by:	1929-30	1939-40	1940-41	1941-42
Farm consumption	27.1	32.7	36.0	38.3
Other home consumption	21.5	29.9	33.1	33.1
Export	51.4	37.4	30.9	28.6
Total	100.0	100.0	100.0	100.0

The advance towards self-sufficiency is obvious. While the reduction of exports that has taken place during the war is, no doubt, an inescapable necessity, the long period trend in the pre-war years is a more questionable development. The Banking Commission expressed dissatisfaction at the reduction in agricultural exports in view of the tendency for the balance of payments to become adverse. This tendency has, of course, been temporarily checked by the reduction of imports during the war, but when peace returns the maintenance of the volume of agricultural exports will once more become of great importance.

Portugal and Italy

[FROM OUR LISBON CORRESPONDENT]

July 31st

MATERIAL and sentimental reasons place Portugal in a somewhat exceptional position *vis-à-vis* present-day events in Italy. The abolition of Fascism and with it the system of corporations is bound to be reflected locally, since the Portuguese trade guilds are admittedly an adaptation from the Italian model, re-cast to meet national idiosyncracies. Moderately satisfactory in normal times, the corporative system has had to meet an unusual strain during the war. This is particularly true of the past twelve months; nor can relief be expected before the 1944 crops are in. Honest though their administration may be, it lends itself to popular criticism, much of it based on rumours and ignorance yet having a small substratum of fact. Portuguese totalitarianism is certainly benevolent when contrasted with Axis models, but there is no escaping the fact that no opposition to the official party viewpoint is permitted free expression. Yet that opposition does exist, in small, and, if Italian reconstruction includes a return to the open vote and the general principles of democratic government, even the exceptional ability of Dr Salazar may not persuade the Portuguese that nothing can be gained and much may be lost by once again opening the door to the professional "politico."

Nevertheless, resuscitation of the royal functions of the House of Savoy, which was so frequently in contact with Portugal in the days of the monarchy, accords with the ideas of the local aristocracy, a small group but of influence in Government circles and in close contact with similar Spanish ideals. They tolerated rather than admired Mussolini and Fascism. Totalitarianism, however, suited their interests as property owners, and the excesses credited to Communists during the Spanish war gave a fresh fillip to this group's belief that benevolent subjection and not too much education were together admirably adapted to Portugal's peasant population, largely composed of field labour. While Mr Winston Churchill's spirited denunciation of the totalitarian principle is well understood to be aimed primarily at the Axis lands, there is yet a certain amount of local heartsearching which the opposition may well be tempted to emphasise for its own political benefit.

Bourse Weak

Despite a superabundance of money, prices of all dividend-paying shares closed on July 30th at the lowest quotations of 1943. In Government bonds a decline was also noted, but to a much lesser extent. Banks, shipping and insurance showed the heaviest depreciation, but colonial shares, notably sugar and cocoa, also dropped steadily throughout July. It should be noted that this general decline occurred prior to the recent labour unrest, which took place on July 29th and 30th, and is officially said to be at an end. Both in Portugal and in Spain it is felt that, apart from political repercussions, the withdrawal of Italy from the war may well react financially and commercially upon the two countries in a manner unprofitable to their immediate trade interests. Uncertainty about the possible political developments in Spain is also accountable in some measure for the uneasiness that at present exists in the Portuguese market.

Germany at War

Economic Attrition

THE so-called total mobilisation decreed by Goebbels after the disaster at Stalingrad marked the beginning of a phase of acute economic attrition. The inevitable contraction of the available resources had already begun when the period of territorial conquests ended in 1941. Ruthless concentration and the technological control introduced by A. Speer, Minister for Armaments and Weapons, made it possible to maintain the output of munitions and weapons at a high level before and during the summer offensive of 1942. When it was clear that this offensive had failed, there was only one thing left to do—to concentrate all resources on the maintenance of war production without regard to civilian demands.

Measured in economic terms, the results of the total mobilisation, which officially came to an end a short time ago, are small. At the cost of closing down a large number of retail shops, and extending the conscription of labour, a total of roughly one million additional workers, mainly married women and old men, have been mobilised for war work. The total mobilisation enforced at the same time in the occupied countries yielded a greater number. But the women who have been sent to war work are mostly employed on part-time work, and the efficiency of the foreign workers is comparatively low. It is probably no exaggeration, therefore, to assume that, for one German worker called up for the Wehrmacht since February, 1943, at least two workers have been employed to replace him.

The difficult administrative problems created by these changes can be imagined. Just at the time when the new workers had to be sorted out according to their ability, heavy bombing started again, and it became necessary to undertake large-scale evacuation of women and children, as well as of important factories, from heavily bombed areas. The total mobilisation and the evacuation, which has not yet been completed, constitute a new and very extensive migration of people all over Europe. In Germany, millions of people have been moved from the Ruhr-Rhine area, from north-western towns and from Berlin to southern and eastern Germany. From occupied Russia, France, Belgium and Holland several millions of workers have been sent to factories in central and eastern Germany and Poland. The result is that a very large number of German workers live in huts and barracks. Foreign workers employed in Germany number roughly 20 per cent of the adult German population. The greater part of these, too, live in camps near the factories. In agricultural districts, the entire male population consists of foreigners, old men and young boys. German agriculture, as well as German armament production, is largely maintained by foreign workers.

Barter Trade

Total mobilisation was mainly conceived by Dr. Goebbels as a political move, but it served at the same time an important economic purpose. For some time, civilian commodities, particularly textiles, furniture and all kinds of household goods, had been in extremely short supply, and the shortage was intensified by bombing. A minimum production programme had been planned as part of Speer's concentration of industries, but labour and material resources were diverted to armament production. Total mobilisation meant that the manufacture of civilian articles was stopped altogether. The clothing cards became fictitious, and retail shops were unable to replenish their stocks. A new situation has arisen in the civilian sector of Germany's war economy. Those retail shops and department stores that are still allowed to exist have been ordered to reduce their stocks, which were fixed at a certain percentage of pre-war stocks. This means that many shops will have to hand over some of their stocks to the Wehrmacht pools. It means also that the shops have nothing to sell, and that the population now depends on second-hand goods. The gradual disappearance of civilian commodities, long before total mobilisation was declared, could be seen by the increase of private barter and the trade in second-hand goods. It became necessary, in 1943, to include the prices of second-hand goods in the system of price control, and special committees had to be set up for fixing prices. In practice, however, they could not be controlled, and a separate market, with its own price regulations, grew up.

More and more, a price level developed which can be compared only with prices for paintings and other objects of rare value. Trade of this kind constitutes a threat to the official price level, and the authorities were forced to restrict it by legalising barter trade. Most of the large German towns have now opened so-called barter department stores. Prospective buyers have to contribute some article. The price is assessed by official valuers, and articles can then be exchanged against any already brought in by other people.

Shock Production

Total mobilisation has left little or no marks on war industries, which constitute the greater part of the economy. The economy is already termed the fourth part of the Wehrmacht, which shows that, apart from foodstuffs, the entire output goes to the Wehrmacht. In fact, the declaration of total mobilisation created confusion in the reorganisation of the economy which Speer began in the spring of 1942. On paper, the new organisation looks extremely simple. The "Committees" and "Rings" set up by Speer are in direct control of industry. The regional self-governing organisations have been reduced to one Economic Chamber in each Gau, which are again controlled by the Economic Bureaux in each district. "Order Steering" departments, special commissars for the distribution of machine tools and tools, for the exchange of production experiences, for replacing scarce materials by substitutes, and so on, have been set up in the different sections of industry. The remnants of the cartels have been merged with the former industrial federations for fixing and controlling prices. But, in practice, the number of organisations has increased with every adjustment of the economy to new production programmes; and the organisation as a whole, which was meant to be simplified, has actually grown more complex in spite of the fact that the production has been concentrated in large factories.

After four years of war, during which no statistics have been published, there is no means of estimating the actual industrial output. Frantic efforts have been made to maintain the coal output by using more labour and by installing a number of combined coal-cutting and loading machines. The production of lignite is, however, still increasing, and company reports give the impression that the generation of electricity rose again during 1942-43. In the iron and steel industry, the production of high-grade steel has been sacrificed for inferior grades; and the supply position of non-ferrous metals, particularly copper, tin and even aluminium, is very difficult. Breweries and other closed-down factories are stripped of all their copper and metal parts. The use of substitute materials is now a fine art, but they demand a considerably greater labour force. There are signs that a shortage of machine tools has been growing for some time. Just as civilian industries were combed out for workers, factories are now being combed for machine tools. Germany's industry has, in fact, reached a stage where economising is the overriding principle, and where every bit of scrap material must be collected. Apart from the manufacture of a new type of heavy tank, there is a decided trend towards the manufacture of weapons and equipment that are simpler in design and demand less high-quality material.

An attempt is being made to direct production according to the principles of conducting a battle, that is, by forming "centres of gravity" in production, which means the concentration on the manufacture of certain weapons to which all other production is subordinated. Both qualitatively and quantitatively, production is on the decline in Germany. Yet there is still the possibility of "shock production," which is a peculiar feature of totalitarian countries at war. In other words, as long as the political regime is intact, it can direct men and materials to the production of certain things, without any regard to housing, family connections and costs, which would be prohibitive in the war economy of a democratic country. This is obviously what happened in Germany during 1942, and it is being attempted again in order to overcome the effects of bombing and military reverses. Last year, this policy was partially successful. If it is repeated this year, it can only hasten the general economic attrition.

THE BUSINESS WORLD

Marine Insurance

(By a Correspondent)

IN 1917 marine underwriters suffered very heavy war losses for six months and recouped them before the end of the year. In 1918 they had a very satisfactory time and closed their war account with a light percentage of losses. In 1942 marine underwriters suffered terribly heavy war losses for six months and recouped all or most of them before the end of the year. In 1943 they have (so far) had a satisfactory time, and seem likely to close their war account for the year with a light percentage of losses. As the Germans at present seem to spend most of their waking hours in thinking about 1918, Dr Goebbels, if this should catch his eye, may like to add another comparison of 1918 with 1943 to the armoury of his propaganda weapons. His German public will no doubt be interested to learn how closely, even in matters of insurance, the pattern of this war is following the pattern of the last.

Under normal conditions the marine market probably derives considerably more than half its premium income from time risks, and time figures in consequence have a greater influence on the year's result than voyage. In war things are different, and the high rates called for by the perils of war produce an income out of proportion to the humdrum revenue of the ordinary time market. And in this war marine voyage rates have risen sharply; the corresponding rise in time rates has been moderate. Whether the rise has been large enough to pay for the increased hazards of navigation must for a long time remain an unsettled problem, for repairs are postponed and again postponed, and the tail of a time account is today a very long one. It does not, however, seem probable that, with the cost of ship-repairing at its present level, time all-risk underwriters can with any confidence expect a satisfactory result from their war-time underwriting.

The underwriting of war risks in the past eighteen months has had most widely varying fortunes. When the United States came into the war at the end of 1941 it very soon became apparent that the market had badly misjudged the position. Orders to insure American ships and cargoes against war had for months been coming to London in great volume, and, on the strength of the neutral flag, underwriters had committed themselves heavily at low, even at nominal rates of premium, which proved to be wildly out of proportion to the risks which had to be run. The market, in fact, had let itself in for exactly the trouble that it had always envisaged and against which the non-marine war exclusion clause had been purposely designed. It came to a new war with a book full of war risks accepted at rates which were attractive enough so long as the peace lasted, but were disastrous the moment war broke out. The naval situation, too, had been misunderstood, and heavy losses came to the market, mostly in dollars, on time and voyage policies against war risks which had been signed at rates of less than 1 per cent. It was a difficult period. But the great merit of war risks from the underwriters' standpoint is that they run off fairly quickly and premiums can be adjusted, without much delay, to correspond with a rising hazard. That, fortunately for the market, happened in 1942, and the year will probably close on some under-

writing accounts with a not too serious loss and on others with a margin of profit. On the other hand, the present year should be profitable for almost all war underwriters. The premium income will not be sensational, but the failure of the U-boat campaign has greatly reduced the number of losses, and to-day a careful underwriter taking his booked war premiums with a reasonable estimate for unsigned premiums and setting against that figure his settled and known war losses will find that the ratio of losses to premiums is highly satisfactory. There is (touching wood) little reason to expect a reversal of fortune before the end of the year, and the year should continue to follow closely enough the precedent of 1918.

The most revolutionary changes made during the war have been made by voyage underwriters who have introduced an entirely new system of rating. Before the war underwriters, with the help of their own judgment and by the light of their own experience, quoted what they thought was the appropriate rate for the voyage and the interest to be insured. It was an outright rate, sometimes with additional premiums for trans-shipment; but the one rate covered the whole risk, and it was the product of the underwriter's unaided intelligence. As the risks of navigation and trans-shipment increased with war conditions the surcharge was introduced, and it was fixed not by the individual underwriter but by a committee acting for the whole market. The basic rate was still left to the underwriter's free judgment; but he had to add to it the agreed surcharge, which (to begin with) was the same for every kind of interest and for all conditions of policy.

These surcharges, as time went by, became both higher and more elaborate, varying more and more from voyage to voyage, and varying, too, according to the nature of the cover. "FPA policies" (free of particular average) carried one surcharge. "With average" policies carried another. "All risks" policies carried a third and a fourth. And finally came the combined marine surcharges, ranging from 2s. 6d. to 90s. per cent. printed in four columns and conveniently bound in pamphlet form for bedside reading. Those pamphlets to-day are the voyage underwriter's bible and liturgy; and the result is that while on a particular risk his basic rate, evolved from his own judgment, may be 5s. per cent, his surcharge imposed from on high may be 70s. per cent.

At this point we touch the real change that war has brought to the marine market. It is now a planned organism, and the economist who is concerned with the advantages of the planned State—its encouragement of enterprise, its scrupulous adjustment of the interests of producer and consumer, its stimulus to personal industry and hard thinking—will find them all in the marine market. One committee of underwriters decides the war rates for everybody and publishes them in two leaflets, black and red, according to the degree of compulsion to which the underwriter is subject; and the best war underwriter is the man who memorises best the printed orders of the controlling authority. Another committee decides the surcharges which underwriters must apply to marine risks, and the best marine underwriter is the man who finds his way most quickly through their four-column instructions. Finally—and this must have made some of our predecessors turn in their graves—hints are circulated to brokers how and where they should show their risks.

Perhaps all this is inevitable. In the planned State it will, doubtless, be permanent. But it was not along this road that London became the greatest market in the world.

This is the third in a series of four articles on Insurance. The concluding article of the series, to be published next week, will deal with Insurance in the Post-war World.

The Machine Tool Industry

ONE of the clearest lessons the war has taught has been the vital importance of the machine-tool industry. The theoretical economist classifies the factors of production as land, labour and capital; but to the planner of war production the trio appears in the guise of manpower, materials and machine tools—and the greatest of these is often machine tools. It is not often, however, that machine tools appear thus as a direct and primary contributor to production. They do so in wartime only because machinery and metal goods generally are the end-product of war production; they are what the community most wants to consume. In peacetime, not much metal is directly consumed, and the chief need for machines is to serve as producers' goods—that is, to assist in making other goods for consumption. Machine tools are producers' goods in the second degree—they are needed to assist in making machines to assist in producing goods for consumption. This means that the makers of machine tools inevitably suffer from the extremes of prosperity and depression. The baker does not do much more business in good years than in bad. The maker of bakery machinery has a more irregular business, since he gets orders only in the bakers' good years. And the maker of machine tools to make baking machinery can expect to be busy only when the maker of baking machinery is so busy that he needs to expand his capacity. The example is over-simplified to the point of caricature; but it indicates the nature of the economic climate in which the machine tool maker lives.

There are many variant definitions of what constitutes a machine tool, but, broadly speaking, the term can be taken to cover any power-driven apparatus for working on metal. The lathe, with its many descendants, is the essential machine tool, but machines for planing, drilling and stamping metal also fall within the definition. As is true of so much of the apparatus of an industrial world, machine tools

were invented and first made in Great Britain. But in later years, Britain has fallen behind both America and Germany, both in the size of industry and in the types of machine tools made. Britain has been especially weak in the more complex automatic types and in special-purpose machines. In 1930, the British machine-tool industry was far smaller than the size of the British engineering and other machine-tool-using industries would warrant, and in the pre-war years there was a considerable import on balance. There were several reasons for this. In the first place, British industry was less fully mechanised than American, and probably than German. Many operations which in America are performed by machinery were in this country performed by hand, or by very simple hand appliances. This was true of the actual productive processes in industry; but it was still truer of ancillary processes such as the transport and movement of materials. Similarly the process of mechanising the consumer—by motor cars, vacuum cleaners, refrigerators and domestic machinery of all kinds—had gone much further in America than in Britain. Secondly, it appears to be the case that such machinery as existed was replaced at much longer intervals in British industry than in American. This was partly due to the meagre allowances for depreciation made by the Inland Revenue, but it was also due to the native reluctance of British industrialists to replace a piece of machinery so long as it had any life in it. These two influences combined to reduce the domestic market for machine tools. If the representative British factory had only three-quarters of the mechanical equipment of an American factory with the same output, and if the average life was half as long again, the annual requirement for machinery would be only half as much. And if the makers of machinery also followed the practice of replacing their equipment slowly, the market for machine tools might be no more than one-third in Britain what it was, for the same out-

put of consumers' goods, in America. Thirdly, there are very many different types of machine tools, and when a small total demand has been divided among these many types, the more specialised of them will be needed in such small numbers as not to repay manufacture if they can be imported. Fourthly, while the two other makers of machine tools have protected their markets from the start, the British industry enjoyed only moderate protection for only seven years before the outbreak of war.

During the war the British machine-tool industry has been considerably expanded and developed. The arguments for maintaining it in its expanded condition are equally strong in a context of war or peace. This war has demonstrated the enormous chasm of strength that separates a Great Power from a small nation. It is no longer true, as it was even up to the last war, that two or three small powers equal in strength one Great Power. Either a country is a Great Power or it is militarily defenceless, and no country can be a Great Power unless (among other things) it is an arsenal—that is, unless it is equipped for the production of a reasonably complete outfit of the weapons of modern war. A native machine-tool industry is an essential requirement for an arsenal. Consequently, if Great Britain is to remain a Great Power, she must look to her machine-tool industry as she does to her ships. In peacetime, a flourishing machine-tool industry would be a powerful reinforcement to the export trades. It is becoming more obvious every year that the industrialisation of countries that are now primary producers neither can be nor should be arrested, and that the international trade of the future will consist, more and more, of those articles that are exchanged between industrial countries. If so, machine-tool exports should be a rising market. A machine-tool industry cannot well exist (except for the sort of specialties on which, for example, Sweden has concentrated) anywhere but in a large industrial country. Just as cotton is the first industry to be set up when an agricultural country embarks on industrialisation, so the manufacture of machinery will be the last but one, and machine tools the last of all.

But if there is a case for the maintenance of a strong machine-tool industry as a part of public policy, it is very unlikely to come about by itself. The position on the morrow of the war will be peculiar and difficult. During the war there have been large increases both in the number of machine tools in use (large numbers having been imported) and also in the capacity and output of the British industry. Some of these tools can only be used for munitions, but many of them (almost certainly the majority) can be used for peacetime purposes. They will not necessarily, however, be useful in their present ownership or location. In particular, the Government will be the owner of large numbers of tools, both because of its direct trading in them during the war and because of the large numbers of factories whose construction and equipment it has financed. The automatic result of the end of the war would be that enormous quantities of machine tools would come on to the market. There would be a slump which, so far from supporting the industry, would kill it.

There are some analogies between this situation and that which will prevail in shipbuilding. In both cases it is necessary, on grounds of public policy, to keep the industry going in conditions of world-wide excess of supply over demand. In the case of ships, *The Economist* has suggested that the Government should itself place orders for a regular flow, hiring the finished ships out on long-term contracts

and on such terms as the market will support, to be employed by the shipping companies. This solution could hardly be applied to machine tools. The industry will doubtless require some reorganisation, in which the Government might well take a hand. It might be given financial aid and assistance in developing an export trade. But the great diversity of types of machine tools and the great variety of uses to which they can be put, in peacetime, by a very large number of different firms would make it almost impossible for the Government to draw up either a programme of production or a fair basis of hiring out. More indirect methods will have to be adopted.

The basic difficulty arises from the fact that the supply of machine tools (new and second-hand together) will greatly exceed the demand, and measures should be taken to work on both sides of the equation. On the supply side, the Government should pursue a very cautious policy in disposing of its stocks. Any tools that are more adapted to war work than to peacetime uses should be held in a national munitions reserve. Others that have comparatively little life left should be scrapped. The prices of second-hand tools should not be too low relatively to new tools—which involves the control of second-hand sales and, conceivably, a subsidy in aid of the prices of new tools.

The demand side is more difficult because of the derived nature of the peacetime demand for machine tools. The direct customers are engineering firms—the machine-makers—and it is precisely these firms that have been extensively re-tooled during the war. The war has also, of course, involved intensive usage of machine tools, but on balance the engineering industry is better equipped than it was. Demand could be stimulated by giving every encouragement to the replacement of tools. The cost of such replacement could be allowed (in all cases—not merely in some as at present) to be deducted from income for tax purposes; credit could be provided on easy terms; and if a subsidy were given in aid of the price of new machine tools, as suggested above, it would also assist in stimulating the demand.

But though the machine-makers' demand for machine tools could be stimulated and accelerated by these devices, it will remain dependent upon the demand for machines. Here the problems of the machine-tool industry merge into those of productive industry as a whole. This article is not the place for arguing the case for a great increase in the general mechanisation of British industry—indeed, of economic life generally—and for speeding up the average rate of replacement. It must be enough for the moment to say that there is such a case, based on far wider grounds than the desirability of maintaining the machine-tool industry, and that it is a very strong case. The special difficulties of the machine-tool industry in the period after the war will be temporary, and will vanish with the war's legacy of a surplus of tools. Thereafter the machine-tool makers' fate will depend entirely on the speed and determination with which the country sets about the task of continuing the Industrial Revolution. There should be a policy of first aid, on the lines suggested above, until such time as the general policy can attain momentum and thereafter a special watch over the fortunes of this vital but vulnerable industry. For these purposes, it will be desirable to keep the Machine Tool Control—or some similar agency—in existence. But the long-term answer to the industry's problems can only be given by industrial policy in the widest definition of the term.

Business Notes

Expectant Markets

The profit-taking which followed the rise of about 5 per cent in average equity share values on Mussolini's fall from power has now come to an end, but the markets have given no clear sign of an early renewal of activity. Technically, the omens remain almost wholly favourable. Gilt-edged values are steady, all offerings of high and medium grade industrials have been absorbed at prices only a little below the best, and the volume of business has tended to contract rather than expand during the process of consolidation. These are characteristic features of a bullish, but not a booming, market. The more avowedly speculative media, like foreign bonds, mines, and border-line industrials, have lost some of their recent buoyancy without losing any substantial part of their gains. But the markets as a whole appear to have direction rather than purpose. They lack a definite objective, apart from the purely general consideration that prices inside the closed capital system, with the military background increasingly favourable, must go higher, almost willy nilly. Investors have an Alexandrine desire to discover new factors to discount; for all the obvious possibilities—Allied progress, liberation of territories, and post-war recovery—already find reflection to a considerable extent in the present range of prices. Institutional investors, particularly, have difficulty in unearthing new lines of "attractive" stock. But the upward movement of values, with all its interruptions and temporary setbacks, continues, precisely because they, and others, have a continuing flow of liquid resources for investment, and must go on investing them. In these conditions, the favourable technical features in the market conspectus appear all the more reassuring. The Stock Exchange, where existing securities still have the freest of markets, and human motives find freest expression, would present a more exciting but less satisfactory picture if a speculative spirit, or the fear of inflationary conditions in the foreseeable future, were really common to large numbers of people. From that point of view, at least, the absence of sustained and consistent market activity, in the present phase, is welcome.

Stock Exchange Markings

When must a member of the Stock Exchange disregard his client's instructions? Whenever these would override his "duty to execute each transaction to the best advantage, according to his judgment at the time of dealing." That will be the effect of a new Stock Exchange Rule (No. 73a), which comes up for confirmation next Monday, after having been passed by the Committee for General Purposes on August 9th. The praiseworthy aim of the new Rule is less to protect investors against the consequences of their own human frailties than to prevent the Stock Exchange Lists from becoming a misleading record of "the state of the market." In one sense, the issue goes back to the time of Dunkirk, when for understandable reasons, a tendency arose for some clients to suggest, on placing a substantial order, that business should be done through a particular jobbing firm in whose standing they had special confidence. Later, the practice had a certain eleemosynary significance, in cases where investors were not averse to putting a little business in the way of some deserving beneficiary—even if he had no "book" in the securities concerned and his intervention merely cost the ultimate principal an extra jobber's "turn." There are, however, more sinister possibilities, in instances where the price a third party can be induced to pay for a share may be based, directly or indirectly, on a figure "marked" in the "Business Done" column of the appropriate Stock Exchange List. Rule 73a will henceforth make it impossible for a broker who has put through a sizable order in the normal way at a normal price, to accept instructions to place a small residual parcel through an intermediate jobber. Clearly, it would be against the public interest if the resulting figure, inflated by the double "turn," were held out as a representative marking. Brokers, admittedly, are sensitive on matters which impinge directly on their personal relationships with clients. But the latter deal always subject to Stock Exchange regulations, and the entirely generalised wording of the new Rule at least limits the discretion of members to questions of business interest, which are within their range of professional understanding, rather than of pure morals, which presumably are not.

Motor Industry's Plans

The motor industry, now engaged up to the hilt in war production, is beginning to make plans for the future. It has formed a Public Relations Committee under the chairmanship of Sir Miles Thomas, vice-chairman of Morris Motors and of subsidiary concerns. In his first statement, Sir Miles Thomas made two points. He predicted that the speed with which the industry can resume the production of motor cars will be much greater than is generally believed. This is encouraging. But he added that the industry would resume production from the point where it had left off, and that for some time no great change in models was expected. This is less encouraging. True, the industry could change over more quickly to the production of motor cars if it resumes the production of pre-war models. But this policy, if carried too far, might prejudice its future, especially in the export markets. The industry, in fact, will be confronted with the choice between bringing out new models, embodying the fruits of the technical progress made during the war, which would involve a comparatively slow start, and the production of pre-war models which would permit a quick start. This is a choice which should not be made without careful reflection upon its implications. Indeed, the pre-war policy of the motor industry, especially the insistence of individual concerns on producing a large variety of models, requires careful examination in the light of past experience. Even American manufacturers, with a home market more than ten times the size of Britain's, have found it advantageous to secure the benefits of standardisation by concentrating on a small range of models. Equally necessary is the reconsideration of the Government's taxation policy, for the horse-power tax has undoubtedly hampered the industry on the export market by forcing it to produce low-powered cars. If manufacturers wish to share in the prospective expansion of export demand after the war—as indeed they should—they must look ahead, not backwards.

Wages in Agriculture

The application of farm workers for an increase in the national minimum wage from £3 to £4 a week was rejected last week by the Agricultural Wages Board; the employers' representatives were unwilling to support the application without an assurance that they would be allowed to pass on the consequent increase in costs. But a motion for an increase of 5s. a week in the national minimum wage was carried. The application is to be discussed further on September 21st. Agricultural wages have been raised substantially since the outbreak of war. In July, 1940, when average wages in agriculture were 36s. a week, the national minimum was fixed at 48s., and in December, 1941, it was raised to £3 a week. The present national minimum wage is thus about 67 per cent higher than before July, 1940. The rise almost exactly equals the increase in the earnings of workers in industry between October, 1938, and January, 1943. But the two sets of figures are not comparable; in the one case they relate to the difference between the present national minimum and average earnings before July, 1940, and in the other case they relate to the difference in average earnings on both dates. To obtain a comparison with the rise of earnings in industry, average farm wages before the war would have to be set alongside, not the present minimum, but present average earnings, which are known to be above the minimum. Furthermore, account would have to be taken of the increase in average weekly working hours on the farm and in industry. Unfortunately, the data for such a comparison are not available; but if they were they would undoubtedly show that the increase in average farm wages has exceeded the rise of earnings in industry. This is not to say that the relatively greater increase in farm wages was not desirable. Before the war they were well below average earnings in industry, and some reduction of the disparity was justified. But if a national minimum of £4 a week were granted, farm wages would reach almost parity with earnings in many other industries; not, of course, immediately, but after the war, when industry will revert to normal hours of work. But unless the productivity of agriculture can be raised to the level of productivity in industry—which is unlikely—equality in earnings would involve a heavy subsidy with an agriculture of anything like its present size. In other words, the higher agricultural wages are fixed the smaller will have to be the size of British agriculture if the community is not to be made to bear an intolerable burden.

Change of Employment

Manpower is still a scarce factor, and the latest Order of the Minister of Labour—the Control of Employment (Termination of Employment) Order, which came into force yesterday, requires employers to notify a local office of the Ministry when an employee terminates his employment, or is under notice to do so. It applies to all men aged 18 to 64 inclusive, and women aged 18 to 59 inclusive. There are a few exceptions; the obligation already applies to those covered by essential work orders, which now comprise more than eight million workers. Turnover of labour is increasing, a reflection of the flexibility of munition production. The new Order will not provide any additional labour, but, since the Ministry of Labour will have prompt information when workers are free for new jobs, the time lag between jobs will be shortened. The labour exchanges can summon unemployed workers for interview instead of waiting for them to ask for new jobs. Workers outside the registration ages who are no longer required on work they have been doing have sometimes been lost to industry. By

prompt action they can be placed in useful work in other firms. The Order applies to part-time workers doing more than 20 hours a week, as well as to voluntary workers. It will obviate the necessity of checking past registrations, which was a slow method of catching up with people who had left their work, but who had not applied for new jobs. Under the Order, the Minister of Labour has not taken powers of directing people outside the registration ages. It does not prevent workers from finding work for themselves if they are already free to do so. In general, the Order gives the Ministry more control over the labour force, and doubtless this step might have been taken sooner if the labour exchanges had been able to cope with the work involved.

The Lira Parity

To form any opinion of the intrinsic value of the lira is rendered doubly difficult at the present time by conflicting claims based upon insufficient evidence. Critics of the rate of 400 lire to the £ recently fixed in Sicily, it will be recalled, asserted categorically that such a rate represented a gross undervaluation. While it is more than doubtful whether adequate data are available to substantiate this assertion, there are certainly indications which tend to support it. The pre-war deficit in the Italian balance of payments is evidence that the lira was overvalued at the rate then current of 89 lire to the £, but the overvaluation was probably not serious. And according to Fascist estimates—as was pointed out in *The Economist* last week—the national income of Italy has rather less than doubled during the course of the war, from 90 to 170 milliard lire. This does not suggest that there has been a runaway inflation in Italy's highly controlled economy. Statements that the lira is "now practically valueless" are therefore misleading. If the internal control of prices is in fact becoming increasingly ineffective this is undoubtedly significant; but it would be surprising if inflation in Italy had already reached the advanced stage implied in some comments. Given the present military situation, it would also be surprising if some nervousness about the future of the currency were not to manifest itself. Thus, it has been reported this week that since the fall of Mussolini the buying price for the lira in the free market in Lisbon has dropped by half, from 10 to 5 centavos, whereas during the same period sterling has appreciated from 53 to 56 escudos. This gives an improvement in the cross rate for sterling from 530 to 1,120, but rates determined in a narrow and highly speculative market of this kind obviously have little relevance to economic equilibria. The movement is merely one aspect of the changing views about the war which have elsewhere been reflected in, for example, a slump in the Cairo price for gold sovereigns from 570 to little more than 400 piastres.

Mexican Silver Price

The news that Mexico, the world's largest silver producer, had asked the United States for supplies of the metal on Lend-Lease terms recently provoked a certain amount of ironical comment. The position remains rather obscure, but information which has lately reached this country from New York indicates that Mexican sales of silver to the United States have stopped. The reasons, apparently, are that Mexico needs larger supplies to support its own expanded currency, and that is no longer finds the American price of 45 cents for imported silver attractive. American domestic producers, it will be remembered, are receiving upwards of 70 cents an ounce. On the face of it, the American authorities could easily overcome the difficulty by paying more, as they have done in the case of many other strategic metals like Bolivian tin. The trouble is, however, that this might also involve an appreciation in the peso. This coin contains 38/100ths of an ounce of silver, so that at the present exchange rate of 4.85 pesos to the dollar, the peso has an exchange value of 20.60 cents and a melting value of 17.10 cents (at 45 cents per ounce). An increase, say, of only 9 cents in the price for imported silver would bring the peso to its melting point. Whether the American authorities would approve of an appreciation of the peso against the dollar in order to overcome this complication if the silver price were raised, it is impossible to say. At all events, the underlying pressure is in this direction. Mexico is building up a large surplus of dollar exchange, and although the United States' undertaking to support the peso with a \$40 million

I am the Bomb..

I was once the North and South gates of a London Park. When these gates were closed, small boys would clamber over me to gain the freedom of the City. Now many of them, grown to manhood, are fighting to gain freedom for the World. Behind them, staunchly helping in the fight, is the Motor Industry of Great Britain, making every kind of weapon vital to our cause.

stabilisation fund has recently been extended for another two years, there is no need for it at the present time. The idea is, in fact, being canvassed that the peso should be allowed to return to its old pegged rate of 3.60 to the dollar.

Argentine Railway Capital Changes?

The announcement that the directors of the Bolivar Railway are considering the possibility of reorganising the company's capital structure has prompted discussion of the probability of future capital developments among the South American railways in general and the Argentine companies in particular. The Bolivar line has secured additional permanent traffic, but finds itself short both of engine power and liquid resources to take full advantage of its opportunity. Similar problems are common to concerns in many different industries when recovery comes after a long and gruelling period of adversity. The recognised procedure then is to "clean up the balance sheet," cut away dead wood, write off lost capital, and seek new funds through the usual channels. British-owned railways, for some reason, have been loth, in the past, to follow this procedure. But there are a number of special factors which, in the case of the Argentine lines, may eventually induce directors to examine its possibilities more closely. No single British-owned railway in that country has earned or paid an ordinary dividend for many years. Millions of pounds of dividend arrears have accumulated on preference stocks. Only one company, the Buenos Aires Great Southern, has avoided a moratorium on its debenture stocks, though some lines have been able to make substantial payments of interest arrears. All the companies are carrying heavy debit balances to profit and loss. Inability, in many instances, to finance normal renewals of track and rolling stock (or even, frequently, to obtain the necessary materials), has reduced operating efficiency and laid up a heavy bill for future rehabilitation. Obviously, decisive action must await the end of the war, but it may be argued that the present is the right time for making detailed plans, particularly on the financial side, to be put into operation as soon as opportunity offers. Unfortunately, conditions outside the companies' control militate heavily against firm planning of any sort. An essential for capital reorganisation is a reasonable prospect of maintaining a minimum basis of future profits, and that, it must be frankly admitted, is noticeably lacking. The traffic position has improved *pari passu* with the growth of war-time demand for Argentine products, and the outlook in the post-war period of world rehabilitation in that respect, is bright. But the attitude of the Argentine national authorities has been anything but sympathetic to the railways' claim for the establishment of working conditions in which they can earn even a moderate return on their capital. Increase in rates and charges (the most recent of which was authorised only a week or two ago), have been hedged round with conditions ensuring that their financial fruits shall not reach the proprietors. And the entire legal basis for the companies' operations will come into the melting pot in 1947, on the expiration of the Mitre Law—which has always been regarded as the Argentine railways' Great Charter, though many of its provisions have been honoured in the breach rather than the observance. Suggestions that important interests in Argentina favour a policy of "delayed expropriation," or eventually, of acquisition of foreign-owned railway properties

at bargain-counter prices, may, perhaps, be exaggerated. But so long as they exist, it will clearly be difficult for those in charge of the railways either to find a solid financial foundation for capital re-adjustment schemes or to plan a successful approach to British investors for new long term funds.

Clothing Ration Quality Differentiation

The Board of Trade has recognised the disadvantage suffered by people who buy relatively inferior clothing; since it does not last as long as better quality clothing, it has to be replaced more frequently. Unfortunately, some inferior clothing has to be produced, since material and machinery might otherwise be wasted. The demand for higher-priced goods has steadily increased; the amount spent per coupon was 20 per cent higher in June than the average for the preceding twelve months. Consequently there has been a pronounced tendency for lower-priced goods to remain unsold, and the stocks thus accumulating were beginning to be large. The coupon values of certain cheaper utility cloths and garments—affecting seven to eight per cent of utility output—are to be reduced from September 1st. This may help to dispose of them and to remove the disadvantage of buying cheaper clothing. Because of the small supplies of boots and shoes, their coupon value was raised, from August 15th, from five to seven coupons for women's shoes and from seven to nine for men's. Some cheaper utility shoes and wooden-soled shoes—the production rate of which is 20 per cent of women's shoes and 10 per cent of men's—remain at the old rate. Probably in view of their present quality, men's socks have been reduced from three to two coupons a pair, and women's seamless stockings, which comprise 80 per cent of production, from two to one-and-a-half coupons. If the same quantities of shoes and hose as at present continue to be bought, the effect of the changes in the coupon value of these articles is to raise the men's ration by roughly one per cent and lower the women's ration by the same amount. When the down-pointing of cheaper utility clothing is taken into account, the total effect is to raise the purchasing power of the ration.

Magnesium from Sea Water

Magnesium, the lightest of all metals, is playing a growingly important part in metallurgy and engineering. Pure magnesite (carbonate of magnesium) is of limited occurrence, though there are large deposits of a lower degree of purity. Dolomite, the double carbonate of calcium and magnesium, is far more widely distributed, and sea water provides an inexhaustible source of magnesium chloride, while certain concentrated solutions of magnesium salts occur in the Dead Sea, Michigan and elsewhere. Sea water contains an average of 0.41 per cent of magnesium; one cubic mile of water contains the raw material for over 4 million tons of the metal. The Dow Chemical Co. uses Michigan brines containing one part of magnesium in 100 for preparing the metal. In California the same firm concentrates sea water by solar evaporation and then treats the brine with lime to get magnesium hydroxide, which is reduced to metal. In his Peter Le Neve Foster lecture on "Magnesium" to the Royal Society of Arts early this year, Dr C. H. Desch, F.R.S., lifted in part the veil on British wartime developments in the manufacture of magnesia from sea water. The site of one of the newer plants was originally a small harbour the entrance of which is now closed by a caisson, sufficient water being obtained during high tide to enable the process using ten million gallons of sea water a day to continue during the period of low tide. The method is one of pre-treatment with lime to precipitate any dissolved calcium bicarbonate as insoluble carbonate. In the next stage the surface of the filtered sea water is sprayed with milk of hydrated calcined dolomite whereby the magnesium content of the water is precipitated as insoluble hydroxide. Later steps comprise the settling, filtration, drying and calcination of the magnesium hydroxide. It is suitable for manufacturing metallic magnesium by both the electrolytic and thermal reduction methods, and dead-burnt magnesia for the refractories industry. Another British plant employs pure magnesia instead of calcined dolomite as the precipitating agent. These plants are owned by the Ministry of Supply, and operated by managing companies. The new industry promises to be a permanent addition to Great Britain's economic activities after the war.

Tea Supplies

As reported briefly in *The Economist* of August 14th, the Minister of Food has completed his arrangements for the purchase of tea in the 1943-44 season, which began on April 1st. The quantity contracted for is estimated in trade circles to exceed the round figure given by Lord Woolton—700 million lb—by roughly 30 million lb. Of the total, 431 million lb are expected to come from India, 270 million lb from Ceylon and the remainder of 30 million lb from British East Africa, with Nyasaland and Kenya ranking first. While no official details of the prices paid by the Ministry have been made public, it is believed in Mincing Lane that the price arrangement introduced in the first year of the war will remain in force. By this arrangement planters are being paid the average prices for the years 1936, 1937 and 1938 plus certain allowances for increases in production costs since the end of the basic period. Although the quantities of tea bought by the Ministry of Food in India, Ceylon and East Africa exceeds maximum pre-war exports from these areas by about 125 million lb, it remains 200 million lb short of the total supplies available to the international market in the last pre-war season. On the other hand countries now under enemy control in 1938-39 re-hand supplies of tea of close on 100 million lb. The corded net imports of tea of close on 100 million lb. The season thus amounts to about 100 million lb. The war has not seriously dislocated international tea consumption. Despite the rationing system, United Kingdom consumption is equivalent to about 50 per cent of world consumption; the British Empire and the United States are absorbing the bulk of the remainder. Since last autumn tea has been distributed under the international tea allocation scheme introduced by the Combined Food Board. This scheme, by which the Ministry of Food acquires the whole of the available crops for distribution, serves all consuming areas outside enemy control, including neutral countries. The scheme is proving a success and may well provide valuable experience for possible post-war distribution schemes for foodstuffs. Last year tea distribution was somewhat hampered by the shortage of shipping, but shipments may proceed more smoothly this season. The Ministry of Food has rationalised tea packing for shipment. Tea is now largely shipped in broken form, rather than in the leaf. As a standard chest takes about 145 lbs of broken tea, but only 120 lb of leaf tea, a saving of 20 per cent in shipping has been secured.

The reduction in tea supplies caused by the loss of the Dutch East Indies and other Pacific sources of supply, together with the introduction of the centralised buying scheme, have set an end to the restriction of international exports under the international tea scheme. This scheme attracted attention this week as the International Tea Committee published a review of its activities between 1933 and 1943. The Committee points out that the scheme will not necessarily continue in its present form after the war as it may have to be adapted to the general commodity control plans recommended by the Allied Food Conference at Hot Springs last May. The Committee is in favour of the representation of consumers in the scheme, advocated at Hot Springs. Stress is also laid on the continuation of the work of the International Tea Market Expansion Board. The report, however, is not in favour of a tea buffer pool, but it wishes to see the limitation on new tea plantings extended. It suggests that control should remain in the hands of the industry, not of the Government, and it recommends the continuation of Government support. On the whole, the proposals, with the exception of that for the participation of consumers' representatives, follows the principles of the old agreement. Admittedly, the conditions of the tea market are in some respects different from those in other commodity markets. Consumption, for instance, is mainly concentrated in the English-speaking areas and can only gradually be extended elsewhere. On the other hand production can be greatly extended from existing plants by intensified plucking. In addition, large stocks of tea are normally held in London and India, which render a buffer pool unnecessary; moreover, the types of tea used in the various consuming countries differ substantially. The proposals put forward by the International Tea Committee thus are less open to criticism than may appear at first sight. But whether these proposals will actually form the basis of the post-war tea scheme is by no means certain. The British Government is understood to favour the transformation of the tea scheme from a planters' agreement into a Government agreement.

THE MINISTER OF FUEL AND POWER SPEAKS TO

FACTORY MANAGERMENTS

"New battle fronts mean new fuel consumers. We must make even greater economies in industry during the next twelve months, and I appeal to Factory Managements to intensify existing fuel economy schemes and to initiate new ones wherever possible."

Factory output doubled but Fuel consumption 10% less.

The Managing Director of a firm of Photographic Manufacturers reports:—

"Before the war we used 22,500 tons a year of the best coal we could buy. Though the output of our factory has now doubled, and today we use only slack and outcrop coal, our fuel consumption is actually 10% less."

These are the results of a systematic fuel economy campaign started in January 1940. The boiler house superintendent is in charge. Fuel Watchers in each department make regular systematic checks on each category of fuel consumption. "Fuel Flashes", broadcast through house microphone to all operatives, remind them to save light and heat. Economies are effected by scientific control of refrigeration, air conditioning, heating and power.

Write to the Secretary of the Fuel Efficiency Committee in your Region for technical information, for details of fuel courses, or to arrange for the inspection of your works by an expert. All these services are free.

The Ministry's Regional Offices are at:—

COMPANY MEETINGS

WILLIAM HANCOCK AND COMPANY, LIMITED

INCREASED OUTPUT

The ordinary general meeting of William Hancock and Company, Limited, was held, on the 19th instant, at Cardiff, Col. J. G. Gaskell, T.D., D.L. (chairman and managing director), presiding.

The following is an extract from the chairman's statement circulated with the report and accounts.

The profit has reached a new level consequent upon a slightly increased output. Modification in brewing plant has enabled this increased output to be reached. We are brewing to maximum capacity in spite of many difficulties in the matter of supplies of materials and scarcity of labour. There has been a further slight reduction in gravity in accordance with Ministry of Food requirements, and certain of our well-known brands have necessarily had to be discontinued. Nevertheless, the demand for our products is continually increasing, a reflection that they still retain the popularity that they had gained in happier years.

In the balance-sheet trade creditors and sundry provisions, at £725,000, is £115,000 higher than last year. This includes reserved repairs and war damage reserve, and excess profits tax and income-tax reserve. It further includes substantial increase in liability for Beer Duty for the month of May, owing to a further increase in taxation. Since the commencement of the war there have been five increases in Beer Duty amounting in all to the equivalent of 6d per pint. Your company now pays in Beer Duty alone approximately £100,000 a month.

It has been the consistent policy of this company to give priority in the matter of supplies to members of the Forces and, although fluctuations occur in individual units, that demand remains as urgent as ever. At the same time, the requirements, both for the houses owned by the company and for free accounts, are constantly borne in mind and are, in fact, we think, fairly and even generously supplied.

The directors recommend that a dividend be declared on the 6 per cent. second preference stock for the past half-year ended May 31, 1943, and that a final dividend of 7½ per cent., less tax, be declared on the ordinary stock, making 10 per cent. for the year. This will enable a slightly larger amount to be carried forward than was the case last year.

There is a splendid spirit of cordiality between ourselves and our tenants and managers. They, like ourselves, are working under great difficulties on account of staff shortage, and to those who still remain, both in our houses and in our head office and branch offices, I would like to express the directors' grateful thanks.

The report was unanimously adopted.

CHARTERLAND AND GENERAL EXPLORATION AND FINANCE COMPANY, LIMITED

The ordinary general meeting of this company was held, on the 19th instant, in London, Mr J. E. W. Lomas, chairman and managing director, presiding.

The following is an extract from the chairman's circulated statement:—

The accounts reflect the acquisition of the assets of The United Exploration Company, Limited, as from August 19, 1942. The profit and loss account shows a credit balance of £78,722, an increase of £10,869 over last year. We have again benefited by the favourable course of the markets. Income-tax and N.D.C. on the year's profits at £39,693 is up by £22,000.

We recommend a final dividend of 3 per cent. on the preference stock and a dividend of 10 per cent. on the ordinary capital.

The report was adopted.

UNITED MOLASSES COMPANY, LIMITED

MR F. K. KIELBERG'S STATEMENT

The seventeenth annual general meeting of the United Molasses Company, Limited, will be held on the 27th instant at Brook House, Park Lane, London, W.

The following is an extract from the statement of Mr F. K. Kielberg, the chairman, which was circulated with the report and accounts: The accounts show the great financial strength of the company. Considering the number of countries all over the world in which the activities of the company have been curtailed or temporarily destroyed by the war, the combined earnings must be considered satisfactory.

Profits have been sufficient to maintain the dividends, cash distribution, allocation (£100,000) to general reserve, and slightly to increase the carry forward.

Brief reference is made in the directors' report to the company's acquisition of the controlling interest in Weymann's Motor Bodies (1925), Limited. The acquisition of Weymann's was made in pursuance of the board's policy to broaden the base of the company's activities.

Taking the group of companies as a whole, the trading at home and abroad during the first half of 1943 was reasonably satisfactory, but obviously it cannot be taken for granted that conditions during the second half will remain equally favourable.

The consolidated balance-sheet shows that combined current assets continue to accumulate, and that, at the end of the year, they exceeded current liabilities and appropriations by over £5,000,000. A large part of this amount will probably be required in the early post-war period for replacements of fixed assets lost during the war. The company during 1942 suffered serious shipping losses through enemy action, unfortunately accompanied with considerable loss of life. I am happy, however, to be able to report that losses this year have, up to the present, been a fraction only of those suffered during the same period last year.

AMALGAMATED DENTAL COMPANY, LIMITED

The thirty-eighth annual general meeting of this company was held on the 18th instant. Mr E. Russell Polden, the chairman, presided.

The results of trading, £292,263, against £247,538, showed an increase, but the incidence of taxation reduced the comparative balance available for distribution and left £42,793 to be carried forward against £63,088 from the previous year.

The chairman, in his statement circulated with the report, stated: In providing for taxation, including E.P.T., it will be seen that the reserve of £50,000 already created remains intact. During the period under review the utmost endeavours have been made to maintain effective service, while priority has naturally been given to national requirements.

It would be premature to refer to future developments, but I wish to assure the stockholders that plans are constantly engaging the closest attention of the directors. The report was adopted.

EAST GEDULD MINES, LIMITED

MILLING RESULTS

The sixteenth ordinary general meeting of East Geduld Mines, Limited, was held, on May 11, 1943, at Johannesburg.

Mr P. M. Anderson, the chairman of the company, presided, and in the course of his remarks, said: The ore milled showed a small decrease of 9,000 tons to 1,923,000 tons, and the yield per ton milled was slightly higher at 5.79 dwt. The working revenue amounted to £4,681,486 and working costs absorbed £1,593,157, leaving a working profit of £3,088,329, or slightly more than in 1941. Taxation increased by £201,593 to £2,107,866, equivalent to 68 per cent. of the working profit,

and after taking into account other items set out in the accounts there remained a net profit of £1,006,618, being a decrease of £181,352 on the previous year. Including the unappropriated balance at the beginning of the year, the amount available for distribution was £1,387,183, from which two dividends, totalling 11s. per share, or 1s. 6d. less than in 1941, were paid.

In the interests of the war effort the company has taken steps to effect all possible economies in the consumption of stores and materials, a material step in this direction being the reduction of development work last year to a bare minimum. Such development work amounted to only 4,018 ft., of which 3,780 ft. were on reef and sampled, 2,500 ft., or 66 per cent., being payable with an average value of 9.2 dwt. over 30 in.

The ore reserves, as was to be expected with the curtailment of development, decreased 800,000 tons, to 15,200,000 tons when recalculated as at the year-end. The value of 5.2 dwt. and the estimated stoping width of 59 in. show no change from the previous year.

The Grootvlei Proprietary Mines, Limited, in which our shareholding remains unchanged, recorded most satisfactory progress during the past year.

The report and accounts were adopted.

VAN DYK CONSOLIDATED MINES, LIMITED

MR P. M. ANDERSON'S ADDRESS

The ninth ordinary general meeting of Van Dyk Consolidated Mines, Limited, was held, on May 12, 1943, at Johannesburg.

Mr P. M. Anderson, the chairman of the company, presided, and in the course of his remarks said: Working results were less favourable than those of the previous year, mainly due to a reduction of 1s. 6d. in the yield per ton milled, but the position was greatly aggravated by a shortage of native labour in the latter part of last year, the strength at the year-end being about 20 per cent. below the maximum number in service early in the year.

The ore milled amounted to 1,187,200 tons, or little more than in 1941, and the yield per ton milled declined by 0.18 dwt., to 4.99 dwt. The working revenue was £2,492,773, of which working costs absorbed £1,593,942, leaving a working profit of £898,831. The provision for taxation increased by £23,564, to £449,058, and, after providing for other items detailed in the accounts, there remain a net profit of £441,249, or £109,916 less than in 1941. With the unappropriated balance brought forward at the beginning of the year the amount available for disposal was £720,300. From that amount two dividends totalling 1s. 4½d. per share—or 4½d. less than in 1941—were paid.

In order to assist the war effort your company has taken steps to effect all possible economies in the consumption of stores and materials. Part of this contribution arises through a 25 per cent. curtailment of the development programme, but the extent of this curtailment has proved to be excessive in view of a decrease in the proportion of payable ore disclosed in the course of the work done.

The development work during the year totalled 85,005 feet and of 55,425 feet on reef and sampled, 10,725 feet, or 19 per cent., were payable with an average value of 10.5 dwt. over 22 in. In comparison with the previous year the value shows a slight increase, but the amount of work done was not sufficient to maintain the ore reserves.

The ore reserves, as recalculated as at the year-end, amounted to 3,000,000 tons of an average value of 4.6 dwt. over an estimated stoping width of 41 in. Owing to the inclusion of a greater proportion than previously of ore on the margin of payability, the tonnage shows a reduction of only 100,000 tons compared with the previous year, but the value has decreased by 0.6 dwt.

The report and accounts were adopted.

GEDULD PROPRIETARY MINES, LIMITED

DEVELOPMENT WORK

The forty-second ordinary general meeting of Geduld Proprietary Mines, Limited, was held on May 11, 1943, at Johannesburg.

Mr P. M. Anderson, the chairman of the company, presided, and in the course of his remarks said: The ore milled decreased by 5,000 tons, to 1,393,000 tons, compared with the previous year and the yield per ton milled showed a fractional increase to 4.76 dwt. Working revenue amounted to £2,789,822, of which working costs absorbed £1,369,247, leaving a working profit of £1,420,575, or £19,948 less than in 1941. The lower working profit, combined with a decline in dividend income on our shareholding in East Geduld Mines, Limited, resulted in a decrease of £64,655 in the gross profit, which was £1,837,185. The amount required for taxation increased by £82,642, to £929,049, which is equivalent to 65 per cent. of the working profit, and after providing for other items detailed in the accounts, the net profit was £894,919, or £147,471 less than in 1941.

Including the unappropriated balance at the beginning of the year and funds previously appropriated for capital expenditure now recovered, there was for disposal an amount of £1,199,492, from which were paid two dividends totalling 12s. 3d. per share, a reduction of 1s. 3d. compared with the previous year.

In the interests of the war effort the company has taken steps to effect all possible economies in the consumption of stores and materials. An important step in this direction has been the curtailment of development work to a bare minimum, and on the Main Reef such work has been entirely suspended since the middle of the year.

The development work in Main Reef areas amounted to 1,653 ft. driven, and of 1,090 ft. on reef and sampled, 200 ft., or 18 per cent., were payable, with an average value of 7.5 dwt. over 33 in. Work on the Black Reef horizon was principally confined to making connections between shafts to facilitate exploration on an adequate scale when conditions permit. The footage driven on this horizon was 9,439 ft., and, of 2,880 ft. on reef and sampled, 950 ft., or 33 per cent., were payable, with an average value of 5.7 dwt. over 27 in. The limited amount of work done to date on the Black Reef horizon is encouraging, but, as I indicated last year,

it is insufficient to enable any forecast to be given as to economic possibilities.

The ore reserves, as recalculated as at the year-end, showed a decrease of 500,000 tons, to 8,300,000 tons, the value at 4.2 dwt. and the estimated stoping width of 52 in. being lower by 0.2 dwt. and 1 in. respectively.

East Geduld Mines, Limited, and the Grootvlei Proprietary Mines, Limited, in both of which our interests remain unchanged, made satisfactory progress.

The report and accounts were adopted.

GROOTVLEI PROPRIETARY MINES, LIMITED

TAXATION BURDENS

The thirty-sixth ordinary general meeting of the Grootvlei Proprietary Mines, Limited, was held on May 11, 1943, at Johannesburg.

Mr P. M. Anderson, the chairman of the company, presided, and in the course of his remarks said: The extension to the reduction plant resulted in the ore milled being increased by 349,000 tons, to 1,845,000 tons. The yield per ton milled showed a small decrease to 5.22 dwt. Of the working revenue of £4,052,664, working costs absorbed £1,872,851, leaving a working profit of £2,179,813, which represents an increase of £542,357 over the figure for the previous year. The provision for taxation increased by £472,952, to £1,395,672, and, after allowing for other items detailed in the accounts, there remained a net profit of £778,698, or £68,572 more than for 1941. With the unappropriated balance brought in at the beginning of the year there was £890,999 for disposal, from which amount were paid two dividends, totalling 4s. 9d. per share, an increase of 9d. over the previous year.

In the interests of the war effort the company has taken steps to effect all possible economies in the consumption of stores and materials, and an important step in this direction has been a drastic curtailment in the rate of development work.

During the year development work totalled 30,372 ft., of which 19,210 ft. were on reef and sampled, 10,275 ft., or 53 per cent., being payable with an average value of 15.3 dwt. over 24 in. Two connections have been effected with the underground workings of the Palmietkuil section of the company's property, but in order to conserve materials no development work will be undertaken in that section for the time being.

Due to the curtailment of development work, the ore reserves, recalculated as at the year-end, showed a decrease of 400,000 tons to 9,600,000 tons, the value of 5.2 dwt. and the estimated stoping width of 46½ in. remaining unchanged.

The report and accounts were adopted.

MARIEVALE CONSOLIDATED MINES, LIMITED

INCREASED ORE MILLED

The eighth ordinary general meeting of Marievale Consolidated Mines, Limited, was held, on May 12, 1943, at Johannesburg.

Mr P. M. Anderson, the chairman of the company, presided, and in the course of his remarks said: The ore milled totalled 597,000 tons, being an increase of 5,500 tons over the previous year, and the yield per ton milled showed a slight increase to 5.36 dwt. The working revenue was £1,347,276, of which £897,205 was expended in working costs, resulting in a working profit of £450,071, or £22,008 more than in 1941. The provision for taxation increased by £106,484 to £232,374, and, after allowing for other items specified in the accounts, the net profit was £213,198, or £81,975 less than in 1941. Including the unappropriated balance at the beginning of the year and £5,400 previously appropriated for capital expenditure now recovered, the amount for disposal was £409,652, from which two dividends, totalling 1s. per share—the same as the rate of the previous year—were paid.

The company has taken steps, in the interests of the war effort, to effect every possible economy in the consumption of stores and materials, and an important step in this direction has been a drastic curtailment in the scale of development work. In order to safeguard future production, however, the deepening of No. 1 shaft from the 7th to the 14th level was put in hand.

The development work during the year amounted to 31,637 ft., and of 18,710 ft. sampled and on reef 10,555 ft., or 56 per cent., were payable with an average value of 16.5 dwt. over 20 in.

Notwithstanding the curtailment of development work, the year-end recalculation of the ore reserves showed that these had been maintained at 2,500,000 tons and the value increased by one-tenth of a penny-weight to 6.0 dwt., the estimated stoping width of 38 in. being unchanged.

The report and accounts were adopted.

Company Results

International Tea Co.'s Stores.—Now controls some 1,400 shops.

£5 5s. 9d. per cent on the 20 per cent dividend and 2½ per cent tax free bonus.

RECORDS and STATISTICS

INDUSTRY AND TRADE

Down-pointing of Utility Garments.—From September 1st, about seven to eight per cent of utility cloth is to be down-pointed. Some cloths are to be transferred from Group I (3 coupons per square yard) to Group II (2 coupons per square yard). Other cloths are to be put into a new Group III, with a coupon rating of 1½ per square yard. Some examples of the lower coupon rating for garments made from these cloths are given in the following table:—

Men's	Old rate.	New rate.
Jacket ...	13	10
Women's		
Dress, woollen	11	7
" other	7	5
Blouse	4	3
Nightdress	6	4
Vest	3	2
Open-back overall	3	2

Wholesale Vegetable Trade.—It has been decided to release a proportion of the workers engaged in the wholesale fruit and vegetable trade, for the armed forces and for vital war industries. The Ministry of Food, in collaboration with the Ministry of Labour, will consider firms in groups and apportion the number of persons to be withdrawn amongst members of each group so that the burden falls equitably. The quota to be released will vary in different areas.

Cotton Goods Exports.—In the second quarter of this year there was an improvement on the first quarter in the exports of cotton goods from this country. The piece goods total was 108,413,000 square yards, against 82,130,000 square yards, and the yarn figures were 4,782,000 lb., against 4,678,000 lb. The larger figures may be partly due to the improvement in the shipping situation; merchants have experienced less trouble in obtaining freight. Exports are small compared with 1940, when 978,479,000 square yards of cloth and 66,765,000 lb. of yarn was shipped.

Export Control.—Under the Export of Goods (Control) (No. 7) Order (S. R. and O., 1943, No. 1116), which comes into force on August 30th, control is extended to cover silver and silverware; fatty alcohols (including sulphonated fatty alcohols); cotton bags, sacks and packs; and additional metal goods, machinery and chemicals.

Pig Clubs Production.—The number of pig clubs in operation is 5,090 with a total membership of 110,000. The pigs are fed largely with waste food, and the numbers kept amount to 120,000, producing about 7,000 tons of pigmeat a year.

FINANCE AND BANKING

THE MONEY MARKET.—The difficult credit conditions that were experienced at the end of last week, when special buying was necessary to assist the market, continued on Monday. Government dividend disbursements on that day were not enough to offset the shortage of credit caused by the banks' heavy payments due this week on Treasury deposit receipts. These amounted to £70 millions, against nominal maturities of £50 millions; but pre-encashments had reduced the latter considerably. The market had also a somewhat larger bill quota to take up. No special buying of bills was reported, but official assistance was given through the banks. By the middle of the week, conditions were more comfortable, and the easier position is reflected in the Bank return. The note circulation is down by £2,725,000, and Government securities have risen by £7,058,000. The net effect of the various movements is to raise bankers' deposits by £9,248,000 to £149,507,000.

MONEY RATES, LONDON.—The following rates remained unchanged between Aug. 13th and Aug. 19th:—
Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days 1½%; 3 months, 1½%; 4 months, 1½-1½%; 6 months, 1½-1½%. Treasury Bills: 2 months, 1-1¼%; 3 months, 1-1¼%. Day-to-day money, 1-1¼%. Short Loans, 1-1¼%. Bank deposit rates 1%. Discount deposit at call 1%; at notice 1%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between Aug. 13th and Aug. 19th. (Figures in brackets are par of exchange.)

United States. \$ (4.861) 4-02½-03½; mail transfers 4-02½-03½. **Canada.** \$ (4.861) 4-45-47; mail transfers 4-43-47½. **Switzerland.** Francs (85-225) 17-30-40. **Sweden.** Krona (18-169) T.T. 18-85-95, bank notes at Bank of England, 17-40 kr. **Dutch West Indies.** Florin (12-11) 7-58-62; **Portugal.** Escudos (110) 99-80-100-20; mail transfers 99-80-100-30. **Panama.** 54-02-04; mail transfers 4-02-04½. **Brazil.** 83-64½ cr. A change has been made in the method of showing an excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £119,573 to £2,848,307, the other operations for the week (no longer shown separately) raised the gross National Debt by £59,965,590 to £18,068 million.

THE CHARTERED BANK OF INDIA AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

CAPITAL (PAID UP) - £3,000,000
RESERVE FUND - £3,000,000
 Branches and Agencies throughout INDIA and the EAST
AFFILIATED BANK IN INDIA

THE ALLAHABAD BANK LTD., with 15 Branches & 30 Sub-Agencies
 The Bank offers a complete Banking Service and provides exceptional facilities for financing every description of trade with the East.

Deposits for Fixed Periods or repayable at call or at short notice are received at rates which may be ascertained on application. The Bank also undertakes Trusteeships and Executorships.

Head Office: 38, BISHOPSGATE, LONDON, E.C.2

West End Branch:

28, CHARLES II STREET, HAYMARKET, S.W.1
 Manchester Branch: 52, MOSLEY STREET

New York Agency: 65, BROADWAY, NEW YORK CITY

THE UNION BANK OF AUSTRALIA

ESTABLISHED 1837.

LIMITED

Capital Authorised and Issued ... £12,000,000
 Paid-up Capital ... £4,000,000
 Reserve Liability of Proprietors ... £8,000,000

(Not capable of being called up except in the event of and for the purpose of the bank being wound up)

Reserve Fund ... £3,250,000
 Special Currency Reserve ... £1,600,000

Head Office: 71 CORNHILL, LONDON, E.C.3
 West End Agency: 15 CARLOS PLACE, W.1.

Drafts are granted on the Bank's Branches throughout the Australian States and Dominion of New Zealand. Telegraphic Remittances are also made. Commercial and Circular Letters of Credit, and Travellers' cheques issued. Bills are purchased or sent for Collection. Deposits are received for fixed periods on terms which may be ascertained on application.

THE BANK OF AUSTRALASIA

Incorporated by Royal Charter 1835.

Paid-up Capital ... £4,500,000
 Reserve Fund ... £2,500,000
 Currency Reserve ... £2,000,000
 Reserve Liability of Proprietors under the Charter ... £4,500,000
£13,500,000

Court of Directors:

D. F. ANDERSON, Esq. HON. GEOFFREY C. GIBBS.

Uncertain Alliance?

THE fall of Kharkov crowns the successful Russian actions at Bielgorod and Orel, and it is the certain preface to fresh victories. Who controls Kharkov controls the Donetz. The Red Army is already moving forward across the river basin, and soon the Germans may be standing on the Dnieper line. All this has been achieved in high summer, the time of Germany's greatest triumphs in the first two years of the Eastern war. The winter belonged to the Red Army even in the dark days of 1941. It is not therefore fantastic for the Russians to hope that by following their summer victories with a vigorous winter campaign they can drive the invader from the soil of Russia. It would not be surprising if they also thought—very inaccurately—that this victory had been accomplished without any help at all from the British and Americans and the Red Army alone had defeated the enemy.

This possibility is leading some critics to fear for the stability of the alliance between Russia and the West. They argue that the chief bond holding together Britain, the United States and the USSR was the belief of each that the help of the others was necessary to defeat Hitler. If the Russians discover that without the Second Front they can beat the Germans, they may have little interest in continuing to co-operate. The chief Russian war aim, these critics argue, is to free Russia from the invader. If this can be done by chasing the Germans out, the fact

that the task of Britain and America in bringing the whole war to an end would then be infinitely harder might not move the Russians, who for two years have looked to Western Europe for signs of a Second Front and have failed to see even one cloud no bigger than a man's hand.

The critics support their case from recent diplomatic exchanges between Russia and the Western Democracies; and it is certainly hard to avoid the conclusion that the Alliance between East and West has undergone some strain in recent months. Since diplomatic relations were broken off between Poland and Russia in April, each diplomatic move seems to have increased the tension. First the Union of Polish Patriots, then the Free German Committee were set up in Moscow. M. Maisky was recalled from London, then M. Litvinov from Washington. Contradictory statements on whether or not Russia was invited to the Quebec Conference were issued from America and from Moscow. Meanwhile the Russian press has attacked Mr Churchill's very tentative proposals about European federations with the threat of breaking the Anglo-Russian alliance, and now the policy of the Foreign Office and the State Department towards the French National Committee is being sharply criticised. One might say with Benedict, "This looks not like a nuptial."

If all these indications do in fact point to a withdrawal of Russia, even if not from the war, at least from any

concerted post-war effort for peace and reconstruction, then the outlook for the world is gloomy indeed. The withdrawal of one of the greatest military and industrial Powers into moody and suspicious isolation would have as disastrous an effect on any attempt to build an ordered world as had the withdrawal of the United States after the last war. But such an outcome would be tragic not only for the nations outside Russia, but most of all for the Russian people themselves. If they are once again thrust back upon the boggy of a hostile encircling world, with which neither security nor economic prosperity can be shared, they will have to repeat their 20-year martyrdom of restoring the devastation of a disastrous war, building up a vast industrial system and maintaining an ever-increasing weight of armaments all unaided and at the same time. This week, plans of reconstruction for the reoccupied areas were announced. The Russians wish, perhaps, to suggest that they can do without the economic co-operation of other Powers. So they can, in the long run. But at what cost? The price of single-handed defence and reconstruction in terms of human sacrifice—another generation condemned to oppressive and unrelenting toil, low consumption, forced labour, economic and social tension—can be imagined by those who have studied the history of Russia's stupendous but costly development between 1919 and 1939. And to what end? To a further war? To another catastrophic blood-letting? Isolationism can hardly lead to anything else. Too great a fear of *Einkreisung*, as the Germans have discovered, creates its own enemies. Mutual fear can drive men and nations to fight as surely as mutual envy or mutual greed.

Anyone can understand why the Russians may feel that isolationism is their only path. In terms of human lives and physical destruction they have suffered more than any other great nation—though less, possibly, than some of the small. They have looked anxiously through two years' disastrous fighting for a Second Front. It has not come. It is easy for them to dismiss the Allies' military difficulties as mere excuses, to believe that they are shirking and prefer the Russians to be bled white. It is easy

to think of them as "capitalist wolves" and interpret their action as a deep-laid plot to weaken the great socialist state. It is especially easy to do so when quite a number of British and American left wing critics are losing no single opportunity of saying very much the same thing.

It is easy, it is understandable—but it is also very silly. If destroying the workers' and peasants' republic had occupied so high a priority on the Democracies' list, then presumably Mr Churchill would have lifted the blockade and put the RAF at the Nazis' disposal in 1941. If there had been a real desire to see Russia bled white, the Murmansk convoys would not have been sent, the fighting in Africa would have been restricted to a static defence, the bombing of Germany's industrial effort reduced to a minimum compatible with appearing to be in the war at all. The U-boats and the Atlantic Wall may look like excuses at the Russian end, but if the charge is pressed home *ad nauseam* there is some excuse for the British to reply that they too needed a Second Front in 1940, and it was a Russian miscalculation as well as a Franco-British defeat that deprived the grand alliance of its Western springboard. However, recriminations from either side are out of place. It is a question not of sentiment but of interest, the overwhelming interest of the Russian, British and American peoples in a secure and prosperous post-war world. Although it is easy enough to understand the feelings of the Russians, statesmen have to deal with facts, not feelings. Marshal Stalin has the reputation of being a realist. He would hardly prove it by allowing ideological prejudices and ungrounded suspicions to deprive the Russian people of the friendship and support of the outside world. The difficulties in the way of co-operation do not come primarily from the British and American side. Both Governments have given tangible proof of their desire to co-operate with Russia. Marshal Stalin is great enough to cut through the tangle of resentment and suspicion. He, least of all men, needs to be haggard by the kind of fears that made Hitler a maniac of encirclement.

It is, of course, possible that Russia's recent diplomatic *démarches* really represent nothing more than increased pressure for the Second Front, and that they do not indicate any intention of changing the fundamental strategy of co-operation. There are, after all, very good reasons for having men as well informed as M. Maisky and M. Litvinov at Marshal Stalin's elbow now that the time for political discussion and agreement with Britain and the United States is coming nearer. No irrevocable Russian step has been taken with regard to any of the National Committees or Allied Governments. There are still no rifts that good will and a determination to agree could not easily bridge. The Quebec decisions can no doubt do much to show that the difficulties are ephemeral and the common interest overwhelming. The Allied offensives are to be speeded up, and they may well include invasions elsewhere than in the Central Mediterranean. Another Conference in the near future is projected, this time to include the Russians. In any case, it would be very desirable if Mr Eden and an American statesman of equal standing could go to Moscow to report directly to Marshal Stalin on the joint decisions arrived at during the Quebec Conference.

Yet behind all that the British and Americans can do there lies a question of confidence. No one can compel the Russians to accept the proofs of Allied sincerity. No one can compel them to take a co-operative and not an isolationist view of their long-term interests. All that good will on the battlefield and at the Conference table, to speak with the utmost frankness and realism of the likely consequences of a Russian withdrawal—the Americans them should be able to be especially effective—and finally put forward, in as concrete form as possible, the contribution which they are prepared to make towards building, with the help of the Russian people, a stable and co-operative post-war world.

CENTENARY

The first issue of *The Economist* was published on September 2, 1843. The present issue thus completes a hundred years of unbroken weekly publication and *The Economist* of next week will be the first of the second century.

Among the ways in which the Centenary is to be celebrated are the following:

1. A luncheon at which the Chancellor of the Exchequer, the Governor of the Bank of England, the Secretary of State for Home Affairs, and others are to speak.

2. The publication of a volume of essays entitled "*The Economist, 1843-1943*." This volume, which is mainly historical in character, will be published on September 2nd by the Oxford University Press, price 7s. 6d. (Orders should be placed through booksellers, and not with either the Oxford University Press or *The Economist*.)

3. Next week's issue of *The Economist* will be a Centenary Issue, containing a large number of special articles reviewing the paper's first century and looking forward into its second.

Party Prospects

IS the long reign of the Conservative Party, which has lasted throughout the political lifetime of most of the present generation of electors, now nearing its end? The question is being very widely asked, and there is a surprisingly large number of people who take for granted that the answer is in the affirmative. They speak of the spirit of the times, and point to the steady upsurge of Labour and Socialist parties in the British Commonwealth of Nations. In politics, however, it is not possible to generalise in this way. No doubt, the Leftward trend will powerfully affect the policies of all the political parties in this country, whether Labour and Socialist or not, as it has done for a hundred years. But the actual balance of power between the two main contestants for office, the Conservative and Labour Parties, will depend upon their respective abilities to win and keep the support of a majority of the electorate.

Several arguments are put forward, most of them negative in character, for the belief that the Conservative Party has, for a time at any rate, had its day. The most frequent argument, perhaps, is the suggestion that its tenure of office must end soon precisely because it has been long drawn out; the pendulum, it is argued, must swing at last, the more so because the swing has been delayed. A second argument is that of what may be called war guilt. It was the Conservative Party, it is pointed out, that allowed Germany to grow strong and Britain to grow weak when it possessed ample power to prevent both developments; and Mr Churchill's present Administration still rests politically upon the support of those who in the recent past actively backed this disastrous policy. Time, it is suggested, must inevitably bring in its revenges. A third argument is less redolent of recrimination, which is never a fruitful premise for constructive political thinking. It is that the Conservative Party, despite the large contribution which it has made to progressive legislation and administration during the past three-quarters of a century, is in essence reactionary. The professed policy of those who count most in its constitution is to serve as a brake on the wheel, not to oppose progress, but to infuse it with the utmost caution; and it is argued that this mentality is incapable of satisfying the present national desire for broad forward moves in social and economic policy, carried through with boldness and inspiration. Finally, an analogy is drawn between the fate of the Liberal Party after the last war, when it fell swiftly from power to powerlessness, and the likely fate of the Conservative Party after this war.

The arguments against this thesis are at least equally numerous. In the first place, the fact that the pendulum has not swung for two decades is as much a reason for

wondering whether it will swing even now as it is for assuming that it must swing. Secondly, there is Mr Churchill—and the fact that, whatever the war guilt of those who supported Mr Chamberlain, it is the present Government, led by the leader of the Conservative Party and backed by a Conservative Parliament, that will have won the war. At any rate, it is probable that, whatever party ultimately secures the balance of advantage in post-war politics, Mr Churchill, still leader of the Conservative Party, will win the first election after the war. This will almost certainly be the case, whether that first election is a coupon election or not. In any event, it will be a khaki election; the voting will be taken, not on the Uthwart Report, but on the victorious conclusion of Britain's biggest war. It is true, of course, that Mr Churchill will not go on for ever. It seems likely that his successor in the Conservative leadership will be Mr Eden, whose popularity, in the Party and in the country, especially among men and women without any set party allegiance, is very high. To a point he may inherit, in a considerably diluted form, the good will that attaches to his present chief. The real question is whether he will inherit also the peculiar circumstances which consistently gave, not a leader like Mr Churchill, but men like Lord Baldwin and Mr Chamberlain the assurance of victory at the polls. The outcome of the second and third elections after the war depends, not on *post hoc* indictments or precarious historical parallels, but, first, on the actual successes or failures of the first post-war administrations, which may be mainly Conservative; and, secondly, on the ability of the Labour Party to convince the electors that, put in sole charge of the nation's affairs, it will have the ability to satisfy the nation's needs and aspirations more effectively.

Thus, the ultimate answer to the post-war political riddle lies in the constitution and development of the Labour Party rather than in that of the Conservative Party. It is probably true that the time is due for a period of government by a more progressive party than the Conservatives, despite the traditional vigour and sincerity of their progressive wing, are ever likely to be. But it cannot by any means be assumed that the Labour Party is capable of seizing the opportunity. Between the wars, when this opportunity was no less present, it proved incapable of taking its chance. Nor are the arguments which have been cited against the Conservative Party entirely one-way in their application. The Labour Party, too, has had its share of war guilt; it was singularly prone to that inability to balance commitments and power in its reckoning of foreign policy which Mr Lippmann has aptly called "insolvency." Moreover, it did not show in either its make-up or its mentality any more positive disposition towards constructive and imaginative projects

of reform than the Conservatives themselves. In essence, it, too, was conservative; and this was due to its history and anatomy. The Labour Party was created by long struggle and tremendously hard work from the raw material of organised labour, with the co-operation of a comparatively few "intellectuals"; and, as a consequence, its policy has always been at least as much to preserve the gains already made, for a particular section of the community, as to secure greater gains. This industrial basis has meant that the policy of the Labour Party has always been, on the one hand, too specific and too exclusive to win the enduring support of that part of the electorate which is not organised in trade unions, and, on the other hand, too vague and too doctrinaire in the general principles it has professed to convince a majority at the polls. As a Labour Party, its aim has been "What we have we hold"; as a Socialist Party, its contribution has been simply a general denunciation of the capitalist form of society, without any readiness to take the risk of destroying that society by revolutionary means. Its policy has, therefore, been a compound of collective bargaining and inveterate opposition; and it was this circumstance which, between the wars, made the Labour Party, by its own wish, a permanent opposition rather than an alternative Government.

The Labour Party is Siamese twins. It is balanced uneasily between its industrial and its political bodies; and there have lately been renewed symptoms of this uneasiness. It was perhaps at its peak in 1926, when the determination of industrial labour to impose its will upon the Government by direct action was only countenanced by political Labour with the deepest of misgivings and the minimum of effective assistance. The recent heart-searchings have, in fact, been a minor echo of 1926. The proposal was recently made by one Civil Service trade union, and promptly accepted by Sir Walter Citrine on behalf of the Trades Union Congress, that the Trade Disputes Act of that year, forbidding the affiliation of Civil Service unions to the Trades Union Congress, should be altered by the direct method of ignoring it; and it has taken most strenuous diplomacy on the part of the Labour movement's political leaders, including for the moment—possibly with decisive weight—that massive trade union figure, Mr Bevin, to secure, first, a withdrawal of the threat, without conditions, and, secondly, the formulation of a tentative solution by which the civil servants will seek industrial but not political affiliation. The sense of strain between the two wings has also been displayed by the protest of Labour politicians against the way in which the new Workmen's Compensation Act was agreed by Mr Morrison with the trade unions, but not with the Parliamentary Labour Party, before it was presented to Parliament; and there is little doubt that, behind the scenes, there is a struggle going on to ensure that, despite the highly important place which the trade unions have come to occupy as consultants of the Government in the making of war-time policy, the strategy and tactics of Labour politics shall in the last resort be determined and implemented by the politicians.

The Labour Party must solve these internal problems if the Conservative supremacy is to be successfully challenged. To rely upon any such unlikely event as the splitting of the Conservative Party after the war would be futile. There is, and has been, a distinct fissure within the Conservative Party between what may be called the Chamberlainites and the rest. Between Munich and the

outbreak of war it was wide open, but it was covered, though not healed, when Mr Churchill—the only man who could have formed an effective third party—undertook the leadership of the party as well as the leadership of the nation. This will be by no means the first time that the Conservative Party has held firmly together despite a marked division within its ranks. Indeed, such a division is almost a tradition, going back to Disraeli and Lord Randolph Churchill. Moreover, the circumstances of war-time coalitions have revealed a fissure, probably as large, within the Labour Party itself, not merely between the trade unions and constituencies, but between those who believe in the policy of coalition and those who distrust it. Almost certainly, there will be no split in either party; the respective machines will hold. After 1918, it was the Liberal machine itself that split; and there was, as there is not now, a *tertium quid* in the shape of an untied party of the Left which had worked for a generation towards precisely this opportunity. This time, there is no effective alternative to the Conservative and the Labour Parties, just as there is no alternative in the United States to the Democratic or the Republican Parties. This is not to suggest, of course, that this situation of restricted choice is entirely encouraging. In the United States, the rigid two-party position tends to leave organised Labour out of account, with unfortunate effects on Labour politics; in this country, on the other hand, it is a decided disadvantage that the party of progress should be tied to organised labour and, by all precedents, unwilling, or at least reluctant, to provide opportunities for other progressive elements in society, such as the more intelligent members of the managerial class, to make a contribution to national politics. It is not the two-party system that arouses doubts so much as the particular two parties between which the post-war elector will have to choose.

Will the Labour Party at last be able in the next decade to take the opportunity which has been open but not taken ever since the end of the last war? In other words, can it capitalise the popular desire for a dynamic advance in democratic policies? Can it prove itself, in practice as well as precept, less cautious than the Conservative Party, less sceptical and less mentally indisposed to the boldness that is the highest form of realism in politics? In short, can it win elections?

The first function of a general election in modern conditions is to elect a leader—a Parliamentary and constitutional leader, but a leader none the less. The second is to express satisfaction or dissatisfaction with the achievements of the Governments. The third is to approve a policy. The core of the votes cast on both sides represents an expression of party loyalty, it is true; and the Labour Party possesses loyalty in abundance. Even in 1931, it held its ground surprisingly well in terms of total votes. But elections are decided by the votes cast by electors who have no specific loyalty to express; and, after the war, the number of these will be larger than ever before, because of the long time that has elapsed since elections and party politics were last in operation. Thus, the task of the Labour Party is to find a leader, or leaders, capable of meeting Mr Churchill or Mr Eden at the polls; and to work out a policy and express a mentality which will prove to the electorate—and, crucially perhaps, to the new intelligent class of managers and professional men, who play so large a part in the affairs of present-day society—that it is capable of governing with greater success, in terms of both national and international realities and contemporary aspirations, than the Conservatives can do. The issue remains wide open. Mr Morrison, modestly but firmly, has put in an entry for the leadership and chosen of his own accord the rôle of stating such a policy and expressing such a mentality. The Party's final answer, in face of the traditional claims of other leaders and the dogged conservatism of the trade unions, has still to be given. There have been welcome signs lately, especially among a section of the rank and file of the Party, that a realisation is growing both of what is wanted and of what is wanting. But it is far from a foregone conclusion that the Conservatives are approaching the end of their tether.

Post-War Currency

THE draft proposals of the British and American Governments for post-war currency arrangements were fully analysed in *The Economist* at the time of their production in April. But it seemed best to defer a considered opinion on their merits until the ground had been more thoroughly explored. In the intervening months there has not only been a considerable volume of public discussion, in America, in Britain, among the other Allies, the neutrals and even in the German press, but there have also been official contributions from the Canadian Government and from the French Committee of National Liberation. At the end of last week, the American Treasury issued a revised draft of its original proposals. This was said to have been drawn up after the consultations that have been going on in Washington; but it is still tentative in nature. The first stage of the discussion can thus be said to be over, and the time has come for expressing an opinion.

In retrospect it is even clearer than it was at the time that the publication of two separate sets of proposals, especially on the same day, has had unfortunate results. An appearance of conflict and rivalry could not be avoided, however unjustified it may have been, and there has been some tendency in both countries (though much more, it is only fair to say, in America than here) to take a stand on national patriotism rather than on the merits of the case. But the publication of two variant schemes has also had another unfortunate effect. It has diverted the discussion—the temperate and expert as well as the clamorous—on to the differences between the two plans. This is a pity, for there is a precedent question of the utmost importance to be decided before either one could be put into force. This is whether any plan of this general nature, for both have a strong basic similarity, will work in the conditions that are likely to exist after the war.

Both plans are based on the assumption that it will be possible after the war to restore substantial freedom of foreign payment (an exception possibly being made for short-term capital transfers) and that the balances of payments of the nations, severally and collectively, will then either be in equilibrium or so close to equilibrium that they can be brought to it by quite minor adjustments. Much, of course, will depend on the rates of exchange which are fixed between the different currencies at the start. The revised American proposals provide that the starting rates shall be those now prevailing, except where they are clearly inappropriate, in which case they shall be "determined by consultation between the country and the fund"; they also provide that, for a period of three years, there shall be "special provision" for adjustments in rates, but that thereafter a change would require a three-fourths majority. This is an attempt to make provision for elasticity, and should be recognised as such. But it does not go very far. Is it likely that appropriate rates could be found in the three-year period by "consultation"? Is it likely that matters will have settled down in three years so completely that the rates then existing can be regarded as appropriate for the long run?

Let it, however, be supposed that the problems of transition are overcome and that a period is entered, not long after the end of the war, when the disturbances to be expected are only those of a normal character. Whether there is any meaning in normality in these days is in itself an open question; but it is reasonable to hope that there will some day be a period when economic relationships will not be directly subject to wars and the rumour of wars. The question to be asked is whether either of the plans—Keynes or White—could be expected to work in such conditions. Both plans, it is true, foresee the possibility of disequilibrium arising; indeed, their central aim is to provide credit facilities for countries which find themselves with deficits in their balances of payments. But both plans also contemplate—they could hardly do

otherwise—that this assistance would be limited and that before a country had exhausted its credit line the necessary adjustments would have been made to bring its balance of payments back to equilibrium. It cannot be emphasised too strongly that both plans depend on this assumption. They will not work unless the nations' balances can be put right by the methods envisaged and quickly enough to keep the borrowings within the limits contemplated.

Some of the problems of international finance after the war can be fairly clearly foreseen. There is, for example, the much-discussed problem of the pound sterling. Unless the volume of British exports can be increased by something of the order of a half, the British international accounts will not freely balance. The problem is not inherently insoluble; but it can hardly be solved either quickly or easily. Much more important than the problem of the pound, and much more difficult to solve, is the problem of the dollar. It has never been easy, ever since the last war, for countries other than the United States to earn as many dollars as they require; but it will be very much more difficult after the war. America's export position has been strengthened during the war, and her requirements of imported raw materials have been greatly reduced by such developments as the growth of the synthetic rubber industry. Without going into a detailed analysis of the prospective American post-war balance, the conclusion may be ventured that the two sides can be balanced only if reasonably full employment is secured in the United States (thus increasing the potential demand for imports) and if the tariff wall is lowered (thus allowing the increased demand to become effective). Can these things be counted on for certain? Full employment requires a large degree of skilled central direction of the national economy. The wartime experience in America is not very encouraging; and the political trend is sharply away from any form of central direction. As for tariffs, there is no visible sign of any willingness to go beyond the existing reciprocal programme, and it is so probable as to be almost certain that the new synthetic rubber industry will have its market protected, to the partial or complete exclusion of natural rubber.

Thus, without enquiring into the situation of the countries that have been ravaged by war, it seems to be very far from certain that either the British or the American balance of payments will be easily brought to equilibrium. But what of the adjustments prescribed by the two plans? Are they not intended for just such contingencies? Undoubtedly they are; but it is difficult to believe that they would be strong enough. The American plan is not explicit about the nature of these adjustments. It does say that countries are not to impose any fresh exchange controls or to devalue their currencies except with the consent, after the first three years, of a three-quarters majority—which is unlikely to be forthcoming save in the most aggravated cases. It can also be taken for granted that the imposition of prohibitive tariffs and import quotas by a deficit country would hardly be in accordance with the intentions of the plan. It would thus appear that a deficit country is expected to make adjustments by a lowering of its domestic cost structure—that is, by deflation. The British plan is more explicit and more liberal; but it too does not go very far. Apart from exchange control on capital (which may exist in any case) and the surrender of gold and currency holdings (which can have an adjusting effect only if it induces internal contraction), the only non-deflationary adjustment it permits is devaluation of the currency—and even there, the devaluation must be limited to 5 per cent every two years, unless the approval of a majority can be secured.

These weapons are not very powerful. Let us imagine not unlikely circumstances. Let us imagine that Great Britain has already incurred a debit in the books of the

Fund but is contriving with some difficulty to keep her continuing deficit within manageable proportions. Let us then suppose that there supervenes a sharp depression in the United States leading to a large American surplus on international account. According to the American plan, Great Britain may neither devalue sterling nor impose exchange restrictions, but must, presumably, deflate in step with America as soon as her credit with the Stabilisation Fund is exhausted. According to the British plan, an application may be made for a devaluation of sterling by more than 5 per cent, but it is unlikely that any really substantial alteration would be permitted. If not, deflation is again the only remedy. The British White Paper contains an expression of the unexceptionable statement that because disequilibrium has occurred in the past it need not necessarily occur in the future. That is true; but are the circumstances here envisaged very unlikely? And if they are not, is there not a danger of repeating the gold standard mistake of 1925, and of setting up an excessively rigid system which cannot ultimately be maintained, but which imposes on countries the choice between default and deflation?

The one essential requirement in an international currency plan would therefore seem to be flexibility. As has been suggested above, it is doubtful whether the British plan is flexible enough. The original American plan was very rigid, and the revisions make no effective change. Indeed, it almost appears as if the United States Treasury has been more anxious to meet the views of conservative financiers in Wall Street than of the other nations that would have to work the scheme. This is particularly true of the gold provisions. The original suggestion that one-eighth of each country's quota should be paid in gold was difficult enough for the gold-poor countries to swallow. But the revised proposal that one-half of the quota shall be in gold is the purest phantasy. Much has been heard of what the American Congress will and will not accept, and it is perhaps as well to say with all necessary clarity that there is not the slightest chance of securing for any such proposal the approval of the British Parliament or public.

The revised American draft should not perhaps be taken as the last American word. But the possibility must

be envisaged that the American Government will not depart very far from it. If so, it will be necessary to decide whether the desirability of an agreed scheme, great though it is, should lead Great Britain to accept an arrangement which will almost certainly not work. It is relevant to enquire into the alternative to an agreement. It would not be utter disruption and chaos. The principles of the Clearing Union have for some years been applied within the wide boundaries of the sterling area. The political and economic ties between the sterling countries are certainly no less than they were; each of them finds in the others of the group its chief markets and its chief sources of capital funds or of investment opportunities, as the case may be. Other such groupings may well come into existence, and it ought not to be very difficult to build up a system of currency groups with substantial freedom of payment within each group and controlled—but not restrictively controlled—exchanges between group and group. The French proposals appeared to have something of the sort in mind, and suggested that, between groups, arrangements similar to those made between sterling and the franc in the first winter of war might be possible. There is not the slightest reason why the relations between these different groups and the dollar, or the dollar group, should be relations of hostility or discrimination—unless, indeed, it is hostility and discrimination to suggest that other countries cannot spend more dollars than they can earn.

This would, of course, be a second-best. As Lord Keynes pointed out in the House of Lords, anything that prevents world trade from being fully multilateral is against British interests. Both for this reason and also for the wider advantages that would attach to a successful conclusion to the first negotiations on a specific post-war proposal, every effort should—and doubtless will be—made to reach an agreement. But a system such as has been sketched in the preceding paragraph is a workable alternative; it would not be unduly restrictive to world trade; and it would provide a very large field for multilateral trade. It would be preferable to a system which was fully international but also too rigid to cope with the changes and chances of what promises to be a very mortal world.

NOTES OF THE WEEK

Quebec

The official communiqué summing up the results of the Quebec Conference suggests that the decisions reached were primarily military.

The necessary decisions have been taken to provide for the forward actions of the fleet, the army and the air forces of the two nations.

Obviously the decisions could not be disclosed, apart from such public matters as the appointment of Lord Louis Mountbatten as Commander-in-Chief in South East Asia. But the public was left to make what it liked of the statement that the military discussions "turned very largely on the war against Japan." This may, of course, be designed to bluff the Germans or it may mean that the decisions on the European war had already been taken and only await execution at the appointed time. Nevertheless, it is a little odd. Now surely is the time, if there is ever to be a time, for a knock-out blow in Europe, which to be a knock-out at all, must be concerted. It is for this reason that the absence of any Russian military advisers is rather disturbing. The communiqué gives the assurance that

Full reports of the decisions, so far as they affect the war against Germany and Italy, will be furnished to the Soviet Government.

This, with all respect, is not co-ordinated planning for a joint blow. Possibly the separate strategies of the West and East will coincide, possibly not, but Quebec is not very reassuring. The problem of Russia's absence is more serious from the political angle. It is obvious that political decisions were taken—why else should Mr Eden and Mr Cordell Hull have attended? In any case, the communiqué fore-

shadows one of the decisions—a statement "this week" on the status of the French National Committee. The co-ordination of political strategy cannot be divided into separate fronts. Either there are joint reconstruction plans or there are a lot of divergent, possibly contradictory and certainly unco-ordinated policies. To put an end to this anarchy, the Western Allies must work with all possible despatch for the "tripartite meeting" forecast, not too optimistically, however, in the joint communiqué.

Himmler Takes Over

Just four weeks after the fall of Mussolini, a significant change has taken place in the internal policy of Germany. Heinrich Himmler, Reich leader of the SS, Commander of the *Gestapo*, chief of the entire police and of the Air Defence Security Service, has been appointed Minister of the Interior and General Commissioner for the administration of the Reich. This move comes at a time when the Army is suffering serious defeats on every front, when Germany's main partner, Italy, is trying to get out of the war, when unrest is breaking out in all the occupied countries, and when in Germany itself the people are exposed to the terrific strain of constant air raids, and the large-scale evacuation which these air raids have entailed. Himmler has not been hitherto a great political figure. He has not written books, he has not made speeches, he is not a well-known broadcaster. He does not stand for any particular trend in German policy or thought. He has been known to the Germans simply as the sinister and omnipotent head of the secret police. This is certainly the most important thing about

him, and the most important thing about his new appointment. He controls the most privileged part of the Nazi party, which is itself the core of the totalitarian state. His new position gives him the power to achieve an absolute concentration of all that is most effectively Nazi in Germany. He controls the secret police, the state police, the SS police divisions and, if necessary, he can use the *Waffen SS* divisions, although these are still part of the *Wehrmacht*. The men in these organisations are the picked men of Nazi Germany. They have been trained to brutal efficiency, ruthless discipline and unquestioning loyalty to the Fuehrer. They can be used as a terrifying weapon of oppression, and will be used relentlessly against any sign of mutiny on the Home Front. The degree to which their action could be effective may be judged from the doings of June, 1934. The SS was used to crush the opposition led by Captain Roehm, behind which all the parties in opposition to the Nazis had grouped themselves. Victory went to the SS, and since that time much thought and effort have been spent upon making it a far more efficient instrument of oppression. Himmler will not hesitate to use this overwhelming concentration of power to maintain the regime with efficient brutality. To this extent his appointment represents a rallying of the power of the Party such as Mussolini could not hope to achieve. There will be no insensible slipping of power from Hitler to a General and from a General to a business man or a resurrected democrat in Germany. The Party under Himmler is ready to fight anyone, including the Germans. Yet as a concentration of force, it can only be temporary. The SS has never had any programme. Racial superiority, anti-Semitism and Fuehrer worship will not sustain the German people during a winter of defeat and bombing with the certainty of ultimate disaster beyond.

The Air War

While the process of transforming Rome into an "open city" is apparently going steadily forward, the destruction of Berlin by bombing has presumably begun. At any rate, the raid carried out by the RAF on Monday night, in which 1,700 tons of bombs were dropped in 50 minutes, was regarded in both Germany and Britain, as well as in other countries, as the start of an operation to devastate the German capital after the example of Essen and Hamburg. Berlin is farther away than Essen or Hamburg and the risk of losses, against active, skilful and experienced defences, is correspondingly greater; Monday night's raid cost 58 heavy bombers, which was probably nearer to 10 per cent of the attacking force than to the less than 5 per cent which is customary. This is fully appreciated by the British public. What is not so clearly understood is the aggressively apologetic air which is tending to creep into the direct, and still more into the indirect, propaganda of the Air Ministry. The value of these great raids; the damage done above all, to the enemy's war effort; the smallness of the losses in relation to the aircraft used; the bomb-load carried; and the results achieved—all these evident and important facts are being hammered home with such pervasive and ceaseless repetition that it almost seems as if the publicists of the Air Ministry were trying to convince a nation solidly opposed to bombing of the error of its views. This is surely not the situation. The people know very well that the Allied mastery of the air is a decisive factor; they have welcomed enthusiastically the increasing entry of the American Air Force into the battle. They also know that they have neither the information nor the competence to adjudge on the difficult issue of what proportion of total air power should be used for independent bombing and what proportion for military or naval co-operation, or, say, on the extent to which the heaviest bombers by concentrating on military targets at the moment of invasion could effectively co-operate themselves with other arms; and these are probably the set of specialised and inter-service problems which Air Marshal Harris's restive publicists have most in mind. The people lack the facts. They will judge by results, and not by scattered facts and figures such as comparisons between the enemy's curtailed air strength and his huge losses, which never work out right, and, though they are true in themselves, can never tell anything like the whole story. The people of this country are solidly in favour of this programme of annihilation by bombing, on condition that it will shorten and win the war and save lives—not just British lives but total Allied lives, including Russian soldiers and civilians, a calculation which is too often forgotten by the pundits who, in praise of contem-

porary strategy, simply compare British lives lost in four years of this war and the last. The general view is in agreement with the opinion of the Prime Minister that "the experiment is worth trying," as apparently it is being tried. Sometimes, it is true, members of the public do openly and honestly recognise the awful nature of the new weapon used in this way and on this scale. But they do so not to oppose the bombing policy or to draw any unfavourable distinction between German bombing which failed, and Allied bombing, which is succeeding, but to express the undoubted fact that no pleasure is taken by the majority of British people in the annihilation of lives and property, wherever it may occur and no matter how inescapably necessary it may be—and to emphasise the responsibility of the makers of strategy to make certain that the promised results, which would amply justify the means chosen, including the devotion of a phenomenal proportion of the country's economic resources to the manufacture of aircraft and accessories, will be actually forthcoming.

Victory Election

Another Dominion Prime Minister has reaped the reward of the past year's Allied victories, and of the contribution made by his country, under his direction, to the total effort of the British Commonwealth. It seems likely that Mr Curtin, when the complicated process of counting and transferring votes, including those sent in by voters serving overseas, has been completed, will have obtained in the Australian House of Commons, like General Smuts in the South African Parliament, the support of some two-thirds of its members. Indeed, Mr Curtin's triumph has been more complete and more unexpected in its magnitude than that of the Union Premier. Not even his best friends had forecast that he would transform his dependence on the votes of one or two Independent members of the House into the biggest majority ever possessed by a Labour Government in Australia; and still less that in the Senate, in which the Opposition had a small majority before the election, he would obtain a clear majority, which will carry with it control of the Senate for at least another six years. In an article elsewhere in this issue it is suggested that, in contemporary parliamentary elections, votes are cast not so much in favour of policies or principles as in support of particular personalities, and in judgment of the achievements of the retiring Government; and this is especially the case in wartime (or immediately post-war) elections which inevitably take on a khaki hue. The mandate which has been given so overwhelmingly by the people of Australia has been given to Mr Curtin for what was done during the months of the Commonwealth's greatest danger rather than to Socialism or the long-term programme, still vague, of the Australian Labour party; with an unmistakable voice they have approved the work of Mr Curtin's Government in making Australia strong and keeping it safe. In part, too, however, the sweeping vote was an indictment of the Opposition—although it should be said that both Mr Menzies and Mr Fadden had tried to do before Pearl Harbour what Mr Curtin was enabled to do afterwards by the rip-tide of events. Shrewdly, Mr Curtin took his election stand on the defence and mobilisation of Australia since the aggression of Japan made defence and mobilisation imperative; and, foolishly, the leaders of the Opposition fought him on his chosen ground, vying with one another to disparage the methods and the motives of his unquestionable achievement. What time they had to spare from this campaign of abuse—of a kind not by any means uncommon in the vigour of Australian politics—they devoted mostly to disparaging one another. The formal plea which Mr Fadden made for the formation of a National Government was made ludicrous by these strange proceedings; and though Mr Curtin's majorities have come as a distinct shock even to his supporters—and, it may be hazarded, to Mr Curtin himself as well—their extent could almost be explained by the mistakes and divisions of the Opposition, if the record of successful defence and Pacific victories was not in itself a sufficient explanation.

Australia's Task

Dr Evatt, who is regarded by many shrewd observers as the leading Australian statesman of the next epoch, chose the morrow of his party's electoral triumph to set out in precise if broad terms the responsibilities to Australia and the world, which Mr Curtin and his colleagues must under-

take by virtue of their victory. Because of the circumstances, because of Dr Evatt's assured weight in Australia's counsels, and, above all perhaps, because of the particular problems which the Minister for External Affairs put first in priority—including, notably, the question of immigration—the statement was of the greatest importance. It is evident that two main tasks confront Australia. First, there is the need to realise its commitments as a world power; to recognise, as it has done during the war, both the remarkable extent and the distinct limitations of what the Commonwealth can do to help itself; and to work out the ways and means of discharging its inescapable obligations in association with the other powers, possessing similar interests, to which Australia must look for aid. Secondly, there is the task of economic self-development on a basis that will be sound, both nationally and internationally; this is vitally connected with the first task, inasmuch as a nation's ability to defend itself and to participate with other nations in collective security depends upon the economic contribution which it can make in terms of output and manpower. Mr Curtin has already told the world of Australia's determination to play its proper positive part in world affairs, and called for the setting up of permanent Imperial machinery of consultation and decision to register the common interests and aspirations of the British Commonwealth and the equal status of all its members. Dr Evatt's survey went straight to the heart of the matter: Australia

cannot afford again to have defence areas so weak as to attract an aggressor and thus preparation in common is the one guarantee of security for all.

Australia's "frontiers," like those of the United States, span the Pacific; they cover areas in which China (which Dr Evatt did not mention), Holland, France and Portugal, as well as the United States and Britain, are concerned; and they can only be protected, first, by the disarmament of Japan, and, secondly, by the establishment and maintenance of a sufficient pool of collective force in "a great south-west Pacific zone of security." And, for Australia to play its part, "there must be a sufficiently powerful Australian regular army and an efficient Australian navy and air force." The basis will be Australia's own economic arrangements. Dr Evatt listed the prime requirements: full employment, an increase in the birthrate and "suitable" immigration. For the first he looks to industrial expansion in order to supply the goods which will provide better standards of living for the 130 million native Pacific people "at present under Japanese domination"; and for the third to the continuation of "the principle of a White Australia."

Population in the Pacific

Dr Evatt's programme of collective security and national development is primarily framed to prevent a second aggression in the Pacific area by a non-White people; and, within that context the programme is constructive and realistic, provided that its limiting factors are fully recognised. The first is that the swarming of the non-White peoples in the East arises from the fact that their numbers are markedly on the increase, while those of the White peoples are becoming stationary and approaching a decline; the fact that there will be very few men and women of the right hue to spare for emigration to Australia will make it far from easy to fill the Commonwealth's empty spaces, especially if the traditional opposition of the Australian Labour Party to the competition of "cheap labour," of whatever colour, remains unmodified. In the context of population pressure from non-White peoples, the promise to assist in raising native standards of living in the crowded Pacific islands is shrewd and sound. The second point is that, though the development of Australia's industries is both desirable and inevitable, the strength of its economy and its standard of living will continue to depend mainly, as in the past, on the remarkable productivity of its primary production. Neither strategically nor economically has Australia anything to gain, and much to lose, by a policy of autarky; the international division of labour, in both defence and commerce, is the Commonwealth's greatest safeguard.

Jugoslavian Crisis

The Jugoslav political crisis has taken an ugly turn for the worse. Ever since the first Cabinet crisis in June, which turned on the problem of the future form of Jugoslavia—should it be unitary or federal?—continuous nego-

tiations have been carried on to secure a firm basis of agreement between the three national groups. The real difficulty seems to be distrust—the distrust felt by the Croats and Slovenes of the ultimate intentions of the Serbs. That pan-Serbism is strong both in London and at General Mihailovic's headquarters is not in doubt. The pan-Serb activities of the Yugoslav Minister in Washington are not reassuring. In these conditions, the Croats and Slovenes demand guarantees, and do so all the more urgently because of the proposed shifting of the Government to Cairo. Possibly the Serbs feel that the Croats and Slovenes are all being very tiresome in their lack of confidence. But the importance they attach to guarantees should make the Serbs all the more anxious to meet their case. Under the Trifunovic Ministry negotiations continued, and it seems that agreement was almost reached on the central issue—the federal reorganisation of Yugoslavia. Then, over the week-end of August 10th, the Trifunovic Cabinet resigned and a non-party Government of "officials" took its place, with M. Puric as Prime Minister and including M. Milicevic, M. Rasic, General Zivkovic and General Mihailovic. This is the Cabinet which King Peter proposes to take to Cairo early in September. There are a number of things to be said about it. First, it seems to have been brought into being by the fiat of the young monarch, a procedure which recalls alarming features of his father's regime. Next, it is not so much non-party as anti-party. It marks the end of the attempt to reach a solution by methods of democratic negotiation between the different groups. Next it marks in its personnel a return to what might be called the Stoyadinovic era. Most of the leading figures were connected with the post-Alexandrine period of dictatorial rule. General Zivkovic even assisted in the liquidation of democracy in 1929. Incidentally, most of these men are strongly pro-Serb. If this unrepresentative group goes with King Peter to Cairo in order in due course to return as a Government to Yugoslavia, then there are two dangers. One is that Britain's reputation as the defender of constitutional democracy in Europe will disappear; the other, that the Jugoslavs may conceivably turn from fighting the Axis to fight their invading "government."

Manpower Changes

Before the summer recess, Mr Bevin told the House of Commons of some of the measures he proposed to take, in order to meet the industrial manpower requirements which the latest phase in military strategy dictated. He said that priority would be given to aircraft production and coal-mining, and that this would involve consequent adjustments in the supply of labour to other forms of production. The Minister of Labour's latest announcement about the changes in the call-up reflects the same need for adjustment in the supply of men to the fighting services. The Royal Navy, Royal Marines and the air crew branches of the Royal Air Force and the Fleet Air Arm require men most; and, for the time being, voluntary recruitment for the Army is to be suspended, except for men who intend making it their career. Men available for military service will be directed into the Navy or the Marines, unless they express preference for air crew service or underground coal mining. In this way, coalmining is to be placed on a level with military service. The Government is launching a recruitment campaign. It is estimated that, by March, 1944, the labour force will have dropped to 690,000, and the aim is to bring it up to 720,000, which would meet estimated coal requirements. Before long Mr Bevin will almost certainly have to exercise his powers of direction.

Labour Turnover

Changes in the strategy of the war and in the programme of output are making wholesale changes in the distribution of manpower inevitable at a time when the nation's labour resources are already seriously strained. Since he can no longer bring up reinforcements, the Minister of Labour has continually to be moving the existing pieces on the board to more advantageous positions; and it is essential that this should be done with the maximum of smoothness and the minimum of time lost in turnover. The obligation which was placed last week upon all employers not already obliged to do so to report to the Minister of Labour the termination of employment of men between 18 and 64 and women between 18 and 59, if they were engaged for 20 or more hours a week, is an attempt to deal

with this immense turnover problem. Some idea of the scale of the problem can be gathered from the survey of manpower just issued by the Minister's Parliamentary Secretary (the details of which are shown on page 280). Within the context of total mobilisation vast changes are taking place affecting a very considerable proportion of the workers mobilised. Some are working shorter hours, others longer hours. A large number are, or will be, on the move. Great factories are being closed down, and the biggest industry of all, aircraft production, is being expanded. Inevitably, there are very many men and women in fact out of work for brief periods while they move to new stations. The latest unemployment figures (shown in detail on page 284) provide a further indication of the extent of mobilisation. On July 19, 1943, there were 71,129 unemployed, compared with over 100,000 in July, 1942. These figures are, of course, deceptive. For one reason or another, they do not cover most of the labour which is being transferred from one form of production to another. Workers in industries covered by the Essential Work Order who are moved to other industries, or to other branches of the same industry, covered by the Order, are not to be registered as unemployed between jobs, and these number 8 millions. Moreover, the unemployment figures, which are now only published quarterly, could not in any case show short-term movements. It is these factors that account for the apparent discrepancy between reports of temporary local pockets of unemployment and the official statistics which, while they do measure quite genuinely the extent of real unemployment, do not give any picture of the actual turnover.

Fees in Secondary Schools

The Government has already decided that in all secondary schools for which local education authorities are responsible education shall be free. The question of grant-aided secondary schools, whether those who receive their grant through the local education authority (generally known as aided schools) or those who receive it direct from the Board of Education (the direct grant schools), had been left for further consideration and for the recommendations of a Special Report of the Fleming Committee on the public schools. This report has now been published (price 6d. net). On the face of it, the question it had to decide seems a small matter; it would appear obvious that if fees are to be kept in one type of secondary school and abolished in another, the existing cleavage between the various systems of secondary education would be intensified. On the other hand, if the fees are abolished in the grant-aided schools, they will have to rely for their existence entirely on their endowments—if they have any—and on grants from public funds, which means a correspondingly increased measure of public control. To many people this will involve no sacrifice. But the Fleming Committee recognises that the loss of their independence may mean a lowering of educational standards through the imposition of a common standard of uniformity. Only the prejudiced will deny that, taken as a whole, the grant-aided schools are better schools than those provided and maintained by local authorities, and it would be no service to education if the result of providing secondary education for the masses was the lowering of the standard in the better schools to the level of the others. The majority of the Fleming Committee resolve the dilemma by recommending that tuition fees should be abolished in all grant-aided schools, but that instruments of government should be adopted by the LEAs and the Governors, defining *inter alia* the functions of the governing bodies, which should include the appointment of the headmaster in consultation with the LEA, and the relationship between headmasters and the governing bodies. Similar constitutions should, they recommend, be adopted for maintained schools as well and even for technical and modern schools. The present list of direct grant schools should, the majority report recommends, be revised: in future, it should include only those schools which serve a wider area than their own locality and which have existed successfully alongside the provided secondary schools. The final recommendation, in the attempt to preserve the independence and traditions of the grant-aided schools while making them accessible to all, is that a proportion of the available places should be reserved for the Governors to award at their discretion, provided that the pupils can prove their fitness and the Board is satisfied with the selection arrangements.

The minority report, whose seven signatories include the chairman, agrees with the importance of maintaining the standards and traditions of the grant-aided schools, but argues that it would be impossible to secure this if all fees were abolished. It recommends that in direct grant schools the Governors should award at least half the available places and that such places should be fee-paying. It argues that if a parent wishes to send his child to a grammar school, and can afford to, he should not be compelled to send him to a modern school. This argument is not unreasonable, but it assumes that there will be sufficient places in the grant-aided schools to accommodate all the children that the LEA wishes to send on grounds of merit, as well as those whose parents can pay. Since, however, extra accommodation cannot be provided overnight, selection will have to be on merit only, whether it is carried out by the Governors or the LEA. But the divergent viewpoint is interesting as a foretaste of what will happen when the Committee's full report on the much more difficult question of the boarding schools and the public schools is published.

The Higher Civil Service

As the end of the war approaches, the expected campaign against "bureaucracy" is under way in the expected sections of the press. The game of baiting the civil servant is always popular, and at the moment it serves the purpose of those who wish to see a radical diminution in the powers of the state after the war. In this atmosphere the publication of a lecture given last February by Mr H. E. Dale on "The Personnel and Problems of the Higher Civil Service" (Barnett House Papers, No. 26. Oxford University Press, 1s.) comes like a breath of fresh air. Mr Dale was concerned in his lecture only with the tiny group of civil servants at the top who exercise a real and direct influence upon policy. They number less than 500; they make up perhaps a third of the administrative class of civil servants; and they amount to about half of one per cent of the total Civil Service. But it is they, their qualities and their work, their virtues or vices, which largely determine

Vitamins in chocolate for liberated Europe

The British Government, having examined all the ways in which sufficient vitamins could be provided to the under-nourished children of liberated Europe, have arrived at the conclusion—as Rowntrees did in 1938—that chocolate offers one of the best vehicles for carrying added vitamins. In chocolate, the vitamins retain practically all their potency.

Before the war, Rowntrees, alone among British manufacturers, pioneered the addition of vitamins to cocoa and chocolate. Their object was to enhance the protective value of these already highly nutritious foods.

Today, when the Allied Governments are faced with the enormous problem of rehabilitating each occupied territory as it is freed, Rowntree's experience of fortifying cocoa and chocolate with vitamins on a large scale is proving of great value. When the war is won, this experience will again be used for the benefit of the British public.

ROWNTREES

whether those who denounce the Civil Service as sluggardly and timorous, as well as those who accuse it of overweening ambition, are right or wrong. Mr Dale starts without any prejudices and ends, therefore, with some quite sensible conclusions. The measured tempo of Civil Service work he puts down in the main to the influence of Parliamentary control, and not to the inefficiency and slackness which the newspapers delight in proclaiming. Civil Service business goes slowly, and there is a diminished willingness to take risks, because of the vigilance of Parliament, which may be expected to take up any point, however tiny, at any moment for major criticism.

Timidity, rigidity, slowness of decision and action, red tape, evasiveness, fear of responsibility—such imputations are the convex, so to speak, of the concave represented by close obedience to law and to the will of Parliament, loyalty to Ministers, prudence, moderation, impartiality, skill and discretion in speech and writing, the desire to meet the varying demands of the public and the House of Commons.

Mr Dale asks in a significant passage what would happen to the affairs and procedure of any commercial or industrial undertaking which was suddenly subjected to the supreme and day-to-day control

of a committee of 200 elected shareholders, of which eighty will be bitterly opposed to you and your policy and will be perpetually endeavouring to turn you out and substitute a Chairman and Board chosen from among themselves.

He suggests that the directors and managers of such undertakings would be worked much harder than before; that the business of the overriding committee would normally take precedence of everything else; that business would be delayed for fear of provoking discussion in the committee; and that both directors and managers would be less willing to take risks in their enterprises. But Mr Dale does not believe that all is for the best in the best of all Civil Services. There are some failings, in his view, in the present personnel at the top. He acknowledges the intellectual ability, integrity and industriousness which are universal in this group of administrators; but he finds a lack of "vitality and nervous energy" and of the understanding of the ordinary lives of ordinary people. He puts this down in part to social and educational deficiencies and in part to the strain, first, of examinations and, then, of over-hard work. His immediate proposals are that higher civil servants should be worked less hard and that, at the ages of 30 and also 45, they should be given long periods of absence to work or study in other surroundings. These suggestions do not, of course, go to the heart of the matter, though they are valuable and shrewd. But Mr Dale is surely right when he says, in effect, first, that Civil Service procedure is dictated by Parliamentary control; and, secondly, that the so-called problem of the Civil Service is really a problem of education.

Uneasy Europe

This has been an awkward week for the German masters of Europe. In Italy the agitation for peace continues; in Croatia many of the Nazis' *Ustasi* supporters have gone into hiding; and in Hungary—although the first shock of Mussolini's fall has somewhat worn off and there is no more talk of the need for a "democratic revolution"—the official line is to dissociate Hungary as far as possible from the war between the Great Powers. They deny that any real help is going to Germany, and, in fact, limit it in every way they can. Finland has gone so far as to put out definite, if unofficial, peace offers. The Finnish Trade Union leader, M. Vuori, established contact in Stockholm with Mr Arthur Deakin, of the Transport and General Workers' Union, and gave him the terms on which the Finnish Trade Unions would like to see an armistice with Russia. If the satellites are uneasy, the occupied peoples are rampant. In France desperate attempts are being made by the Germans and the Vichy authorities to compel the handing over of all arms. The death penalty is to be imposed and there is talk of setting up summary tribunals for the purpose. This is a direct consequence of a flare-up in partisan fighting in Savoy, and there is evidence to suggest that it is spreading to the centre of France. In parts of Thessaly and Macedonia, Greek guerrillas seem to be in complete control. They are continually at work raiding and harassing the Germans' difficult communications down the Vardar Valley and the campaign will probably be intensified now that the Chief of the

Patriot Armies has gone to Cairo to consult with the Greek Government. The chief disturbances have, however, come from Germany's model province—from Denmark, which has enjoyed a very special status in the New Order as a sort of model of how beneficial and politically innocuous German occupation could be. Apparently the Danes have not found it so. Sabotage has increased enormously in recent months and the Germans are putting pressure to bear on the Scavenius Government to get its co-operation in handing over saboteurs to court martial. One effective form of sabotage with which the Germans seem powerless to deal is the strike. When the port workers at Esbjerg struck the Germans had to give way, and at Aalborg a determined strike compelled the Germans to lift the state of siege. At present the centre of disturbance appears to be Odense, Denmark's third largest city. Here a number of German soldiers have been killed and determined efforts are being made by the Danes to prevent the railways on the island of Fyen from being used for an increased traffic in German troops and war materials. The Allies have still to fling in the torch, but the Germans cannot fail to know that they are sitting on a powder magazine.

Indian Lull?

The centre of gravity in Indian affairs has shifted, for the moment, from war and politics to economics. Rightly or wrongly, the danger of a Japanese attack is now taken to have been removed; the mobilisation of an Allied offensive is steadily proceeding, but there is no sign yet—apart, perhaps, from the emphasis laid at Quebec on the war against Japan and the appointment of Lord Louis Mountbatten to command in South-East Asia—that the crucial campaign to recapture Burma is likely to be opened at any very early date. Politics are in abeyance, while the two sides, British and Indian, ponder upon possible new gambits to end the impasse that followed the failure of the Cripps Mission. In these circumstances inflation and food supplies are the reigning considerations. The price of rice in Bengal has risen sevenfold in a year. The combination of high employment and earnings with serious local shortages, not only of food, has brought about grave distress and considerable dislocation in a number of districts; and the situation has been exacerbated by chronic hoarding of money as well as food, by racketeering of almost every variety, by transport difficulties and by the inevitable confusion of central, provincial and local jurisdictions in a continent with 400 million inhabitants. The food position in Bengal has recently been reported to be particularly bad, and a few of the inhabitants of Calcutta have collapsed the streets from starvation or exhaustion. It would be shortsighted, simply because for a time there is apparent a political lull, to regard this extremely disturbing state of affairs as having no political significance. A great deal depends, when the process of seeking a political solution is resumed, on the apportionment of blame and responsibility between the inescapable exigencies of wartime, the timely failure of the rice harvests in Bengal, malpractice and maladministration. So far the attempt to pool food supplies over very large areas and to bring all food grains into the pool, which is obviously the right policy, has been very much impeded by provincial and local reluctance and by the absence of overriding central authority. Both at the centre and in the provinces the men in charge are Indians, as are the speculators and other persons who are obstructing fair and effective distribution in the markets. But there is no doubt that the responsibility for success, failure will be laid by the Indian politicians upon British shoulders; and expediency as well as justice and human demands that nothing should be left undone, in India elsewhere, to increase the supplies of food available to guarantee its prompt distribution to those in want. Authority must be asserted with the utmost dispatch.

The TUC and the War

One section of the annual report of the General Council to the Trades Union Congress, which meets in Southampton on September 6th, is devoted to a review of the Council's relations with the various Government departments concerned with the prosecution of the war during the twelve months. Consultation at the top between the Government and the TUC is, of course, close and frequent. Looking down, the position is apparently not regarded as so satisfactory.

factory. In its 1942 statement, the Council had reported that the Central Joint Advisory Committee to the Production Executive had "rarely been consulted by the Government" and had held only five meetings since its formation, and the hope was expressed that the new National Production Advisory Council to the Ministry of Production, which replaced the old Committee, would prove more successful. This hope does not seem to have been justified. This year, the General Council reports that "they cannot conscientiously state that it [the NPAC] has been as useful as they had hoped it would be because . . . its advice on production difficulties is seldom sought." It also considers that there is "scope for considerable improvement" in the machinery of the Ministry of Production and its Regional Boards, as reconstituted last summer. The TUC is more satisfied with the progress made at the lowest level, that is, in the establishment of works production committees, where the problem is one of collaboration with managements rather than with the Government machinery; but it reports that difficulties have been encountered in securing recognition for the work of the trade union district production committees. The difficulty all along has been that the Ministry of Production was set up too late in the day to exercise any real co-ordinating influence in these matters, though it must be recognised that the TUC's comments give only one side of the picture and its criticisms are negative rather than constructive. It is not surprising to find that the machinery for joint consultation with the Ministry of Labour, which was established at the very beginning of the war, has been more effective—this is, moreover, Mr Bevin's Ministry. The Joint Consultative Committee has dealt with the numerous problems arising from the mobilisation of labour: transport and accommodation for transferred workers; absenteeism; the Essential Work Order; reinstatement; part-time work and out-work; national arbitration. Similarly, the trade union committees attached to the Board of Trade and the Ministries of Food and Home Security have given valuable advice to the respective departments on such problems as clothes rationing, extra rations for manual workers and fire-watching. The General Council's survey of its war activities, while it shows that there is perhaps room for closer co-ordination in matters of production, conveys some impression of the very close relations now existing between the trade unions and the Government, and of the vital part which trade union co-operation has played in the conduct of the war.

The Law and Strikers

One item is missing from both the agenda of the Trades Union Congress meeting and the report of the General Council. This is the important question of prevent-

ing strikes. At present strikes are illegal without notice and arbitration; but in the main it is the trade unions and not the law—which is astonishingly seldom applied—that see, or are expected to see, that the workers' bond is kept. No doubt the unions have a tremendous record of success in doing this; their successes are not set down and made public; and despite the very marked increase in labour disputes during the past year or eighteen months the war period, in spite of the strain of four years of mobilisation and effort, still compares favourably in this respect with the last war, or with peacetime periods of very high activity. This is partly due to the concession, among many other concessions, of a guaranteed pay-week to millions of workers and partly to the continuous co-operation of the trade unions. But the failures of the trade unions do go on record, and they seem always to happen, however small and brief, at key points in war industry—coal, engineering, aircraft manufacture, transport and, the latest example, the docks. The Liverpool dock strike is fortunately now over. It was unofficial, that is, the trade union did not countenance it; but it was not prevented. The strikers came out in sympathy with 34 dockers who, because they refused to work overtime, were suspended—quite correctly, according to the existing agreements; and the strike ended a week ago with the reinstatement of the suspended men and a promise from the Ministry of War Transport to investigate the dockers' grievances. There is, of course, no smoke without fire. A list of the stated demands of the dockers, including an investigation of the entire dock labour scheme, an increase in basic wages and pay-as-you-go income tax, as well as the reinstatement of the 34 men, shows that many things are rankling in the Liverpool docks; and an impartial and intelligent inquiry may be overdue. But the point is that there should have been no strike. It was the union's job to prevent it, grievances or no grievances, and to get the grievances dealt with by the proper means without permitting the dislocation of dock work at a critical moment. If the answer to this is that the union tried and failed then the answer to that, in turn, is that, if the unions cannot impose lawabidingness on their members in all critical cases of dispute, the courts must do so, with the utmost rigour.

Shorter Note

The largest Aleutian island, Kiska, has been occupied by the first joint operation of Canadian and American soldiers, after the preliminary blasting of the island by American bombers had driven the Japanese out. For the first time, too, a Japanese position has not been defended to the last man. Allied control of Attu had already cut Kiska off from its sea links with Japan.

AMERICAN SURVEY

Rift with Russia

Newspaper and radio commentators this week have been more deeply stirred by the withdrawal of M. Litvinov from Washington than by the Quebec Conference. M. Litvinov has been regarded in Washington as the embodiment of Russian collaboration with the Western democracies. His return to Moscow at this time has caused an uneasiness that is not to be allayed by soothing statements to the effect that it has been long expected or that it is well known that the Kremlin is short of old experienced hands. The isolationist press is already making mischief by suggesting that this is a prelude to a separate Russian peace which will stagger the complacent conference at Quebec. More responsible journals are regretting that nothing seems to be done to arrest the drifting apart of Russia and her Western Allies at the very time when solidarity is most needed. There is an under-current of irritation that the Russians do not appear to appreciate what a contribution has been made to the common cause by the Anglo-American campaign in the Mediterranean or by the day and night bombings of Germany's nerve centres. The pressure of a disturbed public opinion is bound to have its effect upon the Administration.

The Two-Thirds Rule

The provision of the American constitution which requires the ratification of treaties by a two-thirds majority of the Senate is undergoing a certain degree of reinterpretation—that process by which the Constitution is kept elastic and more or less in tune with a changing world. In meetings between a sub-committee of the Senate Foreign Relations Committee and the State Department, to discuss American participation in post-war relief and rehabilitation abroad, a compromise has been suggested to avoid the necessity of invoking the two-thirds rule. It is that piecemeal "agreements" on international matters should become effective by a mere majority vote in both houses. This is halfway between the contention that all technical conventions should be considered treaties and require approval by two-thirds of the Senate and the other extreme position which would regard them as purely matters for executive action. If Congress concurs in the proposal, this ingenious device may smooth the way for an American share of international responsibility. But it will have to be employed with discretion. While there is a substantial body of opinion in the United States which believes wholeheartedly that the two-thirds rule gives an obstructionist minority undue power,

and tends to emasculate treaties and paralyse the executive by the mere fact of its existence, any wholesale attempt to interpret away the Constitution by this easy and tempting subterfuge would crystallise every faction's opposition to an alarming degree. The ideal solution would be to see the two-thirds requirement eliminated by constitutional amendment. There are optimists who believe that such an amendment could be successful in the near future. It would have to be submitted to a convention of the states; yet if there were immense public pressure for the step this would not mean inordinate delay. But it is difficult to believe that such popular demand exists, and it is only too easy to foresee what a rallying cry could be made of an attempt to modify the Constitution in order to make more certain American participation in a new international order. The value of these recent state department conferences with representatives of the Senate seems to lie more in the precedent of active and timely concert between the executive and the legislative branches than in any hope of circumventing or amending the Constitution on a large scale. In this effort no one on the executive side is more likely to succeed than Mr Hull.

More for Civilians

One of the notable points in Mr Byrnes' speech last week was the authority he gave to the belief that some essential supplies for civilians will be increased in the near future. The war programmes, he said, had been subjected to a critical review, the result of which was to suggest that, without lessening the war effort, there was room for an improvement in civilian supply. The pressure in this direction has been growing this year. It prompted the proposal for an independent Office of Civilian Supply, and stimulated Mr Nelson to set up an enlarged office of that character within the War Production Board. On June 9th, steel allotments for farm machinery were increased to permit the manufacture of 80 per cent of 1940 production; concentration was abandoned; and no limit was placed on the production of spare parts. The manufacture of ice-boxes, alarm clocks, pressure cookers to preserve the vegetables from Victory gardens, and radio tubes has been increased. In the last week or two, WPB has been increasing its efforts to supply steel for such essential civilian uses as farms, the railroads and warehouses. Prospects are good for more irons and washing machines to take part of the load from commercial laundries, which, particularly in war production centres, are having to ration their customers to three shirts a week, to slash special services, and revert to the earlier custom of delivering the wash rough dry. Steps to avoid breakdowns in essential civilian services, whether they are railroads or laundries, are direct contributions to an efficient war effort. What is less reassuring is the line Mr Nelson took last month on textiles. Announcing a plan to increase textile production (where it would not interfere with the war effort) and to improve distribution, he declared that if there were co-operation from consumers this would make rationing or strict regulation of clothing unnecessary. In view of the fact that the bottleneck in textiles is manpower, an increase in production hardly seems possible without some impingement on war production; and if the aim is merely to avoid rationing, rather than to remedy a condition of desperate shortage, it is a confession of lack of confidence in the rationing machinery.

Sanctions at Home

The War Labour Board, which at one time looked like following its predecessor into oblivion, has come out of its encounter with the formidable Mr John L. Lewis with a drastic new set of sanctions. The anti-strike Act, passed over the President's veto, empowered the Labour Board to prescribe terms and conditions governing the relations between unions and management in disputes brought before it. In a letter to the Chairman last week, Mr Roosevelt made it clear that, when compliance to a Board order must be enforced upon a recalcitrant union, the plant may be taken over by the Government and all benefits, privileges and rights of the union, particularly checked-off dues (i.e., the collection of union subscriptions by the employer) may be withheld until the union shows its willingness to co-operate. Dues will be held in escrow until the union is restored to grace, when they will be returned. Sanctions against employers, which have already been put into effect, though not heretofore purely at the discretion of the Board, include Government seizure of plant, and with-

drawal of war contracts, priorities, transportation and fuel, when this can be done without damaging the war effort. Mr Roosevelt was at pains to point out that, of the more than a thousand disputes disposed of by the Board during the past 18 months, only seven had to be referred to the President for persistent non-compliance. Of these the two most notable and outstanding cases are those of Mr John L. Lewis, on the labour side, and on the employers' side, the US Gypsum Company, which has refused to accept the check-off and the "maintenance of membership" clause (i.e., a clause providing that any worker who is already a member of the union must maintain his membership as a condition of employment—the last step before the full closed shop) recommended by the Board. The test with Mr Lewis will not be long delayed. Mr Ickes has already announced the imminent return of some mines to their owners, despite Mr Lewis's threat of a renewed stoppage if the Government did not continue to control the mines. And the Labour Board has invited the attendance of Mr Lewis and the anthracite operators at hearings to determine a new contract in view of the fact that 20 weeks of negotiation have brought them no nearer to agreement. At the same time the pill has been somewhat sweetened by an order establishing a 48-hour week in the mines, which adds nearly \$10 a week to the miners' weekly pay envelope.

Picketing Pegler

In principle the picketing of a journalist by a union which disapproves of his opinions has little to recommend it; but it is difficult not to sympathise with the members of the National Maritime Union who are at present engaged in picketing the *New York World-Telegram* against the anti-labour column of Mr Westbrook Pegler. According to the banners of the pickets, "Hitler torpedoes us at sea—Pegler torpedoes us at home." A letter from the union goes on to argue, with substantial truth, that Mr Pegler attacks not only the seamen's union, but all labour, and sows confusion and creates disunity at home. Mr Pegler, formerly a sports writer, has built up a considerable reputation as a political columnist, and in recent years particularly by his attacks on graft, corruption, and racketeering in labour unions. He has had considerable success in uncovering and bringing to an end glaring abuses, especially in AFL unions. He represents in an illiberal form the great old muckraking tradition of the American cities. Not all his protests that he is really in favour of honest labour unions, and only bent on rooting out their abuses, however, carry much conviction that he is not basically anti-labour. However, picketing in New York is not likely to have a greatly deterrent effect on a columnist syndicated across the country. The *World-Telegram*, which prints Mr Pegler on the same page as Mrs Roosevelt and Mr Raymond Clapper, has announced its intention of continuing his column, "to record his own opinions." It is probably also true that the union's resort to direct action will only give Mr Pegler an agreeable and stimulating illusion of martyrdom and a useful amount of free publicity. Not long ago he was initiated into one of those New York clubs which prescribe an ordeal by whimsy for new members. It was arranged that the waiters downed tureens when the soup was served him; the orchestra refused to play, but provided hideous disharmonies throughout the meal; and an impersonator of Mrs Roosevelt—Mr Pegler's *bête noire*—insisted on joining the company. Mr Pegler, who has a powerful sense of the publicity value of animosity, flourishes on attack.

The Food Position

Vigorous replies were launched last week by two members of the Administration on critics of the farm and food position. Judge Jones, the War Food Administrator, declared that, despite bad weather, total crop production would be 5 per cent higher than in any year except 1942, and, with greater livestock production, total food output would break all records again. With good luck the farmer will have broken all food production records every year for six successive years. For 1944 an even greater production programme is being planned and will go into effect on the customary voluntary basis. This is an amazing record. What the critics say, however, is that production might have been much higher but for the 47,000,000 acres withdrawn from food production between 1932 and 1939 under the Agricultural Adjustment programmes. Mr Byrnes in his speech last week took occasion to deliver a direct rebuke to "persons of recognised prominence"

ex-President Hoover presumably—who repeat this accusation. Mr Byrnes declared that the figure, which applies to the 17 principal agricultural crops, is misleading in that in the same period the acreage of other crops increased by 9,000,000. Since 1939 the acreage of 52 agricultural crops has been increased by 16,000,000 acres, so that the total harvested acreage in 1942 was only 22,000,000 less than in 1932. Yet with 22,000,000 less acres in production and with less manpower than in 1932, 36 per cent more food was produced in 1942, making possible a better diet for American civilians than they enjoyed before Pearl Harbour. This was accomplished through efficient soil conservation and by striking increases in yields per acre. As Mr Byrnes pointed out, it is not the fault of the farm programme if, owing to their own higher purchasing power and war requirements, the American people cannot eat everything they would like.

D-Day

A warning that six months after the end of the war there might be 12 million unemployed in the United States has been issued by the Bureau of Labour Statistics of the Department of Labour. In the aircraft industry it predicts the squeezing out of 1,500,000 or more workers; that in shipbuilding will be almost as drastic, while employment in the converted automobile industry is, it suggests, likely to drop from 800,000 to 200,000 before climbing back to about 600,000. The likelihood which it mentions of a vast contraction in the production of machinery and machine tools after the war has been worrying the industry for some months. On the bright side, however, is the Bureau's expectation of an almost immediate expansion in industries producing refrigerators, sewing machines, electrical appliances, textiles, leather, lumber and paper. In its recommendations the Board takes much the line suggested by the National Resources Planning Board, now defunct. The need for the rapid reconversion of industry; a public works programme to give employment in the interval; financial help during the same time to demobilised servicemen and war workers; a gradual programme of demobilisation; and a Federal job-placement service—are points that one would expect to be the subject of common agreement, although already some of the enemies of Government interference are arguing that if only the Government will withdraw its controls as soon as the armistice is declared, private industry will be able to take up the slack. This is hardly to be taken seriously. As the Bureau warns, without substantial adherence to its programme, the unemployment problem, "certain to be critical, may be devastating." The problem to be faced is more complicated, however, than merely one of providing Government aid to the unemployed until industry is back on a peacetime footing. Among the subjects which the Bureau feels should undergo further exploration are the disposal of Government-owned war plants and surplus

war stocks, in a manner to aid private enterprise; wartime business taxes and aid to small business; the continuation of anti-inflation measures; and the gradual tapering off of war contracts. These are all issues into which the NRPB report went most thoroughly. With the disavowal of the Board by Congress, presumably the ground will have to be gone over again from scratch—if there is time.

Manpower Figures

The July issue of the "Survey of Current Business" contained a number of statistics of the manpower problem which serve to illustrate its dimensions. From June, 1940, to June, 1943, the civilian labour force fell from 56.2 millions to 54.6 millions. This means that recruitment to the labour force, as a result of the increase in that population and the growing employment of women, failed by 1.6 millions to offset the men lost by drafting into the armed forces. In spite of this shrinkage of the total labour force, employment increased from 47.6 millions to 53.4 millions, the reason being, of course, a fall in unemployment from 8.6 millions to 1.2 millions. These comparisons are over a three-year period. In the last year of the three the position has not been so comfortable. Agricultural employment has been maintained, but the total employed in industry has fallen by 300,000, in spite of an influx of 2.6 million women. The next twelve months are going to pose a very difficult problem. A total of 3,900,000 persons are wanted for the armed forces, the munitions industries, Government war agencies and the food-processing industry. It is estimated that there will be only 1,300,000 new recruits to the labour force in the period, so that 2,600,000 persons will have to come out of less essential trades. With an effective manpower system and a successful control of purchasing power, these problems would not be insuperable. With no mobilisation mechanism (except the draft for the armed forces) and with a steadily mounting head of purchasing power pressing on all markets, it is difficult to see how the necessary shifts will be achieved.

Shorter Note

Rumours, which have an authentic air, allege that Mr Sumner Welles has resigned, or been dismissed, from the State Department because of irreconcilable differences with Mr Cordell Hull. If this turns out to be true, it will bring the issue of the State Department to a head. It has been difficult to believe all the allegations of reactionary, semi-Fascist leanings in that department, but if Mr Welles goes it will be impossible to withhold belief any longer. Not that Mr Welles is a rabid left-winger. Indeed, to find Liberals deploring his removal is the best evidence of the pretty pass that things are coming to.

THE WORLD OVERSEAS

Nazi Failure in Norway

[BY A CORRESPONDENT]

DURING the early period of the occupation of Norway, the Nazis hoped for a rapid development of natural resources. Far-reaching plans were made for expanding hydro-electric power stations, and the production of light metals, ferro-alloys and chemicals. The construction of power stations for at least half-a-million kw., that is, roughly one-quarter of the total pre-war generating capacity, was actually begun, and was to have been completed in stages during 1943 to 1945. At present, not one of these projects has been completed. Since the autumn of 1942, most of the construction work has had to be suspended because of the shortage of material and labour. German plans originally envisaged the expansion of the aluminium capacity from some 37,000 tons to 140,000 tons, whereas in 1941, actual production fell to 50 per cent of the 1940 output. In 1942, production may have increased to, perhaps, 26,000 tons. The lack of imported

bauxite prevented production from being maintained, and the construction of new plants for processing Norwegian labradorite met with insurmountable difficulties.

All foreign-owned aluminium plants were taken over by German capital interests. For this purpose, two new companies were formed—the A/S Nordisk Lettmetall of Oslo and the A/S Nordag. The German I.G. Farben, the Norsk Hydro, the Bank der Deutschen Luftfahrt-Berlin, and the Hansa-Leichtmetall AG-Berlin, control these two companies. The Norsk Hydro, which actually expanded its power stations, chemical works and light metal plants, is now completely owned by the I.G. Farben trusts. But the pre-war output of iron ore, pyrites, nickel and molybdenum, as well as of ferro-alloys, has not been reached. German hopes of turning Norway into an important part of the European war economy were thus disappointed.

Shortage of labour has been a peculiar feature of Norway under German occupation. There is, first, the tremendous coastline which has needed fortifications at a great number of places. At the same time, the Germans were forced to extend roads, aerodromes and communications. The con-

struction of fortifications and roads requires a considerable labour force. Work on new factories and plants, and the necessary extension of agriculture for replacing at least part of the foodstuffs formerly imported, also demanded more labour. Conscription of labour was thus introduced as long ago as 1941, and people were forced to work for a limited period in agriculture, forestry and fortifications. The labour decrees that have been published since 1941, culminating in total mobilisation after the German model early this year, illustrate the story of the resistance of the Norwegian population to the occupying power. Before conscription was applied, German authorities, in collaboration with the Quisling administration, forced workers to take up employment by denying them food cards if they refused.

Failure of Conscription

Norwegians soon realised that the demand for workers for military constructions was growing from month to month. Industries not engaged on war production were denuded of labour. At the end of 1942, it was estimated that roughly one-third of a total of 500,000 workers in employment were engaged on fortifications and other defence works. The total mobilisation of 1943 is said to have yielded an additional 10,000 workers, although the Germans had demanded at least 35,000. Other reports state that not more than 3,000 workers were obtained. The general registration, which was the basis of the total mobilisation, met with a particularly interesting resistance. Forms were filled in illegibly; interviews had to be repeated several times; in short, many delaying tactics were employed. It has never been possible to recruit appreciable numbers of Norwegians for work in Germany, and each tightening of conscription increased the exodus, particularly to Sweden. In fact, Norway is the one country under German occupation where considerable numbers of German civilians, said to number at least 100,000, had to be engaged, not to speak of Russian and other prisoners of war. It may not be far from the truth to state that at least 300,000 Germans, that is, 200,000 soldiers and 100,000 civilians, are now stationed in Norway. The Germans in Norway are thus nearly equal to the number of Norwegians of military age.

Norway's agriculture is hopelessly inadequate to supply the population with the minimum of foodstuffs needed. Imports of grain from Denmark are small, and the lack of feeding stuffs forced farmers last autumn to reduce their cattle herds by a quarter. The shortage of fats became more marked. As a result, the allowance of milk for farmers was greatly reduced. All churns were sealed by the police, and the surplus milk had to be delivered to dairies. The delivery quotas for grain were increased at the same time. The greater part of the fishing output is still shipped to Germany, and the production of herring oil for use in Norway has again been reduced. As in other occupied countries, farmers have benefited financially. They have received higher prices without, however, being able to spend the money on civilian commodities, or on replacing agricultural machinery and implements. Consequently, debts have been repaid, and the enforced bankruptcy of a farmer was unknown in 1942.

Norway's financial situation is largely a matter of conjecture since all official information has ceased. Even vital statistics, which are still published in other countries, have been suppressed. The reports of the Central Bank and the Budget figures were suspended a long time ago. It is estimated that the costs of occupation financed by the Central Bank were as follows:

End of 1940	Kr. 1,500 millions
" 1941	" 3,800 "
" 1942	" 6,000 "

The annual expenditure of the Quisling government is estimated at at least double the pre-war expenditure. The national debt has increased accordingly, and the notes in circulation are perhaps three times as great as before the war. The leading commercial banks are largely employed on financing the expenditure of the Quisling government, which is reflected in considerable holdings of Treasury bills and bonds. Private demands from industry for finance are negligible.

The financial situation reflects the great losses inflicted by the occupation on Norway's economy. It is estimated that the value of the national resources has been reduced by Kr.3,000 to 4,000 millions as a result of the requisitioning of goods, the slaughtering of livestock for military purposes and general wear and tear. During three years of occupation, Germany has received goods and services to the value of Kr. 9,000 millions. The annual amount is roughly equal to three-fourths of the pre-war national income.

In spite of these conditions, price control has been fairly effective. From August, 1939, to the beginning of May, 1943, the wholesale index increased by 77.4 per cent, and the cost of living index by 48.9 per cent—a small rise compared with that in other occupied countries. Wages increased during the same period, however, by only 6 per cent, which shows very clearly the considerable reduction in the standard of living under German occupation.

During three years of occupation, the German administration and the Quisling government have tried very hard to reorganise Norway's economic system after the German model of a totalitarian economy. Yet no "Nachstand" and no "Labour Front" have emerged which can claim to have organised farmers and workers. The attempt to form a corporative parliament for industry has also been abandoned. It was not until May, 1943, that an Economic Council was formed, which combines ten economic groups covering the entire economy. The Economic Council is directly controlled by the Department of Trade and Industry of the Quisling government. Membership is compulsory, and the different groups are simply a compulsory form of earlier industrial and other federations.

Brazil in the War

[BY A CORRESPONDENT]

LAST weekend, Brazil celebrated the first anniversary of its entry into the war. Although Brazil is earnestly considering the drafting of an expeditionary force to North Africa or Europe, its main contribution to the war, apart from providing military, naval and air bases, has been, and will be, on the economic front. The country's economic effort since its entry into the war has been twofold—first, to supply the United Nations, and especially the United States, with strategic materials and other commodities; and, secondly, to meet its own demand for industrial goods as far as possible from domestic sources in order to save labour, materials, industrial capacity and shipping in the other Allied areas. In both directions Brazil has been fairly successful.

Brazil's entry into the war was accompanied by the mobilisation of all its economic resources. Since then, the country's "Co-ordinator of Economic Mobilisation," supported since early this year by a "Consultative Council of Economic Mobilisation," has placed the country's trade and industry on a war basis. Although private initiative has been retained to a certain extent, all production programmes and development schemes are centrally directed and controlled. The trend towards industrialisation has been accelerated and the development of resources of strategic materials has been intensified. Although from the point of view of the war effort the latter trend is undoubtedly the more important, there can be little doubt that the progress made in industrialisation will be one of the main milestones in Brazil's economic history.

Brazil's economic difficulties in the past have been largely connected with the fact that the country was a "one-crop producer." Coffee, of which it used to produce over two-thirds of total world production, and which until ten years ago accounted for some three-quarters of all Brazilian exports, was the backbone of the country's economy. President Vargas had tried from the beginning of his period of office to widen the country's economic basis. The results of his early endeavours, however, were not very significant. There was an increase in the country's production of some other agricultural commodities, like cotton and citrus fruits, but its mineral wealth remained largely untapped, and its industrial production remained exceedingly small.

The war has brought many changes. Brazil's mineral production is now attaining a high level. With the direct help of the Allies, especially the United States, the iron-ore mines of Itabira (Minas Geraes), the manganese mines of Minas Geraes, Matto Grosso and Bahia, the chrome ore deposits of Bahia, the tungsten and nickel mines of Goyas, the bauxite deposits of Minas Geraes, Espirito Santo and Maranhao, as well as numerous other mines producing diamonds, non-ferrous metals, mica, asbestos and similarly important strategic minerals, are now being developed to supply the Allied war industries. In a number of cases, such as steel and aluminium, important refining installations are being constructed in Brazil. Their capacity will be large enough to enable Brazil to export part of its production.

In the agricultural field, the Brazilian war effort is not less marked. Some 100,000 workers have been drafted into the

Amazon Valley and into Matto Grosso to tap the country's vast resources of wild rubber. Vegetable oils of various kinds are being produced in greater quantities than ever before. Soon, cocoa surpluses in Brazil will be utilised for the production of cocoa butter. Medicinal herbs, which formerly came from the Pacific area, are being collected in growing quantities in Brazil. Last but not least, Brazil has become one of the main Allied sources of silk for the manufacture of parachutes.

Along with the development of its natural resources, Brazil has greatly extended its industrial production. There are now close on 80,000 industrial establishments in Brazil, some 15,000 more than at the outbreak of war. The number of industrial workers, which numbered some 825,000 two years ago, is now approaching 1,000,000 men, while the value of the country's industrial production is now nearly one-fifth of the country's national output, against just over one-eighth at the outbreak of war. The new industries of Brazil no longer consist of small workshops producing a limited range of simple products. They include large and modern enterprises for the production of such complicated goods as electrical appliances, including radio equipment, motor cars and airframes, with aero engine production in active preparation, certain types of machinery, textiles of a surprisingly high quality and even ships.

In most instances it is obvious that the new productive capacity will survive the war, and become the nucleus of a fairly large national industry.

As most of Brazil's statistics have been suppressed, it is not possible to give a detailed picture of the country's economic changes. Even the monthly foreign trade returns have not been published since April, 1942. The last annual report of the Bank of Brazil, however, quoted some figures of Brazil's foreign trade in the whole of 1942. These figures already indicate the change in the trend of Brazil's economic activities to some extent, although shortage of shipping gave priority to shipments of strategic materials, and supplies of foreign manufacture last year remained below the country's needs. Total imports in 1942 reached 4,644,000,000 cruzeiros, or only slightly less than imports in 1939. Exports, on the other hand, at 7,495,000,000 cruzeiros, were almost 50 per cent larger than in 1939. The trade surplus, at 2,851,000,000 cruzeiros, was nearly five times as large as in the last pre-war year. Whereas imports consisted largely of machinery, industrial equipment, transport equipment, fuel and similar materials, exports were mainly made up of products needed for the war. Coffee and cotton, which ten years ago were together responsible for three-quarters of Brazil's total exports, and even in 1939 for three-fifths, in 1942 accounted for less than 35 per cent of all exports, against 45 per cent in 1941. Under more normal shipping conditions, coffee exports should be higher than they were in 1942, but it is almost certain that this commodity has lost its dominating influence on Brazil's national economy.

The rising export surpluses, together with the large North American funds flowing into Brazil to finance the development of strategic material production, have greatly improved the country's financial position. Apart from repaying its gold debt to the United States under the 1939 credit agreements, the Brazilian Exchequer has been importing gold from the United States on a large scale during the past twelve months. In addition, Brazil has been accumulating a large reserve of foreign exchange, and it is very likely that the surpluses on Brazil's balance of payments will continue to rise for the remainder of the war. The favourable trend of Brazil's financial position is of particular interest to this country, for the current, highly unfavourable Brazilian foreign debt scheme will expire at the end of March, 1944, and is due for reconsideration not later than October, 1943.

Northern Ireland Transport

[FROM OUR BELFAST CORRESPONDENT]

GROWING attention is being given in Northern Ireland to problems of post-war reconstruction. A Planning Advisory Board with a large and representative membership has been established, with the task of making recommendations regarding physical planning and reconstruction. A strong Agricultural Enquiry Committee has also been appointed under the chairmanship of Lord Justice Babington, while a further committee is dealing with the post-war future of the linen industry. It is probable, however, that one of the most urgent problems with which the Government will be confronted is that of transport.

Wartime Lessons that will influence Britain's Export Marketing in the Peace

THE use made by the Allied Governments during the war, not only of propaganda, but also of public-opinion and public-behaviour research, may be taken as prophetic.

It appears now most unlikely that these instruments for learning people's desires, beliefs, and habits on the one hand, and for moving them to constructive action on the other, will be dropped when peace comes. They are certain to play an indispensable part in post-war export trade.

International Organization

The J. Walter Thompson Company Limited can justly claim to have helped in the steady development of the new propaganda techniques and the new research methods—both before the war, on behalf of industry, and since, on the Government's behalf. And this experience, together with the Company's international facilities, makes its services particularly valuable to business men faced with the problem of Britain's overseas markets.

It is true, of course, that the Company's offices in the Occupied Countries are temporarily closed and that the London office and the offices in the United States, in South America, in India, and in the Dominions are carrying on their work with reduced staff.

Planning Now

Nevertheless, the offices now operating are able to undertake a limited amount of market research and post-war planning, and the European offices will, it is hoped, be reopened soon after the war ends.

So far as the marketing problems affecting post-war export trade can be "tackled" at this time without detriment to the war effort, it is generally agreed to be in the national interest that they should be. With this in mind, the J. Walter Thompson Company will be pleased to exchange views with any responsible concern that is interested in its international experience and facilities.

J. Walter Thompson Company Limited

6 Grafton Street, London, W.1

BOMBAY	BUENOS AIRES	CALCUTTA	CAPE TOWN	CHICAGO
JOHANNESBURG	MELBOURNE	MONTREAL	NEW YORK	
RIO DE JANEIRO	SAN FRANCISCO	SÃO PAULO	SEATTLE	
	STOCKHOLM	SYDNEY	TORONTO	

The small size of Northern Ireland and the short distances to be covered led to the rapid development of road traffic after the last war. Soon, a mass of small road transport undertakings were operating with little co-ordination or regard for the real interest of the public, while periodic rate-cutting between rival operators added to the confusion. To regulate the position, the Road and Rail Transport Act of 1935 was passed, under which the Northern Ireland Road Transport Board was established as a public utility, which gradually acquired almost all road transport undertakings operating passenger or freight services in Northern Ireland. A single authority was created to deal with public road transport. There remained, however, the position of road transport in relation to rail. The Act of 1935 provided for a system of pooling receipts between the Road Board and the three railway companies operating in Northern Ireland. This provision of the Act never operated, however, and, in fact, considerable rivalry existed before the war between the Road Board and the railways. In so far as passenger transport was concerned, the operations of the Road Board were successful, but in the case of freight transport it had become apparent that there was not a sufficient volume of public freight transport to enable both the Road Board and the railways to operate economically.

The position has been radically altered by the war. Shortage of petrol has restricted the operations of private traders in the carriage of their goods by their own vehicles. The war has originated a large amount of direct war transport. In these ways, the volume of public transport has greatly increased, but it is realised that sooner or later the problems which had arisen before the war will have to be solved. In the meantime, traders are concerned to ensure that no limitations will be imposed in regard to the carriage of merchandise by private lorries after the war, and that private transport will not be restricted on the pretext of securing that there is an adequate volume of traffic to enable public transport undertakings to operate efficiently. If, however, as seems probable, the volume of public transport declines after the war to a level approaching the 1938 level, then the first solution would appear to be the amalgamation of all road and rail services in Northern Ireland under a single public utility organisation. It is admitted that the pre-war level of freight transport was quite inadequate to maintain the Road Transport Board and the three railway companies on an economic basis. The integration of road and rail services, so as to eliminate overlapping, is an essential development in the interest of efficiency, while important economies would also arise from the unification of the management, accountancy, technical and publicity organisations at present duplicated in four separate undertakings.

The Indian Census

In February, 1940, the Government of India decided to undertake a census of all India, and the report of the Census Commissioner is now available in this country. The 1941 census, which is the eighth in the series, was conducted under conditions of exceptional difficulty, owing to the war, shortage of staff and the political situation. Certain changes in the method of enumeration were employed. Thus the old system of counting the number of heads at midnight on a given date was replaced by an enumeration spread over a longer period and based on a previously prepared house list. Another change was the introduction of mechanical tabulation, which enabled the number of enumerators to be reduced. A third change was the abandonment of the system of language and script enumeration, as it was felt that Hindu-Moslem feeling would make the returns worthless where the Urdu and Hindu languages were concerned. The present census is described as a "utility" census report. The returns show the distribution of population by districts, sub-districts and towns and as between the different communities. Relatively little information is provided about economic and social conditions, but, in spite of its limitations, the present document is a valuable social record, and it is creditable that the Government of India, amid its many burdens and duties, should have been able to undertake a task of such magnitude.

The census shows that the 1941 population of India was no fewer than 388,997,955, which is an increase of over 50 million in the last ten years. The report attributes this increase mainly to increased expectation of life, reduction

in maternal and child mortality and the downward trend of the death rate from such destructive diseases as cholera and the plague. Since 1920 the infant mortality rate has fallen from 195 per thousand to 160, and this cause alone is responsible for a population increase of 3,000,000. During the same period the general birth rate fluctuated between 33 and 36 per thousand, and the general death rate declined from 31 per thousand to 22. The reduction in the rate of maternal mortality, which is now estimated at about 20 per thousand, is attributable to improved public health services, and should tend to produce still further increases in population. The balance between the sexes has remained constant, though the proportion of women to men has fallen slightly in British India. For India as a whole, the ratio is 935 women to every 1,000 men.

India is still overwhelmingly rural. Its urban population numbers 49½ million, that of its countryside 339½ million—a proportion of roughly one to seven. This fact is also shown by the small number of towns compared with villages—2,703 towns to 655,892 villages. A town is regarded as a place with 5,000 inhabitants, a city is a town with not less than 100,000. There were 58 cities in India in 1941, which is a considerable increase since 1931, when there were only 35. The report emphasises the growing importance of city life in India, with the development of industry and the increase in overseas trade. It is significant that, in the last 50 years, the population of Calcutta has been trebled, those of Madras and Bombay have doubled, and that of Lahore has quadrupled, while the same tendency to grow is shown in other cities, such as Karachi, Jamshedpur, Ahmadabad, Trivandrum and Sholapur, which have developed during the past fifty years from small villages to urban centres of considerable importance.

The report contains some interesting information about the community grouping of the population in the various districts. For All India, including the Indian states, 66 per cent of the population are Hindu, 24 per cent Moslem, and 7 per cent tribal. In British India, the proportions are 64.5 per cent Hindu, 27 per cent Moslem, and 1 per cent Christian, the Christian element being strongest in the Madras presidency. In Travancore state, Christians represent 32 per cent of the population, and in Cochin state 29 per cent. Persons of European origin, including British soldiers, represent about one in every thousand of the total population.

At first sight, the tremendous extension of literacy—the increase amounting to 70 per cent for All India (60 per cent male and 150 per cent female)—might seem to give ground for satisfaction. But the actual figures of literacy reveal the incredible backwardness in this respect of the Indian population. The standard was a very low one—the ability to read a simple letter, and not as in previous years to read one and write the answer. Yet the figure for women in the whole population is only 2 per cent. In Punjab, the literacy figure is 13, which covers a 390 per cent increase for women; Bombay shows a literacy of 30 per cent for males and 9 per cent for females; Bengal 25 per cent and 7 per cent for men and women respectively. The highest figure is found in the two princely states of Travancore and Cochin, where it is 45 per cent, which is four times as high as in any province of British India. The Commissioner expresses the hope that broadcasting, by making the people conscious of a want of education, may tend to reduce illiteracy. This might help, but it is clear that vigorous efforts will have to be made by the authorities if this deplorable feature of Indian life is to be remedied.

Taken as a whole, the census has the effect of whetting the appetite for more information. The vital statistics, the population groupings, and the literacy returns are of great interest and importance. It is to be hoped that, as soon as practicable, the Government of India will be able to make a census giving information about occupations, agriculture and industry, housing, public health and schools, and enabling the formation of a comprehensive picture about how the Indians live and work.

Russia at War

Output of Arms

INFORMATION about the situation in the Soviet war industries has recently been more scarce than usual. The black-out of facts and figures so familiar in other belligerent countries prevails in Russia, too; and, in addition, the discussion of economic and industrial problems which for a time was very common in Russia at war has been abated. Moscow publications now give extremely few glimpses into the development of the industrial war effort in the Urals and the Asiatic industrial centres, which until a short time ago was widely discussed; and nothing has been published lately except either very general over-all percentage figures of increases in production or scattered detailed accounts of output records obtained by individual workers. Crucial problems such as the replacement of raw material and fuel resources lost to the enemy; the problems of industrial organisation in the east; the special labour problems of regions only recently opened to industry; the new geographical distribution of war production; and the regional variations in output, wages and the cost of living—all these and similar aspects of Russia's war economy are now shrouded in increasing secrecy.

It is by the victories of Russian arms on the battlefield that the achievements of Russian factories can now be gauged. General Sabennikov, the Russian commander on the Orel sector, stated last week that during the decisive phase of the fighting for Orel his artillery was able to cover every yard of ground on the average with nearly two guns; the density of the barrage at Orel was "at least ten times as large as that at Verdun." The credit for this stupendous saturation of fire power belongs, of course, to the Russian war industries, even allowing for the very substantial contribution made by Lend-Lease deliveries.

The production drive in the Urals and Siberia apparently went on unabated during the first half of this year. In a recent report the Deputy Commissar of the Munitions Industry, M. Khrunichev, stated that, during the first six months of 1943, the Russian munition factories produced nearly 50 per cent more than during the first half of 1942. This figure of 50 per cent is an average covering all types of munitions. The same statement mentioned an eight-fold increase in the output of the "most essential types of munitions"; in the manufacture of shells, for instance, special emphasis was laid on armour-piercing power to immobilise the German Tiger tanks; and the ordnance factories have concentrated on new kinds of self-propelled guns.

On the production of tanks and aeroplanes reports have been still less specific. Not even percentage increases have been published lately. Instead, a very considerable improvement and modernisation in the technique of production has been reported. Automatic electric welding machines have been introduced in many factories in the Urals, which has made it possible to speed up and perfect the manufacture of tanks as well as to save skilled labour. "A girl who only recently left a collective farm for a factory (one report goes) is able on an automatic welding machine to turn out as many tank parts as five skilled welders used to produce by hand." Much has also been done to ensure an even flow of output from aircraft factories. New multi-spindle lathes have been brought into use, with a very large economy in labour and machines. In some instances only an eighth of the previous number of workers are now required to carry out a particular operation; and one multi-spindle lathe does the work which twelve times as many lathes of the previous type used to do. The experimental machine tool factory "Lathe Constructor" is said to have worked out a method by which an even flow of output can be maintained even in processes involving transport of very heavy loads up to 15 tons.

Many of the new technical devices, which have recently been given publicity, still remain in the experimental stage; but many others have been put into operation and have enabled a number of armament factories to switch over to mass production. The tendency towards "americanisation," which has been apparent in Russia ever since the first Five Year Plan, appears to be a dominant influence in the many

new industrial centres in the Urals which have sprung up in the course of the war like mushrooms. Shortages of labour and raw materials seem to have stimulated this trend very markedly.

The weakest spot in the Ural war industries has always been the supply of fuel and electricity. In this respect the northern and central regions of the Urals are in an even worse position than the southern regions, which are nearer—though by no means near—to the coal basins of Kuznetsk and Karaganda. In the course of this year some progress has been made in the exploitation of local resources of coal and other fuels. The Sverdlovsk region—very important for its tank and aircraft factories—has doubled its output of electricity and trebled its output of coal. It seems doubtful, however, whether the fuel bottleneck has really been broken; and the fact that the shortages of coal and electricity in the central and northern parts of the Urals have not frustrated the plans for industrial expansion there is in itself a remarkable achievement. It can only be explained by the extraordinarily energetic and strict allocation of fuel, according to priorities, to the factories which have lacked and needed it most.

The spirit in which the Urals drive is being continued is illustrated by a new collective letter "from the workers of the Urals to their beloved leader, Marshal Stalin." The letter contains the promise:

... to work still more smoothly and enthusiastically in order to help the Red Army drive the Fascist beast into its grave as quickly as possible.

The Urals people swear by their lives and their honour to keep their word and give in 1943 twice as much armaments and ammunition of the best quality as in the previous year.

End of Co-Education

The new school year in Russia starts with a sensational reform. The co-education of boys and girls in secondary schools has been prohibited; and in the new year separate schools for pupils of the different sexes must be provided right from the beginning. The reform is to be enforced with the utmost determination.

The Regional and Territorial Party Executive Committees and the People's Commissariats of the USSR and of the Autonomous Republic must guarantee the carrying out of this important Government decision (*Pravda*).

The sudden liquidation of the co-educational secondary school will put a heavy strain on the Soviet school system, which has already been to a very large extent disorganised and weakened by the war. No reasons have been given officially to explain this step, which marks a significant departure from Soviet pedagogical principles. Co-education was until recently regarded as one of the progressive features in which Soviet schools took a particular pride. The reform is, no doubt, in keeping with the reforms carried out a few years before the war, which brought the Russian school back to its more or less traditional path. The so-called self-government of school children was then abolished; the authority of the teacher was re-established; uniforms for school children, as well as formal examinations, were reintroduced; and, last but not least, fees were introduced for secondary schools attendance. In the same way the abolition of mixed schools undoubtedly aims at the re-establishment of a more rigid discipline along orthodox lines—and may be associated with a determination, by a greater concentration on housewifery and mothercraft subjects in the education of girls, to restore the ravaged home life of Russia.

Even so, the question still remains why this latest reform is being carried out just now, and why there has been so marked an insistence on its urgency. It may be hazarded that it has been made necessary by some deterioration in standards of behaviour, owing to mass evacuations, homelessness, lack of parental care, inadequate supervision and so on. The growth of juvenile delinquency is a common phenomenon in every belligerent country; and it is only natural that in Russia, where so much more of normal family life has been uprooted and destroyed than elsewhere, juvenile delinquency should have assumed a correspondingly larger scale. The urgency with which the liquidation of mixed schools is now being enforced suggests that the position may have even become somewhat alarming.

THE BUSINESS WORLD

Motor Cars After the War

THE motor industry, quite rightly, is beginning to lay its plans for the future, for the change-over from the production of aircraft, military vehicles and other war equipment to the manufacture of automobiles for civilians. It will have an important part to play after the war, not only in providing employment and in satisfying the demand for motor cars, but also in earning foreign exchange. For these reasons it will be of great advantage if the industry makes all the preparations necessary for a quick change-over from war to peace production; it will be of equally great advantage if the industry can devise a policy which would lead to a substantial expansion in its size above the pre-war level and enable it to secure a much bigger share than hitherto in the world market for automobiles.

The potential home demand for motor cars will be very large after the war. Great Britain's stock of private cars, numbering some two millions before the war, will be seriously depleted. Production was suspended in 1940 and, in spite of the petrol restrictions, a substantial proportion of the pre-war stock will be worn out and unfit for further use. While it is difficult, at this stage, to forecast the number of serviceable cars available after the war, it may not be much more than half the pre-war figure. Even in the best of the industry's pre-war years, in 1937, its output of private cars and taxis fell short of 400,000 units. At this annual rate, the industry would require 2½ years to bring the stock of cars back to the pre-war level and no less than 5 years to replace the whole of the pre-war stock, without making any allowance for exports.

Overseas demand is likely to be no less buoyant after the war, for all the large producing countries in North America and on the Continent of Europe have ceased to manufacture private motor cars. The world's total stock of cars and taxis numbered 35 million units at the end of 1938, of which 25 millions (27½ millions in 1940) were in the United States. Europe's stock of about 4½ millions will be even more depleted than Great Britain's, but America's fleet of serviceable vehicles may have been reduced to a lesser extent. The United States and Canada are the only two major countries, besides Great Britain, which are likely to resume production fairly quickly, and even the United States, whose output reached 3½ millions in 1941, will not be in a position, at that rate, to meet the enormous replacement demand at home and abroad in much less than 3 to 4 years. True, the United States and Canada can, and probably will, step up their output well above their record levels. Nevertheless, manufacturers in this country are not likely to be short of export orders for some years. In 1937, the best pre-war year, Great Britain exported 78,000 private cars and chassis, valued at £8,325,000, an average of £107 per vehicle. This was merely a fraction of America's exports of 273,000 cars, valued at \$141 millions, in that year and, besides, most of the cars sent abroad from this country went to the Empire. In the sellers' market during the immediate post-war years British manufacturers should find no difficulty in improving on this figure and in entering fresh markets. They should aim at selling abroad at an annual rate of at least 200,000 cars.

If British manufacturers are to replace the domestic stock of cars in five years and also to export at a rate of 200,000 vehicles a year, they would have to increase the rate of production to 600,000 vehicles a year, an increase of more than 50 per cent over the best performance in the past. There should be no serious difficulty or delay in raising output to this level, though it can only be done by producing pre-war models, that is, by the utilisation of available tools and jigs, at any rate for the first post-war season. The United States is likely to adopt a similar policy, though it must be remembered that its models are two years later than the British industry's. If for this reason alone, it is vital that the British industry should be preparing to bring out wholly new models, and as soon as possible, incorporating all the improvements of the last few years, both

in materials and in engineering technique. During the period of transition it may be necessary, for the sake of foreign exchange, to give priority to the export market and to control prices to avoid an immediate rise.

The heavy replacement demand at home and abroad after the war, and the prospect of a further expansion in the number of car owners, will give the motor industry its long-awaited chance to put British cars on the map. An assured market for something like 600,000 cars a year, if only for a few years, should enable it to organise the industry on American lines and to secure the economies of mass production which are essential if costs are to be reduced to a competitive level in the world's markets. The large British private car manufacturing groups—including the Austin, Ford and Morris groups—are in a position to carry out the necessary technical reorganisation and, individually, to achieve a rate of output which would yield substantial economies. If necessary, a further measure of financial concentration could be undertaken to add still further to their potential sales. True, even an output of 600,000 cars a year is still less than a sixth of the American figure for 1941. But there is a point in every industry—and this may be within the 600,000 a year limit—where the economies achieved by still further expansion are negligible.

It may also become expedient for the firms engaged in mass production to reconsider their past policy of producing each season a large variety of models in the hope that at least one of them will prove a winner. The manufacturers know their market and they are conscious of the economies that could be reaped by a reduction in the number of models. If they have not done so in the past it is because the public demand for variety is too strong, and it may be that this will continue after the war. There might, however, be scope for some agreed reduction of types. There would still be room, of course, for small-scale manufacturers catering for the more expensive tastes. These first-class engineering firms—to mention only Rolls-Royce—have been a valuable asset to this country.

But if the mass-produced British car is to be put on the map it will be desirable also to reconsider taxation policy. The horse-power tax, as much as the tariff, has provided British manufacturers with a secure home market, for the simple reason that the United States, with its big cars, did not find it worth while to cater specially for the British demand, nearly two-thirds of which was for cars of 10 h.p. or less. But, for the same reason, British manufacturers found it impossible to sell their cars in foreign countries. It may be that an increase in the scale of the British industry, together with the increases in costs of production in the United States that seem inevitable, will enable Great Britain to compete without protection. But even if this is not so, and protection for the home market continues to be necessary (it can be fully justified on defence grounds) there would be advantages in relying on straight tariff protection, or on some other method which did not handicap the British industry in the world market or condemn the British motorist to a less satisfactory car than he would desire. But protection is not the sole, nor even perhaps the main, purpose of the horse-power tax, and if it were abolished some other means of raising the revenue would have to be found. The familiar alternative is the petrol duty—but a very high price of petrol might discourage the big car almost as effectively as the horse-power tax. A third possibility is a tax graded according to the original cost of cars, so that a big cheap car (the type that the industry should be encouraged to develop) would be taxed more lightly than a small *de luxe* car.

The industry thus has no shortage of problems to be faced in its reconstruction plans, and some of them can only be solved after decisions have been taken by the Government. Time is getting short; if there is to be a permanent expansion in the industry the decisions should not be too long delayed. The chance may not recur.

British Insurance Looks Ahead

LIKE other major industries, British insurance is keenly absorbed in discussions of post-war problems. Apart, perhaps, from the industrial life offices, it would be wrong to say that the industry is anxious about its future. On the contrary, it faces the prospect with confidence; it has shown a high degree of adaptability to war requirements, and is in a strong financial position; the large numbers of its pre-war staff—over 60 per cent—at present serving with the Forces have been generously treated, and their places held open for their return to civil life; schemes of education have been kept going, chiefly for the benefit of those who are prisoners of war. But there is realisation of the need, in certain directions, for a new outlook and new policies. This realisation arises partly from the upheaval created by the war, which has brought simplifications of procedure and a degree of market co-operation hitherto thought impossible, and partly, no doubt, by the challenge implicit in the Beveridge Report—but in large measure it is a culmination of trends of thought originating long before the present war. It shows itself in articles and discussions in the insurance Press; in the very interesting presidential address of Mr W. H. Walker to the Insurance Institute of London in March this year; and in the appointment by the British Insurance Association—a body representative of all branches of the industry—of a committee to study post-war problems. To stimulate this self-analysis there has also been a measure of criticism from without, its latest manifestation coming from a rather unexpected quarter in the form of a pamphlet by Sir George Mitcheson, JP, MP, the chairman of the Political Committee of the Constitutional Club.

The burden of Sir George's complaint is this. He is concerned only with fire, accident and casualty insurance, and uses collated summaries showing a premium income in 1937 of £125 millions, claims of 48 per cent, commission of 18½ per cent, and expenses of 22½ per cent, the balance of 11 per cent being taken as profit. The items for commission, expenses and "profit" amount to £65 millions, and Sir

George argues that these could all be covered by a maximum of £30 millions, thereby saving the insuring public £35 millions annually. This very large economy is to be achieved by the creation of a monopoly, subscribed to by the companies in proportion to their existing business—the position of Lloyd's Underwriters is not discussed—to have only one new business section and one claims branch in each area; this, Sir George considers, will reduce expenses to 10 per cent, a saving of 12 per cent, but he does not show how he arrives at his calculation. Brokers are to be encouraged at the expense of agents, but commissions generally are to be reduced at an average saving of 10 per cent, and profit is to be fixed at 5 per cent, a reduction of 6 per cent.

There is, of course, much in Sir George's pamphlet that is hopelessly ill-informed. For example, although his scheme is not to apply to "foreign business of any kind," he is apparently unaware that of the premium figure of £125 millions considerably more than half was derived from overseas sources. Overseas insurance constitutes a valuable export business, which benefits the British community by conferring upon it the ability to import goods of a value equivalent to the profits, and through the revenue derived from taxation on those profits; overseas business, incidentally, is in general more profitable than insurance in Great Britain. This error alone throws out the whole of Sir George's calculations, and is perhaps sufficient reason for dismissing the proposed monopoly. The commission item quoted by him is a hybrid figure, comprising various elements of original and reinsurance commission, both at home and abroad, and the average commission paid to agents on home business is certainly very much lower than 18½ per cent. The figures make no allowance for adjustment of reserves, and the apparent profits are subject to numerous charges which appear in the profit and loss accounts of the companies. As the figures published in *The Economist* Insurance Supplements of pre-war days show, the actual profit on fire, accident and marine business seldom, if ever, reached

5 per cent, and the majority of companies would undoubtedly be very pleased if they could be assured a steady favourable balance of this ratio on their home business.

Nevertheless, there is a certain substratum of truth in Sir George's criticism of the present agency and branch system. There is a strong case for raising the status of the intermediary, aiming ultimately at the elimination of part-time and "own-case" agents. It would not, however, be practicable to require all business to be negotiated by brokers. One reason for this is that the brokers have closer connections with Lloyd's Underwriters than with the companies; this does not mean that they do not place a great deal of business—especially shares of large fire and marine policies—with the companies, but it does mean that they tend to consider it their primary duty to act as feeders to Lloyd's. Secondly, the essential attribute of the broker is his skill in placing business, in finding the best market, and the creation of business through sales' effort is not his real *métier*. If, as Sir George seems to think, this country had reached the stage where the whole community realised without pressure the need for adequate insurance of all kinds, then the broker, as sole intermediary, might be a reasonable solution. As things are, the general state of under-insurance must now, and for a long time to come, necessitate active propagation through salesmanship—in other words, the inclusion in insurance charges of an element of sales cost is still justified. A great advance could be made if, besides the brokers, only full-time agents or direct representatives of the companies, with recognised professional qualifications, were permitted to function. Such a radical change would, of course, require legislation, but the ground for this might well be prepared by the companies.

In the matter of branch offices, it is not so much a question of there being too many as, from the point of view of public service, of their being in the wrong places. The centre of a city with a population of half a million may contain fifty branch offices, and a town with fifty thousand inhabitants nearly as many sub-offices; but the small town or suburban area—with its branch offices of the banks, its gas and electricity showrooms—will contain no insurance office at all, apart, perhaps, from the branch of an industrial company. This problem is, no doubt, one which cannot be fully solved without a measure of inter-company concentration. Nevertheless, it is a remarkable fact that some concerns which have been under common management for as long as twenty years have still not rationalised their branch systems. Insurance, as a whole, still tends to think of its relations with the community too much in terms of connections, and not enough as a public service.

Would changes on these lines lead to any reduction in costs? Without a detailed investigation, it is impossible to give an answer. In the United States and Canada, where the professional agent functions side by side with the broker, expense ratios are generally higher than here. Higher ratios may, however, be justifiable if they bring a corresponding improvement in service; conversely reductions in expense ratios are not necessarily desirable *per se*. Many years ago the Fire Officers' Committee initiated a policy of granting rate reductions for approved safety devices; this led at the same time to lower premiums and higher expenses, and the rise in ratios of expenses to premiums was considerable. Later moves in the same direction were the

establishment of a station for testing materials and fire-fighting appliances, and, quite recently, the launching of an advertising campaign to prevent fires. By refraining from making these moves the companies might have kept their premium income higher and their expenses lower, but they would have been neglecting their duty to their policyholders—to say nothing of their social function. The fact is that expense ratios are meaningless unless analysed into their constituent elements; to talk, as Sir George Mitcheson does, of the policyholder having to pay "well over £1 for every 10s. worth of insurance value he receives," is sheer nonsense. All the same, there is no doubt scope for economy in certain directions; the wartime practice of issuing collective fire and marine policies is an example of saving introduced without any deterioration—indeed, with an improvement—in service to policyholders.

Positively, therefore, there exists a need for improving the status of the insurance intermediary, coupled with a more logical branch system; furthermore, all economies should be diligently pursued which do not involve a loss of service. Beyond this there is much that the industry could accomplish by closer co-operation among the various sections of the market—it has been found possible to sink sectional differences for the purposes of war, why not for peace? Rating improvement must no doubt be left to the individual company or underwriter, or to the tariff organisation, but the market as a whole could join together for purposes of research, first, into ways and means of reducing losses, and, secondly, into the needs of consumers. By the Beveridge plan the task of satisfying the basic insurance needs of individuals in the community would be entrusted to the State, but there remains for private enterprise an immense field in providing cover over and above the legal minima, and in risks not covered by the plan. Lessons learned from research could be driven home by appropriate schemes of collective advertising. If these things are left exclusively to tariff bodies they are likely to remain undone in those classes of business where the tariff position is not strong. There are, of course, some things which could be accomplished by a group of leading offices acting together—for example, the introduction of standardised accountancy forms and procedure. If the majority of offices had been using revenue accounts designed to show the true underwriting results, Sir George would not have been able to contend that profits are excessive.

Abroad, British insurance will be called upon to play an important rôle in the rebuilding of Europe. There will be a strong demand for provision of insurance and reinsurance facilities from this country, the more so in that the German and Italian offices are not likely to be popular—nor for that matter to have the necessary financial resources—for some time to come. It can hardly be expected that business will be profitable in the immediate post-war period, and it may be, therefore, that reinsurance relationships with Continental offices will tend to be on a more intimate and permanent basis than has characterised them in the past. It is to be hoped that British companies and Lloyd's Underwriters will never again enter into unbridled competition in overseas markets; their activities can and should be complementary rather than competitive. Perhaps the visit to French North Africa, just announced, of a British Insurance Mission comprising two general managers and a member of Lloyd's may be taken as a happy augury for the future.

Business Notes

Markets and Quebec

Though stock markets have continued outwardly placid, with only a moderate volume of dealings, their undertone has remained firm. Neither the Kremlin's decision to recall M. Litvinov from Washington nor the Australian electorate's vote for a Labour Government has caused even a ripple on the surface, though the implications, outwardly, could hardly have been welcome to investors as such. Conversely, the fall of Kharkov, despite its unquestioned significance, brought in no new buying orders. The explanation of the markets' continuing but rather unenterprising fortitude lies mainly in the persistent refusal of holders to part with their stock in present conditions. Since Mr Churchill went to Quebec, in fact, there has been an air of subdued expectancy on the Stock Exchange, which may mean a great deal in terms of the future, but has put an effective brake on any immediate increase in activity.

The market view is that the Conference heralds an immediate and considerable increase in the scope of the military effort of the United Nations. For investors, that would involve a change of emphasis and perspective, because the design undoubtedly will be mainly to shorten the duration of the war, perhaps by many months. Up to now, the suggestion that the stock markets have "discounted the end of the war" has been only partially true. A victorious end sooner or later has been taken for granted—but there would have been no investment at all without it—but there has been no effort to put a time-limit on hostilities. If events in the near future made the war seem likely to end not "sooner or later," but within a relatively measurable period, investors (like the Government) would have to do a great deal of hard thinking. Hitherto, they have bought shares in industries, at home and abroad, whose recovery after the war was more or less a foregone conclusion, and

given a wider berth to those to which the opposite applied. But if the date at which hostilities in Europe will end could be seen more clearly, they would have to consider many more difficult questions, like the incidence of Government controls in the post-war transition period; the prospects of individual industries of obtaining labour, materials and finance for the change-over; the possible extent of taxation reliefs; the timing of the release of popular purchasing power—and much else on which they have at present very little to work upon. Beyond that, the details of the industrial and investment set-up, in the more permanent regime which will follow the transition period, are virtually unexplored territory. Many current price relationships will doubtless be greatly changed when investors have discovered, in due time, the answers to all these questions. Meanwhile, a more definite lead from the Government, on its post-war policy, would be distinctly helpful, here as elsewhere.

Electricity a National Service

The rounding off of the organisation of the electricity supply industry as a public service is advocated in the well-drafted report of the Electrical Power Engineers' Association, representing the technical staff of the industry. The Electricity (Supply) Act, 1926, was designed to link up the generating resources of Great Britain by means of an "electric grid"; the Electricity Board, which administers the scheme, acts as a purchaser and supplier of electricity in bulk. This arrangement, though it has brought many advantages, remains defective in that generation and distribution cannot be planned to the best advantage. The Association therefore suggests that a single authority—a National Electricity Supply Board—should be responsible for generation, transmission, distribution and utilisation. Generation and bulk transmission would be controlled nationally, but the detailed administration of distribution and utilisation would be on a regional basis. Great Britain would therefore be divided into distribution areas, to be determined in the first instance by the Electricity Commissioners, but subject to modification by the Board in the light of experience. Each region would be under the control of a regional distribution engineer and manager appointed by the National Electricity Supply Board, and they would be subdivided into districts in accordance with technical and administrative considerations. Further a regional consultative committee would be set up in each region; its main function would be to collaborate with the regional manager in dealing with the requirements, interests and problems of the consumers in the region. Organised on this basis as a national public service, electricity could be supplied more cheaply and more efficiently. The members of the Board would not be elected representatives of the industry, but would be appointed by the Government, in consultation with the Electricity Commissioners. Some of them would be appointed for their technical qualifications, and others as "representatives of broad interests vitally concerned in the electricity supply industry."

In transferring the statutory undertakings to the Board, the guiding principle should be, in the view of the Association, that undertakers should make neither profit nor loss, and that, unless otherwise agreed, purchase should be on the basis of payment of "the fair value, that is capital cost less depreciation, of the physical assets." In the case of local authority undertakings, the Board would take over the liability for payment of the outstanding debts; in the case of company undertakings, the Board would take over outstanding debts and their fair value would be paid with the Board's stock. The idea of turning the supply of electricity into a national service now probably commands a good deal of support; the scheme prepared by the technicians of the industry is attractive in its general outline; its details, and especially those relating to the method of transferring statutory undertakings to the Board, require further discussion and elaboration.

An American Business Emissary

Mr Eric A. Johnston, President of the Chamber of Commerce of the United States, has paid a visit to this country with the object of harmonising the points of view

of British and American business about post-war aims. He has informed British business men and workers of the faith of American business in an expanding world economy and private enterprise, and of its willingness to collaborate with Great Britain and other nations in reviving world trade and improving standards of living. The impression he has gained by discussing post-war problems with British business men is that they are concerned with three main issues: the adjustment of tariffs, especially by the United States; the stabilisation of currencies; the creation of conditions in world trade that will enable them to make a profit. Mr Johnston pointed out that business men in the United States were fully alive to the fact that Great Britain will have to seek a substantial expansion in exports to make good the fall in its income from overseas investments and would consider the adjustment of tariffs. He pointed out that, in his view, America, with a national income well above the pre-war level, would provide an expanding market for high-class consumers' goods which should enable this and other countries to increase their exports. Mr Johnston's fact-finding enquiry has brought home to him the strong views held by British business men on the subject of American tariff policy whose downward adjustment will be one of the most potent factors in the revival of world trade.

Exports and Imports

An interesting point of view on the rôle of exports in America's trade was given by Mr Warren Lee Pierson, President of the Export-Import Bank—created and owned by the Government of the United States—in an address reported in a recent issue of *Foreign Commerce Weekly*. His line of reasoning is reflected in these sentences:

The industrial machine of the United States has grown too big to be healthy in its own backyard . . . to utilise its capacity at a profit or to give full employment to our people if it is limited to producing for the domestic market. We believe, therefore, that American industry must . . . take advantage of the demand for its products overseas. This demand can be made effective only if the purchasing power of our foreign customers is substantially increased—in part by an enlightened policy toward the reduction of trade barriers everywhere, but principally by aiding those customers to release and acquire the great reservoirs of wealth which they already possess.

Mr. Pierson thus seems to regard exports as a kind of safety valve for the huge productive capacity of the United States. "American capital and technical assistance" will provide an immediate outlet, and, he hopes, by enlarging the purchasing power of other countries, also a permanent outlet. This is the policy which has been pursued actively by Great Britain in the nineteenth century, though not for the same reason. While Great Britain kept the door wide open to imports until 1932, when a moderate tariff was introduced, Mr Pierson expressed the warning that "our industries would be foolish to sacrifice their great domestic market to gain one abroad." The logic of his reasoning would seem to point to the accumulation of foreign surpluses by the United States on a huge scale. Unless he envisages an active policy of foreign lending the safety-valve will jam. On this point his address was obscure; it is difficult, for example, to square his statement that Brazil could "maintain a huge excess of imports on a debt-free basis." If he meant that American expenditure on productive equipment in Brazil is likely to yield a return, there still remains the problem of paying interest and, ultimately, of repayment of capital, which can only be done by goods and services. Mr Pierson's conception of the *raison d'être* for American exports stands in striking contrast to the present attitude towards exports in this country, where they have come to be regarded as vital, not to employ surplus industrial capacity, but as a means of providing the foreign exchange for vital imports of food and raw materials.

Export-Import Bank

Mr Pierson gave an interesting account, both of the methods of the Export-Import Bank and of the achievements it already has to its credit. The bank was founded in 1934 to finance the development of the resources of the Western Hemisphere and to facilitate trade between the United States and other countries. It was set up to supplement, rather than to compete with, private financial institutions. The scale of its operation is shown by the fact that advances exceeding \$1,000 million have been authorised, of

which \$640 million are outstanding. As a condition for the granting of credits

all machinery and materials not available in the country of the borrowers shall be purchased or loaned in the United States and such machinery and materials shall be transported in American ships.

This, then, is an example—not entirely unknown, of course, in British transactions with other countries—of the practical application of Mr Pierson's views about American export policy. The list of development schemes financed by the Export-Import Bank is impressive. For example, it is now assisting Brazil in constructing a large modern steel mill at Volta Redonda and in opening the rich Itabira iron mines, in electrifying and modernising part of its railway system, in improving highways and the facilities of the port of Rio de Janeiro. In Mexico the bank is also aiding in the construction of a steel mill and in the improvement of highways; in Uruguay it is financing the completion of the great Rio Negro hydro-electric project, and so on. In fact, the bank, while undoubtedly and deliberately assisting American exports of capital goods, is at the same time rendering a service to the countries concerned by assisting them in the development of their resources.

Gold Quotas Under White Scheme

One of the principal, and it may be said more surprising, modifications of the original White Plan in the recently published revised draft is the proposed raising of gold contributions to 50 per cent of quotas. This means a total contribution ranging from \$2,500 million to as much as \$4,000 million if sufficient countries join the scheme. From its peak level of \$22,800 million in October, 1941, the US monetary gold stock has declined by some \$500 million, and during this period the rest of the world has on balance absorbed the current world output of perhaps \$2,500 million. At the end of 1942—the latest date for which fairly comprehensive figures are available—the principal recorded gold holdings of countries other than the United States were as shown in the following table:—

GOLD HOLDINGS END 1942

	\$ (in millions)		
France	2,000	Other Latin-American States*	290
Switzerland	824	Sweden	335
Belgium	735	British India	274
South Africa	572	Roumania	241
Netherlands	506	Total of above	6,131
Argentina	354	Other countries	1718

* Brazil, \$115 million; Chile, \$36 million; Colombia, \$24 million; Peru, \$25 million; Uruguay, \$89 million † Including B.I.S. \$24 million.

During the current year there has been a continuing, if slight, increase in the holdings of neutral countries; for example, the combined holdings of Switzerland, Sweden and Turkey rose from the equivalent of \$1,273 million in December, 1942, to \$1,348 million in April. It should be mentioned that many Canadian gold holdings do not figure in the above table, having been transferred to the Foreign Exchange Control Board. Since the non-American holdings considerably exceed the maximum contribution that would be called for under the revised scheme, it might seem at first sight that this could be provided without difficulty. The point is, of course, that these outside holdings are not distributed proportionately to the probable allotment of quotas under the scheme. This country in particular, which might be required to deposit \$500 million or more, had by September, 1941, already disposed of all but some 4,000,000 ounces of its pre-war holding of close on 80 million ounces. Since that date, presumably, the reserve has been depleted still further. It is hardly to be supposed that this country will be willing in the difficult post-war transition phase, when its exports will have to bear the strain of meeting the gap in the current balance of payments and possibly of effecting some repayment of overseas sterling holdings, to export goods to the value of, say, £125 million simply to acquire a gold reserve. To burden the capital position still further with the service of an unnecessary gold loan would surely be almost equally undesirable.

Neutrals and "Tainted" Securities

By the terms of a Bank of England notice issued this week, no interest, dividends or capital repayments may be received by, or credited to, persons resident in Sweden or

Switzerland until collecting banks here have received solemn and detailed declarations from selected banking institutions in those two countries to the effect that the securities concerned are free from any enemy taint. These new declarations differ from those hitherto required in two important respects. First, a neutral banking institution of standing assumes the responsibility of confirming the title to the securities "either as a matter of personal knowledge or from full proof obtained and verified"; secondly, a history of the location of the securities since September, 1939, must now be supplied. This step is an earnest of the declared intentions of the United Nations to compel the Axis Powers (first and foremost Germany) to disgorge their loot, or at worst to prevent them from enjoying any benefit therefrom. It is presumably one of the first fruits of the study undertaken by the committee of Allied experts to deal with the problem of property stolen by the Germans in occupied countries. Not the least welcome feature of this new measure is the co-operation of two of the leading neutrals in this difficult task. If all of the neutrals can be enlisted, then the problem will be well on the way to solution. This week's other change in the administration of the regulations—the merging in Central American accounts of the "old" current accounts of residents of the countries concerned—is of minor importance, but is welcome as a further step in reducing the multiplicity of non-resident accounts.

What is a Franc?

What is the present sterling equivalent of the French franc for British holders of securities, expressed in the currency, who are being repaid? This question is raised by the notification by the Government of the Turkish Republic that Bonds of the three series of the Turkish Public Debt 7½ per cent, 1933, remaining in circulation will be repaid "by anticipation" at par, on November 25th next. The Bonds were created 10 years ago on surrender of the old Ottoman Bonds, and represented Turkey's share in the debt of the former Ottoman Empire. Redemption was originally designed to take place by 1983 by a cumulative sinking fund, but the Bonds were made redeemable on three months' notice after June, 1943. Early opportunity is being taken of this clause to repay a debt which carries, from the Turkish Government's viewpoint, a relatively heavy rate of interest, at a time when general conditions are eminently favourable to the repatriation of British-owned Bonds. An interesting question arises, however, owing to the fact that the loan is expressed in francs. The Bonds, of frs. 500 denomination, stand at about 45s. on the Stock Exchange, and it is assumed that British bondholders will be paid in sterling. There is, however, more than one possible conversion rate, including the so-called "de Gaulle" rate of 176 to the £ (the pre-war rate), the "Giraud" rate of 200, and what the market, a little irreverently, calls the "Kingsley Wood" rate—a hypothetical figure which might be assumed to allow for events since 1940 on the basis of the arguments which influenced the Treasury in Italy's case. History can have recorded few examples of repayment in terms of a currency of former international standing, at a time of the complete submergence both of its normal market and its issuing authority. A further complication arises from the provision limiting repayment in England to Bonds whose last coupons were encashed there or whose purchase can be proved by documents to have been made in this country before the publication of the present notice. It is estimated that about 10 per cent of a total issue of frs. 715,352,000 is held in this country. Though most bondholders have not received interest recently, there has been a market in coupons, and it is understood that some purchasers have been able to cash them in Switzerland. It would seem, therefore, that British holders who have disposed of their coupons in this way will qualify for repayment in England only if they purchased their bonds before notice of repayment was given. Clearly, the present international situation, which helps the borrower to repay, may on occasion create unexpected difficulties for those who are being repaid.

South American Bonds

There has been a good deal of discussion on the Stock Exchange of the treatment meted out, recently, to British bondholders by certain Central and South American countries. Severe criticism has been prompted by Mexico's action in tabling terms for debt conversion which London

deemed unfair and unacceptable and subsequently declaring them binding on their acceptance by 20 per cent (or less) of holders, at a time when the British Treasury was waiting, apparently, for a more formal offer before defining its attitude to the complaints of bondholders. The question of the renewal, or amendment, of the existing Brazilian debt scheme, again, must arise before next October. In this case, with little more than a month to go, British holders lack authentic details of the terms the debtor means to propose—or even whether there will be an opportunity to discuss them at all. It is known that the Brazilian authorities have been in communication with interested quarters in the City of London. No official intimation has been given, however, of the sort of terms which are being canvassed, though unofficial but fairly circumstantial reports current recently have suggested only a moderate improvement on existing arrangements—which market opinion would regard as doing injustice both to bondholders' claims and the debtor's improved international balance of payments.

Another potential bone of contention is the suggested desire of the Brazilian authorities that any scheme devised now should be made definitive and permanent, whereas bondholders would wish for one of limited duration which could be revised, in the light of changed circumstances, within a few years after the war. The Council of Foreign Bondholders has interested itself in the matter, and further comment must, necessarily, wait upon more definite information. There is, however, greater unity among investors now than at any time in the last fifteen years, in believing that the British Government might, perhaps, be a little readier than in the past to lend its aid, directly and indirectly, in ensuring that the strong points in their case are duly appreciated in overseas quarters. During the international currency difficulties of the early 1930's, particularly, embarrassed Government debtors in primary producing countries took many decisions which certainly could not be reconciled with any recognised canons of equity or contractual obligation. For example, provision for the application of part of the reduced funds available for debt service to the purchase, in the market, of bonds depreciated by the debtor's own default, became almost common form. Bondholders, in the troubled times of the last decade, frequently had little choice but to agree to, or connive at, such expedients. Their present approach, however, is based on the broad consideration that the terms which a debtor should accept, after due discussion with his creditor, should at all times be a function of his ability to pay, and that what happened in the crisis of the 1930's has little relevance to-day. Behind this, naturally, is the belief that Great Britain, bereft of so many of its best-paying overseas investments, should be prepared to fight as hard as possible to secure the utmost income from those which are left.

New War Bond "Tap"

The Treasury's decision to replace the current issue of 2½ per cent National War Bonds, 1951-53, on September 1st by a new issue dated 1952-54, but to leave the issue terms of 3 per cent Savings Bonds, 1960-70, unchanged, represents an effective compromise between the respective trends of official policy and the market. A cheap money policy in war financing requires an additional turn of the interest screw against borrowers whenever "tap" issue rates are changed. But the gilt-edged market price trend has lately been against the Treasury, particularly in the longer-term issues, the latest figure of the Actuaries Index (end July) for 2½ per cent Consols being 142.5 (December, 1928=100) against 146.9 a year earlier. More recently, however, the market for the shorter dated issues has shown a firmer tendency. The Treasury, therefore, has this time moved the redemption year-bracket of its shorter dated "tap" issue—war bonds—forward by only one year against two on the previous occasion; and has left the longer term issue—savings bonds—untouched. Actually, the effective tightening of the war bond screw is even less than a comparison of redemption years itself suggests, for the maximum currency of the new bonds, ten years and six months, is only three months longer than that of the existing war bonds when they were first issued. The total obtained by the Treasury from both varieties of "tap" bonds has now reached the impressive figure of £3,000 millions. The war bond issue which is being withdrawn has brought in subscriptions to date of approximately £480

millions (compared respectively with £444 millions, £494 millions and £712 millions for the 1945-47, 1946-48, and 1949-51 issues), but the current total will almost certainly be swelled appreciably before the end of August by last-minute subscriptions. In due course the Treasury will have to take a decision about the present issue of savings bonds, which so far has brought in about £600 millions, against £713 millions for the earlier issues, dated 1955-65.

Aircraft Contracts

In its report on the aircraft industry, discussed in *The Economist* of August 21st, the Select Committee on National Expenditure gave an interesting account of the procedure adopted in fixing the price of aircraft. The cost plus system, inevitably, is employed in the initial stages of production, that is, for the prototype and for the first, or educational, batch of a new type. The method used for subsequent orders is the fixed-price system, based on technical estimates. Once the factory is tooled up for large-scale production the technical costs officers and accountants of the Ministry of Aircraft Production are in a position to prepare an estimate of costs; on the basis of these estimates, and the estimates prepared by the contractors, a price is eventually fixed for each order by the process of bargaining. In fixing the rate of profit for each contract, care is taken to provide an incentive to economise labour and materials, and for this reason it is related, if indirectly, to the capital employed by individual firms. The bargaining procedure, based on detailed estimates of costs, causes delay in the fixing of prices. Although the method is that of the fixed-price, prices are often fixed at an advanced stage of production, and the evidence submitted to the Committee suggests that a large proportion of orders is completed before a final price has been agreed. Since individual orders are usually for comparatively small batches, and as the sum in dispute is generally small, the Committee recommended that, in order to save the time of technical and accounting staffs and to increase the incentive to economy, the process of price-fixing should be shortened, even if this may sometimes result in a "bad" price.

Manpower Statistics

Statistics relating to manpower have been collected in the accompanying table. Included in the difference of 10,830,000 between the totals aged 14 to 65 and the numbers employed are about 10 million women engaged on essential household duties. Many of them are looking after evacuees and lodgers, are in the WVS or in other forms of voluntary work. School children and students, the sick and incapable account for the rest. The difference between the totals registered, and therefore called up or compelled to work,

DISTRIBUTION OF GREAT BRITAIN'S MANPOWER (000's)			
	Total	Men	Women
No. of persons between 14 and 65	33,130	15,900	17,230
No. of persons between 14 and 65 in forces or full-time employment	22,300	15,200	7,100
Covered by Essential Work Orders	8,300	...	...
Part-time workers in industry	...	...	650
Occupied in essential household duties	...	...	10,000
Registrations, total	19,283	...	...
Born, 1892-1900	...	1,933	...
" 1900-1925	...	7,750	...
" 1897-1924	...	...	9,600

and the number actually in the Forces and full-time work is striking. It is more than 4,000,000. They consist of men under 18 and over 51, and women under 19 and over 46. Altogether 2,000,000 people not normally gainfully employed are engaged in full-time work. Over 90 per cent of single women between 18 and 40 are fully employed, and of the 7,000,000 women between 14 and 65 who are working 2,500,000 are married.

US Silver for War Industry

According to the latest survey of the Guaranty Trust Company of New York, sales of surplus silver to war

industry will bring the US Treasury a substantial profit. The surplus metal is listed by the Treasury at a cost value of \$591 million, indicating an average purchase price of about 47 cents an ounce. The price fixed for sales of the metal, on the other hand, is that of 71.11 cents an ounce paid to domestic producers since 1939. On the sale of the whole surplus stock there would therefore be a profit of some \$300 million; but as the indications are that this would take about 25 years, the operation will hardly make a very significant contribution towards financing the war. The requirements of war industries are estimated at not more than 9,000,000 ounces monthly. Against this US domestic production exceeds 3,000,000 ounces a month, while 1,000,000 to 1,500,000 ounces are being imported (principally from Mexico and Peru) at the much lower import price of 45 cents an ounce, leaving only 4,000,000 to 5,000,000 ounces a month to be supplied from stock.

Canadian-Sterling Balance

The April-May issue of the *Statistical Summary* of the Bank of Canada contained a summary of the balance of payments between Canada and the sterling area during the war. Slightly re-arranged and further summarised, the figures are as follows (in millions of Canadian dollars):

	Calendar Years				Fiscal Year 1942/43
	1939	1940	1941	1942	
Current Account :—					
Receipts :—					
Exports (inc. munitions)	436	699	1,098	1,558	1,602
Freight and shipping (net)	8	40	83	57	59
Other services and miscellaneous (inc. war activities in Canada not involving exports)	15	44	99	143	147
Total	443	783	1,280	1,758	1,808
Payments :—					
Imports	177	236	279	226	200
Interest and dividends (net)	76	69	64	49	49
Other services and miscellaneous (inc. Canadian war expenditure in sterling area)	27	55	133	233	290
Total	280	360	476	508	539
Capital Account :—					
Receipts :—					
Total (inc. U.K. capital exp. in Canada, other capital receipts and decrease in Canadian sterling balances)	97	116	181	881	885
Payments :—					
Official repatriation of securities	75	137	189	296	73
Private capital payments (inc. repatriation)	105	111	73	51	48
Interest-free loan and contribution to U.K.	...	...	...	1,700	1,700
Purchases of gold and U.S. \$ from U.K.	2	248	...	23	166
Purchase of U.K. munitions plants	...	...	...	...	40
Increase in sterling balances and adjustments	...	82	728	74	106
Total	182	578	990	2,144	2,133
Balance of current account	+ 163	+ 423	+ 804	+ 1,260	+ 1,269
Balance of capital account	- 85	- 462	- 809	- 1,263	- 1,248
Errors and omissions	- 78	+ 39	+ 5	- 17	- 41

The close balancing of the totals of the two accounts should not be misunderstood. It arises from the way the figures are set out, since everything not otherwise accounted for must either be covered by Canadian loans or gifts to the United Kingdom or lead to an increase in the Canadian sterling balance in London. The more significant way of looking at the figures is to say that, over the four calendar years, Canada ran up credits on current account with the sterling area of \$2,650 millions, of which only \$1,370 millions could be met by the repatriation of Canadian debt or by sales of gold or U.S. dollars. These figures document the two basic facts of Canada's international position: first, that very large assistance has been given to the United Nations of the sterling area, most of all to the United Kingdom; and, secondly, that Canada depends entirely upon facilities for the conversion of sterling into US dollars for the balancing of her accounts. These facilities have not existed during the war, with embarrassing results for Canada. If they are not available after the war, the embarrassment will continue.

COMPANY MEETINGS

STANDARD BANK OF SOUTH AFRICA, LIMITED

RECORD BALANCE-SHEET FIGURES

DIVIDEND OF 14 PER CENT.

LORD BALFOUR OF BURLEIGH'S STATEMENT

The one hundred and thirtieth ordinary meeting of the Standard Bank of South Africa, Limited, was held, on the 25th instant, at the head office of the bank, 10 Clements Lane, London, E.C., the Rt. Hon. Lord Balfour of Burleigh, the chairman, presiding.

The secretary (Mr H. Dales) read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement circulated with the report and accounts for the year ending March 31, 1943:—

Last month we were all grieved to learn of the death at Pretoria of Sir Patrick Duncan, who had served with such marked distinction in many spheres and particularly as Governor-General of the Union since 1937. By reason of his high character and outstanding gifts he had wielded a wise and far-reaching influence.

On the day following the last meeting of shareholders came the sad news of the death of Sir Roderick Roy Wilson, whose able services as a member of the board had covered a period of over twelve years. In him the directors lost a valued colleague and friend.

SIR DOUGAL MALCOLM'S APPOINTMENT

In September last Sir Dougal Orme Malcolm, K.C.M.G., was appointed to a seat at the board. As you will know, besides holding the Presidency of the British South Africa Company he is connected with many African interests. We are fortunate in having the benefit of his wide knowledge of affairs in Africa and this country, and I am sure that at the general meeting the shareholders will be pleased to confirm the appointment.

The balance-sheet at March 31 last shows the record total of £153 millions. Compared with the figures for the previous year there is a further increase of about £31 millions in deposit, current and other accounts, which stand at £136 millions, this being again principally due to the large funds available as the result of expenditure by the Union Government for war purposes. Cash in hand and at call and short notice is higher by nearly £22 millions, and investments have increased by approximately £12 millions, placed in Government stocks. There was a decline of about £3 millions in bills of exchange purchased and of some £2 millions in customers' bills, etc., for collection, which was to be expected in view of the restriction of shipping to goods of an essential nature. The figures of bills discounted, advances to customers and other accounts show little change.

SATISFACTORY POSITION

You will see that the profit and loss account reflects a satisfactory position. The balance of profit for the year, after making an appropriation to contingencies account, was £568,326, being an increase of £7,586 over the figure for the previous twelve months. With the amount of £155,509 brought forward, the sum for disposal was £723,835. The interim dividend paid in January last absorbed £125,000, and after appropriating £50,000 for bank premises there is a balance of £548,835.

It is recommended that £150,000 be allocated to the officers' pension fund, that a final dividend of 7s. per share be paid, together with a bonus of 2s. per share, making a total of 14 per cent. for the year, and that £173,835 be carried forward.

When it was decided in 1914 to discontinue the holding of two meetings in each year the shareholders were informed that an interim statement of accounts would be published in addition to the annual balance-sheet. That practice has since been followed, but, having regard to the restrictions on the use of paper, copies of the statement of accounts as at September 30, 1942, were only sent to shareholders on application being made for them. Very few such applications were received, and apart from the economy in paper and saving in time and labour I feel sure the shareholders will agree that the preparation of an interim statement of accounts is now hardly warranted. It is therefore proposed to discontinue the issue of the statement.

CONDITIONS IN SOUTH AFRICA

With regard to conditions generally in South Africa, the process of continuous adaptation of Union economy to the fresh demands of the country's war effort has proceeded satisfactorily, and the enforced absence of various external supplies has encouraged the development of local resources with marked success. The direct and indirect contributions of the gold-mining industry have again proved indispensable to the maintenance of general economic activity.

In Southern Rhodesia special efforts continue to be made to develop base mineral deposits to meet war demands, and the production of copper in Northern Rhodesia has proved a valuable asset to the United Nations. In Nyasaland general business was good during the year owing to the better returns received by the farming community. Though many obstacles have had to be overcome and a prolonged drought was experienced, the East African territories have continued to play a great part in the war effort as producers of essential materials.

APPRECIATION OF STAFF'S SERVICES

I conclude by expressing our warm appreciation of the services rendered by the staff in Africa, London, and New York. Notwithstanding the difficult and trying conditions they have maintained their usual high standard of efficiency, and under the wise guidance of Mr Milton Clough and his colleagues in the administration in South Africa, and of Mr Ralph Gibsorn in London, the interests of the bank have been well cared for.

Since the outbreak of the war over 1,400 members of the staff have joined the Services in various spheres, a large number of them as members of the South African Forces which have acquitted themselves so splendidly in North Africa and elsewhere. We deeply regret to record the loss of 62 members of the staff who have given their lives in the cause for which we are fighting.

The chairman moved, "That the report and balance-sheet to March 31, 1943, now presented, be adopted."

Mr R. E. Dickinson seconded the resolution and it was carried unanimously.

THE DIVIDEND

The chairman: I have now to make the following declaration:—

"As empowered by the Articles of Association, on behalf of the board, I now declare a dividend for the six months ended March 31, 1943, of 7s. per share on 500,000 shares, as a final dividend for the twelve

months ended on that date, with a bonus of 2s. per share (making, with the interim dividend, a total distribution of 14 per cent. for the year), both payable in British currency and subject to income tax, to be paid to those shareholders whose names appeared on the register on August 4th, and to become payable on the 28th instant."

On the motion of the chairman, seconded by Mr E. Clifton-Brown, the retiring directors, Mr R. E. Dickinson and Brig.-General Sir Samuel H. Wilson, G.C.M.G., K.C.B., K.B.E., were re-elected.

The chairman next proposed the confirmation of the appointment to the board of Sir Dougal O. Malcolm, K.C.M.G., which was seconded by Mr Stanley Christopherson, and unanimously approved.

On the proposition of Mr Joseph Nissim, seconded by Mr. R. E. N. J. Seyd, the auditors, Mr Roderick M. Peat, F.C.A., Sir Nicholas E. Waterhouse, K.B.E., F.C.A., and Mr Leonard J. Osmond, F.C.A., were reappointed.

VOTE OF THANKS

Sir Frederick Eley, Bt., said that he was sure shareholders would like to place on record their appreciation of the services of the directors during another difficult year. The financial stability—he might almost say the fool-proof financial structure—of the Standard Bank was so well known that many people might think that it went on automatically, but he had had some experience of the bank and knew that an ever-vigilant eye had to be on the watch. He moved, "That the cordial thanks of the meeting be accorded to the directors for their attendance to the affairs of the bank and to the chairman for his conduct in the chair."

Sir Ernest Clarke seconded the vote and it was unanimously accorded, a brief acknowledgment by the chairman concluding the proceedings.

THE RHODESIA RAILWAYS, LIMITED

INCREASED NET EARNINGS

The forty-sixth ordinary general meeting of the Rhodesia Railways, Limited, was held, on the 24th instant, at 11 Old Jewry, London, E.C. Mr Arthur E. Hadley, C.B.E. (the chairman), presided.

The following is the chairman's statement which was circulated with the report and accounts:—

The recent Government regulations reducing the amount of paper which may be used in printing the annual reports and balance-sheets of English companies are responsible for considerably less detail being given in the accounts now presented.

There was an increase in gross revenue of £272,315, as compared with the previous year, and working expenditure, after the special provision of £100,000 for the re-boiling of engines, was £241,552 higher, leaving net earnings with an increase of £30,763 at £2,556,660. The year was a busy one as well as a satisfactory one on the financial side, and our gratitude is due to the general manager and his staff for their successful handling under difficult conditions of heavy traffic essential to the war effort.

In addition to this operating profit of £2,556,660 there was an income of £270,172 from investments remaining after certain interest charges had been deducted, a profit of £30,998 from realisation of investments and the annual subsidy of £10,000 payable by the British South Africa Company until 1949.

There is also transferred to the credit of the net revenue account £176,327 (out of the amount of £544,511 provided during the year for depreciation and renewals) towards the annual payment for the redemption of 4½ per cent. debenture stock.

There was, therefore, a total amount of £3,044,156 to meet debenture stock interest £892,434, debenture stock redemption £208,268, excess profits tax in the Dominions £234,896 and income-tax in

RECORDS and STATISTICS

INDUSTRY AND TRADE

Coal Output.—The output of saleable coal in the four weeks ended August 7, 1943, averaged 3,097,800 tons a week compared with 3,579,700 tons in the previous four weeks. These figures are, however, not comparable with the previous four weeks owing to the incidence of the August holiday.

* Percentages based on output, adjusted for tonnage lost through holidays and circumstances beyond the industry's control. † Not yet available. ‡ Still under review.

The production from open cast working (outcrops) averaged 116,600 tons per week. The three districts which qualify for output bonus are Leicestershire, Somerset and South Derbyshire.

Green Vegetables Prices.—The Minister of Food has made an Order extending the operation of the Green Vegetables (Maximum Prices) Order, 1942, as amended. The Order will come into force on September 2, 1943, for sales by growers, on September 4th for sales by wholesale, and on September 6th for sales by retail, and will renew the price schedules operative at the end of August except that the maximum prices for sub-standard broccoli and cauliflower will be reduced, and that no prices will be prescribed for kale. The Order will also prescribe maximum prices for brussels sprouts and sprout tops.

Argentine Meat.—The Ministry of Food has arranged with representatives of Argentina for the purchase of the exportable surplus of Argentine meat for the two years ending September 30, 1944. This covers the past season during which shipments have been proceeding in anticipation of the settlement of terms. The purchase has been made on behalf of the United Nations; it includes frozen, canned and dried meats. The supplies will be allocated in accordance with the recommendations of the Combined Food Board; as usual, however, the frozen and dried meat will be shipped mainly to the United Kingdom. Similar proposals have been made to Brazil and Uruguay.

Unemployment in July.—The total number of persons in all categories registered as unemployed at the employment exchanges on July 19th was 73,258. This represents a fall since

April 12th of 6,833. Unemployment among boys and girls rose as a result of school-leaving. Detailed figures for April 12th and July 19th are given below.

FINANCE AND BANKING

THE MONEY MARKET.—Most of the big banks have been making up this week, but on the whole credit conditions have been easier. On Monday and Tuesday, it is true, there was little demand for bills from the banks, and some special assistance through the banks was given to the market, which obtained a

(Continued on page 285)

GOVERNMENT RETURNS

For the week ended Aug. 21st, 1943, total ordinary revenue was £54,669,000, against ordinary expenditure of £111,479,000, and issues to sinking funds of £275,000. Thus, including sinking fund allocations of £3,580,958 the deficit accrued since April 1st is £1,272,104,000 against £1,122,037,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £35,766 to £2,812,541, the other operations for the week (no longer shown separately) raised the gross National Debt by £55,889,048 to £18,124 million.

(Continued from page 284)

38 per cent allotment quota at last week's Treasury Bill tender, compared with 30 per cent at the previous tender. But, by Wednesday, there were bigger demands for September and Bank Return reflects the change. Not only is there a further reduction of £2,050,000, in the note circulation, but Government securities have risen by as much as £14,920,000 to £202,028,000. To the market. Bankers' deposits have risen to the very comfortable level of £166,767,000 an increase of £17,260,000 on the week.

A. H. LEWIS, Manager.

London Office: 8, OLD JEWRY, E.C.2.

Also at AUSTRALIA HOUSE, STRAND, W.C.

An exceptional opportunity presents itself for a man, preferably with a fairly full electrical experience, to take over the control of the selling activities of a well-known company specialising in certain types of electrical heating. This might be of particular interest to a Supply Company's Officer, who at the same time has had practical experience of the control of outside Sales Staff and measurements of markets on up-to-date lines.

Remuneration will be by basic salary with increments based on results achieved.

Please send full particulars of age, education, experience, business career and when available, in strict confidence, to Box 288, THE ECONOMIST, Brettenham House, Lancaster Place, London, W.C.2.

SHILLING

1843—1943

The first issue of *The Economist* was dated September 2, 1843. Had the centenary fallen in peacetime, a large special issue could have been published, in which full commemoration could have been made. In wartime, when paper restrictions make no exceptions for centenaries, this cannot be, and the present modest issue—rather smaller than an average peacetime issue of *The Economist*—has only been made possible by hard-hearted stinting of paper week by week.

It was thought wrong to allow these transient embarrassments to abbreviate the record of the past, and a collection of essays dealing with *The Economist's* first century has accordingly been published as a book, of which an announcement will be found elsewhere.

There remained, however, the problem of what use to make of the few pages that could be scraped together for this issue. After much thought it was decided to include two articles on the past history and the present policy of the paper—the former wholly and the latter partly based on the centenary volume—but not to attempt here any further record of the past. This is, after all, the first issue of the second century, not the last of the first century. The bulk of this special issue is therefore devoted to a collection of articles that look forward rather than back. There is, in these articles, no attempt at completeness, though something is included for nearly all of *The Economist's* many interests. Each article is self-contained and the whole is neither a platform nor a manifesto—and still less a prophecy. Every one of them has been written by the staff of *The Economist*, whose instructions were simply to project their minds forward on some specific subject of their special concern. The purpose is to provide present readers of *The Economist* with food for thought on the problems of the post-war world—and to give the readers of 2043, when they come to celebrate the second century, a cross-section of the paper's present views which they will be able to compare with those of James Wilson, the first editor.

The events of the present week are dealt with in the "Notes of the Week" and "Business Notes" sections, which begin on page 334. "American Survey" and "The World Overseas" do not appear this week.

The Economist has many strengths. But by far the greatest of them is the loyalty and indulgence of its readers. The present Editor, on behalf of his predecessors and his successors no less than of himself, takes this opportunity of rendering thanks to the multitude of *The Economist's* friends.

In the great caravan of human affairs, the journal of opinion, if it be humble and honest, has its place. *The Economist* has stayed with the caravan for longer than is given to most. It hopes to stay a great while longer.

THE ECONOMIST, 1843—1943

The First Hundred Years

The Founding Family

THE first number of *The Economist*, or the Political, Commercial, Agricultural and Free Trade Journal, a weekly publication, appeared on September 2, 1843, one hundred years and two days by the calendar before the date of this, the 5,219th number. The paper's first editor was James Wilson, founder and sole owner; the second editor was Walter Bagehot, Wilson's son-in-law; and *The Economist* "owes its birth, upbringing, graduation and establishment" to the Wilson family. James Wilson, banker, politician, publicist and financial expert, was a distinguished public figure. He was several times Member of Parliament, and was successively Financial Secretary to the Treasury, Paymaster-General and Finance Member of the Council of India; it was he whom the Chancellor of the Exchequer called to his side in 1857 when he conferred with representatives of the Bank of England on the crisis in British finances; and his budgetary reforms, carried through in the closing months of his life, became the basis of the finances of India. *The Economist* has been Wilson's fitting monument.

Walter Bagehot, Wilson's discovery and chosen successor, was a great man, a great thinker, a great critic, and a great journalist. He came to write for Wilson on banking in 1857, married Eliza, Wilson's eldest daughter, in 1858, and in 1859 took charge of *The Economist* (under the nominal supervision of Richard Holt Hutton of the *Spectator*) when Wilson went to the work in India that proved to be his last activity. In 1860, when Wilson died, Bagehot was confirmed as editor; and, until he died in 1877, his editorship of *The Economist* was the pivot of a famous career that spanned the whole of Victorian life and letters. There is no more significant pointer to the nature of the man and his age than the fact that the author of *The English Constitution*, *Physics and Politics*, *Lombard Street* and *Literary Studies*, the adviser of Ministers, the associate of all men of light and leading, and the active vice-chairman of the Stuckey Somersetshire Banking Company, the largest private bank of issue in England, was first and foremost *The Economist's* editor. Lord Bryce called him one of the finest minds of a great and remarkable generation "which included Charles Darwin, Lord Tennyson, Lord Kelvin, Clerk Maxwell, Thomas Huxley, and John Stuart Mill." Mr. Gladstone claimed gratefully that he had enjoyed "the advantage of frequent and free communication with him on all matters of finance and currency." Matthew Arnold praised among all his qualities "his concern for the simple truth," and it was this concern that caused Bagehot to write *Lombard Street*, as Lord Keynes once put it, "to knock two or three fundamental truths into the heads of City magnates"; to write *The English Constitution* to knock two or three other fundamental truths into the heads of politicians; and to furnish *The Economist*, not only with a brilliant series of leaders, year in and year out, on political and economic topics, but also with a unique apparatus of statistical technique and analysis.

Wilson's *Economist* was described by Frédéric Bastiat, two years after its foundation, as "a precious collection of facts, doctrine and experience mutually supporting each other"; and the paper's unique character and reputation were made in the single generation between its foundation and the death of Bagehot. Throughout *The Economist's* history, the greatest progress in its statistics and economics has been made by the editors who have concerned themselves most also with political, social,

international and general topics. The founder and his son-in-law struck this note from the start. They shared a passion for facts; but they shared, too, a passion for individual liberty and the common interest and a broad interest in the whole range of public affairs.

James Wilson not only designed and launched this paper; he gave it a charter, sailing orders and a course to steer that are all still valid; and he left it furnished, through the piety of his family, with a lasting safeguard against misdirection and wreck. For eighty-five years *The Economist* was a family business. At his death the founding father bequeathed it in trust to his six daughters, and handed on its editorship to his son-in-law. To the fact that, for sixty-eight more years, *The Economist* remained the property in trust of the Wilson family, the paper has owed its complete independence of any interest or party. Wilson's daughters lived long and cared much for their *Economist*; Mrs Bagehot, the eldest, died in 1921; the last to go, Mrs Barrington, who wrote biographies of both Wilson and Bagehot, died only ten years ago. There is no more picturesque feature in the history of any newspaper than the gentle proprietorship of these long-lived ladies.

When the reign of "the dear old ladies" (as Francis Hirst called them) and their descendants came to an end with the sale of *The Economist* in 1928, after the original property had been broken by death and descent into a complicated series of subsidiary trusts, the Wilsons did their duty to the last. Arrangements were made with the purchasers to keep the paper's editorial independence intact, for it was realised that "if the control of *The Economist* were to pass either to a newspaper group or to any particular financial interest, a reputation built up on independence of judgment and unfettered criticism would be jeopardised." Half the voting shares in the new company, *The Economist Newspaper, Limited*, went to Financial Newspaper Proprietors, Limited (now *The Financial News, Limited*), and half to a strong group of individual shareholders; and a Board of Independent Trustees was appointed, not only with the right (possessed by other newspaper trusts) to veto transfers of voting shares, but also with the power to veto the appointment or dismissal of editors—a fresh step forward in the maintenance of independent journalism. All those who have read, directed or written for *The Economist* in the course of its first hundred years have owed what they have prized to the Wilson family; and it is a debt that should be deeply underlined in this centenary issue. For a century, *The Economist* has been no man's creature but James Wilson's; the present editor is as free as the founder from financial control or pressure, and he, as much as James Wilson himself, is solely responsible for the policy of his paper.

A Sound Property

It was a sound property that James Wilson handed on to his descendants and successors. By founding *The Economist* to be "a medium of practical usefulness to commerce, manufacturers and agriculture" and "to combine with these the political and general views of the week," to be read mostly by the business men who held the balance and directed the development of Victorian England, but to cover, as well as business matters, every topic at home and abroad in which an intelligent business

man might take an interest, he staked out a claim in world journalism that has never been jumped. *The Economist* was, as its extended title showed only a few months after its foundation, a Political, Literary and General Newspaper, as well as the Weekly Commercial Times, Bankers' Gazette and Railway Monitor. It was, and is, a journal of public affairs with its own special approach, the quantitative approach of the political economist, trained to try every argument or doctrine by reference to facts and figures. Its readership, though always influential, has never been large. The immense influence of Bagehot's *Economist* everywhere English was read was derived from a circulation in the neighbourhood of 3,000; and the world-wide esteem of the paper in the years before this war was built upon the sale of some 10,000 copies a week. The outbreak of war in 1939, and the extension of the conflict in 1940-41, lost to *The Economist* nearly a quarter of its total sale. But this has been recouped during the war by increased circulation in Great Britain and in other countries that are still free, and in August, 1943, the last month of the hundred years, the circulation just exceeded the pre-war record.

Yet there was no year in the century in which *The Economist* did not pay its way. It has never "made money." Its profits have always been small, often well below the ruling rate in other businesses, but they have never failed, for, from the start, *The Economist* met a need which has never been met elsewhere. James Wilson drew a winning ticket in the lottery of journalism by founding a paper whose contents were to be based upon, though not bounded by, a systematic weekly survey of economic data at the very beginning of a century in which the economic aspect of social, political and international relations was to be the dominant theme. He and Bagehot provided industrial Britain with a continuous chronicle of commercial, industrial and financial intelligence illuminated by shrewd, principled and educated comment. *The Economist* was, and is, a sound property because this journalistic formula has proved a good business proposition. The people who counted in Victorian England welcomed eagerly a paper whose function was to record, measure, analyse, expound and interpret facts; to set its long-term assessments of political, economic and social trends against the short-term preoccupations of politicians and business men; to plot and chart trading, manufacturing and investing England, with developing techniques of measurement as trade, industry, transport and finance grew and ramified; and to state, from its own special vantage point, what its editors believed to be the dictates of right conduct and wise action in public affairs.

Not even the best of intentions on the part of James Wilson's descendants and successors could have kept *The Economist* alive and independent for a hundred years if the paper had not paid its way. Nor was it enough for this purpose to give a small though influential circle of readers, at home and abroad, what they wanted. No newspaper, in fact, can live on its circulation alone; and it is another proof of the acumen of *The Economist's* founder that, as early as 1847, he saw straight to the heart of the economics—and politics—of modern journalism. In a leading article, Wilson wrote "Whether a journal can be sold to its readers for a penny or sixpence with profit to its proprietors depends, therefore, on the revenue it can obtain from advertisers. In addition to the financial and other advantages which advertising confers on the Government and the public, it sustains in wealth and independence that press which is the best guardian of the public liberty."

The Formula and the Tradition

"The old delusions of seclusion, exclusion, restriction, interference and protection are waxing old, and are even now ready to vanish away." James Wilson wrote these words in the first issue of his paper. He founded *The Economist* "in order to further free trade principles," and in particular to secure the repeal of the Corn Laws. But, although he had the moral backing of Cobden,

Bright and the Anti-Corn Law League and the financial support of Lord Radnor, Wilson did not permit the paper to be the League's propaganda sheet. To business men at home and intellectuals abroad, *The Economist* spoke from the outset for the shrewd, hard-headed British liberalism which was the most dynamic element in the political thinking of that generation. The Corn Laws were repealed three years after the paper's foundation, but *The Economist* went on. "Wilson's life ended," Bagehot wrote in 1860, "at the moment when the ideas and doctrines he had so fully expounded had acquired the fullest acceptance in England, and were about to be applied in some measure throughout Europe." But, though its initial programme had, apparently, been successful, *The Economist's* usefulness was not ended. The tradition and the formula of Wilson and Bagehot remain undulled to-day.

Probably never has a newspaper been so well begun. Wilson laid the foundations. He stated the doctrine of free trade, low costs, cheap food, free enterprise, prosperity and peace. He attacked the view that "because good trade was accompanied by high prices, the recipe for prosperity must be price-raising on the basis of inconvertible notes"; and opposed both the theory of the Bank Charter Act and the arguments of its critics. He rested his opinions of trade and finance upon the facts which he displayed in full to his readers—the weekly statement of "prices of Government Funds, Foreign Securities and Stocks and of the various descriptions of Joint Stock Companies in Great Britain and Ireland, with the most recent information respecting the same"; the Railway Monitor surveying every week the statistics and problems of railway building and finance; the Weekly Commercial Times reporting the state of the markets; the Board of Trade Returns, in full; the Bankers' Gazette setting out all the relevant figures of money and banking. Here was the basis of Wilson's views on economic trends at home and political trends abroad. He supported political reform in order to remove impediments to trade and enterprise. But, until his collaborator, Nassau Senior, persuaded him that the unrest of oppressed European peoples might be more dangerous to social and economic progress than drastic political changes, he opposed political revolution because of its threat to business stability and international commerce.

Wilson to Bagehot

Wilson had three chief aides: Herbert Spencer, who was assistant editor from 1846 to 1853; Nassau Senior, the economist, who wrote leading articles on foreign affairs and foreign policy for over a decade, organised a remarkable intelligence service on the Continent and was responsible for *The Economist's* attitude to post-1848 Europe, to Austrian and Russian Imperialism, to the Eastern Question and to Napoleon III; and Walter Bagehot. Bagehot, in his turn, was no less well served. Senior continued to write for him until his death in 1864; William Newmarch, economist and statistician, was collaborator in the great advance made in statistical technique during Bagehot's editorship; the statistician, Robert Giffen, was Bagehot's assistant editor and right-hand man from 1868 to 1876; Daniel Connor Lathbury, who was to write for *The Economist* for over thirty years and to be joint editor for six, wrote leading articles.

It is impossible to summarise in this short space Bagehot's contribution to *The Economist's* growth. The scope of the paper's scrutiny now became the whole of the economy. Its technique of recording data became expert, specialised and unrivalled. To Wilson's records and statistics, Bagehot added the "Investor's Monthly Manual," which not only provided full facts and figures about all investment matters, but also interpreted and took stock, month by month, of every trend in the market, against the social, political, economic and international background; the "Annual Commercial History and Review," which reported year after year, in uniform style, the course of business in every trade and industry and every district; the "Joint Stock Banking (later simply

'Banking') Supplement," which surveyed banking as the "Manual" and "History" did investment and trade, though less fully; and, experimentally, a "Budget Supplement" which described the public finances.

The Economist has been a pioneer in the use as well as the presentation of statistics, and under Bagehot the Index of Wholesale Prices began a long story of achievement. *The Economist* was the first newspaper to publish regularly a price index comparing prices at different dates, and the Index still appears fortnightly, though not in its original form. This was the chief contribution of William Newmarch to Bagehot's *Economist*; he had begun to calculate indices of various commodity prices in 1859, and had been followed by Jevons, who used the prices quoted in *The Economist* as the basis of his calculations; from 1864 Newmarch's indices were published regularly in *The Economist*, and in 1868 they were added together to make a crude composite index, based on the years 1845-1850.

For Bagehot, as for Wilson, facts and figures were raw material, the beginning not the end of argument, the yardstick by which to test the doctrines of the day. Never were two editors less doctrinaire. Bagehot was above all a realist, especially in his treatment of foreign affairs. But his main province as a leader-writer was at home; British interests and British affairs, especially those of the markets, came first. He explained the nature and significance of the money market in the style of "Lombard Street"; he wrote regularly on limited liability, on the defects of company managements and the excesses of finance companies. He attacked the "laxity and easiness" of the policy of the Bank of England, for he regarded the Bank's policy of following instead of leading the market as "a recipe for making panics." He emphasised always, in politics as in economics, in government as in banking, manufacture and commerce, that "sound practice never could be secured by ready-made rules, but only by leaving men free to learn, with full personal responsibility, the policies which would best serve their long-term interests."

Consolidation

The death of Walter Bagehot ended an epoch in the story of *The Economist*. Not again until the reign of Sir Walter Layton (1922 to 1938) was progress of the same order made. After Bagehot the story falls into four distinct stages: the interregnum from 1877 to 1883, when R. H. Inglis Palgrave, the economist and statistician, shared the editorship with Daniel Connor Lathbury, who probably wrote leading articles for *The Economist* for a longer period than any other man; the humdrum period of consolidation under the "business" editorship of Edward Johnstone, the first trained City journalist to be editor of *The Economist* and the longest in office (1883-1907); the period of Francis Wrigley Hirst (1907-1916) and Hartley Withers (1916-1921), when the former's notable attempt to revive and restore the catholic, humane and expert tradition of Wilson and Bagehot was defeated by the First World War and its aftermath; and the period of recovery and reconstruction under Sir Walter Layton. It may be that a fifth period, one of great opportunities and high responsibilities, is already beginning, ushered in by the Second World War.

To say that the earliest and latest chapters of the story are outstanding is not to decry the achievements of the editors and writers who came between. Palgrave's monetary and statistical expertise advanced both the doctrine and the technique of the paper in its special fields. It was in his editorship that the first attempt was made to measure the terms of overseas trade, that is, to ascertain how far changes in the value of exports and imports were due to changes in price and how far to changes in volume; and many of Palgrave's articles on the technical problems of the money market "have become incorporated in the standard literature of banking."

When, in 1878, *The Economist* published its first calculations of the terms of trade, it is probable that

Robert Giffen, who had been Bagehot's devoted assistant and statistician until he went to the Board of Trade in 1876, had helped in the work. Giffen, indeed, would have been Bagehot's obvious successor. Instead, he remained at the Board of Trade and assisted in founding *The Statist* in 1878. It was the fact that Giffen was not chosen to edit *The Economist* in 1877 that left the gap which was filled by the joint editorship of Palgrave and Lathbury. During this interregnum the routine burden of editing and management was borne by A. J. Wilson, the assistant editor, a financial expert who was to found the *Investor's Review* in 1891. For the greater part of its history *The Economist's* staff was minute, and the successive editors owed an immense amount to the compendious labours of individual assistants such as Spencer under Wilson, Giffen under Bagehot, A. J. Wilson under Palgrave/Lathbury and Walter William Wright under Johnstone. Apart from salaried assistants, there were also the regular outside contributors, such as Bagehot under Wilson, Senior under Wilson and Bagehot, Newmarch under Bagehot and Herbert Asquith and Alfred Milner under Palgrave/Lathbury and Johnstone.

A New Start

It was in Johnstone's long editorship that this system of a few industrious apprentices in the office and an increasing number of outside leader-writers became unwieldy and unbalanced. The staff remained tiny, the number of regular contributors grew and, in effect, the leader columns of the paper were "put in commission" in the hands of a group of writers on special topics. When Francis Hirst took over in 1907 it was his task to convert a stereotyped *Economist*, designed primarily to instruct and advise business men on mainly business matters, into the journal of public affairs that Wilson and Bagehot had planned. From the start Hirst, classical in both his scholarship and economics and passionately Liberal in his politics, wrote his own leaders on the whole range of

public topics. He began the building of a competent and able staff of assistants inside the office; he made it his aim to raise the standard of editorial writing, to broaden the paper's outlook, and to restore its principles and its influence in political circles, while losing nothing of its weight in the City and the centres of trade and manufacture. He brought in Alexander Murray Stewart from the City desk of *The Tribune*; the Laytons, Walter and Gilbert; David Eric Wilson Gibb, a connection of the owning family; Hilton Young, later City Editor of the *Morning Post* and editor of the *Financial News*, and now Lord Kennet; Leonard Reid, who later became City Editor of the *Daily Telegraph*; Mary Agnes Hamilton, the first woman in the editorial record; and C. K. Hobson.

What Johnstone had done in his twenty-five years should not, however, be underestimated. He had consolidated the gains of his remarkable forerunners, and even enhanced the high authority of his paper in the City proper. Under him *The Economist* had spoken in its old accents against the blunders and lack of leadership that brought on the Boer War and then bungled its conduct; and the "raging, tearing" tariff propaganda of Joseph Chamberlain had been opposed with characteristic vigour. But there was too often a narrowness and a complacency about Johnstone's journal; it was assumed too readily that free trade, low costs, cheap food, free enterprise and, above all, peace and prosperity—the objectives of the founder—had come to stay. Johnstone had kept an old-world *Economist* in good repair; the regular record of Capital Issues was introduced early in his editorship; and the "Investor's Monthly Manual," the "Annual Commercial History" and the Trade and Banking Supplements waxed and flourished. But the paper had lost its statesmanship and fallen out of line with the political and journalistic requirements of a new era. It was inclined to be dull. Hirst made a new start. The tragedy is that his work was undone by the war he hated and opposed.

Trial and Recovery

The work of Francis Hirst, despite the disillusionment and disappointment that he suffered, was not in vain. It was his reforms that set the standard for the post-war, or rather inter-war, *Economist*. He had shown that the way to revive the legacy of Wilson was, first and foremost, to improve and increase the personnel of its staff and to better and broaden its style, scope and technique—precisely the lines on which Sir Walter Layton worked during his sixteen years "from Washington to Munich." Hirst followed Bagehot and preceded Layton in the statement and application of broad principles in public affairs and in the search for new and better instruments for recording facts and measuring economic change. He began the quarterly analysis of industrial profits in 1909 as "perhaps the most direct test of home trade at present available." As an editor in the technical sense he was exceptionally accomplished. As a writer of leaders he was always lucid and polished. As an expositor of economic doctrine he followed Cobden and in foreign policy Lord Morley rather than Sir Edward Grey. Ceaselessly he argued the inseparable connection between prosperity and peace, and showed how much Europe and Britain stood to lose by war.

"The economic, financial and social convulsions attendant upon a general European war appeared too evil to incur by any action or policy. Only to contemplate them as deterrents was enough for the editorials of those years." But the general European War came in 1914. The stable, rational and peaceful world that Johnstone had taken for granted and Hirst took as the postulate of all his arguments came to an end. The high Liberalism, the editorial gifts and the moral fervour of *The Economist's* last peacetime editor were no defence against the shocks of a changed and changing world. On July 8, 1916, he wrote in a farewell article: "Since the war began, the function of an editor who believes that truth and patriotism ought to be reconciled has been difficult and

even hazardous. . . . In my view the financial fabric of Western Europe is in imminent peril, and in a few more months it will no longer be possible to disguise the bankrupt condition of several great nations. Civilisation as we have known it, and representative institutions are doomed unless, through the exertion of individuals, the rights without which an Englishman at any rate will hardly care to live are speedily restored. To this end freedom and independence must somehow be won back for Parliament and the press."

Hirst's successor, Hartley Withers, was the second City journalist to edit *The Economist*; Johnstone, who worked for fifteen years in financial journalism with *The Scotsman* and *The Pall Mall Gazette*, had been the first. Withers, trained in a stockbroker's office, was City Editor of *The Times* before he came to *The Economist*, and was remarkable both as a financial journalist and as an economic author for his power of simple, direct and forceful exposition. His tenure of office was not a fortunate one. His writings were high in reputation and wide in influence; his attacks on wartime inflation and unsound war finance were trenchant and telling; and his comments on the problems of peace and reconstruction were often timely and to the point. But he had to carry on through the final years of war and the following period of post-war dislocation with only a meagre wartime staff; and in 1921 he left *The Economist* to participate in a new journalistic venture.

With the coming of Sir Walter Layton at the beginning of 1922 the second epoch of real development in the paper's history began. He recruited new men; he introduced new methods and new features; he reached out, not always with complete confidence and not always successfully, for new ideas in tune with the new age. He set out to build up a sufficiently large, sufficiently competent and sufficiently specialised staff inside the office to conduct all branches of the paper's work; and he continued the use of able and expert outside collaborators. On his staff he had Hargreaves Parkinson, now Editor of the *Financial News*, Aylmer Vallance, later Editor of the *News Chronicle*, Norman Crump, now City Editor of the *Sunday Times*, Douglas Jay, afterwards City Editor of the *Daily Herald*, Graham Hutton and Geoffrey Crowther. From outside Professor Arnold Toynbee wrote on foreign affairs, and H. V. Hodson on the Empire.

Journal of World Affairs

Perhaps the greatest single development between the wars was the extension of *The Economist's* concern with world affairs. Articles on foreign policy, correspondence from overseas, international statistics—all these went back in origin to the first epoch of development under Wilson and Bagehot, when *The Economist's* news and views from European capitals and the United States, in the paper's own peculiar genre, were already notable. Under Johnstone and Hirst they were still a special and unique feature. But under Layton a long step forward was taken; overseas features were given a new and foremost place and a wider range, in line with the international preoccupation and problems of the times.

The avoidance of another world war was again set first in *The Economist's* policy; but the isolationism or limited liability preached to this end before 1914 were now seen to be not enough. Britain alone could not defend itself and its Empire against an aggressor. (Bagehot had expressed much the same view long before.) Sixty or more articles between 1924 and 1929 posed the choice between effective pooled security and an unlimited and disastrous arms race; and the paper insisted, almost weekly, after 1931, on the preferability, from the world's and Britain's standpoint alike, of the former course of strengthening the executive powers of the League of Nations "through a limitation of national armaments coupled with and dependent on an agreement to translate collective security into effective action."

At the same time as *The Economist* was being made once more into a principled and purposeful survey of world as well as British affairs on a new model, progress

was equally being made in its records and statistics. Once more, the collection and measurement of facts, the analysis and interpretation of quantitative trends and the broadening of the paper's political and journalistic outlook went hand in hand. The Insurance Supplement surveying the whole field of insurance activities was introduced; a new, regular Budget Supplement giving all the facts and figures about central and local finance was begun. The Index of Shipping Freight Rates was started in 1923, "in view of the violent movements in tramp shipping freights and the important relation between freight rates and the volume of world trade." The Index of Insurance Share Prices was begun in 1927. The Index of Business Activity, to show short-term variations in the ebb and flow of general economic conditions, was first published as a composite index in 1933. In 1928, Newmarch's Wholesale Price Index, which had been revised under Hirst in 1911, was again revised and enlarged; and in 1940, under Layton's successor, a new Sensitive Price Index was announced.

Change and Quest

In doctrine as in personnel, make-up and technique, the Layton years were years of change and quest. New judgments and old conventions jostled one another in the paper's approach to the problems of money and banking, investment and industry and trade. The return to gold was regarded by *The Economist* in 1925 as Montagu Norman's "crowning achievement"; but the paper was not an unthinking adherent of the orthodoxy of those years. It was, for example, consistently opposed to the payment of war debts, and the argument of the Macmillan Committee that Bank rate should be raised to meet a disequilibrium due, not to a rise in domestic prices, but to a fall in world prices, was shrewdly questioned. But the May Report of 1931 was welcomed, and *The Economist's* cure for the crisis was to cling to gold and cut costs ruthlessly.

The 1931 crisis, the collapse of the gold standard, the Great Depression and the recovery under managed and cheap money blew away many cobwebs. *The Economist* was compelled, like many others, when faced by the

problems of pre-war and war economics, to evolve a fresh monetary policy, based on a grasp of realities and an understanding of new techniques. By the eve of the war *The Economist* held clear views on rearmament finance, full employment and inflation; the attempt was being made to place the monetary policy in perspective against the wider economic background.

Then came the war, the single track of wartime journalism and the straitjacket of paper rationing. What contribution the paper may have made to war economics and war finance is recent and can be read. The internal development of the paper has been less obvious. Dimly there can be seen the triune form of the post-war *Economist*—the Survey of Public Affairs, at home and abroad, in the front of the paper; the Business World in the middle; and Records and Statistics at the back—embodying the political, expert and factual formula of Wilson and Bagehot in a new and more precise form. The Layton version of the "precious collection of facts, doctrine and experience mutually supporting each other," in which the distinct sections of the paper were sorted out for separate and specialised treatment, has now been carried a stage further. And the concern for world affairs has continued; the weekly American Survey has been born, as well as the *ad hoc* wartime surveys of Germany and Russia at war. *The Economist*, even in wartime, reaches this centenary milestone on the march.

A handful of men working in a small family business have created a journal whose fame and readership run round the world. *The Economist* is, and always has been, an anonymous paper; almost without exception its articles have gone unsigned and its editors and their staffs have not been named or advertised. It is this impersonality that has made possible what continuity of tradition, balance of judgment and weight of influence the paper has possessed. But it is right that on such an occasion, which will not be repeated until September 2, 2043, this tribute should be paid to the men—and latterly women—who have produced *The Economist* every week for a hundred years and transformed the small venture of James Wilson into an international institution.

The Economist's Policy

THE ECONOMIST was founded to expound and to propagate a specific and clearly defined philosophy. Its particular concern in the first few years was, it is true, only with one aspect of that general philosophy—namely, with the removal of all obstructions to the free import of food. But from the start the repeal of the Corn Laws was seen against a much wider background. James Wilson refused to make his paper an official organ of the Anti-Corn Law League; and the victory on this particular issue came so promptly and completely and, once achieved, was so little challenged that the infant *Economist* either had to widen its horizons or disappear. For the rest of Wilson's editorship, and much more so in Bagehot's, it became a general advocate of the Liberal philosophy.

There can rarely have been such an articulate and consistent philosophy, or one so carefully worked out in all its details by men of letters and so scrupulously followed, again in all its details, by men of state. So well known is it, even to-day, that description is quite unnecessary. It has become the fashion to sneer at "Cobdenite shibboleths," and to be a member of the Manchester school is becoming more of a confession than a boast. But the principles of Victorian Liberalism have nevertheless been the foundation of Western democratic society and provide far more of the substance of the present-day world than the present-day world acknowledges. *The Economist* was born into the very centre of this philosophy, and for almost eighty out of a hundred years professed its doctrines substantially unchanged.

The ideas expounded in *The Economist* since the end

of the First German War, and especially in recent years, are not those of the Manchester school. In a world so changed, they hardly could be. Wilson and Bagehot were no believers in static ideas—their whole philosophy was of expansion and free development in ideas as well as in material things—and their marvel, if they could return to-day, would probably be that so much of their ideas remains rather than that there have been changes.

Freedom and the Common Interest

So many battles have been fought round the symbols of the liberal faith that it is often forgotten that they were only symbols. The ultimate objects of nineteenth-century liberalism were part of that great awakening of the human spirit which marched in step with the developing technique of the modern world. Opinions will naturally differ on precisely what, in any order of ideas, is a fundamental dogma and what is mere changeable expression. But the two dominant beliefs of the liberal philosophy are comparatively easy to identify. The first is freedom—the belief that it is not only just and wise but also profitable (in politics and in economics) to let people do what they want to do. The second is the principle of the common interest—that is, that human society need not be an arena of conflict, but that it can be an association for the welfare of all. Nearly all else in the beliefs of *The Economist* of a hundred years ago is merely incidental to these two grand principles. Wilson and Bagehot believed that freedom for the individual and the common welfare of the society of individuals could best be served by free

trade, free enterprise and political reform at home, by disarmament, commerce and fraternity abroad. A hundred years later, we have come to have doubts about the efficacy of the means they devised to attain their ends; but in their ends—in liberty and the common interest—we still believe as passionately as ever. The problems of the national and the international society seem, in 1943, to be more complex and more difficult than they did in 1843, and less capable of solution by simple and embracing formulas. But the ultimate goals remain unchanged.

The greatest difference in means between the twentieth-century liberal and his forefathers is the place that he finds for the organising powers of the state. James Wilson firmly believed that the state was the enemy of freedom, the instrument not of the general welfare but of the special interest. Bagehot, too, was, in general, what would to-day be regarded as a believer in *laissez faire*. But he had the clear sight that is needed to distinguish between ends and means and the far sight that can see what is coming down the corridor of time. In 1867, an address of his contained these very modern-sounding words:

The English state is but another name for the English people, and to be afraid of it is to be afraid of ourselves. . . . The co-operative, if not the compulsory, agency of the state ought, too, to be used far more than now in applying to our complicated society those results of science which are new to this age. . . . The relation of a free and intelligent Government to practical science is a new subject, because such science is very modern, and such Government almost inconceivably rare.

Eighty-six years have passed since those words were written, and in that interval both the need for the state's organising power (for the application to society of "science") and also its power to organise society intelligently have grown, as Bagehot saw they would grow. James Wilson, if he were to reappear, might need some convincing before he would accept the place of the state in modern life; Bagehot would find himself at home.

The policy of *The Economist* can, then, be expressed as being that of adhering to the fundamental objectives of 1843, but of modifying the means of attaining those objectives as time passes, as experience accumulates and as the climate of society changes. It so happens that this centenary falls towards the end of a period when not merely *The Economist* but liberal society in general has had to make substantial adjustments—in its appraisal of the means that will best serve the unchanged ends of society. The opportunity is therefore a good one for re-stating, more deliberately than is possible from week to week, *The Economist's* opinion of the methods of political and economic action, at home and abroad, which seem, in 1943, best fitted to achieve the two great objects of liberty and the common welfare. This is done, in a generalised way, in the present article. The articles that follow are specific examples, chosen as illustrations and without any pretence of completeness.

Political Structures

The men of 1843 had less courage of their convictions in political matters than in economic. As economists, they stood for the radical solution, they were for going the whole hog. But in politics they hesitated. They saw the iniquities and the impossibilities of autocracy and aristocracy; they detested the *ancien régime*, both French and British; but they were still frightened of democracy. We are neither better men nor bolder; but we have learned that the fears of democracy were groundless. We have learned that there is at least as much corporate wisdom in the many as in the few, and perhaps more. And we know, what our grandfathers could not possibly have guessed, that a universal-suffrage electorate, men and women, can provide more votes for the Conservatives than for any other party in seven elections running. It would be unduly cynical to suggest that it is only because of this demonstrated traditionalism of the masses that there is such general attachment to democracy to-day; it has its roots in much more sincere emotions. But, whatever the cause, it is a manifest fact that there is no wish

in any significant quarter to go back on the principle of universal suffrage.

The ballot box, by itself, however, can mean much or little. Hitler and Mussolini have ruled by the ballot box. The other element in democracy is consent, and on that too there can be no going back. One more demonstration—and one of history's most impressive—is unrolling before our eyes that methods of consent pay in the long run. The British democracy can assert with some pride that, even in war, it moves by the consent of its members. The conscientious objector is as much a symbol of democracy as the ballot box.

The political formula of 1943 is thus much the same as that of 1843, with the timidities disproved and the toleration possibly enlarged. It is government by consent, the consent being expressed by free votes in an opposed election. It is a formula which is just receiving the powerful reinforcement of achievement. The British political system has stood the test of this war as well as—no, better than—any other. But there are nevertheless certain tendencies of development—possibly of improvement—at which it will be as well to glance.

The Place of Parliament

The state of to-day is a very complicated piece of mechanism, dealing with difficult and highly technical problems, which demand both foresight and consistency. To say that they require the attentions of experts is possibly to give a false impression. The problems that face the statesman are not beyond the understanding of the common man, when the common man has the necessary data and will think about them. The expert is merely a common man who has all the data about one set of problems and keeps his mind directed to them. He is an example, in the political sphere, of that division of labour and specialisation of function which, in the economic sphere, is the foundation of all wealth. The expert stands for foresight and consistency in policy—in a word, for efficiency in the mechanism of the state; while even the most fervent democrat has to admit that the ballot box sometimes disrupts consistency and the need to secure consent hampers foresight. There is a dilemma here—how to use the expert and still preserve government by free consent, how to combine the managerial revolution with parliamentary democracy—and it is leading to a shifting in the emphasis of the constitution, especially in the position of Parliament. A hundred years ago Parliament was the Sovereign Assembly, of which the Cabinet was the Executive Committee. It was Parliament that decided, Parliament that made and unmade Ministers. That is still what it is described in the text-books, and it is still a theory to which elaborate deference is paid, not least by the present Prime Minister—perhaps because he is the only Prime Minister of recent years who can be said to have been put in office by Parliament. But the *de facto* reality behind the *de jure* theory is that it is the Government that decides, deriving its authority from the people. Parliament can criticise and bring pressure; it keeps its sting, but, like the bee, if it stings it dies in the act. A General Election nowadays is, in fact, a referendum to elect a Prime Minister and in the triumvirate of People, Parliament and Executive, it is the first and the last who nowadays share the sovereignty. In the nineteenth century, the triumvirate was in stable equilibrium, but to-day's position has more analogies with the eighteenth century. Two hundred years ago, the crown or the party group in possession of the executive power used the electors as a device to get the Parliament they wanted—and they rarely failed. The electors were elaborately courted, but their free choice was a romantic myth. To-day, the people use the House of Commons as a device to get the Government they want, and the sovereignty of Parliament is becoming somewhat mythical.

This argument must not be pushed too far. In particular, it must not be pushed to the lengths of supposing that Parliament is losing its useful functions. That is not in the least the case. But Parliament's useful function is changing. In the nineteenth century, it was the process of legislation that held the centre of the stage. To-day, it is

a rarity for the divisions on any Bill to excite much interest, while the Parliamentary Question and the adjournment debate are coming into their own. The most important function of Parliament in these days is neither to make and unmake Governments (the people do that) nor to decide upon legislation (the Government does that), but to criticise, to cross-question and to discuss. Not merely administration, but legislation also, are increasingly—and must increasingly—be left to the experts or (to give them their derogatory title) the bureaucrats.

The late Lord Chief Justice invented for this tendency the name of the New Despotism. But it cannot be stopped, and if it could, the result would be chaos. Under the pressure of new circumstances, a new form of government is emerging. It is no longer true that the executive merely administers the laws that Parliament, in its wisdom, enacts; it is nearer the truth to say that Parliament enacts the laws that the executive, in its wisdom, drafts—and if this latter statement diverges from the truth it is because there is a great deal of legislation, in peace as well as in war, which Parliament never sees.

This new system of government is no less democratic than the old—criticism is free and the Government's mandate is given by the people and can be taken away by the people—but it is less Parliamentary. It involves the citizen in a steadily increasing toll of compulsory duties; but it is no less based on consent, since none of these duties will be pressed to the point of overriding genuine scruples of conscience and any one of them can be removed by the will of the people. It is an example of the flexibility of British institutions, when challenged, to adapt themselves to the need for consistent and expert management of the nation's affairs.

The Economist's opinion is that this political development—this accretion of power to the executive and this transformation of Parliament into an advisory body—is not one to be viewed with alarm. It is in the logic of events. Indeed, so much in the present world revolves around the mechanism of government, that its efficiency must be the paramount consideration. Nevertheless, the incidental effects of the development will need careful watching. The new system, for example, must not be deprived of its basic consent, and consent implies knowledge. Any attempt by the Government, therefore, not merely to have the executive and the legislative power, but to exercise it in secret, will have to be resisted to the utmost. "Let the people know" is an essential maxim of any democracy, and not least of this new emergent type.

From Consent to Co-operation

Consent is an essential prerequisite of any form of democracy; but it is a negative element, and one of the greatest needs of the twentieth century is to transmute it into something more positive. British institutions are freer than any in the world—in the negative sense that they commit less tyranny on the individual. But if they are to measure up to the demands of the next few decades, they need to have generated behind them the explosive force of the active co-operation of a whole people. There have been examples in past history of the enormous momentum that can be developed when a whole people feels itself at one with its institutions; the classical example is the sudden change from the effete and disintegrating France of Louis XVI to the dynamic energies of the Convention, and something of the same spirit fired Elizabethan England. But it has been left for our own age to show what enormous forces can be generated when the enthusiasm of a whole people is united with the technique of the modern state. We have seen it in Nazi Germany, and then again in Soviet Russia. But neither of these is governed by consent, and a free system ought to be able to do far better. If these energies, tempered by free consent and harnessed to the technical efficiency of British government, could be directed to the peacetime purposes of democracy, the twentieth century would be a second Elizabethan age for Britain.

The task is, then, one of arousing positive enthusiasm for institutions which are now merely accepted. The

British citizen *should be* an ardent participant in his public affairs; he is little more than a consenting spectator who draws a distinction between "We" who sit and watch and "They" who run the state. There is no lack of signs that he is unhappy in his rôle; the passion for Russia that has been such a feature of the last two years is probably to be interpreted less as an admiration than as envy—envy of a country that is not frustrated. The note of hysteria in the acclamation of the Beveridge Report (admirable though that document is) betrays an almost pathetic desire to break loose from invisible bonds that have held the British community back for twenty years. It is difficult to diagnose exactly what is missing. It may be that the chronic ineffectiveness of the Labour Party is clogging the natural safety-valve—that there is no effective way of going into Opposition. It may be that the peculiar social structure of modern Britain, based on and perpetuated by a dual system of education, is creating psychological obstructions. But whatever the cause, it must be one of the chief labours of the next few decades to level the barriers between "We" and "They." This must be done not merely because it is just, but mainly because we cannot afford not to. Democracy in the twentieth century needs fire in its belly; it is an internal combustion engine that cannot run on one cylinder only.

Economic Objectives

The outstanding difference in economic ideas between 1843 and 1943 is that they had only one economic objective, while we have three. A hundred years ago the fact of poverty was obvious and insistent. The shortage of material goods was so clearly the chief defect of the prevailing economy that the creation of more wealth imposed itself on the men of 1843 as by far the most important task of political economy. More production was needed, at almost any cost. Not that the men of 1843 were wholly materialist. "If we look around us at home," wrote James Wilson in the Preliminary Number of *The Economist*, "we see ignorance, depravity, immorality, irreligion abounding to an extent disgraceful to a civilised country; and we feel assured that there is little chance of successfully treating this great national disease while want and pauperism so much abound; we can little hope to improve the mental and moral condition of a people while their physical state is so deplorable." It was not that material wealth was the only sound object of policy; it was so essential a means of attaining all other objects that policy should concentrate upon it.

In the twentieth century, economic policy has three objects. They have been defined by Professor Pigou as being to increase the national income (the old policy of increasing the sum total of wealth), to improve the regularity of the national income and to improve its distribution among the individual members of the community. In more homely terms, they can be expressed as being to abolish poverty, to diminish unemployment and to reduce inequality.

A very great deal, if not quite all, of the differences in attitude towards the economic problems of the day is implicit in this change. For example, the development from complete *laissez faire*, as preached in *The Economist* of 1843, to a belief that the organs of the state have a most important and positive function to perform in the national economy, as expressed in *The Economist* of 1943, is a necessary consequence of the widening objective. *Laissez faire* may well be, in certain circumstances, the ideal system for securing the largest and quickest possible increase in the total income of the community, if regularity and equality are unimportant; but no one has ever made a convincing case for *laissez faire* as a means of avoiding economic fluctuations or of reducing the inequality of incomes. The task of the twentieth century is thus more difficult than that of the nineteenth: there is no simple formula to attain a single object, but a com-

plex policy to achieve a balance between different, and sometimes diverging, objects.

Laissez faire is all but dead in the Britain of 1943. There is still some verbal advocacy of it; but practice diverges more completely from it with every month. And the overwhelming majority of opinion is ready to accept the view that both the free enterprise of the individual business man and the collective initiative of the organising state have their part to play in a sound economy.

The Economist of 1943 accepts this view. The germ of it can be found in Bagehot's address of 1867, quoted above. There is no prepossession for collective organisation in principle—there is rather an awareness of the great difficulties it involves. But equally little is there any fear of the state in principle—there is rather a recognition that without the organising powers of the state many of the inventions of the natural and the social sciences will run to waste.

Private Enterprise and State Control

Thus the economic problem has its analogies with the political. In both, it has been necessary to abandon the position that freedom merely means the absence of all constraints, and that the general interest will automatically be served by allowing every citizen to pursue unrestrained his own individual self-interest. In politics, the intervening hundred years have been a long experiment in the balance of the compulsory and the voluntary. In economics, there is a similar problem in balance between freedom and order, and far less progress has been made in working it out.

It is in working out this formula that the problems of the next hundred years will present themselves. There will, first of all, be the problem of delimiting the frontier between the proper spheres of order and of freedom. It is easy to say that the province of collective organisation is in assuring all that is basically necessary to the economic life of the individual and of the community, while the fullest freedom of private initiative should be left for all that varies with taste and circumstance. But the formula is neither very scientific nor very easy to follow. It will be proved or disproved only by many decades of trial and error. The sphere of collective organisation once delimited, there will be the problems of evolving the technique of state control. And there will be the problems of ensuring that the development of "purposive direction" in the community's economic affairs does not choke the freedom of individual initiative in that vast field where progress and prosperity will continue to depend on private enterprise. Private enterprise, in fact, will need defending from itself as well as from the state; monopoly in all its forms is going to trouble the next hundred years much more than it ever did the last.

The keynote, in 1943 as in 1843, is boldness in the interests of expansion. A hundred years ago, complete free trade was a courageous policy to advocate. To-day, *The Economist* believes in removing the obstructions to constructive private enterprise, and it believes in experimenting with methods of collective organisation far more courageously than hitherto. But this phase is necessarily experimental. Wilson thought the state to be the enemy of freedom; to-day it is counted as a friend, or at least given the benefit of the doubt. But it is impossible not to have a doubt, and the doubts may grow. If it is necessary to be wary of the state, it is because state control can so easily become, and has in the recent past often been, the ally and representative of sectional rather than of communal interests. The state will be given the benefit of the doubt—but it will be kept under Parliamentary scrutiny and public vigilance, subject to challenge and open to the fullest publicity for its actions. Here, too, "Let the People Know" is the surest and most necessary of safeguards.

War and Peace

It is in the field of international affairs that the largest differences in policy between *The Economist* of 1843 and

its successor to-day are to be found. In 1843, the paper's policy—in accordance with the prevailing philosophy of the time—was non-interventionist. For seventy of its hundred years *The Economist* opposed entangling alliances with all the fervour of a Midwestern senator, and its view of armaments and of preparations for defence was that they were, at best, a necessary evil, to be restricted to the minimum. The paper opposed the Crimean War and the Boer War, and in 1914 it thought that British participation in the First German War was both unnecessary and unwise. Yet this attitude was combined with the most ardent internationalism. Non-intervention never became isolationism, for *The Economist* took as an article of its faith the doctrine that the nations depended on each other, in political matters no less than in economic. The attitude of non-intervention was born of the belief that the way to peace and fraternity lay through the development within each nation of free political institutions and the practice between them of the utmost possible freedom of commerce. Wars were disturbers both of political liberty and of trade; no good could come of them; and the British liberal should have no part in them.

The attitude of 1943 is quite different. *The Economist* of to-day does not believe that a sound economic policy will, by itself, secure peace; on the contrary, it holds that without a secure political basis, not even a beginning can be made with sound economic policies between nations. Nor does it believe that nations, left to themselves, will automatically evolve towards liberal parliamentary democracy, or that, if they did, peace would thereby be secured. *The Economist* of to-day believes that peace requires enforcement, and that enforcement requires force.

The contrast could hardly be more complete. Yet this, once again, is a change in method rather than in ultimate aim. The liberals of a century ago were not non-interventionists for selfish reasons or because they were nationalists, but because they thought that such a policy on Britain's part was best calculated to bring about the peaceful international society they desired. Experience has cast doubts on their methods. But the aim is the same; indeed *The Economist* of to-day is even more internationalist, since the tacit assumption of the old doctrines—that Britain was strong enough to stand apart without danger to her own safety—is no longer tenable. Britain to-day is not internationalist merely by choice, but also by compulsion. Not only is this another example of a change in methods to achieve an unchanging aim, but it is the same sort of change in methods as has been found necessary in domestic politics and in economics. What our ancestors thought would come of itself, given a total absence of constraints, we believe must be sought by complex and difficult organisation.

On the nature of the organisation that will secure peace, minds are much less clear. It is becoming steadily more difficult to believe that anything short of a surrender of national sovereignty to a supra-national body will prevent a third world war. But it is also very difficult to believe that any of the Great Powers, Britain included, are ready for such a surrender—are ready, that is, to transfer the control of their armed forces to an international body on which they might find themselves in a minority. This is the crucial question, and no proposals for new leagues of nations, or for federations, will be strong enough to secure the peace unless they control the force. Indeed, there is a danger that international organisations which create the illusion of a world concert, while not changing the realities of power, may do more harm than good. In this field, more than in most, the perfect is the enemy of the good.

The Dilemma of Foreign Policy

The dilemma that this creates for British foreign policy is very real. On the one hand, the development of international institutions should be encouraged by all possible means, for in that direction lies the only lasting

hope. International institutions cannot be expected to grow strong if they are never given any responsibility. On the other hand, until they are strong enough to take over the effective policing of the world, it is essential to see that Britain and her friends keep in their own hands a sufficiency of force. There is a twofold reason for defending British interests. The first (which it would be hypocritical to omit) is that they are our own. The second is that we believe Britain to be one of the trustees of the future. It would be ridiculous to be willing to fight a full-scale war every generation to insist on getting our own way, and then between wars to pretend that our own way was no better than anyone else's. And, as part of the policy of remaining strong, it is one of the basic tenets of *The Economist's* faith that every effort—and, if need be, many sacrifices—must be made to achieve the utmost coincidence of policy between Great Britain, the other British nations and the United States. Other alliances should be sought where they can be found, but the policy of the Oceanic Commonwealth is basic.

Thus in foreign affairs as in domestic politics and in economics, the simple and easy solutions have disappeared, leaving the delicate task of seeking a balance between conflicting elements. In politics, it is the conflict between freedom and order, which is already well on the way to solution. In economics, it is the conflict between free enterprise and collective organisation, where the main outline of the solution is in sight. In foreign affairs, it is the conflict between the need to prepare the way for a surrender of sovereignty and the interim need to maintain the strength of Britain. It would be wildly optimistic to say that the solution is yet visible. But it must be sought.

International Trade

The Economist was founded as a "Free Trade Journal" and bore that sub-title for many years. This review of the paper's policy as it stands to-day can hardly conclude without some reference, however brief, to this much controverted subject.

The pattern, once again, is the same: the fundamental aim remains unchanged, but there is some modification in methods, since experience has shown that some form of deliberate organisation, or purposive direction, is needed to achieve what it was thought in 1843 would come about by itself. The basic belief of the Free Traders was in the virtues of the international division of labour. *The Economist* has never wavered in that belief, and holds to it as firmly to-day as ever. Every element of enforced self-sufficiency is an element of poverty, and there is no nation on earth—least of all Great Britain—with sufficient wealth and variety of wealth that it can afford to neglect the economies of international exchange. But in a world that seeks regularity in its economic system, and that uses force in its political relationships, it is highly doubtful whether the best way to secure the maximum possible division of labour is simply to remove all controls and impediments. For example, there is no doubt that a country does far more harm to world trade by allowing itself to suffer a depression than by almost any imposition of obstacles to foreign trade. If a necessary part of a Full Employment policy is (as it would be in Great Britain) the taking of steps to prevent too sudden a rise in imports, does that mean that Full Employment must be forsworn, lest it infringe the Free Trade canon?

Once again, as in the previous sections of this article, the answer is one of balance. The problem is not simply to eschew all mechanisms of control, but to use them positively. What this means in precise terms, and with reference to international trade, is another of the issues on which much clarification of thought will be needed, and it would be idle to pretend that the outlines of the answer have yet taken shape. The future economic relations between the nations interlock at every point with their future political relations. If one can be said to wait

upon the other, then it is the economic on the political, and it would be a delusion to suppose that any controlling decisions can be taken on the methods of world trade until the methods of world peace are established.

There are, however, certain negative considerations that can be laid down. It may be a mistake to prohibit the use of all constraints in world trade; but a system of constraints that prevented all growth would certainly be wrong. If there must be a controlled system, it must be one of controlled expansion. The primary test of a country's commercial policy should not be the height of its tariffs, but whether on balance its foreign trade is expanding. And, secondly, if there must be restraints on freedom of trade, they should be restraints imposed in the general interest. The community is the sum of its members; but the welfare of the community is not served by the protection of individual interests, and any system of restraints on trade which, like the British Import Duties Act, takes its decisions on an examination of individual interests is almost certainly harmful. A confederacy of vested interests masquerading as the public welfare is no less noxious when the immediate enemy is a foreign trader. Controlled expansion in the public interest is leagues apart from restrictive protectionism.

"The World Does Move"

There are those amongst us who, amid doubt, discouragement, decayed enthusiasm, and even chilling sneer, still cling to the belief that a better, a higher, a nobler destiny still awaits the family of man. Not an imaginary perfectibility, not a visionary millennium, not such a change of the organic structure, body and mind as would make the human being other than he is. But man as he is, in many respects helpless, in much imperfect, and in all feeble, when viewed individually, is still capable of a social elevation such as society has not yet beheld.

These men are not disheartened by appearances which, to superficial observers, would seem to indicate that man, so far from advancing, is sometimes retrograding; and that the human race is, after all, much the same from age to age. . . . nay, the world may rise in arms, and . . . still they feel that "all things work together for good." The world *does* move; that is their conviction, and it is ours; were it not so, *The Economist* should not have appeared.

So wrote James Wilson in the first issue of *The Economist* on September 2, 1843. That faith in the possibility of progress still endures. But it is somewhat battered by the disillusion of a hundred years. That all things can be made to work together for good is still an article of faith. But it is no longer possible with such touching confidence to believe that natural forces will so spontaneously combine to effect human progress. Man's rôle is no longer that of simple beneficiary, the spoilt child of Nature; the curse upon him is not that he shall not make his way upward, but that he shall work for his salvation. Progress, to us to-day, is not impossible, but far more difficult of attainment than it seemed to our forefathers. We must harness the natural forces, and learn to drive them.

The simple rules of thumb of 1843 have disappeared, and in every sphere of public policy we are now presented with the most difficult judgments, the most delicate balances. The greater is the responsibility resting on the statesman. The greater is the responsibility resting on the journalist.

The idyll of the early Victorian years could not, after all, be expected to last, and we should not be unduly downcast by the much greater complications of our task. It is normal for the problems of human society to be difficult, and it was entirely abnormal for them to be solved so simply by such an unprecedented uprush of new forces. We should rather console ourselves with the reflection that it is a higher, not a lower, calling to devise a purposive direction for our affairs rather than to float on one of history's spring tides. Our age presents more difficulties, but it does not for that reason provide fewer opportunities of achievement.

TOWARDS THE SECOND CENTURY

Britain in the World

THE only foreign policy that has any hope of being consistently pursued is one in which national interests are fully and obviously safeguarded. No nation puts the interests of the international community before its own. It is only if the two can be seen to coincide that there is any possibility of effective internationalism. One of the great dilemmas of the twentieth century is that whereas every physical and technical development drives the world on towards greater unity, there is a time lag in the nations' awareness of their growing interdependence. Of the four great Powers, three are vast land empires, rich in resources. They can argue that if they fully mobilise their manpower and devote a sufficient proportion of their resources to vigilant defence, then there is no reason at all why they should make efforts or sacrifices to maintain an ordered world. The war has shown that this type of reasoning is fallacious. The development of aviation in the next ten years will make it even more so. Unfortunately it is still appealing enough for the coincidence of national and international interests to be blurred. A nation which still believes it can be successfully isolationist is most unlikely to give a lead in genuine internationalism.

There is one great Power, however, for which isolationism means disaster. Great Britain in resources and manpower is not one of the giants. Many of the elements which made up its 19th century pre-eminence—a rapidly expanding population, unrivalled naval power, industrial and financial supremacy—have gone. Others, such as world-wide imperial and trading interests, depend absolutely on the existence of a peaceful and co-operative international order. In a world which needs the greatest possible degree of economic, social and political integration, British interests and the interests of the international community tend to coincide at every point. Great Britain has everything to gain if a process of "getting mixed up together" continues in the post-war world. It has, too, a special responsibility to carry this process forward. If the lead does not come from Britain, it is most unlikely to come from anywhere else.

Britain's Experience

Fortunately Great Britain's position for giving such a lead is very strong. No other nation is involved in world politics to quite the same extent. The British Commonwealth operates in every quarter of the globe, and in spite of many gloomy prophecies, has shown itself in this war, as in the last, to be an effective system of collective security. Most of the joint machinery in the world to-day was either elaborated in London or at least hinges on British co-operation. Britain has been readiest to share military bases. In Iraq and Egypt, it has made a working compromise between national independence and military dependence. On the economic side, it has co-operated fully in Lend-Lease, not by any means as a beneficiary only; it has established at Cairo a remarkable piece of international machinery—the Middle East Supply Centre. It has experimented freely in the sending of accredited Ministers overseas, a Minister of State to Washington, another to Cairo, a Resident Minister to West Africa. No Chief Executive in history has travelled so extensively as Mr Churchill. Finally, in the sphere of post-war thinking, the suggestions and projects put forward by Britain, even if they are neither so well defined nor so exhaustive as the criticisms might wish, cover a wider field than those proposed by any other Power.

This is the rich and varied experience Britain brings to the post-war world. Much of it has of course been gained under the pressures of war. The degree of "mixing up" which exists now will be hard to maintain unless new

objectives can be found for international policy. They will not be so compelling as that of defeating the Axis. This does not mean that none exist or that Britain cannot forward their acceptance. As a broad definition, it is difficult to improve on President Roosevelt's four freedoms. Peace, rising living standards and an expanding area of human freedom—these are all necessities for Britain's survival as a Great Power. They also happen to be what the mass of ordinary people want. Yet while they can be safely assumed to be a commonly accepted purpose, they are far too vague to constitute a policy. Both for collective security and for economic co-operation, plans are needed as precise as the leasing of bases or the pooling of war material or Lend-Lease.

Principles of Action

In the concerting of these plans, certain principles have been established by the experience of the war. First of all, there is nothing in the outlook and behaviour of the nations to suggest that they feel any less jealously than before about their sovereignty. Schemes for co-operation which come to them demanding a general sacrifice of authority—the transfer of major powers to a still untried international body—stand little chance of being accepted. On the other hand, if the nations are invited to co-operate as interested partners in a joint scheme directed towards a specific function—an irrigation scheme, perhaps, or the joint use of certain military bases—the sacrifice of sovereignty will be noticed far less. The successful pieces of co-operation in this war have over and over again been aimed at a particular need or problem—for example, the joint American-Canadian agreement about the use of bases and joint defence or the co-operation of all the Middle Eastern states in the Supply Centre at Cairo. The first principle of successful British diplomacy is to keep the "mixing up" at a practical, functional level.

The next principle is that British diplomacy should present the world with decisions as well as projects. The more confused the atmosphere in which the nations operate, the more a clear-cut decision taken anywhere becomes the crystallisation point of many other decisions, so that by taking the first step, a nation often discovers that it has compelled others to take the second and third. Britain's decision to go to war brought in the Dominions and paved the way to Lend-Lease. The establishment of the Supply Centre at Cairo meant that the Americans had something to join—which they did.

This point is in turn bound up with a last principle—self-confidence. The aim of British foreign policy is to get as many states as possible as mixed up as possible. It may not be possible to involve them all. This does not mean that the areas where integration is still possible should be neglected. Let us suppose the most unfortunate outcome—be impossible to mix things in the grand manner, but parts of Europe, most of Africa, even South-East Asia, would all be areas in which Britain could continue to give a lead in joint action.

In the post-war world, Britain will have to deal with nations of very varying degrees of magnitude. There are three broad categories—Great Powers, independent smaller Powers and colonial peoples. With very few exceptions the smaller nations fall into natural groupings—South-East Asia (Malaya, Indonesia, Indo-China), Africa (a predominantly colonial area almost entirely controlled by states), the Middle East (a group of independent Arab states), South America and Europe. The Great Powers—the British Commonwealth, the United States, Russia, at a later day China—are both needed and feared by these regional groups, needed because only with their help can

military security and economic progress be assured, feared because their military power is overwhelming. This dilemma cannot be evaded. Under modern conditions only Great Powers have the industrial potential and military strength necessary for waging war. The problem of security in the post-war settlement belongs primarily to them. By maintaining their military predominance they can ensure that none of the present aggressors is in a position to make war again. Britain's first task must be to keep the alliance intact. But their behaviour towards the smaller states will need to be such as to banish the suspicion that they in their turn may turn to aggression. Britain must also give a lead in developing the political harmony and economic prosperity of the various regional groupings.

What can be done to maintain the Alliance of the Great Powers? The British have a twenty-year treaty with Russia—but practically no joint machinery. They have no formal arrangement with the United States, but a vast amount of joint machinery. With China, so far, they have neither treaty nor machinery. Finally, with the Dominions, they lack really adequate joint machinery for consultation and decision. It is most unlikely that these gaps can be made good by setting up a world council with a joint military and joint economic general staff. Ideally that might be the solution, but if a council has not emerged in the course of the war, it is most unlikely to appear once the stress of battle is done. British policy will need to be less sensational and more arduous—to persuade the Russians to extend their commitments and to accept, say, the idea of joint bases, the joint policing of strategic key points, regular consultations. At present, these possibilities appear to depend on the course of the fighting in Europe, in particular on the opening of a Second Front. With the United States, it is a question not of formalising the association—American prejudice against "entangling alliances" is still strong—but of maintaining all the joint enterprises the war has made inevitable—pooled bases, regular staff talks, the standardisation of equipment, and so forth. Whether Britain can use its influence to hold Russia and America together in a joint peace strategy again turns on a military front—this time the Far Eastern front. If Russia maintains its neutrality to the end, the American reaction cannot fail to be hostile. The course of the Far Eastern war will also determine the closeness of China's association with the other Great Powers. Only with the Dominions can British policy be really uninhibited. Here all the Commonwealth Powers have a direct interest in the establishment of some organ of closer imperial co-operation. It is their surest way of maintaining their influence in the counsels of the nations.

Building the Regions

The test of any new system based—as any system must be—on the predominance of the Great Powers will be the use they make of their military and economic strength. Are the areas which lie between their exclusive sovereignty to be turned into battlefields? Competing spheres of influence? An area for economic struggles? Or will the Great Powers co-operate in maintaining their neighbours' independence and increasing their prosperity and cohesion? There can be no doubt where Britain's interests lie. In general terms it should sponsor as many world-wide economic policies as possible for increasing trade, raising living standards, evening out the trade cycle and ensuring that all increases in wealth are widely distributed. In economics, as in politics, there are limits to the surrenders of sovereignty to which the nations will consent, and the plans must accordingly eschew the grandiose. But their foundations should be laid with an eye to future extensions. The Keynes Plan is such a proposal. It should be supplemented by an International Finance Corporation whose particular responsibility would be to foster investment in development schemes which are too costly for single governments or which cross a number of national frontiers, or which would directly assist the economic development of areas too backward to raise themselves by their own heel straps. The pooling of food supplies proposed by the British at Hot Springs is another very desirable piece

of functional international machinery. The technical services instituted by the League, in particular the ILO, could be restored and expanded. And, although it would need vigilance to prevent them from adopting restrictive policies, some of the organisations set up during the war to control the supply of raw materials might be maintained to secure their fair distribution, and, when necessary, to even out the alternation of gluts and shortages.

Within the general framework of co-operation created by this network of international agencies, it should be the aim of British policy to strengthen the different regional groupings by encouraging their economic development, helping to provide them with economic and social agencies which transcend their different frontiers, and by giving support to any local tendencies towards closer political union. In three of the areas—Southeast Asia, Africa and the Middle East—Britain is in a position to give a bold and imaginative lead. The Government has already acknowledged the desirability of Regional Commissions. The Colonial Powers directly concerned—the British Commonwealth, Holland, France, Belgium and Portugal—together with other Powers with vital interests in the colonial area—the United States in Africa and Southeast Asia, China and possibly Russia in Southeast Asia—and with representatives of the colonial peoples, could form a council to cover the whole area, which, while leaving the administration of the colonies to their present owners, would provide for military security and for the development of inter-regional economic and technical services. If a real crusade is to be waged against disease and malnutrition and abject poverty, no one country can provide out of its own resources all the necessary expert technical and scientific skill. At the same time, the opening of an enlarged colonial service to able people from every nation would help to lessen the resentment of peoples without colonies. If the Council for Africa were imaginatively conceived and publicised, it might come to rank as a common interest for all the peoples of Europe.

United Europe

Of the remaining regions—South America, the Middle East and Europe—the security and economic development of the first is a closer responsibility of the United States than of Britain. Yet it is in the interests of Britain, America and the South American States that Britain's economic and cultural links with South America should be developed. It would prevent the growth of suspicions based on the one-sided predominance of the United States and would keep open a broad avenue of contact with Europe. In the Middle East, the developments of the war have given Britain the opportunity for really decisive leadership. An article on page 314 goes into the possibilities.

The problem of Europe remains. For Britain—indeed for the world—it is the most vital problem of all. Two world wars have had their origin in Europe. Unorganised, it is still the greatest menace to world peace. Organised, it could be the richest cultural and economic complex in both hemispheres. Britain has an obvious and urgent interest in the establishment of an ordered, prosperous Europe. The fate of the only three attempts at political federation—the Polish-Czech and Yugoslav-Greek negotiations and Mr Churchill's offer of common citizenship to France—suggest that a frontal attack on European nationalism is still beyond the power of diplomacy. But, as in the other regional groupings, a vast amount can be done to build up the economic, technical and social adjuncts of unity. From the United Nations Relief and Rehabilitation Administration could spring such joint agencies as a European medical and veterinary service, an agricultural advisory board with a permanent pool of experts and technicians. The unification of European industry brought about by the Nazis could be maintained to put control of heavy industry—including German heavy industry—under European supervision. The Germans have also created a degree of centralised control for transport and the public utilities. This could surely be maintained in a modified form. A European grid system, a network of international trunk roads, joint arrangements for civil aviation—all these present technical problems

and possibilities on which the nations could work together without feeling and resenting a loss of sovereignty.

Two obvious difficulties stand in the way of this ideal of a unified Europe. One is the fear of the European nations that a unified Europe would ultimately be a German-dominated Europe. The other is the possibility that the Soviets may prefer a weak and divided Europe to a closer organisation which, they fear, might eventually be directed against them. British diplomacy has at least a chance of dispelling both fears, provided always that its action is sufficiently clear and emphatic. By pledging its military and economic resources to the fullest participation in the re-ordering of Europe, it can act as a counterblast to the fear of Germany, especially if its guarantees can have the more or less explicit backing of the United States. And a frank understanding with Moscow can surely convince the Kremlin that a peaceful Europe is a common interest and that neither of its Western allies will underwrite any organisation or policy directed against Russia's security.

All these questions represent only a part of the problems Britain will be called on to settle after the war. It is obvious, even from their bare enumeration, that they demand the highest measure of intelligence, flexibility and ingenuity. The old methods of diplomacy are bank-

rupt. The alternative methods most generally discussed—federation, Leagues, political councils—are not applicable to a world of jealous nationalism. It follows that methods more various, ingenious, and insinuating must be evolved. The first need of British foreign policy is thus intelligence—minds open to new ideas, ready to grasp the possibilities of any new situation, eager to bring every kind of skill—technical, industrial, economic, social—to the solving of international problems. The second need of British foreign policy is hard work, not only hard work by diplomats and experts, but hard work by the nation as a whole so that it has both the material resources, the energy and the inventiveness to be a power-house of capital, of goods, of men and of ideas. However carefully foreign policy is devised, in the last analysis it remains a function of the nation's well-being as a whole. Britain dominated the world of the 19th century because it was on a tidal wave of self-confidence at home. Appeasement abroad was only the expression of internal dullness and stagnation. So in the post-war world, the chief factor in a really successful foreign policy will be the attractive power of a Britain that has evolved its policy of full employment, attained its social security, assured its civil liberties, and that faces the future with confidence, gusto, clear-headedness and daring.

Active Citizenship

THE conversation took place, just about two years ago, at a stockbrokers' lunch in the City of London. There were present a number of City men and a Russian journalist, with an English journalist to hold the ring, and the talk turned, in the light of the new Anglo-Soviet alliance, on the different degrees of freedom in Britain and the Soviet Union. The Russian was pressed to admit that, under the Soviets, it is not possible to oppose or even to criticise the Government. He replied that this is so, but he went on to point out that it is possible in Russia, as it is not in Britain, for ordinary workpeople not only to criticise but also to secure the dismissal of the managers of the factories or offices in which they work.

Even without prejudice, there will be many people who will doubt whether, in Marshal Stalin's directed and regimented state, freedom even in this limited sphere can have the same connotation as in the aspirations of the people of this country. But, rightly or wrongly, there is a widespread impression in this country that this element of actual participation, this measure of control over the daily round and common task, is one important difference between the British and Soviet regimes. A large number of people are convinced that here, despite the familiar forms of representative government, they have neither part nor lot in the making of decisions: "They" rule; "We" obey. In theory, participation should be the common principle running through the whole of organised life in this country; all the units of British life—the associations, the societies, the churches, the joint stock companies, the trade unions, the clubs, the friendly societies, and the political parties—are, in principle, based upon the free and spontaneous participation of all their members in all their activities. Yet this is precisely what is now so widely doubted or denied; and so the system of local soviets and workers' councils, considerably more than a little idealised, is regarded by many with not a little envy. "It's their own show" people say; and in this way they explain, naively, no doubt, but significantly, the achievements and endurance of the Russian people since June, 1941.

Those who argue like this are not, for the most part, Socialists, still less Communists. They do not want so much to emulate the Russian experiment as to restore, in the complicated context of modern government and economy, the associative reality of British democracy. They are well aware of the elements in the Soviet regime which, from their own national and traditional stand-

points, are alien and distasteful; but they believe that their own form of freedom, which in principle they undoubtedly prefer, is in fact frustrated. The war has given a powerful stimulus to this line of thought. The organisation of total war has made it plainer than ever before that the few make policy and govern while the many do what they are told. On the other hand, new methods of giving ordinary people some sort of share in the making of decisions and the management of their daily affairs have been sought; the joint production committees of workpeople and employers in industry are the chief examples. It is certain that one of the most important questions which rank and file citizens, especially young ones, are asking about the post-war period is what sort of say are they, personally, going to have in what is done.

"We and They"

Conventionally the answer to this murmuring is quite simple. Wartime is abnormal. Wartime government, unlike peacetime government, has to be by compulsion; and joint-production committees and similar expedients are necessary merely for the sake of morale in exceptional conditions which will end when the war ends. Then things will be different. Parliament will become representative again and reassert its authority; so will local government councils. There will no longer be any need to order individuals about; and correspondingly no need, for instance, to maintain special devices for workers to take a share and an interest in the management of their work. In short, the *status quo ante bellum* is the answer. Unfortunately, it is not a satisfactory answer—though the emphasis laid upon the rehabilitation of representative government is vital. The doubts which have come to the fore during the war are not wartime doubts. They are only more strongly felt in wartime; the contrast between the few who give orders and the many who obey them is more vivid, because of the larger number of orders that have to be given; and the participation of everybody, or almost everybody, in work and sacrifice throws into deeper relief the non-participation of most of them in making the decisions upon which the orders are based or in applying the orders. The fact is that precisely the same problem of "We" and "They" existed, and will exist again, in peacetime.

The problem has two sides. The scale and character of modern administration and economy make it impossible

 INCORPORATED BY ROYAL CHARTER A.D. 1720

The authoritative position of THE
 LONDON ASSURANCE securely
 rests on 223 years of continuous
 world wide operation which has
 recognised throughout as an essential
 part of its policy that integrity is the
 foundation of commercial goodwill.

for any considerable proportion of citizens to take an active share in their direction and management; this is the technical reason why the few rule the many, and it is even more applicable in Soviet Russia than it is in Parliamentary Britain. But there is another reason, a social and human one; the vast majority of British people, whether as citizens or employees or church members or trade unionists or shareholders, have apparently no desire in normal times to undertake any responsibility for the associations to which they belong, so long as things go well. The state has outgrown the simpler forms of democratic association and, in its vastnesses, its citizens have surrendered their sense of public service. This question of participation has become articulate and pressing in wartime Britain simply because the public spirit of the British people has been re-awakened to a phenomenal degree by the challenge of war.

The real problem, then, is not only to apply but also to preserve and keep alive this public spirit in peacetime when the challenge of war has passed; and to apply it in spite of the technical inhibitions imposed by modern society upon the active participation of citizens and workers in the community's affairs. Two things seem sure about any solution. First, it is not possible to solve the problem of putting back the clock. To abandon large scale organisation and administration and mass production, and go back to a simpler and more primitive form of society, if this were conceivably possible, would be to throw away the means of ending poverty and insecurity, which this generation is the first to possess. Secondly, the solution must be by a marriage of old and new methods. The rehabilitation and revival of representative forms of government and association, within the limits set by the technical conditions of modern life, is a first necessity. So, too, is the achievement of a genuine and universal equality of opportunity in education, work and public service. But, in addition, it is necessary that there should be an adaptation and extension of the methods that have been used in wartime to secure general and willing participation in the war effort, including the principle and practice of universal national service.

Compulsion and Consent

During the war there has been compulsion to an unprecedented extent; but the basis of the effectiveness of this compulsion has been universal consent. The beginning and foundation of recruitment for the forces, the factories and the air raid defence services has been the volunteer; the Local Defence Volunteers sprang to arms in a night before the Home Guard was thought of; the pilots who won the Battle of Britain and the wardens and firemen who fought the blitz were volunteers. Conscription and direction have been necessary for technical rather than political reasons, and there has been little or no opposition to them. The explanation is significant. The aims of the Government in fighting the war have been wholeheartedly approved, even though the right to criticise the conduct of the war in detail has been jealously and fruitfully preserved; and the people have desired to play their part at their appointed stations. If the aims of government in peacetime can gain the same approval, if the same willingness to contribute in a positive way to the common task can be secured, the peace effort can be accomplished with equal success—and with greater freedom of choice and action for the individual.

It is not easy to translate these generalities into concrete terms and specific proposals. *Pace* Rousseau, a nation cannot be forced to be free. It is possible, indeed essential, for the state to set its sights on targets that will catch the imagination and enthusiasm, and serve the interests of the community: full employment, industrial efficiency, equal opportunity, good health and housing, security for the individual, the family and the nation and the maximum of private and public enterprise. But it is not possible to ensure by Act of Parliament that the

parties and the electorate will in fact choose men and women able and willing to set these as their marks; to guarantee that the majority of citizens will be prepared, in peace as in war, to play a positive and active part. The people of Britain have more and more delegated their individual and civic responsibilities to a few professionals—party caucuses, trade union officials, central and local government officers, industrial managers, company directors and so on; and they cannot be compelled by enactment to resume their active interest. Indeed, the management of political parties, trade unions, central and local administration, industry and commerce is a professional and full-time job. It is not true, for instance, to say that even Parliament will be able to reassert its authority over the executive when the period of war government is over. Parliament cannot govern in modern conditions; its main functions will still be to choose the Government, according to the expressed preference of the electorate, to know what that Government is doing and to scrutinise and query its actions. The same is true of all the other associations that make up British life. They must still be run by professionals; but it is of crucial importance that their members should know and be interested in what is going on. There is a string of devices that might be used for this purpose with greater or less effect: the standing Commons committee to scrutinise departmental administration; the constituency committee of electors to scrutinise the qualifications of candidates and the activities of Members; the association of parents to learn and survey the running of schools; the panel of shareholders to watch over the interests that directors no longer represent; the joint production committee in factories and pits; and the committee of consumers to speak on prices and products for the unorganised and amorphous mass of purchasers in a particular trade. But in the main these are growths that cannot be forced; they depend for their development upon technical possibilities and upon the public spiritedness of the people, upon the will and the desire of individuals and groups of citizens to take part in their own affairs. All the state can do is to create the conditions in which active citizenship can flourish if the people wish it; and the state's prime responsibility on behalf of the community for protecting the interests of electors, parents, schoolchildren, shareholders, workers and consumers, cannot in any case be delegated.

Universal Service

The state's first duty is to represent, both in its personnel and its policy, the true interests, desires and aspirations of the people; and its second is to be efficient in the execution of that policy. Without the positive co-operation of every individual and every group within the community, which includes constructive criticism and honest opposition to particular Governments, the state can be neither representative nor efficient. Only by active citizenship can able and representative Parliaments be elected, to support and scrutinise able and representative Governments. Only by active citizenship and the adjustment of individual and sectional interests to communal needs can the goals of Full Employment, Social Security, Equal Opportunity and National Defence be achieved. That is why the greatest single contribution that the state can make to the remodelling of British democracy on positive lines, apart from the radical recasting of British education, is the permanent continuation of universal national service, so that every man and every woman, regardless of class or income, will be provided, not only with an equal opportunity to serve the community, but also with an equal training in the performance of service. If the widespread wartime wish to take a share now and afterwards in the affairs of the nation reflects a lasting reawakening of individual responsibility and the sense of civic duty, the finest hour of this country's freedom may be still to come, and the new and manifold rights which the commonalty very properly claim will be well and worthily earned—as earned they must be.

Enterprise and Efficiency

THE general economic policy of *The Economist*, as expressed in an earlier article, is one of believing that the twentieth-century system can find room both for constructive experiments in the technique of collective organisation and also for the freedom and the dynamism of private enterprise. The essential is that both principles should be allowed to develop their positive merits and that neither of them should be used negatively as a brake upon the other. There is a sphere for each; and though neither can be entirely banished from the sphere of the other—private enterprise cannot be allowed to be anti-social nor can state enterprise be wholly uneconomic—the effort should be so far as possible to clear the path for the incentive to action and progress which, in any particular field, is allowed to be dominant. There has been too much obstruction during the past thirty years. Collective management has been tried here and there—but timidly; it has been made to conform to “business principles” and has consequently, and quite naturally, not shown at its best. On the other hand, the private entrepreneur, though he has been left with much the largest part of the responsibility for taking the initiative and bearing the risks, has been burdened with any number of negative restrictions imposed in the interest of social welfare. The aim should be so far as possible to release both energising principles from their bonds.

Other articles in this Centenary Issue propound suggestions for experiments in collective organisation. This article is intended to show the other face of the medal and to suggest some of the ways in which private enterprise can be liberated from its obstructions.

The Rehabilitation of Profits

Perhaps the most important single requirement is that the private entrepreneur should be restored to a place of honour in the community. The present position of a great body of opinion is frankly absurd. On the one hand, nobody but the fanatics imagines that more than a comparatively small proportion of the national economy will be transferred to the management of the state for many years to come. Gradualness is not becoming less inevitable as the years pass. On the other hand, the business man is told that he is an anti-social influence. The manager of the nation's business (or at least of the largest part of it) is told that he is incompetent and immoral—and is left in charge. It ought to be said with all necessary emphasis that the private entrepreneur has been, is, and will remain a member of society of more than average usefulness and of complete acceptability. He is not simply a transient and embarrassing phantom, a mere caretaker left in charge until the state can get around to expropriating him. He is a permanent pillar of economic society. He will not, it is true, have the whole of economic activity for his province, as in the past. He may, in the course of time, be restricted to only about half of the national economy. But in that half he will continue, for as far ahead as can be seen, to be the linch-pin of the economic mechanism. Not only will he so continue, he should so continue. Such, at least, for better or for worse, is the opinion of *The Economist*.

Much of the confusion arises from the very muddled thinking that is now fashionable on the subject of the profit motive. The Archbishop of Canterbury, it must be said, has done more than any other individual to obscure the issues. What distresses the moralists—and quite properly so—is to think of any activity as being impelled by greed. If they confined themselves to the condemnation of excessive profits, no one would disagree with them. But they do not. Their moral arguments apply only to excessive profits; but they speak of the profit motive tout court, and the Archbishop's famous example of his tailor shows that he cannot distinguish between profits and excessive profits. A trader who puts his prices up in

order to conserve his circulating capital is no more yielding to greed than a clergyman asking for Easter offerings; he is protecting himself against loss of livelihood.

The avaricious are to be found in every walk of life, and perhaps most frequently among business men. But it is a fantastic misunderstanding of the nature of the economic process to suppose that there is anything immoral about the profit motive. *The Economist*, for example, is run for profit. What does this mean? Simply that it cannot afford to run at a loss. A better name for the profit motive, in fact, would be the avoidance-of-loss motive. For every one business man who is motivated by the desire for excessive gain there are twenty who never get a chance to do more than avoid losses after paying a moderate rate of interest on their capital. No business enterprise which does not enjoy the state's taxing privilege can follow any other motive than the profit motive. Wherever there is an enterprise which boasts of not operating for profit, it will be found on examination either that it enjoys a subsidy or a guarantee against loss from some profit-earning body or else that its profits are so high and so well protected that it can afford to play the hypocrite.

It really is time that there was a little straight thinking on this subject of profits. The avoidance of loss is the necessary condition for an economic employment of resources. The emergence of a profit is (with certain well-recognised exceptions) the best proof of economic efficiency. It is true that many large incomes are based on profits (past or present) and that gross inequality of wealth is becoming more and more distasteful to the public. But to attack profits because there are rich men is like prohibiting milk because there is tuberculosis. Profits are not the enemy of wages, but the ally; they go up and down together, and it should be the interest of the Left to see that profits are as high as possible—whatever steps they may subsequently take to see that the profits do not get into rich men's pockets.

The Bugbear of Control

It will not, however, be enough simply to pat the business man on the back and tell him he is discharged without a stain upon his character; some more specific action will be needed. One of the business man's chief bugbears is what he calls bureaucratic control by the state, by which he means all those activities that involve filling up forms and requesting permission. Now it is obvious that the exercise of purposive direction by the state is going to require a volume of control, less doubtless than in wartime, but more than the business man has been accustomed to in the past. When the business man inveighs against “control” in general, he does not deserve a very great deal of sympathy. But there are controls and controls, and it is important that care and forethought should be given to the nature and technique of state controls as well as to their purpose.

The chief essential is to avoid divided authority and its concomitant, negative or restrictive control. Whenever one party has the initiative for taking action, and another party has to give its permission, there is danger of divided authority. Whenever, of two parties (the industrialist and the state), only one can say yes, but either can say no, there is a two-to-one bias of negation. In some cases, the activities of an industry are so closely affected with the public interest that the state must require its permission to be given in advance and in detail for every step in the development of policy—it may be that transport charges are a case in point. But if an industry gets to this point, there is a strong case for bringing it under state operation as well as state control.

In the generality of industries, the state's endeavour should be to choose, for such controls as it finds necessary, the least hampering forms. Thus, in many cases, control can be effectively exercised by a requirement of publicity

—that is, by leaving the business man free to act, provided he has to tell the world what he has done after he has done it. In other cases, instead of requiring a detailed system of licences the state can proceed by laying down a general principle of policy and by taking action *post facto* against anyone who infringes it. Or there is the technique of the open licence, which, with particular application to the markets of the City of London under exchange control, is described in another article in this issue. The tendency, in evolving the technique of controls, has been to consult the convenience of the bureaucrat much more than that of the business man. The former's desire is to have every case submitted beforehand for consideration and consent; the aim is to avoid mistakes. The business man's interest is to have known limits within which he can operate, but to be free to take his own decisions within those limits. It might be a sound idea to have a standing body, attached to each Ministry, whose task it was, not to question the purpose of controlling measures, but to adapt their form as closely as possible to the need for preserving the freedom of enterprise.

Tax-Collector and Wage-Earner

Hardly second to control as a business man's bugbear is taxation. Here again, the plea is not to reduce the volume of taxation (at least, if that is the plea, hard necessity prevents it from being listened to) but to levy it in the least damaging way. Any form of taxation has some deterrent effect on enterprise, but some are far better in this respect than others. The vital distinction is between taxes which diminish the rewards of enterprise and those which increase its risks, and there is nothing that more clearly illustrates the fact that the so-called “profit motive” is really the “avoidance-of-loss motive” than this distinction. If, through the operation of a 50 per cent income tax, the reward that a business man can hope to reap from a given transaction is cut in half, that will, admittedly, have a deterrent effect on his willingness to take the plunge. But the deterrent effect will be comparatively small; he will not have to pay the tax unless he reaps some reward. But if the tax is of the kind that has to be paid in any event, win or lose, then it actually increases the risk that the transaction will, in fact, result in loss, and the deterrent effect is much larger. Thus the golden rule in taxation is not to levy it until the profit has emerged; the taxation of losses inevitably leads to lack of enterprise and unemployment.

Between the wars, the British fiscal system took, in this respect, one step forward and a number of steps back. Rates, which have to be paid win or lose, were very largely removed from industrial undertakings in 1929. But there has been a steady growth in employers' contributions to social insurance (which, being a tax on employment, are a factor tending to make the giving of employment unprofitable), in heavy indirect duties adding to transport costs (such as the motor vehicle licences and the petrol duty), in protective tariffs on raw materials and in levies for special purposes such as the spindles levy in the cotton spinning industry. The argument is not that less money should be raised from industry, but that it should be levied after enterprise has been successful. Instead of the contribution to be levied from employers under the Beveridge Plan, for example, the present National Defence Contribution—a straight proportional tax on business profits—should be converted into a Social Security Contribution.

Labour is the source of another set of restrictions on the freedom of action of the business man. Here the argument is again similar—not to abridge in any way the gains won by Labour in recent decades, but to see that they fall on the business man in the way least likely to lead him to curtail his activities. Labour affects the business man in various ways. There is, for example, the question of restrictive practices—the sort of job-protecting rule that leads a trade union to insist on having twelve men on a machine that four or five could handle efficiently. It is easy to understand how these practices arise; but from the social point of view there is nothing whatever to be said for them, and it would be a good thing if the

employer could be given more assistance by the state—and by the Labour movement as a whole—in combating them.

Much the most important aspect of labour relations is the subject of wages, since nearly everything else that is done in the name of Labour has its effect upon labour cost and hence on wages. A high standard rate of wages is like any other form of fixed charge, an obstacle to the avoidance of loss and therefore a deterrent to enterprise. Trade union policy, in its earlier phases, necessarily concentrated on the concept of the standard wage, and it has become one of the Labour canons. But it is easily possible for labour to price itself too high and restrict its own market. Wages and earnings are not the same thing, and the individual wage-earner, like the tax-collector, might well earn more if he would defer part of his claim until the profit has been earned. From the point of view of a community that believes both in a high level of earnings and also in private enterprise, the ideal wage system is one that combines a moderate standard rate with a large share in profits. No such system can, with fairness to the worker, operate with variations from firm to firm in each industry; but there is a case for operating from industry to industry the sort of “ascertainment” that has functioned in the coalmining industry for many years.

The Equity Principle

Together with the tax collector and the wage-earner, the other partner to whom the manager of industry has to make payment is the capitalist. The principle remains the same: in so far as the payment is fixed in all circumstances, profit or no profit, it is a deterrent to enterprise; in so far as it is not made until after the profit has been earned, it can be far larger without being a deterrent. The business man's interest, in other words, favours equity financing and the ordinary share. Here, too, there has been retrogression between the wars. More and more the supply of capital has come to be in the hands of the banks, the institutional investors and the “small investor”—each of whom, for his own reasons, prefers a fixed interest security—less and less has it been in the hands of the rich man who was willing to take a risk. The state, so far from discouraging this tendency, has actively furthered it; for the new publicly-controlled boards, such as the Central Electricity Board and the London Passenger Transport Board, have been endowed with what is very nearly wholly fixed-interest capital. One of the more encouraging developments has been the growth of the unit trust movement, which is educating the small man in equity investment. Business in general looks like becoming a more rather than a less chancy matter, and it is essential that ways should be found by which the entrepreneur can get his capital on terms that share the risks and the profits. If the capital market is to be still further “institutionalised,” then the institutions must be made equity-minded.

This contrast between risks and rewards is, in fact, the heart of the matter. The gross revenue that the entrepreneur can draw from his venturing is becoming steadily more fluctuating and erratic as the world grows less stable. But at the same time the tax-collector, the wage-earner and the capital-provider have been making their demands more rigid. Between a fluctuating income and a rigid outgo, the risk of loss—which no private person can afford—is obviously greater. This, no doubt, largely explains the business man's endeavours in these last few decades to seek stability for his incomings by all the devices of protection, monopoly, restriction, price fixing and quota limitation. That way, as every one knows, lie stagnation and inefficiency. If the business man is to be told (as he should be) to abjure this form of error, he has a right to retort that there are others who should be told that they too cannot have perfect stability in an unstable world. It is the business man's particular function to take risks and to act as a shock-absorber between the world's instability and his other partners. His rôle is to have a fluctuating income. But there is a limit to the risks he can bear and still play his part. It is the community's interest to restore to him the possibility of free action.

The Future of Banking

IT is part of the institutional apparatus of banking to cultivate an air of traditionalism and stability. Banks cannot exist without the confidence of the public, and confidence is not easily granted to the changeable and the erratic. Banks must seek liquidity, but not fluidity. Their architecture is chosen (perhaps subconsciously) to suggest massive permanence and the whole appearance they present to the world must set at defiance the mutability of human fortunes.

Behind this professionally unruffled façade, however, the calling and industry of banking has been changing more rapidly in the last thirty years than in probably any other comparable period since the banker evolved from the goldsmith a quarter of a millennium ago. A bank—not only in this country—will be a significantly different institution after the Second German War from what it was before the First. The changes have not been at the instance of the banks themselves, nor have they been entirely welcome. The banks, in fact, have been largely passive agents, and the transformation of their activities has been a by-product of the wider convulsions of our times.

The nature of the changes can best be seen by a summarised comparison of balance sheets. The following table shows the assets and liabilities of the joint-stock banks of Great Britain in 1913 and in 1943. The figures for almost all the English banks are for December 31, 1913, and for June 30, 1943; those for the Scottish banks are from the balance sheets nearest to those dates:—

JOINT STOCK BANKS OF GREAT BRITAIN
(£000's)

Liabilities	1913	1943
Capital and reserves	99,364	176,508
Deposits	935,239	4,060,125
Other liabilities	88,251	163,850
Total	1,122,854	4,400,483
Assets		
Cash in hand and money at call and short notice	269,919	817,430
Investments	159,287	1,418,538
Treasury deposit receipts	...	905,500
Discounts and advances	617,564	1,076,533
Other assets	76,084	182,482
Total	1,122,854	4,400,483

The most obvious difference between the two years lies in the totals of assets and liabilities. In the thirty years, the balance sheet totals have increased almost exactly fourfold. At first, this may not seem badly out of line with the increase in the national income in the same period. National income in 1913 was probably about £2,400 million and must be running in 1943 at about £7,500 million—an increase of just over 200 per cent. But national income is unduly swollen by war conditions. If the comparison is made over the 25-year period from 1913 to 1938, from the eve of one war to the eve of the next, the increase in the balance sheet totals of the banks was 163 per cent, and in the total of deposits 177 per cent, compared with an increase in the national income of about 90 per cent. Clearly, the banking business has been expanding much more rapidly than the wealth and income of the country.

The cause of this expansion is, of course, the great creation of credit during the two wars of this generation. A full-scale war cannot be financed wholly out of the proceeds of taxation and of "genuine" savings (i.e., savings derived from individual and corporate expenditures being less than income). Both in the last war and in this, the Treasury has had to have recourse to the banks. This method of financing is not necessarily inflationary in the wider economic sense of the term; it may merely reflect the hoarding of funds by persons who, for one

reason or another, do not invest them in Government loans. But it certainly exerts an inflationary effect upon the balance sheets of the banks. When a bank advances £100,000 to the Government against Treasury deposit receipt, £100,000 is added to the assets and (when the Government spends the money) to the liability side of the balance sheet without there being any, or at least any commensurate, subtraction from any other items.

The Unreceding Tide

This is, of course, familiar doctrine. But what is more interesting, and less generally realised, is that the tide never recedes. So far as it is possible to tell from the inadequate statistics, the banks' deposits increased during the last war—say from 1914 to 1920—in slightly smaller proportion than the national income. But when the war was over, national income diminished under the double influence of falling prices and rising unemployment while the credit created remained. The highest end-year total of deposits in the English and Scottish banks was £2,266 million in 1921; the lowest of the subsequent years was £2,048 million in 1925—a fall of less than 10 per cent from highest to lowest. When the war and its aftermath were over, the public was left with a substantially higher volume of money and credit, relatively to its income, than it had before the war began. Moreover, throughout the years of peace, there seemed to be a similar tendency for the money supply to outrun the national income. Between 1924 and 1938, the national income, on Professor Bowley's estimates, increased by a little less than 12 per cent. During this period, the total of English and Scottish bank deposits increased by 26 per cent. If the period is examined in detail, the cause is discovered to be similar to that in the war period. When the national income is increasing, as in 1924-29 and 1932-38, the banking system expands; when the national income contracts, as in 1929-32, the banking system does not contract with it.

The present war is repeating the experience of the last. The exigencies of Government finance are creating the necessity for a large and continuous expansion in the banking system. Every year since 1939, the deposits of the London clearing banks (whose figures, unlike those for all the banks in the country, are available month by month) have increased by from 10 to 18 per cent, and 1942, on the average, was about 44 per cent above 1938. This is less than the increase in the national income, which was 64½ per cent in the same period. But the national income will fall after the war; there will be a reduction in overtime earnings and some prices will fall, even though any overall decline in the price-level is avoided and full employment is attained. In the April, 1943, issue of the *Economic Journal*, Mr Nicholas Kaldor estimated that the post-war national income—on certain reasonable assumptions, of which a 25 per cent rise in the general level of prices was one—would be £6,500 million, or 40 per cent above the 1938 level. But, if the recent rate of expansion in the banking figures continues until the end of 1944, bank deposits in 1945 will be from 80 to 85 per cent above 1938. In these quite likely circumstances, over the whole 32 years from 1913 to 1945, bank deposits will have increased about fivefold and the national income about 2½ times. The ratio of bank credit to the national income will have almost doubled in a generation. If war finance continues beyond the end of 1944, or if there is a slump in prices, or if reasonably full employment is not maintained—in any of these contingencies the conclusion will be reinforced.

It would be tedious to recite the figures for other countries. It must suffice to say that all other countries with a similar banking tradition to the British have had the same general expansion.

LLOYDS BANK

LIMITED

The name of Lloyds has been a household word in banking circles since 1765, when the firm of Lloyds & Company was established at Birmingham. In 1865, this firm became a Joint Stock Company and was known as Lloyds Banking Company Limited, which name was changed to the present title in 1889. Since 1865 more than fifty private and Joint Stock Banks, one of which was established in Lombard Street in 1677, have been absorbed by Lloyds.

Whilst maintaining many of the traditions attached to the days of the private banker, Lloyds Bank has kept abreast of the changing conditions and customs of the time, and the services it offers have been constantly extended and modernised.

Head Office:

71 LOMBARD STREET, LONDON, E.C. 3

Established
1833

NATIONAL PROVINCIAL BANK LIMITED

Head Office:

15 Bishopsgate, London, E.C.2

Affiliations:

COUTTS & CO.
GRINDLAY & CO. LTD.

The Westminster Bank

is represented by an extensive system of branch offices in England and Wales with agents elsewhere, and is amply equipped to conduct your private and commercial banking business. The Manager of any branch will gladly give an interview to discuss or explain any point which will help a client, or prospective client, to a full use of the services available to the Bank's customers.

WESTMINSTER BANK
LIMITED

Head Office: 41 Lothbury, London, E.C.2

Experience and Progress

Barclays Bank has a history covering a period of more than two centuries. The accumulated experience and sound traditions of the past are united with a progressive policy in an organisation fully equipped to meet all modern requirements.

The Bank has Branches throughout England and Wales and is directly represented by affiliations in many parts of the Empire and elsewhere.

BARCLAYS
BANK
LIMITED

many cases (in the United States, for example) the depression led to much greater monetary expansion than occurred in this country.

Expansion, even on this scale, would not by itself justify the assertion, with which this article started, that the whole character of banking is changing. But the expansion has had profound effects upon the composition of both sides of the banks' balance sheets. On the liabilities side the changes are not immediately apparent. Capital and reserves, it is true, are much lower relatively to the total business than they were thirty years ago, with the result that satisfactory dividends can be earned with a lower rate of profit on turnover. But the more important changes on the liabilities side are wrapped up in the total of deposits. In fact, it is impossible to be certain what the changes are. It can only be said that they must be considerable. Since 1913, something like £3,000 million of bank credit has been created and has lodged in the deposits of the banks. Who owns these deposits? How has the distribution of the total—for example, between individuals and business firms—altered? These are questions to which it would be most valuable to have the answers. One thing, however, is clear. The deposits now on the books of the banks have not originated from anything that can properly be called saving. Three-quarters of them have come into existence since 1913, and their origin lies in Government financing. Whatever may have been true in the past, it is almost wholly misleading today to regard bank deposits as the fruit of voluntary abstinence on the part of anybody.

Investments and Advances

The changes on the assets side are more interesting. Over the whole period, the figures are available only in the very summary form given in the first table of this article. Even this, however, shows the main outlines of the changes that have taken place. In 1913, investments and advances were 55 per cent. To-day, investments have risen to 32 per cent, and discounts and advances have shrunk to 24 per cent. The story can be traced in more detail from the London clearing banks returns for the period from 1924 to date. In the following table, the 1924 figures are the monthly average of that year, the 1943 figures the average of the first six months of the present year. (The division of discounts between commercial and Treasury bills has been estimated for 1943; the 1924 figure is taken from the Macmillan Report):—

LONDON CLEARING BANKS

	1924		1943	
	£ mn.	%	£ mn.	%
Cash in hand and at Bank of England and cheques in course of collection.....	217	11.4	499	13.1
Money at call and at short notice.....	80	4.2	151	4.0
Commercial bills discounted.....	126	6.6	(50)	(1.3)
Treasury bills discounted.....	105	5.5	(123)	(3.2)
Treasury deposit receipts.....			917	24.2
Investments.....	365	19.1	1,133	29.8
Advances to customers, etc.....	774	40.6	759	20.0
Other assets.....	239	12.5	168	4.4
Total assets.....	1,906	100.0	3,800	100.0

The money at call and at short notice is used in the stock exchange and discount markets and can therefore be regarded as indirectly invested in securities and bills. If an arbitrary distribution of this figure is made, it would appear that in 1924 the clearing banks were lending about £500 million to the Government against about £950 million to the public. In 1943 the figures are about £2,275 million to the Government against £860 million to the public. In 1913 loans to the Government probably absorbed only about one-sixth of the banks' resources and in 1924 only just over one-quarter; to-day the proportion is three-fifths and by the end of 1944 it may well be about two-thirds or even more.

Nor is this change due entirely to the increase in Government securities. Perhaps the most interesting phenomenon of all is the decline in advances. In 1913

the advances of the constituent elements of the present clearing banks were probably about £450 million; in 1924 they were £774 million, and to-day they are £759 million. Thus over the whole period of thirty years, while the national income has more than trebled, the public need for accommodation from the banks has increased by less than 70 per cent; and during the nineteen years since 1924, while the national income has nearly doubled, advances have actually fallen. Wartime conditions, admittedly, are peculiar; but the comparison would still be startling enough if it were taken to 1938.

What has been happening, in short, is that the state has been forced to multiply the means of payment in existence. This newly created credit has lodged in the hands of individuals and business firms who use it as their circulating capital instead of borrowing from the banks. The banks are left to hold, in the form of deposits, this greatly inflated corpus of credit, while the mere fact of its existence deprives them of the possibility of employing it in the classical way. In other words, the textbook definition of a bank is now badly out of date. A bank used to be an institution which collected savings by offering to pay interest on them, and used them to make loans to industry and trade. A bank nowadays is an institution which holds the credit-money of the community, created by Treasury financing, and uses it to finance the Government deficit.

Will there be a reversal of trend after the war? There may be some revival in the demand for advances, and it is possible that the banks will be able, over a period of years, to dispose of some of their inflated holdings of investments (the second change depending, of course, upon the first). But it is unlikely that there will be any substantial reversal. If, after the last war, in spite of the sharp deflation of prices and chronic depression, there was a contraction of less than 10 per cent in the total volume of bank credit, is a large decline, or any decline at all, likely after this war? Moreover, both public and expert opinion, in its present mood, looks with much less disfavour on Budget deficits than it did after 1918. The omens would seem to suggest a continuance rather than a reversal of recent trends.

The Pampered Depositor

If so, several important consequences for the banking system seem to follow. Banking practice hitherto has been based on attracting and pleasing the depositor. He was the basis of the business. Unless he could be persuaded first of all to accumulate savings and secondly to entrust them to the banks, there would be no banking business. But this is completely untrue to-day. The depositor cannot do anything else with his balances but leave them on deposit. They did not originate in any abstinence on his part; they came into existence as bank credit, and can have no other form of existence. Even an attempt to convert them *en masse* into "currency" would have no other effect on the banking system as a whole than to turn them from one form of bank debt into another (though it would, of course, raise difficult problems as between the joint-stock banks and the Bank of England). The depositor of to-day is rendering no service to the banking system in "depositing his money" with it; he cannot help himself; and the banks are performing a very large service of convenience to him in handling his transactions. The boot is entirely on the other foot. It is true that any individual bank must, in theory, defend its deposits against the other banks, but with such few and such equally well managed banks as there are to-day, there is really little force in this argument. It follows that there is no longer any justification for the pampering of depositors in which the British joint-stock banks, perhaps more than those of any other country, still indulge. The banks perform most valuable services for their depositors for which their charges are much lower than either the cost of performing them or the sum the depositor would pay rather than go without them. Of the functions that the banks perform, that of holding the community's cash and handling its transactions is being heavily subsidised at the expense of the others.

The Cost of the Debt

What are these other functions? Broadly speaking, they are those of lending to the Government and to the public, in the ratio of about three to the former and one to the latter. Clearly, if the rates charged for these loans can be reduced, the public interest will be served. Cheap money is an essential part of any full employment policy and the rate charged by the banks for advances is one of the basic elements in the whole interest-rate structure. As for the rate charged on loans to the Government—whatever the exact instrumentality—the advantages of a reduction are obvious. The only justification that can be advanced for charging anything like commercial rates on created credit lent to the Government is that the banks incur costs in handling the deposits to which their loans give rise. But if depositors bore the costs of handling, this argument would disappear. It would certainly be wrong after the war to fund the floating debt now held by the banks (either in Treasury Bills or in Treasury Deposit Receipts), unless some form of funding could be devised that would not increase the rate of interest paid. And methods should be explored of further reducing the burden on the Exchequer of servicing the public debt held by the banks. There are great technical advantages in having part of the banks' holdings in securities which can be bought and sold on the market, and these securities naturally bear the market rate of interest. But the rate paid on Treasury Bills and Treasury Deposit Receipts is fixed almost at will, without regard to the markets, and it might not be impossible to assign arbitrary rates of interest to part of the banks' long-term holdings—that is, to their investments.

This suggests an altogether novel way of regarding the profit-and-loss position of the banks. After this war, some two-thirds of their business will, in effect, consist of financing the Government, and on the greater part of this business there is no external criterion for determining rates. Over a period of years, the aim should be to shift the greater part of the burden of meeting the operating costs of the banks—suitably abridged by all reasonable econo-

mies—on to the depositors, at least to the extent of charging, for the services performed, what they are worth to the recipient. If, after this has been done, there is any part of the total costs (including reasonable profits) which is not covered by (a) interest charged on advances, and (b) interest earned on securities purchased in the open market, then—but only then—a charge should be made for the remainder of the public debt held by the banks. In other words, the cost to the Exchequer of this portion of the national debt would be the net cost of operating the banking system, after all those for whom it performs services have paid for them. This net cost might well turn out to be nil, or even negative.

This suggestion has been stated bluntly, with the aim of clarity. But it would be sufficiently disruptive of traditional banking practice to require the most careful examination before it could be applied. It may, in part, be described as an attempt to apply to the banks as a whole the principles that already govern the Issue Department of the Bank of England. The analogy is close; for the joint-stock banks are rapidly approaching the position of the Issue Department. On one side of their balance-sheets they are issuers of fiduciary money; on the other they are holders of public debt.

It is not the purpose of this article, however, to propound any specific proposals, except by way of illustration of the type of adjustment that will be necessary to meet the changed position of the banks in the community. It is the extent of that change that it has been here intended to emphasise. Thirty years ago, the banks were trading institutions like others, with particular responsibilities for probity and caution, but with no closer organic connection with the central mechanism of the state than many other industries. To-day, they have been caught up in that mechanism beyond the possibility of disentangling. It is easy to show that the ingenuous device of simple nationalisation would create many problems and solve none. But it is even easier to show that some readjustment of the banks' relationship to the community will soon be inescapable.

The Steel Industry

A Case-Study in Industrial Policy

THE steel industry of Great Britain is an excellent clinical case for the new art of industrial politics. It is an industry whose existence and efficiency are basic to the strength of the country in peace or in war. It is an industry whose present state is unsatisfactory. But it does not lend itself either to simple nationalisation or to simple competition. And the compromise solution that has been pursued since 1932, that of a protected and state-sponsored cartel, seems to most of those who have no interest in the matter to be the worst solution of all. Monopolistic practices in the steel industry would ensure an early if comfortable death from hardening of the arteries; the enforcement of price competition would bring a painful death from capital starvation; bureaucratic control might keep the industry going, but with the community paying its bills. The economics of steel illustrate the urgent need for a new technique of organisation which will ensure the progress and efficiency of large-scale modern industries, a technique which should combine the virtues of private enterprise and initiative with the virtues of disinterested expert guidance and direction in the interests of the community.

Steel economics are dominated by three factors. First, the capital required for a modern steel plant is very large, running into millions of pounds. The technical developments of the present century have steadily increased the size of the minimum efficient unit. Secondly, the rate of obsolescence in the industry is high, since the technique of steel-making and the science of metallurgy are both still advancing very rapidly. Better methods and new pro-

cesses are continually being evolved—for example the new sheet mills of Richard Thomas and Co., Ltd., at Ebbw Vale, turn out not only cheaper but also better sheets than the old mills in South Wales. Thirdly, the demand for steel fluctuates very widely from year to year. The management of an efficient steel industry thus involves not merely a high degree of technical competence and initiative, but the willingness and ability to take large risks.

Defects of Old Methods

The organisational difficulties of the industry arise out of these three factors. In the period before 1914—or at least until the end of the nineteenth century—these difficulties did not arise, partly because the demand was still rising rapidly, but mainly because, in the then state of technique, there was room in the British market for a comparatively large number of separate units. The conditions approximated to those of a competitive market, and competition worked. The basic reason why free competition (which may still be appropriate in the United States) will not work in Great Britain to-day is that the units are too large relatively to the market. The erection of a single new plant—or the extension of an old one—is of concern to the whole industry and might knock it off its balance. In these conditions, competition could only result in the cutting of prices down to levels at which they barely covered current costs and made no provision for the maintenance, renewal or improvement of plant.

The attempt of a newcomer to compete by the erection of a more efficient plant might, by paradox, result in a lowering of the average efficiency of the whole industry.

Some measure of combination, to prevent prices from being so far reduced that capital cannot be maintained and to control the erection of new capacity, is thus almost inevitable in a country such as Great Britain. In accordance with the general economic policy of the Baldwin-Chamberlain period, the steel industry was, in 1932, given the protection it asked for and encouraged to form its own central organisation. The public interest was to be secured by the appointment of an independent chairman of the British Iron and Steel Federation. The results of this policy are well known. There was a certain amount of technical reorganisation, and the standard of efficiency rose from the low levels to which it had been driven by the prolonged depression of the 1920's. But the degree of reorganisation was limited by two factors. First, the sovereignty of the steel firms could not be infringed, unless, of course, like Richard Thomas, they got into trouble with the banks. This meant that reorganisation had, in most cases, to stop short at the financial frontiers, which were almost as intricate as the political boundaries of eighteenth-century Germany. And secondly, the policy of the Federation had a definite bias towards making things easy for the high-cost producer. It is one thing to say that a newcomer should not be allowed to shatter the whole price structure of the industry. It is another to say that every existing producer shall be enabled to go on earning profits. If the period 1932-39 was one of steady progress in technical efficiency, it was also one of rising prices. Whoever benefited from the increased efficiency, it was not the British steel consumer, who was consistently charged a price for his material higher than his foreign competitors had to pay. The independent chairman was doubtless a brake on these monopolistic practices; but it is perhaps a sufficient verdict on the efficacy of the device to note that the Import Duties Advisory Committee, the inventor and best friend of the independent chairman, had concluded by July, 1937, that an independent body was necessary to represent the public interest in matters of capital development, price fixing and tariffs.

Nationalisation?

If neither competition nor self-government is the solution, perhaps the industry is "ripe for nationalisation"? It is indeed very heavily affected with the public interest, and the right and duty of the state to control its destiny have been admitted for many years. But there could hardly be an industry less suited to nationalisation in any of the accepted meanings of the word. Outright departmental control is quite out of the question; nothing is less routine and more unlike the accustomed principles of Treasury control than the management of a steel mill. A public corporation, with a fixed-interest capital structure and committee government, would be hardly any better. It is rather a case for the abandonment of preconceptions and for the evolution of a new form of organisation to fit the special requirements.

The interest of the state can be stated quite briefly. It is to ensure that the industry is brought to the highest possible pitch of technical efficiency, and to see that the fruits of this efficiency accrue (after reasonable provision for capital) to the many industries for which steel is a basic raw material. There is no inherent reason why these aims should not be achieved. The basic advantages of this island in steel-making still remain. There is coal in plenty; iron ore is easily available—either imported ore brought to the coastal mills, or the low-grade native ore, the use of which has so greatly increased in recent years, especially during the war. The second largest national income in the world—and therefore, other things being equal, the second largest market for steel in the world—is at the mill gates. Skilled labour exists at wages distinctly lower than in North America. In the whole chain from mine to ultimate consumer there should be a smaller element of transport costs for British steel than for any

foreign steel. There is no reason why steel should not be made as cheaply in this country as anywhere else in the world. The war will not have disturbed the industry this time nearly as much as last. There has been some improvement of the main carbon-steel capacity of the country; but there has been no great expansion and accordingly there will be no great problem of excess capacity. Where the expansion has occurred is in special steels and in special processes—in alloy steels and in such things as drop forging capacity—and these are the departments in which the greatest buoyancy of demand can, in general, be expected.

The Technical Approach

On what lines should reorganisation proceed to turn these potential advantages into actualities? The key to the problem lies in the technical approach. The great technical defect of the British industry is its dispersion in small units. As a first step, let a purely technical plan be drawn up for the geographical re-grouping of the present capacity of the industry. It should be a plan for rationalisation, in the sense that its object is to re-group the industry in technically rational units. The instructions to the technicians should be to ignore all questions of ownership and to think solely of furnaces and mills. The details of such a plan are highly technical matters; but the layman can understand the first principles. The conditions of production and demand preclude the concentration of crude steel production in a few plants of American size. Some plants would have to be near ore bodies as they are now, while others could best be located on the coast, where they can draw on sources of cheap imported raw materials. There can be very little doubt that such a technical plan would result in a reduction in the present number of units and in the emergence (together with a number of special plants) of a comparatively small number of much more closely integrated units. In some cases, existing plants might be left untouched. In other cases, there might have to be additional construction at some centres to match scrapping elsewhere. And in some cases there might well be physical removal of plant from one location to another.

The second stage should be to turn this technical plan over to the financiers with instructions, not to amend it, but to devise methods by which the tangle of ownership could be sorted out and each technical unit become the property of one company. This, again, is a specialist problem of some complexity. But it is not impossible of solution. One possible method would be to create a new company for each technical unit, to convert all existing companies into holding companies and distribute the shares of the new operating companies in accordance with a valuation of assets or some other agreed criterion.

The third stage should be to see that the industry, thus rationalised, was provided with sufficient capital to replace every item of obsolescent plant. In so far as the grouping itself involved new construction, it would automatically effect a certain amount of replacement, but much more would certainly be needed. If this additional capital could be raised in the capital market, well and good. But it is unlikely that the whole would be forthcoming from the public. In that case, the state would have to find the finance. But if so, it should provide the finance on equity terms—that is, by the purchase of ordinary shares in the operating companies. This is desirable on two grounds. The first is that it would not burden the new companies with heavy fixed-interest obligations at a time when the average future rate of profit must be impossible to calculate. The second is that it would provide a means whereby the state could exercise a direct control in proportion to the public funds invested in the industry. There is, of course, ample precedent for equity investments by the Government. If one generation could purchase a portion of the equity capital of the Suez Canal Company and another generation make an equity investment in the Anglo-Iranian Oil Company, there is no reason why a third generation should not buy the ordinary shares of a still more important industry. And if this investment of equity capital by the Government led in due course to a

majority holding, then nationalisation would have been secured by the most orthodox methods of capitalist finance. But even after such a culmination of the policy, it would be essential that each of the operating companies should be run as an ordinary commercial enterprise, under a board of directors and with the best managers that money can hire.

A Steel Commission

A policy such as has here been outlined will never be brought to birth by the worthy bureaucrats of the Board of Trade and the Import Duties Advisory Committee. Nor will it ever be recommended to the Government by the British Iron and Steel Federation (which is the existing companies) or by the Iron and Steel Control (which is the same body under another name) or by the Raw Materials Department of the Ministry of Supply, whose Minister is the former (and possibly prospective) independent Chairman of the Federation. In short, if any policy of this nature is to come about, a necessary preliminary would be the appointment of that independent body to represent the public interest which IDAC proposed in 1937. Such a Steel Commission, in fact, is very badly needed. It should consist, not of representatives of management or labour (though it might well have representative assessors to assist it), but of persons chosen for their individual technical knowledge and competence. The place to look for prospective members of such a Commission is among the younger and more progressive managers and technicians in the industry, and it would be an advantage to have one member with American and another with Continental experience. These Commissioners should be full-time servants of the Crown; they should be paid

enough to secure first-class men; they should be required to sever all connections with the industry; and they should act collectively as the advisers of the Government on all matters relating to the steel industry.

Their first task would be to draw up the plan of rationalisation outlined above, and their second to see it through to accomplishment. In the third stage, they should be the channel through which Government funds are supplied to the industry and the registered holders of any shares acquired. But their functions would not end with the rationalisation plan. IDAC proposed such an independent body for purposes of price-fixing and tariffs, as well as for capital development. They should in fact be the agency through which the state exercised any of its functions in relation to the industry. The industry as such should have no power to fix prices or to designate production quotas. If fixed prices or output quotas were needed, the Steel Commission should fix them. If protection against foreign competition were needed, the Steel Commission should fix its amount. Its standing instruction from Parliament should be to ensure that the technical efficiency of the industry—not merely in a few show plants but throughout the industry—was maintained at the highest pitch and, remembering that this involves the earning of fair profits on existing capital, to see that the benefits of efficiency were passed on in the fullest possible measure to the consumer.

The solution here sketched has been hand-tailored for the steel industry. There is probably not another industry in the country that should be handled in just this way. The better will it serve as an example of the flexibility of methods that needs to be sought in adjusting the relations between individual industries and the state, as trustee for the community.

An International Example

IT is a truism in Hitler's world to say that national sovereignty is not enough. The scale of military and industrial power necessary to mount a modern war effort debars any but the largest Powers from maintaining effective security in isolation. Unfortunately the passion for sovereign independence is, if anything, stronger to-day than fifty years ago and the difficulty about most schemes for securing interdependence, be they Leagues or federations or multilateral alliances, is that they attack the question of sovereignty at its rawest and most sensitive point. The central fact about a federation is that it transfers powers from the participating states to a new federal authority. By definition, it is a diminution of sovereignty. It tends, too, to transfer just those powers which modern statesmen look on as the hallmark of independence—foreign relations, military power, broad questions of economic policy.

Yet the need for interdependence remains. If solutions are not immediately obvious in the sphere of politics, they must be sought by other means and at other levels of international life. One of the most striking facts about the League of Nations is that its economic and technical services showed more solid achievement than its political efforts. In the course of this war, too, technical and economic arrangements directed towards specific objects—such as Lend-Lease, the various raw material controls, the shipping pool—have had a profounder effect on the activities of the participating Powers than general political arrangements such as the Pan-American conferences. It can be argued that if agreement between the nations is sought in relation to a specific problem and not to a particular transfer of power, it is far easier to secure agreement. Power falls into its proper perspective when it is seen, not as an end in itself or as a jealous possession, but simply as a means to accomplish a desirable end. Sovereignty is sacrificed without any consciousness of sacrifice, for while absolute control is diminished, possibilities for positive action are greatly enlarged.

This method of concentrating on particular problems as opposed to general political principles may be called the

functional approach to international collaboration. Too much must not, of course, be claimed for it. The basic problem remains the same—the pooling of political power, particularly of military power. But functional co-operation can be a means for persuading the Powers ultimately to make the wider sacrifice. By showing them that minor sacrifices of authority for specific ends are not only easy but advantageous, it can put them in a better mood for accepting the final sacrifice of power to a super-state or world authority which is the only ultimate guarantee of peace. Britain needs international order more than any other Great Power. It would be folly for the British to neglect any method of reconciling the nations to pooled sovereignty. Indeed it would be doubly foolish to do so, for, by a typical process of British empiricism, a remarkable piece of functional international machinery, the Middle East Supply Centre, has been evolved in the course of this war. It is an experiment which can be maintained in its own area for the post-war period and, with modifications, serve as a model for similar centres elsewhere.

Supply Centre

Among the states served by the MESC—Egypt, Iraq, Persia, Syria, Lebanon, Transjordan, Palestine and Saudi Arabia—form, broadly speaking, a natural regional grouping. They are to an overwhelming extent Arab. They have very similar climatic conditions—extremes of heat and cold and a general problem of drought. With the exception of Palestine and Egypt, their industrial development has hardly begun. Great economies could be secured if the area were developed as a unit. In any case, many of the problems, particularly the problem of power and irrigation, cross national frontiers. But the states are fiercely nationalist, and where, as in Syria and Palestine, dependent status is still maintained, full national sovereignty is the chief goal of politics. The Middle East is thus a microcosm of a much broader world problem—how, in an area which in order to achieve prosperity and security cries out for unification, to transcend a multitude of jealous national sovereignties.

FOR 100 years *The Economist* has commented on, criticised and interpreted affairs. It has seen life move at an ever-increasing tempo; it has seen ideas that could not stand the test of time disintegrate before more enlightened thought.

From the opening of this century HARRAP'S have published books for thinking people—students' text-books, dealing with principles such as PROF. GIDE's standard works; topical and provocative books such as GUSTAV STOLPER's *This Age of Fable* (10/6 net), or contributions to current discussion, such as *The Problem of Unemployment* (9d. net). the 'outstanding' paper by LEVER BROS. AND UNILEVER LTD.

HARRAP'S offer their congratulations and good wishes to
The Economist.

102 YEARS STEADY PROGRESS of the United Kingdom Provident Institution for Mutual Life Assurance

	Total Funds	Total Amount Assured (including Bonuses) in Force
1850	£44,222	£507,107
1870	£1,246,168	£5,646,149
1890	£4,902,801	£11,618,386
1910	£9,182,354	£21,727,373
1930	£18,960,141	£46,437,663
1942	£27,857,680	£63,935,534

The above figures give an indication of the ordered progress of this Mutual Life Office, which has continued to gather strength and popularity since it was established in 1840. Having no shareholders its only concern is for its policy holders, to whom the whole of the profits belong. Its valuation is stringent and past bonuses have been on an attractive scale. It has branches in most large towns.

Correspondence invited or Prospectus sent on request.

SIR ERNEST J. P. BENN, Bt., Chairman and Managing Director.

THE UNITED KINGDOM PROVIDENT INSTITUTION

Head Office: 196 Strand, London, W.C.2

Phone: Temple Bar 4062

The MESC's wartime work is chiefly to regulate the flow of supplies into this area in the interests of war economy. This it can do because shipping is short and all imports come in on sufferance. The question here is not the activities of the Centre during the hostilities, but whether as a piece of machinery it can serve a vital purpose after the war. Its organisation is simple. Since 1942, it has been a joint Anglo-American venture. It derives its authority from the fact that it is the sole channel through which the British and American Governments deal with the various supply problems throughout the Middle East. The men working at the MESC are predominantly technical and scientific and, incidentally, young. Their chief work is to serve as a centre of information and contact, to advise, instruct and encourage the local authorities, to be, as it were, the guiding intelligence for the whole area.

Some of the work done by the MESC already points on towards the functions it could fulfil after the war. The establishment of the Centre as a clearing house for ideas led to the discovery that many of the experiments in agricultural development which were being successfully carried on in one area never found their way to neighbouring states, however similar the conditions. The MESC has become a general transmitter of agricultural projects and improvements. For example, the colonial authorities in Cyprus had worked out an admirable scheme for dealing with the menace of the goat to reafforestation. Since Cyprus, as a British colony, was administratively closer to the British West Indies than to its neighbours in the Mediterranean, it was only after the setting up of the MESC that the excellent system of goat-control was brought to the notice of the Syrians. Similarly, successful experiments in the growing of seed potatoes have now been extended from Malta and Palestine to other Middle Eastern states. Iraq and Persia have profited by Palestinian varieties of early-growing wheat.

Regional Services

This pooling and exchange of information is backed by surveys carried out by experts from the Centre into local conditions of agricultural production, with comments on how they could be improved. The Centre has also arranged for the provision of agricultural machinery. Most important of all, perhaps, are the schemes of irrigation which it has sponsored. Three are being operated in Persia, another is under discussion for the headwaters of the Euphrates. In Syria, a scheme which, like the Euphrates scheme, had been considered for years, was carried through by the 61st Tunnelling Company of the South African Army at the request of MESC. They bored a tunnel to the Litani River, and brought water to 7,000 acres, which will be bearing crops in 1944.

Another example of international co-operation planned through the Centre is locust control. Research established the fact that these devastating insects executed a regular nomadic cycle through the Middle East, wintering in Southern Persia, to return, marauding all the way, through Iraq, Syria and Egypt to Abyssinia. No one Government could ever have dealt with this vicious circle, but the MESC has been able to bring all the interested states together. Under the direction of Dr Uvarov in London, locust poison and the necessary implements have been despatched to Cairo; the RAF and the Red Air Force have provided the planes; and all the nations—Abyssinians, Saudi-Arabs, Persians, Iraqis—have joined the exterminating crusades operating from the air and on land the length of the Red Sea and up through Persia and Iraq. For the first time in history, the plague may be brought under control. Without the MESC, the necessary co-ordination would not have been achieved.

The MESC has operated successfully in the medical field. The shortage of medical supplies has compelled the various states to place their orders in bulk with the MESC. This has made possible a very useful standardisation of drugs and medical appliances and hospital equipment. Hitherto each state had its own preferences. The variations were valueless and prevented any pooling of the medical resources of the area. The new types of supplies are more

uniform, medical practices in different areas are being brought into line and, through the medical committees set up in the Middle East, government medical services are coming into contact, in the RAMC and the American services, with the finest medical minds of Britain and the United States. These two factors have undoubtedly raised the standard of public health already. In an area where malaria is a greater scourge than locusts, far more could be done.

The Post-War Task

There are a hundred other examples of successful work—the creation of new industries, for example, or the assistance given to transport. But these are enough to illustrate the kind of influence the MESC, and other similar centres, could exercise after the war. The Centre should be conceived of, first of all, as a pool for all kinds of economic, social and technical services. It should be able to make available at any time the best kind of advice and assistance to the Governments in the area it serves. These experts would vary. Sometimes they would be seconded from home or from another field job. Sometimes they could come out and serve a term of years. The important thing would be that, in an area starved of technical efficiency, expertise would be always available without onerous political or economic conditions attached to its use, although the various Governments should certainly be asked to contribute something in return for the advice they receive.

The Centre would also be a programming or planning Centre. The experts would conduct regular surveys of areas or problems and advise the Governments on the best methods of solving their difficulties. Any problem which was beyond the competence of the local authorities or involved two or more Governments could be referred to the Centre for expert opinion. Its conclusions would not be binding, but its powers of suasion would be very great. It would be hard for any Government to oppose a scheme fully worked out in practical terms and of obvious advantage to the whole area. The planning could cover schemes for capital development. In the past the Middle Eastern states have had neither the money nor the skilled labour nor the experts to embark on big projects. Since the sojourn of the British Army, two of these three lacks have been remedied. The area is bulging with sterling, and as local workers are released from roads and airfields and camps, a pool of skilled labour is coming into existence. What is needed is the vision and skill to transfer this potential wealth into practicable schemes. By energy and guidance and clear thinking the Centre could develop the work done so far a hundredfold. Irrigation schemes, roads, power, artesian wells, industrial development, all crossing and recrossing national frontiers, could give a unity to the Middle East which five generations of pan-Arabism would not achieve. Indeed, the Centre could be the kernel of effective unity round which the latent desire for political unity could grow up. Arab federalism in the abstract will split on nationalism, on prestige, on minority problems. Arab unity achieved through work and development and rising living standards is practical politics.

A Centre of this sort, beginning as a piece of effective machinery for regional planning, co-operation and research, might, if it were kept flexible enough and the people running it were sufficiently imaginative, stretch out in a hundred directions—to regional health services, transport authorities, public utilities, industrial and agricultural development boards—and be adapted with necessary modifications to other regions the world over—to East and West Africa, South-Eastern Asia, the Caribbean, South America, even Europe. That such a development would serve the cause of interdependence cannot be doubted. American participation is already a guarantee of its international character. Russian support would strengthen it still more. At the same time it would create a vast new field for British influence and British ideas. As a nation, the British are mature. They have reached high standards of technical and organised efficiency. Their industry has developed beyond the stage of mass production of cheap textiles and cheap

goods for export. They have to learn how to make the most of this maturity. Whereas they used to export business men and traders, they must concentrate now on experts, on technicians, doctors and scientists, on skilled administrators, on people who combine Britain's great and humane traditions with the technical and scientific skill the century requires. The export of brains can be Britain's major export. In the field of industry, they must concentrate on complex and intricate manufactures—machine tools, new inventions, more complicated consumer goods. The work of the various Centres in industrialising backward regions and raising living standards everywhere could create new markets and ensure the economic success of the passage in Britain to a new industrial system based on high grade products and services. The prestige of a nation which developed its influence through sheer force

of intelligence and industry would outweigh any loss in actual political control. In a world in which Britain's physical power is relatively small, it has need of friends and neighbours, not servants and dependencies.

Britain has not only the most urgent interest in using the methods exemplified in the MESC to further international co-operation. It also has the best practical experience of how they work. If the functional approach to the problem of pooling sovereignty is the best and most efficient approach, Britain would be failing itself and the world if it neglected any opportunity of using this new technique. The pooling of sovereignty, the transfer of power to a world authority, is the ultimate problem of international society. Every technique, every new approach, every suasion that advances the nations in that direction must be exploited to the full.

Commonwealth or Empire?

"SOME people," said Mr Churchill, in his speech after receiving the freedom of the City of London, "like the word Commonwealth; others, and I am one of them, are not at all ashamed of the word Empire. But why should we not have both?"

Why not? In a recent address, Mr Amery defined the word Empire as a term descriptive of the sum total of self-governing states, dependencies, colonies, protectorates and so on comprised within the British polity. Commonwealth, on the other hand, he defined as the political system constituted by the mutual relationship of its autonomous members. But, he went on to say,

We may rightly use the word Commonwealth when we wish to emphasise the idea of free co-operation between its members or to convey our purpose that with the development of self-governing institutions in every part, the terms Empire and Commonwealth shall become completely synonymous.

The fact is, however, that to critics of the British Empire, especially American critics, the two terms are not interchangeable. To them, Commonwealth stands for the United Kingdom and the self-governing Dominions, whereas Empire is given a bad connotation—it stands for capitalist exploitation of colonial peoples, for the wish for territorial aggrandisement, for the determination that "what we have we hold."

To anyone who has studied the recent history of the British colonial empire, this definition of British imperialism is a clear travesty of the facts. Instances of exploitation cannot be denied, but the most obvious faults have not been the British people's possessiveness, but their apathy and indifference towards their colonial possessions. So far have they been from wanting to make money out of the colonies that it has not even occurred to them that the colonies could be profit-making concerns, with the result that they have not bothered to see that colonial resources were being properly developed.

The consequences of this indifference are well known. Even before the war, the sporadic labour troubles that burst out in many of the colonies, and the reports of committees that inquired into their cause, had revealed the poverty, squalor, disease and illiteracy into which each new generation of colonial peoples was born. If the war had not broken out and swept the colonies into its orbit, if the richest of them had not been lost to another power, it is still probable that the British people would at last have been stirred into a greater interest and into an awakening to their responsibilities. As it is, there probably never was a time when so much interest was taken in the colonies and when so many official statements of colonial policy were made. Rightly, official exponents have stressed the evolutionary nature of British colonial rule; principles recently laid down for the advancement of the colonies have, they would claim, been accepted by colonial officials for many years and acted upon. Nevertheless, the new emphasis which they have been given in the last two or three years and the urgency with which they have been put forward will enable future historians of the colonial

empire to look upon this period as the rebirth of British colonial rule.

What are the lines on which it is likely to develop after the war? It is not difficult to see the broad trends because official declarations have been unusually explicit, and in one important respect have been embodied in an Act of Parliament. The Colonial Development and Welfare Act, passed in the darkest days of the war, established the entirely new principle that the colonies could be given financial assistance from the Imperial Exchequer without making themselves subject to the control associated with grants-in-aid. The old vicious circle, which meant that a poor colony was unable to undertake the reforms that alone could increase its wealth and thereby help itself towards political independence, has been broken. It is now possible for a colony to receive financial help without losing its political status. Economic development and political progress can go hand in hand.

The Ultimate Goal

It is well that the significance of the Colonial Development and Welfare Act should be known, for there is in some quarters a tendency to see in it a reversal of British policy, the concentration, in the future, on the economic development of the colonies, on making them self-supporting and prosperous rather than on making them independent. It is quite true that, in practice, the most outstanding advances in the colonies in the years after the war will probably be in the economic sphere rather than the political. Years of neglect have to be made up, in addition to the launching of the proposed reforms—the improvement of communications, the rehabilitation of colonial agriculture and the establishment of secondary industries. At the present time, the economic defects of colonial life are far more glaring than the political ones; a drive to raise colonial standards of living can begin at once, whereas for many colonies political independence is still impracticable.

Nevertheless, throughout all official declarations on colonial policy in the war years has run the principle that colonial development is not an end in itself, but a means to the establishment of political independence. They have not argued: "The colonies are poor, backward and undeveloped. Let us remedy this, and stop talking about the vote when we have not given them bread." They have said: "The colonies cannot achieve self-government so long as they are poor, backward and undeveloped. Let us remedy this in order to hasten on the day when they can be given the vote." Thus, the economic development of the colonies will be conditioned by the need to achieve an even more important goal.

The post-war years, therefore, will not see an abandonment of political reforms in the colonial empire. Far from it, for during the war the Government has already pledged itself to constitutional reforms in several of the dependencies. The thirties were a period of constitutional setbacks rather than of progress. New-

foundland lost its Dominion status; Cyprus lost its Legislative Council; Malta lost responsible government in internal affairs. Only in Ceylon did the people march, through trial and error, to a higher political status. During the war, however, throughout the colonial empire there has been a cry for more independence, for the right of colonial peoples to manage their own affairs. Promises of full responsible government in internal affairs have been given to Ceylon and Malta; a new constitution, limited though it was, has been given to Trinidad; Jamaica is in process of receiving one, based on universal adult suffrage, though with powers of certification and veto still left in the Governor's hands; the franchise in British Guiana and Trinidad is under review. It can hardly be doubted that after the war the grant of new constitutions, giving more independence to the people of the colonies, will spread.

There is, it is true, a danger in a too rapid constitutional advance. Before it is granted, the British Government has to make sure who exactly will benefit from it—the mass of the people or a few who have managed to raise themselves in wealth and importance above the level of their fellows, the native population or a handful of European settlers? Can it be said that the grant of responsible government to Southern Rhodesia, even with the proviso that legislation affecting native affairs must have the consent of the Dominions Office, has been to the entire advantage of the native majority in that territory? On both political and economic grounds, amalgamation of colonial dependencies into larger units is desirable; yet, how can this be achieved when it means surrendering the position of trustee for backward peoples to a small European minority?

The Communal Problem

It can be argued that this happened in the Dominions; and as Professor Hancock, the shrewdest observer of the current history of the British Empire, shows,* after a bitter initial struggle Maoris and white men found a common loyalty as New Zealanders. French and British, in spite of acute political differences, both call themselves Canadians. Even in South Africa, where Dominion status has been marked by considerable discrimination against the natives, he sees the stirrings of a more liberal attitude. Communal problems need not be insuperable obstacles to political progress. But until they have been overcome, it may well be that for the many it is better to remain in the Empire than to join the Commonwealth.

The communal problem is not the only problem which will inhibit colonial policy in the post-war years. Even though the one aim, consistently pursued, is political

* "Argument of Empire," by W. K. Hancock. Penguin Books, Ltd. 9d.

freedom, towards which economic development is directed, there will still be the danger that the means will tend to overshadow the end. The Colonial Office has to steer a course between doing too much—and not allowing the colonial peoples to do enough—and doing too little—and keeping them perpetually backward. Criticism of official policy tends, in fact, to be two-faced. On the one hand, it is criticised for neglect and *laissez faire*; on the other, it is criticised for not allowing the people of the territories concerned to manage their own affairs.

The official answer to this problem is in the British tradition of compromise. What its policy aims at promoting is self-help. There are to be no grandiose schemes forced on the colonial peoples without their consent, even though to the outsider these may be clearly to their great advantage. Economic development is to be pursued in the same spirit as that in which indirect rule was originally adopted. The colonial peoples, especially the vast majority who are still in a primitive state, are to be led towards a higher standard of living, not driven. Reforms are to be based on individual peculiarities and adapted to them. Similarly, social welfare—education, the health services and so on—is to be based on training the colonial peoples to manage them themselves. The Central Medical School at Fiji, which provides a training for native doctors and nurses from many of the Pacific islands, is an outstanding example of what can be done to promote self-help. Achimota College, in the Gold Coast, and especially the proposed Institute of West African Arts, Industries and Social Science to be associated with it, is another. The report of the Stockdale Commission in the West Indies is permeated with the principle that all progress must be based on the people themselves.

The danger of this admittedly right compromise is that its execution takes time, whereas what is wanted is speed—if only because otherwise the demand for political freedom may gather such force that it has to be granted before the educational and economic basis for it is established. Perhaps the greatest problem of all which colonial policy will have to solve in the post-war years is to find the right tempo for colonial development. Time-schedules, as Mr Willkie once urged them, will not always be appropriate. But, as Professor Hancock pleads, where they can be used—say, for completing soil erosion works or providing full educational facilities—they should be. The tempo should be set by the needs and idiosyncrasies of the colonial peoples, not by the procrastinations and hesitations of official policy. Only if the Colonial Office shows unwavering determination can the British "purpose that... the terms Empire and Commonwealth shall become completely synonymous" be made plain to the whole world.

Constructive Trade Unionism

"MEN who are ready to render up their private liberties to the despotic rulers of trade unions seem scarcely independent enough to exercise political liberties." Thus *The Economist* wrote in 1860. At that time, the agitation that culminated in the Reform Act of 1867 was at its height; the trade unions were weak and struggling; they had not even formed their trade union congress; they were without legal protection and were striving to reduce their long working hours and raise their wages. The idea of denying men political liberties because they combined for better economic conditions seems incredible to-day, when the trade unions have not only become "respectable," but an integral part of the body politic. Nevertheless, it is true in 1943, as it was in 1860, that there are dangers in restrictive practices and bureaucratic administration, and the trade union movement to-day must guard against a weakening of its democratic basis and the hardening of a bureaucratic crust at the top. It must see that its great strength and influence are

used for the benefit of the whole community. The 1943 Trades Union Congress, held at a time when the prospects for peace are no longer remote, but tangible, will provide an opportunity for the unions to take stock of their present position and to plan the part which they are to play in the shaping of post-war society.

Wartime Developments

The present war, like the 1914-1918 war, has seen tremendous advances in trade union organisation. There are now more trade unionists in Britain than at any time in history. Many of the new members are women, who have flocked into the munition industries, and whose recruitment is regarded by the unions as vital, not only in the interests of the women themselves, but in order to safeguard the future standards of the men whom they have replaced. Since the war, trade unionism has spread to hitherto relatively unorganised sections, such as the

motor and radio industries, and it has developed rapidly among professional and non-manual workers. The area of collective bargaining has been greatly extended and the standards of the lower-paid workers raised. Joint industrial councils have been set up in such trades as distribution, and the creation of a wages board for catering workers has paved the way for improved organisation in an occupation which, by its very nature, tends to produce isolation. At the same time, the responsibilities of the unions in every sphere, and at every level, of the war effort have widened. With trade union co-operation and under the direction of a powerful trade union leader, the task of mobilising the nation's manpower for total war has, on balance, been accomplished smoothly and efficiently.

The growth in their strength and status has inevitably stimulated the unions to seek a greater measure of consolidation. The present structure, dominated by a few giants on the one hand and with a multiplicity of small unions covering the workers in a single industry, on the other, is altogether anarchic and out of keeping with modern methods of production. The last war brought about a spate of amalgamations—it saw the formation of the Transport and General Workers' Union and of the Amalgamated Engineering Union—and the same trends are evident to-day. Many individual unions have been pressing the General Council of the TUC to take steps to promote closer unity between the various unions and to avoid overlapping and competition, and a number have already taken steps in this direction. The National Union of Railwaymen, the Associated Society of Locomotive Engineers and Firemen and the Railway Clerks' Association, after presenting a joint wage claim, have set up a committee to "secure the maximum unity of purpose on matters of common interest to the three unions." The Amalgamated Engineering Union recently joined with other unions catering for engineering workers in demanding wage increases, and discussions about amalgamation have been proceeding. The miners decided in 1942 to set up "one big union," in place of their present loosely organised federation, and a draft constitution for the National Mineworkers' Union is now being discussed by the district associations. In many other trades, covered by different unions, such as printing, furniture making and foundry work, the unions have either set up joint committees or are forming federations or amalgamations.

These tendencies are natural and healthy. Greater unification in the trade union structure, whether on the lines of industrial unionism or of federation, may assist in breaking down sectionalism—with its bugbear of jurisdictional disputes—and it should certainly increase the effectiveness of collective bargaining. It does, of course, present numerous difficulties and drawbacks. The different unions have varying resources, rules and rates of contribution, and opposition is bound to be encountered from the smaller bodies, whose officials might find themselves displaced or relegated to minor posts in the hierarchy. But similar difficulties were overcome when amalgamations took place after the last war. There is perhaps more justification for the fear that amalgamation might lead to increased bureaucracy. But this danger can also be averted. The size of the Amalgamated Engineering Union has not impaired its democratic basis. One method of preserving the maximum amount of democracy would be for the unions to encourage devolution on a district basis, through local trades councils or through such bodies as the wartime union district production committees, and to strengthen their local branches and workshop organisations. By and large, the advantages of unification far outweigh the disadvantages.

It seems certain that the trade union movement will find itself in an extremely powerful position at the end of the war. From the point of view of the unions themselves, the problem will be how to preserve their forces and prevent them from being dispersed, as they were after 1921. From the point of view of the community as a whole, the question will be whether the unions' favourable position will be turned to the best advantage of the nation.

No hard and fast line can be drawn between the short-

term and long-term post-war period. The end of hostilities will bring forward problems of demobilisation and re-instatement, and the transition period, whether short or long, will assuredly be critical. The long-term objective will be to prevent the post-war boom, that seems inevitable, from degenerating into slump, and to maintain a stable and high level of employment. Both for easing the transition period and for fulfilling the aim of full employment, mobility and flexibility of labour will be an essential condition. The war has accelerated the introduction of mechanisation and mass production methods in industry, even in such a traditionally craft employment as ship-building, and if skilled processes are broken down into component parts they can be performed by less skilled labour. Such developments are bound to be intensified in the post-war period; revolutions in technique and the development of new industries may render pre-war methods obsolete and blur the old boundaries between different trades. If increased social security brings about higher standards of living, consumer demand will become more exacting and more fluctuating, and the industrialisation of backward countries may change the character of the export trades. Britain can neither satisfy the new needs nor compete with other countries which enjoy greater natural advantages, if its economic system remains rigid. For this reason, it is essential that obstacles to flexibility, such as are presented by craft demarcations and restrictions on labour movements, should be removed.

Outlines of a Bargain

The question of the re-training and re-settlement of the unemployed is closely related to that of flexibility. Labour has accepted the Beveridge proposal that unemployment benefit should be conditional upon work or training, after a limited period of unemployment, though it stipulates, quite properly, that there must be adequate safeguards against arbitrary decisions. The TUC is in favour of training centres for unemployed juveniles and training facilities for adult workers during industrial depressions. But in the past, the unions have deprecated the idea of compulsory training for the unemployed, and it is vital that the conditions upon which they would accept re-training should be clearly and promptly defined. There will also have to be agreement about entry into trades, apprenticeship and training of juveniles. The schemes which have been drawn up for the building, mining and cotton industries might serve as a model for other industries. A measure which has proved indispensable under conditions of wartime full employment is that of direction to work. Mr Bevin suggested at the miners' conference that the trade union movement might well consider the advisability of retaining some measure of direction after the war. Though direction to work might appear to restrict the individual's freedom of choice and movement, yet the worker who has been displaced through technical developments, or shifts in the balance of industry, would stand to gain, and not to lose, by being sent to a place where work was available or where prospects for employment were good. Indeed, if there is to be national planning for the location of industry and the utilisation of all productive resources, some such form of direction of labour would seem essential. The General Council of the TUC in its report for the 1943 Congress recognises that it would be impossible to maintain control over a wide range of economic and industrial activity "without imposing some measure of control over labour itself."

If the trade unions are ready to accept modifications in their practices, and other measures that would make for greater flexibility of labour, they will be entitled to expect a *quid pro quo*. In wartime, the unions have given up many traditional rights and liberties. They have agreed to submit their disputes to arbitration, although in practice the workers' side of the compact has not always been observed, and they have allowed the dilution of labour in war industries. At the same time, labour has acquired many benefits. Mr Bevin has consistently argued that these benefits have been as great as, if not greater than, the restraints which have been imposed, and that

JONATHAN CAPE

DUFF COOPER
DAVID

This study of a heroic character curiously blends the functions of the historian, the psychologist, the commentator and special correspondent. For Mr. Duff Cooper relates events as if he had witnessed them, and explains them as if he knew just what the unspoken thoughts of the actors were. The method is eminently successful. The figure of King David is seen in the round; life is breathed into the statue, and the scene wherein it is set is made actual to the mind's eye. DAILY TELEGRAPH [10s 6d net]

SIR JOHN T. PRATT
WAR AND POLITICS IN CHINA

This is a didactic work, written as all such books if worth their salt must be, lucidly and trenchantly. Some such books are also written dogmatically, as this one is. Its avowed purpose is to correct the errors of other writers, and to attempt a new interpretation of the principal events in China's relations with the modern world. THE SPECTATOR [12s 6d net]

HAN SUYIN
DESTINATION CHUNGKING

Han Suyin writes beautifully and is an acute observer. . . . If this book is typical of the young generation now growing up in China, and I believe it is, it augurs well for the future of that great country. It shows the Chinese not as "inscrutable orientals," but as people like ourselves, with the same human hopes and aspirations. An extremely valuable piece of work, and with considerable literary merit. TIME AND TIDE [12s 6d net]

J. H. TAYLOR
GOLF: MY LIFE'S WORK

No man arrives at the position of being a first-class professional at any game without having remarkable qualities, but it is rarely that a championship player adds to these the capacity to write well about his experiences, but Mr. Taylor is one of these rare exceptions. . . . Not only golfers will enjoy this book, which they cannot afford to miss, but all who have ever been true amateurs of any game will find delight as well as instruction in it. THE SPECTATOR [12s 6d net]

MODERN BANKING

CABLE AND WIRELESS LTD.

A CENTURY OF PUBLIC SERVICE

Today, the 'ECONOMIST' celebrates its centenary—a hundred years of enlightened opinion on national affairs. CABLE & WIRELESS LTD. wish to join with its great public of appreciative readers in offering greetings and congratulations.

One hundred years ago the people of two hemispheres were discussing a miraculous new invention—the electric telegraph. The claims made for it seemed incredible: the still greater marvels of submarine cable and of wireless were undreamed of. Little did our ancestors foresee that one day messages would flash round the globe, making neighbours of the farthest nation and altering the whole conception of world trade.

In the history of modern communications CABLE & WIRELESS LTD. have played a predominant part. Now, in the midst of war, they are carrying on the greatest volume of traffic in telegraph history.

CABLE AND WIRELESS LTD.
The only British owned and operated Overseas Telegraph Company in this country

if they are to be continued after the war, labour should accept continued responsibilities. The Miners' Federation have suggested that such wartime legislation and regulation as has proved beneficial to the workers might be retained in the future. Among these benefits may be counted the guaranteed working week, the enforcement of minimum trade union rates, the provision of works canteens and the numerous measures to promote industrial health and welfare. The Essential Work Order has been a wartime necessity. Though it imposes restrictions, it provides security of employment which could be a long-term advantage to labour. The unions will undoubtedly formulate many other demands, and some of these have already been indicated. One is the claim for shorter working hours and the introduction of the 40-hour week. Though the exact length of the working week cannot be determined in advance, it is clearly desirable to aim at a better balance between work and leisure, harnessing the powers of science to make both more congenial; the extension of holidays with pay and the provision of more facilities for recreation should help in this direction. Nearly every union in the country has recently been pressing for increased wages and some are already seeking the consolidation of their war advances in a permanent wage structure. The principle of "equal pay for equal work" as between the sexes has been widely accepted, in theory, since the war, and the unions are quite right in insisting upon its application both now and after the war. The trade unions will probably also ask for legal recognition, on the lines of the Wagner Act in the United States, which obliges employers to recognise the union approved by their workers. The closed shop could not be tolerated if its effects were restrictive, but if adopted on the broadest possible basis—a nation-wide closed shop—it might assist in developing flexibility. Quite apart from specific demands of this character, the unions are united in their desire for better social and economic conditions, better housing, education, health and social security for the working population—objectives which command a wide measure of agreement throughout the country.

In essence, the outlines of a post-war bargain are fairly clear. If, on the one hand, labour receives agreed national minimum wage rates, the guaranteed working week wherever it is practicable, legal recognition and the

nation-wide closed shop—its other demands cannot necessarily be determined in advance—then, on the other hand, it should be prepared to accept the removal of obstacles to mobility, in particular to the retraining of the unemployed, and the principle of direction to work. It is certain also that the unions will claim a far greater share in the control of industry than before the war. One of the objects of the TUC is "proper provision for the adequate participation of the workers in the control and management of public services and industries." In wartime, provision has been made for joint consultative machinery at the top and, however limited, at the factory level. It is impossible to foretell what form of machinery will emerge after the war, but it is safe to assume that the interest which the workpeople are taking in matters of production will be a factor of importance in future industrial relations; as Sir Stafford Cripps has said, it may provide the kernel of future industrial democracy. In return, employers might well consider extending the principle of profit-sharing, which has hitherto only been tried out by a few firms, but which seems the logical corollary of increased workers' participation in management.

In practice, of course, the operation of any such bargain may be difficult. The controversy that has arisen over the Trade Disputes Act is an indication of some of the hurdles that will have to be surmounted. One final word of warning, moreover, must be given. Whatever form of industrial organisation may emerge after the war, it is essential that it should provide complete and effective safeguards against the development of any tendency for employers' and workers' organisations, planning and acting in concert, to enforce restrictive policies against the consumer and the community. There are signs that some industrialists and trade union leaders are thinking in terms of an alignment which might have just this effect. It is all to the good that there should be joint planning, but such plans must allow for ample protection of the ordinary consumer's interests. "Self-government" in industry is, basically, only another name for corporatism. "Democracy" in industry is altogether a different, and more attractive, proposition. The trade unions have an inescapable responsibility for determining the path along which they will travel.

The Standard of Living

ON July 6, 1940, the people of this country were expecting, with some sense of unreality, the call to fight against the invader on the landing grounds and beaches. On September 7th in the same year the bombardment of London by night began, after the Luftwaffe had been soundly beaten by day in the Battle of Britain. Yet it was on these two dates three years ago, when mortal danger was closer to this island than ever before or since, that two articles appeared in *The Economist*—"The Minimum" on July 6th and "The Standard of Living" on September 7th—expounding the thesis that "the time has come for the State to guarantee to every individual a sufficient quantity of food, clothing, shelter and the acknowledged necessities of life." There was nothing specially original about the argument of *The Economist*, which simply acted, in this matter, as the general practitioner of the ideas that were current on the subject at that time. Some persons have professed themselves shocked that the more limited proposal of the Beveridge Report—that all citizens should receive a guaranteed minimum money income in all the contingencies of life and work—should have been put forward in wartime. They would perhaps do well to reflect on the fact that it was in 1940, during the nation's "finest hour," that the objective of physical security for all British families became an explicit part of the generality of political and economic thinking. It is the purpose of this article to restate, in a form less confined in its application

to the siege conditions of total war, that argument of 1940 for a National Minimum; to emphasise that to be effective, the Minimum should be conceived in terms of goods and services as well as of money incomes; and to suggest, in addition, that so far from being a repudiation of individual responsibility and initiative, the guarantee of a minimal standard of life for everybody is a necessary condition for the maximum of enterprise among the people, and carries with it the universal obligation upon all citizens and their associations to be enterprising.

Any political party which omits social security, as it has come, not too happily, to be called, from its post-war agenda will start at a grave disadvantage. This is not attributable to any greed for gain on the part of the mass of the electorate, but to the belief, reinforced by expert opinion, that it is now possible as well as desirable to put a bottom into the social structure without impairing the national income or diminishing the national wealth. It is not a question of extra outlay or expense, but simply of guiding national expenditure in the most needed direction; of distributing family incomes so that none falls at any time below a set level; and of ensuring that the goods and services needed for a decent subsistence are available to every family in the required quantities and at prices which the minimum family income can cover. In wartime the problem is chiefly one of supply: the mobilisation of resources to furnish the sinews of war involves a deliberate curtailment of the goods and services available

for civilian purchase, and the corollary of this process is the fair distribution of the limited stocks available by rationing, price control and utility manufacture, together with a scaling-up of the lowest incomes by the increase of minimum wages and social service payments to enable the poorest families to take up their share. In peacetime the problem will be, as it was before the war, rather one of demand. The total stock of goods and services will be ample to meet the minimum needs of every family, with a considerable margin to spare; there will be no guarantee that every family will in fact be in a position to purchase its basic requirements. Social security, in the sense in which the phrase is now used, means the provision of this guarantee.

There is, of course, nothing revolutionary about this proposal; and its implementation by one means or another must be taken for granted in post-war politics. Ever since the institution of the Elizabethan poor law, it has been the accepted responsibility of society, as it formerly had been of Christian charity and the gilds, to prevent actual death by starvation, however crudely, callously and imperfectly the obligation may often have been discharged. In the twentieth century the obligation has been translated into a ramified system of public provision and social insurance, supplemented by the establishment of minimum wages through collective bargaining or trade board machinery and by the mutual activities of voluntary associations and private charity. The demand now is simply that the existing piecemeal apparatus for preventing utter destitution should be made comprehensive and universally effective; that the complete prevention of all avoidable want should be made the specific aim and guaranteed consequence of public policy.

The Prevention of Want

The pre-war provision was insufficient. Neither casual and itinerant workers nor the independent middle class nor the families and dependents of insured workers were covered by social insurance. Insurance benefits and assistance payments were in many cases appreciably below the bare minimum income reckoned indispensable by expert researchers; and even the inadequate cash sums received by the sick and disabled were considerably more satisfactory than the treatment they were given to restore them to full health and fitness. Cash provision was, and is, of three kinds: pensions to old people, widows, orphans, the sick and the disabled; allowances to the long-unemployed and the destitute; and insurance against illness, accidents and unemployment. Provision in kind took the form of free education, health services, housing subsidies, and cheap or free food for schoolchildren. But too many people were too near the borderline of insecurity and destitution; and the diet of something like half the population was regarded by experts as nutritionally insufficient. Nor was this state of affairs simply the consequence of ill-health and unemployment. It rather reflected a distribution of incomes that was inadequate in all its lowest ranges to meet family requirements; and it registered the fact that the wages of workers are based, as they must be, not upon their needs or the size of their families, but upon the supply of and demand for their services and the greatly varying bargaining power of their trade unions.

There are several parts therefore to the prevention of want: the insurance of every citizen against every contingency over which he, individually, can have no control; the raising of all benefits and payments to subsistence level and the incorporation in their assessment of the needs of families and dependants; the introduction of children's allowances; the provision, above all, as Sir William Beveridge has urged in his famous "assumptions," of positive ways and means to prevent both unemployment and ill-health and to succour the sufferers from these two basic misfortunes by training, transfer, treatment and rehabilitation; the guarantee, in good times and in bad, of minimum money incomes by a combination of comprehensive insurance, children's allowances and adequate minimum wages; and the assurance of a sufficiently ample and sufficiently cheap supply of the necessities of life so that minimum incomes may actually cover minimum

needs. To do all this is to travel farther along a well-trodden road; the only new element will be the will and determination to prevent want entirely.

It is not true to say that the nation cannot afford to adopt the policy of a Minimum. The standard of living of a community is dependent on the size of its national income; and the standard of living of a class is dependent on the way in which the national income is distributed. It is obviously possible for a community to decide, as a first charge upon its social and economic arrangements, that a given proportion of its income shall go to its poorest members in order to assure to them a minimum standard of life. When the problem of fixing the size of the Minimum comes up, however, there is room for debate; the question of what can be afforded arises in two ways, absolutely and relatively to other claims. Obviously, it would be sheer fantasy to attempt to provide every family with, say, the equivalent in real terms of £1,000 a year at current prices; the real national income is, and will be, much too small. But if the material means are available to provide the goods and services required to reach a more modest goal, say, the 40s. a week for man and wife and 56s. for a family of four proposed by Sir William Beveridge, then the question becomes one of choice, not of practicability. In money terms the issue is the amount by which the maximum incomes of classes above the minimum, and the funds available for non-consumption purposes, will require to be reduced to implement the guarantee; in this instance there is little doubt that the Beveridge scale, or its equivalent at the prices of that time, could have been introduced in, say, 1938 with no appreciable disturbance to the social structure or to the balance between investment and consumption, and no doubt that it will be possible to introduce it after the war, when the national income, in real as well as money terms, should be appreciably higher than it was five years ago.

For Services Rendered

Thus the practicability and size of the Minimum depend, first, on economics and, secondly, on politics. The crucial point, economically, is that the larger the national income and the lower the level of unemployment, the higher the guaranteed standard of living of the poorest classes can be—with the minimum of political conflict. The quite fatal thing would be if the establishment of a National Minimum were to impede the expansion of the real national income, by causing the curtailment of necessary investment, or to obstruct the policy of full employment, by reducing individual enterprise or diminishing the inclination of individuals to change their occupation and places of work. It is, of course, absurd to suggest that the guarantee of 40s. a week to a man and his wife is likely to make him cease to toil or spin, provided work is available for him; but the institution of a minimum standard of living does carry with it the plain obligation upon every citizen to display maximum efficiency, maximum productivity and maximum mobility. There is no more important post-war issue than the unreserved realisation of this by the trade unions—just as the policy of full employment depends upon the realisation by employers, as well as workpeople, that full employment means, not the maintenance of some particular distribution of employment at the highest possible level of activity, but the employment of all the nation's resources in the occupations which from time to time prove to be the most productive. The objective of social security is no more likely to impede economic progress than the objective of full employment, provided that, in each case, sectional interests are subordinated to the interests of the community and that certain specific and pressing duties are seen to be the correlations of the recognised right to "work or maintenance."

Mr Bevin has called the Beveridge proposals "ambulance" work. In an important sense he is right, though to say so is no disparagement, since ambulances are indispensable so long as accidents happen. The great hope of the future must be that social security, in the current sense, and the bolstering of national subsistence, national diet, national health and national fitness by *ad hoc* means

may be rendered needless by a great and regular increase and diffusion of national wealth and prosperity. Full employment will bring more social security than social security itself. Meanwhile, within the present framework of social provision, extended to embrace a Minimum, it is upon prevention and cure, more even than on insurance and assistance, that the energies of the next generation should be focused: on work rather than on maintenance; on the prevention of accidents and the rehabilitation of

the disabled rather than on pensions; on the prevention and treatment of sickness rather than the care of the sick. "Ambulance" work there must be. Post-war Britain will demand and deserve a National Minimum and what is called social security. But it is only by a positive policy to master their material environment that the people of this country will eventually be able to establish and ensure a standard of life for all which will be worthy of their hopes and powers.

Why Nationalise?

THIS is a time when the economic structure of the country is, very properly, under review. The review will almost inevitably lead to a considerable extension of the field within which public policy has something to say about the conduct of industry and trade. So much is a matter of general agreement. But a wide section of public opinion goes further; whenever, in any particular industry, a *prima facie* case has been made out for some intervention of public policy, adherents of this school of thought plump automatically for nationalisation. To many people, in fact, economic reconstruction appears to mean little beyond the compiling of lists of industries to be nationalised. It is true that the public corporation, on the model of the London Passenger Transport Board, is now the fashion, and that public corporations, though they are managed by nominees of the community, still derive their capital from private purses. But for most practical purposes the definition of nationalisation can be stretched to cover this variant. And the new version shares with the old the characteristic that it is prescribed indiscriminately for all cases. It is a universal specific.

In these days only the most rabid reactionary is opposed, on principle, to Government intervention in economic affairs. But this indiscriminate advocacy of a single method has two dangers. First, it diverts attention to the mere mechanics of organisation, to pure constitution-mongering, and away from the real issue, which is the way in which the industry is to act. It pretends that Siéyès is the important figure and ignores Bonaparte. And, secondly, it fails to recognise that the conditions of different industries, and the reasons for which the state intervenes in them, are infinitely various.

The historical origins of the attitude are easy to identify. The socialist ideology has a very powerful emotional momentum in this country, and nationalisation lies at the very centre of it. It is not so long since the Labour Party professed as its policy "the nationalisation of all the means of production, distribution and exchange." The Labour Party no longer believes in this policy—at least, not in the lifetime of the present leaders—but it has never been formally abandoned, and though they

no longer believe in the nationalisation of *all* the means of economic life they still believe, by instinct, that nothing is real progress unless it involves the nationalisation of something, and that any other form of economic reorganisation is a temporary compromise with the forces of expediency. They believe this by instinct—and one strongly suspects that they have quite forgotten why.

Historically, the main basis for the policy of nationalisation was the desire to redistribute wealth. It is doubtful whether Karl Marx would have recognised any other reason as being more than very subsidiary. But nationalisation as advocated in this country is not in the slightest degree a redistributor of wealth—rather the contrary, for the compensation paid is always fair and often generous, and the capitalist whose income was formerly at the mercy of commercial risks becomes a pensioner of the state. There are other means of diminishing the inequality of wealth, which have been carried a long way and will doubtless be carried a long way further. But nationalisation (unless it also implies confiscation) is not among them, and anyone who advocates it on this score is deceiving himself.

Secondly, there is the plea of efficiency, the belief that the state can manage industry more efficiently than private managers. This may be true in some cases, either because the private managers in possession are unduly incompetent or because there is some obstruction to efficient management that only the state can remove. But, as a general proposition, the available evidence points in the other direction. Other things being equal, a nationalised industry can be expected to be less efficiently run than a privately managed one, partly because it cannot wholly evade the disadvantages of committee control and partly because it will inevitably be subject in greater or less degree to some sort of political pressure, from trade unions as well as from politicians.

Another reason frequently advanced for a policy of general nationalisation is that functions essential to the life of the community cannot properly be left in private hands. Since this is, in part at least, a moral issue, every-

one will have his own opinion on it. Some people are outraged by the fact that the functions of note issue and credit control are in private hands. But others—and they are probably the majority—feel that so long as these functions are properly performed there is no cause for intervention. The importance of an industry is an argument for saying that the state should know what is going on. It is not an argument for the state taking over the management unless that would lead to an improvement. And in many cases it would not. The management of merchant shipping, for example, is an activity of the highest importance, but one where there is every reason to believe that public management would be less efficient than private. It is precisely because shipping is important that it should not be nationalised.

The monopoly argument is very similar. When an industry has been effectively monopolised by a single firm, the argument runs, it should be nationalised. But here again one would first wish to be satisfied that the industry, after nationalisation, would be run not merely differently but better than before. If the private monopoly is grasping and restrictive, the case for nationalisation is strong. If it is efficient and responsible the case is weak.

Different Behaviour

These examples are perhaps sufficient to illustrate what is the only real, though strangely ignored, argument for nationalisation. An industry should be nationalised when the community wants it to behave in a way substantially different from its behaviour under private management, and when the best way of securing this change is by buying the private owners out or by imposing public managers. For example, to nationalise the railways and then to leave them to operate substantially as they do now (which would certainly be the result of simple nationalisation) would be to take a great deal of trouble for no purpose. But if the state wished to carry through a complete change in the methods by which the community's transport costs are met, nationalisation of the railways might well form part of the scheme. Or again, nationalisation of the banks, if it simply meant the replacement of boards nominated by the shareholders by boards nominated by the Government, would have no practical result whatever. But if (to take an imaginary case) the state should decide that it would be an economy to pay no interest on the national debt held by the banks, and in return to meet their working losses, there might be a case for buying out their proprietors.

The "different way of behaving" that the state may wish to induce may take many forms. It may be, for example, that the industry is required to change its organisation in the interests of efficiency or of better relations with its workpeople. This is the case for the nationalisation of coal-mining. It may be that the industry is required to run at a loss, in the public interest. This was the case for the nationalisation of civil aviation, and it was suggested in a recent article in *The Economist* that the state, without intervening in the management of merchant shipping, should take over the risks and financial losses of supporting a long-term programme of merchant shipbuilding. It may be that, without running at a loss, the industry is required to forbear from taking a profit. This is, in part, the case for the nationalisation of land. It may be that the industry, without running at a loss, is required to sell its product more cheaply to some customers than to others. There may be a case on these lines, after the war, for continuing the virtual war-time nationalisation of the wholesale food trades.

These are only a few examples of the many different reasons that may exist for direct commercial intervention by the state in the processes of industry—for the appearance of the state as a public body, that is to say, as a trading principal, not merely as a supervisor or policeman. And since the reasons can be so various, and the circumstances of the industries to which they apply are so different it would obviously be folly to prescribe a single form of organisation. In some cases outright nationalisa-

ALWAYS READY!

IN the long armistice which followed the "cease fire" in 1918, British Railways instituted developments and improvements which could not have been more wisely planned had they known beyond doubt that hostilities would be resumed in 1939. Many millions of money were expended on widening tracks, improving signalling, removing bottlenecks and in a hundred and one other ways which gave the public the fine trains and high speeds prevail-

ing before the war. *The railways carried through these improvements during a period of acute depression when they were suffering grave loss year after year.*

Their courage and foresight have stood the Nation in good stead—for these years of intensive development have made it possible now for British Railways to carry smoothly and efficiently the vast burden of additional freight and passenger services so vital to the war effort.

tion would be appropriate, as with the BBC or British Overseas Airways Corporation, where the state owns and its nominees manage. In other cases the public corporation (private ownership and public management) will be the best method. In still others the opposite of the public corporation (public ownership and private management) will serve the purpose best. Shipping may well be one of these, with the state owning the ships (or some of them) and the shipping companies managing them. And in other cases there will doubtless be other forms of organisation. The only general principle should be that, since the state intervenes to secure a certain pattern of behaviour, the form of organisation should be such as will best accord with the desired behaviour.

The curious thing is that many of the advocates of nationalisation as a principle, so far from admitting the simple pragmatic argument advanced in this article, are at some pains to prevent nationalised industries from behaving in any different way from private concerns. Thus the "Statement on Employment Policy and the Organisation of Industry," recently issued by Nuffield College, in advocating public corporations for a number of important industries, stipulated that they should "consist mainly of persons with direct managerial, technical or other practical working experience of the industries or services concerned" and that they "should

in general be so managed as to cover costs, including a reasonable return on their real capital assets." If the public corporations are to be managed by the same sort of people and on the same principles as private industry, one is left wondering what purpose they are intended to serve. Indeed, one is left wondering why their advocates put them forward, unless it is out of piety to a principle learned in youth but the reason for which has been forgotten. It would be reasonable either to be bolder or more cautious; either to leave things as they are or to insist on a different sort of behaviour from the industries in question. To re-name the ship and change her captain without altering either her course or her speed would be a very curious procedure.

The danger is that so long as nationalisation is advocated on principle, without regard to the facts of each case, it will be resisted on principle—and the resisters have the powerful force of inertia on their side. The right attitude would seem to be to regard public ownership and public management as two of the perfectly respectable and permissible techniques of economic policy, to be neither supported nor condemned on principle. The less nationalisation is brought forward without a real reason the more possible it will be, where there is a reason, to exploit this method of economic organisation to the full limit of its potentialities.

Merchanting under Exchange Control

ALTHOUGH the debate on the future of the sterling exchange market has far from run its course it is impossible to ignore the strong current which is taking it in the direction of a more or less permanent form of official control. There is virtual unanimity about the necessity for carrying the control of sterling exchange, almost intact in its wartime rigour, into the immediate post-war period. But even beyond that, there are few who do not regard an indefinite prolongation of some form of exchange control—even if it is only on capital movements—as part of the permanent post-war financial system. The most manifest reason is the desire to ensure that the cause of exchange stability is not again threatened and defeated by panic movements of capital or by more sinister speculative operations. But behind this there is the fear that this country will suffer from a chronic shortage of dollars for a long time after the war. Moreover, there is the inescapable fact that Britain will emerge from the war a heavy debtor on short term to other countries. The main concern of the authorities, therefore, is that there should be continuing and strict control of capital movements.

For the rest, the prevailing view in high official quarters seems to be that a return to a free market would be desirable. The British Treasury's Clearing Union scheme suggests that merchants and traders should be allowed to operate freely and that the new mechanism of international clearings should interfere as little as possible with normal international banking operations. But this part of the Clearing Union scheme bears all the evidence of compromise. It does not explain how it proposes to make this clear and convenient distinction between what are capital transactions, which will be controlled, and the rest, which will be free. Any clean cut line of demarcation is very difficult to draw. There are obvious instances of each type of transaction, but there are almost innumerable operations where the white of the one and the black of the other merge into indefinable shades of grey. Moreover, the most obvious foreign trade operation can, by a simple twist, become a capital transaction—as, for example, when the proceeds of export sales are not repatriated. In any case, control over capital transactions demands some supervision of commercial operations, since there is no more practised way of evading regulations against the export of capital than by under-invoicing export goods sold to confederates in the country with the desired currency or with a free exchange market. If conditions after the war are such as to justify the maintenance of sterling

exchange control in respect of capital transactions, the trading community should reconcile itself to the prospect of keeping in being an extensive apparatus of supervision over current foreign trading transactions. It is desirable that this highly important fact be kept in mind when considering the future organisation of British foreign trade, for there are some systems that fit admirably into the pattern set by exchange control, others which could be adapted to its requirements, others, again, which would be quite incompatible with it.

State and Private Trading

State trading obviously falls into the first category. It seems to be the natural concomitant of exchange control. Since the trader and the controlling authority are in this case one and the same person, the customary restrictions of exchange control on the freedom and initiative of the trader do not apply. Exchange control is perfectly attuned to the activities of an enterprise such as the United Kingdom Commercial Corporation, whose pre-emptive and other operations are essentially political in character and largely divorced from the customary economic considerations of price and relative costs. If, after the war, it is desired to maintain the state's direct participation in foreign trade—as, for example in bulk buying of basic foodstuffs and other essential commodities—the maintenance of exchange control would serve a useful purpose by further increasing the odds against the rash individualist who might be tempted to enter these preserves and pit his merchanting skill against that of the authorities.

It is equally easy to visualise the kind of merchanting system which lies at the opposite pole—that which would wither and die under the ministrations of exchange control. It is the system represented by the free, highly sensitive and internationally organised markets which functioned in this country before the war. Examples will be readily found: the cotton and metal markets, the Baltic market in grains, the markets in rubber and in the hundred and one types of colonial produce which used to bring to a walk through the Mincing Lane and Eastcheap part of the City all the scents of a tropical adventure. Part of the trade handled by these markets represented the import of goods consumed in this country. Another part was *entrepôt* trade in produce which was re-exported after a brief sojourn in British warehouses. But to a very large extent the commodities that were dealt in never touched this country. It was trade between two overseas markets

WHY CHOCOLATE WILL BE SCARGER

When the starving peoples of Europe are liberated, how can they be fed? What can we send them which will supply the deficiencies and restore them quickly to health and strength? Something which is not only a food in itself but is capable of retaining the full potency of added vitamins?

This was the problem Britain's food experts had to solve, and experiments were made with many kinds of food before they made their final choice—chocolate.

For many months big shipments of Cadbury's Chocolate, rich in vitamins, have been going to help to keep our Armies fighting fit. Now, in addition, a large part of the output of the Bournville and other chocolate factories will consist of special 2-oz. blocks for liberated Europe.

That is why you will get less chocolate in your ration.

All descriptions of Banking and
Exchange Business Transacted

which dealers in this country could succeed in transacting owing to their foreign organisation, their resources, their skill and their international reputation for fair dealing. Wheat might be sold from Canada to Shanghai, rubber from Malaya to the United States, gum from the Congo to Hamburg. Not only would the transaction yield its profit to the dealer and broker in London, but it would probably be carried in a British ship, it would be insured at Lloyd's, it would be financed through a London credit and would thus leave its trail of profit to a large number of British institutions.

That kind of market, dealing as it does with commodities quoted in every important commercial centre in the world, demands, above all, rapidity of decision and of dealing. The arbitrage which can take advantage of minute differences in international price levels would be killed stone dead if every deal had to go through the mill of the exchange control machinery, which with its filling of forms must, even at its most efficient, grind slowly. Moreover, the normal functioning of these markets demands a bewildering variety of spot and forward exchange transactions among which it would be difficult, even for the expert, to decide which was essential and which tinged with speculation. The wheat operator straddling long and short positions in the commodity between Chicago, Buenos Aires and Sydney, improvising on this more or less covered position a whole host of subsidiary operations, shipping from stock here and buying forward there, then making all the appropriate cover in the forward exchange market, perhaps deciding not to remit certain proceeds of sales in anticipation of future outlays for shipping or warehousing in the country concerned—this operator might be very hard put to it to justify all his exchange operations to a suspicious control. How to distinguish between a genuine hedging transaction and one of more speculative character is a question which even the operator himself, unless he be singularly objective, may find it difficult to answer. Many of the speculative sales of suspect currencies in the inter-war period were justified by the sellers as protection for property held directly or indirectly in the country concerned. On all these issues—rapidity of decision, freedom to deal as the situation demands with the proceeds of export sales, complexities of covering forward exchange positions—no foreign exchange control could adequately meet the requirements of the type of international commodity market which flourished in this country before the war. If by reason of the overwhelming need for exchange control these markets could not be revived in something like their previous form, their passing would deserve much regret. They were the result of many decades of gradual evolution and experience; they performed a most important function in the world distribution of the commodities which they handled; and directly as well as through the ancillary

shipping, insurance and financial business they brought to this country, they provided a source of foreign exchange income which will be more than ever needed after this war.

The Open Licence

Fortunately, the available choice is not wholly bounded by this return to wholly free markets on the one hand and the UKCC type of State trading enterprise on the other. One type of compromise which has been tried during the war is for the Government to do the trading but to go on using the machinery of the old market. This has proved an unsatisfactory device. It amounts to no more than the payment of compensation to dispossessed merchants and brokers. If use is to be made of their ability and experience, they should be incorporated into the new State trading organisation. There should be no pretence that there is still a function for the former market to perform once the basic dealing activities have been taken over by the State.

A more promising compromise between free merchanting and exchange control would be to put the market on trust, allowing it freedom in its exchange operations subject only to the check of occasional supervision and of giving the authorities full and regular information of its operations and of its open foreign exchange positions. For firms of recognised repute, *post facto* reports can take the place of prior permission. This is the system of open licences in which some British authorities have seen the way to marry exchange control to free and vigorous initiative in our merchanting system. In considering this solution two points suggest themselves. The first is that the licences will have to be really free and comprehensive. For example, the control will have to be prepared to provide exchange for such unpleasant purposes as to meet losses incurred in foreign currencies, though, of course, the sterling equivalent of such losses must be shouldered by the merchants themselves. The second, and more important, point is that the open licence system would necessarily convert every produce market into a closed preserve for the licensed dealers. Licences would be granted to established firms of known financial and moral solidity. The way for the newcomer into the trade would be made much more difficult. So would the activities of those versatile and adaptable firms which in the past have served themselves and the community well by switching to whatever type of business activity the changing scene appeared to offer. Provided adequate safeguards were taken to prevent abuses by these Government-made monopolies, the price paid for this adjustment of the merchanting system to the strait-jacket of exchange control might not be unduly high. But that a price will have to be paid is certain and it should be carefully computed before irrevocable decisions are taken.

Investment—The Second Century

IT was *The Economist's* fortune to be born near the beginning of the adventurous phase of modern British investment. In September, 1843, only approximately £70 million of a present total of £1,100 million had been invested in the trunk railway system. British industry—particularly "heavy" industry, with its high proportion of fixed assets—had a century of continuous and phenomenal growth ahead of it. The public utilities were in their infancy, national electrification was still to come, and the internal combustion engine had not appeared. Before *The Economist's* first century closed, however, the British investor, by his own effort, had not only met all the domestic demands on his saving power which these comparisons imply, but had accumulated some thousands of millions of pounds-worth of external securities in the process of carrying the Industrial Revolution over the globe. Both the scale and the results of the effort were prodigious. The state had little part in creating or directing them, other than by assuring freedom of action in an expanding context. Yet, for a process in which trial and

error (the true "speculation") necessarily played so large a part, losses were surprisingly low. If it were ever necessary to compose an epitaph for individual enterprise, as the founders of *The Economist* conceived it, the achievements of the investor, 1843-1943, might worthily fill a line.

What rôle will investment play in *The Economist's* second hundred years? Admittedly, the question demands more of those who essay to answer it than was vouchsafed, by way of prophetic power, to *The Economist's* own pioneers a century ago. It may be assumed that, if James Wilson and his colleagues had foreseen a tithe of the contribution which investment would make to the economic progress in the next three generations, its needs would have figured more prominently in *The Economist's* Preliminary Number and Prospectus. In fact, they were hardly mentioned. Even the most percipient prophets are apt to err by under-estimation in making forecasts for long periods; the temptation to project known conditions into an unknown future is very insidious.

Scientific invention, the chief falsifier of the "actuarial" type of economic judgment, was never more decisive in shaping events than during the last century, and its influence in the next may, by all present indications, be more rather than less important. The transition from the Steel Age to the Plastics Age—a possibility which occupies the minds of many investors to-day—may be (who can tell?) only among the first and least of the problems which new demands, processes and techniques will impose in the investment world. War, again, is a proverbial upsetter of all prophetic calculation. The record of economic achievement in *The Economist's* initial hundred years owed much to the fact that, for the first seventy of them, this country was involved in no major wars. The story of the next hundred years, equally, can hardly be unaffected by the events of the last thirty. It is scarcely conceivable that Britain could twice have successfully withstood, within so short a period, the economic strain of a World War, waged à outrance, if her economic foundations had been less well laid between the 1840's and the early years of the nineteenth century. But the Second German War, in particular, and the events which preceded it, have not merely altered the immediate direction of a considerable part of Britain's productive effort and entailed the realisation of many of her accumulated overseas investments. They have also given a powerful urge to ideas of the right relationship between the individual and the state, in investment and much else, which, whatever their merits, were not those which *The Economist's* founders had in mind when the paper started a hundred years ago.

Investors, looking at affairs, naturally, from their own special viewpoint, are well aware that the almost universal acceptance of Full Employment as a post-war objective entails momentous consequences for themselves. If the crux of that policy's successful application lies in control of the relationship between saving and investment, and if there are phases of the trade cycle when the state's intervention in the investment market will be indispensable, then, whether the state comes in as friend, guest, or Trojan Horse, it may be presumed to have come into the market to stay. Its direct intervention may be intermittent and infrequent, but its watchfulness will be constant. The capital market will be aware not only of an eye which never sleeps beneath the wing of night, but of a mind which decides priorities, requires submission of certain borrowing projects for its approval, decides how fast different market queues shall move past the turnstile and has its own ideas about interest rates. The market, in other words, will have to accustom itself to having the state as ultimate arbiter. And how much more?

Are certain fields to become closed areas for the private investor, because the industries within them provide

essential public services, because they have become monopoly-ridden, or because they are merely big or unenterprising? Does the principle of limited liability, the legal machine-tool of so much investment in *The Economist's* first century, need overhauling, refitting with new modern devices, or, even, superseding? Is the Public Corporation, in which private investors have a financial but no controlling interest, destined to become, for some industries, the characteristic functional unit? Certainly, that might offer a practicable solution for one problem which these first hundred years have left unsolved. *Quis custodiet ipsos custodes?* Who shall control the management, that third estate to which shareholders, in so many instances, have handed over the reins of power, because they themselves have become too numerous and diffused to exercise it? If the success of the Companies Act of 1862 in drawing capital from remote springs into great reservoirs had had that paradoxical result, then public control might claim that it was but taking a right which private investment had allowed to lapse, but was too dangerous to be left to go by default. But does that solution itself create yet another problem, if investment, without control, is nevertheless expected to continue to exercise its risk-bearing function?

The answers given to questions such as these may well determine the lines of evolution of British investment during the next couple of decades, and its amount, direction and purpose for the next century. In one sense, they are fundamental. They involve a marriage between public interest and individual enterprise, and neither partner can afford the consequences of an unhappy union. In another sense, they are but formal. The public interest, remote or near, has always been paramount in investment, and enterprise has been, and will remain, its indispensable motive force. There is no final, determinate relationship between them, no mixture by a chemical formula, good for all time. However the frontier may change, investment will go on. In a hundred years' time, new industries will have been equipped, older industries will have changed out of recognition, the authorities will have obtained the wherewithal for waging war or improving the health and amenities of citizens in peace, and British capital will again have played its whole essential part in increasing the economic stature and productivity of foreign countries. Investment is continuous, and the more its outward forms and instruments change, the more it remains the same. Fortunately for the community—and perhaps for the investor—the pool is bottomless, whatever sluice-gates regulate the waters that feed it. Investment's problems defy endeavours to find any one answer for all time. As long as human progress endures, investment will remain a sensitive index of its trend and fluctuations.

NOTES OF THE WEEK

The German Retreat

The week has been crowded with Russian successes. The great victory of Kharkov has been followed up by the recapture of Taganrog. All previous Russian counter-offensives on the Azov, in the winter of 1941-42 and early this year, foundered against this powerful stronghold which the Germans were able to hold for nearly two years. Its fall is therefore the most spectacular achievement of the Russians after Kharkov. But the repercussions on the German position in the Donetz basin are not yet decisive. It is fairly certain that the Germans are engaged in a massive retreat in this area; but as long as they manage to hold the Stalino-Slavyansk network of railways, they still have a fair chance of achieving an orderly evacuation. The Russian lines, however, are not far off; and unless the Germans at this point make very extensive use of the communications leading from the Donetz basin westwards they may soon find themselves facing the risk of a very costly "battle of annihilation." The Russian advance between Kharkov and Poltava and to the north-west of Poltava brings them steadily closer to the northern flank of the

Dnieper bend, at Kremenchug. Further to the north the Russians have advanced from Sevsk and crossed the northern boundary of the Ukraine, a fact the moral significance of which is perhaps greater than its immediate tactical consequences. Of all the victories of the week the capture of Yelnya in the Smolensk area has perhaps been the most important one, since it threatens to unhinge the German defensive perimeter in front of Smolensk. Only a few weeks of the summer campaigning season are still left to the Russians. If, during this time, they succeed in reaching the Dnieper bend in the south and Smolensk in the north they will have prepared the ground for their third and most pretentious winter offensive.

Europe Resurgent

The political situation in Europe is disintegrating on every side. In Bulgaria the King is dead. In Denmark there is something approaching a state of war. The attitude of the Swedish Government to Germany has grown

suffer. In Croatia a number of the leading supporters of the Nazis among the *Ustasi* have gone into hiding. And in France the Germans, ably assisted by Laval, are doing all they can to shatter the spirit of French resistance before *Le Jour*—the day of invasion—comes. The policy of sending French workers to Germany has a double purpose. It augments the German labour force, but it also sends the most vigorous and able-bodied men away from the potential battlefield. In the last week there has been a new purge among French officials, even among those who are outwardly collaborating, and, if reports are correct, the Germans have found it necessary to arrest even so innocuous a person as M. Lebrun. It is not, of course, his personal record which has earned him this—it has been correct, but not outstanding—it is the fact that he, as President of the Republic, is still a symbol of the continuity the Germans wish to crush. All these symptoms of unrest point in the same direction—towards the disintegration of Nazi power, towards the rise of a new spirit of resistance, towards greatly increased vigour in the violence and sabotage activity of the underground movements. The new situation presents unrivalled opportunities for a strong political strategy on the part of the Allies; it is the Nazis now who are on the defensive, and the initiative in the war of ideas could easily pass to the United Nations—if only they had decided on what their political strategy should be. A picture of a liberated and united Europe, in which the rights and liberties of individual peoples were guaranteed, in which prosperity was served by functioning international economic arrangements and security given within a friendly framework of the three Great Powers, Britain, America and Russia—such a picture, hammered home by the propaganda services of all three nations, and accompanied by specific examples and guarantees, might add many divisions to the Allied strength. At the moment, no such joint strategy exists. The voice of Washington is not the voice of London, and the voice of London is not the voice of Moscow. The occupied countries, waiting to surge forward, are held and bewildered by the diversity of roads along which they are being asked to tread. Thus the failure in political strategy is having, and will continue to have, military consequences.

There is only one way in which this situation can be remedied and an effective political arm added to the strength of the military offensive. The three Powers must meet without delay and concert their political strategy. The dismay and questioning aroused by Russia's absence from Quebec have apparently persuaded the American and British leaders that this need is urgent. In his broadcast from Quebec, Mr Churchill gave the weight of his support to a joint conference of the Foreign Ministers of the three Powers.

not merely to explore the various arrangements for world security but to carry their discussions to a point where the heads of States and Governments may be able to intervene.

Mr Churchill went further. He said that Britain and America desire to "associate" Russian representatives with political decisions affecting the Mediterranean front, and declared that there was no step or decision

about which we should not wish to consult with our Russian friends and allies in the fullest confidence and candour.

In spite of other more general passages in the speech, in which the Prime Minister skilfully restated earlier answers to the demand for consultation with Russia and for the opening of a Second Front, this statement should help to clear away many of the doubts and ambiguities of recent weeks. Everything turns now on what is actually done, on the vigour with which preparations for the Foreign Ministers' conference are pressed forward, and on the frankness and comprehensiveness of the talks. Mr Maisky is in London, and it is said that the latest initiative for a meeting has come from his side. Mr Eden has seen him and Mr Winant. The sooner their consultations lead to action, the better pleased will be the British public and the better served will be the Allied cause.

War in Denmark

The myth of a free and independent Denmark co-operating within the framework of an ordered German Europe has been finally exploded by the abolition of the Danish Government in Denmark, the dissolution of the Cabinet, the placing of King Christian under what is virtually house arrest and the transfer of all political power to General von Hanneken. The German Commander-in-Chief is now in

complete control of the country with full powers to govern, to punish and to execute. This sudden end to Denmark's quasi-independence comes after a period of intense unrest. Strikes, sabotage and serious clashes with the German troops have occurred throughout the country. These outbreaks are the cumulative effects of three years of German occupation, together with the growing certainty in Denmark that the Germans have lost the war. From the first, the Danes have resented bitterly Germany's propaganda to the effect that they accepted and even enjoyed the New Order; and for some time past politicians, trade union leaders and municipal officials have been co-operating in a campaign to prepare the people for sabotage, and even insurrection, should the German hold begin to loosen. They were determined to prove to the outside world that Denmark could not be bought off by special delicacies from the German table. The disappearance of Mussolini, followed soon after by the cancellation of the German transit agreement with Sweden, must have convinced the leaders that the time for stiffened Danish resistance had come. This period also coincided with a big increase of German pressure on the Danish people. In recent weeks, the Germans have introduced more intensive preparation against air raids. The cancelling of the transit traffic put a sudden and extremely heavy load on the already overburdened Danish railways—and railway workers. Fear of an Allied invasion compelled the Germans to strengthen their coastal fortifications, and to do this they had, for the first time, to introduce the Danes to forced labour and requisitioning. The trade unions countered the growing German pressure by demanding increases in wages and war risk bonuses, by instigating sit-down and open strikes, by dynamiting factories, blocking railways and derauling trains. The Germans appealed both to the Scavinius Government and to the King to help them to check the spread of disorder and resistance; but the situation was quite out of hand, and now the Germans have been compelled to take steps which virtually amount to a declaration of war on Denmark.

Screws on Sweden

It is too early to say whether the sharp exchanges between Germany and Sweden over the sinking of two

Swedish fishing vessels will develop into a more violent conflict. The facts are straightforward. German mine sweepers sank two Swedish vessels, killing their entire crews; these ships were fishing off north-west Jutland in waters which the Germans declared to be protected but which were not within the territorial limit. The Swedes protested energetically with the full and angry support of the Swedish press. At this, the official German *Diplomatische Correspondenz* chose to rebuke the Swedish newspapers severely, reminding them of their country's awkward geographical position and declaring "It is time to pronounce a sharp warning." Now come rumours of a concentration of German warships off Denmark. Clearly the revolt in the north is an embarrassment to the Germans. First the ending of the transit arrangements and, following it, the disturbances in Denmark have upset all the transport arrangements for supplying the Norwegian front. It would undoubtedly be a great convenience for the Nazis to be able to make use of the railway system in south Sweden. Against the advantage, they must set the outlay of military power which would be necessary to drive the Swedish army out of southern Sweden, and the economic loss which would follow from the cutting off of Swedish iron ore and timber. It does not seem an auspicious moment for the Germans to undertake new military commitments and fresh economic losses. They will certainly try intimidation. The limitation of this policy is that they no longer play from strength.

Exit King Boris

Ex-King Ferdinand linked Bulgaria to Germany in the last war and lived on to see his country's defeat. King Boris, the son who learned nothing from his father's failure, has met his death before Bulgaria's second defeat. His disappearance leaves Bulgaria in the throes of an internal crisis which has put an end to the "quiet and glorious" era of Bulgaria's cheap and bloodless victories over Greece and Yugoslavia. The two main internal factors in this crisis are the army and the peasantry, and both have tended for some time past to pass out of the monarch's control. To bring Bulgaria into line with the German war effort, the Bulgarian Government has taken very dangerous liberties with the country's economic structure. Dairy farming has been starved and cereals have given place to tobacco and industrial plants. This readjustment has affected the peasants disagreeably, and, combined with the countryside's strong sympathies for Russia, has given the peasantry an anti-German and anti-Government bias. Their attitude has naturally influenced the ranks of the country-bred army, and, however pro-German the officers may have been, the army as a whole was not a reliable instrument for Boris's policy. Though he declared war on Great Britain and the United States, he never wavered in his desire to maintain intact diplomatic relations with Russia. Over and above the pro-Russian feeling of the peasants there has always been a pan-Slav undercurrent in Bulgaria, and this feeling was outraged by the shameful oppression of the Yugoslavs at the hands of Boris's soldiers. The Allied victories and the collapse of Mussolini have naturally intensified the general sense of unrest and dissatisfaction. It is therefore plausible to suppose that King Boris spent the last months of his reign trying to manoeuvre himself out of a very awkward position. In this he was, like Badoglio, hampered by the presence of German forces. The Gestapo has recently tightened its grip over Bulgaria, and the last agreement between Bulgaria and Germany (signed by Boris only a few days before his death) was, significantly enough, concerned with "the extradition of criminals."

The death of King Boris is likely to bring the crisis to a head. Under the Constitution of Tirnovo, the King enjoyed unlimited dictatorial powers. The new six-year-old ruler, bear-led by the archaeologist Prime Minister Filov, will hardly be a sufficient rallying point to provide unity and keep the country quiet. A Council of Regents is to be formed, and it will be very surprising indeed if this Council is not torn from the very beginning by divergent policies and plans. It is almost certain that the pro-Italian party represented by the Queen-Mother (the daughter of Victor Emmanuel) will be strengthened at the expense of the pro-German party at the Court. The Regency's foreign policy will probably run parallel to the policy of the Badoglio Government. Conditions in the two countries are similar in several ways—the reluctance of the people to fight and the critical collapse of authoritarian leadership, on the

one hand; and, on the other, the existence of commitments to support Germany backed by the presence of the Wehrmacht.

The Pattern of Production

The war enters its fifth year with an overwhelming superiority of armament on the side of the United Nations. Mr Lyttelton, Minister of Production, has stated that the combined output of the Allies is now three times as great as that of the Axis, and that next year it will be four times as great. Substantial increases in output have been made in this country during the past year. The total output of munitions for all three fighting Services was 25 per cent higher in the second quarter of 1943 than in the second quarter of 1942, which was a particularly good period; in aircraft alone, there was an increase in the structural weight of output of 44 per cent. Actual production during the first six months of this year has equalled planned production. A policy of switching over from the production of defensive to offensive weapons was decided upon last January, when the Allies for the first time secured the strategic initiative; and Mr Lyttelton described its effects. The production of weapons and equipment which have become obsolete, which were primarily needed for desert warfare or of which there are now abundant supplies, is being stopped or curtailed, and production will be concentrated on the most modern and offensive types of weapon. The foremost of these is aircraft, which has a high obsolescence rate, involves constant adjustments and modifications to maintain superiority of performance, and carries with it the highest hopes of the Allied strategists. And increased emphasis will be laid on the production of certain types of naval vessels, of the scientific instruments used in sea warfare, and of radio equipment. During its first six months the transition was carried out with remarkable smoothness, though the scale of the change-over during the preliminary months was considerably smaller than it is, or will be, when the new policy is in full swing. Some 75,000 workers were released from their previous occupations between January and June, 1943, and of these, only 1,500 were unemployed for a month or more. Labour released from the production of Army supplies was rapidly absorbed in aircraft or naval work, and the cuts were made in the most heavily congested areas—thus about two-thirds of the cuts were made in the North-West, Midlands and London regions. The next stage, when the full effects of the change-over are felt, and the production programme gathers momentum, will be correspondingly more difficult to negotiate. The acceleration of the change-over from job to job, and from industry to industry, is bound to result in both local pockets of short-term unemployment, and, briefly, a slowing down of activity and idle hours in particular factories. The area of choice for recruits to the expanding industries will be limited because the numbers involved will be large, and there will be no margin. It will not be easy to secure a balance between cuts and expansion. But these are problems to be solved—and to be explained and publicly understood.

The Human Element

It is the Minister of Labour's task to secure a sufficient supply of labour; it is the Minister of Production's to allocate it in such a way as to conform to the strategic requirements of 1943-44. Both Ministers are concerned to minimise the considerable human problems involved in the execution of this policy. The actual transference from one type of production to another must result in inconvenience to both workers and managements, and often in financial losses. Wherever possible, the aim is to take the work to the workers, rather than to move the workers to the work. The Minister of Production is seeking to arrange for contractions in Ministry of Supply factories in areas where the labour released can be absorbed in aircraft production; for the allocation of Ministry of Aircraft Production work to Supply factories whose contraction is planned; and, where transfers are necessary, on a group rather than an individual basis. But there are practical limitations to this policy, and many of the Supply factories cannot be adapted for aircraft production. In some factories, particularly in aircraft work, the programme changes and modifications may involve periods of idle time, which have puzzled and distressed the workers. There is also a tendency for the growth of complacency and slackening of effort, in part due to the closing down of production sectors hitherto regarded as vital, and in part a reflection of the

AN ESSENTIAL OF WARTIME DIET

Stored in this tiny capsule are two vitamins without which it is impossible to maintain health. They are 'protective' vitamin A and 'sunshine' vitamin D and, unfortunately, they are not always readily obtainable in a wartime diet.

A daily dose of Crookes' Halibut Oil—one of the richest natural sources of these vitamins—will build up your resistance and stamina and prove of inestimable value during this fifth winter of war.

CROOKES' HALIBUT OIL

Obtainable only from chemists
CAPSULES — PER BOTTLE OF 100 — 8/6
LIQUID — PER PHIAL — ENOUGH FOR 16 DAYS 2/-

MANAGEMENT MUST SAVE MORE FUEL THIS YEAR!

The technical knowledge of the nation has been mobilized. Over 650 fuel experts are assisting the Regional Fuel Efficiency Committees. Trade associations have organized themselves to solve by co-operation the special fuel problems of their industries. The Ministry's bulletins are providing the best technical advice. Classes and demonstrations for managers, engineers, and operatives have been arranged throughout the country.

HERE ARE EXAMPLES OF THE VALUE OF THIS ADVICE

"The recommendations of the Ministry's engineers have saved my company £17,000 this year," reports one managing director.
"Attendance at the Ministry's lectures has reduced our fuel bills by one-third," says another.

Management must take the lead or this effort will be wasted. Will you —

- ★ see that the Ministry's engineers' recommendations are carried out.
- ★ meet your fuel watchers regularly and support their suggestions.
- ★ see that your fuel watchers know how and where to look for waste.
- ★ arrange for members of your staff to take the Ministry's instructional courses—go yourself if you can.
- ★ keep in touch with your Trade Association's Fuel Efficiency Committee.
- ★ see whether thermostatic control will reduce your heating load.

The Ministry's Regional Offices are at: GLASGOW • NEW-CASTLE • MANCHESTER • LEEDS • BIRMINGHAM • NOTTINGHAM • CAMBRIDGE • CARDIFF • BRISTOL • READING • LONDON

ISSUED BY THE MINISTRY OF FUEL AND POWER

general confidence in victory. It is doubly important to explain directly to workpeople the necessity for changes which affect them so much as individuals.

* * *

Recognition at Last

The manner in which the three Great Powers recognised the French National Committee was a reflection of their reactions towards General de Gaulle. In Britain and the United States reservations are still made about the scope of his political ambitions, and there is an undercurrent of anxiety lest recognition should strengthen unduly his personal position in post-war France. Thus both the British and the Americans limit their recognition of the Committee's authority to French territory overseas. The National Committee will not be regarded as the sole custodian of the interests of metropolitan France—indeed, the Committee's general claim to be custodian of all French interests is not conceded by either Government. Again, in the preamble to their statements of recognition, the two Governments stress the need for the French Committee to act as a collective body, and underline their desire that nothing should interfere with the French people's free choice of their government after the war. The Russian recognition which followed immediately after the announcement of the limited British and American recognition goes much further:

The Government of the Union of Soviet Socialist Republics, having acquainted itself with the Declaration of the French Committee of National Liberation, has decided to recognise the French Committee of National Liberation as representing the state interests of the French Republic, and as leading all French patriots fighting Hitlerite tyranny, and to exchange with it plenipotentiary representatives.

During the course of the last year, General de Gaulle has been building up much closer relations with the USSR, and his known determination to direct post-war French policy towards friendship and understanding with Russia has probably decided the Soviet Government to accord a recognition of the National Committee which virtually gives it the status of a Provisional Government. In the present rather uncertain state of diplomatic relations between the three Great Powers, it is a matter of regret that their recognitions should not have been better co-ordinated. The Russians proved their willingness to collaborate, and their loyalty to the terms of the Anglo-Russian Treaty by delaying their recognition until months after they were ready to accord it. It is permissible to ask whether the final failure in co-ordination must not be laid at the doors of the British and the Americans. This is the kind of divergence which, however unimportant it may seem in origin, can expand into a real conflict of policy. The best argument for some close and even permanent organ of Anglo-American and Russian consultation is that regular contact would enable the statesmen to discuss every difficult problem at an early stage in its development, and not leave it until time, prejudice, propaganda and the growth of vested interests have made it virtually insoluble.

* * *

French Reactions

It is not very likely that the verbal form given to recognition by the British and American Governments will have very much influence one way or another in deciding the future political framework of France. Insofar as their recognition heightens the status of the Committee, it can help to mitigate any danger there may be of personalist politics after the war. But no amount of reservation can counter the fact that the French National Committee, presided over by General de Gaulle, is the body to which nine-tenths of the French people will look in the hour of liberation, and which will, therefore, have a very large measure of political power in the immediate post-war period. The question of how that power will be used depends upon internal rather than external factors—for example, on the influence and solidarity of the civilian members of the Committee and, even more, upon the temper of the French people themselves. What little evidence there is suggests that the approach of liberation is bringing with it a slight shift of emphasis in the underground political life of France. The shift is away from a single-minded concentration on resistance—the state of mind of which General de Gaulle was the supreme symbol—and towards a new awareness of the future and of the part which political organisation will play in it. Significantly enough, the Socialist Action Committee has now

returned to its former name of French Socialist Party, and in its manifesto, although it states the necessity of setting up a Provisional Government presided over by General de Gaulle, it demands that this Government shall be one of national concentration, including men of the pre-1940 political life of France, as well as men who have proved themselves in the resistance movement—significantly enough these men are referred to in the document as "Republican guarantors"; and it also demands that there shall be a Provisional Assembly of Control, including representatives of the resistance organisations, party delegates, deputies who did not take part in the betrayal of the Republic of July 10, 1940, and delegates from all the already liberated departments. Even more significant, perhaps, is the manifesto signed by the group of twenty-seven Communist deputies in Algiers. The second point declares that the National Committee must break definitely with Vichy politics by "accustoming the people to follow neither a single man, nor a group of men, but a programme which everyone can and must discuss, insofar as time and conditions permit." Possibly these are only straws in the wind, but at least they suggest that the wind is not, as some observers suppose, blowing steadily in the direction of personalist rule and the single-party state.

* * *

Indian Food

The inevitable political implications of the present food shortages in India were discussed in a Note in *The Economist* last week. Considerable political capital is being made out of the very distressing situation that exists in a number of districts. Congress newspapers place the entire responsibility on the shoulders of the Central Government; reports of hoarding, racketeering and obstruction or maladministration by provincial and local authorities are dismissed by them as mere excuses. It is important, for the future of common sense and good will in the discussion of Indian politics, in every Allied country, that these accusations should be set in a right perspective. In the first place, the shortages are local, worst in Calcutta and parts of Bengal, though serious also in Bombay, Travancore and Cochin. The peoples of India eat mainly rice and wheat, and there is no shortage of wheat, except that due to the maldistribution of stocks and, of course, to the deficiency of rice. The case of rice is different. In normal years, India imports 2,000,000 tons of rice from Burma and Siam, both now closed to trade; twice successively India's own rice harvest has been poor; cyclones and floods have spoiled crops and prevented their carriage; moreover, India has the problem, common to all belligerent countries, of dovetailing civilian requirements with a rising demand for both food supplies and transport facilities. This is the basic situation, for which in general no particular authority or persons can be blamed.

*

But the situation has been made worse, and more difficult to solve, by a combination of factors. There has been some withholding of stocks by farmers and speculators, with the object, or at any rate the consequence, of driving up prices still further and lessening the supplies available. There has also been a definite inflationary trend, tending to drive up prices generally, due to the familiar phenomenon of dwindling supplies of consumers' goods combined with rising purchasing power; indeed, one of the reasons why farmers have been disinclined to market their crops has been the difficulty of converting the proceeds into the consumers' goods that they want. Hoarding has not been confined to producers, middlemen and speculators. In a different form, it has appeared provincially, in the reluctance of some provinces to release surpluses to meet the requirements of other regions. This does not mean, of course, that no responsibility at all attaches to the Central Government for the continuing crisis. Its job has been to make the best of a bad job, and, for a variety of reasons, it has not yet succeeded in doing this. Broadly, the proper policy of physical control over supplies and distribution has been stated; the pooling of supplies of all food grains throughout India; the unimpeded dispatch of supplies to deficiency areas; the control of prices; the prevention of malpractices; and, possibly most difficult of all, the introduction of rationing in areas with adequate supplies. Unfortunately, it has not yet proved possible to enforce this policy satisfactorily. The provinces, for instance, on whom lies the main responsibility for enforcing food laws, have not yet, in many cases, been fully persuaded of the need for drastic action; and, it seems, they cannot be coerced

velvet glove has been more in evidence than the iron hand. Measures have been taken, with appreciable effect, to check inflation, and at any rate to prevent prices from rising above the present levels—which, however, in the case of rice, make consumption by the poorest almost out of the question. Much more is needed. The Central Government's correct reply to the Congress charges is to call for the support of Congressmen and all other patriotic Indians in a determined campaign to distribute India's food according to India's needs.

The Catholics and the White Paper

Last week, the Roman Catholic Hierarchy of England and Wales spoke out loud and bold on the White Paper on Educational Reconstruction. They

regret to find that according to its provisions we shall still be penalised for our conscientious convictions... we see in the White Paper a threat to the existence of our schools...

Unfortunately, the declaration, though full of generalities and statements of principle, was obscure about the particular provisions of the White Paper to which objection is taken. To the layman, the provisions seem fair and reasonable. In the "Local Agreement Schools," that is, schools which come within the provision of the 1936 Act enabling, for a limited period, a local education authority to make a grant of 75 to 50 per cent for building, religious instruction will be under the control of the managers—the Roman Catholics welcome the revival of the Act. In "Controlled Schools," whose managers cannot meet half the cost of building and repairs, all financial obligations will pass to the LEA, together with the appointment of teachers; but the managers will be consulted on the appointment of a head teacher, and the foundation managers will have the right "to be satisfied" on the appointment of reserved teachers who will give denominational instruction for not more than two periods a week to children whose parents desire it—the Roman Catholics agree

that a way could be found whereby we could with security surrender the right to the appointment of teachers.

In "Aided Schools," where the managers can meet half the cost of improvements and repairs, the remainder will be met by a direct Exchequer grant, and the power of the managers regarding the appointment of teachers and the giving of denominational religious instruction will remain substantially unaltered—the Roman Catholics

are not indissolubly wedded to all our managerial rights.

*

It is difficult to see how a better compromise between Church and State on this most controversial question of religious instruction could have been devised, especially since it is not one Church, but at least three that have to be reconciled. The Catholics are apparently afraid that their resources will not allow them to provide half the cost of improvements, and that their schools will consequently become "controlled"; they are also probably afraid that they will not be able to compete in the provision of new schools, and it is

against their conscience to send [their children] to any but Catholic schools.

They ask for the introduction of the Scottish system to England, but, as the White Paper points out, conditions and tradition are quite different in the two countries. In Scotland, there is no ban on denominational instruction, whereas in England the ban on such instruction in publicly provided schools is as old as compulsory education itself. It is also well established that help from public funds must be accompanied by increasing public control, however much that control is tempered by the wish to preserve individual initiative and independence. Many Catholics would be among the first to argue that if the public schools are given grants from public funds they will have to be subject to a corresponding measure of public control. The same principle holds good for their own schools.

From Anomaly to Anomaly

This week, the Pensions and Determination of Needs Act, 1943, came into operation. The provisions of this Act were discussed in a Note in *The Economist* on May 15th (page 618). Now that the regulations made under it have come into force, it seems that its patchwork character is going to be worse than was then feared. It is an improve-

ment that a widow under 60 with dependent children, who is covered by the contributory pensions scheme, will be eligible to apply for supplementary pensions even after her children die or cease to be dependent; it is very hard on the woman whose husband dies just after her child leaves school, because she will still have to rely on public assistance to supplement her widow's pension or on her child's earnings, and will not be able to apply for a supplementary pension until she is 60. Most curious of all, however, is the provision applying the principle of the Determination of Needs Act—substituting an individual needs test for a household means test—to the grant of outdoor relief under the poor law and to the provision of financial assistance to the blind, in cases where the applicant for relief is a member of a household. This has led to the absurd situation that a son living with an aged father who is applying for relief will only be treated as contributing to his support if he earns £6 a week or more. But an order for maintenance under the poor law can still be made against a son not living with his father—and to the full extent of his means. Surely, it is time that the Government learned that, with such an anomalous system as the British social services, anomalies can only be removed in one place at the cost of creating others elsewhere. It was to avoid just such situations that Sir William Beveridge reported.

The Dilemma's Horns

The riddle of the future organisation of retail distribution and its manufacturing suppliers has seldom been better stated than it was by Mr Paul Cadbury in a speech to the Confectionery Trade Council a week ago. Nor, probably, would Mr Cadbury claim that he was able to resolve it. On the one hand, Mr Cadbury avowed himself implacably opposed to the kind of control by sectional associations of traders and manufacturers which takes the form of maintaining high prices and high margins and restricting the entry of new competitors. On the other hand, he did frankly say that distribution is the country's "least efficient industry"; and that the line of progress, technically, should be the lowering of distribution costs by better organisation and the elimination of redundant units—precisely the case which is made, disingenuously, by the trade associations when they claim powers of self-government and coercive control. Moreover, both in wartime and in the immediately post-war period, special conditions of shortage, of both raw materials and labour, make necessary a degree of regulation and control which is now familiar in the form of concentration, zoning, rationing and the limitation of the number of shops—all policies which, again, are seized upon by sectional interests as the exemplars of "planning" in the very different conditions of peacetime plenty. Mr Cadbury was firm in his opposition to the use of wrongful means to achieve, or to give the appearance of achieving, the desired end of cheaper and more efficient distribution. The proposal that, in the trade with which he is particularly concerned, retail outlets should be licensed by a committee of two manufacturers, two retailers and one representative of the public, he condemned. Nor did he agree with the demand that all manufacturers should, by compulsion, be made to join their trade association. Nevertheless, as he said, the problem of efficiency or rationalisation remains. The sectional method of reorganisation by which

THE PLANNING OF FREE SOCIETIES

By FERDYNAND ZWEIG, Professor of Political Economy in University of Cracow.

B. SEEBOHM ROWNTREE, in *Spectator* writes: "A really important book, which none concerned with post-war economic developments can afford to overlook."

R. P. SCHWARZ, in *Fortnightly Review* writes: "The author's precise and well-balanced argument will win him wide approval."

Times Educational Supplement: "The best book yet published on planning, covers every aspect of a huge subject."

12s. 6d. net.

SECKER AND WARBURG

the *status quo* is protected by the prohibition of new competition and the maintenance of prices and margins as high as possible is unacceptable: "It is the new entrants that keep the trade alive." Mr Cadbury felt tentatively towards the alternative of state regulation in the interests of the community—that is, of full employment and rising standards of living—and not those of a section. He suggested that the need for fewer and more efficient shops might be met by the provisions of town planning—by the creation of neighbourhood units in each planned area and the allocation to each of a limited number of shopping sites. On price control, he was not quite clear. He spoke equally against "price cutting" and artificially high margins. He admitted that, in his belief, there will have to be some degree of price maintenance; but he hastened to add that the aim should be "as low margins as possible with high turnover instead of low turnover with high margins." Plainly, there is room for much more discussion of these crucial points, and the emphasis laid by Mr Cadbury—in the teeth of his trade, which took it very well—upon the national rather than the sectional viewpoint is a worthy contribution.

* * *

The Small Trader

The Liberal Independent Trader Enquiry Committee lately issued a report, published in pamphlet form, called "Fair Play for the Small Man." The fundamental points of its recommendations deserve approval. It is, for instance, right to treat the small independent trader as an important part of the distributive system, instead of as an unfortunate relic—the representative of "far too many shops." It is also a right principle that, subject to the requirements of town planning, there should in general be complete freedom of entry to retail trade, and that the manufacturers' practice of making it a condition of sale to a retailer that the latter should not buy from a competing manufacturer, together with similar monopolistic restrictions, should be prohibited. The appointment of a Retail Trade Commissioner, with the duty of watching the retail trade associations and reporting to the Board of Trade any case where they exceed their proper functions, also deserves consideration. It is, however, difficult to draw the line between freeing the small man from obvious hardships and showing him undue favouritism. In its tenderness for small retailers, the Committee tends to overlook the fact that as a body they are far from being a freedom-loving community. They are very enthusiastic about their own freedom, about their independence of cartels and trust and trade association restrictions. But they are equally enthusiastic when it comes to opposing the freedom to trade, and they all stand for restricting the access to trade by qualification tests, licensing and registration. An example of their reactionary views can be found in their demand that Co-operative dividends should be prohibited, and it is surprising that the Liberal Committee should support this view by recommending that a dividend exceeding a "reasonable discount" should be subject to taxation. This is a most dubious recommendation. The Co-operative dividend is a device for distributing savings within certain periods, and it would surely be wrong to subject economies secured by Co-operative organisation to taxation. It is also doubtful whether an association of independent traders, as envisaged, would serve any useful purpose. It could hardly work in close contact with the regular trade associations if its members decide to uphold the right to trade in its full sense; if they do not, it would merely make the monopolistic organisation of retail trade more complete. The Liberals should beware lest their enthusiasm for the small man as such should lead them into the very dangers they are trying to combat.

Food Economy

Lord Woolton has explained that he does not intend to increase the present food rations, which are adequate for good health and nutrition. Stocks are needed for emergency and for fresh military campaigns. The Minister's slogan "Food for Attack" recognises that, as in the case of the expeditions to North Africa and Sicily, new operations must trench upon his province—directly by their call for extra foodstuffs, and indirectly by their demands upon shipping. Lord Woolton is the most successful of wartime Ministers in the eyes of the majority of ordinary men and women—if not in the view of those sections of the food trades where control and regulation have inter-

fered with peacetime ways most harshly. Mistakes have, of course, been made. The problem of distributing vegetables has apparently proved hardly soluble. Where food strategy has impinged most closely upon agricultural policy the higher wisdom has not invariably prevailed; the wartime maxim that foods for direct human consumption, those of the highest nutritional value and those most saving of ships should have an overriding priority in home production has sometimes been resisted, not always wholly in vain. But this year's harvest is a tribute to the triumph, on balance, of the right ideas—as well as to the technical efficiency and hard work of British farmers and farm workers, reinforced by volunteers from schools and towns. The chief reason, undoubtedly, for the success of the Minister of Food was the decision to introduce rationing and price control early in the war. The fatal tendency to regard rationing as a sign of weakness instead of, as it should be regarded, as an essential instrument of wartime policy and a guarantee of strength in battle, was resisted—after some indecision, which lingered on for a considerable time as each new need to tighten and extend food rationing came up. The British people know that they have been rationed, not because food has been scarce, but to prevent it from becoming scarce, and in order to preserve resources of ships and manpower for other war purposes. It is the more easy now for them to understand that, although present stocks and arrivals of food would permit appreciably higher rations, it would be contrary to policy to allow any increase. Moreover, the German under-water fleet is still in being. So long as this is so, Britain's foodstuffs, which are drawn across the seas from the entire world—meat, butter and cheese from Australia and New Zealand; meat, milk and eggs from the United States; wheat and bacon from Canada—should not, in the slightest, be squandered.

* * *

Science in Industry

Britain, as a nation, is not science-minded. It spends only one-tenth of one per cent of its national income on science, compared with one-third of one per cent in the United States, and one per cent in the Soviet Union. Comparisons of this kind, in terms of money and not of results, and in terms of national incomes which, because of statistical and social differences, are hardly comparable, do not prove much. But it is plain that, unless this country takes every step possible to mobilise and utilise scientific research for post-war development, it may not be able to hold its own in world markets. This is the view of many scientists and industrialists, and it is the tenor of a pamphlet, entitled "Are You Research-minded?" which Sir Harold Hartley, Fellow of the Royal Society and vice-president of the LMS Railway, has addressed to his fellow-industrialists. The pamphlet is timely, especially as it coincides with the bicentenary of the great Lavoisier, the founder of modern chemistry, who was conscious with a foresight beyond his age of the possibilities of applying the discoveries of science to the processes of industry. For some time past, there have been criticisms that the nation's scientific resources have not been harnessed to the war effort as speedily or as effectively as they might have been. The Association of Scientific Workers has produced a weight of evidence on the misuse of scientific manpower, and Professor A. V. Hill and others have consistently pressed for the setting up of a Scientific General Staff to direct and co-ordinate research work. Considerable improvements have been recorded in the past year, and the intention of Sir John Anderson's recent visit to the United States was to ensure the maximum co-operation between British and American scientists. There is obviously room, however, for further improvement, not only to meet immediate needs, but, above all, in planning for the future. Sir Harold Hartley makes several suggestions: closer contact between scientists in industry and those in the universities, who tend to operate in an academic vacuum; more industrial research associations—out of 24 associations, only four spend more than £50,000 a year, which is 0.06 per cent of the turnover of the industries concerned; more integration between research and development. He might have added that scientific workers in industry are underpaid, though the fruits of their labour may gain or save their firms many thousands of pounds; and that there is still an undue reluctance, from the national viewpoint, to pool information about new developments. Moreover, the higher civil service, trained largely in the classical school, often fails to appreciate the importance of scientific methods. An exception is the Ministry of Food, which provides an example of a Government department that not only encourages science, but applies it, to the advantage of the whole nation.

Sugar and Clothing

The Government's decision to raise the retail price of sugar by one penny a lb., that is, to fourpence per lb., on September 16th, provides an interesting example of the methods used to stabilise the official cost of living index. Broadly, the object is to stabilise the statistical index as a whole, rather than, directly, the actual cost of living, but to allow some flexibility of movement to the components of the index. If the cost of any one of the components rises, the Government can prevent this rise from being passed on to the consumer by means of a subsidy, or it can reduce the price of another component, also by a subsidy. The cost to the Exchequer of these alternatives may differ very considerably; it depends largely on the weight allocated to individual goods in the index, and on the relative expenditure of consumers on different articles. Thus, the rise in the retail price of sugar to domestic consumers involves a reduction in the sugar subsidy from 2½d. per lb. to 1½d. per lb. This saving in the sugar subsidy has been made possible, without any consequential rise in the cost of living index, by the downward trend in the average price of clothing, which, in turn, is due largely to the remission of purchase tax on utility goods. It is not stated whether the Treasury will benefit from the transaction, that is to say, whether its saving on the sugar subsidy will exceed the loss of purchase tax. The effect on the individual consumer will depend on his relative expenditure on sugar and clothing. If he takes no sugar, to cite the extreme example, he will gain most, but only if he purchases utility clothing; if he consumes his sugar ration and buys no clothing—if that were possible—or only non-utility goods, he will lose most.

* * *

Second Thoughts in Spain

The logic of events has not been lost on the Spanish Government. In particular, the discrediting of Fascism by the fall of Mussolini has had a very unsettling effect upon the Falangist machine, and the realisation that pro-Axis non-belligerency is no longer a winning ticket has led to a number of significant modifications in Spanish policy towards the belligerent Powers. For example, the messages sent by all Axis correspondents must now be censored. Allied war films are being shown for the first time, and the press is now permitted to publish the wave-lengths of British and American broadcasts. Even more surprising is the change of tone in the press. In a recent issue of *Ya*, Britain, after four or five years of solid slanging, came in for a glowing tribute.

In the middle of political and social disintegration, the atmosphere, the unity, the harmony and the solidity of the British Empire are one of the few comforting sights. Guided by its old and traditional institutions, dominated only by the idea of individual liberty and by respect for man, the British Empire is an example, a hope and a guarantee that neither disorder, nor barbarism, nor tyranny shall enslave the world.

This quotation is an interesting commentary on the hopes and fears of the Spanish Government for the post-war world. Both the press and all official utterances are as insistent as ever on the menace of Communism, but they are attempting to dissociate Britain and America from Russia and to suggest that the western democracies will preserve "order and civilisation," which is the Falangists' euphemistic description of their own regime. The interpretation which the Spanish Government puts upon British intentions is not a matter of very great interest for the time being. What is of interest is Spain's virtual recognition of Germany's defeat and its attempt to reorientate its position accordingly. The western democracies are thus in a strong position for securing whatever conditions and guarantees they require to ensure Spain's strict neutrality. Sir Samuel Hoare has seen General Franco, and has made it quite clear to him that the Allies cannot tolerate the anti-Allied propaganda current in the Falange, the assistance given to the Axis through spying and sabotage and, in particular, the leakage of information about Allied shipping and naval arrangements generally. Nor can the Allies accept the present position in Tangier, or the activities of Spanish officials and German agents in Spanish Morocco. The execution this week in Gibraltar of a Spaniard charged with sabotage is a practical reminder that Britain's long suffering has come to an end. It is to be hoped that General Franco drew the right conclusions from his interview with Sir Samuel Hoare and that the Allies will have no further cause to complain during the course of the war. As for the future—that is the concern not of the British but of the Spanish people.

Miners' Welfare

The Minister of Fuel claims that more has been done in the past year to improve the conditions and welfare of the miners than in the whole of the preceding fifty years. Many of the reforms were long overdue, but the credit side of the balance-sheet stands high. The setting up of pit-head canteens, the development of rehabilitation centres, the preventive measures against dust disease and the scheduling of pneumoconiosis under the Workmen's Compensation Acts—these are but a few of the positive measures introduced during the last few years. The mining community wishes to make sure that these are permanent, and not merely temporary improvements to be whittled down if the coal industry should again become depressed. An earnest of the Government's intentions has been given by Major Lloyd George, who assured the Miners' Executive last week that he intends to complete the provision of pit-head baths as rapidly as possible after the war. In April, 1939, the Welfare Fund Act increased the output levy from 3d. per ton to 1d. per ton, for a period of five years, for the express purpose of providing more pithead baths. But the building programme was suspended when war broke out, and, as it is, only about 60 per cent of the miners are covered. This year, the 1d. per ton levy will expire, unless Parliament extends the period, and the Miners' Federation is pressing, rightly, for its maintenance. Among the many claims on building labour and material which will be put forward at the end of the war, the construction of pithead baths should have a high priority. The Government is making strenuous efforts to increase the mining labour force, and hopes to recruit 30,000 men by March, 1944, and another 50,000 between March, 1944, and March, 1945. Miners' welfare, in the broadest sense, is one of the most important aspects of the mining manpower problem. If men are to be attracted—or directed—into the pits and are to choose mining as their peacetime profession, it is essential that their conditions should be raised at least to the level of those in other industries, which start out with the advantage that they are safe, clean and healthy, by comparison with underground coal mining.

Shorter Notice

"The Stock Exchange Official Year-Book, 1943." Thomas Skinner and Co. (Publishers), Limited, 330, Gresham House, E.C.2. 3,144 pages and cxxxii. of Appendices. 80s. net.

"The Stock Exchange Official Year-Book" is once more available, despite all the difficulties of wartime production. Notwithstanding the difficulties of censorship, paper control and the growing shortage of labour, it is as comprehensive as ever, and there is little or no indication that the information contained is any less up to date than in recent years. In fact, there are two modest additions of considerable convenience to those concerned with stock markets, namely, a list of "marking names" recognised by the market and of the officers of the Joint Advisory Committee of Stock Exchanges, set up last year.

Business Notes

Fall in Activity

After the remarkable rise in July, during the second half of which alone the industrial share index of *The Financial News* rose by almost 5½ per cent, it is not surprising that there should have been some reaction in market prices. Actually, the fall in the four weeks to August 31st was only one-sixth of the rise in the preceding period of that length. The falling off in activity is clearly reflected in a reduction in the number of bargains received, but the full effects of July's developments have not yet worked themselves out. The rise and the reaction were, largely, concentrated upon market leaders. The more persistent type of investor is now busy searching for less-known shares. Some of these can still be obtained at prices which look attractive to him, after making full allowance for their reduced marketability. Thus, slight as is the August reaction in the index, it probably exaggerates the total movement in British industrial equities, as, indeed, it is intended to do, since this is a sensitive index. Pending the publication of the figures of *The Actuaries' Investment Index*, a study

FIXED INTEREST AND EQUITY SECURITY MOVEMENTS (July 1, 1935 = 100)

Financial News Indices of 20 fixed-interest securities (converted to new base) and 30 ordinary shares.

of some recent brokers' lists of equities is useful. This shows a very wide margin in the yields obtainable on what are considered post-war recovery shares and on shares of companies which are doing well out of the war. The margin is particularly great where the former class has been forced to reduce its dividends below pre-war levels. This generalisation is, however, only true, in an unqualified form, if the choice of shares is restricted to very well known concerns. The return on a large number of less-known shares which should do very well in the immediate post-war period is often as high as that on the war industrial. This condition is due to three factors: the inertia which prevents investors from making detailed investigations; the reduced marketability of the lesser-known shares; and the solid objection that it is often even more difficult to obtain information about the standing of managements of small concerns than of those which are more in the public eye. The last is an important factor, but the second need deter no investor who is certain of being able to wait to realise, including those who require only a small volume of such securities for "mixing" purposes.

Yesterday the country and the market entered the fifth year of war. The investor as such takes little account of anniversaries, and he is at present inclined to rest until some further light is cast upon the future. If he looks back over the past year, or over the full four years of war, he may conclude that things might easily be worse. EPT and other disabilities notwithstanding, his holdings in British industrial equities have improved some 20 per cent in value over the past year, on the basis of the figures of *The Actuaries' Investment Index* or *The Financial News*. On

either basis they are double the nadir of June, 1940. As against end-August, 1939, the latter index shows an appreciation of over 50 per cent, and although the figure of the former will be less satisfactory, it will probably be about 78 against under 58 in August, 1939. It is true that the fall in yield is almost as steep as the rise in price, but that is some evidence of faith in the future. These movements have gone hand in hand with a modest but steady rise in all classes of fixed interest stocks, only recently converted into a sagging tendency, mainly restricted to long-term Government stocks.

III. THE NATIONAL DEBT (£ millions)

	Sept. 2, 1939	Aug. 31, 1940	Aug. 30, 1941	Aug. 29, 1942	Aug. 28, 1943
Floating debt	1,167,000	1,969,000	3,223,000	3,593,000	4,420,000
Other internal debt	6,204,000	6,868,000	8,320,000	10,356,000	12,418,000
External debt	1,032,000	1,032,000	1,060,000	1,298,000	1,298,000
Total	8,403,000	9,869,000	12,603,000	15,247,000	18,136,000

complete the data required for a retrospect of war finance in each of the four completed years of this war. The essential figures are summarised in the accompanying tables showing, for each of the four years of war and for the complete period of 208 weeks, the revenue and the expenditure, the capital repayments and the new loans raised. The last are given in full detail. Finally, there is given the approximate state of the national debt at the end of each of these twelve-monthly periods. The features brought out by these tables are the crescendo of national expenditure over these four years; the improving ratio of tax revenue to total expenditure; and the comparatively small resort to floating debt borrowing. Gross borrowing in these four years amounted to £9,983 million against which repayment of pre-war loans and sinking fund payments totalled £257 million, leaving net borrowing of £9,726 million—about 54 per cent of the total expenditure incurred since the beginning of the war. Of that total, £3,253 million, or roughly one-third, has been raised by floating debt borrowing, while the amount subscribed by investors of all kinds to "dated" loans is £4,897 million. Of the balance, £608 million represents the special subscriptions of Post Office and Trustee Savings Banks to long-term loans, £550 million has been derived from tax reserve certificates and £372 million consists of "other debt" mainly external borrowing.

No Corner in Industrial Diamonds

While diamonds have long been used in industry, the demand for them as an abrasive has shown a marked increase since the outbreak of war. They are used widely in engineering and mining and, in the form of powder, in the preparation of tungsten carbide and other engineering tools. Industrial diamonds, in fact, are now a vital raw material. The suggestion was recently made in the *New York World Telegram* that supplies to America's war industries were in the hands of a British diamond syndicate and that, by agreement,

the syndicate feeds industrial diamonds to American industries in quantities sufficient only to meet current needs. The agreement carries every safeguard against building up a surplus in the United States which might break the syndicate's control after the war.

It is quite true that supplies of both gem and industrial diamonds from producing countries in Africa are controlled and handled by a central agency—the Diamond Trading Company. It is also true that the quantity of gem diamonds released by the Diamond Trading Company is restricted to protect producers and—incidentally—consumers from the effects of reductions in demand or increases in supply. But it would be a very serious matter indeed if the syndicate were restricting the supply of diamonds to industry. No doubt, the diamond monopoly has the power to do so. But there is no evidence at all that it is in fact doing so and thereby holding the war industries of the United Nations to ransom—which would indeed be intolerable. There appears to be no deliberate restriction of either production or sales, which are in fact made on the basis of pre-war prices. True, the maintenance of pre-war prices does not mean that the industry is making any sacrifice; the expansion in demand which has rendered possible the liquidation of stocks has probably added appreciably to the industry's profits. The monopoly has no control over the allocation of supplies of industrial diamonds, and there is no proof of any discrimination against the United States. Of course, the fact that diamond producers are not exercising their power to restrict the supply of an essential raw material, and are selling it at pre-war prices, does not in itself justify the existence of a producers' monopoly. The monopoly has not abused its power—there is no corner in industrial diamonds—but it can always do so.

Building Society Concentration

In view of the small average size of building societies, the news of the projected fusion of Abbey Road with the National may, at first, seem rather odd. The two societies are, respectively, the second and the sixth largest in the country. It is tempting to ask whether it would not be better to continue concentration by the grouping of really small units, some of which are certainly not able to render all the services which the larger unit ought to be able to

give. It may be doubted, however, whether, except within very wide limits, size is the proper criterion, and, even if it is, the projected Abbey National, with total assets of some £80 millions, will be of moderate stature compared with the £126 millions odd of the Halifax. As in other fields, the objective should be to secure a balance between undue duplication and the creation of monopoly. By this criterion the Abbey National fusion is, potentially, a step in the right direction. Potentially, because neither directors nor staff of either society is to suffer from the fusion, so that immediate economies would seem to be restricted to some saving in the rent of overlapping branches plus, possibly, some increased service to customers. There is, apparently, no question of direct competition either in securing cash or in giving more favourable terms to would-be borrowers. Both societies deprecate the cutting of rates, except by national agreement, and it seems probable that concentration will have to proceed further before that is possible, while it is far from certain that a more closely knit movement would find lower rates very acceptable. None the less, the avowed object of the fusion is to increase the two societies' contribution to the good of their own members and of the community as a whole. If it results in economies, and these are used, either to give greater flexibility to the terms of purchase—or renting, for the societies are pledged to investigate that field—or to give the would-be borrower an assurance that he is getting real value for his money, it will have helped the movement to take a step forward.

Revised US Currency Plan

The official summary of the United States Treasury's revised proposals for an International Stabilisation Fund brings out a number of amendments other than those dealt with in *The Economist* last week—which were the stepping up from 12½ to 50 per cent in the proportion of each member nation's quota that must be paid in gold and the provision that only during the first three years will changes in foreign exchange rates be permitted without a three-fourths majority. The revision of the gold clause is not quite so unrealistic as might at first sight appear, for the plan states that "a country with inadequate gold holdings may have its gold contribution reduced." Most of the other amendments have evidently been introduced in deference to ultra-conservative criticism of the first draft, which was held by certain American banking quarters to be altogether too "starry eyed." Thus it is categorically stipulated in the revised version of the plan that "the resources of the Fund shall be used exclusively for the benefit of the member countries." The obligation which was laid on member countries by the original draft to sell to the Fund, in return for its local currency or for foreign exchange, all the gold or foreign exchange which it might acquire in excess of its official holdings at the time it became a member of the Fund is now reduced by half. According to the revised version only 50 per cent of that excess must be compulsorily sold to the Fund. The provisions for transferring abnormal blocked balances to the Fund have also been considerably attenuated; there is no attempt in the revised plan to formulate a long-term plan for the transfer and repayment of these balances. Instead, it is stated that, during the first two years, the Fund may buy from member countries blocked balances held in other member countries not exceeding in the aggregate 10 per cent of the quotas—a contribution which would make little impression on the problem of abnormal sterling balances, since the global quota for all member countries, namely, \$5,000 million, is smaller than the total of these sterling balances promises to be. In the matter of voting rights there is some indication of give and take. The revised plan reduces from one-fourth to one-fifth the proportion of the aggregate basic votes which may be held by any one country. This amendment removes the possibility of an American veto on all fundamental decisions, which require a three-fourths majority. Against this concession, however, the revised plan provides for an increase in the votes of creditor countries and a decrease in those of debtor countries, when voting on the sale of foreign exchange. The revised plan maintains its demand that member countries should abandon exchange restrictions except on capital transfers, and goes out of its way to emphasise a point which had already been stressed in the original draft, namely that "the Fund shall deal only with member Governments and their fiscal agents and not intrude in the customary channels for conducting international commerce and finance."

Anglo-Iranian Taxation

The accounts for last year of Anglo-Iranian Oil, summarised on page 347 make an excellent showing, the net profit, after meeting royalty payments and local taxation, being more than doubled and the total net revenue, before tax, the highest on record. Even after meeting home taxes and making heavy special appropriations, it is possible to raise the ordinary dividend from 7½ to 20 per cent, with a reasonable margin for addition to the carry forward. This is reassuring so far as it goes, but the value of the accounts as a guide to future earning power is completely vitiated by the fact that there is still no disclosure of the real EPT position. The chairman, Sir William Fraser, makes it clear that the Retainable profit of some £7,800,000 would be lower but for the fact that an EPT deficiency was carried forward from earlier years, but there is no indication of the extent of this credit. It is in consequence quite impossible to say what will be available in any future period. This is a matter of the very first interest to shareholders and potential investors, and the information ought not to be withheld unless there is very good reason to believe that its disclosure would be damaging to the national interest. It would appear that it cannot be the censorship which is responsible, for, if the enemy is interested in any figure of the company, less informative than its turnover, it is its gross profit, not the assessment of the Inland Revenue as to what its earnings were in the base period. Unless the censorship is unreasonable, directorates are withholding, of their own initiative, company information which is vital to the members, whose servants they are.

Unwilling Sellers

Reports that there was considerable dissatisfaction with the price offered for the ordinary shares of Short Brothers (Rochester and Bedford) and that the matter was to be submitted to arbitration are now proved accurate. Messrs William Charles Crocker have, during the past week, issued a letter stating that shareholders, representing a substantial proportion of the 831,000 odd ordinary and "A" ordinary shares, intend to exercise the right to challenge the price, and inviting those of like opinion to join with them. The price fixed was the middle Stock Exchange quotation of 29s. 3d. on the day the official controller was appointed. The letter states that such a quotation cannot, in any circumstances, be taken to represent the true value of the whole of the company's share capital. As stated, this is a direct challenge to the doctrine that the market price is, in normal circumstances—and it does not appear to be suggested that the circumstances were abnormal—the best valuation available, and it will be interesting to see what arguments are put up to rebut that view. There remains, however, a point which does not emerge from such summaries of the letter as are available, namely, the fact that the "A" ordinary shares, of which there are 250,000, carry a million votes and so would give complete control, even if a default on the preference dividend gave that class of capital the right to vote. There does not appear to have been any substantial body of litigation in this country concerning the value of voting rights as distinct from the right to receive dividends. It would seem to be arguable that a special value might attach to this right which would justify the payment of a higher price for the "A" shares, previously held privately and for which there is no question, than for the ordinary. This point is not, however, made in the circular.

Costings for Wool Textile Trade

On September 6th the Wool Yarn and Wool Cloth (Maximum Prices and Charges) Order, 1943 (S.R. & O., 1943, No. 1187), comes into operation. Except in one or two minor sections, all prices for wool textiles are now controlled. The Order lays down rules for costing yarn and fabrics, which take account of the state of activity; it is the result of the impasse to which the industry has been brought by previous Orders. Since the inception of the utility scheme, all utility fabrics have had to comply with certain conditions and sell within certain price ranges. For a year, all other fabrics have had to be sold at prices not exceeding those which the manufacturer secured for them in June, 1942. Several advances in production costs have had to be met by the spinner and manufacturer,

mainly wages and dyeing and finishing charges. The result was that those fabrics containing most labour and most dye-ware could not be made at a profit. (The Wool Control has kept the issue price of raw materials steady, and has just announced that it will remain unchanged until the end of February next year.) The Board of Trade has had to admit that, if maximum prices are fixed for finished goods, but wages and processing costs are allowed to advance, the result is a poorer quality finished article. To overcome this difficulty, new specifications of utility cloth have been admitted, mostly of the better-class fabrics, at increased prices, so that their manufacture, which had gradually been forced to cease, may now continue. For non-utility cloth, the spinner and manufacturer had arrived at the point when they must either go into a worse type of trade or out of business. One of the factors in increasing production costs during the past year has been the larger amount of machinery standing idle due to withdrawal of workpeople and the reduction in export fabric trade. In some sections there has been a decline in the amount of Government orders, and the reduction in activity means increased overheads on the active plant.

By the new Order, which, incidentally, indicates the change in the activity of the industry since last year, the cloth producer is given the choice of charging a profit varying between 4½ and 6 per cent on his costs of a year ago, plus 17½ per cent, or the same margin of profit on his present costs, whichever may be the lower. In other words, if he can make a cloth to-day at a smaller advance in costs than the general advance that has occurred in the industry, he is not allowed to take the difference for himself. The following table has been extracted from the Order and refers to machinery activity, which is taken into account in the method of costing:—

Type of Firm	Assumed Activity in June, 1942	Assumed Activity in July, 1943
	%	%
West Riding spinner manufacturer....	90	72½
West Riding weaver	52½	62½
West of England weaver.....	66½	62½
Scottish weaver	66½	66½
Huddersfield fine worsted weaver.....	62½	52½

The woollen sale yarn spinner is assumed to have run at 90 per cent of capacity a year ago, against the present rate of 72½ per cent. There appears to be nothing in the Order about the carpet weaver, who has virtually been closed down by the Board of Trade for more than a year, nor is there anything about the carpet woollen spinner, who is now struggling to make a pittance by spinning a few apparel yarns. Apparently he will have to cost on a 72½ per cent activity for his yarn, even though he may only be running 40 per cent of his plant. The Order makes history by imposing a system of costing upon one of the most individualistic industries of Great Britain.

Utility Furniture

The issue of permits to buy utility furniture, suspended on July 20th, because demand had outrun supply, was resumed on September 1st. Since production could not be increased to satisfy demand, the Board of Trade was faced with the alternative of making fewer people eligible to obtain the furniture or reducing the amounts they could buy. The latter course has wisely been chosen. The classes of claimants remain unchanged; people whose homes have been bombed, who are setting up house because they have young children or are expecting a child, couples married on or after January 1, 1941, those about to set up house on marriage, and those who need a bed for a growing child. The maximum number of units to be issued to a couple is reduced from 60 to 30, but seven extra units are allowed for each additional member of the household, including babies. Nursery furniture can still be obtained permit free. The number of units required for a bed-settee has been reduced from 15 to 10, for a divan from 8 to 6, and for a bed-chair from 7 to 6. These reductions may be a reflection of relatively low demand for these articles. The allowance of 30 units is barely sufficient to furnish one room—a bed and the smaller wardrobe and dressing-chest take 21 units—so that a permit to buy furniture can do little more now than to assist in the furnishing of a home. Presumably more second-hand furniture may be bought, but in general it is more costly than utility furniture. It is a pity that

2½% National War Bonds, 1952-1954.

Interest payable half-yearly on the 1st March and 1st September.
A first interest payment will be made on the 1st March, 1944.

PRICE OF ISSUE £100 PER CENT.

PAYABLE IN FULL ON SUBSCRIPTION.

Bonds of this issue are an investment authorised by The Trustee Act, 1925, and The Trusts (Scotland) Act, 1921.

THE GOVERNOR AND COMPANY OF THE BANK OF ENGLAND, by authority of the Lords Commissioners of His Majesty's Treasury, offer the above Bonds for subscription. Subscriptions will be received on Wednesday, 1st September, 1943, and thereafter until further notice in the "London Gazette." Subscriptions may be lodged at any office of the Banks hereafter mentioned.

Subscriptions must be in multiples of £50 with a minimum of £50. Subscriptions must be accompanied by the full amount payable in respect thereof.

The Principal of and Interest on the Bonds will be a charge on the Consolidated Fund of the United Kingdom.

If not previously redeemed, the Bonds will be repaid at par on the 1st March, 1954, but His Majesty's Treasury reserve to themselves the right to redeem the Bonds in whole or in part, by drawings or otherwise, at par on, or at any time after the 1st March, 1952, on giving three calendar months' notice in the *London Gazette*.

The Bonds will be registered at the Bank of England or at the Bank of Ireland, Belfast, and will be transferable by instrument in writing in any usual or common form in accordance with the provisions of the Government Stock Regulations 1943.

Bonds will be transferable in sums which are multiples of one penny. Transfers will be free of Stamp Duty.

A first interest payment, calculated from the date on which the subscription accompanied by payment is lodged to the 1st March, 1944, will be made on the 1st March 1944; thereafter interest will be payable half-yearly on the 1st March and 1st September. Interest will be paid by warrants transmitted by post and Income Tax will be deducted from payments of more than £5 per annum. The first interest payment will in all cases be payable to the original subscribers or to their nominees.

The Bonds and the interest payable from time to time in respect thereof will be exempt from all United Kingdom Taxation, present or future, so long as it is shown in the manner directed by the Treasury that they are in the beneficial ownership of persons who are neither domiciled nor ordinarily resident in the United Kingdom of Great Britain and Northern Ireland. Further the interest payable from time to time will be exempt from United Kingdom Income Tax present or future, so long as it is shown in the manner directed by the Treasury that the Bonds are in the beneficial ownership of persons not ordinarily resident in the United Kingdom of Great Britain and Northern Ireland.

These exemptions will not apply so as to exclude the interest from any computation for taxation purposes of the profits of any trade or business carried on in the United Kingdom. Moreover the allowance of the exemptions is subject to the provisions of any law, present or future, of the United Kingdom directed to preventing avoidance of taxation by persons domiciled, resident, or ordinarily resident in the United Kingdom, and, in particular, the interest will not be exempt from Income Tax where, under any such provision, it falls to be treated for the purpose of the Income Tax Acts as income of any person resident or ordinarily resident in the United Kingdom.

Subscriptions, which must be accompanied by payment at the rate of £50 for each £50 of Bonds subscribed, may be lodged at the Bank of England Loans Office, E.C.2, or at any office of the following Banks:—

IN GREAT BRITAIN:

Bank of England,
Bank of Scotland,
Barclays Bank, Ltd.
British Linen Bank,
Clydesdale Bank, Ltd.
Commercial Bank of Scotland, Ltd.
Co-operative Wholesale Society, Ltd.
Coutts & Co.
District Bank, Ltd.

Glyn Mills & Co.
C. Hoare & Co.
Grindlay & Co., Ltd.
Isle of Man Bank, Ltd.
Lloyds Bank, Ltd.
Martins Bank, Ltd.
Midland Bank, Ltd.
National Bank, Ltd.
National Bank of Scotland, Ltd.

National Provincial Bank, Ltd.
North of Scotland Bank, Ltd.
Provincial Bank of Ireland, Ltd.
Royal Bank of Scotland,
Union Bank of Scotland, Ltd.
Westminster Bank, Ltd.
Williams Deacon's Bank, Ltd.
Yorkshire Penny Bank, Ltd.

IN NORTHERN IRELAND:

Bank of Ireland,
Belfast Banking Co., Ltd.
Hibernian Bank, Ltd.

Munster & Leinster Bank, Ltd.
National Bank, Ltd.
Northern Bank, Ltd.

Provincial Bank of Ireland, Ltd.
Ulster Bank, Ltd.

A commission of 1s. 3d. per £100 nominal subscription will be paid to Bankers or Stockbrokers on subscriptions bearing their stamp.

Subscriptions must be made on the printed forms which may be obtained, together with copies of this Prospectus, at the Bank of England Loans Office, London, E.C.2, or at any of the Branches of the Bank; at the Bank of Ireland, Belfast; of Messrs. Mullens & Co., 13, George Street, Mansion House, E.C.4; or at any Bank or Stock Exchange in the United Kingdom.

BANK OF ENGLAND, LONDON.
31st August, 1943.

N.B.—Separate Prospectuses relating to 2½% National War Bonds, 1952-1954, to be held on the Post Office Register will be issued by His Majesty's Postmaster-General (and may be obtained at any Savings Bank Post Office or Bank), and by the National Debt Commissioners on behalf of Trustee Savings Banks. The amount subscribed by any person under the Prospectuses issued by His Majesty's Postmaster-General and by the National Debt Commissioners must not exceed £1,000.

the Board of Trade has not announced how long a delay is to be expected between ordering the furniture and its delivery. There are now 158 firms making the furniture, and further designation is not contemplated, except in so far as it may be necessary to level up production of particular items in particular areas. Thus the Board of Trade now knows what production can be expected.

The Marginal Producer

Owing to the pressure of war demand, the output of many raw materials has had to be extended to the limits of capacity. The need for utilising high-cost capacity has given rise to interesting problems of pricing. The fixing of prices at a level at which high-cost producers can make a profit involves the payment of excessive prices to low-cost producers. This problem does not arise in industry, where separate contracts are fixed with individual firms. In the case of raw materials, the adoption of the system of individual contracts would have caused administrative difficulties of no mean order. The solution which has been adopted for certain materials in this country and in the United States has been to fix standard prices high enough to yield reasonable profits to the majority of producers, but not high enough to bring in high-cost capacity; marginal producers are paid a premium over the standard price in order to secure their output. This system has been adopted with success in the British iron and steel industry, and it is also applied to coal. Producers in both industries have to pay a levy on output, which is used to compensate the marginal producers. In the United States the device has been applied to domestic producers of copper, zinc and lead, for example; it has been estimated that the premiums paid to them will reach the annual rate of \$80 million by the end of this year. The system was introduced in February, 1942, because the standard prices—12 cents per lb. for copper, 8.25 cents per lb. for zinc, and 6.50 cents per lb. for lead—were unlikely to encourage production to the limit. By the method adopted, which will remain in force until January, 1945, all producers receive premiums

—5 cents per lb. for copper, 8.25 cents per lb. for zinc, and 5.50 cents per lb. for lead—for any output above the 1941 level. The economies achieved by this policy have already been substantial. On the basis of production in 1941, amounting to 2,100,000 tons for the three metals, an overall increase in prices of 1 cent per lb. would have added \$42 million to the bill; an increase of 5 cents per lb. would have cost an additional \$210 million. This method of fixing prices has been a useful expedient in conditions of wartime scarcity; although its application in peace is likely to be limited, it has interesting possibilities—both good and bad from the community's standpoint.

Coal as a Raw Material

Hitherto the research work of the Mining Association, through the British Coal Utilisation Research Association and other organisations interested in fuel economy, has been directed mainly towards the utilisation of a larger percentage of the potential energy in coal. The progress made in recent years has been substantial, and in some branches of industry spectacular. In its recent memorandum on "Coal Research and the National Economy" the Parliamentary and Scientific Committee stated that, between 1913 and 1938, the percentage of the energy recovered had been increased from 15 to 30, and that there were some industrial installations today working with an overall efficiency exceeding 60 per cent. It is probable that these achievements have been excelled under the war-period economy campaign of the Ministry of Fuel and Power. Latterly, however, increasing attention has been paid to the need for the fuller exploitation of the natural wealth of coal as a raw material for chemicals. Last May the BCURA announced a scheme by which £1,000,000 is to be spent over the next five years, partly for this purpose and partly on a more intensive research into methods of coal combustion; but the discussion provoked by the memorandum of the Parliamentary and Scientific Committee, and particularly by the speeches in the debates on the subject of scientific research in the House of Lords on July 15th and 20th, seems to have convinced the coal-

mining industry of the urgency of the need not merely of scientific research but for the immediate and vigorous development of processes for the production of hydrocarbons and hydro-carbon derivatives from coal. On the recommendation of the Central Council of Coal Owners, the industry is shouldering this responsibility. A preliminary programme, involving the expenditure by the end of 1945 of between £400,000 and £500,000 (to be raised mainly by a small levy on output) has already been prepared, but the promoters of the scheme hope to secure the co-operation of interests outside the coal industry which may be engaged in related research activities; and it is understood that the Department of Scientific and Industrial Research has not only given the project its blessing, but promised its active support. It is the future of the coal-mining industry in relation to the expansion of the chemical industries that the scheme has primarily in view; the Parliamentary and Scientific Committee has outlined the task in these words in its memorandum:

The chemical treatment of coal must be attacked with all the resources of pure science and engineering skill. Every branch of chemical industry in Great Britain is entitled to look to coal to supply its raw materials and intermediates. Fertilisers for agriculture, dyestuffs and chemicals, plastics, synthetic rubber, soaps, lubricants, and, perhaps most important of all, liquid fuels, and especially high octane spirit for aviation, can and should be produced from coal.

Absenteeism in ROF

The Industrial Health Research Board of the Medical Research Council has published the results of a study of absenteeism among women war workers at two selected Royal Ordnance Factories. The inquiry, which was undertaken on random samples of the personnel, covers two periods of six weeks ended on August 11, 1942, and June 27, 1943. It is limited in scope, covering only about 1,300 workers, and there is no suggestion that it is representative of conditions in industry as a whole; nevertheless, it throws an interesting light on a problem which is common, in greater or less degree, to all war factories, and about which singularly little statistical information has been made available. The data collected confirm many tendencies which have already been observed in connection with the problem of absenteeism, for instance, that more time is lost by married women than by single women. While the percentage of women in the two factories who were absent for some part of the six weeks was 84.5 and 70.5, respectively, the proportion of married women was 87.9 and 75.9 per cent, and that of single women 82.1 and 63.1 per cent. The incidence of absenteeism was highly irregular, very few women losing one or two shifts each week; but the absence of married women tended to be spread over a greater number of weeks than those of single women. Younger women up to 25 years of age lost more time than older women. The rate of absenteeism was noticeably higher on the morning than on the afternoon or night shifts; it was highest on a Saturday, and lowest on pay-day. There would not seem to be any direct correlation between absenteeism and travelling time, though the rate tended to increase over and above a period of 60 minutes taken to reach the factory. The inquiry revealed that absenteeism was far higher in the larger of the two factories examined; this divergence was attributed to the fact that it employed five times as many women, was situated in an isolated position, and had expanded rapidly. The investigation was primarily concerned with the amount and distribution of absenteeism, and no attempt is made to analyse its causes or to break it down (as is done for the mines) into voluntary and involuntary absenteeism. But the conclusion is drawn that, in view of the irregular nature of absenteeism, its incidence should be studied from a personal standpoint, and individual methods of treatment should be upheld. The fact that the rate is highest among married women seems to indicate that far more attention still needs to be paid to easing the domestic responsibilities of married women who have entered industry.

Austin Debenture Conversion

In commenting on the original plan for financing the redemption of the 5 per cent first mortgage debenture stock of the Austin Motor Company by an issue of preference shares, it was pointed out in *The Economist* of April 24th that there would be some disappointment that the new capital was to be privately placed. This proved to be an understatement, and it is a matter of satisfaction that those responsible, whether the company or the Treasury, have

reversed their original decision. In consequence, holders of £944,280 5 per cent debenture stock, repayable at 103 on January 1, 1944, are to have the option of accepting, instead of cash, the new 4½ per cent cumulative redeemable preference shares of £1 at 20s. 3d. per share on a pound for pound basis. That is to say, there is a choice between £103 in cash or £100 preference shares and 35s. in cash. On this basis the new investment gives only the modest yield of 4.44 per cent, compared with an average for manufacturing preferences of 4.37 per cent, according to the figures of *The Actuaries' Investment Index* at the end of July. Looking back over the vagaries of the motor industry during recent decades, this seems a meagre return, and it is far from clear what the outlook will be once the post-war restocking movement is over. If the British Government, instead of protecting the home market, facilitates the production of suitable cars for export, and if the world is prepared to accept reasonable freedom of trade, the outlook may be very good, but there is so far no assurance that this desirable object will be achieved. So, on a long view, the return offered is perhaps not very attractive. But, on the short, it would not be easy to find alternative investments of greater merit. It is some disadvantage to the holder that the new preference shares can be redeemed by purchase below the redemption price of 21s.; but on the showing of the latest balance-sheet, dated July 31, 1942, they are covered over three times by fixed assets and twice by net liquid assets, five times in all, while the average available profits of the past six years, 1935-36 to 1940-41, cover the dividend 18 times and the total service, calculated to redeem the whole issue by 1978, some 12½ times, even if the issue is extended to the limit of £1,000,000. The offer closes on September 14th, and it is very regrettable that there is no hope of the accounts for the past two years being available by then.

The Future of Tin

The occupation by Japan of Far Eastern tin-mining countries, which formerly supplied two-thirds of the world's total demand for this metal, has compelled the United Nations to encourage the expansion of production in other countries—especially in the Belgian Congo and Nigeria—and to economise in the use of tin by the introduction of new methods, such as the electrolytic tinning process. Both these factors are likely to have permanent effects on the demand for tin. Moreover, other materials, such as light metals and plastics, are likely to compete with tin to a growing extent. This does not, necessarily, mean that the consumption of tin will show a permanent decline which would be aggravated by the war-time extension of capacity when the Far-Eastern mines have been re-equipped. Tin has many properties which should assure it a growing demand. It is not surprising, therefore, that the industry is taking steps to intensify research and development work. It is understood, for example, that the Malayan Chamber of Mines in London has asked the Colonial Office to assist in this work by subsidising the Tin Research Institute, whose director is reported to have prepared a detailed programme of post-war research. But much will depend on the industry's price policy after the war. An excessive price might defeat the industry's object of finding new markets for the metal.

COMPANY MEETINGS

WATNEY COMBE REID AND COMPANY, LIMITED

COLONEL O. P. SEROCOLD'S SPEECH

The ordinary general meeting of Watney Combe Reid and Co., Ltd., was held in London on the 30th ultimo.

Col. O. P. Serocold, C.M.G., the chairman, in the course of his speech, said: Since we last met there has been a further increase in the Beer Duty, involving yet another 1d. a pint. The Chancellor has budgeted for a revenue from beer in excess of £250 million during the current financial year. Physical difficulties and depletion of our labour force render it impossible for us to maintain the elasticity of output which in normal times enabled us to meet upward fluctuations in demand. I will not enlarge on the many things which, owing to war conditions, we have been unable to do, but prefer to report that our three breweries and our bottling stores have been working very well under most difficult circumstances, in which I can foresee little prospect of relief.

TRANSPORT ECONOMIES

To meet the requirements of the Ministry of Transport, brewers have effected considerable economies in the carriage of beer, both by means of area interchanges of trade and by transferring traffic from road to rail. The whole subject is a complex one, requiring continued patient investigation on the part of those dealing with the question. Summary action might well lead to whole areas going short of beer, since the location of breweries and the demands for beer are not geographically in step.

While the war has been going on, a measure which is now called The Catering Wages Act has, without previous enquiry, been introduced and passed by both Houses of Parliament. There may well be wide room for differences of opinion as to its merits, but, as it is the elementary duty of the good Englishman to make the best of the laws given to him by Parliament, it behoves all of us in any way connected with the liquor trade—wholesalers and retailers alike—to do what we can to make the Act effective for the good of all classes engaged in what may very roughly be called "The Catering Trade."

WAR DAMAGE AND REPLANNING

I informed the stockholders a year ago that legislation effected in the Finance Act, 1942—helped to some extent by representations from the Liquor Trade—had provided for the maintenance in suspense of licences of houses destroyed or damaged by enemy action or closed on account of the destruction of the surrounding neighbourhood. These provisions are still in force and will

continue until the licences come into effective operation again. The future of all such licences will be intimately affected by the proposals and schemes about reconstruction and replanning of the bombed areas, which must take effect, in some shape or other, after the termination of the war.

As I said last year, we have a number of licensed premises in these categories and there is little doubt that it will not be expedient to re-open some of them on the sites on which they previously existed, and I recognise that a number of removals to fresh sites is more than likely to follow. It is common ground that the provisions of the Licensing Law as to removals were not intended for, and are not suited to, the circumstances which have arisen, or may still arise, from enemy action, and that the Replanning Authorities must be given wider and more direct powers without interfering unduly with the functions and powers of the licensing justices.

WM. COOPER AND COMPANY PURCHASE

Investments in subsidiary companies include the Ordinary share capital of William Cooper and Co., Ltd., of Southampton, acquired during the year. Investments in Government securities, tax reserve certificates and cash at bankers total just under £2½ millions. A more accurate estimate of the current percentage increase applicable to the cost of repair work had shown it to be prudent but by no means excessive to add £400,000 to the existing reserve of £280,000.

The report and accounts were unanimously approved.

W. J. BUSH AND COMPANY, LIMITED

SATISFACTORY RESULTS

The forty-sixth annual general meeting of W. J. Bush and Co., Ltd., was held, on the 27th ultimo, at the Great Eastern Hotel, Bishopsgate, London, E.C.

Dr Percy C. C. Isherwood, O.B.E., Ph.D., F.I.C., the chairman and managing director of the company, presided.

The Secretary (Mr. D. E. Arnold, F.C.I.S.) read the notice convening the meeting and the report of the auditors.

The following is the review of the chairman on the year's working of the company, which was circulated with the report and accounts, and taken as read at the meeting: Your directors consider that under existing conditions it is again desirable to dispense with the usual review of the past year's working by the chairman and for me to provide a brief statement to accompany the report and statement of accounts for the year 1942.

During the period under review the company has felt the effect of the spreading of the war to the Far East. This has not only deprived us of markets for the sale of our products, but caused a cessation of the sup-

plies of raw materials normally obtained from some of these territories. In spite of these adverse features, the company has, in the opinion of your directors, been able to achieve satisfactory results.

A very considerable proportion of the year's profits is required to meet taxation and your directors have considered it desirable to charge excess profits tax before arriving at the net profit. For the convenience of members, the 1941 figures shown on the accounts for comparison have been adjusted accordingly.

I am pleased to report that our branches and subsidiaries throughout the world have, in spite of many difficulties, maintained a satisfactory position.

The chairman moved the adoption of the report and accounts.

Mr. H. B. Bush (managing director), seconded the resolution and it was carried unanimously.

The final dividend of 6 per cent. on the Ordinary shares, making, with the interim dividend already paid, 10 per cent. for the year, was declared.

The retiring directors, the Rt. Hon. Lord Hayter, Lieut. E. L. Bush and Mr W. J. Thomas, were re-elected, and the auditors, Messrs. Turquand, Youngs, McAuliffe and Co., were reappointed.

Mr T. E. Binsted proposed a hearty vote of thanks to the chairman, directors and staff, and congratulated them on the excellent results submitted.

The vote was cordially approved, and the chairman, acknowledging the compliment, said that no company could have a more loyal and efficient staff, both at home and overseas, and their relations with all their workpeople had always been most cordial. He felt that every one of them had the interests of the company at heart.

The proceedings then terminated.

A. AVELING-BARFORD, LIMITED

The meeting of Aveling-Barford, Limited, was held on the 1st instant, at Grantham, Mr Edward Barford, M.C., the chairman, presiding.

The following is an extract from the total chairmans circulated statement: The total amount paid or payable on account of E.P.T. up to March 31st is in the neighbourhood of £450,000 and income tax liability during the same four-year period is approximately £160,000. The enormous figure for E.P.T. is due to the fact that our so-called "standard" is less than half our actual pre-war profit. It does indeed seem paradoxical when it is the new works and re-organisation of the business which has enabled the company to make such a big contribution to the war effort.

During the year under review a further increase in production was achieved and the company looks forward with restrained optimism to its part in the reconstruction of this country and of a stricken world.

GOVERNMENT RETURNS

For the week ended Aug. 28th, 1943, total ordinary revenue was £65,682,000, against ordinary expenditure of £79,179,000, and issues to sinking funds of £30,000. Thus, including sinking fund allocations of £3,610,958 the deficit accrued since April 1st is £1,285,631,000 against £1,181,035,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £29,995 to £2,782,546, the other operations for the week (no longer shown separately) raised the gross National Debt by £12,801,464 to £18,137 million.

INDUSTRY AND TRADE

Railway Statistics.—Since the outbreak of war, British railways have moved over 1,000 million tons of freights and have run 180,000 special trains for the transport of troops and equipment. The equivalent of thirty divisions a week is at present carried in special trains. There are 20,000 steam locomotives in

use; 143 freight locomotives and 1,600 wagons have been sent to Russia. Over 100,000 railwaymen are in the fighting forces, and the labour force now consists of 500,000 men and 100,000 women.

Harvest Workers.—It is expected that the number of town dwellers who have helped to gather in the harvest and have stayed in the holiday camps organised for the purpose will number 150,000 before the field work has been completed. In addition, 50,000 schoolchildren will have worked on the land. Help has also been given by local residents and week-enders who are members of land clubs.

HERE'S LUCK

White Horse is a tonic when you are jaded in body or mind, and if you are in lighter mood it puts a finer point on your enjoyment.

WHITE HORSE

Bottles 25/9;—Half-Bottles 13/6

Quality of Reproduction

For nearly half a century the world's greatest artists have entrusted the permanent reproduction of their art to "His Master's Voice"—exclusively. Purity of tone and quality of reproduction have therefore become a tradition with "His Master's Voice" . . . a tradition which ensures that "His Master's Voice" radio sets and radio-gramophones enable you to hear the world's greatest artists as they would wish to be heard.

"HIS MASTER'S VOICE"

RADIO RECEIVERS—RADIO-GRAMOPHONES

We regret that no Radiograms or Radio Receivers are available for the time being

Printed in Great Britain by ST. CLEMENTS PRESS, LTD., Portugal St., Kingsway, London, W.C.2. Published weekly by THE ECONOMIST NEWSPAPER, LTD., at Brettenham House, Lancaster Place, London, W.C.2—Saturday, September 4, 1943.

THE SCIENTIFIC PREVENTION OF COLDS

THOUSANDS who used to catch colds easily will again experience a winter free from colds. They are users of SEROCALCIN tablets and each Autumn they take the immunising course which gives complete protection against colds in 8 out of 10 cases.

How it is done

SEROCALCIN acts by stimulating the natural defence powers of the body. It enhances the resistive capacity against invading organisms that cause colds and prevents a cold before it happens.

Simple and Safe

The immunising course consists of 60 SEROCALCIN tablets taken at the rate of two daily for thirty consecutive days. In 80 per cent. of cases this course gives complete immunity against colds for a period of 3 to 4 months. There are no "drugs" in SEROCALCIN—it is perfectly safe both for adults and children.

Proved by Tests

Tests by Doctors in private practice, Hospitals and Factories have established the claims made for SEROCALCIN and confirm its ability to give successful results in 80 per cent. of cases.

Supplies and Prices

Hospitals, Schools, Munition Factories and export trade have first claim on supplies, but most Chemists have adequate stocks. The immunising course of SEROCALCIN (Reg. Trade Mark) costs 8/5 inc. tax. Industrial and School Medical officers, nurses, welfare workers, Labour Officers and interested members of the public are invited to write for a booklet "Immunity from colds" which will be sent on receipt of 1d. stamp.

SEROCALCIN PREVENTS COLDS

HARWOODS LABORATORIES LTD., Rickmansworth Rd., WATFORD, Herts.

Vitamins in chocolate for liberated Europe

The British Government, having examined all the ways in which sufficient vitamins could be provided to the under-nourished children of liberated Europe, have arrived at the conclusion—as Rowntrees did in 1938—that chocolate offers one of the best vehicles for carrying added vitamins. In chocolate, the vitamins retain practically all their potency.

Before the war, Rowntrees, alone among British manufacturers, pioneered the addition of vitamins to cocoa and chocolate. Their object was to enhance the protective value of these already highly nutritious foods.

Today, when the Allied Governments are faced with the enormous problem of rehabilitating each occupied territory as it is freed, Rowntree's experience of fortifying cocoa and chocolate with vitamins on a large scale is proving of great value. When the war is won, this experience will again be used for the benefit of the British public.

The First Surrender

THREE years and three months after Italy's entry into the war, the Italian forces have surrendered unconditionally; and although all the great issues of the war still lie ahead, the British people can afford to pause a moment in their struggles and labours and look back over the long road they have come. Somewhere in his memories of the last war, T. E. Lawrence wrote "There could be no honour in a sure success but much might be wrested from a sure defeat." It would be hard to find a better statement of the relative positions of Italy and Britain in June, 1940. It was the bait of "sure success" that brought the bellicose Mussolini and his unwarlike people into the fight, and, indeed, as they know now to their cost, "there could be no honour" in it. It was "pure defeat" that appeared to face British arms, when, standing alone in Britain, in Africa, in the Far East, the small crippled British army, flanked by its comrades from the Dominions, took up the challenge of the Axis. Then, in what was at once the British Empire's darkest and finest hour, Winston Churchill made the decision upon which all the Mediterranean triumphs, and perhaps the future of the war itself, were based. He sent out from the denuded beaches of Britain the Army's only fully equipped armoured division. He sent it to the Middle East. It was by that superb gesture of courage and imagination that success has finally been wrested from "sure defeat." Not a year after El Alamein total victory has been won in the Mediterranean and a new phase of the battle has already begun on the shores of Europe.

The collapse of Italy was certain once Mussolini had disappeared. Only the timing was in doubt. In the event, the armistice was signed on September 3rd, but General Eisenhower, who had secured the agreement of the Russian as well as the British and American Governments, delayed its joint announcement by himself and Marshal Badoglio in order to get as large a force of Allied soldiers as possible on to the Italian mainland before giving the Germans the intelligence, not only that Italy no longer fought beside them, but on the contrary would now join in the fight to drive them out. That such a volte face is possible is one more illustration of the criminal folly of Mussolini in leading his people into an unwanted war at the side of a Power which, to the great majority, remained the traditional enemy. It is very hard to estimate how much stomach the Italian soldiers will have for carrying on the fight, but it may be, provoked by their former masters, that they will turn and strike.

With or without the positive assistance of the Italians, the strategic prospects are dazzling enough. The Balkans lie open to attack from two sides; the Italian armies there, estimated at some 25 to 30 divisions, will tend to disintegrate in the occupied territories; and, in the Dodecanese, they may well become an active factor on the Allied side. General Maitland Wilson has broadcast his instructions to the Italian troops in the Balkans, instructing them to fly their aircraft to Allied airfields and sail their ships to Allied ports, and to give no further assistance to the armies of occupation.

Another vital result is the final freeing of the Mediterranean and the probable transfer to the Allies of a number of serviceable ships. A new range of objectives in German Europe, including the Roumanian oilfields, comes within effective reach of Bomber Command, Middle East. Finally, the defection—worse, the desertion—of Germany's greatest European Ally cannot fail to have a devastating effect upon public opinion in Germany and upon both public and official opinion among the remaining satellites—and, above all perhaps, on the retreating German armies in the East.

The list is so impressive that many people will be tempted to conclude that the war is over. While it is obviously true that the days of Hitler's Empire are numbered, it emphatically is not true that the last battle is won or even joined. On the contrary, as Mr. Churchill has pointed out, the hardest fighting against the cornered Nazi animal may still lie ahead. Analogies with 1918 are obvious, but they can be misleading. Then the defection of Bulgaria in September finally led the German General Staff to advise the German

Government to ask for an armistice. Italy's defection is far more sensational than Bulgaria's. May it not be relied on to have the same effects? The answer lies with the German Army, and the German Army of 1943 is not the same as the German Army of 1918. As Prince Max of Baden pointed out in his memoirs, it was not the civilians who cracked in 1918. On the contrary, the Government repeatedly urged Ludendorff in the autumn of 1918 to hold out longer, so that there might still be some hope of peace by stalemate. It was the nerve of the High Command and the morale of the troops

that broke—the troops who after the great Allied summer offensives greeted the new recruits with the cry of "Blackleg." The stab in the back is the greatest and crudest of all German myths, created by the Army to cover the fact that they, not the people, cracked first. And it is impossible to argue at this moment that the nerve of the German High Command has given or that the generals do not still count on the possibility of a "Frederikan war," dividing the Grand Alliance, playing Russia off against the West, and terrifying all the belligerents by the horrible price in blood and death which must be paid to storm the Atlantic, Alpine and Dnieper walls. The defection of Italy will create many grave embarrassments—true; in the Balkans, in Italy itself, the Germans must now use their own troops for reinforcements; but one advantage of shortening the Russian line, in itself a great defeat, should be to free troops for other fronts. The German Army is everywhere on the defensive, indeed, in retreat, but its spirit is not broken. Those who fought in Sicily give testimony to the astonishing toughness of the Nazi defence. If some part of the Italian mainland can be transformed into another Tunisia, and a long delaying action fought there, the Germans may still argue that time is on their side.

It is thus essential to keep the Italian collapse in perspective as an incident in the major campaign of bringing Germany down. The wider strategic picture includes the Russian effort in the East and the Allied bombing offensive in the West. The grand strategy of the war must be to bring together these separate efforts into a final co-ordinated blow, strong enough to crack through the German defences and speedy enough to do so before another year of misery has worn down still further Russia's—and Europe's—powers of resistance.

Speed is essential. The Russian call for the Second Front which has begun again at the time of the Soviet's most sweeping victories springs from a double conviction, that co-ordinated action can win the war this year and that another year of fighting is almost physically impossible. The question the overstrained Russians are asking is whether Anglo-American strategy recognises the urgency of speed and whether the Anglo-American High Command is prepared for the sacrifices which may be necessary to secure speed, above all things, speed.

It is impossible for the layman to judge whether the strategy elaborated at Quebec is, in fact, a United Nations strategy, or still just an Anglo-American strategy. Is the war against Japan really receiving as high a priority as the much more urgent struggle in Europe? What decisions have been taken on bombing policy? All-out bombing has been tried this summer. Can it be said that, in spite of the terrific damage done, it has proved beyond a doubt its claim to be able to deliver the knock-out blow with speed enough to justify the great resources it consumes?

If not, is there any assurance that its claims will not be allowed to inhibit the elaboration of other, possibly more effective, strategies? Finally, will enough strength be concentrated in Italy itself to drive the Germans north and to develop the mainland as an advance base for new and immediate blows against the Balkans, against Danubia, against Southern France?

Much more even than speedy victory depends on the answers given to these questions. There is no doubt that, at this stage of the war, the hope of securing post-war collaboration depends upon much closer military collaboration now.

The cry for a Second Front is not only a question of need. It is becoming a test of confidence. It is admirable that the Foreign Ministers of Britain, the United States and Russia should meet in conference. It is admirable, too, that a permanent joint Commission should be established to provide the machinery of understanding. But the root, basis and substance of understanding will still be proved, not at the conference table, but on the field of battle.

CENTENARY RECORD

1. We very much regret that, owing to paper rationing, it has not been possible to supply more than a fraction of the copies sought of the Centenary Number of *The Economist* which appeared on September 4th. With the generous co-operation of our printers, however, we have been able to prepare a limited number of copies of a commemorative pamphlet, which will include (a) all the special centenary articles which appeared in the issue of September 4th, dealing with the history, policy and present views of *The Economist*, and (b) the speeches made at a centenary luncheon on September 2nd by Sir Walter Layton, chairman of the gathering; the Chancellor of the Exchequer; the Governor of the Bank of England; the Home Secretary; and the Editor of *The Economist*. Copies will be available in a few days (price 2s., postage 2d.), and applications should be made to *The Economist*, Brettenham House, Lancaster Place, London, W.C.2. (Temple Bar 3316.)
2. A volume of essays entitled "*The Economist, 1843-1943*," which is mainly historical in character, has been published by the Oxford University Press, price 7s. 6d. (Orders should be placed through booksellers, and not with either the Oxford University Press or *The Economist*.)

The Government and the Press

THE insistent demand that is being made by all spokesmen of the press for the immediate end of official control and direction after the war was voiced once more last week-end by Mr Gordon Robbins to the Institute of Journalists. It is a demand that few will feel disposed to question, for without a free, intelligent and enterprising press the bloodstream of a democracy must be both sluggish and thin. There are, however, two aspects of the present campaign for an independent post-war press which require somewhat more careful consideration than has so far been given. On the one hand, there is a tendency to overstate the degree of wartime control over the newspapers. Paper is harshly rationed, and the most important news, for reasons of national security and the exigencies of war-making, is passed through an official filter; but the expression of views, apart from a range of safeguards for the defence of the realm, which in fact have operated very far from onerously, has been quite remarkably unconstrained. With regard to the post-war period, on the other hand, too much, perhaps, has been said by the representatives of the press about what the Government must not do, and too little, certainly, about what the press itself must do, if it is to discharge fully its great public responsibilities.

During the war the newspapers have been confronted by an array of special machinery set up to guide and instruct the public. The press has been used by the Ministry of Information and by the press officers and public relations departments of the various Ministries to explain the war and its conduct to the people; and the essential condition has been the unprecedented degree of national unity embodied in Mr Churchill's all-party coalition Government. Control of the press, insofar as there has been control, has been one of the means to an agreed end. But, although there has been a truce to party politics in the peacetime manner, there has been no truce to discussion and criticism. Indeed, the suspension of party politics in Parliament, and, in the form of elections, in the constituencies as well, has provided the press with added opportunities and responsibilities—"to speak for England." It is for this reason that every attempt to use the Ministry of Information as a Ministry of Propaganda, or to use particular press officers as the advocates of particular Ministers, has been jealously, and on the whole successfully, opposed. On a balance of its wartime deeds and misdeeds, the press has done well; more harm has almost certainly been done to the war effort when newspapers have been too uncritical than when they have been too critical.

But if the press can claim a good conduct stripe, so,

too, can the Government. It is a figment of the imagination to picture the newspapers exposed to ceaseless pressure and dictation during the war; and a false conclusion to argue from this false pressure that the whole apparatus of public information at present provided by the Ministries in wartime should be swept away. Modern government, in peace or in war, has a particular need of an informed public, and therefore of an informed press, if its democratic character is to be preserved; and there are many items in the complexity of twentieth-century legislation and administration which must inevitably be unknown, inaccessible or unintelligible to journalists no less than to the citizenry at large. The case for press officers and public relations departments was already proved before the war. Experience since 1939 has underlined the usefulness of these earlier innovations over a wider field, while emphasising the necessity for official publicists to be really competent at the job of giving out information and to be adamant in refusing to be the personal salesmen and apologists of their Ministers.

Competence is the key. There are certain informatory functions which can only be performed by Government departments themselves; they cannot be satisfactorily carried out either by question and answer in Parliament or by unassisted press investigations. They are functions that must be performed if the right principle of "Let the people know" is to inspire the business of government. But they must be efficiently performed. Information must be made available to the press and to the public at all the various levels of sophistication from which inquiry is likely to come; and it must be purveyed by men who know what they are doing, are anxious to do it in the appropriate way and are acquainted with all the relevant facts, figures and explanations needed to make the information complete. These conditions are not universal in public relations departments. Inevitably there have been defects in attitude, personnel and method; some have lacked even the inclination to answer questions; others have left too much of the work, perhaps willy nilly, to unsuitable persons; others again have failed to master the intricacies of filing and indexing upon which a satisfactory intelligence service wholly depends. But, equally, there have been several outstanding successes; and there is no reason why, after the war, each Government department should not have officers capable of giving every newspaper and citizen, without prejudice, the information they want in the form they want it.

The very real need for more and better press officers and public relations departments should not therefore be obscured by unspecific charges of official "dictation."

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

The editor who allows himself to be dictated to by Government officials, any more than by advertisers is, in any case, a poor editor. But the case for keeping public relations departments does not extend to the Ministry of Information itself, whose be-all and end-all is the war. Both halves of its home functions, censorship for security purposes and the dissemination of war news, should cease automatically when the war ends; and insofar as recent press pleas have been intended to secure guarantees of the Ministry's demise they have been entirely justified. The overseas activities of the Ministry, like those of the BBC's Empire, Overseas and European services, come in a different category. Properly, they should come within the extended ambit of the Secretary of State for Foreign Affairs, reorganised to oversee and collate all national relationships with other countries. Certainly, they should not impinge in any way on the work of the British press. "Comment is free and facts are sacred." This phrase of C. P. Scott's has become the hackneyed slogan of the British press; and if the aim of post-war independence in the true sense is to be reached it can only be by making this slogan generally true. This is the responsibility that the newspapers will owe to the public when the wartime grip of the Government, such as it has been, is removed. It is in this positive direction that professional guidance is looked for, vainly more often than not, in the current polemics in favour of a press freed from "dictation." This is not to say that the press of this country, in comparison with others, has fallen far short of its responsibilities, in peace or in war; the reverse is true. But it is to say that the struggle to maintain high standards, in the face of proprietorial pressure, financial considerations and the contemporary mistranslation of popularity to mean vulgarity, will be hard and unending. This is an age of newspaper millionaires, of mass circulations, of the concentration of the newspaper industry, when a comparatively few men, chosen by the chances of commerce or the accident of birth, wield immense power through the vast readership of their newspapers. The process by which this has happened cannot be reversed. A newspaper is a commodity. It is produced for sale; and the newspaper shares with other products in the modern trend to large-scale organisation. The quality of a newspaper is bounded—within very much wider limits, however, than is sometimes suggested—by the quality of its readers, by the standard of their taste and education and the character of their curiosity about the world they live in. Any attempt to impose upon the public the kind of newspapers they ought to read, according to some arbitrary criteria of taste and value, or to stereotype their opinions in order to rule out proprietorial excesses would be ridiculous and wrong, in principle as well as commercially. But the present position is that, increasingly, a handful of newspaper

proprietors are themselves able to do precisely this—that is, to impose upon the public the newspapers that they (the proprietors) think they ought to read and to stereotype public opinion in a few primitive and not always very slightly moulds. Some proprietors and boards of directors do not use their power in this way; they have a high sense of public duty and a regard for good and honest journalism, and they protect their editors and staffs, within the broad limits which they naturally feel entitled to set. But more than a few behave quite otherwise. Often they own the most powerful papers; and they can have their way because in the field of national newspapers, and increasingly of provincial newspapers as well, the consumer has a very limited choice; mass production, concentration and mass advertising have done their work. The really important question is whether the outspoken desire of the press for independence is matched by an equal sense of public service on the part of those who direct it.

There is no mechanical formula by which newspapers can be made worthy of their high responsibility in a modern democracy; and a State press would be a mockery of press and democracy alike. But there are two simple rules by which the conditions might be established to allow right-minded and able newspaper men, without ignoring the commercial motives that must operate in every industry, to do their best work. The first looks backwards; it is the old tradition of the best age of British journalism, summed up in C. P. Scott's phrase—the treatment of news honestly, accurately and objectively, distinguishing, as the Editor of *The Spectator* has recently urged, between the important and the trivial; and the rigid, punctilious, unvarying separation of news from views, whether editorial or proprietorial. The second looks forward. Is it too much to expect that the great magnates of the newspaper world, some of them already deeply conscious of their duty to the community, may be prepared, while surrendering none of their proprietorial control over the balance sheet, to abate their control over editorial policy? As has been said, some boards and proprietors have, in effect, done so already. This is the right road; but more is needed to give the assurance that is needed. The goal should be the general restoration of the conditions of virtual independence in which the best of British editors have flourished; and the best means, undoubtedly, would be the general setting up of boards of independent trustees, to hold the proprietors' powers of control in commission, to oversee and protect editors and their staffs and to reconcile divergences between editorial and commercial considerations.

The difference between the press and other vested interests, in this campaign for the removal of Government controls, is, or should be, that the press has a priceless service to the community to perform in independence. Its justification will be to perform it. It will be remembered that Milton himself, having enshrined the independence of the press in his *Areopagitica*, later became one of the most rigorous press censors this country has ever seen; and it is important that, while the bogey of State tyranny is being well and truly slain, provision should at the same time be made, by the press itself, for the inhibition of other more insidious tyrannies. Neither editors nor proprietors have failed so much in their duty in the past to suggest that optimism is entirely out of place. The maintenance of good journalism is the editors' task; it is a problem of principle and personnel—above all, perhaps, of personnel in these days when the entire flavour of a newspaper is given by the taste and intelligence of its sub-editors and caption writers. The restoration of editorial independence is the proprietors' task. It has been said, with what truth it is hard to say, that no proprietor of a mass-circulation daily could follow the example of, say, *The Times* and set up a trust without losing heavily in competition with his rivals who did not follow suit; and it may be that what is needed is a dramatic act of abdication by the Newspaper Proprietors' Association. But if the will is there, the way can be found; and the plain dangers of financial trustification can be counter-weighted by trustification of another and nobler order.

THE WESTMINSTER BANK

is represented by an extensive system of branch offices in England and Wales with agents elsewhere, and is amply equipped to conduct your private and commercial banking business. The Manager of any branch will gladly give an interview to discuss or explain any point which will help a client, or prospective client, to a full use of the services available to the Bank's customers.

The Future of Income Tax—1

Pay As You Go

IT is not the purpose of this article to estimate the post-war level of taxation. As the end of the war approaches and the conditions of the post-war era begin to take shape, that exercise begins to be a little more than mere crystal-gazing. But there are nevertheless too many unknowns for a close estimate to be possible. It is not yet possible to be sure either of the value of money or of the level of interest rates. Of the cost of armaments, the only thing that seems reasonably certain is that it will be heavier than it was after the last war. It is impossible to forecast how the cost of attaining Full Employment will be met, or what effect it will, in its turn, have upon the revenue. Nor is the future cost of social services known. It must be enough for the purposes of this article to assume that the post-war level of taxation will be higher than the pre-war, but lower than the present; it may perhaps be conveniently symbolised by a standard rate of income tax of 7s. 6d. in the £. The purpose of this article is rather to inquire what changes in the system of taxation, as distinct from the rate of tax, will be required.

It may be that some of the war-time taxes will be continued after the war—though the two chief of them, the Excess Profits Tax and the Purchase Tax, are equally unsuitable for the purpose. It may also be that some part of the increases in the duties on tobacco and on alcoholic drinks will be retained. But the overwhelming probability is that the main reliance of the Exchequer after the war will be on direct taxation. And within the direct taxes, it must be mainly on income tax. Surtax yields less than £100 millions even in war-time conditions and can hardly be further increased. Death duties yield about the same. There will tend to be an increase as the holdings of public debt created during the war gradually come under review; and the rates could be increased if it is desired to diminish the inequality of wealth. But the sums obtainable are clearly likely to remain small in comparison with a total Budget that is likely to be nearer £2,000 than £1,000 millions.

The public finances of the future therefore rest on the direct taxation of incomes, by far the fairest and most flexible of all fiscal instruments. The British income tax, as invented by Pitt, reimposed by Peel and gradually perfected over a period of a century and a half, is a magnificent engine of sound finance and good government. If it is true that finance is the Achilles heel of all popular governments, then the British people have a very great deal for which to thank the income tax. With one exception (the results of which prove the rule), no British Government has ever had to suffer political embarrassment for financial reasons; neither home nor foreign policy has ever (with the same exception) been seriously weakened or distorted because of a technical failure in the financial departments. The income tax has not alone been responsible for this record; Treasury control and the salutary constitutional rule prohibiting expenditure from being proposed by any but Ministers have also played their part. But without an efficient and flexible means of raising revenue, these would not have availed. Nobody who is acquainted with the springs of government would lightly propose any tampering with the income tax.

Nevertheless the tax was never designed to be applied at rates such as seem likely to prevail in the future—rates considerably higher than the 5s. in the £ which came to be regarded, in the interwar period, as the peace-time maximum. Moreover, in the last three years, it has been extended to whole classes of incomes which never knew it before, until to-day the great majority even of wage-earners pay income tax. It is very necessary to inquire whether the structure of a tax which was intended to be imposed, at a rate of a few pence in the £ on a few thousand incomes is really well adapted to being levied, at very high rates, on nearly every income in the country.

The income tax, as it exists to-day, really serves three purposes which are, or should be, distinct. First, it is a universal proportional tax, subject to allowances, on almost all incomes. Secondly, together with the surtax, it is a steeply progressive tax on the incomes of the middle classes and the rich. Thirdly, it is a tax on the profits of business. So long as rates were low, a single tax to serve all three purposes had great and obvious advantages which outweighed any defects. But it would be a surprising coincidence if the structure and rates appropriate to one purpose were also the best for the other purposes. The time has probably come to devise separate taxes for each purpose. But this conclusion can only be provisional until the requirements of each section have been passed in brief review.

In its function as a universal direct tax, the income tax suffers from three defects. It is somewhat too complicated in assessment. It is collected in arrear, and it appears to bear with particular weight on the earnings of additional effort. The ordinary man has some difficulty in understanding how his liability is arrived at. It is collected in a period which begins six months after the end of the period on which the assessment is based, and in the meantime he may or may not have maintained his rate of earning. And the one clear idea he retains is that if he works harder than he need and his earnings begin to exceed a certain figure (about £6 10s. a week for a single man and £8 13s. for a married man with two children), he will be taxed on the excess at what seems to him to be, and is, the very high rate of 9s. in the £. These defects are familiar and the subject of wide debate at the moment. The second defect is the most dangerous and, unless it is corrected, will inevitably cause the gravest difficulties as soon as wage incomes begin to fall. Other countries have the same problem, and both in Canada and in the United States, "pay-as-you-go" systems have been enacted. The American scheme is not really one of current assessment, but of payments on account with an adjustment at the end of the year and, with its provisions relating to the so-called (and quite mythical) "forgiveness" of a year's taxes, is far too complicated and cumbersome to serve as a model for this country. The Inland Revenue produced a White Paper in April, 1942, proving, with the most impeccable logic, that the present income tax could not be put on a "pay-as-you-go" basis. But they are believed to be thinking again.

The second defect in the present income tax as a universal direct levy—its deferred collection—cannot be removed without also removing the first defect—the complications of assessment. For the chief obstacle to current assessment is that week-to-week calculation cannot without great difficulty make provision for the various allowances, which differ from person to person. The only tax which can easily be collected from incomes as they arise is one which ignores all allowances and is calculated at a single flat rate on all incomes—or at a very simple progression (though this at once introduces complications). But to abolish all the allowances would, of course, be monstrously unfair. There is really only one way of escape from this dilemma. That is to provide the allowances, not as deductions from income before it is taxed, but as offsets against the tax payable. The allowance for a child is at present £50, deducted from income before tax is charged. With income tax at 10s. in the £, this is equivalent to a reduction of tax by £25. Let every parent therefore be given tax vouchers to the extent of £25 a year, or 9s. 7d. a week, for every child. Let the other allowances be treated in the same way. Let tax be payable on all income, as it arises, at 9s. (or 10s. for unearned income) in the £, and let the tax vouchers be acceptable in payment. Nearly every receiver of an earned income would deposit his vouchers with his employer, who would

offset them against the tax and deduct from wages or salary only the balance. In the exceptional case where this is not desired, the vouchers could be cashed at the Post Office against proof that an at least equal amount had been paid in tax. There might be some difficulty in converting all the allowances to a cash basis. There might also be some administrative difficulties; but they would be far smaller than have been surmounted years ago in connection with income tax, and they should be balanced against the enormous administrative economy that would arise from the fact that, for the vast majority of citizens, only their family circumstances and not their incomes would require the individual attention of the Inland Revenue staff. In this way, a system would be devised which would not only be more intelligible to the ordinary man but would have the merit of discharging the liability week by week, or month by month, as it arises. The small trader would require special treatment, but there is no reason to suppose that this would cause insuperable difficulty. It is very greatly to be hoped that the reflections of the Inland Revenue will result in the proposal of a scheme of this sort.

What has been suggested above is by no means new. But a novel further suggestion has recently been made in a paper read to the Institute of Actuaries.* In calculating the cash value of the various allowances, the authors were struck by their similarity to the rates of benefit proposed in the Beveridge Plan. Thus the personal allowance for a single person is £100, equivalent at a standard rate of 10s. in the £ to £50. The reduced rate allowance (for those whose incomes exceed the range in which it operates) is equivalent to about a further £29. The cash value of a single person's allowance is thus from £50 to £79. The "Beveridge" allowance for a single person would be £62 8s. (i.e. 24s. a week). For a married couple, the income tax allowance is from £70 to £99, or from £85 to £114 if the post-war credit is included; the "Beveridge" figure is £104. For a child the income tax allowance is 9s. 7d. a week; the "Beveridge" proposal is 8s.

It would therefore appear that, after the adoption of a simplified income tax as proposed above and of the Beveridge plan, the position would have been substantially reached that everyone *with* an income would be paid an allowance by the state as an offset against his income tax, and that everyone *without* an income would be paid very

* "Income Tax in Relation to Social Security." By A. T. Haynes, F.I.A., F.F.A., and R. J. Kirton, M.A., F.I.A. Submitted to the Institute of Actuaries on May 14, 1943.

Russia Looks Back

THE future historian of Russia will surely devote a special chapter in his book to some of the remarkable changes which Russian life has undergone in the course of this war. He will naturally single out the heroic battles that marked the turning points in Russia's stupendous struggle for existence; but he will also turn his attention to some less spectacular—and less martial—events, which he will probably describe as symptoms of a very significant change in the Russia of the early forties. It may perhaps be permissible to make a guess about the actual contents of some of the paragraphs which this future historian will include in a chapter under the title "Moscow 1942-1943."

"The citizens of Moscow [he will write] were much too absorbed by the hardships and exacting tasks of that terrible war to pay much attention to things that did not seem to them directly connected with their superhuman struggle. When, in the spring of 1943, the papers announced the dissolution of the Comintern, Muscovites who read the news shrugged their shoulders; the fate of a small village in the Kuban which had just been retaken by Russian soldiers moved them incomparably more. Only a few elderly people remembered that,

much the same allowances. Why not simplify the whole process and pay a cash allowance at fixed rates to every citizen, and levy income tax at two standard rates—one for earned income, the other for unearned income—on all incomes at the source as they arise? At first blush this seems like a revolutionary proposal. And yet, as Mr Haynes and Mr Kirton point out, it is not substantially different from the present income tax plus the Beveridge Plan. By the cumulative effect of several complicated enactments, the community is already on the verge of a position which, stated in simple terms, sounds quite revolutionary. Why not acknowledge it for what it is? To do this would sweep away at one blow all the difficult administrative questions of qualifying for benefit. Every one would get his minimum income at all times and all incomes would be taxed. What more direct way could there be of attaining the ideal of a National Minimum?

This is Messrs Haynes and Kirton's thesis. It is new and startling, and it requires very careful examination. It is not quite true (as they are aware) that a scheme such as they suggest would leave everybody substantially where he is now. It would be true of all social insurance beneficiaries, and it would be true of all those whose tax, at the flat standard rate, equalled or exceeded the cash allowances. But in between, those with incomes of less than double the allowances (assuming a standard rate of 10s.), less than 2½ times the allowances (with a standard rate of 7s. 6d.) would realise a net gain, which would impose a corresponding cost on the Exchequer. This could be got round if it were provided that the allowances were paid only as an offset against tax due or against proof of eligibility for insurance benefit—but in that case much of the simplicity and of the attraction of universality would disappear.

For this and other reasons, a radical solution of this kind is hardly practical politics at the present time. It is good, however, that it should be brought forward for the widest discussion, in order that the public may grow familiar with it, for it is not so far removed from possibility that it may not be taken up in earnest before many years have passed. It is no more radical to-day than the Beveridge Plan would have been twenty years ago. The only reason against bringing it forward for discussion now is lest it should impede the attainment of the much simpler—and much more urgently needed—adjustment of the income tax to a "pay-as-you-go" system discussed in earlier paragraphs.

A second article will discuss the other functions of the income tax—as a progressive tax on larger incomes and as a tax on business profits.

exactly twenty years before, the fourth Congress of the Comintern had kept the whole of Moscow in suspense, when Lenin had just made his last appearance in public and Trotsky, with his fiery speeches on world revolution, had held the centre of the stage. In 1943 even old Muscovites could hardly spare any time for reminiscences. Life was too hard. Similarly, when the papers published the news, in the first days of September, that Marshal Stalin had received the Metropolitan Sergius and agreed to the restoration of the Holy Synod, few people in Moscow stopped to think of its meaning; the readers of *Pravda* and *Izvestiya* were almost certainly much more preoccupied with the news about the Russian advance in the Donbass. The Donbass meant coal; and with the approach of autumn the Russians thought with a shudder about the two war winters through which they had gone without coal for their homes.

"Yet [the historian will go on] the meeting between Marshal Stalin and the Metropolitan Sergius was a remarkable event. It was more than a quarter of a century since the Holy Synod of the Orthodox Church had been banned by the Revolution. And now it was called back to life by Marshal Stalin. Some biographers

of the Marshal have described this step as his 'return to the Church.' In his teens the Marshal had spent eight years in a clerical seminary, preparing for the career of a modest Orthodox deacon. Then he left the Church for the Revolution in which he was to play so important a rôle. Together with all the other Bolshevik leaders he fought against religion and denounced it as 'opium for the people'—until, at the very height of his career as statesman and military leader, he again paid tribute to the faith of his youth. Thus runs the story of the biographer and the fiction writer.

"But there is no evidence in the archives to support this picturesque tale. The Marshal in fact remained an atheist for the whole of his life. His sudden 'reconciliation' with the Church was not the expression of his personal attitude towards religion or of any change in his views. It was dictated by two important political motives. There was, first, his desire to strengthen Russia's prestige and influence in the countries where the Orthodox Church traditionally looked to the Holy Synod in Russia for religious, and often also for political, guidance. The Marshal might even have said to himself that Russia's prestige in the Balkans was worth an Orthodox Mass. Secondly, the revival of the Holy Synod was also in keeping with the whole trend of the many reforms which Marshal Stalin had initiated in the years of the War of Liberation. All had one feature in common. They rehabilitated old, pre-revolutionary Russian traditions; they aimed at imbuing post-revolutionary Russian society with an intense national feeling and with pride in Russia's Imperial past, which the historians of the Leninist period had treated so inimically. The Orthodox Church and the Holy Synod were part and parcel of that Imperial past. The Holy Synod could not, of course, aspire under Stalin to a position of any independence *vis-à-vis* the state. This has never been the case in Russian history. It was Peter the Great who rudely dethroned the Patriarch; and from then on the Holy Synod owed complete obedience to the Tsars. The Metropolitan Sergius could hardly have been much surprised if, in the course of that memorable reception at the Kremlin in 1943, he learned that Marshal Stalin was reserving for himself some of the rights in relation to the Church which Russia's rulers had always possessed. The gain to the Church was obvious. Every official in every corner of Russia who read the news would read into it a tacit instruction to treat the local priest with more tolerance, if not more respect, than before.

"To see the background against which this reconciliatory step was taken [the historian will no doubt add] one must follow the Metropolitan Sergius from the Kremlin into the streets of Moscow. The picture which the Metropolitan saw must have appeared at once very familiar and very novel. The officer in charge of the guard at the gates of the Kremlin was very smartly dressed; his epaulettes shone with unusual brightness. So did all the epaulettes on all the uniforms of the

officers walking in Moscow's squares and streets. And all these epaulettes had been sewn on only a short time ago. Like the Holy Synod, they had been banned as the symbols of the Imperial past; and now they had reappeared. The soldiers in the streets saluted their officers as they had done in old Tsarist days. On one of the squares soldiers were taking the oath, and they knelt down to kiss the fringes of their regimental banner. The banner itself might belong to one of the many hundreds of Guards' Regiments—for the Guards, too, had been recently rescued from revolutionary contempt. On his way the Metropolitan might have passed a newly opened officers' club, another new but old feature, in which other ranks were not allowed. Or he might have read a placard on a wall announcing yet another innovation and revival, the opening of schools for military cadets.

"In the windows of the bookshops, large portraits of Kutuzov and Suvorov, the great warriors of old Imperial Russia, were on show, even more than the somewhat faded portraits of Lenin; the pictures of Karl Marx had almost disappeared. Much of the scene would have been unthinkable only a few years earlier, but commonplace a generation before. Everything seemed to bear witness that the years of 'ideological folly' were over; that Moscow was now looking back to the past, reaching out for the old symbols and the old shapes and sights and finding some unsuspected spiritual pleasure in the feeling of kinship with those bygone times. This change in modes of thinking and taste was by no means a matter of chance. It reflected the fundamental fact that Russia was waging the War of Liberation neither in the name of Communism nor, even, in the cause of Anti-Fascism. It was a holy war for Russia's national existence and greatness; and the cult of the past was seen by Russia's leaders to be more inspiring than Communist ideology.

"The few old Bolsheviks who survived into the forties [he will conclude] no doubt viewed those changes with some alarm, and thought of them as a counter-revolution. Yet it was not a counter-revolution, though it was indeed a period of counter-reform. A counter-revolution destroys the social system created by a revolution; counter-reforms make gradual changes within the revolutionary system, leaving its framework intact. This is what happened in Soviet Russia during the War of Liberation. The social system, with its state-owned industries, its planned economy and its collectivised agriculture, was not substantially affected by the change in psychology and customs. The picture of Moscow in 1942-43 shows many paradoxical traits; but the counter-reforms carried out under Marshal Stalin did pave the way for the new turn in Russian history that was to fill the first decade or so after the war."

And so the historian will proceed to describe in his next chapter what that new turn in Russian history actually was.

NOTES OF THE WEEK

Combined Operations

The surrender of Italy is a famous milestone on the way to peace. It is a signal triumph for combined operations, for the remorseless pressure of Allied strength at sea, in the air and on land, and for the remarkable co-ordination achieved in military matters, at both the strategic and tactical levels, by Britain and the United States. It is this co-ordination that Mr Churchill wishes to preserve when the war is over in the shape of the Chiefs of Staffs Committee which has planned the war effort of these two Allies in Washington. This, together with Basic English, was the specific proposal for the future of Anglo-American relations that Mr Churchill made in his speech at Harvard on Monday. "What we have we hold" is not always a bad slogan; the Chiefs of Staff Conference is a proved instrument of international collaboration. So, too, is the Pacific War Council, for the peacetime retention of which Mr Curtin is now calling from Australia; and, whether perma-

nent or not, both will be imperatively needed during the armistice period between the end of fighting and the making of peace. The last peace was lost before it was made by the break-up of the wartime process of alliance and the absence, not only of a common policy, but also of any instruments of common decision, common will and common action. Here are the instruments which have spanned the Atlantic and the Pacific in a second world war. In them Allies and members of the British Commonwealth have met on equal terms, and counted now according to their needs and now according to their contributions. They are not instruments of general peace, because their scope is restricted. It is a misfortune which springs from both geography and history that the Chiefs of Staffs Committee does not embrace Russia. Nor, because Russia is neutral in the East, does the Pacific War Council. But the Pacific Council is international, and not Imperial. It is significant that Mr Curtin's demand for a permanent machine of consulta-

tion within the British Commonwealth, with each partner on an equal footing in the common quest for peace and prosperity, should now have included this wider scheme. There was never the slightest chance that the Canberra Plan would follow the unhappy exclusive lines of the Ottawa Agreements; but it is good that Mr Curtin has made this plain to all. World peace must start from realities, and the most enduring reality in world affairs is the *Pax Britannica*. It is a starting point. But it is not enough. The British Commonwealth had not the power to beat down the aggressor without the United States and Russia. The only firm starting point, whether the goal is peace or prosperity, is the association embodied in the Chiefs of Staffs Committee and the Pacific War Council—and, without Russia, it is still no more than a starting point. Moreover, without a common policy for peace as well as war, in economics and politics alike, it may not even be a starting point, after all. Machinery is not enough.

The Great Advance

The past week has brought momentous events in Russia. All along the front, from Smolensk to Taganrog, the Soviet armies have advanced at the extraordinary average rate of 5 to 10 miles a day. With the capture of Stalino, the Donetz basin has been to all intents and purposes freed from German occupation; only the westernmost fringe is still (at the time of writing) in German hands and there can be little doubt that this area, too, will fall within the next few days. Everywhere the fighting has again become a series of battles for vital railway junctions. In the Donetz area, the Russians have captured Slavyansk, reached Stalino and threatened Lozovaya, all three places of vital importance to communications. The German retreat here stretches over a distance of about 200 miles, from the Kharkov-Izium sector in the north to the area east of Mariupol in the south. Between Kharkov and Poltava, the Russian thrust has gone in the direction of Krasnograd, the point where the Kharkov-Dniepropetrovsk railway cuts the Rostov-Kiev line. In the Kursk sector, the advancing armies have taken Konotop and swept forward along the Kursk-Kiev line, cutting into a dense network of lateral railways. Here is the base for future operations against Kiev, about 120 miles away. From Bryansk to Smolensk, the gains have been less spectacular than in the south; but they have been substantial and steady. The feature of the German retreat has been the relentless destruction of industrial and private wealth wrought in the areas of their withdrawal. The Russians have countered this policy, designed to slow down their advance, with the unequivocal statement that Germany will have to pay to the last penny for the enormous destruction. This threat will hardly deter the Nazis who are now fighting to prevent their own doom. "*Après nous le déluge*" has become the guiding principle of their conduct of the war.

Algiers Looks Forward

In the course of last week, it became clear that another political crisis was brewing in Algiers, and the satisfactory way in which the difficulties have been overcome shows that both the authority of the Committee and its sureness of political touch are rapidly increasing. The imminent possibility of the re-invasion of France had thrust two problems to the fore. One was the attitude which the victors would take towards the Vichy regime, the other, the kind of relationship which ought to be established between Algiers and the underground movement. Opinion was divided on the advisability of declaring the men of Vichy traitors now, or of waiting until their cases could be properly examined by a judicial commission. In particular, the Communist party pressed for denunciation now, on the grounds that the attitude of the re-invading armies would need to be clear from the start. The suggestion comes with peculiar unsuitability from the group who, in 1940, were quite as implicated as Pétain in the policy of defeatism, but there is no doubt that a great majority of French people feel nothing but resentment towards the men who weakened and disgraced France, collaborated with its enemies, worked against its friends and delivered up millions of French workmen to do hateful work for the enemy. In the event, Algiers has denounced the Vichy regime without waiting for a judicial enquiry. The problem of the relations between the Algiers Committee and the underground movements is probably the most delicate political problem of all. Some
