of the resistance groups in France have professed the closest possible personal allegiance to General de Gaulle, and the Fighting French Committee in London for long controlled the coming in and going out of French agents and supplied them with their funds. Critics of the de Gaulle movement maintained that this control was helping to build up a sort of pretorian guard for the General inside France. They were not altogether reassured when, on the setting up of the Algiers Committee, contacts with the underground movement were put under the control of M. André Philip, a close and devoted collaborator of General de Gaulle. The imminence of military operations complicated the task of this machinery of collaboration. No one could doubt that the underground movement would play a very big military part once re-invasion began. In that case, it was essential to co-ordinate their plans with those of the French army, a task which M. Philip was not in the best position to accomplish. Now a compromise has been announced: relations between the French Committee and the underground movement will pass through a committee of three, consisting of General de Gaulle, General Giraud, and M. André Philip. In this way, the army has a direct say in the organisation of plans. At the same time, there can be no question of maintaining any sort of political monopoly for any one group.

New Men

While, on the whole, the new arrangements at Algiers met the point of view of those who pressed both for the open condemnation of Vichy and the organisation of the resistance movement under the primary responsibility of General de Gaulle, the Committee has wisely approved a number of new appointments and safeguards to ensure that a proper balance will be maintained. Men of Vichy are to be condemned; but a new Minister of Justice has been appointed, who, coming straight from organising the resistance movement in France, will have a much better picture of the state of French opinion than have the émigrés. M. de Menthon has had a distinguished record. He fought and was taken prisoner in 1940, escaped from the Germans and returned to found the resistance group *Liberté*, which is one of the groups helping to produce one of the greatest organs of resistance, the newspaper *Combat*. He held a post for a time under Vichy—the chair of Political Economy at Lyons—but when in 1942 the great purge of Allied sympathisers occurred, Bonnard, the Vichy Minister of Education, dismissed him. Before the war M. de Menthon was associated with M. Champetier de Ribes, who led the *Parti Démocrate Populaire* and as a Minister in the Reynaud Cabinet, was one of those who voted against capitulation. M. de Ribes also played a great part in the Catholic Social Movement in France. Another crucial appointment is that of M. Quetion. He was a very respected figure under the Third Republic, a Senator and member of a number of different Ministries. Prime Ministers came and went, but M. de Quetion's solid virtues and central position assured his continuance in office. He is now to preside over the Commission of Disembarkation. He will have a crucial rôle to play in deciding at which point the civil administration can take over from the re-occupying forces, in co-operating with the military leaders and in ensuring that liberated territory is provisioned and secure. Both these appointments speak well for the outlook of the National Committee; and it has further asserted its adherence to democratic forms by announcing that on November 3rd the first session of a new Consultative Assembly will take place. Efforts are being made to prevent this assembly from being a mere creature of the National Committee. Deputies and Senators, representative of the underground movements, are to sit on it and its task will be to supervise the work of the National Committee. A lot of ground has been covered in Algiers in the last week and on the whole the outcome is very successful. The French National Committee is acting with firmness and good sense, and the Allies can certainly welcome the proposal made by Washington that France should be given its rightful status as an independent nation and take part on an equal basis with the other United Nations.

Mr Bevin Gives his Word

Some months ago, Mr Churchill put on record the refusal of his Government to make pledges which it may not be possible to carry out. In his speech to the Trades Union

Congress on Tuesday, however, Mr Bevin gave two pledges which it is much easier to justify in principle than it will be to fulfil in practice. He stated them very explicitly. Length of service is to be the sole criterion for the release of men and women from the Forces after the war; and the law is to be amended so that employers will be compelled to reinstate volunteers as well as conscripts when they return. Both pledges are right and fair; but, also in fairness, Mr Bevin should have added that, except very broadly, neither is practicable. It is the Government's duty to see that, so far as possible, the men who joined earliest will be demobilised first; but it is the Government's duty also to explain candidly the industrial and military reasons which will make inevitable many exceptions, especially if the war with Japan lasts for a considerable time after the defeat of Germany. In fact, the immediate post-war task of public policy cannot be stated in individual terms. It is to maintain employment, not to retain or restore particular jobs; the onus for re-employing demobilised men and women cannot be transferred to individual employers, who by now may have a legal obligation to reinstate several persons in the same job, which may not now exist. Where reinstatement is possible it should be enforced, but it cannot be made a state pledge. The state's pledge is to provide work; and if employment is to be maintained after the war, both reconstruction and the transition from war work to peace work must be consciously planned with set priorities for the use of materials and labour. Just as there was need for a schedule of reserved occupations in the first stages of mobilisation, so there will be need in the first stages of demobilisation for some workers more than others—and, on the Forces' side, while fighting and occupation last, need for the retention of some soldiers, airmen and sailors more than others.

Discrimination must indeed be reduced to a minimum. Mr Bevin is right: there must be no loophole for wire-pulling or favouritism. But there will inevitably be differences of treatment, unless post-war policy both at home and abroad is going to fall into utter confusion—as it did after the last war. Then, it is true, planned demobilisation was tried and broke down in face of the natural clamour for fair play; and there followed the disastrous "rush from the colours" into short-lived dead-end employment. This time it is apparently proposed to fly to the other extreme, to court chaos with open arms, to make the "rush from the colours" official policy. The end of the last war taught two lessons: planned demobilisation is inhuman and unworkable; and unplanned demobilisation is disastrous. Surely, the right policy now is to temper justice with expediency in a viable compromise, and to explain frankly to those concerned why this has to be done. Any other policy will invite untold recrimination and bitterness.

The Trades Union Congress

A remarkable feature of this year's Trades Union Congress has been the emergence of a new alignment of forces. Hitherto, Congress has been dominated by the two powerful general workers' unions, the Transport and General Workers' Union and the National Union of General and Municipal Workers, which command 800,000 and 720,000 votes, respectively. This year, these two unions have been defeated on more than one issue of policy and organisation. The votes of the three other most powerful unions, and the most vital from the point of view of war production—engineers, miners and railwaymen—have been swung in the opposite direction, and the smaller unions have tended to follow their lead, rather than that of the general workers. The majority in favour of the reaffiliation of the Chemical Workers' Union—a "break-away" union which has been hammering at the door for the past seven years—was in itself a small incident; but it was the first occasion on which the General Council had been defeated for a very long time. A resolution calling upon the General Council to examine trade union structure, with a view to avoiding overlapping and competition was unanimously carried—though a similar resolution was rejected in 1942. The discussions on war production were overshadowed by those on post-war reconstruction, and there were barely any references to the prevention of strikes. The speedy implementation of the Beveridge report, a less leisurely pace in educational reform, a greater share in the control of industry, with the extension of public ownership over vital

industries: these were the claims put forward. The demand for the continuation of essential controls in the immediate post-war period was stressed by the chairman of the TUC, Dame Anne Loughlin, by delegates and by Mr Bevin. There was concern that certain employers, confident in approaching victory, were now seeking to revert to the *status quo ante bellum*. The 1943 Trades Union Congress shows that the organised labour movement—numerically greater than at any time in its history—is very conscious of its strength, and that it is determined to retain the advances it has made in wartime. So far, however, although Mr Bevin repeated his now familiar warning that there would have to be continued responsibilities, there has been little evidence to show which of their wartime responsibilities the trade unions would be prepared to accept in peacetime.

* * *

War Debts

The President of the United States has made a little-noticed concession to Congress which may, conceivably, have large implications—in view of the drift of American politics from the President's earlier ideas. In his recent Lend-Lease report to Congress, which is discussed in a "Note" on page 365, it was stated that the United States wants "no war debts after the war," but only victory and a sure peace. This was much what Mr Roosevelt and other Administration spokesmen had said on other occasions; but now it seems that, though "technically" true, it should not have been said. The Lend-Lease report has been appropriately amended. This is, of course, entirely a matter for the people of the United States to decide. Formally, as the President told the press on Tuesday, "the essence of Lend-Lease is that other nations should repay the United States as far as they can"; and the repayment can be in dollars or goods and services. Even on the merest arithmetical basis, indeed, repayment has already begun in the form of Mutual Aid; and, from time to time, the President has added refinements of calculation, such as the principle of "equality of sacrifice" applied to the relation between war effort and national income, which make simple arithmetic misleading. The comment that it is a matter of strategic accident, and therefore a poor basis for financial reckoning, whether munitions made by one Ally are employed in battle by its own forces or those of another country might just possibly be dismissed as special pleading—or restricted perhaps in its application to the 21 months during which the United States has been itself a belligerent. But there is a sense in which the question "Does the United States want war debts?" is very relevant from the purely American standpoint. Memories are still vivid of the way in which world trade and the international exchanges were bedevilled after the last war by war debts—and by the high American tariff, which, in the last resort, made repayment impossible, however good the will. The United States has to show that, this time, it will be possible for its debtors to acquire the dollars, or to sell the goods, required to balance the account when it is finally reckoned. Many people already fear that neither the Keynes nor the White plans for the post-war exchanges would work,

INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

because of deep-set tendencies to disequilibrium that might wear out all their resources. War debts will not ease the position, to say the least, unless there is a great change of policy on the part of creditor countries.

BBC Changes

It was announced last week that Sir Cecil Graves had resigned his post as Joint Director-General of the BBC and that the Governors had appointed Mr Robert Foot, the other Joint Director-General, as sole Director-General and chief executive officer of the Corporation. More significant was the announcement that a new post had been created, that of Editor-in-Chief. The official announcement stated that, subject to the Board of Governors, the director-general and the editor-in-chief will be jointly concerned with the character and quality of the whole of the BBC's output. But a far fuller statement of the powers and functions of the editor-in-chief will be looked for when Parliament reassembles. The bald communiqué leaves a great deal unsaid. What are to be the exact relations between the director-general and the editor-in-chief? If they are to be such that a clash over policy may arise, whose view will prevail? There is surely a case for making editorial policy as independent in the BBC as, so it is argued in an article on page 355, it should be in the daily press. Or, to take another illustration, there might well be the same division of functions and responsibility as exists in a voluntary hospital, where the heads of the medical and administrative staff are both supreme in their own spheres. This assumes, of course, that the new post of editor-in-chief is intended to be far more than an honorary title. It may be that it presages no change in the existing process of stultification from the top and that the dull uniformity imposed on BBC programmes will continue. It is, at least, a good omen that so capable a man as Mr W. J. Haley, joint managing-director of the Manchester Guardian and Evening News, Ltd., and a director of Reuters and of the Press Association, should have been appointed to the new post, for he is not likely to have accepted it if he knew he was to be a cypher. But the public can only wait and hear.

Birds of a Feather

When a member of the National Union of Journalists asked the Trades Union Congress to recommend that its affiliated bodies and trade councils should admit as press representatives to their meetings only members of the NUJ or of unions recognised by the International Federation of Journalists of Allied or free countries, he probably doubted whether such a scandalous proposition would be accepted—even at the headquarters of the "closed shop." As it happened, the Conference accepted it unanimously, and so indicated "its confidence in the NUJ as the one organisation recognised by the great and powerful trade union movement to speak for working journalists." More than that, it asserted the right to prevent journalists not of a trade union or belonging to the Institute of Journalists—the real nigger in the woodpile—from hearing trade unionists speak at all. It is a claim that should be indignantly denied, despite "the greatness and the power" of the TUC. Journalists have a right to organise themselves for the purpose of bargaining with their employers. Like printers, they do so very successfully. But, even with the complacent connivance of the TUC, they have no right, by intimidation, pressure and the restraint of other journalists' trade, to prevent others from organising themselves as they wish if they can. And this is pre-eminently a case in which, as *The Times* has put it, the freedom of the press implies the freedom of the public—freedom, through any of its representatives of the press, to attend and hear, without passport, let or hindrance, all public proceedings. The NUJ, which has lately been full of fine words about the freedom of the press, has taken this aggressive action against the IJ because the latter has just been recognised by the Newspaper Proprietors' Association, quite legitimately, as a negotiating body to deal with wages and conditions—not, it should be emphasised, as the exclusive negotiator, but on a parity with the NUJ. Hence this attack—and, once again, narrow sectional interest and the closed shop have appealed more to trade unionists at large than the democratic principles about which they talk so much.

International and Industrial

Sardonic critics regularly claim to have discovered that the so-called principles of economics actually change with the times. The latest instance of this badinage arises from—or, rather, has been stimulated by—a remarkably interesting analysis of pre-war trade by Mr H. Frankel which has been published in the latest *Economic Journal*. Mr Frankel shows from the facts that trade is no longer simply an exchange of manufactured goods for primary products—which is, of course, a truism. More interestingly, in his examination of trade between industrialised countries, he shows how these countries tend to export and import the same manufactured articles, with this characteristic, that there is a difference in quality, and therefore in value, between the goods sold and those bought. Thus Britain both sells and buys boot and shoe making machinery and cream separators, but the machinery and separators exported were of better quality and cost more than those imported. This trade is thus based on differences of skill and workmanship, not on differences in natural resources. And so, it is argued by some, the old theories of the international division of labour are outmoded. This is, of course, nonsense. Times and the terms of trade have indeed changed. But the old principle that it is best for a nation to produce those things which it can make more cheaply than buy, and to purchase from abroad those things which it can buy more cheaply than make, is thrown into a newer and truer relief—without being over-confused by the ephemeral circumstance that the trading nations were for a time, as to a point they still are, sharply divided into industrial and agricultural countries. Moreover, light is thrown on Britain's trading future. There need be no fear because the nations can say, with increasing truth, that "we are all industrial now," provided this country can remain sufficiently skilful in the production of high-grade goods. Indeed—aside from the very important fact that this country must sell goods to mainly primary producing countries in order to obtain essential raw materials and food in return—the more industrial countries should be better and more profitable markets for manufactures of quality. The deciding factors will be the efficiency of British industry and the degree of productivity with which its material and human resources are employed, which is a very old and very true principle of economics.

National Output

One of the most striking features of Great Britain's pre-war economy, revealed during the war, was its reserve of productive capacity. By utilising manpower fully, it has proved possible to maximise the strength of the Services and, according to Mr N. Kaldor's calculation in the June-September issue of the *Economic Journal*, to add 4 per cent to the number in insured employment between 1938 and 1942. If allowance is made for an 11 per cent increase in average weekly hours of work, the number of man-hours worked rose by 15½ per cent during this period. But this is not all. There has been an increase of 6 per cent in the output per

THE SOURCES OF WAR FINANCE
(£ millions at 1938 prices)

	1940	1941	1942
Increased production.....	300	710	1,140
Reduction in consumption.....	415	645	665
Increase in adverse overseas balance	455	445	285
Reduction in private investment, including reduction of private stocks	625	615	565
Increase in Government expenditure on goods and services from 1938	1,795	2,415	2,655

man-hour, which indicates that production in 1942 was 22½ per cent higher than in 1938, by no means a year of depression. The accompanying table, taken from Mr Kaldor's article, shows the increase in Government expenditure since 1938 at constant prices. It reveals that, in 1942, much the most important single contribution to the increase in national income, 43 per cent, came from an increase in production; the reduction in consumption provided 25 per cent, a decline in private investment and privately held stocks 21 per cent, and an increase in the adverse balance of payments 11 per cent. Mr Kaldor estimates that if hours of work were reduced to the level of 1938, and if half of the additional 5 million persons now in industry and in the Services could be retained in industrial employment after the war, home-

produced output would be 18 per cent higher than in the last pre-war year; with reasonably full employment and a further improvement in productivity, it would be possible to envisage an output greater by a quarter than that of 1938. Mr Kaldor is certainly not a pessimist.

Pit Boys' Wages

The announcement of the award of the National Tribunal on the wages of boys and youths in coal-mining came as a rude shock to those who were optimistic about the prospects of attracting labour to coal-mining. At the very moment when Mr Bevin was broadcasting an appeal to boys to volunteer for the pits, and outlining a picture of the prospects of a permanent career which the industry could offer, the Tribunal awarded a wage scale which in some cases compares unfavourably with the present rates, and is indeed substantially less than the employers originally offered. It is hardly surprising that Mr Lawther, president of the Mineworkers' Federation, should have strongly criticised the award, and it was somewhat disappointing that Mr Bevin should have omitted all reference to the coal situation in his speech to the Trades Union Congress. The needs of the coal industry for labour have been given high priority, and the strength of the miners' claim for better wages and conditions is widely recognised. The Tribunal's award is contrary in both letter and spirit to the recommendations of the Forster Committee on juvenile recruitment, which, without entering into details, proposed that there should be a wage scale for young miners comparable to that established for adult workers. Quite apart from its bearing on recruitment, the award may bring into discredit—and possibly jeopardise—the negotiating machinery set up in accordance with the Greene Tribunal's findings. Juvenile wages was the first issue to be referred to this Tribunal, and the award is not of a nature to command the miners' confidence in the future working of the new machinery, which at the time of its establishment was hailed as inaugurating a new era in industrial relations in the mining industry. The miners, it is reported, are restive and discontented; they regard the Government's demand for more coal and more labour for the pits and its treatment of mining workers as contradictory and irreconcilable.

Dictatorship in Argentina?

Since the Ramirez Government announced that no elections would be held in the autumn, evidence has accumulated that the tendencies of the new regime are along the old familiar lines of authoritarian dictatorship. American correspondents report that the new regime is based upon a typically Fascist programme of "corporative democracy," and the correspondent of the *Baltimore Sun* describes the regime as "anti-semitic, anti-Communist, anti-labour, anti-foreigner and especially anti-United States." Many of the actions of the Government certainly bear out this interpretation. The headquarters of the National General Workers' Federation has been closed. A number of so-called Communists have been arrested, both at Buenos Aires and in the provinces, and sent off without trial to Patagonia and Terra del Fuego. The Government's hold has been tightened over all means of propaganda. The pro-United Nations weekly *Argentina Libre* has been suspended, and *La Vanguardia* was temporarily suppressed for some criticisms of Government policy. All Left Wing publishers have been raided and closed. The press and the radio seem to react mainly against the Allies—even President Roosevelt's speeches are censored. All the relief organisations for the British, American and Soviet Red Crosses have been closed down. There are reports that a Council of seven Corporations is to take the place of Congress; the supreme power is to be the Head of the State. There are reports, too, of the setting up of volunteer militias "for the formation of national consciousness." The anti-foreign bias can be seen in the suspension of facilities for naturalisation and in the various steps taken against British and American economic interests. Measures have been taken against the British and American Buenos Aires Transport Company, and the British president and the American manager of one of the Buenos Aires electric companies were recently detained and their books seized. However, undeterred by the curious impression made by this regime, Admiral Storni has written to the American Government requesting military aid under Lend-Lease. "The rumour," Admiral Storni protests,

has spread that General Ramirez and the armed forces and men who form the new Government profess the markedly totalitarian ideology or at least that we look upon Axis Powers with great sympathy. I can affirm, and I beg that you, Mr Secretary, accept this affirmation as the word of a man of honour, that such assumptions are absolutely false. The Argentine nation, its armed forces, and the men in its Government base their acts on the firmest democratic convictions.

It is not altogether surprising that Mr Cordell Hull has refused the request, for Argentina has still to implement the steps taken by the other American Republics for breaking off relations with the Axis. Mr Hull declared that in the opinion of the United States, Argentina

has indicated clearly that Argentine armed forces will not, under present conditions, be used in a manner designed to forward security in the new world.

Brazil in the War

The reason compelling the Argentine Government to swallow its anti-American prejudice and request Lend-Lease aid is undoubtedly the growing military strength and prestige of its great neighbour, Brazil. With American aid, the Brazilian Navy has grown into a useful force with up-to-date equipment—nine destroyers and twelve corvettes have already been built in Rio de Janeiro—and it has gained battle experience in the anti-U-boat war. By the end of this year, the Brazilians expect to have about 250,000 men under arms, not all of whom will be sent overseas. In August, the Minister of War was again in Washington to speed up military supplies and confer with the American military authorities on the use to be made of the expeditionary force. American aid has been even more striking in the economic field. It is estimated that there are now 76,000 factories registered with the Ministry of Labour, all working on Allied requirements. In particular the district of Sao Paulo in the south is growing rapidly in economic importance; the stimulus of coffee has been succeeded by the growth of textile and light engineering industries, in both of which this city of over a million people has made great strides since the war. Brazil exported in 1938 500,000 lb. of cotton piece goods. (In 1941, 19 million lb. were exported, 11 million lb. to Argentina alone.) Electrical components are now being manufactured on a large scale. Increasingly, too, Sao Paulo is sharing, on the manufacturing side, in Brazil's rubber revival. It contains 74 rubber factories, three of which are large tyre-producing plants. These industries may be expected to receive a fresh stimulus from the trek westwards in search of wild rubber out into the Matto Grosso (a part of which has been opened up by the new railway to Corumbá). While rubber in the larger Amazon basin is being exported to the United States, Matto Grosso rubber now finds a natural outlet in the southern industrial region of Sao Paulo. The Brazilian *Commissao de Controle dos Accordos de Washington* is reported to be studying the feasibility of a highway from the River Paraguay northwards to Manaus, the Amazon rubber centre, to link these two widely separated prongs of the rubber drive. This big economic expansion, which is being given a firm industrial basis, has its repercussions on the general political strategy of South America. The

attractive power of a strong and prosperous Brazil on its neighbours would obviously be very great and would complete with Argentina's claim to be the greatest and most influential South American state. Indeed, there are already signs of new economic and political configurations which cannot fail to be a cause of friction unless the ABC states (Argentina, Brazil and Chile) can come together within a wider co-operative framework.

* * *

The Case of Bolivia

Bolivia is an example of the way in which Brazil's growing economic importance can have political repercussions. As an article on page 369 shows, several recent agreements with Brazil have strengthened the latter's influence in Bolivia. In addition to these specific agreements, Bolivia seems likely to look with greater interest to Brazil as a consuming and processing market for at least some of its mineral output. Southern Brazil has known coal deposits estimated at over 5,000 million tons, and plants have already been set up in Brazil for the extraction of zinc from Bolivian ores as well as for aluminium manufacture from native Brazilian bauxite. For Bolivia, too, whose Andean region is rich in minerals but poor in food, there is the prospect of tapping the wheat and cattle zone which extends southwards from Sao Paulo. Bolivia's growing cooperation with Brazil in the economic field has been followed by a Bolivian request to Chile for a corridor to the Pacific, where Bolivian traffic already enjoys free port facilities from both Chile and Peru. Chile has rejected the request, with, significantly, the support of Argentina, whose Foreign Minister has informed the Buenos Aires representatives of Bolivia, Brazil and Chile that Argentina is firmly opposed to any action "likely to disturb South America." This revival of Bolivian irredentism, latent since the country lost the nitrate coast in 1883, is one more instance of the intensely nationalistic background against which the development of South America's hinterlands is proceeding. Economic expansion is very vigorous in and between complementary regions where national boundaries are often arbitrary rather than natural. In the thrust of the large maritime republics into the interior, Brazil has been the first to approach the hitherto undeveloped Bolivian jungle. In the process, it offers Bolivia, and to a lesser extent Paraguay, the prospect of an eventual connection which must strengthen their economies and, by bringing them into Brazil's sphere of influence, increase the suspicions of Chile and Argentina.

* * *

Basic English

When such a master of English as Mr Churchill speaks in favour of the adoption of basic English as a medium for international intercourse, the most conservative must think again. The Prime Minister announced, in his address to Harvard University, that a Committee of Ministers is studying the subject and will report upon it. The chairman, it has since been made known, is Mr Amery, and the other Ministers are Mr R. A. Butler, Mr Oliver Stanley and Mr Brendan Bracken. There are strong reasons in favour of the spread of basic English. The English language is a difficult one to learn, and if a knowledge of English culture and an understanding of English ways of life are made easier by simplifying the English language to consist of 850 words—650 nouns and 200 verbs or other parts of speech—then the scientific study and use of basic English may be a valuable means of breaking down the barriers between the Anglo-Saxon countries and the rest of the world. It may be of particular value in the education of primitive peoples. Sir Harry Luke, formerly Governor of Fiji, tells us* that in the pidgin English of the Pacific "mine" and "thine" become "b'long-me-fella" and "b'long-you-fella," while a violin is "one small bokkis b'long whiteman all he scratch him belly b'long him he sing out good fella" and a gramophone "one bokkis b'long whiteman he get voice he no get man." Basic English should do better than this. But there is the great danger that too wide a spread of basic English may lead to the atrophy of

* "The British Pacific Islands." Oxford Pamphlets on World Affairs.

real English. English—and American—are both rich languages and have much to learn from each other. They are not sufficiently well known even in their own countries, and it would be a national disaster if the English and American people went through their lives speaking and reading nothing but basic English. Put some of Mr Churchill's own speeches and writings into this language and see how much of the fire and vigour are left. Even the famous and thunderous "Nay" would presumably be translated.

* * *

September 2, 1943

The Economist is now settling down into its second century, and the time has come to write *finis* to the chapter of its centenary celebrations. But before this is done it may be of advantage briefly to set on record the form these celebrations took and to express *The Economist's* thanks for the many messages of congratulation it received from home and overseas. Sir Walter Layton was in the chair at a luncheon given by the directors and held in the Connaught Rooms. After the loyal toast had been drunk, he began his speech by reading out a telegram, reproduced elsewhere in this issue, from President Roosevelt, which was greatly applauded. The toast "*The Economist*" was then proposed by the Chancellor of the Exchequer, Sir Kingsley Wood, and supported by the Governor of the Bank of England, Mr Montagu Norman, and the Home Secretary, Mr Herbert Morrison. The Editor replied. Unfortunately, paper rationing makes it impossible to reproduce these speeches in *The Economist* itself, but for the benefit of readers they are being printed in a pamphlet, together with the leading articles of last week's centenary issue. All that can be done in these columns is to place on record *The Economist's* gratitude to the speakers for their kind words. It would also like to thank all those, representing so many walks of life—including politics, economics, finance, industry and journalism—and numbering 119 in all, who honoured the paper by their presence at the luncheon, and it deeply regrets the enforced absence of two of its trustees—Sir William Beveridge and Sir Charles Hambro—of Mr Brendan Bracken, and, particularly, of Sir Henry Strakosch, its chairman, owing to serious illness. In the evening, a more informal celebration took place at the Savoy, where, by invitation of the staff of *The Economist*, over 200 people were present at a cocktail party. This was no occasion for speeches. It was merely a happy gathering of *The Economist's* friends, and the staff was delighted that so many were able to be present. And so to the second century.

* * *

Shorter Notes

The Colonial Economic Advisory Committee, foreshadowed by Mr Oliver Stanley some time ago, has now been set up. It is a strong committee, composed of persons with administrative experience in the colonies or first-hand knowledge of them and of economists, and from its wide terms of reference it should give a new impetus to the economic development of the colonies.

*

Oxford University is planning to establish a Department for Ophthalmic Research, and is appealing for £250,000 for the purpose. In 1941, out of a total blind population in England and Wales of 74,000, some 63,000 were over 40 years of age and were thus cut off from leading a normal working life. Apart from actual blindness, the relation of eyesight to general health and, particularly, the importance of healthy and efficient eyes in industrial life are other important fields of research. The new department is certainly wanted. But, for the community, what is even more wanted is the opportunity to avail itself of the fruits of research. National provision for the testing and treatment of eyesight is far more inadequate even than the present provision for research.

AMERICAN SURVEY

A Party Question at Mackinac

The foreign policy plank evolved at Mackinac by the Republican Post-War Advisory Council looks not unlike that all-things-to-all-men formula which it has been confidently believed that Senators Vandenberg and Taft had up their sleeves all along. It favours American participation in a "co-operative organisation among sovereign nations" to ensure peace, but is securely qualified by the provision that wherever such participation might endanger American national interests, the United States would adhere to its "constitutionalism," whatever that may mean. The triple responsibilities of the United States after the war are held to be the preservation of all national interests; aid in restoring order and decent living in a distressed world; and the acceptance of a full share of a programme for permanent peace. This is perhaps all that could be expected from intensive study throughout two days by a committee under the chairmanship of Senator Vandenberg. The "conspiracy to avoid commitments" has come off. The Council has refused to follow Governor Dewey's lead or to be smoked out by Deneen Watson's stern warning against producing a "weasel-worded plank on foreign policy." It has taken what Mr Watson would certainly regard as ignoble refuge in magic phrases about the preservation of sovereignty and the constitution. Yet, it would not be an exaggeration to say that the very calling of the Conference is a tribute to the irritating goad which Mr Willkie has fixed in the side of the party machine. The meeting was not unlike a performance of "Hamlet," in which not only the Prince of Denmark, but Polonius and the Ghost are missing, for not only was Mr Willkie, the titular head of the party and its most impressive personality, missing, but Mr Hoover and Mr Landon were also uninvited. Yet all three had their representatives upon the stage, and the liveliest ghost of all was probably Mr Willkie, despite the plank that was produced. Governor Dewey's conversion to the idea of a firm Anglo-American military alliance—that "fool statement," according to Senator Taft—is proof of which way the wind is blowing. Governor Dewey is as sensitive a political barometer as the Republican Party possesses; and not prone to leaps in the dark.

* * *

Check-Mate to Dewey?

While Governor Dewey develops his theories of international collaboration at Mackinac, an electoral campaign is going on in his home state which may decide whether one of the Republicans' favourite sons will be free to be drafted next year. The death in office of the state's lieutenant-governor has made necessary a new election in November, as the courts were unsympathetic to the Republican view that the vacancy should be filled by a Dewey appointment. The rival candidates are General Haskell, Democrat, and Mr Joe Hanley, Republican, the majority leader in the state senate. Should General Haskell be elected, the pressure to draft Governor Dewey—if the need should arise—would be substantially offset by the unwillingness of the Republicans to turn over a key state like New York to their opponents. A Democratic victory would also adversely affect Mr Dewey's prestige and Republican patronage powers, perhaps with some effect upon the choice of New York's electoral votes next year. The feud between Mr Farley and President Roosevelt which let Governor Dewey in last year appears to be healed for the occasion; and the American Labour Party, which refused to support Mr Farley's candidate in the gubernatorial election, has now withdrawn its candidate in favour of General Haskell. The Democrats are working hard to recapture some of their lost prestige.

Labour Under Sanctions

Although it is early for conclusive evidence, President Roosevelt's fear lest one section of the Smith-Connally Anti-Strike Act should stimulate rather than discourage stoppages looks like being borne out in practice. The National Labour Relations Board, which has to administer the Act, and should not be confused with the War Labour Board, is said to be on the point of requesting Congress

to eliminate the section of the Act requiring a thirty-day cooling-off period before a strike vote may be taken, and thus, by implication, accepting the principle of strikes in wartime. The case that precipitated the Board's decision involved a dispute in the Allis-Chalmers plant in Springfield, Illinois. Here District 50, Mr Lewis's catch-all union, demanded a "strike vote" as a means of bringing pressure to bear on the NLRB to hold an election to determine whether the workers should continue to be represented by the CIO union with which Allis-Chalmers have a contract, or by District 50. The NLRB refused the request, on the ground that a new election before the current contract expired would establish a precedent which would unsettle labour relations throughout industry. Undeterred, District 50 has again threatened to strike; and, most significant of all, the management has backed it up, out of, it is said, the fear that a strike would lead to Government seizure of their plant. This lends a certain colour to reports that business is finding the Anti-Strike Act less of a damper on unrest, and more of a boomerang, than it expected. Meanwhile the War Labour Board, perhaps under the influence of its new sanctions, has been pursuing a firm line. It has turned down the portal-to-portal pay provisions embodied in a contract between John L. Lewis's United Mine Workers and the Illinois Coal Operators' Association. A development which is being watched with interest is the gradual return of the mines to private ownership. Mr Ickes has announced the relinquishment of Government control over about 100, belonging to 53 companies. In accordance with the Anti-Strike Act, which requires the return of seized plants within 60 days after the restoration of "productive efficiency," he is now surveying the remaining 1,300 mines under his control. Mr Lewis, it will be remembered, put himself on record as saying that the miners would feel themselves free to strike if the Government returned the mines to the operators.

OUT THIS WEEK

Transatlantic

*The new Shilling Monthly
published by Penguin Books*

Who are the rooters, and why do they root? Will America go back to Isolation? Who is Joe Ball? What does Geography do to America?

THESE and a great many more questions are answered in the first number of TRANSATLANTIC. The people who matter in Washington—life in the small farming communities—the hot, sleepy Old South—the treeless Great Plains—the weeping forests of the North-West—financiers, cow-punchers, statesmen, gauchos, lumbermen . . . You will find them all from time to time in word and picture in this unusual new monthly.

TRANSATLANTIC is British owned and edited—a magazine of information without official bias. It will not try to make you admire everything American, but will try to ensure that you base your likes and dislikes on knowledge instead of supposition. Its purpose? To assist the British and American peoples to "walk together side by side in majesty, in justice and in peace."

THE WORLD OVERSEAS

Italy Under Badoglio—I

IN all great social or political upheavals the origin of the upheaval, the point at which the collapse of the *ancien régime* started, is blurred and obscured by the quick succession of events. The collapse of Italian Fascism has been no exception. Six weeks after Mussolini's downfall, and on the morrow of the unconditional surrender of Italian arms, the question may still be asked by whom was the Duce overthrown: by a conspiracy at the top, in which the King, Badoglio and some members of the Fascist Grand Council were involved, or by popular forces which military defeats had suddenly awakened from their long-lasting lethargy? There can be no doubt that, for several months before the July crisis, political ferment was growing in Italy; a strike movement was spreading over the industrial north; defeatism was taking hold of the minds of the people; the regime was visibly losing control. This restiveness among the masses would by itself hardly have brought about the collapse of Fascism so quickly. But it was the spectre of popular revolt that inspired the Court and the military hierarchy with fear. Victor Emmanuel and Badoglio resolved to act. Mussolini was dismissed. But Mussolini was more than the head of the Government. He was the leader and the symbol of a system; and his dismissal was the death knell of Fascism. The plot at the top, which was meant to forestall rebellion from below actually became the catalyst of a revolutionary process; and, during the six weeks that elapsed between July 25th and September 3rd, when the armistice was signed, the Italian revolution had already gone through several distinct phases.

The Night of July 25th

In a period of political cataclysms a single day or a single night may mean more than a whole decade of normal political life in a quieter era. The night after Mussolini's downfall was, in itself, a distinct phase in the evolution of post-Fascist Italy. The Court opened the flood-gate; and the flood immediately swept the streets of the Italian cities. The scenes are known from the history of revolutions: enthusiastic crowds cheering the benevolent king and his new advisers, the men and the symbols of the recent past insulted, humiliated and hunted down. In their first intoxication with freedom the Italian people knew no slogan except "peace." This one demand seemed to imply all the rest: the end of the oppression and corruption associated with the regime which had driven Italy into the war. In the first fit of joy, during that festival of liberation which lasted no more than a day, the immediate fulfilment of all those desires seems to have been taken for granted by the cheering crowds. But the night of July 25-26 brought a fresh surprise. On the morning after Mussolini's downfall the still clandestine parties of the Opposition appeared on the stage. Events had not caught them napping. During the night their newspapers were already being printed in Rome—and in tune with the mood of the masses, they demanded immediate peace. But, at the same time, they warned the masses against their own illusions. Mussolini

had gone, but Fascism had not been destroyed. The King and Badoglio had themselves been Mussolini's accomplices. The demand for peace was immediately linked with the demand for the restoration of democratic liberties. During his first few hours in office Badoglio learned that the underground movements would not allow Italy to relapse into political amorphousness; the dismissal of Mussolini must, of necessity, be followed by the liquidation of Fascism. He could gauge the strength of the defeatist mood in the ranks of both the organised opposition and the unorganised masses.

The next phase, roughly from July 26th to the first days of August, was occupied with Badoglio's attempts to combine the liquidation of Fascism with the suppression of the anti-Fascist opposition. The first part of the programme was dictated by the need to appease the people, the second by the desire to preserve the new Government, to swamp the centres of defeatist propaganda, and to rally the people for the continuation of the war. The Fascist party was dissolved, but at the same time all political parties and organisations were banned. Some political prisoners, especially those belonging to the Right Wing and moderate factions, were released; but martial law was declared for the whole of Italy. A committee to investigate the illicitly acquired fortunes of the Fascist leaders was established; but no prominent Fascist leader was indicted. The Fascist Militia was incorporated into the Army, and the most compromised prefects of police were dismissed; but the police and the Army were ordered to enforce the ban on meetings and political activities; and newly-established special courts tried those who transgressed the ban, and fresh batches of political offenders were sent to prison. This policy culminated in the decree of July 30th, under which all the workers and employees of the railways, post and telegraph were militarised.

Government and Labour

The first half of August brought an open clash between the Government and the Labour movement, and ended with the failure of Badoglio's dual policy. The parties of the Opposition had threatened a general strike in July. They were not strong enough to carry out the threat; nor would they risk an all-out challenge to the ban on their activities. But they proved strong enough to exert powerful pressure on the Government and to make the ban practically ineffective. Meanwhile, the political centre of gravity had shifted very distinctly from Rome and, generally speaking, from the south to the industrial north. Genoa, Turin and Milan became the centres of half-spontaneous and half-organised sit-down strikes. The character of these strikes was economic as well as political. In many cases the workers explicitly refused to produce anything connected with armaments, and demanded an "immediate change-over from war production to peace production." The other purely political demands were the release of old and new political prisoners, the abolition of martial law, freedom of the press and so on. The economic claims were concerned with increases in wages and indemnities for wages lost during air raids. At the same time, "factory councils" emerged. What has been their rôle so far is not quite clear. It seems that they have not joined to form town or regional councils; and that, consequently, their rôle has not been very important. Even so, the Badoglio Government was in the first days of August confronted with a double menace from the north: the local strikes threatened to spread into a general strike; and the factory committees threatened to transform themselves into workers' councils.

This double threat has compelled the Government to seek some compromise with the Opposition, and especially with the Labour movement. The eight-hour day has been re-introduced. Special tribunals have been established to revise the cases of political prisoners who have been convicted on charges of pro-Allied activity. Under a decree of August 10th, the Corporative Organisations have been suppressed.

The Federation of Industrial Workers has been put under the leadership of two only recently released Syndicalist and Socialist leaders, Buoizzi and Roveda, and the direction of the Farm Labourers' Union has been entrusted to a Communist trade union leader. Finally, on August 20th and 21st, the Minister of Industry and Labour, Piccardi, paid a visit to Turin and Milan, where general strikes were already in progress. The Minister got into direct touch with the factory committees and the Labour organisations. The result was a sort of an armistice between Government and Labour. The strikes were called off; and on September 2nd a special agreement defining the status of the factory committees was signed between the Ministry of Industry and Labour and the trade unions. The agreement has confined the committees to purely economic activities and deprived them of the revolutionary characteristics which they were beginning to develop. Finally, the leaders of the various political groups have been permitted in spite of the ban, which is formally still in force, to assemble in Rome in order to discuss schemes for the future organisation of their parties.

The concessions made by Badoglio met with response from the Opposition. The leaders of the trade unions started to calm the ever-louder clamour in the factories for peace. Probably not the whole of the Opposition followed the new policy—some reports, for instance, say that the *Giustizia e Libertà* group has accused Buoizzi and Amedo of "treason to the people"—but Badoglio has undoubtedly scored a success, if only by achieving a split in the ranks of Italian Labour. This success can be explained by various factors. Events have shown the relative weakness of the new regime as well as of Italian Labour. For the time being, no side seems to be able to venture a trial of strength. On the other hand, Badoglio and his Ministers undoubtedly met the clamour for peace with the assurance that their policy aimed at the early cessation of hostilities; and leading Socialists felt free to plead for the workers' support to Badoglio on the ground that "he will give you peace if you have patience enough and support his efforts." The conclusion of the armistice has now proved that these pledges were not baseless. But the whole trend of events also shows that, though Badoglio is the formal signatory of the armistice, the capitulation has been forced on him by irresistible popular pressure inside Italy no less than by the pressure of Allied arms outside.

The armistice on the battlefield—though fighting against the Germans in Italy will go on—will now undoubtedly impart some measure of stability to the armistice in Italy's domestic policy. But the capitulation is also certain to act as a powerful stimulus to the development of the popular forces which will hail the cessation of hostilities as their victory.

Vatican Policy in Europe

[BY A CORRESPONDENT]

ON September 1st, the Pope broadcast an appeal to the world. In content it marked no difference from any of the earlier appeals that have come from Rome during the war. Since 1939 the Pope has pleaded with the belligerents to put an end to the war by a negotiated peace based on respect for the cultural and political rights of every nation, great and small, a peace of justice which would appease the passions roused by the war and give some hope of lasting reconciliation. To-day the appeal is still the same—that is, the substance is the same, but the context is completely different. In the past, the Pope's addresses have had an air of great unreality. The Axis nations were the probable victors and were quite uninterested in a peace based on justice. The totalitarian flood had blotted out the Vatican's political influence in the Councils of Europe. Inside the occupied countries, and, indeed, in Germany itself, the direct social and spiritual influence of the Church was steadily growing as the pulpits became the most open and outspoken centres of resistance to Nazi oppression. But the Vatican could not officially profit by this growth of prestige. Operating at the level not of home or school or concentration camp, but of Government and diplomacy, it continued to state in a sort of vacuum the principles for which the local leaders were fighting. It was not impressive. The diplomatic function of the Vatican was held to debar the Pope from particularising the Church's general condemnation of aggression. The victims were naturally aggrieved that no direct reference should ever have been made to the

INDUSTRY AND PEACE

A WORD FROM THE NEW WORLD

"Industry is helping to win the war . . . industry must help build a peacetime world.

To-day, all industries must produce as never before, must speed the output of food, tanks, planes, guns, ships and other instruments of war—must conserve vital supplies—that we may win quickly a decisive victory.

To-morrow, all industries must continue to produce—beating swords into ploughshares—to prevent world-wide unemployment leading to ultimate economic collapse.

If the world is to prosper, there must be the same cohesion among the United Nations during the transition period and thereafter as now exists during the world-wide conflict. Internal stability here and in other nations can be gained and maintained only by sustained industrial production and by interdependence.

The people of this country, in common with the people of other lands, will prosper materially and spiritually when this war is ended, but only if plans world-wide in scope are formulated promptly for A JUST AND DURABLE PEACE."

★ ★ ★

The above Statement has been issued by the International Nickel Company of Canada and is widely published in Canada and the U.S.A.

We reproduce the Statement here because we believe that all engaged in industry in Britain will approve its principles and desire to collaborate with all the United Nations in formulating plans for a "just and durable peace."

fact that Germany and Italy were the aggressors and Poland and Greece were not.

Today the situation has altered radically. The nations "less favoured at a given moment by the fortunes of war" are now the aggressor nations. The victorious Powers are those who share the Pope's desire for peace and who in their war aims do not greatly diverge from his appeal for justice. At the same time, the political influence of the Vatican in Europe is on the increase. This is partly a dividend earned by the central power from the outlay in courage and fortitude made by the local clergy. It is due even more to the fact that the proud totalitarian regimes which tricked, cajoled, undermined, discredited and finally fought the Church are now "going down to the chambers of death." Europe is losing its old leadership. There is still no certain sign of the new. The Vatican can play and is playing a new and vigorous part.

A Peace Party

The most striking manifestation of it has already occurred in Italy. It is also apparent in Germany and among the satellites. It lies in the emergence of the Church as an active factor in the undermining of the totalitarian government and in the emergence of a strong peace party. The fall of Tunis and the February crisis in the Fascist party convinced the Vatican that Italy could not remain in the war much longer; that Fascism was growing more and more discredited; and that the nation was thus drifting into a state of military and political deadlock from which a violent social explosion followed by a dictatorship of the Left might be the only way out. The Vatican's policy towards the Fascist party changed from one of reserve to open hostility. In June the Vatican radio began a peace campaign and the Church leaders made a bid for mass support among the workers of the North. The culmination was the Pope's address on June 15th to a mass meeting of 26,000 workers in Rome in which he reaffirmed his paternal regard for the rights and interests of the workers and declared that "no one has pleaded and exhorted more continuously than we have: peace, peace, peace."

The Fascists had no illusions about the significance of the meeting. The *Regime Fascista* attacked it as a "political mass meeting." The bishops followed the Pope's lead and, vigorously led by the Bishop of Turin, launched a campaign for peace and reform. The influence of the Vatican in the transfer of the Government to Badoglio must certainly have been great; and, since that time, the Church has thrown its full weight in support of the new regime. This may have a stabilising effect. It mends the deep division in the Italian state which has been a source of weakness since 1870. For the first time since then, Church and State are united in a common policy. Much will depend on the repercussions among the Italian people to Badoglio's capitulation and on the next phase of the war. Much will depend, too, on the extent to which the mass of the people are associated with the new regime. The Church is making a strong bid for working class and trade union support. The campaign of "peace and reform" is designed to check the extremists to both Right and Left.

Germany and the Vatican

The Vatican's policy in Germany has followed a similar line—of encouraging a peace movement and, as far as

possible, of directing it. For years past, the German bishops have not given Nazism even the passive acceptance conceded to Fascism in Italy. Under such leaders as Galen, Faulhaber, Preysing and Bertram, the struggle has long been intense. In the autumn of last year, however, the opposition of the Church to the Nazi regime became far more bitter. The new year saw a series of fierce and open attacks on the regime. Bishops' pastorals denounced the anti-religious education of youth, racial discrimination, the attack on human rights and liberties. These were followed by a Papal allocution speaking of an independent Poland. In June the Nazis put up a Dr Friedrich on the Paris wireless to lead a counter-attack. The Church was violently attacked and accused of war-mongering. So strong was the Vatican reaction on all its services, especially the Dutch service, that the Nazis were driven to issue a disclaimer.

The fall of Mussolini brought a sharp change of policy. The open attacks have ceased. Instead, all German pastoral letters in recent weeks have dealt with air raids, not, however, in any belligerent spirit—they are described as a chastisement for the sins of the people—but in an attempt to rally towns and cities and individual groups to self-reliance and self-help and a bearing of each other's burdens. Why this change in policy? There is probably a twofold reason. The Church does not wish to see the moral substance of the people completely rotted by misery and terror. But, more imperatively, it does not wish to become involved in any "stab in the back" campaign. It would be very easy for the nationalist extremists in a few years' time to say "Yes, in Germany's darkest hour, the Church attacked the resisting Government." If the Catholic leaders are to play a part in the country's future, they must encourage the peace movement now, but without losing their dignity and prestige in the process. That is their argument. The line to-day is: no support for the war, strong appeals for peace, but no defeatism. The Pope's most recent broadcast shows that the Vatican does not wish Germany any more than Italy to be submitted to a ruthless and unnegotiated peace. The Church is shrewd enough to see that dismemberment of Germany would undermine the Catholics' opportunity of playing a leading part in Germany's reconstruction. If the Catholic districts—Austria, the Rhineland, the provinces bordering on Poland—were cut away from Germany, a Prussian Lutheran rump state would remain. It is not surprising therefore to find no support in Vatican broadcasts for an independent Austria, nor for an aggrandised Poland. The Vatican wishes to see Germany, purged of Nazism, play a Christian rôle in post-war Europe. As in Italy, the only alternative it sees to this is anarchy followed by a dictatorship of the Left.

In the satellite countries, the Church's influence is everywhere at work in the same direction—weakening the will to resist; undermining German control; and making a bid to secure the support of the "constitutional elements" and particularly of the trade unions. Cardinal Serebi's attacks on the Nazis in Hungary have the Vatican's warm support. So have the Archbishop of Zagreb's repeated attacks in the Croat Ustasi. In Slovenia the bishops are encouraging strong manifestations of Slovene nationalism. The support given to the French and Dutch hierarchy in their resistance to the *relève* is absolute—one reason why in France the higher clergy are now almost as outspoken in their hostility as the younger clergy have been from the start.

The most interesting development of all is, perhaps, the

sharpening of the Vatican's attitude towards Spain. The Falange has been under suspicion for some time, but recently, in the middle of Sir Samuel Hoare's diplomatic *démarches*, the Vatican came out with a sudden and sharp attack on the whole idea of personal dictatorship. In this context it is also interesting to remark that Portugal barely features in the Vatican's broadcasts. It is emphatically not regarded any longer as "the model Catholic state."

The picture of Vatican policy which emerges from the broadcasts and initiatives and local action of recent months is consistent. The aim is a negotiated peace, its basis, a respect for the rights of the nations, the co-operation of victors and vanquished, an end to totalitarian rule and the setting up in Europe of constitutional government. The Vatican in a broadcast to Britain denied that Catholicism was a concern of the Right. On the contrary, it affirmed the Church's constant desire to collaborate with the Left and pointed to such examples as the work of Lacordaire in France and Bishop Ketteler in Germany. This broadcast is only a particular example of a general policy which the Vatican has been pursuing in every occupied country—backing the leaders of the organised workers, encouraging the Catholic trade unions to play a leading part in the resistance movements and, through the bishops, going out with a direct appeal for working class support on the basis of "peace and reform."

Thus, in the Catholic hierarchy and organisations of Europe, the Allies might find strong support for the restoration of constitutional government and the rule of law. However, the policy is not dictated only by a respect for the human person and legal government. It springs equally strongly from fear of Communism and a secularised dictatorship of the Left. The Vatican's distrust of Russia as a factor in the European situation has not abated, although an entirely new step was taken in Vatican policy when, this year, broadcasts in Russian were introduced.

New Deal in Bolivia

[FROM A CORRESPONDENT IN LA PAZ]

August 6th

HENRY WALLACE is no longer President of the Board of Economic Warfare, but the policy he stands for has made a gratifying achievement in Bolivia. It was recently announced that the Metals Reserve Corporation categorically refused to increase the price of Bolivian tin in favour of the big mining operators, but that it will grant an increase of 2.5 cents per lb to the exclusive benefit of the miners. This is the outcome of a hard fight between the big mining operators, such as Patiño, Hochschild and Aramayo, and Bolivian labour, which relied on the support of the New Deal circles of the US Government.

It was originally expected that an agreement on the new tin price would be reached during the recent visit of President Peñaranda to the United States. After the President's return, however, it was said that the Metals Reserve Corporation asserted that the mine-owners already realised big profits, and that a further increase in the price paid to them would not raise the output, but merely increase their profits further. The US authorities were, on the other hand, ready to grant an increase which would be used exclusively on behalf of the miners. This was not mere altruism, but a fortunate coincidence of the interests of the Allied war effort and those of Bolivian labour. The big mineowners did their best to present the issue as open intervention in the internal affairs of a sovereign state, and steadfastly opposed any agreement on these lines. They declared that an increase in the tin price on their behalf was fully justified because of the big increase in their costs of production.

About the middle of July, the Bolivian Confederation of Workers published a statement showing that the working classes of Latin America are beginning to realise that their most formidable enemy is their own reactionary oligarchy, and that, on the other hand, much good will towards them can be expected from progressive circles in the United States. The manifesto ran as follows:—

At this moment Bolivian labour has sufficient reason to believe that there was plenty of willingness on the part of the competent North American government agencies to increase the price of tin on condition that it should not be pocketed by a few big mining operators, as happened last year, but that it should benefit exclusively the miners—the producers of the mineral wealth. The strong pressure exercised by the big mining interests prevented, for the time being, such a measure from being put into effect, under the pretext

that it impairs the sovereignty of the country. . . . If, however, present conditions are not substantially improved, neither the best will nor the most strenuous efforts will be able to secure an increase in the output of strategic raw materials. Above the interests of the big mining operators, above their pre-occupation with their dividends, is the war effort of the United Nations and the health and welfare of the working classes.

When the Board of Economic Warfare was transformed into the Office of Economic Warfare, and Mr Wallace resigned its presidency, the big mining operators confidently expected to negotiate with new officials who would accept their point of view. Their hopes, however, were not fulfilled, and they had to yield. Thus, a new turn has been given to the good neighbour policy, which will, it is hoped, lead to close understanding not only between the Governments of the United States and Latin America but between their peoples as well.

Agreements With Brazil

The agreements signed with Brazil during the recent stay of President Peñaranda in Rio de Janeiro deserve attention. These agreements refer to the immediate initiation of railway traffic on the Santa Cruz-San José de Chiquitos section of the Corumba-Santa Cruz Railway, and to the immediate start of construction work on the section Vila-Santa Cruz, which will conclude the building of the transcontinental railway from Santos in Brazil to Arica in Chile. The geological reports which the Bolivian Government recently received from Standard Oil are to be jointly examined by Brazilian and Bolivian experts as a necessary preliminary to financing the drilling of new oil wells in the territory between the rivers Parapeti and Ichilo. In addition, Santos has been declared a free port for Bolivia, while an agency of the Banco do Brasil will be established in La Paz.

All this will further strengthen Brazilian influence in Bolivia, and is a new step forward in Brazil's bid to become the leading industrial, political and military power in Latin America. It is also a new blow to Argentina, which is watching with hardly concealed anxiety the expansion of Brazilian industry, and particularly the provision of the Brazilian army with modern equipment. It is reported that, impressed by Brazil's recent successes, Argentina intends to take immediate steps to accelerate the construction of the Yacuiba-Santa Cruz railway, which is intended to be a counterweight to Brazilian expansion.

This expansion, it should also be said, has created some uneasiness in Bolivian nationalist circles, who fear that the territory which lies athwart the Corumba-Santa Cruz railway will sooner or later pass under Brazilian sovereignty, thereby depriving Bolivia of its potentially rich oilfields.

American Railroads

(From a Chicago Correspondent)

August 14th

NEWS of the fall of Mussolini as head of Italy's Government not only made newspaper headlines, but set up financial reverberations that caused the widest price reaction in the New York Stock Market of the fifteen-month period which ended on July 31st. Traders and brokers attributed the decline to "peace nerves," and, as a matter of fact, the stocks of war industry companies were among the hardest hit; but the reaction of railroad securities, marketwise, was poorest of all. Day after day, stocks like Nickel Plate, Union Pacific and Southern Railway Preferred had losses ranging to 3 points. And, day after day, the outstanding leader of them all on the retreat was Santa Fé, the big east-west carrier, which was hauling the biggest freights in its history, and earning tremendous profits at the task. Plainly, the first verdict of the market on the future of the American railroads was that, when the stimulus of wartime business ended, the rails would revert to the orphan status of the 1930s. The possibility that peace might come earlier than had been expected was leading many

individual investors, and institutions too, to dump their holdings of railroad securities as though this were a last-chance matter.

The questions being seriously asked are, can the railroads maintain their credit? Can they survive new and stiffer forms of competition, such as freight-hauling airlines? What to do about the immense deterioration of their equipment as a result of severe wartime usage and limited replacements?

On the subject of replacements, for instance, the combined freight and passenger traffic of the Atchison, Topeka and Santa Fé Railway in 1943 increased 33 per cent over 1942, while the number of locomotives assigned rose only 4 per cent. A spokesman for the Association of American Railroads has put a very gloomy face on the situation, saying that, unable to obtain steel rails, track accessories and manpower, the carriers are deferring repairs until after the war; and, as a result, revenue that would ordinarily go for such maintenance is accumulated as apparent net earnings. The railroads must be prepared to meet these deferred repairs in future years, he said.

As a further development of this picture, the railroad securities committee of the Investment Bankers' Association of America has reported that the railroads will need billions of dollars for postwar improvements and rehabilitation. Some authorities, the report said, estimate that the roads will require \$1,000 million per year for a 10-year period after the war. The committee said estimates of earning power indicated the railroads could raise only \$600 million for maintenance and improvements during the first year after the war. For the rest, they probably will have to turn to the public for capital.

The current serious-minded attitude toward the railroads does not originate from the fact that they are not making money. They have been doing so well that a good earnings report from practically any road is hardly news any more. Railroad cash drawers this spring bulged with an unprecedented total of \$2,346,270,006 of cash or easily cashable securities. This record-breaking total of cash or its equivalent was \$1,255,343,860 more than was held by the railroads one year earlier. The railroads also widened the margin of current assets over current liabilities to \$1,534,130,433, the best current position in the history of the industry.

Well aware of the present prosperity of their industry, the operating brotherhoods of the railroads have asked for a 30 per cent wage increase, thus introducing the factor of greater labour costs. Dr J. H. Parmalee, director of the bureau of railway economics of the Association of American Railroads, a private organisation, in reply to the workers' demands, said flatly that present levels of railroad traffic and earnings are temporary and will disappear when the war ends.

Dr Parmalee said:

As soon as the abnormal stimulus of the war effort is withdrawn, traffic due to war activity will rapidly decline to the vanishing point, while other traffic will be subjected to more intensive competition than ever before.

He added that it was

entirely probable that the net railway operating income for the second half of 1943 will fall far below that of the corresponding period of 1942.

Thus glumly spoke a railroad expert, who was willing to admit at the same time that war production since 1939 had brought an increase in rail traffic "more rapid and more pronounced than in any period of American railway history." One outstanding phenomenon of the wartime bull market has been the heavy speculative activity in railroad stocks and bonds. Dr Parmalee's admission pretty well explains why.

With credit impaired and business at depression levels, the railroads during the early 1930s were in the slough of despond. Investment firms discontinued their staffs of railroad analysts. The market was dead, and that was that. It was a generally accepted belief that investment customers would never again be interested in the rails. It was not as though the history of the American railroad industry had not produced a background of disappointments to justify this ultimate attitude of distaste. Enormous sums of capital financing went into the carriers during the last century, and with London the financial centre of the world, good round sums of pounds sterling poured into this country in order to build the network of steel that now covers it. A lot of this sterling was lost in bankruptcies, since not much of the early financing was very sound. In later years the roads revived on operating profits, having a real monopoly of transportation in a nation where industrial activity was expanding at a phenomenal rate. Then came the motor truck. In the ensuing battle for traffic, the rails, with their heavy debt structures, were at a great disadvantage. Rail earnings went down; bonds defaulted. Many more millions of invested funds were lost.

Railroad credit went to pieces in 1895, in 1931 and in 1938. Securities of the operating companies could not go much lower during the 1930s, but their business was later to soar, as described by Dr Parmalee, and the market for railroad issues would do likewise. Wise investors, and there are a few, foreseeing the effect of the war on railroad business, began to work into advantageous positions in 1939 or earlier. The public, as usual, was to follow unwisely and much later, guided by rumours that "rails were a buy." In a mounting frenzy they bought tons of rail paper, much of it intrinsically worthless. The market boiled until the end of March, 1943, when the United States Supreme Court cooled things off with a decision approving the Interstate Commerce Commission's methods of doing surgical things to the debt structures of the roads in reorganisation. Millions of "paper profits" in unsecured securities were wiped out in a few days. Again the public was disappointed, and there must have been some doubt created in the minds of even wiser men, as evidenced by that "peace" slump of July and August, when shares of the strongest roads in the country went down with the rest.

The rejuvenation of interest in the railroad securities market in recent years brought about the re-establishment of statistical departments in investment firms for the convenience of their customers. Because of the extremely intricate nature of railroad debt structures, this type of survey work must necessarily be studious and careful. A comparatively obscure "reorganisation" bond frequently is found to be selling at half its asset value, and the speculative possibilities of buying in on the ground floor and merely waiting for reorganisation to take place are obvious. That situation being what it is, there will be individuals interested in the railroads for some time, whatever the public attitude.

The opinions of these investment analysts on the railroad security outlook are usually worth consideration. Patrick B. McGinnis, who is analyst for the New York Stock Exchange firm of Pflugfelder, Bampton and Rust, has stated that the motor truck has not been a total disadvantage for the railroads, since it has permitted them to eliminate many miles of thoroughly unprofitable "feeder" trackage. He insists

that the loss of railroad credit did not result from the loss of business, but from

unregulated rates of trucks, primarily, which existed from the time trucks were first thought of, to and including 1939. . . . The Interstate Commerce Commission now has complete charge of rate regulation of trucks and for all other forms of competition, and I think the economic factor, the decline in rates, has been stopped and stabilised at approximately its present level.

A survey prepared by Mr McGinnis discloses that the Interstate Commerce Commission, in setting up reorganisation plans for 20 railroads, eliminated stocks with a par value of \$1,828,185,000; reduced their fixed interest debt 67 per cent, from \$3,376 million to \$1,123 million; and converted \$2,253 million of debt into income bonds and preferred and common stocks. A railroad is in no danger of receivership because of failure to pay returns on income bonds and stocks. Mr McGinnis is convinced that railroad credit actually has been re-established, but that the public does not generally realise this. He has assembled statistics showing improved expense controls and operating efficiency which suggest that in the post-war world the carriers ought to be able to hold their own even against fierce competition.

Another survey, prepared by Pierre R. Bretey of the research staff of Goodboy and Co., also a New York Stock Exchange firm, writing of the strides accomplished by the railroads in the way of operating efficiency states:

The trend since 1929 has been in the direction of sizeable economies, since freight expense per 1,000 revenue miles in 1941 was \$6.15, which figure represented a 17.3 per cent decline from the 1929 levels.

Mr Bretey submits that the industry is not likely to experience a decline in gross revenue to levels of \$4 billion (average level for all Class I railroads for the 1930s). This level compares with \$6 billion in the 1920s and \$7½ to \$8 billion during the current war effort. He estimates as a reasonable probability that gross revenues in the post-war period could exceed \$5 billion annually, from which would be left enough to cover fixed charges well in excess of 1½ times.

But Mr Bretey also makes this cautious statement:

We cannot emphasise too strongly that the railroad industry must use the war and post-war periods to reduce debt in order to ensure weathering the inevitable ultimate readjustment of railroad gross to much lower levels. Such substantial revenues as have accrued to the rails during the war and as are likely in the early post-war period, offer the industry a golden opportunity to solve their financial problems through a substantial reduction in debt. Unless the rails use present and prospective large earnings to effect a drastic reduction in debt, the industry may well again find itself in a period such as the early 1930s, when one-third of all railroad mileage (though not the most important mileage) was forced to seek the refuge of the courts. We have confidence that railroad managements have sufficient foresight and financial acumen to adhere to conservative financial policies, and accordingly we look for a continuation by the railroads of the current debt reduction programme, both for the remainder of the war and for the period immediately following the cessation of hostilities.

To which investors must say amen, and, for all who are interested, the railroads retired about \$400 million of debt last year through purchase of bonds in the open market, exclusive of any reductions through reorganisations, and the railroad securities committee of the Investment Bankers' Association of America says a substantially larger amount will be retired this year.

Business Notes

Reginald McKenna

The death of Mr McKenna removes the one outstanding figure from the ranks of our joint stock bankers. Though he had been a member of the most brilliant Ministerial team ever assembled in this country, and had served at the head of such diverse offices as the Treasury, the Admiralty and the Home Office, it is as a banker rather than as a politician that Mr McKenna will be remembered. He joined the Midland Bank, the largest of the joint stock banks, in 1917 after his split with Mr Lloyd George, and served a hard apprenticeship for the second of his two careers as chairman-elect under Sir Edward Holden. From the moment at which Mr McKenna became chairman, in 1919, he showed that he could even improve on the tradition of good banking and emphatic, aggressive individuality set by his predecessor. He refused to be sucked under by that dangerous and depersonalising quicksand, the "atmosphere

of the City." He was a rebel against authority—not because he revelled in the rôle, but because he found something in the commonly accepted dogmas of the City with which he profoundly disagreed. He was a leader in the fight against the return to the gold standard and against the price, in the form of unemployment, depression and dear money, that it was to cost. He championed the cause of an elastic and managed gold standard when such championship appeared to the City as ungentlemanly heresy—though it must not be forgotten that Mr McKenna (together with that other heretic, Mr J. M. Keynes) was one of the signatories of the Macmillan Report which in 1931 reported in favour of holding on to the gold standard at the old sterling parity. In his clashes with authority Mr McKenna sometimes allowed his impatience with what seemed to him the obtuseness of his opponents to lead him into actions which were not truly the business of a joint stock banker—

tions raised by the international application of the standard, and, in particular, the problem of relating local currencies to the commodity unit and of devising the mechanism that would maintain stability of exchanges at the chosen rates.

The Problem of Stabilisation

In an extended footnote to Professor Hayek's article, Lord Keynes makes some basic comments on the general problem of international price stability. In his view, the gold standard has two defects. The first is that it does not provide the appropriate quantity of money. This is, in effect, the first of Professor Hayek's criticisms. The second complaint is that it attempts to confine the natural tendency of wages to rise beyond the limits set by the volume of money, but that it can only do so by deliberately creating unemployment, a method the world has decided to discard "after a good try." This complaint may be just as valid against a new standard which aims at providing the quantity of money appropriate to stable prices as it is against the old gold standard. Any international currency scheme which aims at exchange stability must have as its main difficulty that its members may get out of step in their domestic wage and credit policies. Thinking of the tasks that will confront the Clearing Union or Stabilisation Fund, or whatever variant of these schemes may be applied after the war, Lord Keynes writes:

Some countries are likely to be more successful than others in preserving stability of internal prices and efficiency wages—and it is the off-setting of that inequality of success which will provide an international organisation with its worst headaches. A communist country is in a position to be very successful. Some people argue that a capitalist country is doomed to failure because it will be found impossible in conditions of full employment to prevent a progressive increase of wages. According to this view severe slumps and recurrent periods of unemployment have been hitherto the only effective means of holding efficiency wages within a reasonable range. Whether this is so remains to be seen. The more conscious we are of this problem, the likelier shall we be to surmount it.

If this relative stability of efficiency wages cannot be maintained from within and is not to be imposed from outside, it is evident that considerable recourse will have to be had to the agreed alteration of exchange rates for which both the British and American currency plans make some provision. But if as much reliance on these provisions were to be placed as Lord Keynes rather gloomily expects, then the application of the schemes might indeed cause headaches which promised to become chronic migraine.

Another Discount Merger

The integration of the discount market into fewer and larger units takes another step forward by the absorption of the business of Daniell, Cazenove and Company by that dynamic, nucleus firm, Cater, Brightwen and Company. Daniell Cazenove was a private partnership with capital and reserves reputed to total about £250,000, and running a book of about £7,000,000. It had valuable personal connections which should be transferred safely and intact to Cater, Brightwen, since Mr Geoffrey Daniell, the senior partner, is joining the board of that firm. Assuming that the new business adds something of the order of £7,000,000 to Cater Brightwen's figures, it should carry these to about £53,500,000, and thus put this private firm approximately on a par with Alexanders Discount Company. The facts, therefore, fully justify the listing of these firms, together with the Union Discount Company and the National Discount Company in "the big four" of the discount market. With this absorption, the number of discount market firms, other than running brokers, will have been reduced to 11, or half the total of a decade ago. The scope for further amalgamations is becoming restricted, but it is probable

The OCEAN

Accident & Guarantee Corporation, Limited
Head Office: 36-44, Moorgate, London, E.C.

FOR ALL CLASSES OF INSURANCE

that further infusions of fresh capital will strengthen the smaller firms in the market. There is no lack of offers of such capital from insurance companies and other parties who see in the discount market a channel for safe and comparatively remunerative investment.

Cinema Deals

Associated British Picture Corporation, Ltd., the second largest "movie empire" in this country, is reported to have added to its chain of about 500 cinemas another 44 houses from the Mayfair Circuit. This transaction does not seem to infringe the letter of the arrangements made by the President of the Board of Trade last July; these were designed primarily, to call a halt to Mr Rank's policy of extending his already strong hold on the British film industry. Mr Rank then undertook not to secure control of additional cinemas or their booking arrangements, or of production studios, without the prior consent of the Board of Trade. But the chief shareholders of Associated British merely undertook not to dispose of their shares without consulting the Board of Trade; unlike Mr Rank they were apparently not asked to promise to consult the Board of Trade before adding to their own company's cinemas. The strengthening of Associated British may be in the public interest in that it would provide more scope for healthy competition; but there seems no justification for discrimination between Mr Rank and the Associated group. If Mr Rank has to obtain the Board of Trade's consent to any new acquisitions other concerns should be asked to do likewise. The offer of Odeon Cinemas, a constituent of the Rank group, to purchase the shares of the Metropolitan Cinema Investment Corporation—which controls a number of cinemas—presumably comes within the terms of the arrangement between Mr Dalton and Mr Rank, whereby Mr Rank was given permission to conclude deals that were already far advanced.

Mr Bevin Appeals for Miners

In a broadcast last Sunday, Mr Bevin, Minister of Labour and National Service, appealed for volunteers to go into the mines. Unless special steps are taken, wastage through age, ill-health, and death would reduce the industry's labour force to 690,000 by the end of this year, that is 30,000 below the minimum required to meet essential demands. Some 30,000 recruits must be found as quickly as possible and another 20,000 next year. Since the gap cannot be filled by miners in the Services, the only solution is to tap new sources of manpower. Even if the required 30,000 recruits can be found this year, they can hardly become fully productive without a period of training. The demand for coal during the coming winter will have to be met by the existing labour force. The omens are not good, for since June the rate of output has been appreciably below last year's corresponding level; during the eight weeks ended on August 7th, production was no less than 9 per cent smaller than a year earlier. Last winter serious difficulties were avoided by economies in consumption and comparatively mild weather. Next winter additional countries will have to be supplied, while a prolonged mild spell in Great Britain can hardly be taken for granted. And, meanwhile, the miners profess themselves exasperated to breaking-point by Government policy in matters of wages and welfare.

Speculation in India

Heavy expenditure by the United Nations in India has swollen that country's money income at a time when—as was shown on page 266 in *The Economist* on August 28th—the supply of food and other civilian goods is scarce. According to the statement of the Reserve Bank of India, notes in circulation rose from 4,602 million rupees early in August, 1942, to 7,498 million last month. Speculation in commodities has long been rife, but the Government of India has only recently decided to intervene by stopping futures and options trading in some of the leading commodities. Last Saturday's Order prohibiting futures trading in castor, cotton and sesame seed—open contracts had to be settled at rates fixed by the Government—completed the measures taken against speculators in oilseeds; the terminal markets for the most important oilseeds, that is groundnuts, linseed, rapeseed and mustard seed, were closed last May. At the same time, futures and options trading was also stopped in cotton and in gold and silver

bullion. In cotton, control has since been extended to finished goods. Measures have also been taken to control supplies and prices of wheat and other grains. In certain other commodities, such as tea, shellac and jute, speculation has been evoked by the fact that the British Government, as agent for the Combined Food Board and the Combined Raw Materials Board, is purchasing the whole, or large proportions, of available surpluses. Last June, moreover, a Defence of India Rule was issued, empowering the Central Government to prohibit or restrict advances on the security of commodities or bullion. But unless effective measures are taken to restrain the rise in spendable incomes, speculation will mainly be transferred from controlled to uncontrolled commodities, and from one market to another.

Record Demand for Treasury Bills

A milestone in the history of the Treasury bill was passed on Friday of last week when the applications for the £90 million of bills then on offer exceeded £200 million for the first time. Applications had been mounting steadily of late; within the past five weeks they twice exceeded £190 million. The fluctuations in the aggregate demand for Treasury bills at the weekly tenders can only to a very small extent be attributed to applications from the discount market. The syndicate tender is known to cover the amount of bills on offer with a small margin to spare and has thus been static ever since April 23rd, when the weekly offering was raised to £90 million. The only possibility of fluctuations in the market application arises when a house chooses not to apply for its full quota, which sometimes, though rarely, occurs, or when additional capital comes into the discount market, on which occasions the quota of the firm concerned is appropriately adjusted. But the main factor in the fluctuations of the demand for bills, which have caused applications to range between £152,775,000 and £200,360,000 since the offerings were fixed at £90 million, is to be sought in the official or special demand for Treasury bills which is still satisfied through the weekly tender. The fact that a considerable part of last week's applications for bills came from official applicants is indicated by the average rate of discount of £1 os. 2.4d. per cent. It is evident from this that a substantial part of the bills must have gone to tenderers who bid £99 15s. for them, against the bid of £99 14s. 11d. made by the market. At the former figure there would be next to no profit either on reselling bills to the banks at 1 per cent or on running them with clearing bank money. Only official applicants for bills can altogether disregard the profit motive, and it may therefore be deduced that they have recently been taking an increasingly prominent part at the weekly tenders. If the trend continues, it may be expected that the issue of bills by tender will again be raised—perhaps to the round figure of £100 million a week. That course would be indicated if the authorities are consistent in their previously declared policy of providing a sufficient volume of Treasury bills to meet the essential requirements of the banking system.

Payments to Enemies

The Trading with the Enemy Department of the Board of Trade has issued a notice defining the procedure to be followed in the collection and payment of dividends and proceeds of redemption of securities owned by enemies. The intention of the new Order is to tighten up the control over these funds. It is stipulated that in future only a defined class of bank will be allowed to undertake this business. A list of the authorised institutions is appended to the Order. This also prescribes the duties of the collecting banker and, in particular, stipulates that immediate payment of such receipts must be made to the Custodian of Enemy Property when the owner of the securities is resident or carries on business in Germany, Italy, Japan, Albania, Siam, Roumania, Bulgaria, Hungary, Finland, Denmark, France and French Indo-China. The list is as important in its significance for the countries which it excludes as for those which it includes. The new Order makes no fundamental change in the practice of handling these payments, but it strictly limits and defines the channels through which such business is to be transacted in the future. The previous latitude allowed in the choice of the agencies through which such business was canalised had unquestionably permitted an appreciable amount of undesirable seepage to occur.

THE NATION'S WAR SAVINGS CAMPAIGN

The new issue of

2½%

NATIONAL WAR BONDS

1952-1954

Continuously "on tap"—No limit to holdings

A Full Trustee Security repayable at par on the 1st March, 1954, the Government reserving the right, on giving three months' notice, to redeem at par on or after the 1st March, 1952.

- Price of Issue, £100 per cent.
- Payment in full on application.
- Subscriptions of £50 or multiples of £50 will be received *until further notice*.
- Interest 2½% per annum payable half-yearly on the 1st March and 1st September.
- Interest accrues from the date of purchase.
- Income Tax is deducted at the source from Interest payments of more than £5 per annum.
- Bonds are transferable free of Stamp Duty.

Prospectuses and Application Forms obtainable from all Banks and Stockbrokers.

There are also for this Security a Post Office Issue and a Trustee Savings Bank Issue, of which full details can be obtained at any Post Office or Trustee Savings Bank respectively. Subscriptions of £10, or any higher multiple of £5 may be made. Maximum subscription £1,000. Income Tax not deducted at source.

ISSUED BY THE NATIONAL SAVINGS COMMITTEE

By which to see

It is so easy to regard lighting as a convenience ready for immediate needs that its importance as the means whereby our eyes function is apt to be overlooked.

Everybody depends on sight for nearly every action during their waking hours, and for sight they depend on lighting for much of the time. If the lighting is adequate and suited to the particular needs of the eye in any specific circumstances, individuals will be able to see well and, therefore, to work well. But if the lighting in a works is not right, if it is insufficient in quantity or unsuitable in the way it is applied, they will find it more difficult to see, and their work will suffer, both in quality and quantity. Benjamin are specially equipped to give you the best lighting for your

works. Many years of experience and a highly trained staff ensure the most skilled advice on lighting problems and the preparation of lighting schemes designed in every way to suit particular plants. Factories specialising in the manufacture of the finest industrial lighting equipment that can be made, and laboratories constantly engaged in lighting research, ensure the best reflectors for every situation.

Benjamin are not concerned with wiring, but we co-operate with contractors or the electrical staff of works. We make the best industrial lighting equipment and we can show you how to obtain the best lighting in your works and consequently the best working conditions for your operatives.

Clothing Concentration

The concentration of industrial production had been largely completed before the clothing industry was tackled. Clothing was left until the last because the structure of the industry presented special problems. The main feature is the large number of small firms in the industry, which can be seen from the following table; it shows the size distribution of firms employing more than ten people:—

Size Group Number of Factory Workers	Number of Firms as a Percentage of Total
10-25	46
26-50	23
51-100	17
101-200	8
Over 200	6

There are probably about 25,000 firms altogether, and in July, 1938, the labour force (including boots and shoes) was 625,770, 70 per cent of which was female labour. The process of concentration was begun in July last year, in Leeds; and the object was as much to save factory space as to save labour, although the average release of labour has been fixed at between 20 to 25 per cent of the labour force at June, 1942. This was divided between the different branches of the trade as follows: tailoring and children's wear, 25 per cent; underwear, 16½ per cent; overalls and infants' wear, no release; shirts, which present special difficulties, were allowed an additional 10 per cent. Nucleus certificates are granted to firms whose factories are running at full capacity, whose labour force is not less than 90 per cent of the number employed before June, 1940, and normally consists of at least 50 workers. These certificates, which carry certain guarantees of labour, are taking the place of "designation," which was devised in the autumn of 1941 to safeguard labour supplies in certain conditions. Generally, closed firms buy from nucleus firms and maintain their own sales organisations. There is no compensation scheme as in some other concentrated industries; care and maintenance can be arranged between manufacturers. Outside London, concentration has already covered most of the centres of clothing production. Firms employing fewer than ten people and the bespoke trade are not included in

the scheme. The fact that rationing was already a year old when concentration was put in hand may have been of assistance, since the total output required was a known quantity, and therefore the labour force required could be more or less accurately gauged. Nevertheless, that the fluidity and diversity of the trade, and its other special problems, have not proved insuperable obstacles to concentration is a tribute to those concerned in carrying out the scheme.

Ship Welding Committee

The adoption of electric welding in the construction of ships has proved to be a successful innovation; it is applied on a large scale in North America, but progress has been much slower in this country. Recently, however, the practice has been increasingly used in place of riveting in British shipyards; in view of its importance and scope, the Admiralty has appointed an Admiralty Ship Welding Committee

to consider and investigate special problems arising from the employment of welding in ships' structures and to advise on methods for their solution.

The Committee is a strong one for, in addition to the directors of Naval Construction, Merchant Shipbuilding and Scientific Research and Experiment of the Admiralty, it includes representatives of the Ministry of War Transport, Lloyd's Register of Shipping, the British Corporation Register of Shipping and Aircraft, the Shipbuilding Conference, and the Welding Research Council. Apart from the main committee, a small working committee has been set up under the auspices of the Welding Research Council for the purpose of carrying out investigations. The appointment of a special committee by the Admiralty may be evidence of a new decision to speed up the adoption of the process of electric welding.

A Transport Monopoly?

During the past fortnight or so, there has been an appreciation of some 25 per cent in the market valuation of the £1 ordinary shares of Coast Lines to 17s. 6d., of

**STEEL
MILNERS
EQUIPMENT**

for the post-war office

The Safe aid to efficiency

MILNERS SAFE CO. LTD., 21, HAMPSTEAD LANE, LONDON, N.6
Telephone: MOUntview 6655

which almost half occurred in two days this week. The explanation advanced for this rise was a report that the company, whose title is sufficiently indicative of its activities, is to be taken over by a main line railway company. The company denies any knowledge of such intentions, but in terms which do not forbid the enquirer to suppose that some such development may be possible. This would appear to be the latest manifestation of a tendency, which has been in existence for some time, to work for a transport monopoly in this country. The railways already own the bulk of the canals. They are largely interested in internal air services and in passenger transport by road. If they obtain control of coastwise shipping—the acquisition of Coast Lines would be only a small step in that direction—it would remain only to seek an accommodation with those carrying freight by road—and much work has already been done in that direction. An effective agreement for the fixing of charges would be almost as damaging to the interests of the country as a formal monopoly and it must be prevented. Otherwise this country will run a very grave risk of being saddled with a fixed structure of facilities and charges for transport at a time when there is every reason to believe that important technical developments are possible, at least in road and air transport. Great Britain cannot afford a private transport monopoly which would involve the loss of the economies which may be expected to flow from the stimulus of competition to these and other sections of the industry.

Retail Trade Trends

The fall in the volume of goods and services during the war has been more than offset by the rise in prices, due, partly, to the increase in indirect taxes. According to the White Paper on the National Income and Expenditure (Cmd. 6438), personal expenditure on consumption rose from £4,035 million in 1938 to £4,800 million in 1942. Although these estimates include items such as rent, fuel and light and the income issued in kind to the Services, the value of retail trade, shown by the Bank of England's indices given in the accompanying table, rose after the outbreak of war. But while the rise in the value of food sales has been maintained, the turnover in other goods has shown

RETAIL SALES

(Bank of England indices: 1937=100)

Twelve Months ending June	Food and Perishables	Other Goods	All Departments
1939	105	101	103
1940	111	104	108
1941	111	107	109
1942	112	101	107
1943	114	97	106

a tendency to decline since 1942. The downward movement appears to have been accelerated this year; during the six months from February to July, the value of sales recorded by the Bank of England showed a fall of nearly 10 per cent from those of the corresponding period last year. The reduction has been most marked in the clothing, piece-goods and furnishing departments; it is largely a reflection of the increased supply of utility goods and of the effectiveness of price control. Although retailers have been able to effect substantial economies during the war, the sharp fall in the turnover of many articles other than food this year may well have brought a diminution in profits.

White Fish Distribution

The seasonal reduction in white fish landings is expected to begin early in October, and the full restrictions of the zoning scheme will then be reimposed. The summer arrangement allowed wholesalers to sell to anyone within their zone any surplus after their registered customers had been supplied, according to the conditions of the scheme. During the winter, by the full scheme, merchants must supply their authorised customers only in the proportions shown on the official customers' lists. Minor amendments to the original scheme will be made. A few large towns will draw supplies from different ports, owing to the expected changes in the proportions of landings at the main ports. Other modifications have suggested themselves as a result of last winter's experience. A reduction in the number

of suppliers serving a particular town or trader will make possible further economies in transport. The re-introduction of the full scheme has been decided upon in agreement with the Fish Industry Joint Council. Relations between the Ministry of Food and the trade are now more happy than at any time since the war. Since Lord Woolton's firm refusal to abandon the scheme last December, a "partnership" between the Ministry and the trade has grown up. On the one hand, the Ministry has consulted the trade more fully, and on the other, the trade has taken more kindly to control. This is a fortunate sequel to the former disputes.

COMPANY MEETINGS

ZINC CORPORATION, LIMITED

DIVIDEND MAINTAINED

The thirty-second ordinary general meeting of the Zinc Corporation, Limited, was held, on the 8th instant, in London.

The following is an extract from the statement of the chairman (Mr J. R. Govett) circulated with the report:—

After providing £211,605 for taxation, £30,523 for depreciation, and £20,000 for shaft sinking and special development, the net profit for the year was £104,590, compared with £102,085 in 1941. The fixed cumulative preference dividend of 4s. per share and an interim participating dividend of 1s. per share have been paid, and a final participating dividend of 1s. per share is now recommended, making the total distribution to per cent., the same as last year.

Last year I stated that a scheme of recapitalisation was being studied, and I have now to advise you that a scheme has been prepared by your board, which they consider to be fair and in the interests of both classes of shareholders. The scheme has yet to be approved by the necessary authorities here and in Australia, and as soon as this approval has been obtained, full details will be sent to shareholders.

EFFECT OF WAR CONDITIONS

The drain of manpower has affected our output, whilst the general restlessness due to war strain is another factor affecting production. With reduced production and with wages raised somewhat to meet the altered conditions and the increase in the

cost of living, costs have increased. As regards the present outlook, a further temporary reduction in output would appear probable. The mine has responded well to development and there is every prospect that in the days to come it will be able to meet without strain the increased output of recent years. Ore reserves have been maintained and treatment results have shown that the metal values in the yearly estimates are calculated on a conservative basis.

The output for the year was over half a million tons, and of this output over 90 per cent. came from above the No. 14 level (1,960 ft.). Development proceeded steadily on the levels below the No. 14. Advance diamond drilling from the main shafts and crosscuts on the Nos. 16 and 18 levels has indicated the satisfactory downward continuation in size and value of the ore body to a depth well below the lowest stopes now being worked.

IMPROVED MINING PRACTICE

In recent years there has been a steady improvement in mining practice, and this has led to higher efficiency. The improvements of recent years made themselves felt also in the metallurgical results, and the high standard attained makes further improvement difficult, but again some advance has been made, the recovery of lead having risen from 96.5 per cent. to 96.8 per cent., and that of silver from 92.9 per cent. to 93.7 per cent.

Generally, the outlook for the mine is excellent. So far as the realisation of our products is concerned, Governments are to-day our only customers for export. This must necessarily be the case so long as Governments control sea transport and consumption in importing markets; it is clear, however, that conditions would

NEW BROKEN HILL CONSOLIDATED

SATISFACTORY PROSPECTS

The seventh ordinary general meeting of New Broken Hill Consolidated, Limited, was held, on the 8th instant, in London.

The following is an extract from the statement of the chairman (Mr J. R. Govett) circulated with the report:—The liquid resources at the end of the period amounted to approximately £52,000, a reduction of £13,000, which latter figure represents the expenditure in the year.

The Downcast Airway was sunk 227½ feet, or approximately 36 ft. below the No. 18 level (2,600 ft.) of the Zinc Corporation. A North Drive was commenced, to connect with the No. 18 Level Drive of the Zinc Corporation, and advanced 316½ ft. The South Drive on No. 16 Level (2,280 ft.) from the boundary winze was advanced 473½ ft. to within 580 ft. of the Downcast Airway. This has since been completed.

The accumulated evidence indicates very definitely the existence of a large body of good grade ore under the Downcast Airway, that is 1,000 ft. within our property. Despite delay due to reduction in manpower, the work done to date and the developments during the year confirm our views of the importance of the property and the satisfactory prospects of your mine. The report was unanimously adopted.

INDUSTRY AND TRADE

Straw for Papermaking.—The present price arrangements for the purchase of straw for paper and board making are to be continued unchanged for a further six months until the end of February, when they will be reviewed again. The Papermakers Straw Trading Company, the central buying agency for all the mills, will buy only wheat straw in England and Wales, for which they will pay £4 per ton free on rail or delivered to the mill, plus the merchants' margin.

Special Preserves Ration.—In addition to the normal preserves ration a special ration of 1 lb. of certain imported and home-produced jams will be allowed for each of the three four-weekly periods commencing September 19, October 17 and November 14, 1943.

Bakers' Advisers.—The Minister of Food has appointed a number of advisers who are practical bakers, to give help to and advise bakers in England and Wales who are not getting the best results from national flour and who are experiencing difficulty, from time to time, in handling it.

Toilet Preparations.—The Board of Trade has made the Toilet Preparations (No. 3) Order (S.R. & O., 1943, No. 1213) which came into operation on September 1st. The principal feature of the new Order is that it replaces the quota control by a system of individual licensing of registered manufacturers.

Alarm Clocks.—Arrangements have now been made in consultation with representatives of the trade interests concerned, for the distribution of the alarm clocks which are being imported from Canada and the United States. These will be sold through normal retail trading channels only against buying permits, which will be issued to certain classes of workers. In the first instance issues will be made to railway workers and road passenger transport workers, and the trade unions concerned have undertaken to distribute the permits on behalf of the Board of Trade to those of their members who are entitled to them. It is hoped that distribution will begin immediately. The retail price will be 16s. 9d.

FINANCE AND BANKING

THE MONEY MARKET.—The banks had to find £45,000,000 of Treasury Deposit Receipt money this week against which there were no maturities. In spite of this, money remained fairly comfortable and the banks found it possible to buy moderate amounts of Treasury bills from the market. The Bank return shows a drop of £15,624,000 in bankers' deposits which, however, still leaves their total at the adequate level of £140,370,000. The main counterpart to this movement is a fall

DOMINION OF CANADA

For the purpose of preparing the Interest Warrants due 1st November, 1943, the BALANCES will be STRUCK on the evening of the 1st October, 1943, after which date the stock will be transferred ex-dividend.

For Bank of Montreal,

EDWARD POPE, Manager.

47 Threadneedle Street, E.C. 2. 1st September, 1943.

of £10,750,000 in Government securities, but the encroachment on bank cash is also attributable to an increase of £3,034,000 in Public deposits and to one of £2,040,000 in the note circulation. This last movement brings the total of notes in circulation to the new record of £980,782,000.

MONEY RATES, LONDON.—The following rates remained unchanged between Sept. 3rd and Sept. 9th.

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills, 60 days 1½%, 3 months 1½%, 4 months 1½-1½%, 6 months 1½-1½%, Treasury Bills: 2 months, 1-1½%; 3 months, 1-1½%. Day-to-day money, ½-1½% (Sept. 6th and 8th, 1-1½%). Short Loans, 1-1½%. Bank deposit rates ½%. Discount deposit at call ½%; at notice ½%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between Sept. 3rd and Sept. 9th. (Figures in brackets are par of exchange.)

United States, \$ (4.86) 4-02½-03½; mail transfers 4-02½-03½. Canada, \$ (4.86) 4-43-47; mail transfers 4-43-47. Switzerland, Francs (25.22) 17-30-40. Sweden, Krona (18.15) 16-85-95, bank notes at Bank of England, 17-40 kr. Dutch West Indies, Florin (12.11) 7-58-62; Portugal, Escudos (110) 99-80-100-20; mail transfers 99-80-100-30. Panama, \$ 4-02-04; mail transfers 4-02-04. Brazil, \$ 64½ cr. (buying). Uruguay, 7-6597 p. (buying).

Fixed Rates for Payment at Bank of England for Clearing Offices. Spain, Peseta 40-50 (Official rate). Turkey, Piastres 520. Italy, 71-25 lire.

Market Rates.—The following rates remained unchanged between Sept. 3rd and Sept. 9th:

Egypt, Piastres (97½) 97½. India, Rupee (184 per rupee) 17½-18½. Belgian Congo, Francs 176½. China, National \$3-3½. Iran, Rl. 128-130. Special Accounts are in force for Chile, Peru, Bolivia and Paraguay, for which no rate of exchange is quoted in London. Rate for payment into Argentine special account is 16-03 pesos (Sept. 4th, 16-04).

Forward Rates.—Forward rates for one month have remained unchanged as follows: United States, ½ cent pm-par. Canada, ½ cent pm-par. Switzerland, 3 cents pm-par. Sweden, 3 ore pm-par.

Irish Banks' Returns.—The returns for the banks operating in Eire for the June quarter, published by the Central Bank, are as follows:—

	June Quarter, 1942	March Quarter, 1943	June Quarter, 1943		
			In Eire	Elsewhere	Total
Liabilities:					
Capital, reserves, etc.	17,629	17,651	10,442	7,234	17,676
Notes in circulation	16,353	18,173	5,267	12,651	17,919
Current, deposit and other accounts	201,755	219,927	159,232	62,168	221,700
Other liabilities	8,351	8,576	6,322	2,212	8,534
Total	244,089	264,327	181,264	84,965	266,829
Assets:					
Cash and balances with London agents and other bankers	32,449	33,775	10,223	24,193	34,416

Other assets	10,064	11,118	5,808	4,706	10,514
Total	244,089	264,327	75,092	190,737	265,829
Excess of assets outside Eire over liabilities outside Eire	90,238	102,544	...	...	105,171

Although the expansion of the banks' resources continues, the pace of the expansion appears to be decreasing. Deposits are practically the same as in the last quarter while substantially greater than last year. Owing to the temporary nature of many of the war-time deposits the banks maintain a position of exceptional, and rather unprofitable, liquidity. The proportion of highly liquid assets to deposits is 23 per cent. The outstanding feature of the returns is the increase in the net sterling assets, which have reached a record sum of £106,000,000. In addition to the sterling resources of the commercial banks the Central Bank holds £23,130,784 in sterling securities and gold as cover for the legal tender note issue. The total monetary circulation in Eire amounted to £31,082,638 in June, 1943, a compared with £26,315,866 in June, 1942.

NATIONAL BANK OF INDIA LIMITED

NOTICE IS HEREBY GIVEN that the Transfer Books of the Bank will be closed from the 8th September to 21st September, both days inclusive.

By order of the Board,

R. L. HIRD, General Manager.

26 Bishopsgate, London, E.C. 2. 31st August, 1943.

Applications are invited for posts as Temporary Assistant Commissioners with the National Savings Committee. University training and knowledge of economics, public speaking and organisation of meetings desirable. Salary range, £350-£450 (men) and £280-£360 (women) plus war bonus. Applicant should not be liable under the National Service Acts or more than 55 years of age. Service in any part of England or Wales may be required. Write, stating age and full details of education experience and qualifications to QVP215OP, Ministry of Labour and National Service (Appointments Department), Sardinia Street, London, W.C.2.

GOVERNMENT RETURNS

For the week ended Sept. 4th, 1943, total ordinary revenue was £50,207,000, against ordinary expenditure of £41,120,000, and issues to sinking funds of £2,525,000. Thus, including sinking fund allocations of £6,136,266, the deficit accrued since April 1st is £1,379,069,000 against £1,300,896,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £62,209 to £2,720,337, the other operations for the week (no longer shown separately) raised the gross National Debt by £92,756,150 to £18,230 million.

	Estimate 1943-44	April 1 to Sept. 5, 1942	April 1 to Sept. 4, 1943	Week ended Sept. 5, 1942	Week ended Sept. 4, 1943

Also at AUSTRALIA HOUSE, STRAND, W.C.

YOUR WILL

Have you thought of the anxiety which may be caused to
 your dependants if for any reason your affairs have not
 been satisfactorily arranged?

In these days when life is so uncertain, the advisability of
 appointing a corporation rather than an individual as the
 Executor of your Will or in the capacity of Trustee needs
 little emphasis. By so doing, continuity is preserved and
 you are assured of efficient administration.

Full details can be obtained, whether you are a customer
 of Lloyds Bank Limited or not, from any Branch or
 from its Executor and Trustee Offices at

Ewhurst Place, Ewhurst (near Guildford),
 Surrey, 39 Threadneedle Street, E.C.2,
 5 Albemarle Street, W.1, Birmingham,
 Bournemouth, Bristol, Exeter, Liverpool,
 Manchester, Neath (Glamorgan) and
 Newcastle upon Tyne.

After the Armistice

ITALY'S surrender was greeted in this country as a
 great victory—and rightly so. The defection of
 Germany's chief European ally marked a turning-point
 in the war, and jubilation was not misplaced. Both the
 military and the political circumstances were such as to
 undermine German prestige throughout Europe. German
 armies had been driven from Sicily; the Fascist regime
 had collapsed; and the people of Italy were clamouring
 for peace and freedom. Vast breaches had opened in the
 military and political bastions of Nazism. The terms of
 the Armistice made the prospect even brighter; all Italian
 war material would be transferred to the Allies; and the
 full use of all Italian bases and territory was guaranteed
 to them for the further prosecution of the war. These
 sweeping terms were made the more impressive by the
 fact that the Badoglio Government was ready to carry
 them out, and to throw the remaining balance of Italian
 military power on to the side of the Allies.

In these circumstances, it was not unreasonable for
 people's minds to open on new and dazzling perspectives.
 They pictured the Allies, with the help of the liberated
 Italians, driving the Germans from the Italian mainland,
 starting new attacks in the denuded Balkans, and perhaps
 in Southern France, and opening their bombing offensive
 against Germany's industrial centres in the south and
 east. They pictured the rot of revolt and defeatism spread-
 ing to the other satellites, the collapse of pro-Axis puppet
 Governments, disillusion and depression in Germany and
 a corresponding increase in the vigour and effectiveness

of underground Europe. All this, coupled with the great
 Russian advance to the Dnieper, made it seem almost
 reasonable to predict a German collapse this winter.

The hopes and expectations have not yet been fulfilled.
 Only in one instance has the Italian surrender given the
 full result that was hoped from it; practically the entire
 Italian navy is now under the Allies' control and their
 naval mastery in the Mediterranean is complete. For the
 rest, both the military and the political situation are still
 in the balance. The hopeful predictions forgot the fact
 that to achieve a victory is one thing, to ensure its
 exploitation another. The estimates made a week ago
 overlooked two crucial factors: one, a minor factor, the
 war weariness of the Italians; the other, a major factor,
 the vigour and imagination of the German defence. It
 should, of course, not be forgotten that the Allies are the
 attackers, the Germans the defenders, but they have struck
 back strongly in both the military and the political spheres.
 The towns of northern Italy have been occupied; Rome
 is under German control with German troops "guarding
 the Vatican," beside anti-tank guns in St. Peter's Square;
 the Allied landing at Salerno has been counter-attacked,
 driven back and so far held; and, though its forces are
 now being built up and armoured under enemy fire, the
 Fifth Army's inability to widen its bridgehead and to
 secure airfields has placed the expedition in danger. Only
 in the south, where the right wing of the Eighth Army is
 advancing rapidly up the east coast of Italy, after securing
 the vital harbours of Taranto and Brindisi, is the military

situation going wholly in the Allies' favour. The left wing of the Eighth Army is hastening hot-foot to the First Army's aid.

The Nazis have reacted no less vigorously in the political arena. It was a bold and worth-while stroke to abduct the Duce. Too much has been written in Britain to suggest that Mussolini will be a complete liability to the Germans. True, his policy is bankrupt, his reputation exploded and his decline and fall from ruler of Italy to an Italian quisling, miserable and odious; nevertheless, he can provide a rallying point, the only rallying point, for all the desperate men whose lives depend upon the revival of fascism. When Louis XVI was attempting to escape from France, Marat said: "Woe to the people who are unable to watch and to guard the symbol and the head of the *ancien régime*." Similarly to-day, without Mussolini, the remnants of the discarded Fascist order would have been scattered and useless, both militarily and politically. Under the symbol of his name, they may still be gathered together into a fighting minority.

The fact that the Germans can now set to work to establish a quisling Fascist Government has an important bearing on the attitude of the Italian people. One of the factors emerging clearly from the last week is the war-weariness of the masses. It was wrong to suppose that the Italians would give much active support to the Allied forces. This is true of the Italian army quite as much as of the civilians. The Allies can only count on a small minority—the keener members of anti-Fascist parties, the politically conscious workers and soldiers who really see the war in an ideological and not a national light. This minority might have had a more decisive influence on the inert Italian people if the Germans had not succeeded in creating an active and ideological counter-minority. This emergence of a civil war within the international war is discussed at greater length in an article on page 399. Here it need only be said that since neither of the rival armies—Allied or Axis—can count on much Italian participation, the emergence of these minorities who will certainly operate strongly among the remnants of the Italian armed forces, cannot fail to have a political and military effect.

The quick German reaction has raised people's spirits in Germany, and it has probably depressed them greatly in occupied territory. Italy is the full-scale dress rehearsal for re-invasion anywhere. The puppets, the quislings, the satellites, the underground workers, the ordinary men and women are all looking on anxiously to see how their opposite numbers in Italy are faring. If the Germans are able to prolong their hold, wreak vengeance on all who assisted the Italian surrender, restore the Fascists and lay waste the land, the readiness of the occupied peoples to undertake the risks inherent in co-operating with an Allied re-invasion may be considerably damped. The Germans know that this is the crucial test. The first round—the Italian surrender—went to the Allies. The second—the consolidation of the surrender—has still to be decided; and the future strategy of the Allies depends

upon the swiftness with which they can bring the scales down on their own side.

It was always certain that the first landings in Europe would be bitterly and bloodily contested; and what is happening at Salerno, where the bravery and determination of the Allied troops on the open beaches have been outstanding, should disappoint and dishearten no one. All the hopes and expectations aroused by Italy's surrender can still be realised; but only if skill in the elaboration of strategy and speed in its execution are displayed to the utmost. It is success in the pursuit that determines the character of any victory, however great. It is not profitable at this point to go back over the record of the last two months, but it is perhaps permissible to ask whether greater speed and decision cannot be achieved in the months to come. The Badoglio Government appears to have asked for an armistice almost immediately after the fall of Mussolini. Was the long delay due to Italian bargaining or to the Allies' uncertainty about the terms they would impose? The fact that Badoglio at once accepted unconditional surrender suggests the latter. Too much, however, should not be read into political hesitations and delays. The British people have perhaps tended in recent months to think over-much in terms of political warfare, vital though this is. In fact, political events still wait at every turn upon military developments. Mussolini collapsed because the Allies were winning in Sicily. Badoglio accepted unconditional surrender because his armed forces were beaten. The Germans are able to launch a political Fascist counter-movement now because their measures of military occupation have, for the moment, proved successful. Similarly in the next phase of the war, the Allies' political warfare, the strategy of which must be clearly known or decided beforehand, will be successful—in Italy, among the satellites; in Germany, only if their military campaign is developing towards victory.

Here again the layman may ask, though with all possible deference, whether speed has played the part it should in the concerting of the Allied plan. There were long delays after the fall of Sicily. Were they dictated, as they may well have been, by the necessities of logistics, by stern limitations on transport? Was it necessary to leave the gathering of the Salerno expedition until all Sicily was subdued? Could not other landings have coincided with the first landing at Messina? Given the scattered nature of the German defence and the friendly attitude of the Italians, was the promptest use made of air-power and air-borne troops? The amateur cannot answer such questions, but he cannot help putting them; nor can he help comparing the variety of the German reaction with the more ponderous character of Allied strategy and wondering whether lack of equipment or of imagination contributed in any way to the difference.

Italy is only one sector of the campaign for Europe. For either side it can become a trap, drawing off a mass of men and materials out of all proportion to the military results achieved. The Allies' aim is to ensure that the Germans fall into this trap. Tunisia became such a trap, for it drew off a hundred thousand Axis soldiers from the defence of Europe. Italy will become one if the Allies draw the Germans on to their destruction, only to strike elsewhere. Large Allied armies are massed in the Middle East. Large Allied armies stand on guard in Britain. It is impossible to believe that all their resources in manœuvre and striking power have yet been exhausted in the attack on Italy; and there may be more brilliant events to come. Within the wider context of the war, the immediate phase in Italy cannot be decisive. However effective the German defence, it remains a defence only. It is the Allies who in the total picture are inexorably on the advance. But the total picture can be drawn out in time as well as in space, and speed must be the essence of the Allies' strategy if it is to include the efforts not only of Britain and America but of Russia, too. The wider view puts Salerno into a proper perspective; but it only reinforces the necessity for speed.

The Example of Coal

THE Prime Minister has been in North America for six weeks, rounding off old stratagems for the enemy's destruction and contriving new ones. For some time he has been needed at home. The people of this country will be glad and relieved to see Mr Churchill safe again; and they require decisions from him on matters no less pressing than the planning of battle—which has now passed into the hands of the Chiefs of Staff where it is not already entrusted to commanders in the field. With the authority of Parliament and backed to a unique degree by the free opinion of his country, Mr Churchill keeps in his own hands the power to loose and bind. With him in his Government are many able and industrious men who labour unremittingly at the tasks allotted to them. But they have no authority to make decisions of first importance. For these, they must look to their chief, whom they possibly see only seldom in the press of his world-wide affairs. Inevitably, policy proceeds by sudden jerks. Only when there is a knot that must be cut, a problem that must be solved, a peril that must be overcome, can the Prime Minister find the time to intervene. Such a moment has now come in several matters.

The preliminary parleys in London between representatives of Britain, the United States and Russia have not been helped by the absence of the Prime Minister's decisive voice from the discussions. If the three-power conference which each desires and the cause of victory and peace demands is to take place, the close attention and counsel of Mr Churchill are indispensable. Similarly, if the ground-work of post-war Britain is to be devised in time, the Prime Minister must make or allow to be made the crucial decisions of policy and planning without which the process of preparation has now reached a dead end. And there are questions of more immediate domestic concern, some, indeed, matters of danger, that insist upon answers which, as things are, only the Prime Minister can give. Most urgent of all at the moment, and symbolical of much that is being left undone, is the question of coal. Not only is the material equipment of wartime work and life still menaced by the insufficient output of coal, but also there are coming from the coalfields the first sounds of that bitterness between men, masters and the Government which wrecked domestic peace after the last war.

Mr Bevin's performance before the Trades Union Congress at Southport last week sufficiently showed the state of frustration in which coal policy and coal politics have become bogged. He had nothing to say. Mr Bevin is the Minister responsible for the present campaign to

bring men of all ages into the pits. Those called up for military service are being pressed to cut coal; the compulsion of boys is being considered; and the direction of youths to underground work has already aroused grave opposition in the coalfields. It is Mr Bevin who has broadcast the attractions of coal-mining as a career. Yet, faced by the TUC, with its mining members deeply sceptical about the sincerity of the Government's professions and deeply resentful about the recent wages award to pit-boys and the treatment of colliery workers under workmen's compensation, he could offer no answers to their questions. The miners were left bitter and angered.

It would be unfair to pin all the blame for the latest deadlock on either the Minister of Labour or Mr Lloyd George, the Minister of Fuel and Power. In the phrase of our Washington correspondent, applied on another page and in a different context to Mr Roosevelt's Ministers, they are men with "responsibility without authority." They are not in a position, apparently, to take the bold decisions that the situation requires, and it is their lot, painfully, to make the best of a bad job. Whether in fact either has done even this may be doubted; but there is no doubt at all that, in the present situation, only the Prime Minister can put an end to the four-year tragedy of errors in the coalfields.

The melancholy story is well enough known. Like the Turks in the proverb, the powers-that-be have been surprised and aghast each time winter has come. From the outbreak of war, pitmen were called to the colours in over-great numbers. In the hand-to-mouth days after Dunkirk, coal was forgotten, more men slipped away and, with the cutting off of European demand for British coal, collieries were closed. The industry drifted unheeded into difficulties that became suddenly evident when the rising requirements of war industry made new calls for coal. Then, less than eighteen months ago, with the red light plain, some effort was made to set matters right. The position in the summer of last year seemed at last more favourable: there was a general advance in wages and national wages machinery was set up; a bonus on output was instituted; in place of rationing, which was rejected by Parliament, a massive economy campaign was begun; and, above all, the Government announced its decision to assume "full control over the operation of the mines and to organise the industry on the basis of national service." Controllers were given full powers to restore and increase output; the Government pledged itself to see that the coal required would be cut, and the miners' leaders to do their utmost. Yet now, barely a year

CENTENARY RECORD

1. We have been able to prepare a limited number of copies of a commemorative pamphlet, which will include (a) all the special centenary articles which appeared in the issue of September 4th, dealing with the history, policy and present views of *The Economist*, and (b) the speeches made at a centenary luncheon on September 2nd by Sir Walter Layton, chairman of the gathering; the Chancellor of the Exchequer; the Governor of the Bank of England; the Home Secretary; and the Editor of *The Economist*. Copies will be available in a few days (price 2s., postage 2d.), and applications should be made to *The Economist*, Brettenham House, Lancaster Place, London, W.C.2. (Temple Bar 3316.)

2. A volume of essays entitled "*The Economist, 1843-1943*," which is mainly historical in character, has been published by the Oxford University Press, price 7s. 6d. (Orders should be placed through booksellers, and not with either the Oxford University Press or *The Economist*.)

EQUITY & LAW
LIFE ASSURANCE SOCIETY
Established 1844

PROTECTION IN WARTIME

● Civilian War Risk Cover without additional charge is normally granted under new Whole-Life and Endowment Assurances — whether With-Profit or Without-Profit.

● A Guaranteed Bonus each year until 1946 inclusive is provided under all new With-Profit Policies — thereafter Bonuses are dependent upon Profits.

Head Office: 163/4, STRAND, LONDON, W.C.2
(temporarily transferred from 20, Lincoln's Inn Fields)
Telephone: TEMple Bar 0381

later, the crisis is still at hand. Output last winter, though better than in the previous months, was less than output in 1941-42; it is still running appreciably below last year's. The labour force is still dwindling, and next spring, when 750,000 miners may be needed, there may be fewer than 700,000. On the miners' side, persistent absenteeism, especially among the younger and more able workers, has continued. Apart from the success of the economy campaign, aided as it was last winter by mild weather, last year's new coal policy has been a failure; and ominously, the reserves of good will that still existed in the industry a year ago have been dissipated.

Mr Churchill is always constrained to step in, as Mr Pethick-Lawrence points out in a letter on another page, when Parliament as a body demands it—or when there are signs of acute dissension within his own party. The immediate occasion of his intervention last year was the storm of protest, mainly Conservative, against Mr Dalton's (and Sir William Beveridge's) scheme for the rationing of fuel. Mr Churchill gave his blessing to control and economy, and the outlook seemed not unfavourable. In the event, the failure of control to yield any appreciable dividend, either in the form of more coal or in the form of better labour relations in the industry, has only very partially been concealed by the commendable success of the economy campaign. The fresh start proved to be a false start. And in the vacuum left by the absence of an effective policy either to increase the efficiency of coal production or to maintain its labour force, a campaign of recrimination has proceeded within the industry. It was begun by the mineowners, whose publicity for more than a year has been directed towards placing the onus for failure upon the men; it was their normal reflex action to the hint of nationalisation. The campaign has been answered in kind, and the coal crisis has become an issue of partisan politics, with *tu quoque* as the guiding principle on both sides. The results are not a matter for argument—too little coal, too few miners, too few man-hours worked and too small an output per man-shift. These are the reasons why Mr Churchill must intervene again. By nature, he is *deus ex machina*. Last summer he ended the deadlock over rationing; last autumn he personally exhorted the miners' leaders about their part in the war effort. His first task is not to exhort, but to ask three questions and allow no evasions. Why has the control scheme proved practically a deadlock? Why have the miners failed to do their share as they promised? What are the legitimate grievances of the workers?

Public control of the coal industry probably could not work in any event so effectively as some had hoped. The principle was so to redistribute the industry's resources of men and equipment as to obtain the maximum amount of output in the shortest possible space of time. Unfortunately, the coal industry has proved, in practice, strikingly inflexible, and the technical problems of rationalisation are greater than the theory, perfectly sound in itself, usually allows. The movement of men from bad pits to good ones is blocked, not simply by the disinclination of owners to see their individual collieries closed, but also by the reluctance of men to move their homes and by the shortage of housing accommodation. Yet, although the plan was bound to be limited in its effectiveness and to show results in the long term rather than the short, it seems quite certain that far too little vigour and resolution has been shown by both the responsible Ministers and the controlling officers. They have been too modest. They have sunk into the background. The fact that the Government assumed full control over the mines and placed the industry on a basis of national service has by now been forgotten. The miners have no consciousness of being public servants or the managers of being the community's technicians. Control, for all its limitations, has not been given a fair trial—or even a fair chance.

The miners have been given, and must take, their share of the blame. The inability of their leaders to assert their authority has permitted an undue and damaging degree of absenteeism. The Nottinghamshire strikes are another flagrant instance. But the miners have an

answer and, so far as it goes, it can hardly be denied. With ample warning and full knowledge of the consequences, the Government has permitted their number to fall steadily. The necessity for underground workers to be recognised as a special prior class in food rationing, on a par with fighting soldiers, perhaps even with American troops, has never been recognised. Wages and earnings are far from being the most important items among the miners' grievances. Food comes first, and a higher meat ration might have worked wonders with cheese-jaded pitmen. Mining is a very dangerous and very unpleasant employment, and it cannot be made attractive by exhortation. A sixth of each year's industrial accidents occur in mining. It is true that the inadequacies of the new workmen's compensation provisions are due to the basic inadequacies of workmen's compensation itself—and therefore another striking proof that decisions in these social matters cannot be put off until after the war. But mining has a special claim, above all industries. It is mainly in the lowest ranks of the workers that the issue of pay is of first importance. It is anomalous and futile to retain the voluntary principle in recruitment to the industry and, at the same time, to maintain rates of pay which offer no inducement for boys to enter or for older miners to return.

This is not to suggest that anything in the nature of a policy of appeasement is desirable. Lord Baldwin once postponed an explosion in the coalfields for some months by largesse, but the explosion happened in the end. What is needed now is, first, that all grievances which can fairly be put right should at once be met; and, secondly, that the Government's full control over the mines should be asserted to its utmost limits—or recognised as make-believe and scrapped. There are two urgent aims: more miners, and more output per man. The first requires the drafting back of all former miners (though the release of troops may be operationally impossible, and must in any case be very slow) and the enlistment of new recruits, young and old. The possibility of doing this, whether the method used is volunteering, direction or compulsion, depends on the physical (rather than the financial) inducements offered—on whether what Mr Bevin says in words can be made true in fact. The second aim requires more technical efficiency—the mineowners' claims about the technical progress made before the war, even if true, are irrelevant to the present needs for more coal—and less absenteeism. Increased efficiency demands the setting, by public order and control, of the highest possible standards of technique and management in every colliery and coalfield. The diminution of absenteeism demands the reassertion of trade union authority, the demonstration that public control is a fact and, again, the redress of grievances, so that miners may be guaranteed, not more money with which they cannot necessarily buy what they want, but a special preference in the supply of the things they need.

Mr Churchill is a great man because, among other qualities, he is tough. This is eminently a moment for toughness, for the iron hand as well as the velvet glove, whether it be miners, mine owners or Government officials that stand in the way. Once, in the darkest days of last year, the Prime Minister flew to Cairo and, finding the troops disappointed and bewildered after unexpected disasters, made a clean sweep of their commanders—the first move in the pageant of victory which began at El Alamein and went on to Sicily. The commanders he replaced were not inefficient or failures; there is no reason to suppose that they were inferior to those who took their place; but Mr Churchill saw that the requirement, first and foremost, was a fresh start, and he made it. Perhaps he must now do the same thing on the home front for coal. Certainly he must give someone power to act; and when he sets out to do in London, in another sphere, what he did last year in Cairo, he will find that the crisis in the coal industry is far from the only issue he must settle in person, if his own peculiar system of personal rule by remote control is not to creak perilously.

Taxes on Business

THE classical British income tax, now winning its third world war, is really three taxes in one—a universal proportional tax on virtually all incomes; a steeply progressive tax on larger incomes; and a tax on the profits of business. An article last week suggested that if each of these three taxes was in future to be fully adapted to its purpose it would probably be necessary to separate them. A universal income tax, to be satisfactory, must be on a "pay-as-you-go" basis, and it must be very simple in operation. It was suggested that the best way of achieving these results would be for tax to be deducted at the source at a flat rate (or at two flat rates, one for earned and the other for unearned income) from all incomes, and the personal and other allowances to be given, as a separate operation, as an offset against these deductions. This second article is concerned with the other two taxes—the progressive tax on larger incomes and the tax on business profits—now included in the income tax.

On income tax as a progressive tax on larger personal incomes there is little to be said. This is the function which the income tax, in combination with surtax, performs most satisfactorily. If the universal tax on simplified lines suggested in the preceding article were enacted and given the name of Income Tax, the task of levying on larger incomes might be handed over completely to the surtax. Some consequential changes in the surtax might then be advisable. It would become the only personal tax for which an annual review of income would be necessary. To ensure a smooth progression it might be necessary to bring the starting-point of surtax down to a much lower figure than the present £2,000, but the figure would depend on the standard rate of income tax and the size of the allowances given as an offset against it. Whatever the figure, it would certainly be high enough to secure great administrative savings. In general, personal allowances having been given against income tax, no further allowances should be given against surtax. Surtax could be left in its present form, making with the revised income tax a smooth progression from the smallest incomes to the largest. The combined rate on the highest incomes might not remain at the wartime level of 19s. 6d. in the £, but there is no economic reason why it should not remain high.

It is in the field of the taxation of business profits that the greatest change in current practice is required. Hitherto, two arguments have been dominant—first, that all business profits are ultimately imputable to individuals and should therefore be taxed like all other income; and, secondly, that the Exchequer's only concern in the matter is to protect the revenue. The second of these arguments is beginning to look very old-fashioned. It is less than three years since a Chancellor of the Exchequer first openly admitted that he had responsibilities wider than the balancing of the Treasury's ledgers, but already the new doctrine has been so generally accepted that it is hard to imagine any departure from it after the war is over. The sound management of the Exchequer accounts does, of course, pose problems of its own, both of technique and of policy; but the main importance of budgetary policy is as the chief instrument for influencing the development of the national economy as a whole. It is in the light of this new doctrine that the taxation of business profits should be regarded.

One point may be made clear at the start. Whenever profits pass out of the corporate treasury and become income in any individual's pocket, they should be treated in the same way as any other sort of unearned individual income and subjected to income tax and surtax. Income tax at the standard rate is—and doubtless would continue to be—deducted from dividends at the source. But this is a mere administrative convenience; it does not

finally determine the rate of tax that the dividends eventually bear, since surtax is levied on some and a refund is made on others. It is very important to emphasise that a plea for lower taxation on business profits is in no way a plea for leniency to the rich man. He would pay income tax and surtax on all income that reached his pocket, and the provisions against the evasion of surtax through the formation of private companies would remain in force.

The real question relates to the taxation that ought to be levied on profits that remain in the business. It will be argued that sums put to reserve are at present taxed only at the standard rate, though the owners of a company may be subject to surtax; but this is very cold comfort when the standard rate is 10s. in the £. The question is whether profits retained in the business should not be taxed at a rate below the standard rate—or at least below what the standard rate seems likely to be in the future.

It is evident that the economic system that is going to prevail in this country for as far ahead as can be seen will be a mixed system in which, however much public management may grow, very large areas of the national economy will be left in the effective control of private enterprise. Over these large areas it will remain the case that the decisions to increase or to diminish activity will be the decisions of private persons. If one of the community's major preoccupations will be to maintain a high level of activity, and if the responsibility for deciding the level of activity lies, over a wide area, with the private entrepreneur, it is the merest common sense that the state should attempt to create the conditions in which he will decide upon a high level of activity. Whether an income tax—that is, a tax which is not levied until profits have been earned—has a deterrent effect on enterprise is a question that has often been argued. It is certainly far better from this point of view than a tax that has to be reckoned as a fixed charge. But an income tax of as high as 50 per cent almost certainly exercises some deterrent effect upon the business man's willingness to take risks in expanding his business.

The chief deterrent effect may well be indirect. The classical method by which a business can expand is by "ploughing back" its profits. If there are no profits to be ploughed back, the entrepreneur has to raise capital from outside which, at best, involves waiting for a favourable moment in the capital market or persuading a professionally cautious banker and, at worst, involves saddling the enterprise with onerous fixed-interest debt. "Ploughed back" profits are equity capital, available when it is wanted; and it is only at the rarest and shortest periods that capital is forthcoming from the market on equally encouraging terms. If the solution of the Full Employment problem is to be found in an equilibrium of savings and capital investment, it is obviously in the public interest to stimulate "ploughing back." At present, every second row of profits is ploughed under before it has a chance to seed. Moreover, there is a further argument, more specifically directed to the present position of Great Britain. There is substantial evidence for the view that, even before the war, British industry was falling behind its competitors in its degree of mechanisation. The inventors of the Industrial Revolution were falling behind their pupils. This is not the place to set out the evidence; but if the general truth of the contention is accepted, then there is an even stronger case for stimulating British industry to increase its capital expenditure—which can best, and perhaps only, be done out of profits.

A policy for the reform of taxation of profits might well fall into three parts. First, any sums needed for maintaining intact the existing productive power of the business should be free of all tax. These sums, properly speaking, are not profits at all and should not be treated as such.

An article in *The Economist* of January 2, 1943, described the present position concerning depreciation, wear-and-tear and obsolescence allowances. The present state of the law is not so stringent as is sometimes alleged, though it tends to discriminate against the firm with poor financial resources, and against all firms in a period of rising prices. The system needs to be liberalised by the raising of depreciation allowances and by the widening of the definition of obsolescence. The aim should be to secure that firms pursuing a careful and progressive obsolescence policy are not penalised as a result, and that less far-sighted firms are encouraged, rather than discouraged, to keep their equipment up to date.

Secondly, at the other extreme from depreciation allowances, profits that are merely put to financial reserve, kept in cash or invested in securities, without any intended re-investment in the same business, should continue to pay income tax at the standard rate, as at present. There is no reason of economic policy why they should be treated with any particular leniency.

Thirdly, in between the two previous cases, there are the reserves that are "ploughed back" into the business. (The exact frontier between a financial reserve and an extension of business is not always very easy to draw; but an analogous distinction has already been drawn, in connection with EPT, in defining "capital employed in the business"). These profits might be taxed at a rate of, say, half the standard rate. It should be remembered that one of the purposes of this concession is to advance the interests of general economic policy. The community's desire that firms should spend their reserves on capital extensions varies from year to year; when unemployment threatens, it is great; when full employment is tending to merge into inflation, it is at a minimum. Consequently, the rate of tax on "ploughed back" profits might vary from year to year according to the state of the trade cycle. It is not, of course, the putting of these profits to reserve that interests the community so much as their later expenditure on plant and buildings or on stock in trade. It might be provided that every firm should have an "Extension of Business Account" and that all sums paid into this account should bear taxation either at the standard rate or at some high fraction, such as three-quarters, of it. Every year a lower rate of tax would be

laid down in the Budget for profits expended on the extension of business, and on all funds withdrawn from the "Extension of Business Account," and spent in such a way as to increase the capital employed in the business, a rebate of tax would be paid. Thus, if the standard rate were 10s. in the £, any sums placed to the Extension Account out of annual profits would be taxed at, say, 7s. 6d. But in a year when unemployment threatened, the "ploughing back" tax might be fixed at 3s. 6d., and a rebate of 4s. paid on all sums brought out of the Extension Account and spent on an approved purpose. This is, of course, only a sketch of the way in which such a principle might be applied so as to convert it into a weapon of trade cycle policy. The principle itself is more simple: it is that all profits genuinely "ploughed back" into the business should bear taxation at a comparatively low rate.

The objection will be made by some that joint-stock companies are owned by private individuals and that any tax concession that assists the growth of their activities enriches those individuals. Even if they cannot draw higher incomes without attracting taxation, the value of their property will be increased at the expense of the Exchequer. It is true that, so long as any of the means of production, distribution and exchange remain in private ownership, an expansion in the national wealth will bring benefits to individuals. But it would seem an extreme remedy to discourage any increase in the national wealth until such time as the socialist revolution has been consummated. It would seem more sensible to take every means to ensure the most rapid possible expansion in the productive power of the national economy and, if the resulting enrichment of individuals (it is unlikely to be an increase in their proportionate share of the national dividend) outrages the moralists, to restore the balance by an increase in death duties or even, conceivably, by an annual tax on the capital gains of individuals. So long as private enterprise plays any part in the national economy (and it is going to play the preponderant part for as far ahead as can now be seen), it is essential that its facilities for expansion should not be crippled. Both the tax-gatherer and the politician of the Left will be very short-sighted if they ignore this principle. For if industry is stagnant, the revenue will wilt and the condition of the poor will not improve.

The Great Debate

AS the end of war draws nearer, the great debate on foreign policy revives. For four years, the nations have had no foreign policy beyond survival. Now, unless peace is to be a sordid "continuation of war by other means," they must think again; and there can be no doubt that the process of thinking is being conducted more vigorously and vocally in the United States than in this country. The British would be well advised to listen in to this debate. It can clarify their own ideas, and, since the outcome involves their own security, they can and should seek to influence its course. In a sense, it can even be said that the American debate on foreign policy is the British debate, for both nations must operate in the same world of power relations and both have a great variety of similar errors and complacencies to slough off.

The starting point has been admirably defined by Mr Walter Lippmann, whose short book, "American Foreign Policy,"* has acted as a revolutionary catalyst among the shifting ideas and moods and prejudices which make up a people's attitude to foreign affairs. "A foreign policy," he writes, "consists in bringing into balance, with a comfortable surplus of power in reserve, the nation's commitments and the nation's power." He goes on to prove, with a cogency that cuts like a knife through the layers of the nation's muddled thinking, that, in the nineteenth century, American power and American commitments were balanced because of the unrealised and unformu-

* "American Foreign Policy," Hamish Hamilton, 109 pages. 6s.

lated "marriage"—to use Jefferson's metaphor—of America to "the British fleet and nation." Since the emergence of Germany and Japan early in this century, the British navy has no longer been strong enough to ensure American security, yet the Americans

clung to the illusions which had sufficed under the old order. The adherence to this old and now obsolete policy is known as "isolationism." The name is misleading. In reality our commitments had been greatly extended, whereas our power and that of Britain had relatively diminished. The correct name for the policy of keeping the commitments without enlarging our power and our alliances is not isolationism, but insolvency.

In fighting insolvency, Mr Lippmann is fighting on two fronts, against the isolationists who do not deny the question of power, but believe that American power is sufficient and needs no reinforcement from "entangling alliances"; and also against the idealists for whom the question of power is positively indecent, and must be screened from the people's view by a flood of "ambiguous platitudes"—the rule of law, the rights of small nations, collective security, all of them fine and excellent things, but meaningless apart from an ordered system of power strong enough to enforce them. Obviously it is not only in the United States that this issue of power needs to be clearly analysed. It is not many years since sections of Britain's national press were campaigning for Britain "to withdraw" into its Empire. Mr Lippmann's proposal for ending American insolvency is a firm post-war alliance

with Britain, Russia and eventually China, which he calls a "nuclear alliance," for it would be the effective power centre round which the other nations could be grouped in a pooled system of security; and acceptance of his thesis and echoes of his suggestion have appeared in spate in the public addresses of recent weeks—and they have come not from the known supporters of international collaboration, Mr Wallace, for example, or Mr Willkie, but from very much more cautious and conservative circles. When the Republican Post-War Advisory Council met on Mackinac Island, of the five Republican Governors present, three gave their views on America's post-war policy. Governor Warren, of California, said:

To keep out of another war and to prevent one, it will be necessary to have co-operation among nations. I think any co-operation that we have with other nations will have to have force behind it.

Governor Bricker, of Ohio, went further:

I would like to see the Council propose an International Organisation not only to combat aggression but to anticipate trouble and prevent it. It is difficult to say now whether we should have a formal treaty with Great Britain.

Governor Dewey, of New York, went as far as he could go:

It is very likely, and it will be in our interest, to have a military alliance with Great Britain after the war. I would favour eventually broadening the base of the alliance to take in Russia and China.

It is true that the Council finally produced the customary "ambiguous platitude." It recommended only that America should participate

in post-war co-operative organisation among sovereign nations to prevent military aggression and to attain permanent peace with organised justice in a free world. and added the escape clause

If there should be a conflict between the two [international co-operation and national interests], then the USA should adhere to the policy which will preserve its constitutionalism. . . .

But the Governors had already spoken bluntly and Mr Dewey's proposal of an alliance was headline news. In the same week, Mr Churchill produced his contribution to the debate, the proposed continuation of a Joint Anglo-American General Staff after the war. And as spokesman at once of the State Department and of cautious Democratic conservatism, Mr Cordell Hull has now combined a restatement of a number of those general principles—respect for national sovereignty; freedom from internal interference; willingness to settle international disputes by peaceful means; non-discrimination in economic opportunity—which have been used so freely in the past to cover the bankruptcy of American policy, with a firm statement of the power factor which alone would give the principles a chance of realisation:

It is abundantly clear that a system of organised international co-operation for the maintenance of peace must be based upon the willingness of the co-operating nations to use force, if necessary, to keep the peace. There must be certainty that adequate and appropriate means are available and will be used for this purpose.

These statements by American leaders have, of course, to be seen against the background of next year's electoral campaign. In any electioneering, there is bound to be an element of pledge giving, designed to raise the bids and cap the offers of the other side. The direction of the bidding—towards stronger American commitments—throws a hopeful light on the trend of popular thinking in America; it does not necessarily throw any light at all on the final redemption of even the most moderate pledge.

Mr Dewey has thrown into the debate the concrete suggestion of an Anglo-American alliance; large, intolerant and vocal groups in America would not follow him so far. But Mr Lippmann goes further, to the "nuclear alliance" of the four Great Powers; and still larger groups would abandon the policy at this point.

Yet any understanding of the relation between force and security must, to be effective, embody itself in an alliance system, and it would be useless to accept Mr Lippmann's definition of insolvency and refuse the only means available to put an end to it. It would even be very dangerous to accept half his thesis—the necessity for Anglo-American collaboration—and leave relations with Russia to care for themselves. If the war ends with the world divided into two power systems, an Anglo-American and a Russian, a further conflict is almost certain. This is not because either system is essentially predatory, or because they are essentially antipathetic. Rarely in men's history has overwhelming power come to be controlled by nations so nearly satisfied. It is fear, not greed, that would be the instigator of war. On the periphery of their power systems—in Europe, in Asia, in the Far East—the two groups would jockey for position, aligning the smaller nations in rival camps, watching for every provocation. Security from future wars can come only through the lasting association of all the great victorious Allies.

Will American opinion go all the way with Mr Lippmann here? He himself has given part of the answer:

The objective test of whether there is to be peace or war will be whether the borderland between Russia and the Atlantic states is settled by consent or by pressure, dictation, and diplomatic violence. . . . If in this region the effort to settle territorial boundaries and to decide what governments shall be recognised discloses deep and insoluble conflicts between Russia's conception of her vital interests and that of the Western Allies, then every nation will know that it must get ready and must choose sides in the eventual but unavoidable next war.

This is plain speaking. It is also true. However compelling the necessities of power may be, they do not override either in America or Britain certain fundamental principles of international relations—the principles of national freedom and sovereign right outlined by Mr Hull.

At this point, the great debate enters its most difficult and dubious phase. Behind the clarity of Mr Lippmann's analysis, behind the growing acceptance of the need of balancing power and commitments, behind the whole movement away from isolationism and irresponsible idealism, lies the fact that the relations between states are much more than mere power relations. International society is not just an interrelated system of power centres; and, while force is indispensably needed to uphold the structure of international society, power is in itself no clue to the kind of structure within which the nations can find a tolerable way of life. Mr Lippmann's book is not concerned with this wider problem, but he closes his analysis with the reminder that:

The experience of history supports the conclusion that power can endure only if it gives and maintains laws within which men enjoy the liberties they regard as more important than life.

To establish the nuclear alliance is the necessary beginning and condition of peace; but it is by a sound instinct that much of the debate in this war has turned on social and economic collaboration. If the great nations use their power not only to create a bare framework of security, but also to increase the economic and social content of international life, to "mix up" the nations at every level of life, not simply at the political or juridical level, their control will not seem too onerous. If not, they would be unable to maintain even their own alliance in a squabbling, disrupted and impoverished world.

National sovereignty is not enough; nor is power or the nuclear alliance. Economic and social collaboration, in turn, are insufficient without the framework of security. The field of foreign policy is unified and interdependent. and there is always danger that in solving one side of the equation, the nations will neglect all the x's on the other side. However, the ground is being covered: last year it was the economic idealism of Mr Wallace and Mr Milo Perkins; last winter Mr Willkie's vision of world interdependence; and now the shrewd political realism of Mr Lippmann. All these approaches are complementary; and the debate continues.

NOTES OF THE WEEK

Westward Ho!

The Russian advance continues. In the course of the week the Soviet armies have scored big victories on three sectors. In the south they have advanced about sixty miles to the west of Stalino, and are now more than half way between the capital of the Donetz basin and Zaporozhe on the Dnieper. The speed of the advance here has been largely due to the favourable terrain. The pursuing forces have left the densely populated area of the Donetz far behind; and the fighting has moved out to the open steppe. It may be only a matter of days before the Russians reach the Dnieper bend; evidence so far available suggests that the so-called Dnieper defence line does not stretch to the east of the Dnieper here, and that no deep or solid fortifications have been prepared by the Germans far in front of the bend itself. Russian reports mention only light and hastily prepared strong points in the way of the pursuers. The lie of the land suggests that the much-discussed defence zone may start close to the river, and that its pivot is the hilly right bank, which is ideally suited for artillery positions, machine-gun nests and mortar posts. Behind the Dnieper, it is said, the Todt organisation has built up strong defences in depth, covering the whole territory inside the river bend, hingeing on Kiev and extending into White Russia. The testing of this belt in battle will not come before the winter. The Russian summer offensive has already almost reached its objective in the south. This is also so farther to the north, where the Russians have now captured Nyezhin, half way between Konotop and Kiev. The capture of Bryansk has given the Russians possession of another key centre of communications.

It is not, of course, the putting of these prongs to reserve

A German explanation is that the aim of the withdrawal has been to shorten the line. Similar German explanations in the past were not devoid of substance. The withdrawal from the Caucasus early this year allowed the German Command to reconstitute their operational reserves behind a shortened front. Now, however, the new "shortened" front is broken by salients and wedges which impose a great strain on German manpower and firepower. The straightening of the front to the west of the Donbass is set off by the new enormous westward salient from Bryansk to Lozovaya. Another German explanation, that the retreat is an attempt to lure the Russians into a precipitate advance, has no more substance. Almost everywhere the advance has been on a broad front, and every mile of the advance tends to strengthen the Russian transport position. (The only exception perhaps is the sharply pointed Russian wedge from Konotop towards Kiev, where a German counter-stroke might temporarily regain some lost ground.) In fact, the German retreat reflects a distinct crisis in manpower. Though it seems true that the fighting in the Mediterranean has not yet forced the German High Command to draw on their reserves on the Russian front, it must have prevented them from increasing and strengthening those reserves. The Russian doubt whether Hitler has yet been compelled to divert any divisions from the eastern front is an incomplete assessment of the position so long as it does not include in the reckoning the potential and indirect diversion caused not only by the campaigns in the Mediterranean, but also by the Germans' anticipation of further invasions.

Manpower Policy

Parliament's coming inquest on manpower policy will be as close and critical as its discussion of the Italian war. It was announced last weekend that, in view of the urgent need for men in the armed Forces, the Government has decided that deferments granted for men in certain occupations, who were born in or after 1915, 1910 and 1905, must be brought to an end. This prosaic announcement, the latest of a multitude of similar instructions since the old-style schedule of reserved occupations was first instituted and then transformed, came as a bombshell to many. To

some, it seems a hint of some sudden and dramatic change in manpower policy—perhaps following on the decisions of the Quebec Conference. In recent weeks, the relation between recruitment and strategic needs appeared to have been made more clear-cut than before. The Army, it was gathered from official statements, had reached practically full strength; and, industrially, the process of its equipment (the colossal task that was restarted after Dunkirk) was completed, leaving only a demand upon industry for maintenance, replacement, and the supersession of certain specialised weapons by new ones. Men called up were to go in to the Navy, the Air Force, or industry, especially coal-mining; and the structure of war production, it was learnt, was being radically transformed by the transfer of workers and plant from work for the Ministry of Supply to work for the Ministry of Aircraft Production. The main tasks left, it seemed, were to fill the Navy, and to build up the bombing strength of the RAF to a mountainous and decisive level. The registration of women over 46 years of age was part of this air policy; the aim was to release more labour for aircraft factories. The newly announced registration of all women who have experience of work in the cotton industry leads in the same direction, since it is to manufacture aircraft components which contain cotton that these women, or those they replace within the cotton industry, are primarily needed. Then, abruptly, there came this new call-up of deferred men in munitions and other essential industries.

The precise import of this step is not known. It may simply be to speed up the filling of gaps in the Navy or the RAF. It may, since many of these men must, by virtue of their deferment at a comparatively early age, be skilled technicians, be to satisfy the outstanding need of all the Forces for craftsmen. But it cannot be to supply the war industries from which the men are being taken away, or to bring up the labour force of coal-mining. Almost certainly, it is a sign that the earlier view of manpower policy, suggested by all official statements, is no longer valid. The movement from industry into the Forces is reviving, because of the need which the biggest, and probably the most costly, battles of the war, in Europe and the Far East, will bring for reinforcements; and it can be set going again because so much of the industrial process of equipping the troops has already been accomplished. It is perhaps not easy for the layman, when so small a proportion of the great armies of Britain and the United States has yet been brought into action, to see where the need for more men, who have still to be trained, will arise; the operational strength of the Canadian army is to be reduced by 20,000; and manpower policy in the United States (which is discussed in a Note on page 397) has not yet reached the point of universal national service. But the bitter struggle on the beaches by Salerno gives an indication of what the character of the next phase of the war may be—and underlines the fact, forgotten perhaps in the exaltation of built-up strength and the first victories, that the phrase so common in politicians' perorations to the effect that "the hardest part of the war is still to come" is true as well as a truism.

The Second Front

"This is the news, and this is Sir Walter Citrine reading it." The announcement to the Trades Union Congress on Thursday of last week of the further Allied landings on the mainland of Europe, after the publication of Italy's surrender, was made by Sir Walter Citrine; and the fact that, not knowing himself whether the Second Front in France was or was not actually starting, he coupled the announcement with the news of "large-scale amphibious operations off Boulogne," provided the only untoward incident in the TUC's discussion of foreign policy. Both the *Daily Worker* and certain Soviet Press sources have since chosen, with conscious malice, to charge Sir Walter, in effect, with making a deliberately false statement to influence the decision of the conference on the demand, backed by the Russian delegates present, that the

trade union movement should press the Government to open an immediate Second Front. Both the charge and its implications—namely, that the conference refused to press the Government because it was briefly under the impression that invasion in the West had begun—were quite unfounded. It is perhaps surprising that Sir Walter Citrine, almost alone among those who knew of the amphibious operations, did not also know that they were merely an exercise, for security precautions about these manoeuvres were notably poor. But there is no doubt at all that the great majority of those present at the TUC meeting knew its own mind on this subject, regardless of rumour, and was prepared to accept without reservation the answer that Sir Walter Citrine gave to the Russians when he was in the Soviet Union—that is, that the British contribution to the war had been much bigger than the Russians gave credit for; and that it would be presumptuous and wrong for misinformed lay opinion to dictate the details of military strategy, especially when the lives of their comrades-in-arms might be put in jeopardy thereby.

Labour's View

The outstanding feature of the attitude of the Trades Union Congress last week to foreign policy, illustrated by its refusal to be hustled by the deep emotions of sincere sympathy aroused by its Russian comrades into doing more than ask for

an additional front of battle by further invasion of the European Continent . . . at every point where Allied forces can strike with good prospects of success

was its sobriety and realism. Oddly enough, too, it was much more settled and clear-sighted than that of the recent Labour Party conference. This was shown by the voting on what is called, perhaps loosely and imprecisely, Vansittartism. The Labour Party, faced with the choice between condemning all Germans or only the Nazis and war criminals, disputed heatedly, and finally adopted a strange resolution covering both points of view. The TUC, on the other hand, was in little or no doubt; it voted against Vansittartism and condemned only the Nazis; and it did not follow Mr Bevin quite all the way in his analysis of the plans of the German people to save enough from the Second World War to win the Third. Right or wrong, there is a balance about this view which does not compare badly, to say the least, with the hysterical note that is creeping into the denunciation by some newspapers of every conceivable act of "softness" towards men, women or children on the enemy side.

A National Health Service

The forthcoming annual representative meeting of the British Medical Association will be recommended to reaffirm the basic principles laid down in the BMA's report on a General Medical Service for the Nation, which was approved in 1938. These basic principles are: that the service should be directed to the achievement of positive health and the prevention of disease, as well as to the relief of sickness; that every individual should have available a general practitioner or family doctor of his own choice; and that consultants and specialists, and all necessary auxiliary services, together with institutional treatment, should be available to each individual. Speaking in Cardiff this week, the Minister of Health laid down the principles which the Government is determined to maintain in its proposals for a national health service. They are: the removal of limitations on the present service, so that consultant and specialist treatment, hospital and convalescent treatment, and so on, are available to all; that prevention as well as cure should be in the forefront; that the free choice of doctor and the personal relationship between doctor and patient should be preserved; that the doctor should be allowed clinical freedom in his treatment of a patient; and that the service should be based on the family, and that a family doctor for all should be provided. There is thus a striking similarity in principle between the Government and the medical profession. Where differences arise is in the means of achieving these principles. It is worth noting that both parties are at present keeping silent about ways and means. At the BMA meeting they will presumably come up; but the fact that the representatives will be asked to go back to the principles of 1938, and not to the means suggested in the Planning Com-

mission's report of 1942, suggests that the BMA is biding its time. Mr Ernest Brown, too, asks people to await the White Paper for the Government's view on ways and means of making the health services comprehensive. It is not likely that, when it appears, it will meet with the same general approval as the White Paper on Educational Reconstruction. But, with such a general agreement on principle, it would be a great pity if a scheme could not be hammered out which would be workable and acceptable to all.

Pay As You Go

An article on the reform of the income-tax in *The Economist* last week attempted to re-state the disadvantages of the present method of assessing and collecting income-tax, and it suggested how they might be overcome by levying income-tax at a flat rate—which would involve the payment of allowances in cash—and by introducing a "pay-as-you-earn" method of collection. "Pay-as-you-earn" methods of collection have recently been introduced both in Canada and in the United States. Colonel C. W. G. Gibson, Canadian Minister of National Revenue, described the success and popularity of "pay-as-you-go" in Canada at a Press Conference last Saturday. He admitted that certain difficulties had still to be overcome so far as deductions from overtime pay are concerned. But such complications as are involved in the change-over are small in comparison with the advantages of the scheme. The Chancellor of the Exchequer has already expressed himself in favour of the principle of "pay-as-you-go," but the Treasury view has tended hitherto to make Sir Kingsley Wood hypersensitive to the practical difficulties in the way of its application. Now, it seems, some at least of these difficulties have at last been solved by the Treasury pundits, for the Chancellor is expected to announce the introduction of some limited form of "pay-as-you-go" when Parliament reassembles. There is considerable apprehension lest the Treasury scheme turns out to be only a makeshift instalment of the radical rationalisation of the direct tax system that is required—to prevent a collapse when incomes fall after the war, to meet wage-earners' grievances now,

NEWS of WHITE HORSE

*This famous blend of Whisky was
never better than to-day*

It would be easier to buy White Horse Whisky as and when you like to-day if there were not so many people trying to do the same thing. Like so many of the comforts of peace-time, White Horse is scarcer because of the war.

It takes long years to bring this famous whisky to ripeness and maturity. It took forethought and a provident care to provide the present regulated supply. And the same care and forethought are your assurance that to-day and in the years to come the quality of White Horse will be guarded as jealously as ever.

More White Horse could not be released without broaching stocks still growing old and ripe for your future pleasure. And for no consideration will the good name of this great and famous blend be put in jeopardy.

and to make income-tax, in a new form, as flexible an instrument of public policy as, in greatly changing conditions, it was a hundred, thirty or four years ago. (Its future functions are discussed in an article on page 389.) At least, the proposed change, to be effective, should apply to all incomes, without any lack-logic about "forgiveness" of the mythical loss in tax on last year's earnings, when all that is involved is simply a change in the basis of this year's assessment; and it should be a permanent change.

Bulgarian Dilemma

The new Regency Council in Sofia has appointed Dobri Bozhilov as Prime Minister in place of Filov, who has become a member of the Regency. The most significant feature of the new Cabinet is the absence of the former Minister of the Interior, Gabrovski, the most consistent and outspoken adherent of the pro-German policy. The new Minister of the Interior, Docho Christov, has been described as a moderate, with pro-Allied leanings. The new Cabinet was probably settled under the influence of Italy's capitulation. It is doubtful whether the Regency is prepared to make any definite break with Germany—at this stage. Events in Italy will be very carefully watched in Sofia, and the advantages and disadvantages of defection from Germany will be considered in the light of their development. For the time being, the Bulgarians may think the disadvantages still tip the scale. Germany is pouring in fresh forces into Bulgaria, ready to defend the Third Reich on the soil and at the expense of its Bulgarian ally. The threat is held out with a sop; Albania is reported to have been offered by the Germans to Bulgaria, as well as new slices of Macedonia and northern Greece. There is clearly much more reality in the threat than in the sop. Another issue which will not add to pro-German feeling in Bulgaria is the position of the House of Savoy, to which the Bulgarian Queen-Mother belongs. Hitler has now made the destruction of the House of Savoy his avowed purpose. An anti-dynastic coup in Sofia, staged by the Germans, may even be imminent, for the dismissal of Gabrovski will not be easily swallowed in Berlin.

Argentine Dilemma

The foreign policy of Argentina is reaching a deadlock, for the simple reason that its two strongest trends are in direct contradiction to each other. On the one hand, there is a strong isolationism, directed against the United States and against the predominance of any other Power on the South American continent. It finds expression in extreme forms of nationalist pride and in an exaggerated fear of being treated like a second-class state. This attitude has given Argentine foreign policy certain affinities with the international outlook of the Axis Powers. But the fact that the country has not in the past broken off relations with the Axis owes much more to the fear of American encroachments than to support for the Fascist Powers. The other dominant trend is directly contrary. True, it is not less nationalist, but it conceives its nationalism more intelligently. The moderates realise that, if Argentina is to maintain a leading position in South America, it cannot do so in isolation, especially now that American money and American supplies are helping to build up the military and economic power of Argentina's neighbours. Alone among the American states, Argentina was not present at the Food Conference at Hot Springs. Nor will the country be represented at this month's Washington Conference of all the other Latin American states to discuss post-war collaboration and reconstruction in the sphere of trade and finance. The Argentine Government has even had to sit by and hear President Vargas propose that Brazil should represent all South American interests at the Peace Conference. The two trends in policy are represented by two different groupings within the Ramirez Cabinet. On the one hand are the extremists: Dr Guinazu, who conducted Argentina's pro-Axis foreign policy before the coup d'état, is still represented in the Government in the person of his son, the head of the Information Service; the Chief of the General Staff, General von der Becke, is an extreme nationalist; so is the Mayor of Buenos Aires, General Pertine—he also has strong German sympathies. This group are behind all the authoritarian measures taken in recent weeks, and they have fought consistently the moderate trend in foreign policy for which Admiral Storni had been trying to secure acceptance. It was he, for

example, who sent a delegate to the Inter-American Committee for the Political Defence of the Continent, which sits at Montevideo, and it was he who caused the wireless messages to and from the Axis embassies in Buenos Aires to be prohibited. As a moderate, Admiral Storni had the support of President Ramirez and the Finance Minister, Señor Santamarina; but, unhappily, Mr Cordell Hull's terse refusal of Admiral Storni's request for Lend-Lease aid has led to his resignation and to the weakening of the moderate group. The country as a whole is for the breaking off of relations with the Axis, but by its authoritarian measures at home the Ramirez Government is losing touch with public opinion; and it is hard to see how the issue of foreign policy can be cleared up without a fresh political explosion at home.

Post-War Youth

One of the most sensible statements ever made on the so-called youth problem can be found in the report issued by the Board of Education on the youth service after the war (6d. net). The report has been prepared by the Youth Advisory Council appointed by the President of the Board of Education last year. For once, youth is not looked upon as a strange phenomenon which must be treated almost as a disease. The Council, in fact, comes very near to saying that there is no such thing as youth.

Growth is a continuous process, and while it may sometimes be necessary for a special purpose to focus attention on a particular stage of growth, it is misleading and dangerous to split up into artificial divisions what is really an organic whole. Only by thinking of a boy or girl as a whole person, with a past and a future as well as an adolescent present, have we been able to see our subject in proper perspective.

Consequently, the report deals with the youth question against a background of homes, schools and work-places. Build decent homes, provide education, full-time and part-time, until the age of 18, and supervise the type and condition of employment—these are its main recommendations for helping young people to

grow up to be individuals physically, mentally and spiritually capable of playing their full part as adult members of the kind of society we wish to see. . . .

Further, there is a wholesome recognition that young people are not all alike. There are in fact wider differences of temperament and interest in young people between the ages of 14 and 18 than in younger children or in older men and women.

Thus, in the youth service, which, even if the basic recommendations of better housing, education and employment are carried out, will still be necessary, different tastes and interests must be catered for. The cinema is not frowned upon, provided it is not visited to excess; nor is dancing. The whole emphasis of the report is on the desirability of giving young people, through the youth service, the opportunity of spending their leisure as they want, provided their wants are not harmful or pernicious. There is no question of treating the 14-18 age group as a homogeneous body or as an everlasting pimple on the body of the state.

We do not want to see young people segregated . . . from the community as a whole.

Nor should there, in the Council's view, be any question of compelling young people to join youth organisations. Work is work and leisure is leisure, and the whole definition of the latter is that in it a man—or boy—is pursuing his own, freely chosen, occupations.

Local Government Franchise

The report of the Vivian Committee on Electoral Machinery contained the implied recommendation that the local government franchise should be assimilated to the Parliamentary franchise. This is now under consideration by the local authority organisations, and it is reported that the Labour party is in favour of it, though the Conservatives have not yet expressed an official party opinion. Administratively, the establishment of a single register for central and local government elections would be a great improvement. Psychologically, it might do much to raise the status of local government elections in the eyes of the public. At present, whereas the qualification for a vote at Parliamentary elections is, with a few exceptions, the age of 21, to exercise the local government franchise a person must, generally speaking, be a ratepayer or the husband, or

wife, of one. This excludes all other members of the ratepayer's household, whatever their age or qualifications to vote, and means that about 25 per cent of the persons who vote for Members of Parliament are excluded from voting for members of their local council. It also means that members of local authorities are far more dependent than they should be on the goodwill of ratepayers whose natural interest it is to try to keep the rates as low as possible. Reforms have, as a result, frequently to be dropped because the ratepayers will not stand them. Now that scheme after scheme of reconstruction is being loaded on to the shoulders of the local authorities, it is essential that they should not be held back by consideration for their ratepayers' goodwill. It would, of course, be undesirable for the local government franchise to be flooded by voters who have no financial stake in local government policy—no representation without taxation should be generally accepted to ensure a feeling of responsibility on the part of the electorate. But until local authority finance can be severed from its present basis, which links each item of policy and reform so closely with a penny or more on the rates, there is a great deal to be said for introducing a less vitally interested body of people into the local government franchise.

Campaign Against the Uthwatt Report

The Uthwatt Report on Compensation and Betterment (Cmd. 6386) was published a year ago. Its recommendations provided a basis for legislation designed to remove the obstacles in the way of the orderly development and re-development of land. Distinguishing between non-built-up and built-up areas, the Committee suggested that the state should purchase the development rights on the former and introduce a levy on the increment in the value of the latter due to development. In other words, the scheme was designed to secure some of the benefits of nationalisation without the large-scale and complicated process of the outright state purchase of all the land. Opposition to the introduction of the scheme has been growing steadily. Last April, for example, it was described at the annual meeting of the Land Union as destructive of the rights of property and of freedom of enterprise. Encouraged by the indecision of the Government, Mr David W. Smith, general manager of the Halifax Building Society, advocated the *coup de grâce* by a final and concerted onslaught. In an address to the Halifax and District Property Owners' Association on Thursday of last week he is reported to have said

I have no hesitation in stating that, in my opinion, the first essential to the successful solution of post-war housing is dependent almost entirely on the rejection of the development rights recommendation contained in the Uthwatt report. For these reasons I advocate that the building societies should lose no time in linking up with every interest that feels itself threatened by the Uthwatt report and oppose tooth and nail this concealed measure of nationalisation.

The growing campaign against the Uthwatt Report, and the hesitancy of the Government, suggests that the Uthwatt scheme, which was called for and drafted as "a matter of urgency," has now little chance of being adopted. Inevitably, the discussions must turn back to the more radical and more thorough alternative which the Uthwatt Committee set aside—nationalisation or, more precisely, the progressive vesting in the community of property rights in land, as and when the need for the effective planning of land-use requires it.

Shorter Notes

The election of General Chiang Kai-shek to the Presidency of China will make no difference to the political structure of the Chinese state. It merely symbolises what has long been a fact, that the single control of China lies with the National Party, the Kuomintang, through its leader, the Generalissimo. Behind this façade of unity, there are of course very divergent forces at work. A certain number of Chinese, particularly among the merchant classes, have long been war weary. Among the Chinese thoroughly loyal to the continuance of the war, there are strong divergences about the structure and future of the Chinese state. General Chiang's Government has always to hold a rather uneasy balance between reactionary groups on the one hand, who would like to see the perpetuation of the present party dictatorship, and, on the other, the Communists, who have at no time during the war completely abstained from build-

ing up their own power, and attempting to weaken the control of the National Government.

Persia has declared war on Germany, and adhered to the Declaration of the United Nations. This is a very fitting close to the story of Persia's relations with the Allies in the course of this war, which began in August, 1941, with the occupation of Persian territory by the Russians in the north and the British in the south. Persia's entry into the war does not solve its pressing economic difficulties. Persia has suffered more than any other Middle Eastern nation from food shortages, a result in part of a lack of co-ordination between the policy pursued by Russia in the northern grain-bearing districts, and the British and Americans in the south, who were compelled to make good the deficit of the north by shipping in supplies at a time when shipping space was very short; and, in part, too, to a definite lack of vigour in the Persian Government's attitude towards hoarding, and also a certain lack of Allied vigour in its relations with the Persian Government.

Salamaua, the key Japanese base in New Guinea, has been captured. The final phases of the fighting, during which General MacArthur made use of parachute troops, suggest that the Allies are mastering the technique of jungle fighting and developing their own more effective versions.

Penicillin, the production of which has already begun in the United States, where twelve plants are in operation, is now to be produced in Canada, at first mainly for use by the Canadian armed forces. The drug, which is a British discovery, is an important development in chemotherapy. Its properties in the killing of bacteria are such that it will probably put the sulphonamides' noses quite out of joint.

By a printer's error the following sentence was permitted to appear on page 334 of the issue of September 4th: "they [the Russians] will have prepared the ground for their third and most *pretentious* winter offensive." The word "*pretentious*" should, of course, have been "*portentious*."

RACE . . .

for post-war business

The post-war business will move "on ball bearings." Drawers and filing cabinets will open and close at a touch. Desks, cupboards and shelving will be fire-resisting, clean, and practically everlasting. STEEL supplies the answer to all problems of post-war office and factory furniture and equipment, and even now the designers and craftsmen of the great Sankey-Sheldon organisation are at work. New designs with unexpected refinements and devices will be available in the Sankey-Sheldon post-war range of steel furniture and equipment.

THE WORLD OVERSEAS

The Canadian Parties

(From Our Ottawa Correspondent)

August 9th

THE Co-operative Commonwealth Federation originated as a political party in Canada in 1932 at a meeting of farmer-labour politicians in Calgary. It inherits an agrarian and progressive tradition in Canadian politics. It has been regarded as mainly a western political party. But it is now established as a major force in national affairs, since its candidates won 34 out of 90 seats in the Ontario legislature.

Third-party elements have appeared in Canadian politics before, but the two-party system has survived in the main through the ability of established parties to adapt themselves to change. Earlier and temporary third parties in Canada have arisen as demonstrations of protests. They have been symptoms of unrest and upheaval, harbingers of change in the direction of Canadian affairs. The Liberal party of Mr Mackenzie King continued the tradition of Sir Wilfrid Laurier, the creator of Dominion autonomy in the British Commonwealth. But it also absorbed much of the Progressive movement of the early 1920's, by the simple expedient of moving left. The Progressive-Conservative party of John Bracken inherits the tradition of Sir John A. Macdonald and R. B. Bennett. But tradition is not enough, and the party is led away from the extreme rightist and imperialist position occupied by Bennett and associated in the Canadian mind with the depression of the 1930's. It must change or die.

The recent election in Ontario uncovered currents of political change that will affect the course of Canadian policy. It produced a stalemate, with the Conservatives, led by George Drew, falling half a dozen seats short of majority. The popular vote was divided fairly evenly among three parties:—

among three parties.		(Thousands of votes)		Gain or Loss
	1937	1943		
Conservatives	627	426	—	201
CCF	78	375	+	297
Liberals	798	359	—	439
Others	68	90		...

Apathy accounted for the disappearance of more than 300,000 votes, though Ontario has gained population from other provinces because of the concentration of war industries there, which is probably sufficient to offset absentees in uniform. As premier and leader of a minority government, Mr Drew will have the difficult task of steering a course that will commend itself to the real majority of Ontario opinion. Such circumstances may produce good government, as experience shows.

But Mr Drew's failure to win a handsome majority, at the moment of the collapse of the Liberal administration after nine years in office, has set back Conservative hopes in the Federal field. The Drew campaign contained many Federal implications. As Mr Bracken pointed out, it demonstrated Conservative ability to win rural ridings in Ontario.

George C. McCullagh, publisher of *The Globe and Mail*, a Toronto morning newspaper, played a remarkable rôle in the Drew campaign. He made two radio broadcasts, directing the attack mainly at the Federal Government, and singling out the racial issue. He quoted from *Le Devoir*, a Montreal daily newspaper, which had predicted the dominance of the French-Canadian race in Canada through its increasing birth-rate. This "revenge of the cradle" is the bogey of Laurentianism in Canadian politics. It was Conservative money from Toronto that supported the founding of *Le Devoir* in 1910, to oppose Liberal naval policy and undermine Mr Laurier's position in Quebec.

One Conservative advertisement, sponsored by a war veterans' organisation, claimed: "The CCF Would Get Rid of Churchill." There being no one in Ontario public life by that name, this was taken to refer to the Prime

Minister of Britain. The No. 1 plank in Mr Drew's platform called for maintenance of the British connection, and the Conservative slogan became: "Keep Ontario British." What danger, except the Axis, existed to British institutions in Ontario was not clear. No party in the election opposed either the British connection or British institutions, which are thoroughly and irrevocably established in Canada. The curious element of flag-waving in this feature of the campaign, which was by no means negligible, remain a mystery to outsiders. It has little relation to genuine political factors, except in one respect, the fear of encroachment by non-British racial stocks. The melting-pot of the new Canadian nationalism is changing Ontario, as it is other parts of Canada. The Ontario Conservative appeal to racialism contributed to its failure to gain a majority, and it will be a source of embarrassment to the party in the Federal field in a nation in which racial textures are truly mixed. Racialism is not the agency of British institutions in Canada, and it is probably their enemy.

Blow to the Government

The decline of the Liberal party was a serious blow to Mr Mackenzie King's Government. The tide is ebbing. Observers could apply Ontario results to Federal constituencies and begin to estimate the Government's casualties in the next Federal election, which is due not later than June, 1945. The instability of the Liberal administration could be gauged by the fact that it had had three premiers in less than a year—Hepburn, Conant and Nixon. The party has been reduced in Ontario to the rôle of a balance of power. Its fortunes had rested on the strange personality of Mitchell Hepburn, who forsook it to run and be re-elected as an Independent.

The CCF plainly became the vehicle of political unrest. It levelled its main criticisms at the Federal Government's policies of economic stabilisation, especially wage control. The party, not yet quite sure in its own mind whether it is outright Socialist or merely reformist, is now comfortably installed as the Opposition in three provinces—Saskatchewan and British Columbia as well as Ontario. "Now we must prepare," said Mr Coldwell, national leader of the CCF, "to win a clear majority in the House of Commons in Ottawa." He claimed that CCF votes in Ontario were votes against Federal war policies, mainly labour and wage restrictions. The CCF has become closely allied with trade unions, electing 19 trade union members in its group of 34. It harvested political discontent in industrial districts where there have been labour disputes. Three of its elected members were Canadian Congress of Labour organisers, including C. H. Millard, Canadian director of the Steel Workers of America. CCL unions are mainly affiliated with the CIO in the United States. The CCF success was the first major successful stand against the Federal anti-inflation programme.

The CCF promised to follow the model of the New Zealand Government, which led Conservative and Liberal papers and speakers to devote much criticism to New Zealand's record. A Liberal handbill entitled "Chaos in New Zealand" brought a rebuke just before the election from the Acting High Commissioner of New Zealand in Ottawa. One Liberal candidate promised to lock up his drug stores in Ottawa if the CCF programme were put into effect. Against the background of industrial transformation in Canada, the CCF assumes a new importance. It threatens to become the beneficiary of political reactions to war controls. It threatens to rob the Conservatives of their prospects of regaining the position of traditional alternative in Canadian politics. In Ontario, the CCF leader, Edward B. Jolliffe, a Rhodes scholar and lawyer, has become the new major personality in politics.

Mussolini's Hundred Days

AN article in *The Economist* last week described the various phases of the anti-Fascist revolution from the downfall of Mussolini to the conclusion of the armistice. The German occupation of northern and central Italy marks a new and dramatic turn. The Fascist counter-revolution has started with the help of German arms, and the reappearance of Mussolini is to symbolise the restoration of Fascism. Recent days have brought reports about strikes of transport workers in the north and the suppression of "Communist riots" (the German formula) in Milan, Turin and Genoa. The picture of July 25th has now been reversed in the towns of Italy. Black Shirts have reappeared, the symbols of the old regime have been reinstated, and Mussolini's opponents are being ruthlessly exterminated. The Duce's Hundred Days have begun.

Italian Fascism is being restored, temporarily, by the German army, and the civil war in Italy has been merged with the war between the United Nations and the Axis. Though the issue will be decided primarily by the force of arms, the array of political forces inside Italy will continue to play a very important rôle in the struggle. Events will show the balance of military forces between the Allies and the Third Reich; but the period that elapsed between Mussolini's downfall and his escape has already revealed the relation of the political forces which are arrayed against one another in the Italian civil war. The striking feature in the state of Italy under Badoglio was the apparent absence of Fascism. On July 25th Mussolini's regime collapsed like a house of cards; not a single noteworthy attempt was made to defend the system that claimed to have inaugurated a new millennium of Roman conquest and glory. The first wave of the revolution was far too strong to allow the leaders of Fascism to raise their heads; the once powerful prefects of the police accepted Badoglio's reshuffles and dismissals without demur; the militia meekly accepted its incorporation into the Army; the newspapers changed their Fascist staffs for liberal ones overnight. Everywhere the change was apparently made smoothly, almost without friction or pain. This, at least, was the scene on the surface.

In truth, however, the cadres of Fascism could hardly have reconciled themselves so complaisantly to the new position. The great and inert mass, which once applauded Mussolini and his victories, might indeed have swung to the other side. The minor officials and essentially non-political subalterns of Fascism might hastily burn their black shirts and try to serve new masters. But the pretorian guards of the regime, the big and small party leaders, the militiamen, and so on, were too well known and too compromised even to attempt to change their spots. They had a vital vested interest in the maintenance of Fascism; and, fortunately for them, during the six weeks between Mussolini's dismissal and the armistice, the anti-Fascist revolution left the Italian countryside almost untouched. Up to the armistice the revolution still seemed to be almost exclusively the concern of the towns. The Italian peasantry has no reason at all to defend Fascism, and Mussolini cannot count on any loyalty or devotion from the peasants; but though not loyal to Fascism, the countryside has remained politically helpless—and a refuge for Fascists.

A Month in the Country

What is happening in the Italian countryside? This question often crops up in the Italian press [wrote a Swedish correspondent a few days ago]. It is known that the Fascist authorities, even in places near Rome, ignored July 25th, suppressed all demonstrations at the fall of Mussolini, and continued to govern as before. The peasants had got used to these authorities in twenty-two years. They heard about the fall of Fascism in the towns, but they had not the initiative to settle affairs with the local Fascist leaders.

Politically, the countryside lagged—a familiar feature in all similar upheavals. Lack of initiative springs from the natural inertia of peasants. In Italy it also sprang from the fact that, under Fascism, underground opposition could more easily develop in towns than in villages where the movements of every inhabitant were more closely watched and controlled.

There can be little doubt that the pretorians of Italian Fascism were quick to exploit this major weakness of the anti-Fascist revolution. Fascist offices and organisations in the villages seem to have provided shelter for political refugees from the towns; and the countryside became the rallying ground for the survivors of Fascism. At first, nothing was publicly heard about them. But already in August,

Wartime Experience in Propaganda that will help to rebuild Britain's Export Trade

BEFORE 1939, the use of up-to-date methods of advertising and market research was almost exclusively confined to the manufacturers and exporters of the British Empire and the United States.

It can no longer be expected that this situation will reappear after the war. The word "propaganda" is now firmly entrenched in the world's vocabulary, and few business men will have failed to understand its translation into the language of the peace. Similarly "research," though less clearly understood, is now widely recognized as forming an integral element in the post-war revival of trade.

Nevertheless, under the stimulus of war, the English-speaking nations have, if anything, increased their leadership in these fields. The new techniques of propaganda that began to appear in the early '30's have developed into an indispensable weapon of war and international relations; and the new methods of research into public opinion and public behaviour have played no inconsiderable part in the direction of affairs on the home front. It is interesting to note, for example, how field research into the needs and habits of different sections of the community has helped to solve rationing problems.

Post-War Export Problems

When peace returns, British manufacturers who fail to make use of these same techniques and methods in recreating their overseas markets will find themselves at a distinct disadvantage.

Although present conditions prevent a full consideration of the many problems with which the rebuilding of Britain's export trade is beset, it is generally agreed to be in the national interest to initiate now whatever planning can be undertaken without detriment to the war effort.

To business men already thinking along these lines, the J. Walter Thompson Company Limited is particularly well-equipped to render assistance.

International Facilities

Both before and during the war the Company has helped in the development of the new propaganda techniques and market research methods, on behalf of the Government as well as commercial interests. Furthermore, it enjoys the advantage of an international organization whose facilities enable it to provide an intelligent and realistic interpretation of overseas marketing conditions.

Naturally, at the present time, the Company's offices in Occupied Europe are closed, but operations are still being maintained in Great Britain, the United States, and South America, as well as in India and all the Dominions, with the exception of New Zealand.

Despite inevitable reductions in staff, the offices still functioning are in a position to undertake research and planning on a limited scale. The Company will be pleased to exchange views on the post-war export problem with any responsible concern, irrespective of any prospect of business relationship.

during the critical period of the tension between the Badoglio Government and the Labour movement, some signs of their activity became apparent. There was talk about the formation of a Neo-Fascist party, followed by an official, somewhat half-hearted, denial. The strike movement in the north undoubtedly frightened some sections of the upper class, and it may well be that some sort of a neo-Fascism was contemplated to counterbalance the Labour movement. Before the German intervention, the revival of Fascism could be no more than a vague threat; but the advance of the German panzers on Italian soil was the signal of Fascist revenge. The militiamen, whom Badoglio had incorporated in the Army instead of disarming and disbanding them, now stepped forward. True, they are discredited and compromised; and they cannot hope to stir a new mass movement around them. But they can and do play their part as the army of the civil war, which has a vested interest in maintaining "order" behind the German lines. In the course of his Hundred Days Mussolini can no longer play the part of the Duce; but, as in the days of the march on Rome, he may again be able, as chief of the Black Shirts, to drown in blood the forces of Italian democracy.

The actions of Italian democrats under the Badoglio regime were described in some detail last week. Their struggle—full of ardour and sacrifices—for freedom and for peace with the Allied nations has not been in vain. For the time being, under the German occupation, they have been forced back into the underground. But before their voices were silenced by the combined violence of Nazism and Fascism, their last appeal was a call to the Italian people to prepare for the fight against the "new enemy." The appeal was issued—after the announcement of the armistice—by the "Front of Liberty," the political bloc which comprised the Group of Liberal Reconstruction, the Christian Democratic party, the Democratic Labour party, the Party of Action, the Italian Socialist Party of Proletarian Unity, and the Italian Communist party. Its last call expressed the will of the Italian people to recover their honour from the shame into which Fascism—and Nazism—dragged it in the past, and are now trying to drag it again.

Four Years of Neutrality

[FROM OUR DUBLIN CORRESPONDENT]

August 23rd

It may not be without interest to attempt a brief survey of the condition of Eire at the end of the fourth year of war. Although the country has succeeded in maintaining its neutrality, it has not been able to avoid the effects of a conflict involving all its neighbours. Indeed, Eire has been, so to speak, completely surrounded by belligerency, and it is rather surprising that it has escaped the direct consequences of the war to the extent that it has done. The prophecies made before war broke out have been largely proved false. On the one hand, the soaring agricultural prices which characterised the first world war have not been repeated, while, on the other hand, gloomy forecasts of starvation and bankruptcy have, luckily, been very far from correct.

One unquestionably favourable feature is the lack of physical destruction caused by bombing. The damage inflicted by the few bombs that did fall is negligible, and, at least (provided our neutrality is respected to the end of the war), we shall be spared the cost of replacing a vast volume of destroyed buildings. Another favourable feature is that the supply of food has been, generally, well maintained. There have, of course, been shortages of imported foods, and even many home-produced commodities have been in short supply, but there has been no shortage of food as a whole. The compulsory tillage policy has increased the output of wheat and beet. Meat has been abundant. Butter, eggs, potatoes and vegetables have been comparatively plentiful.

The favourable balance of payments that has developed during the war must also be reckoned as a benefit. This would not be admitted by everybody in Eire, where much criticism has been directed against the exchange of tangible exports for "worthless paper." This, of course, begs the question. All the available evidence suggests that the value of sterling will be maintained at a reasonable level, and, if this conclusion is correct, the sterling balances now accumulating will greatly assist in procuring the large imports of capital goods and raw materials that will be needed when peace returns. It is realised that many of the war controls will continue for a while, even when hostilities cease, but, as soon as supplies of imports are again to be had, the

possession of the means to pay for them will not be despised. Finally, the public finances have withstood the strain of the war. In spite of the increased expenditure on defence and emergency social services, nine-tenths of Government expenditure has been met by current revenue, which has proved unexpectedly buoyant. Such borrowing as has been necessary has been effected internally and at very low rates of interest. The yield on Irish Government securities is practically identical with that on British securities of similar maturity.

Adverse Features

Among the adverse features of Irish economic life must be reckoned the reduction in the numbers of livestock caused by the shortage of feeding stuffs. Moreover, the fertility of the soil has not been maintained owing to the shortage of natural and artificial fertilisers. To some extent, the country has had to live on its agricultural capital. But the replacement of the livestock and the restoration of fertility should be rapidly achieved after the war; no permanent damage has been done. Another unfavourable feature is the acute shortage of fuel. The decrease in imports of coal has almost paralysed the railways, has reduced the supply of gas and electricity and has led to many difficulties in domestic heating. Great efforts have been made to provide substitutes. Timber is being felled on a large scale, and the production of turf has been vigorously pushed forward, but it would be idle to deny that coal is still greatly missed. The shortage of petrol, paraffin and other oils has also been the cause of much inconvenience. Raw materials of many industries have been hard to obtain, but substitutes have been discovered in some cases.

Regarded from the long-term aspect, the emigration to Great Britain should be regarded with disfavour, although it has helped to solve many immediate problems by reducing the volume of unemployment. In the long run, the emigration represents a draw on Irish resources. It is unquestionably wasteful to provide supplies of labour which adds to the national income of countries other than that which has incurred the expense of rearing and educating it. It is true that much of the war emigration, unlike the emigration to the United States in the nineteenth century, is only tem-

Vitamins in chocolate for liberated Europe

The British Government, having examined all the ways in which sufficient vitamins could be provided to the under-nourished children of liberated Europe, have arrived at the conclusion—as Rowntrees did in 1938—that chocolate offers one of the best vehicles for carrying added vitamins. In chocolate, the vitamins retain practically all their potency.

Before the war, Rowntrees, alone among British cocoa and chocolate manufacturers, pioneered the addition of vitamins to cocoa and chocolate. Their object was to enhance the protective value of these already highly nutritious foods.

Today, when the Allied Governments are faced with the enormous problem of rehabilitating each occupied territory as it is freed, Rowntree's experience of fortifying cocoa and chocolate with vitamins on a large scale is proving of great value. When the war is won, this experience will again be used for the benefit of the British public.

ROWNTREES

porary. Nevertheless, the return of the emigrants after the war will give rise to many problems. Not only will they expect to be provided with employment, but they will have become accustomed to British standards of wages and social services—they will be "Beveridge-minded." Meanwhile, the remittances which they send to their relatives, while helping the immediate recipients, aggravate the inflationary tendency which is undoubtedly developing. The cost of living index number has risen by 59 per cent since the outbreak of war, compared with 28 per cent in Great Britain. The cost of clothing has risen by 87 per cent and of fuel by 86 per cent. Heroic efforts have been made to stabilise wages, and subsidies have been provided on bread and turf. The upward pressure of prices is, however, very strong. To a large extent, it is caused by increased prices of essential imports, which are, by their very nature, outside the control of the Irish Government.

At the end of the fourth year of the war, Eire appears to be stronger financially than economically. The problem that will have to be rapidly and energetically tackled after the war will be the utilisation of the country's financial strength to increase production and expand the national income.

Letter to the Editor

The Place of Parliament

TO THE EDITOR OF THE ECONOMIST.

SIR,—In your fascinating issue of September 4th there is one allegation which I venture to call in question. It is that in which you suggest that the direct power of Parliament is to-day much less than it was.

I cannot pretend to any personal knowledge of the Parliaments of the nineteenth century, though, to judge from the account given by Low in his "Governance of England," written, I think, at the beginning of the twentieth century, private M.P.s had not had for some time past much direct influence. But of the last twenty years I can speak from inside information. I venture to assert that the present House of Commons, elected in 1935, has exercised more power than any of its immediate predecessors, except perhaps for the two brief periods of minority Labour Governments.

This is particularly true since the formation of the War Coalition, but, even before that, the House had secured the resignation of Sir Samuel Hoare over the Abyssinian question; had induced the Government to create supplementary old age pensions; had insisted on Mr Chamberlain honouring promptly the pledge to Poland; and, as you yourself mention, had overthrown the Government and made Mr Churchill Prime Minister.

Since May, 1940, the House of Commons has been supreme, and the Government has interpreted its wishes. This is hidden from the outside public, partly because the newspapers have very little space to report the debates, but still more because M.P.s prefer to exert their pressure otherwise than in the division lobby, or even in criticism in the Chamber.

I need only mention a few of the admitted achievements of the House of Commons. On several occasions it has induced Mr Churchill to make important changes in the personnel of his Government. It pressed the necessity for national war damage insurance, and, after the Bill was introduced, substantially changed its provisions. It brought about the virtual abolition of the Household Means Test. It has destroyed the Government's fuel rationing proposals. It has procured, in successive stages, immense modifications in the Purchase Tax. It forced on a reluctant Cabinet equal compensation for women for war injury. It has insisted on substantial ameliorations in conditions, pay and pensions of the Services. While some of these have been the work of sections of M.P.s, most of them have been brought about by the House as a whole.

I could continue the list, but must not trespass unduly on your space. I will only add this observation, which you yourself negatively realise. The added power of Parliament to-day arises largely from the fact that as, by common agreement, there cannot be a general election while the war against Germany continues, M.P.s are not "committing suicide" when they oppose the Government.—Yours, &c.,

F. W. PETHICK-LAWRENCE.

House of Commons, September 11, 1943.

CORRECT LIGHTING is an extra hand

IF war-workers had three hands instead of two it would substantially help output. Obviously they cannot be given a third hand, but they can be provided with such perfect seeing conditions that two hands can almost do the work of three.

GOOD SEEING HELPS OUTPUT

It may be difficult to believe that correct lighting can actually assist production, but there is a substantial and indisputable array of evidence to show that correct lighting does in fact do so.

GOOD SEEING REDUCES ABSENTEEISM

Correct lighting prevents

premature fatigue and counteracts strain. Consequently it reduces absenteeism through minor ailments and is an important factor in eliminating accidents.

GOOD SEEING REDUCES WASTE

Correct lighting is a proven economy in other directions too. It reduces spoils during processing and exposes faults and flaws in "raw materials." Above all, it helps to overcome the handicap of poor sight imposed by advancing age. It is a fact that elderly workers need up to 50% more light than youngsters.

All who are interested in "BETTER SEEING" are invited to communicate with:—

M 3999

Germany at War

The Fifth Year

GERMANY enters the fifth year of the war without any hope of the fresh conquests which, for the first two-and-a-half years, were the foundation of an expanding war economy. The conquered, their material resources and their manpower enabled Germany to equip additional armies and sustain the civilian population with meagre but sufficient rations. From the winter of 1942-43 the area of conquests began to shrink with the result that Germany's war economy inevitably contracted. This contraction is very marked in contrast to the still expanding war economy of the British Empire and the United States of America.

Several times during the war new German armies have appeared at the front well equipped and well fed; and even now no reports suggest that the German armies lack the essential materials for continuing the war. But, in sharp contrast to this, there is the totally inadequate supply situation in the occupied countries and the disappearance of civilian goods in Germany itself. Step by step Germany took upon itself commitments which have proved beyond its material and productive resources. By the wholesale requisitioning of stocks and materials in captured countries the Economic Commands of the *Wehrmacht* destroyed the foundations for an effective European war economy. Political blunders led to the Balkan campaign and deprived Germany of Bulgaria, Yugoslavia and parts of Greece as undisturbed supply centres. Economic gains from the occupied Russian provinces have been small compared with the loss of material during the campaigns in Russia.

The different stages of Germany's war economy have shown, each in its turn, a shifting of bottlenecks and difficulties from one sector of the economy to the other. The early period of rigid concentration of industries was replaced by a policy of the dispersal of orders. After the captured countries had been denuded of their stocks of foodstuffs and raw materials, the policy of industrial collaboration followed, until the unsuccessful war against Russia enforced the most rigid concentration of industries and manpower inside Germany itself. Although Germany found in almost every captured country some willing collaborators, the totalitarian political regimes which these collaborators tried to organise were largely failures. Effective economic organisation on the model of the German war organisation could not be built up, partly because of the lack of effective totalitarian governments and partly because of the lack of modern administrations. Rationing and price control, centralised administration and the planned allocation of raw materials, machinery and orders, which are the cornerstones of war economy, are lacking or faulty in all the occupied countries, particularly in the Balkans.

It is true that German banks and industrial concerns control finance and industry in all the occupied countries. Coal, steel, oil and chemical concerns have reduced important industries in many occupied countries to mere subsidiaries. But the framework of a European totalitarian economy as the Nazis saw it still remained no more than a plan. With each penetration, German commitments grew; and the lack of imported raw materials and the necessity of turning industries over to substitute production enforced still more rigid planning and the use of still greater numbers of workers. At the beginning of the fifth year of the war, the deterioration of agriculture and industry in occupied countries has become so pronounced that this year's overall production in Western Europe will probably fall below 50 per cent of production during the last pre-war year. In contrast the cereal harvest in Balkan countries is reported to be good for the first time since 1939.

Against this background of contraction and growing weakness, the German armies are retreating in Russia. The delaying defence which has been carried out at many places during more than two months of heavy fighting can be explained by the desire to get as much of the harvest out of Russia as possible. Military necessity, which now requires, above all, the husbanding of manpower and material would have suggested a general retreat. But the little that has been produced in occupied Russia is priceless for Germany. Food supplies from Italy can no longer be expected, and the grain surpluses available in Balkan countries are no longer as readily sold to Germany as in 1939. In spite of

an average grain harvest in Germany itself, the food situation there will remain extremely strained because of the influx of millions of foreign war workers who must be supplied with a minimum of food.

This, then, is the situation that confronts the Nazi leaders. A general retreat in Russia will undoubtedly free some of their forces. But the situation in Italy, the Balkans and all the other occupied countries demands still more forces for more effective occupation and to meet landings by Allied troops. The nemesis of over-ambitious conquest is overtaking Germany.

Air-War Economy

The concentrated air attacks on German towns have affected, with varying degrees of destruction, roughly 50 per cent of all the German towns populated by more than 100,000 inhabitants. If German reports are taken at their face value, roughly 5,000,000 people have been, or are shortly to be, evacuated from these towns. In addition, there is a concentration of about 8,000,000 foreign workers and prisoners of war on German territory. This is, in absolute and relative terms, the greatest migration of people that Europe has ever experienced. At earlier stages in the war, millions of Poles, Jews and the so-called *Volksdeutschen* from South-Eastern and Eastern Europe were moved to new places or, as was the fate of Poles and Jews, simply exterminated. A very substantial part of the German and other peoples of Europe are without a permanent place of residence. Millions of workers, including Germans, live in camps. Villages and peasant houses in Southern Germany and in Western Poland, particularly the so-called Warthegau, are fearfully overcrowded. Two to four evacuated persons live in one room.

The economic problems created by this mass evacuation are only tentatively discussed in German papers, mostly in the form of exhortations addressed to shopkeepers to do all they can to supply the evacuees. The problems of sanitation, medical services and schooling must be as staggering as the migration itself. A new system of priorities for evacuees has been introduced, and this has made it necessary to suspend the selling of household goods and clothing to all other persons. This tremendous upheaval has not come upon Germany during the last months. The migratory movements date back to the first years of the totalitarian regime. They were accelerated at the beginning of the war and reached tremendous dimensions during 1942-43, especially under the impact of large-scale bombing. If the process had not already begun, the sudden increase during recent weeks would have paralysed the entire economy.

The welfare of individuals is, as a rule, of little concern to totalitarian regimes, in spite of the sentimental propaganda that comes from Germany. Centralised control makes it possible to move people with relative ease. As long as the *Wehrmacht* is fighting on the various fronts, and as long as the regime remains intact, the people can be moved. The main concern of the Nazi regime at the moment is to maintain war production and war transport. This is the reason why German papers speak of an "air war economy." The dispersal of factories is physically limited by the location of heavy industries and the capacity of the transport system. Both limits seem to have been reached, or will certainly be reached, during the autumn and winter.

Industries that cannot be moved must be repaired after bombing attacks. There are indications that a considerable part of the Labour Service and the building industry have been reorganised for the repair of industrial areas, particularly in the Ruhr-Rhine region. Minister Speer set up a "Ruhr-Staff" and appointed a new special commissar for the building industry. At the same time the "Organisation Todt-Regiment Speer" has been formed and is reported to have been moved into the Ruhr area. The Labour Service Corps, as well as the *Wehrmacht*, are also clearing the ruins of bombed towns. Germany has long since passed the peak of production, as well as of military strength. As long as the regime is able to maintain internal political stability, determined military defence will be continued, with the hope that some day general exhaustion or war weariness in all countries may create a situation favourable for a communist

THE BUSINESS WORLD

Brewery Shares

BREWERY shares, according to *The Actuaries' Index*, have risen in value on the average by 15 per cent in the last twelve months, against an increase of 24 per cent for all industrial stocks. They were, however, early starters in the wartime recovery race, and are still well ahead of the remainder of the field. If the comparison be thrown back, say, by fifteen years, brewery shares are now nearly 43 per cent higher than at the top of the boom in December, 1928, when the Actuaries' computations started. Only one other group of shares—electrical manufacturing—has shown a greater overall increase during that period, and the figure for all classes of industrials is still 21 per cent below the base level. *The Actuaries' Index*, compared with other measures of Stock Exchange values, is definitely conservative, and there have been intermediate changes in its constituents, including those of the brewery group. That, however, does not invalidate the conclusion that, in a market in which equity values on the whole have certainly shown no marked advance for a decade and a half (the present market level, like that of 1928, has been reached after a sustained cyclical advance), brewery shares have asserted and maintained an upward trend which has given long-term holders more substantial capital appreciation than almost any other group in the market. Since brewing is a consumption industry, and this is wartime, the latter trend calls for more than superficial explanation. When the further facts are added, first, that from 1928 to the outbreak of the present war the trend of beer consumption was downward rather than upward, and, secondly, that since the war began the beer duty has been raised from 80s. to 28s. 10½d. per standard barrel, and the retail price of beer has been increased by 6d. a pint—then the market achievement of representative brewery shares begins to approach almost the uncanny. What are the reasons for their extraordinary long-term buoyancy?

Clearly, the building up, at the present time, of a huge speculative position in brewery shares is not one of them. Breweries have always been a long-term investors' rather than a speculators' market. A comparison of yields now and fifteen years ago (4.34 per cent against 6.23 per cent) suggests that investors are valuing the shares on a lower income basis to-day, but not by much more than the intervening fall in interest rates generally would lead one to expect. The explanation of the brewery investors' favourable experience must be sought in conditions in the industry rather than the market. What those conditions were in the decade before the war is fairly clear. The industry was steadily increasing its internal efficiency, partly by a progressively closer grouping of productive units and increasing concentration of production in the larger firms, and partly by a consistent policy of modernisation of its properties (largely financed by ploughed-back profits) and improvement of its general "catering" services to customers. Up to 1939, in fact, the industry's experience was an object-lesson in the efficacy of an enterprising industrial and financial policy in overcoming moderately, though not unduly, adverse background factors.

Events since the war, however, obviously need a different explanation. The first factor which has helped the industry has been, not so much the inelasticity of demand as what might be called its "inverse elasticity." Beer consumption (in terms of gallons drunk by the public) has not merely failed to decline as successive increases in the Exchequer's toll have been passed on, but has actually risen substantially since the early months of the war. In the twelve months to June, 1940, total consumption was 25,533,000 bulk barrels. In the next twelve months it rose to 26,929,000 bulk barrels, and in the year to June, 1942, to 29,889,000 bulk barrels. The latest figures, to June, 1943, show a slight decline to 29,541,000 bulk barrels, but this was due entirely to a fall in consumption during the third and fourth quarters of last year. Since the beginning of 1943, the figures have been

running steadily above those for the corresponding quarters of 1942, and the six months' figures exceed those of January to June in the last pre-war year, 1939, by as much as 22 per cent. The conclusion is inescapable that full employment is markedly favourable to high beer consumption, particularly when activity is high in the heavy metal and engineering industries, and many competitive "satisfactions" are rationed while beer is not.

The industry, necessarily, has reduced the average specific gravity of its product as taxation has risen—a given number of standard barrels, that is, represent more bulk barrels than before the war. On the other hand, its costs have risen, and its labour position has become increasingly stringent. But its achievements by way of expenditure economies have been striking. Reduction in advertising expenses has been among the most important of them. Services to customers have been curtailed, though to a less extent than might have been

§ After taxation. || After War Damage Contribution in 1941 and 1942; none in 1943.

expected. A considerable saving, finally, has been achieved by voluntary pooling of deliveries (mainly to economise staff, rubber and petrol) which this year has passed over into zoning, at the instance of the Ministry of Food. Important, however, as the results of its own endeavours have been, the industry has undoubtedly owed a great deal to one crucial factor beyond its own control—namely, the favours it has received from the Government as a wartime "protected" industry. Early last year, a Parliamentary questioner was informed that it was not in the national interest to reduce beer production, and last December the Ministry of Food stated that there was no intention of concentrating the industry. The Ministry has ensured a sufficiency of brewers' raw materials, while the Ministry of Labour has tempered expediency with mercy in its demands for the withdrawal of personnel for the war services. How far the Chancellor of the Exchequer has been a friend in disguise, and how far considerations of national morale have weighed with the authorities is a matter investors may be left to decide for themselves.

What the resultant of all these conditions has been on wartime brewery earnings is a question whose answer, paradoxically, is clearer than the evidence in support of it. Even before the war standardisation of balance-sheet presentation was an ideal at which the industry did not aim. Since the war, the difficulty of obtaining anything like comparable profit figures between one brewery company and another has been intensified by differences of treatment of items like taxation, deferred repairs to properties, war damage and others. In the table on the preceding page, an endeavour has been made to obtain profit figures on as near a basis of comparability as possible, and, particularly, to give some idea of the trend before taxation, but the nature of the data itself has made the results far from perfect. The figures show averages for the three years to 1939, and the first three years of the war, with separate figures for the latest of those years (1942), and for 1943 where possible. When all allowances are made for the approximate nature of some of the figures, the trend remains perfectly clear. Brewery gross profits, with few exceptions, have increased since the war, and are increasing still. The industry's traditional prudence in distributing dividends, however, has been even more in evidence since the war than before; for ordinary dividends have either remained unchanged or been actually reduced, although a few distributions, cut early in the war, have been restored to pre-war levels.

Comparison of brewery share prices at their pre-war peak, in the depths of 1940, and at the present time, respectively, shows, broadly, that the faith of investors in the industry's staying power as a profit-earner has been amply reinstated after a very temporary eclipse, three years ago, owing to conditions mainly external to the industry itself. The most striking feature of the present yield position is the wide disparity—much wider than in the general run of industrial shares—between dividend yields and earnings yields. That in itself points to the probability that the industry will face the problems of transition from war to peace, in due course, with a strong and liquid financial position. In some respects

the industry's task will be less, and in others more formidable, than those of some other home trades. As a consumption industry whose market has not been contracted during the war, it will have fewer structural problems to cope with than most. And its product, being non-durable, will have no "arrears of demand" to upset its normal schedule and impart the "jerkiness" which will be, perhaps, the most worrying of all the demand problems of many other industries. On the other hand, its plant and buildings will have a heavy programme of deferred maintenance and replacement to catch up with. And the inevitable redistribution of population after the war will involve fairly severe transitional readjustments in an industry where production is still highly localised.

For the long-term investor in brewery shares, however, the trend of future British domestic industrial activity as a whole is what chiefly matters. Full employment at a fairly stable level would bring steady and satisfactory profits to the trade, and probably enable it fairly easily to carry a burden of taxation whose weight, probably, will not be materially lightened. But a sequence of boom and depression in industry generally might reinstate a downward consumption trend, through the tendency of demand to lose more during depression than it regained in subsequent recovery periods. For its own part, the industry will almost certainly be able to carry over into peacetime some of the economies effected under stress of war. And neither the scope for increased efficiency through closer organisation, nor the industry's willingness to secure it, is near being exhausted—as the amalgamation, within the last few weeks, of Courage and Hodgsons in the Greater London area and the absorption of Julia Hanson by Wolverhampton and Dudley Breweries in the Midlands aptly attest. Admittedly, at their present prices, the leading brewery shares are chiefly meat for the long-term investor. But that has been true of brewery shares generally for the last thirty years, and will remain true for as far ahead as investors can reasonably be expected to plan.

Business Notes

A World Capital Bank

Discussions are about to be resumed in Washington on the problem of post-war monetary reconstruction. A British delegation, headed by Lord Keynes, assisted by Professor Lionel Robbins, has now arrived in the United States to represent this country. The whole field of monetary reconstruction will come under review, with special emphasis on the latest amendment of the United States Treasury plans and on the mechanism for the control of international capital movements. Reports from Washington state that a memorandum has been prepared by the United States Treasury on the establishment of an international bank which is to make available long-term capital in certain cases. The memorandum argues that

private capital will not be able to meet all the demands of post-war reconstruction. It has suffered too many losses and has been too severely discouraged by depreciating currencies, exchange controls and Government defaults to justify the hope that private investors will lend large sums to foreign countries except possibly at rates of interest which would be extremely risky because of the burden they would put on the borrowing country.

It is therefore proposed to establish an international organisation which would be called the Bank for Reconstruction of the United Nations and Associates, to undertake the task of financing that part of post-war reconstructions which would not fall within the sphere of private finance. The US memorandum emphasises that, before undertaking any long-term loan project, the bank would have to be satisfied, first, that the funds it made available could not be borrowed from private investors except at prohibitive rates of interest; and, secondly, that the loan would serve to raise permanently the standard of living of the borrowing country. This Bank for Reconstruction is also expected to play a considerable role in the international scheme for stabilising primary commodity prices and for organising buffer pools in commodities, which was propounded by the British delegation before the Hot Springs Conference. It might provide some of the finance required for building up the reserve stocks of commodities,

but it would also make loans for increasing the world supply of essential raw materials and assuring member countries of an adequate supply of these materials at reasonable prices.

Through American Blinkers

Every report which arrives from the United States concerning private and corporate reactions to the post-war currency plans makes it increasingly clear that the task, not so much of welding the official British and American views, but of bringing American opinion into line with the any compromise between the two, will be very difficult. The latest of the considered commentaries on the two currency schemes is that of the Economic Policy Commission of the American Bankers' Association, set forth in a report which has been submitted to the annual convention of the Association which opened in New York this week. The report of this Commission, of which Mr W. Randolph Burgess is chairman, is inspired with the kind of monetary philosophy which inspired the Cunliffe Report at the end of the last war. It stresses, above all things, the need for "soundness" in domestic currency before any attempt at international stabilisation can be made. It argues that

no country can maintain a stable currency unless its internal economy is in order, its budget is under control, its price level reasonably stable, and its external payments and receipts well balanced.

It goes on to point out that, regardless of any monetary standards that may be adopted or international organisation that may be devised, the main steadying influence in any international monetary arrangement must be provided by a strong currency. The American bankers have no doubt what that currency will be; it is

a stable dollar, free of all exchange restrictions, a dollar in which the world has full confidence.

In order to achieve the soundness and stability of the dollar, the only measures propounded are measures of

essentially domestic character. The balancing of the budget is one of them. Others are the elimination of obstacles to initiative and enterprise and the provision of "opportunity and not philanthropy" to the men and women "who are ready to restore the normal ways of life." The main criticism of the Keynes plan made by the report is that it holds dangers of inflation for the United States because it would result in expansion of Federal Reserve credit and it would cause a large demand for American products. It is notable that, in all this commentary on exchange stabilisation, there is no single word about American tariffs, except insofar as this subject may be implied in the demand for a reasonable balance in all countries' external payments and receipts,—not, specifically about planned full employment which, more than anything else, would keep up American demand for the world's goods. The gist of the argument does not augur too well for active American banking collaboration in the tasks of financial reconstruction after the war.

* * *

Markets and the War

The aftermath of Italy's unconditional surrender has been almost as disappointing to the market and the investor as to the ordinary individual. The reaction to the first news was a considerable increase in the number of bargains and an even more marked expansion of enquiry. The trend of business reflected an attempt to carry further the discrimination against wartime equities and fixed interest stocks and to pick winners for the post-war recovery stakes. Owing to the previous marked rise in these sections, it was not easy to find really attractive investments, but there were, nevertheless, some really good price rises. The net effect was, however, no longer a general rise in quotations, but a further transfer of weight from one set of securities to another. Consequently, the equity index of *The Financial News*, which had just topped the year's peak touched in early August, on Friday, September 10th, showed no further rise. Almost immediately it began to be seen that, while the potentialities arising from an occupation of Italy were very great indeed, the surrender of Italy had not very substantially altered the immediate position. Logically, the investor ought to react only to developments that promise to shorten the war and not to be much affected by day-to-day news. Until recently, that has been, broadly, his general attitude. But, since the idea that the end might come very soon has got a renewed hold on the public mind, he is unduly sensitive to daily developments and, mainly, to events in the Mediterranean theatre, to the exclusion of the possibly more important progress in Russia. In consequence, the rather ill news of the middle of this week caused a modest reversal of price changes. There remain so many unknowns in the way of Government policy which will affect equities that a number of cautious investors who are taking profit on equities are putting the proceeds into medium short gilt-edged stocks. This tendency has been mentioned before. It has so far done no more than slow down the fall in fixed interest stocks and the rise in equities. It is doubtful whether it can become a general practice, if only because it pre-supposes that the new holdings will be saleable at a very modest loss, and this is not a reasonable assumption to make, even for a dated Government stock, if there is a general rush to sell.

* * *

Transport in War and Peace

It has been recognised, though not at the beginning of the war, that, however efficient each of the four different means of transport in Britain might be, when judged by their individual performances, transport as a whole might be inefficient, and that the solution was to regard and operate rail, road, coastal shipping and canal facilities as one single system with four branches. In other words, the pooling of all transport facilities and their use to the best advantage, irrespective of convention or financial considerations, came to be the object of domestic transport policy, which has been achieved successfully enough to avoid serious delays, in spite of the growing volume of traffic. The pooling of Britain's transport facilities involved, as a first step, a greater measure of central control over each of the four separate facilities. Government control over the railways was tightened in the summer of 1941 with the appointment of a Controller of Railways, who is also chairman of the Railway Executive Committee, and with the substitution of a fixed annual payment to the railway companies for the sliding-scale of the previous

agreement. In the same year Britain's canal system was brought under central control; the Ministry of War Transport set up a Central Canal Committee, to advise on questions of policy affecting inland waterways, and to co-ordinate the work of six regional canal committees. Coastwise shipping was brought under Government control during the first year of war with the requisitioning of coastal liners and the control over the movement of tramps. Central control over road transport was more difficult to achieve, mainly because the large number of independent units in the industry made it administratively the most difficult to fit into a centralised scheme of war transport. After many unsuccessful attempts, a new scheme was introduced towards the end of 1942, designed to bring the whole of the long-distance traffic—that is, traffic over distances of 60 miles and more—under direct Government control; that scheme is now in operation. In sum, the Government has largely succeeded in pooling Britain's transport resources. The advantages of pooling to the nation have been very great in time of war. Its potential financial advantages to the transport interests in peace have not been overlooked by them. Collaboration has become the motto; road hauliers are busy creating a central trade organisation and the railways are reported to keep ever on the look-out for new transport acquisitions. But in peace collaboration without Government oversight means monopoly.

* * *

Montreal—The London Plan

In the event, last week's meeting of the Montreal City Council had presented to it, not one but several plans, including that of the London Committee, and the meeting was adjourned until early next month to consider these and report. The London Plan was, however, published in Canada, and should by now be in the hands of those who lent their support to the Committee. Its main points follow closely the assumptions already made public here; full interest rates to be paid until contractual maturity dates—thereafter the rate to be 3½ per cent—arrangements for repayments over the current decade, coupled with the allocation of the relevant proportion to London agents for purchases in this country, arrangements for all loans to be finally redeemed by 1977. Further, the Committee of Creditors of the City is to appoint the Director of the Budget until the debt of the City falls to \$175 a head; and the Executive Committee is to seek a formula which will give the stockholders security against excessive borrowing. These points the London Committee insists upon, subject to minor adjustments. The alternative plans have not been published, but it is believed that they contain conditions essentially similar. The differences between them and the London Plan are not such as to cost Montreal much money. London aims at rather larger payments now and reduced ones later, and it resists the Canadian desire for a funding operation for the London issues, each of which already represents a considerable block of stock. The cost of the Canadian Plan is never more than \$13,800,000 in any one year. The surplus of the City in each of the two years ended April 30, 1942 and 1943 was some \$15 million, all of which was available for debt service. There would appear to be no reason why the London Plan should not be adopted, and the London Committee expressed the hope that matters would now proceed more rapidly.

POST OFFICE & TRUSTEE SAVINGS BANKS ISSUE

Issued by the National Savings Committee, London

Record Deposits

The growth in bank deposits made further headway last month, the Clearing Banks' figures, given on pages 414 and 415, showing an increase of £42,137,000 in this item, which carries the total to £3,670,008,000, a new record. The whole of this expansion is to be attributed to the banks' larger holdings of Treasury deposit receipts, this item having risen by no less than £57 million over the month. Consequently, there has been considerable contraction in other assets. The most significant of these is a fall of £11,127,000 in advances, while, in addition, bills discounted have fallen by £12,394,000 and short loans by £4,669,000. The fall in advances has probably been greater than that shown in the return because last month Martins Bank, for the first time since the 1920's, ceased to make a separate entry for "items in transit." The separation of this item had been recommended by the Cunliffe Committee in 1918, and two of the clearing banks adopted the suggestion. Lloyds Bank is now the sole clearing bank to show these figures in accordance with the Cunliffe proposal. Those items in transit, which in the main represented payments in course of clearance between branches of the bank, have, as a result of amended accountancy practice, been split up, part of the item going to cheques in course of collection, another part to advances to customers, while a further part disappears from the balance sheet altogether. This return to the pre-Cunliffe practice is to some extent a retrograde step, though it is still to be hoped that the clearing banks will find some way of achieving complete unanimity, not only in the presentation of their figures, but in the definition of the various items in their returns.

British Overseas Cottons, Ltd.

A controversy has arisen about the future of British Overseas Cottons, Limited, formed by the Board of Trade in August, 1940, at a time when foreign exchange was becoming very scarce, for the purpose of promoting the export of cotton textiles. In a memorandum issued last week, the Cotton and Rayon Merchants' Association stated that there was no political mandate for the existence of this organisation, and that it served no useful purpose that could not be performed by the industry itself. The association's policy is understood to have found support from the South American, Indian, Chinese, European and Dominions' sections of the Manchester Chamber of Commerce. The Master Spinners' Federation takes the opposite view; in a resolution passed by a large majority it suggested that, having regard to the uncertainty of trading conditions after the satisfaction of immediate post-war demands, it was desirable that BOC should continue. The agitation of the merchants is a symptom of the coming campaign for the removal of wartime controls. The future of BOC must be settled on its merits, not on the political level.

Mexico's Silver

The tangled story of silver dealings between Mexico and the United States becomes more and not less complicated as one explanation of its paradoxes follows another from Washington. The main fact in the case is that Mexico has considerably reduced its shipments of silver to the United States and threatens to stop them altogether. Testimony recently given before the US War Production Board suggests that, owing to curtailment of Mexican silver exports, the total imports of the United States will reach only 70 million ounces this year, compared with about 100 million ounces in 1942. Mexico has announced that this curtailment of exports has been made necessary by the increased demand for domestic coinage. Mexican silver is urgently needed by the United States for industrial purposes which involve the consumption of the metal in such a manner that it becomes non-recoverable; these demands cannot be satisfied by Treasury silver, which can only be used in industry provided it is in a recoverable form—for example, to replace copper in electrical wiring. Treasury silver could be made available on Lend-Lease terms to Mexico for the coinage requirements, which are now absorbing a substantial proportion of Mexico's output of newly mined metal. It would seem, therefore, that it was Washington, and not Mexico City, which took the initiative in proposing the curious transaction whereby Mexican coinage requirements would be satisfied from US Treasury silver, and American industrial needs by newly mined Mexican silver. Meanwhile, the demands for Treasury silver by American in-

dustry have reached such proportions that the War Production Board has suggested amendments to existing legislation, which would free for such purposes the silver now held as backing for silver certificates. The amount involved is about 1,000 million ounces, and it is proposed that it should be freed by amending the present legislation, which requires the Treasury to have "the ownership and possession" of such silver, into "the ownership and possession or control." Another and even simpler procedure would be the compulsory recall of the silver certificates and their replacement by Federal Reserve notes covered by gold—of which the United States has a surfeit for which no industrial uses can, unfortunately, be found. This simple solution may, however, not appeal to the silver senators, and that would be sufficient cause for choosing the more circuitous way round the obstacle which now prevents the use of this immobilised metal.

The Harvest

The corn harvest has practically all been gathered, and the general view is that it is well above the average. Farmers' labour difficulties this year have been greater than at any time since the war. Recruiting for the Women's Land Army has been suspended. The greatest blow has been that the harvest help given by the armed Forces has been smaller than in former years. Prisoners of war have filled the gap to some extent. There are now about 35,000 working on the land—probably twice the number available last year. The role of volunteers who have and are spending their holidays on the land has been of the utmost importance, and cannot be underestimated. Nevertheless, they did not come forward in sufficient numbers. Two important crops have still to be harvested; late potatoes and sugar beet. The potato crop is regarded as an "insurance" crop. In 1917, potatoes were probably the most potent factor in staving off starvation in this country. A bumper potato crop is still important. The domestic sugar ration depends upon the beet crop. Volunteers are wanted now and next month for these crops. Some counties—notably Northumberland, Northamptonshire, West Riding of Yorkshire, Monmouthshire and Hampshire—are in desperate need of labour, and the County War Agricultural Executive Committees are acting as clearing houses. The farmers have done their part, and others must help to bring in the fruits of their labour.

Women Ex-Cotton Operatives

The labour shortage in the cotton industry has been growing more acute for some time. When the industry was concentrated in 1941, much labour was lost, and the steadily rising demand for cotton has produced a situation where overtime working and the return of some thousands of workers to the mills has not been sufficient to reach the production targets set. The Ministry of Labour is now to register women aged 18 to 55 who have been employed in cotton for six months at any time since January 1, 1935. Each woman's case will be examined on its merits, and transfer back to the cotton industry will be made if her skill can be more usefully used there. At a later date it may become necessary to register men with experience in cotton. Women cotton workers are the fifth on the list of classes of persons who have been specially registered. The others are miners, shipbuilders, marine engineers and nurses. It is a reflection of the urgent need for their services in the production of cotton which is required for aircraft, tyres, parachutes, tarpaulins, uniforms and other war purposes, as well as for essential civilian needs.

Plastics

There can be no doubt that the materials generally known as plastics will play an important part in the production of many capital and consumers' goods. But the rate at which plastics are likely to displace other materials is often exaggerated. Sir Herbert E. Morgan, chairman of the British Homophone Company, has therefore rendered a public service when he said at the annual meeting of shareholders, on September 9th:

The past year has seen increased public interest in plastics, which many agree are destined to play an important part in the post-war world. But it cannot be too clearly emphasised

Splitting
the mighty atom

It is recognised now that coal is a means to an end—or rather to many ends. Not merely something to burn for its heat, but a source of numerous valuable substances that will be the basis of Britain's post-war prosperity.

The carbonising industries point the way to this modern treatment of coal. The process of gas-making splits up the coal into many different parts and extracts every ounce of value from it. Every 100 tons of coal used in the gas works produce 7,500 therms of gas, 50 tons of coke, 1,000 gallons of tar, 250 gallons of benzole, 2,500 lbs. of sulphate of ammonia and 300 lbs. of toluene. And the Gas Industry carbonises over 18 million tons of coal annually.

These valuable by-products of gas-making in turn yield over 2,000 chemical substances of tremendous value. Among them are explosives; drugs such as M & B 693, novocaine, acriflavine and aspirin; sulphuric acid for electric batteries; food flavourings; baking powder and saccharine; camouflage paints; agricultural fertilisers; aviation spirit; and the chemicals from which plastics are made for use in a hundred and one ways from the ubiquitous ashtray to the essential fittings of our fighter aeroplanes.

The Gas Industry in war, as in peace, plays an important part in the national economy.

BRITISH COMMERCIAL GAS ASSOCIATION . LONDON . S.W.1

INDUSTRY MUST MAKE EVEN GREATER FUEL ECONOMIES THIS YEAR

Management is asked to take the lead

A large proportion of the fuel consumed by Industry is used for heating factories. Therefore you are urgently requested to plan now to eliminate waste from the heating of your works. The need to save fuel is even greater this year. We must not expect that the coming winter will be as mild as that of 1942.

HERE IS ONE EXAMPLE OF WHAT
CAN BE DONE:

"Thermostatic control of factory heating has reduced my fuel consumption from 4.5 to 3.2 cwt. per piece manufactured" says the Head of a large Textile Company.

MAKE CERTAIN NOW

- * that the heating system in your factory is suitably controlled.
- * that you are not blowing steam to waste that could be used to heat your factory when the cold weather comes.
- * that any new buildings you are erecting are properly insulated.
- * that your fuel watchers know how to prevent heat losses through open doors and windows.
- * that the brickwork and lagging of your boiler plant are in good repair.

If you have not already received copies of the Bulletins on Thermostatic Control, on the Insulation of Buildings and on the Maintenance of Boiler Plant, write to the Secretary of your Regional Fuel Efficiency Committee for them.

The Ministry's Regional Offices are at:

GLASGOW, NEWCASTLE, MANCHESTER, LEEDS, BIRMINGHAM, NOTTINGHAM, CAMBRIDGE, CARDIFF, BRISTOL, READING and LONDON.

ISSUED BY THE MINISTRY OF FUEL AND POWER

that while the plastic industry has many new fields open to it, plastics will only replace the use of other materials and methods when it is the best medium for the purpose. There has been much imaginative publicising of the uses of plastics, but the practical utility of many of the suggestions put forward must be doubted. Publicity such as I refer to has already inspired speculation in the shares of plastic companies, and there are indications of many new ventures in that field. From my own knowledge of the industry I would suggest that some of these shares could easily reach a price which could bear no relation to the permanent earning capacity of the companies concerned.

Sir Herbert Morgan's warning is timely. He pointed out that Britain's plastic manufacturing resources have been "greatly added to" since 1939 for war purposes. At the end of the war the problem may not be one of immediate further expansion, but of finding outlets for existing productive capacity.

Stock Exchange Statistics

The report of the Committee for General Purposes of the Stock Exchange, London, for the year to March 24th last contains clear evidence of increased activity. There is no direct measure of the number of bargains done, but the total of marks received rose by over 45 per cent and transfers certified increased by some 35 per cent, while there was a material increase in the number of forms submitted to the Bank of England under certain heads. Against these, there was an offset in the reduction of vesting orders and the printing of the new "D" declarations on the back of transfers. Having in view the further reduction in trained staff, there can, however, be no doubt that pressure of work increased further in brokers' offices during the year, and it is probable that there was some reduction in the non-essential services rendered to clients, as well as a further slowing down in completion of business, including final transfer. The year produced a number of developments of importance, and, although there was some reduction in the number of sub-committee meetings held, these reached the large total of 350. During the year permission to deal was granted in almost £911 million nominal value of new securities, producing net some £837 million of new money, compared with £672 million and £591 million, respectively, in 1941-42. Over the same period the total nominal value of securities quoted in the official and supplementary list rose from £19,577 million to £20,731 million, and the market value of the securities increased from £18,695 million to £21,510 million. It must be remembered that the period covered ended more than five months ago, that is before much of the 1943 advance in quotations had occurred. A large part of both rises was due to the issue of £1,030 million of new Government securities. The total number of securities quoted continued to decline.

Accountancy Technique

The reform of company accounts has been urged unremittingly in *The Economist* for years past, and it has, recently, become apparent that no real progress is likely until there is some agreement among accountants about the objective they have in view in the compilations they make. It is, therefore, encouraging to find in the September issue of *Accountancy* a series of notes, contributed through the Incorporated Accountants Research Committee, dealing with the future of accountancy technique. The first of these, by Mr Bertram Nelson, ends with the following sentences, which put the position clearly:

Our familiar accounting technique can be used for new purposes—in business management, in price control, in the formation of economic policy, and in national finance. But we must do some thinking first. What are the fundamental principles on which we are working? By what research methods can these principles be explored? What practical steps should be taken now?

It is to be hoped that Mr Nelson or some of his collaborators on the Research Committee have the answers to these questions ready to produce. Unfortunately, other contributions suggest that no great progress has so far been made; but it is something to find a suggestion from Mr. E. C. Burrell for the creation of a master committee, culled from the councils of the various bodies representing the profession, to develop entirely new conceptions of accountancy technique, to consider procedure, design,

the treatment of depreciation and similar matters, with the object of securing widespread adoption of recommendations made. The same writer advocates machinery for detailed research by full-time personnel and by committees appointed by the professional bodies, working in consultation with district societies. Further, he suggests similar machinery working in co-operation with trade associations to evolve uniform systems of financial and cost accounting for particular trades and industries. These suggestions seem to be on the right lines, but there is need for expeditious treatment of the problems. Further, this particular writer makes no provision for consultation with the economic expert, who may have some useful contributions to make to the problem of what the objectives of the accountant should be.

Indo-China Assets

After a gap of two years, the London attorneys of the Indo-China Steam Navigation Company have decided to make available a statement of assets and liabilities, as at the end of last year, insofar as these can be ascertained. In reading these figures it must be remembered that no account has been taken of assets and liabilities in enemy occupied countries, while those in India have been estimated, no statement having come to hand. The position disclosed is compared with that at the end of 1939 and 1940, but the figures are not strictly comparable. In particular the fleet valuation in 1942 is subject to certain compensation payments still to be agreed, while the item special repairs and underwriting account for that year also includes some unascertained liabilities and other contingencies.

	Years ended December 31st,		
	1939	1940	1942
Net valuation of fleet†	940,000	949,000	376,552
Net liquid assets	Dr. 153,226	Dr. 17,034	1,083,382
Special repairs, etc., and underwriting a/c.	51,137	52,584	197,897
SURPLUS	735,637	905,450	1,262,037
Prof. capital and div. arrears	426,465	381,835	411,589
Net surplus per defd. share of £5	6.234	10.559	17.150
† Subject to mortgage to secure £150,000 Floating Staff Pensions.			

As the preferred ordinary shares of £5 now contain almost 12 years' arrears of 6 per cent dividend, they would seem to be worth about 136s., whereas their price is 126s. 3d. This suggests that the basic yield on this share of 6 per cent is considered insufficient. Meanwhile, the £5 deferred ordinary stand at 13½ after touching 16. Only those who believe that share quotations should be based on break-up value will consider this reasonable. In the absence of any indication of profits, it is far from certain that the whole of the arrears of preferred dividend will be paid off in the near future. The very sharp rise in liquid assets and the fact that gross assets are up by some £517,000 to over £1,665,000 on the two years to end 1942 suggest that funds may be available and that assets were grossly undervalued in the past.

Argentine Railway Mission

So far as can be ascertained, the decision of the British-owned Argentine railways to send a joint mission to discuss the position with the new Government of Argentina originated with the companies. It was preceded by an interchange of directors between the companies, so that it looks as though the process of tightening up the relations between them was being carried much further than seemed probable only a few years ago. This is in itself a step forward, although it is not clear that it is likely to have any marked effect on the outcome of the negotiations. What prospects are there that the new joint representatives will meet a more favourable reception from the present Government than did the repeated representations of the individual concerns from the old? The resistance to the railways' demands rested, in the past, in part on economic considerations and in part on those of a political nature. Developments in the war years have put Argentina in possession of increased quantities of foreign exchange, but mainly because it has been unable to import what it requires. Argentina will need after the war trade outlets and, possibly, long-term loans. It is already beginning

to find that there are inconveniences about its present state of virtual isolation; but it would be optimistic to suppose that, because it may feel compelled to associate with America, it will be kindly disposed towards British capital. There can be no doubt, however, that the statesmanlike approach to the problem lies along the lines of making a reasonable settlement with the railways. What is reasonable includes a decision about what part rail transport is to play in the future development of the country as well as a recognition of past services. It cannot be doubted that the future part should be large or that more capital will be needed. What Argentina should not be allowed to do with impunity is to bring the companies to the verge of bankruptcy and then to buy them up for a song, relying on being able to raise capital elsewhere for their development.

Italy and Quicksilver

Italy is one of the poorest industrial countries; its conquest by the Allies would involve the shipment of considerable quantities of a number of important commodities, such as coal, to meet urgent military and civilian needs. With the important exception of quicksilver, Italy's surplus commodities, which could be utilised by Allied war industries, are few in number, Italy is the world's largest producer of quicksilver. But the two important producing centres are both in the North of Italy; the one, the Monte-Amiata area, is in Southern Tuscany, and the other, the Idria district, is north of Trieste, near the Austrian frontier. In normal times the former district supplied two-thirds, and the latter the bulk of the remainder of Italy's output, which, owing to the restrictive policy of the Italo-Spanish mercury cartel, has fluctuated widely during the past decade. In 1935 it was little more than 28,000 flasks of 76 lbs., but it amounted to 67,154 flasks in 1939, and has been in excess of 70,000 flasks since the country's entry into the war. The loss of Italian supplies was inconvenient to the United Nations, but difficulties have been largely overcome by the steep rise since 1940 in the production of the United States and Mexico, and by the development of mercury deposits in Canada. To-day the United Nations together probably produce more quicksilver than Italy; moreover, as Spain, in normal times the second largest producing country, has not been entirely cut off, the Allied supply position is now much better than it appeared possible three years ago. But as quicksilver is used in very large quantities for a number of vital war purposes, such as anti-fouling marine paint for both war and merchant ships, scientific instruments, electrical equipment and pharmaceutical products, any additional supplies would be welcome.

Allied Meat Purchases

Early this year the Combined Food Board adopted a meat-pooling plan (discussed on page 277 of *The Economist* of February 27, 1943), by which the British Ministry of Food became the sole buyer of meat and meat products for the United Nations in Argentina and the smaller South American meat exporting countries. As it had done before in the case of tea, the Board thus utilised the efficient trading organisation set up by the Ministry of Food earlier in the war to secure supplies for the United Kingdom. Meanwhile, meat shipments from Argentina have been proceeding normally, and allocations to the members of the United Nations have been made regularly by the Combined Food Board. So far, however, the various Allied Governments did not know what they would eventually have to pay for their meat. This uncertainty has now been removed. On August 21st the Ministry of Food announced that it has completed its buying agreements, on behalf of the Combined Food Board, with the representatives of Argentina. The agreement refers to "the exportable surplus of Argentine meat for the two years ending September 30, 1944." The official announcement adds that during the past season shipments have been proceeding in anticipation of the settlement of terms. It does not give these terms, but Smithfield traders believe that there have been certain price increases, although the bulk of these increases appears to represent higher costs. The contract placed is estimated to exceed 1,500,000 tons of meat, the largest quantity ever bought in any area of the world under a single contract. The new agreement includes fresh meat, as well as frozen, canned and dried meats. It is expected that this huge order will have a stimulating effect on Argentine live-stock breeding over the next few years. Such a development is important not only from the viewpoint of Allied war supplies, but also

from that of Europe's post-war supplies. Last year an inter-Allied committee of livestock experts prepared a study, which stated that in view of the forced slaughters by the Nazis, it will take five to six years to restore the livestock herds of Europe to their pre-war level. In the meantime Europe will need more imported meat than ever before, and this meat can only come from South America. When, in February last, the Combined Food Board announced its meat pooling plan it stated that the Ministry of Food's purchases would be spread over Argentina, Brazil, Paraguay and Uruguay. It is understood that agreement with the smaller South American meat exporting countries has now been reached on a basis similar to that with Argentina.

Farm Book-keeping

In the keeping of accounts small farmers have lagged behind other industries and trades. It may be partly due to this that farmers have been notorious grumblers; because they had no figures of profits it was difficult for them to know whether they had made any. In order to help the small farmer to begin and maintain records of his business, which he now requires in the preparation of his income tax returns, the Ministry of Agriculture, in collaboration with the Department of Inland Revenue, has issued a booklet (*Farm Book-keeping*, HM Stationery Office, 3d. net), which deals with farm book-keeping in the most simple and detailed terms. In the introduction, it points out that the keeping of records helps the farmer to manage his farm efficiently, and shows him how the various operations compare in outlay and in receipts. Correct income tax assessments can only be made on the basis of accurate book-keeping. The day-to-day work of book-keeping can be done by the farmer in the course of the ordinary transactions on the farm, using a minimum number of books. If accurate accounts had been kept, farming costs would have been known, and it might have been possible to fix farm prices at a lower level, granting subsidies, where desirable, to high-cost farmers.

Australian Wool Clips

The production of wool in Australia and New Zealand has been maintained during the 1942-43 season. Here are the figures of output and value for the last two seasons, as given by Messrs Dalgely and Company, Ltd.:—

	1941-42		1942-43	
	Output* (Million lbs.)	Value† (£'s)	Output* (Million lbs.)	Value† (£'s)
Australia	1,108	63.1	1,120	74.1
New Zealand	336	18.2	331	19.9
Total	1,444	81.3	1,451	94.0

* Estimated output. † Based on Appraisements.

The value of the two clips in 1942-43 approaches £100 million, due to the upward adjustment of prices. Owing to shipping difficulties, much of the wool—it is not known how much—has had to be stored in the producing countries. But these stocks constitute a valuable reserve for replenishing shrunken wardrobes after the war.

Correction

In a Note entitled "Four Years of War" on page 342 of *The Economist* on September 4th, Government expenditure was analysed in three tables. By an unfortunate printers' error, the first and third tables were headed "£ millions" instead of "£ thousands."

COMPANY MEETINGS

THE BURMAH OIL COMPANY, LIMITED

OUTLOOK FOR THE PROPERTIES

MR. ROBERT I. WATSON'S STATEMENT

The forty-first annual general meeting of the members of the Burmah Oil Company, Limited, was held on the 10th instant, in the Merchants' Hall, 30, George Square, Glasgow.

Mr Robert I. Watson, chairman and managing director, presided.

The following statement by the chairman was circulated with the directors' report and accounts:—

To Sir John Cargill in his retirement you will wish me to send our best wishes for his speedy return to better health, together with our grateful thanks for the fine and long service he has given us. Any reminder of his achievements during his 38 years' occupancy of the chair since he succeeded his father only two years after the company's incorporation in 1902 would really be an act of supererogation; and no tribute could enhance the record of these permanently enshrined in the fine balance-sheets he has himself consistently submitted year after year throughout this long period. From them one can trace how, under his leadership, the company's Burma production steadily and soundly expanded, each step in development being thoroughly consolidated before taking the next, from a volume barely sufficient to meet the small domestic demand of Burma to one supported by an intensive distributing organisation serving the larger part of the requirements of India itself.

Keeping in the van of every scientific and technical advance in the practices of searching for, drilling, producing, transporting, refining and marketing petroleum, and ploughing back surplus revenues into these activities in Burma and India, and into associated activities elsewhere, the company has not only played an outstanding part in the development of the petroleum deposits of Burma and India but has contributed not a little to the development of those greater ones of the Middle East, and, by these and other means, has secured an interest in production and markets world-wide in range.

The deeply regretted death of Mr H. S. Ashton has deprived us of a good friend on whose varied business experience we have been able to draw freely and with much advantage over many years.

THE PROPERTIES

After referring to the complete "denial" to the enemy of the properties in Burma, the chairman in his statement last year continued:—

"While our Burma subsidiary companies naturally look for restoration of their assets lost under 'Denial,' one cannot say when this may be or the conditions to which they will return. It is imperative, therefore, that we should all understand that, even assuming the best priority in respect of manufacture and shipment of the plant and equipment necessary (and we are closely engaged on the study of all this now), rehabilitation to pre-Denial stature, if that is found practicable at all, can only be gradual and may extend over a considerable time. The unhappy fact must therefore be faced that, savings in depreciation, wages, and in other ways notwithstanding and even allowing for the fact that over the next two years, and masking the stabilised position which will later be realised, there should be something coming to them from closing off and bringing into their trading returns unsold stocks held by them outside Burma together with taxation and/or other balances, trading profits will be confined to what oil products purchased for the steeply rationed outlet available to them in India may yield and must thus inevitably show a heavy decline on past experience which will continue until rehabilitation is possible and is gradually

completed to its maximum economic potential."

THE ACCOUNTS

Into the accounts for 1942 now before you the stocks and unclosed balances then referred to have been so effectively swept that figures for 1943 to which it was felt they might extend will no longer continue to mask the fact that the subsidiary companies engaged in production pipe line operating and refining in Burma are presently out of business and that the Burma Trading Subsidiary and the India Trading Subsidiary are meantime reduced to such profits as can be made on purchased oils and these cannot be expected to approach those secured from our own production.

While, therefore, with these 1942 accounts we have been able to close a chapter in a manner well in the character of their 40 predecessors, I must again emphasise that, until the fruits of our enterprise in Burma presently denied us through no fault of our own are once more being enjoyed, trading profits will show a steep decline from the level to which we have been accustomed and it would be too much to expect that interest and dividends from our investments can expand to make good the difference and too early to hazard any guess as to what may ultimately be freed to us as no longer required out of the taxation on profits fully provided for up to and including 1942.

PROPERTIES REPLACEMENT CLAIMS

While in various ways the book value of our Burma losses was reserved against last year, this purely "book-keeping" operation was entirely unrelated either to cost of replacement or to any liability on us for such cost. Despite, then, the claim that we have for replacement cost on the authorities instructing the destruction of these properties, the validity of which would seem as unquestionable as it has been unquestioned, it would have been not merely contrary to our own traditions in finance but, in the circumstances of today, unsound had the board not retained in the company's treasury at least that portion of the profits which has been allocated to general reserve.

While these very substantial amounts placed last year, and again now to general reserve have in no way prejudiced stockholders, they have automatically reduced what employees would have received through the provident and profit sharing funds had the excess of these allocations over normal been distributed in dividend. For, subject to certain prescribed conditions, member-employees receive credits in these funds calculated on their salaries at the rate of the ordinary stock dividend, and thus in this period employees, who have deserved particularly well not only of the company but, for the part they played in "Denial," also of the Allied cause, have been deprived of the degree of participation in profits they might ordinarily have been justified in expecting. In the circumstances, your board have felt it would be stockholders' desire to correct this and have set aside out of the 1942 figures a sum calculated to make up, as far as possible, by way of a bonus, what these employees would have got through these funds had these abnormal allocations not been made to general reserve but been declared as dividends.

THE DIVIDEND

The second interim dividend of 10 per cent., less tax, declared on July 29th, is being paid on September 3rd, and the board's recommendation is that this be

the final, making 12½ per cent., less tax, for the year. The residue balance to be carried forward at £335,034 represents an increase of £83,114 on the amount carried forward in 1941.

For the moment Burma remains in enemy hands. But nothing seen or heard by us suggests that "denial" of its petroleum resources and of equipment for its production and handling was other than of the effective order claimed at the time. It would be quite unfair to the men who so ruthlessly and at great personal risk carried it out, and besides would be quite erroneous to conclude that Allied bombings since reported reflect in any way on the thoroughness with which the job was done.

WAR SERVICE OF STAFF

It is with great regret that I have to report the addition of a further seven fatal casualties from acts of war to the six intimated last year among our employees. These were again men of U.K. origin, but with one exception, normally serving with us in the East. Four more of this category have been reported prisoners of war. Of some 9,800 Indians in our employment in Burma 7,200 had been contacted in India at the end of June, but, unhappily, 72 of these had died since reaching India, and reported deaths of a further 185 were then still being investigated. It is hoped that we may yet have reassuring news both of some of these and of most of the 2,600 uncontacted at that date. Practically all our Burmese employees having remained in Burma, we have no news of their welfare.

Among further "mentions" and decorations given employees of the company since those reported last year there have been a civil C.B.E. to Mr Roper, our general manager in the East, a military C.B.E. to Colonel W. E. V. Abraham, and a civil O.B.E. to Mr Marr Grieve, our superintending engineer in the Burma Fields.

I feel you would wish me to place on record here our appreciation of the contributions by our own employees East and West, and sailing our tankers so gallantly on the seas, as well as by those of our associated company, Burmah-Shell, in the satisfactory trading results embodied in the accounts now being disposed of and so also to our good friends, the Anglo-Iranian Oil Company, Limited, and Shell Transport and Trading Company, Limited, for what they particularly have contributed to our investments.

THE OUTLOOK

While plans for our rehabilitation in due Burma, when we get back there in due course, are now well advanced on paper, stockholders can make as good a guess as I meantime as to when, and to what extent, their application will be possible or desirable. In the period of interregnum expectable in the period of interregnum expectable of dividends should be put no higher than the potentialities, as I have again felt it desirable to stress these, of the less fruitful sources from which alone they can come.

The report and accounts were unanimously adopted.

The second interim dividend of 10 per cent. (2s. per £1 unit) paid on September 3, 1943, was confirmed as the final dividend on the ordinary stock for the year 1942.

Sir William Fraser, C.B.E., and Colonel Hugh B. Spens, D.S.O., the directors retiring by rotation, were unanimously re-elected, and the auditors, Messrs Brown, Fleming and Murray, were reappointed for the current year.

Every year many hundreds of Companies publish Reports of their Annual General Meetings in *The Economist*, thereby reaching thousands of investors in the quiet of their own homes. In time of war the value of this practice is greatly enhanced because *The Economist* provides valuable information which is not otherwise available to investors, who therefore read it more carefully than ever. Full particulars of the charges for inserting these reports may be obtained on application to The Reporting Manager, *The Economist*, to Brettenham House, Lancaster Place, W.C.2.

TELEPHONE RENTALS, LIMITED

RESTRICTIONS ON ESSENTIAL ACTIVITIES

MR FRED JACKSON'S VIEWS

The fourteenth annual general meeting of Telephone Rentals, Limited, was held on the 13th instant, in London.

Mr Fred T. Jackson (chairman and joint managing director) presided, and in the course of his speech said: From the profit and loss account it will be seen that the dividends from the subsidiary operating companies amount to £136,600 compared with £133,820 for the similar period last year. This gives a slight increase of some £2,780, and whilst on this subject I am happy to tell you that all British subsidiary companies have traded at a profit during their respective financial years.

The net result of our trading operations is that we have a profit of £137,756, which compares with £134,085 for the preceding year, showing an increase of £3,671. The total of the credit which we have for disposal is £171,436. Of this sum national taxation absorbs £92,793, which is a slight increase over that of the preceding year, and we have transferred to our general reserve account the sum of £5,000, which compares with a provision last year of £10,000.

We have already distributed an interim dividend of 4 per cent., less income-tax, and it is proposed to pay a final dividend of 6 per cent., which dividends together absorb the sum of £40,832, leaving to be carried forward to the ensuing year the sum of £32,811, which shows a slight reduction of some £869 as compared with that brought in from the previous year.

LICENCE REGULATIONS

The year under review, 1942, would, I think, have been a record year, except that we have great difficulties as it is now necessary for any firm requiring one of our telephone installations to obtain a licence from the Board of Trade. On this point I shall have a great deal to say later on, but according to our experience up to date, very few licences are being granted; it therefore follows that the new business in

telematic installations will be small compared with the business we have done in past years.

This will not affect your company adversely for some years, as we shall still be able to earn profits comparable with the results for the year under review. This is capable of a simple explanation; with the falling off in new business there is naturally a corresponding reduction in overhead expenses, and we have dispensed with the services of our salesmen.

It is interesting to recall the remarks I made at our last annual general meeting to the effect that our telematic and chromomatic services were a very important contribution to the national effort, and that in the times through which we were passing the combination of speed and elimination of waste in production is so vital. It is, in fact, an axiom that if you can save time you can save man-power, which, according to my experience in the manufacturing industry, is scarcer even than raw material.

BUREAUCRATIC CONTROL CRITICISED

I now come back to my earlier remarks on the Board of Trade licence and I preface this with the statement that no ignorance is so complete as the ignorance flowing from a Civil Service which refuses to learn. Unless we realise our shortcomings we cannot learn or progress. I have here an extraordinary story to tell, and I tell it because I feel that the time has arrived when someone should voice opposition to the ignorance and bureaucratic control which is imposed on our business by the Board of Trade.

When the Board of Trade Order was put into force for the licensing of internal telephone installations, I, with my colleague, Mr Philcox, had interviews with the particular director for this section, and pointed out to him the necessity for having quick methods of communication in factories and other business organisations, which was more important than ever in these days when man and woman power are so scarce. I placed before the Board of Trade hundreds of letters, all from leading firms in this country, stating that it was impossible for them to carry on their business efficiently without the aid of our service. This was testimony from

existing subscribers. From all the effort it had, I can only come to the conclusion that the director concerned did not take it trouble to read the letters as they were returned to us without any comment.

I then suggested to the Board of Trade as they still did not appear to recognise the importance of this business in view of the shortage of manpower, that they should at any time come down to our head office and select, entirely on their own account a list of names of our subscribers for their representative to visit in order to obtain the opinion of such subscribers as to the value of our installations. The reply to this suggestion was that they might avail themselves of the offer. This was more than four months ago. Nothing has been done.

CONTRIBUTION TO WAR EFFORT

I would emphasise that my objection to the attitude of the Board of Trade is not influenced at all by the desire to increase our business, but solely because we consider that in continuing to instal installations for firm engaged on 100 per cent. war work we are making a valuable contribution to the war effort. As a matter of fact, long before the Board of Trade licensing system was instituted we refused to carry out installations for firms who could not satisfy us that they were engaged primarily on war work, as we fully realised the importance of the conservation of all raw materials and labour; but as a matter of interest the equipment purchased by your company from a firm of large telephone manufacturers during the year before the present licensing arrangements were introduced represented .08 per cent. of their annual output.

I suggest that as every shareholder will get a copy of this address he or she should send it to their local M.P. This will ensure some action being taken to alleviate the shortage of manpower in this national emergency. We are able to prove that the statements made are correct. They are made in the interest of the war effort, and not to make increased profits. A practical demonstration can be given in a large factory in London to any group of M.P.s sufficiently interested to take this matter up.

The report and accounts were adopted.

By Order of the Board,

C. L. MANNING, Secretary

Crosby Square, Bishopsgate, London, E.C.3.
13th September, 1943.

A large and influential organisation, controlling a number of production units at home and overseas, is seeking an outstanding business man to become a senior executive, leading to managing directorship. The man sought must have held position of heavy responsibility, and used to earning big money. While a knowledge of engineering is of value it is of minor importance compared to the ability to win and hold co-operation from the staff. He should have had practical and successful experience in up-to-date large-scale industrial administration of its widest conception. All applications will go direct to the Chairman of the organisation and strictest confidence will be maintained.—Write Box 189, THE ECONOMIST, Brettenham House, Lancaster Place, London, W.C.2.

The Chancellor of the Exchequer

SELDOM, if ever, has the death of a Minister of the Crown come so suddenly and so unexpectedly as that of Sir Kingsley Wood, who died on Tuesday of heart failure. His death follows swiftly the death of Mr Reginald McKenna; and there could be no better tribute to the sagacity of the late Chancellor of the Exchequer than the fact that, before their deaths, he had all but caught up his senior by his official acceptance of the true heterodoxies of public finance. Starting at the Exchequer in 1940, from the premise of "sound" and conventional budgeting, Sir Kingsley Wood was the Chancellor in office when this country crossed into the land of promise where the nation's real resources, and not its money, become the basis of public economics. His adviser was Lord Keynes himself, the *fidus Achates* of Mr McKenna in an earlier generation and another war—and, it must be admitted, in a less adventurous fashion of economic reasoning.

Sir Kingsley Wood was a good Conservative in every sense; but he was no Bourbon. In political allegiance and foreign policy, as well as in matters of finance, he was ready to learn. It is a mere three weeks since, hale and urbane as ever to those who saw and heard him, he told the guests at *The Economist's* centenary luncheon that he was always thankful for "faithful and salutary guidance." A solicitor skilled in the law of social administration, he came to the Exchequer after a long, industrious and varied political apprenticeship; Parlia-

mentary Secretary, successively, to the Ministry of Health and the Board of Education in Conservative Ministries between 1919 and 1931; Postmaster-General from 1931 to 1935; Minister of Health from 1935 to 1938; Secretary of State for Air until 1940, when the foundations were laid for the Battle of Britain; and then Chancellor under Mr Churchill. He was not quick to see the contrast between the nation's power to produce and the formal tallies of £ s d required by old-style budgets; he could not shake himself entirely free from the faults of under-estimation and narrow monetary reckoning that for so long impeded the total mobilisation of the nation for war. But he listened with his native shrewdness to broader and more farsighted counsel. Of his Budget in April, 1941, *The Economist* said: "For the first time, a Chancellor has quite deliberately thrust the book-keeping aspects of his task—the summation of revenue and expenditure—into a corner of his speech, and devoted himself to a survey of the financial problem of the war economy as a whole." It was "the first real War Budget"; and the annual White Paper on the sources of war finance and the size and distribution of the national income, which made its first appearance then, is a lasting tribute to the political sense of Sir Kingsley Wood as well as to the genius of his advisers. The pay-as-you-earn plan for wage earners' income tax (described on page 422) is a posthumous proof of how open he was to conviction.

This is no time to speak more than briefly of his likely successor. Yet, gaps in the ranks in wartime must be speedily filled. To be Chancellor of the Exchequer in a wartime coalition does not carry with it, as it has done in peacetime, the reversion to the highest post at the Treasury, First Lord and Prime Minister; but peace is not indefinitely distant. Mr Eden is next in line; but he cannot easily put down his critical responsibility for the future of world affairs. What the qualities should be of a modern-style Chancellor has not yet been decided. Is he to remain, ostensibly, a mere Government book-keeper, or is he to be recognised as chief auditor of the community's business? If search is made among Ministers of first rank, and if the Chancellorship is to be raised again to the highest Cabinet status, with surveillance over the National Economy instead of simply the National Exchequer, the choice might reasonably be the Home Secretary, who has stated the right approach to present-day economic policy in many well-timed and well-drafted speeches. If a temporary politician is eligible, the Minister of Production will be considered closely, despite the failure of his Ministry to fulfil all its first promise of drive and direction in war manufacture. The Lord President of the Council probably carries too much weight in the wings to become a leading player.

If the choice is confined to politicians of the late Chancellor's own party, as it may be, a new Richmond may be brought into the political field. The queue of junior candidates for third place in the Conservative hierarchy, after Mr Eden, is lengthy—Mr Hudson, Mr Butler and Mr W. S. Morrison, all three of them favoured lately by the political pundits; Colonel Stanley, who is climbing up again in his party, and Captain Crookshank, whose claim is possibly the clearest cut of all; Mr Assheton, who is a first-rate Financial Secretary to the Treasury, and, at the Prime Minister's own right hand, Mr Bracken; and, junior still in spirit, Mr Amery. None certainly, of either these or the bigger names, could better Sir Kingsley Wood in the qualities Bagehot praised in Sir George Cornwall Lewis when he wrote:

Enterprise neither seemed to be nor was his forte, and bold men thought him rather tame. . . . He was a safe man, a fair man and an unselfish man. He had a faculty of "patient labour" which, as he himself remarked, was as sure to be appreciated when Englishmen meet together to transact business, as wit or eloquence; and, therefore, it was that he had great influence in the House of Commons; and, therefore it was that he rose rapidly.

Grasping the Nettle

WHEN Parliament reassembled this week, both the Prime Minister and Mr Eden gave a heartening account of the relations between Russia, America and Britain. The Prime Minister announced that a joint Anglo-Russian-American Commission had been established to survey Mediterranean problems, that Mr Eden would shortly head a delegation to a conference of the Foreign Secretaries of the Three Powers and that this conference would in its turn be preparatory to a meeting "before the end of the year" between Marshal Stalin, President Roosevelt and the Prime Minister.

This news is the more encouraging since it comes at a time of victory—the Russian victory on the Desna, the Anglo-American victory before Salerno. The survival of a victorious coalition into the strenuous days of peace is rare in history. Mr Churchill's good news gives reason to hope that this war may not see a disastrous repetition of the end of so many other wars—the disintegration almost on the battlefield itself of the effective power which made victory possible and could alone lay the secure foundations of the peace.

There is indeed no good reason why the coalition should disintegrate. As Mr Eden put it: "Our interests do not clash and all our interests are in peace." The search for prosperity is as great a bond. The Three Powers need each other's economic assistance. The horrifying scale of devastation in Russia is analysed on another page. The need there is obvious; but the need of the United States and the British Commonwealth, if less obvious, is no less real. Their industrial systems are geared to world prosperity, and anything that impairs the consuming power and economic vitality of other nations directly affects the prosperity of their own.

If this coincidence of political and economic interest—in peace and prosperity—can be made the cornerstone of postwar policy, then there is some hope of banishing war for at least as long a span as, say, the nineteenth century's peaceful years. The conditions would be similar. The peace of the nineteenth century was a peace based on the predominance of the British navy. Peace might be secured for the second half of the twentieth century if another effective and pacific instrument of power were to be made the core of international organisation. A tripartite agreement or alliance could provide such an instrument. Indeed only the co-operation of the three Great Powers can provide a stable basis for peace, for modern industrial technique has given them, together, an overwhelming predominance of world power.

Unhappily this preponderance of power which could be the best guarantee of peace is in itself a potential source of conflict. The real obstacle to British, American and Russian understanding is still fear, fear lest either side should use its military force to attack the other. Distrust breeds wars as well as ambition; and where, as is the case between Russia and the West, differences in ideology and all the misunderstanding bred of totally different historical traditions reinforce the more elemental fear felt by nations for any other powerful group, distrust becomes the major obstacle to a peaceful settlement. Mr Eden is alive to this. "There has been too much past history of misunderstanding," he told the Commons and agreed "that there can be no co-operation if it is not based on confidence." But he was right to remind them "that confidence cannot be created by one side alone" and that "if we are to understand one another, we must be frank with one another." Frankness demands that in the forthcoming conferences the highest priority should go to the matters which are likely to divide the nations most. The Foreign Secretaries and the Heads of State must go through a stiff course of nettle grasping in the next few months.

It is obvious that distrust must operate most freely in a no-man's-land. Where there are no roads and boundaries and neighbours' landmarks, any movement begins to look like an encroachment, and on each side of the debatable land the Great Powers perpetually peer through the darkness for a glimpse of advancing raiding parties. One of the first necessities in banishing fear is to put an end to no-man's-lands. These are, broadly speaking, the independent peripheries of Great States, the areas in which the pressure and counter-pressure of rival powers make themselves felt, the areas, therefore, in which all the great wars of history have had their origin. Before the last war, the Balkans, lying between Germany and Russia, were such a no-man's-land. Between the rise of Hitler and the outbreak of this war, Central Europe was the field of action and counteraction. With Germany defeated, and Britain, America and Russia in sole control of effective power, the new peripheries will lie between these three Powers, and the test of banishing fear, of securing, not an uneasy balance disintegrating into hostility, but a firm core of pacific power, will be the policy they adopt towards the areas lying between their separate sovereignties. Of all these areas, Europe presents the most difficult and most immediate problems.

Now it is true of Europe, as of all the other small

power groupings—South-East Asia, the Middle East, the Caribbean—that there are only two alternative possibilities of organisation. One is the method of the sphere of influence, which divides. The other is some type of regional organisation, which can unite. The first of these alternatives will prevail if the Great Powers fail to reach agreement. Each Power will attempt to build up an outer glacis of semi-dependent states—the question to which Germany would belong might well give the Germans a lever for restoring their nation speedily to effective strength—and, as always, what begins as a defensive glacis would end as an offensive springboard.

The Three Power Conference must therefore concentrate on the search for some kind of autonomous regional framework for Europe. Naturally, this does not mean the abolition of separate state sovereignty. No state is ready for such a sacrifice. It rather means the conscious pursuit of joint as opposed to separatist policies and the creation wherever possible of joint institutions to express those policies. Such an approach entails a very wide range of detailed decisions in the political and economic sphere. The first of the political problems is, Europe's frontiers. To the north, west and south they are fixed by the sea. Eastern Europe is the debatable ground. In the key position—that of Poland—there is no absolute juridical line which can be objectively established. What can be established is the principle of negotiated, not unilateral, change. If there are no concessions to generosity from the Russian side, or to realism from the Polish, the attempt at a peace settlement will fail at this, the first obstacle. The consequences for all the parties would be equally disastrous, and it is the special responsibility of British and American diplomacy to keep the perspective of the wider consequences of failure firmly before the disputants. The future frontiers of Germany demand another series of firm joint decisions, and behind these frontier problems lies another political puzzle which has much to do with the kind of settlement envisaged by the Allies. To what extent will a change of regime in the aggressor nations be taken to absolve them from the consequences of their crimes? Mr Churchill has spoken of "self-redemption" with regard to Italy, and has hinted that the satellite Powers may be permitted "to work their passage home." The formation of a German officers' union in Russia together with the existence of the German National Committee—both appealing to the Germans to help end Nazi tyranny—points to the same kind of problem. And this problem, again, is linked with the wider question of the types of government in Europe to which the three Powers will accord recognition. What exactly do the Russians mean by "the liquidation of fascism"? What do the State Department and the Foreign Office mean by it? The association of Russia with Amgot, in itself a highly desirable move, will lead to great confusion unless the presuppositions of its working are agreed on in advance.

At the political level, the three Great Powers should provide the framework of world-wide military security within which Europe and other national groupings can build up their regional institutions and interests. The economic structure is analogous. The aim of the Great Powers should be, by their investment policy, their currency plans, their encouragement of international trade, to provide a general framework of world prosperity—expanding markets and rising living standards. It is only natural that these plans should so far have been discussed between the United States and the British Commonwealth, for their Russian partner must in the immediate post-war period at least be a beneficiary rather than an active agent in the restoration and expansion of world living standards. Even so, the time has come to associate Russia with the talks which British and American Treasury officials are conducting in Washington.

At the regional level in Europe, the various agencies which will presumably be set up under the United Nations Relief and Rehabilitation Administration can become the growing points of such regional services as transport, public utilities, public health; the "scrambling" of European industry under the Nazis can be used to maintain a number of key points—certain heavy industries perhaps—under some form of internationally responsible control; finally, the investment policy of the Great Powers should be used wherever possible to initiate development projects—hydroelectric schemes, trunk roads, land reclamation—which cross national frontiers. On the degree of "mixing up" in Europe that can be achieved at the functional level depends the hope of taking the economic sting out of national frontiers, creating common interests for the new generation of scientists and technicians and administrators and, most important of all, of finding some way of allowing the defeated nations their chance of economic prosperity without thereby restoring their military hegemony.

The agenda for the discussions is long. It could hardly be otherwise. A peaceful co-operative world order cannot be built on a few chance coincidences of interest. It is a matter of hard thinking, hard bargaining and hard work. The two aspects of post-war policy—Great Power agreement and Small Power co-operation—interact at every level. If the power exercised by the Great Powers is politically tyrannical and economically imperialist, any hope vanishes of organising the areas between their sovereignty on peaceful lines. Yet if they do not agree on policy and put, all the weight of their power and influence behind their agreement, the smaller Powers cannot of themselves create order and prosperity. The Great Powers cannot escape the responsibility of leadership, because the only alternative is anarchy and, later, war.

The Last Lap

ACCORDING to the latest poll taken by the British Institute of Public Opinion, four out of every five persons in this country are satisfied with the Government's conduct of the war, the highest proportion yet recorded; and nine out of every ten support Mr Churchill. No Gallup was needed to show the remarkable degree of popular confidence in the Prime Minister and his administration in this period of victories. Yet, Mr Churchill has come back from America to face a four days' barrage of Parliamentary criticism. The impression derived from these proceedings might even be one of considerable dissension; the Prime Minister has been cross-examined on the pace and direction of Allied strategy and on the objectives of political warfare in Italy and Occupied Europe; Ministers have been heckled on manpower policy and the present labour unrest.

Neither the Prime Minister nor any citizen need, of course, have sleepless nights. It is Parliament's job to criticise and cross-question, to concentrate even now, not on the acknowledged achievements that have brought the nation so far along the road to victory, but on the things that ought not to be done and those that ought to be done. Mr Lloyd George said after the last war that the critics won it; and Mr Churchill, in his turn, has paid tribute to the refreshment given him this time by Parliamentary vigilance. Deeds done are by-gones; it is the problems still unsolved that matter.

The labour problems which were discussed for two days this week are an apt instance of the current mood. The headway made in war mobilisation has been remarkable and unprecedented, and it has been secured by consent and acceptance. Out of 15,900,000 males between 16 and 64 years of age, 15,200,000 are either in the Forces or in full-time gainful employment; the residue is only 700,000 and this includes schoolboys and the disabled. Out of 17,230,000 women between the same ages, 7,100,000 are in the Services or on full-time work; the balance of 10,130,000 includes 650,000 women in part-time employment, schoolgirls and the nation's full-time housewives, many of them doing voluntary work as well. Hours in industry have been very much lengthened, on the average by at least 10 per cent, but in many cases by much more. Mobilisation for war purposes has been made complete by a process of registration, conscription, direction, combing-out and transfer; and every man and woman at work is, by official definition, in essential employment. More than 8,000,000 workers are tied to their present jobs by Essential Work Orders; they cannot move except by official command. The majority of other workers cannot change their employment without official permission. All this has happened without serious opposition or protest in Parliament or elsewhere; and the spectacle of a people so completely in arms compares significantly with the position in the United States, where the principle of universal service has still to be applied by law and volunteering remains the mainspring of equipment outside the Services.

The complaints and criticisms voiced in Parliament this week are simply the measure of the tremendous effort already made. Conservative opposition to the call-up of women over 46 years of age springs from the opinion that no more housewives can be spared from the nation's essential home work. Labour opposition to the direction of youths and boys into underground work at the pits springs from the opinion that the ranks of the coal industry could and should have been filled by other means, and that it is unfair to place upon young men in colliery districts obligations not imposed upon others of their age elsewhere. The protests are not against mobilisation or the method of compulsion, but against the Government's priorities; it is not compulsion, but its particular purpose, that arouses resentment. It is accepted that all

workers are now in necessary employment; there are no reserves. The aim of policy now is to redistribute the national army, where necessary, according to the changing needs of output and strategy. What is questioned is whether the distribution sought by the Government is right one. This is the doubt behind the long-standing widespread demand that coalminers should be re-called from the Forces. It inspires the belief of many that the essential work of the home should not be further delayed. It causes the complaint that Civil Service departments, despite the activities of the Kennet Committee, are not more generously staffed than equally essential work of other kinds; harassed local authorities and business firms, bereft of key employees, feel this strongly.

The background of the present questioning is thus a double suspicion; that too much may be being attempted with the nation's limited stock of manpower, and that the proposed distribution of the workers transferred may not be to the best advantage. These are doubts that inevitably arise on the last lap of the most punishing race in history, when the final ounce of effort required for a victory costs pain and is precious. It is the duty of Parliament to state them. The frictions of the fifth year of war mirror the hard labour of the four that have gone. Workers, managers, employers and administrators have undergone a great physical and mental strain, not comparable in any way to the sufferings of occupied Europe or war-racked Russia, though more prolonged, but sufficient to make understandable far more unrest than has appeared. The causes of most of the strikes that have captured the headlines in recent days are local and personal; they concern the grievances of individuals or the exasperation of relatively small groups of workers. In the main, they represent loose ends that could be tied up by trade union action or direct official redress. They are important because they may be symptomatic of greater unrest to come. They undoubtedly represent a serious warning; but they should not be overestimated. There is no evidence yet of any real wave of strikes. Labour disputes in the first seven months of this year were less damaging to production than those in the same period of last year; and 1942 compared well with the peacetime average in days lost by strikes and lock-outs. The trend has been upwards, it is true, since 1940. In that year the number of days lost was 940,000; in 1941 it was 1,790,000; in 1942 it was 1,527,000. But even this last figure is that of a good peacetime year. In 1929, 8,290,000 days were lost; in 1931, 6,980,000; in 1937, 3,410,000. The ominous feature of recent events is the spreading number and frequency of unauthorised stoppages, rather than their duration and direct effect. The figures for the first seven months were better than last year because of a drop of over two-thirds in the days lost in coal-mining; and in the weeks since coal strikes have increased in number. The fall in coal stoppages up to July was accompanied by a doubling of the number of disputes in engineering and a trebling of the days lost; a doubling of both disputes and days lost in ship-building; and a multiplication of both by five in transport. All this is not yet evidence of serious labour unrest, but it is evidence of a widespread fraying of nerves and goodwill. Workers are vexed by wartime conditions and troubled about their prospects after the war; the absence of Government decisions on post-war policy causes scepticism and alarm.

Whether friction and nervous tension develop into something much graver depends upon the good sense of trade unionists and the practical sympathy of the Government, coupled with the firmest and promptest possible action under the law against deliberate obstruction of the war effort; all strikes are illegal in wartime. Discipline must be maintained in a nation at arms; but it can only be demanded, in a democratic country, if real grievances are first redressed. The main grievance of

most strikers is not the general level of earnings. The average rise in earnings between October, 1938, and January this year was 65 per cent. But there are discrepancies and anomalies. Workers have been moved from higher to lower paid work. Coal mining is an example of the fact that the most necessary jobs do not all carry the highest pay. In principle, all war workers are now directed to their jobs; but the appearance of voluntary recruitment is preserved in differential rates of pay. The fact is that, at some points, though not now at very many, the differentials are wrong, and the inducement to maximise war output is correspondingly lessened. More important, practically, is the supply of physical necessities, food, clothing and shelter; the principle that the hardest driven and most essential workers should have preference has been only half-heartedly applied. Housing accommodation, perhaps inevitably, is often very bad and always crowded. Canteens for "heavy" workers are too generalised; and canteens for "heavier" and "heaviest" workers do not exist. It is in the adjustment of these details, and in the matching of effort by welfare, that grievances can best be met.

Even so, there remains the overriding doubt about policy. Has mobilisation reached its limit? Is the present and proposed deployment of war workers the wisest possible when the nation is already at full stretch? These are questions that only the Government can answer. Only Mr Churchill and some of his colleagues know the numbers of men, aircraft, munitions and stores that must be delivered to the Allied fronts; and it is presumably

a decision of Allied policy that determines how many more British women must be called up or transferred to work in aircraft production. But Parliament is entitled to ask for the facts and figures upon which policy is based. There is one crucial fact in every calculation which Members, back from recess, know better than most Ministers—the mood of the people under their protracted burdens. It is their duty to state it, and to remind the Government that, in most instances, the work from which men and women are now being taken is as essential, in its way, as the work they are being taken to. It is the Government, not Parliament, that makes policy; if Parliament is persuaded after this week's frank debate that mobilisation and transfer must continue on the present lines, criticism will abate, and support for Mr Churchill will in any event be unshaken. But the administrators of policy, whether in Government Departments, at trade union headquarters or in national service offices, will do well to recognise and re-examine the manifold local and personal troubles that are the substance of the impatience of this very willing people in the fifth year of war. Ministers themselves, Mr Churchill above all, could not do better than to reckon what a spur and stimulant might be given now to jaded workers—and toiling troops—by bold, sincere and specific assurances in legislation and Cabinet decisions that every possible step will be taken, without let or hindrance, to establish after the war a minimum standard of life for every family; an equal opportunity of training, work and service for every child; and full employment.

Local Authority Finance—I

THE Prime Minister's statement on Wednesday in the Commons on local government was not helpful. He admitted that the "cumulative effect" of the proposed extension and improvement of many public services might bear heavily upon the existing authorities. But he said that the reform of local machinery was too controversial and difficult to be tackled in wartime. Far more of the machinery of government in this country rests on the local authorities than is generally realised; and the "cumulative effect" of which Mr Churchill spoke will hit them hard financially as well as administratively. Of the Government Departments only the Post Office, the Ministry of Labour and the Inland Revenue have long-established local organisations. (A number of others have built up local organisations for war purposes, but these are presumably temporary.) The Assistance Board also has a local organisation, but at the outbreak of war it was young and had hardly outgrown its origins, which were derived from the Ministry of Labour and from the local authorities. All the many other functions of Government policy which can only be exercised in the localities are administered through the local authorities. The Board of Education does not run a single school; the Ministry of Health owns no hospitals. These two big services, together with town and country planning, housing and police (outside London) are all administered by the local authorities. The Ministry of War Transport has the responsibility for the trunk roads, but it employs the county councils as its agents. There cannot be many other countries where the administration of national policy is so completely decentralised.

The effectiveness of local authority administration is thus a matter of far more than local concern. It is an essential part of national policy. Unfortunately the machinery is not working well. Parliament legislates, but policy often languishes in the local areas. Where Parliament lays a duty on the local authorities, their performance is often very varied. And where Parliament merely encourages, by the grant of powers and the promise of subsidies, there is often no performance at all. Town planning—particularly in respect of the restriction of ribbon development—has been hanging

fire for years. Educational development (as the recent White Paper acknowledged) has been largely restricted to the bare minimum required by law, and the permissive powers given as long ago as 1918 have become virtually dead letters. The present state of affairs is not so bad that the word breakdown can fairly be applied; but it may not be an exaggeration if further heavy obligations are loaded on to the local authorities as part of post-war reconstruction. And that such additional burdens are in prospect is very clear. The local authorities are to bear 45 per cent of the not inconsiderable cost of the Government's new education proposals. Large schemes for town and country planning and for medical services are in preparation. Both will be operated through the local authorities, and it will be entirely contrary to all precedent (including the very recent precedent of the Education White Paper) if a sizeable part of the cost is not left to be found by the local authorities. Housing is another case in point, though here it may be made possible for a local authority to recoup itself fairly completely from rents and subsidies combined. These heavy prospective burdens create a very serious situation, and there is real danger lest a very large part of post-war reconstruction break down because of the simple, almost mechanical, fact that local authorities cannot play their part. The vague statements from the Ministry of Health to the effect that a reform of local government is now in prospect have now been made vaguer still by the Prime Minister's pronouncement.

Part of the difficulties of local authority administration arise from the smallness of the areas. Broadly speaking, there are no authorities larger than the counties and the county boroughs. The county boroughs have no subordinate authorities beneath them, and can therefore bring all local authority functions together in one administration; but many of them are very small, with populations of little more than 50,000. The counties are, on the average, larger; but they have subsidiary bodies in the form of municipal boroughs and urban and rural districts, which administer many of the functions. Moreover, it is only on the average that the counties are larger; they include such tiny areas as Rutland, the Soke of Peterborough, Radnorshire and

Huntingdonshire, whose combined population is only 146,000. There were in England and Wales in 1931 1,850 local authorities (counties, county boroughs, metropolitan boroughs, municipal boroughs, urban and rural district councils). Of this large total only 118 had a population of over 100,000 and only 45 had a population of over a quarter of a million. The representative local authority, even of those of county status, is thus a small body. Grouping for specific functions has made very little progress, and the majority of functions are left to be administered by such officials and with such financial resources as a small authority has available. In these circumstances full efficiency is hardly to be expected.

Small size, however, is neither the only nor even the chief handicap to efficient administration. The main trouble is financial. The local authorities are almost at the end of their financial resources, and if they fail in their duties the main reason is that they cannot afford to do any more. They draw income from only two sources (apart from fees and charges for their trading services): from the rates and from Government grants. The main Government grant is the block grant enacted by the Derating Act of 1929. This grant was intended, not merely to replace the revenue lost by the local authorities as a result of derating, but also to lower the general level of rates, and to introduce a certain measure of equalisation between areas. It achieved these purposes only for a time; and by 1939 both the general level of rates and the inequalities between them were as bad as ever. In addition to the block grant, which is a general grant-in-aid and can be used for any variety of expenditure, there are various specific grants for special forms of expenditure, of which the education grant is much the largest. Most of these grants meet only a stated proportion of the expenditure—the education grant, for example, is to be raised, as part of the new proposals, to 55 per cent, on the average of all local authorities. The central Government has always been very strongly opposed to grants covering the whole or a very large part of local authorities' expenditure; its reason—with which it is difficult to quarrel—is that those who do the spending should be subject to the check of having to find part of the money themselves. It will be recalled how much time was spent in the years 1936-39 before this rule could be set aside in the case of civil defence, which remains the only large exception. The position, therefore, is that if a local authority wishes, or is compelled, to increase its expenditure, it must find either the whole of the money or (in the case of a service for which there is a specific grant) a proportion usually in the neighbourhood of one-half. The only

source from which it can find the money is rates. Rates are a most unsatisfactory tax. They are inequitable as between rich and poor. They penalise the family against the single person or the childless couple. Their burden on business undertakings (they are still levied in full on commercial premises and at quarter-rate on industry) is a fixed charge to be met before profits are struck. And, most important of all, they fall most unequally on different places. Among the county boroughs in 1938-39 Merthyr Tydfil levied rates at 27s. 6d. in the £, Bournemouth at 7s. 10d.; Eastbourne and Manchester were raising more than £6 10s. per head of their population (Eastbourne had one of the lowest poundage rates in the country), while Darlington and West Hartlepool raised less than £3 per head.* These discrepancies are in part due to the differing needs of the various areas and in part to their differing means; where the need is greatest the means are apt to be smallest. There is also the most surprising divergence between different areas in the methods of valuing property; and Professor and Mrs Hicks, who have enquired into this aspect, state that high valuations tend to go with high rates, so that the inequalities are even greater than appears on the surface. The average rates throughout the country were already between 13s. and 15s. in the £ before the war. They will be increased by rising costs, apart altogether from new legislation, and it is a delusion to suppose that most authorities will be willing or able to make large additions to the rates for expanding welfare services.

This is the dilemma in which all reconstruction schemes which call for local administration will, in the default of far-reaching reforms, find themselves. The local authorities will exert all possible forms of resistance to an increase of rates. Their case will be so little based on recalcitrance or ill-will that the Departments in London will find it very difficult to insist on full enforcement of their plans. On the other hand, the Treasury will, quite rightly, refuse to give the local authorities a blank cheque on the National Exchequer by increasing the specific grants to, or nearly to, 100 per cent of any additional expenditure. With the present structure of local finance it is hard to see how deadlock can be avoided.

The methods of escape from this dilemma will be discussed in a second article.

* Some of the foregoing facts are taken from *Standards of Local Expenditure*, by J. R. Hicks and U. K. Hicks (National Institute of Economic and Social Research Occasional Papers No. 3. Cambridge University Press, 4s. 6d. net). This deals only with the county boroughs, but it is a most instructive and illuminating survey of the problems of local authority finance.

Pay-as-You-Earn

THE scheme for taxing weekly wage earners on a pay-as-you-earn basis, announced on Wednesday, is admirably designed to achieve its limited objectives. The system of income tax is left unaltered; but its application to one section of taxpayers—the large majority, by numbers though not by payments—will be radically changed. In the words of the White Paper (Cmd. 6469), which sets out the details with great lucidity, "The tax deducted from earnings in any financial year will represent the liability for that year, measured by the actual earnings of that year, and the deduction of tax week by week will keep pace with the accruing liability." The prospect is removed of wage earners being saddled with heavy retrospective obligations when abnormal wartime earnings fall or if, as is likely in the case of many women, they go out of gainful employment when the war ends.

The new method of collecting income tax, which will come into force on April 6th next year, and will apply to all weekly wage earners whose tax is deducted at source (with the exception of civil servants and railway officials, to whom special arrangements already apply), is ingenious in construction and simple to operate. The weekly liabilities of wage earners, which will of course fluctuate week by week with earnings and employment, will be worked

out according to a complicated formula; but this will be calculated beforehand by the tax authorities to cover all cases and translated into a series of tax tables, which will serve as an automatic ready reckoner for employers in making deductions of tax from weekly wage payments.

At present the amount of one year's tax is assessed, for every taxpayer, on the basis of the preceding year's earnings. In the case of weekly wage earners, who are also weekly taxpayers, the lag between money earned and tax paid is ten months, which gives rise to misunderstanding and may cause definite hardship when earnings fluctuate, decline or cease. The new system provides that the weekly tax payment will be based on the same week's earnings, with allowance every week for a proportionate share of the exemptions and reliefs to which the taxpayer may be entitled. The amount of tax to be deducted each week will be the tax due on the total wages received in the tax year up to and including that week, less the tax already deducted in the previous weeks of the year. For example, the tax to be deducted in the first week will be the standard rate less one-fifty-second of the reliefs and allowances for the year; the tax to be deducted at the end of the second week will be the standard rate on the earnings of both weeks, less the tax deducted in respect of the earnings

in the first week and two fifty-seconds of the reliefs for the year. If, say, earnings suddenly cease in the third and fourth weeks, tax liability does not accumulate, but reliefs do; and the tax liability at the end of the fifth week, assuming work to have been resumed, will be the standard rate on the aggregate earnings of the first five weeks, less the tax already deducted in respect of the first two weeks and five fifty-seconds of the reliefs and allowances for the year; and if aggregate relief for the five weeks and the tax already paid in respect of the first two weeks exceed the tax at the standard rate on aggregate earnings during the five weeks, the difference will be refunded.

Thus, by the adoption of a cumulative principle, the taxpayers covered by the scheme will have neither liabilities nor credits at the end of the year. Such small margins as may appear at the end of the year will be due mainly to the use of round figures. Provision is made for special circumstances, such as a change in reliefs due to additions to the family and changes in employment. The principle of the scheme is very simple and it will be easy to operate, though it may not be easy to explain in detail to those it affects. The employer will be given a Tax Deduction Card for each weekly wage-earner. On this he will record, week by week, the wages earned and the deductions made, and this will also serve as the employer's return of wages for his own income tax assessment. For the purpose of tax deductions, each wage earner will be given a Code Number, which will indicate what reliefs are due to him, according to the size of his family and other circumstances. The Tax Tables with which every employer will be provided will show for each Code Number the amount of cumulative tax to be deducted from any given sum of wages in any week; they will show at a glance the amount of tax to be deducted or refunded at the end of every week for every wage earner.

The change-over will take place at the beginning of the financial year 1944-45, when under the existing system the weekly wage-earners will already have paid tax for two months on the basis of their earnings in 1943-44. From April, however, the basis of assessment will be changed from earnings in 1943-44 to earnings in 1944-45, that is, to current earnings. No tax is "forgiven"; the windfall of £250 millions mentioned in the White Paper, which newspapers allege will be presented to wage-earners, is a notional figure; it simply states what these taxpayers would have paid on the basis of 1943-44 earnings if 1944-45 earnings had not been substituted as the basis of assessment—which, in fact, may cause a higher sum to be paid instead; every wage-earner liable to tax will still pay tax every week; all that happens is that the basis of assessment will be changed, which in many cases will increase, not

decrease, the tax due. The Treasury's "loss" in individual cases will arise from the fact that when taxpayers die or cease to be liable their tax payments will cease also; there will be no deferred liability outstanding. On the other hand, new taxpayers will pay tax throughout their first year of liability, instead of, as at present, not until their second, so that there are swings to balance these rather academic roundabouts. The scheme is simpler and more effective than those adopted in Canada and the United States; it could easily be combined with the distribution of "Beveridge" allowances. It forestalls difficulties after the war, when earnings may fall, many incomes will cease, and deferred collection would mean default. The immediate effect on the revenue will depend largely on the course of incomes and on the number of weekly wage earners. If wage incomes suddenly drop next year, the Treasury will obtain less than the estimated receipt of £250 million on the old basis; but if incomes suddenly drop or cease the Treasury would have lost in any case, through default. If, on the other hand, incomes continue to rise next year, and the number of wage earners remains unchanged, the Treasury will gain by collecting tax on a higher basis of assessment.

The introduction of "pay-as-you-earn" is a definite improvement in the system of tax collection, and it is impossible to understand why its application is to be confined to weekly wage earners. Many workers who are paid monthly earn less, and possess less, than weekly wage earners. True, the proportion of salaried persons who possess savings is probably greater than that of weekly wage-earners, which much reduces the chance of defaults after the war on the present basis of retrospective assessment and deferred collection. Nevertheless, the Treasury must be urged to reconsider its decision and extend the scheme to salary-earners.

The main criticism, however, must be that, though the basis of assessment is to be changed, the method of assessment is not. The present method is tortuous and hard to understand. In its details this scheme will be no easier to understand than the old one, however automatic it may be in operation. It is hard not to feel that a great change has been lost. All the basic defects of the present income-tax system could be solved together by the adoption of a scheme, such as outlined in *The Economist* on September 11th, by which tax would be deducted at a flat rate from all incomes and allowances paid in vouchers which could be used in payment of tax or cashed. It is a great gain that this first step towards changing the basis of income-tax assessment has been taken. But it is a gain that only underlines the necessity of reforming the method of assessment as well, so that income tax may become the simple and flexible instrument of policy that modern economy needs.

NOTES OF THE WEEK

Amphibious Operations

Mr Churchill is credited with having once said that modern armies have become so mobile that they are practically immovable. T. E. Lawrence said much the same thing twenty years ago about the unsuitability of modern equipment in Arab warfare. The extraordinary apparatus required to move modern forces over long distances of water has been the main limiting factor in the strategy and time table of the Allies since the process of mobilisation and industrial output reached a sufficiently advanced stage to make attack possible.

We are terribly hampered by the sea, which has been our shield and protection, but which is now a barrier which prevents the employment of those great forces.

This was the theme of the Prime Minister's statement to the Commons on Tuesday. On the one hand, in this task of deployment, there has recently been an outstandingly favourable factor, the defeat of the submarine offensive—which could not, of course, be counted upon at Casablanca in January when sinkings were still serious. There has been a dramatic change:

It is a fact that, for the four months which ended on September 18th, no merchant vessel was sunk by enemy action in the North Atlantic. During the first fortnight of this September, no Allied ships were sunk by U-boat action in any part of the world.

The abatement in the sea menace has made it possible to

lay up great stores at home and overseas for the next offensives. Even with this advantage, in its suddenness and completeness almost as much of a "windfall" as the surrender of Italy, it was apparently not possible to hasten the timetable of attack more than was in fact done. Mr Churchill's explanation of the implacable limits set by the logistical problem of moving modern forces in large-scale amphibious operations seemed at one point to place the main responsibility upon a shortage, not of ships, but of landing craft. The gap between the Battles of Sicily and Italy was set, it seems, by "the time necessary to disengage each landing craft from the beaches of Southern Sicily"; they had to be repaired, re-loaded and ordered and arranged for the next expedition. If it is true that the speed and diversity of Allied deployment in the new European theatre is determined—whatever other resources are available and whatever the degree of sea superiority possessed—by the number of landing craft available, the question obviously arises whether the supply of these vessels is sufficient. It was a bold step to start their design and construction in 1941 when the time for their use was still distant, though some had suggested it even in 1940; and it would be more than a pity if other claims upon labour, plant and materials were now to hobble, for lack of landing craft, the great forces that stand poised to spring. It is right to ask whether the claim of heavy bombers for engines has slowed the output of these vessels, many of which are said to be engined similarly.

The Italian Delays

Mr Churchill met his critics squarely on the question whether unnecessary delays had held up the invasion of Italy. These criticisms have been made from different angles. Some people were not convinced that the military planning had been as alert and speedy as it might have been. Could there not have been a more rapid following up of the gains in Sicily? Could the landings in the toe of Italy have taken place sooner, or have been accompanied by more landings elsewhere? These were the questions that Mr Churchill answered by his description (discussed in the preceding Note) of the supply and transport problems involved. "The condition and preparation of the landing craft were the sole but decisive limiting factor." This blunt statement also answered the second group of critics who argued that the Allies were not ready with their peace terms, and then spent time haggling over the conditions. Mr Churchill showed that the reason for delay was quite simply the ubiquitous presence of Germans in Italy. Marshal Badoglio's envoy approached the Allies on August 15th—after some preliminary feelers—and stated "that when the Allies landed in Italy, the Italian Government were prepared to join them against Germany." From that day the negotiations were conducted smoothly and with all speed. The delays were due to the secrecy with which the Italians had to act, surrounded as they were by their ex-Allies. Even so, the course of the negotiations did not influence the date of the landings on the mainland. That date was fixed by military considerations alone, and the armistice terms were withheld to coincide with the landing, not *vice versa*.

The Italian surrender was a windfall, but it had nothing to do with the date for harvesting the orchard.

* * *

The Margin of Opportunity

Political developments in Italy clearly outran the time table to which the military machine had to work. The Prime Minister and the High Command were well aware of the discrepancy, as the exchange of letters between Mr Churchill and General Alexander conclusively shows. The question which some critics, experts as well as laymen, still ask is whether the complicated and ponderous working of the invasion machine cannot be simplified and made more flexible. Unexpected turns and sudden crises are essential features of modern warfare; there is need for a margin of opportunity, as well as a margin of safety, and events in Italy have thrown a sharp light upon the importance of this margin. The place of the landings in Italy, the Prime Minister explained, was determined by the range of shore-based aircraft, without whose support the invading force would have been exposed to attack from superior land-based forces in the critical moments of the landing. The critical period on the Salerno front lasted from September 9th to September 16th, when the enemy enjoyed to the full all the initial advantages. These were ultimately overcome chiefly by two factors: aircraft support (sufficiently massive to concentrate 2,500 bomber and fighter sorties into twenty-four hours), and naval artillery. A landing further to the north could have been supported by naval guns and sea-borne aircraft, but not by shore-based aircraft; and the advantage of close air support over Salerno was only partly undone by the fact that descent there

lacked the element of surprise. The enemy, too, knew Salerno to be the northernmost limit of the range of the Allied shore-based aircraft, and prepared for defence there. It may be argued that a landing made farther to the north and much earlier might have benefited from surprise more than it might have suffered from the lack of close air support. But, given the time of the landing, more than six weeks after Mussolini's downfall, the choice of Salerno was undoubtedly correct. It enabled the Fifth Army to join hands with the Eighth Army advancing from the south. With the capture of Potenza the Allies have now established a more or less continuous front in the south of Italy. The difficult and costly march to the north now moves continually between the two precipices of which the Prime Minister spoke: "the precipice of caution and the precipice of over-daring."

*

The margin of opportunity is widening almost everywhere in the Mediterranean. In the west, Sardinia was freed from the Germans with surprising speed and ease by the Italians themselves. In Corsica the Fighting French have captured Ajaccio, forced the Germans to evacuate Bonifacio and Porto Vecchio in the south and to withdraw to Bastia, the only port of embarkation left to the enemy; here a popular insurrection has merged with the war and, in fact, gone ahead of the military operations. A similar and an even more significant phenomenon can be seen in the east. Large stretches of the Dalmatian coast have been captured by the Yugoslav guerillas; excellent invasion ports, such as Fiume and Susak, are being kept, at terrible risk to the guerillas, in expectation for the Allied invasion; and German communications in Croatia and Serbia are being harassed. In the Aegean, the Germans have been quick to tighten their grip on Crete, Rhodes and on the Dodecanese islands. But the Allied descents on Cos, Leros and Samos mark the beginning of an important new series of offensive moves.

* * *

Pacific Offensive

"At the Conference at Quebec much attention was given to the prosecution of the war against Japan." Mr Churchill did not, naturally, reveal any plans for the further prosecution of the Pacific war, but he gave the House of Commons some idea of the importance attached to this aspect of the Anglo-American war effort—"the main strength of the United States is deployed in that ocean." The question is, will the tempo now be quickened? Are more troops and material to be devoted immediately to the Far Eastern war? The appointment of Admiral Mountbatten to the Combined Command of South-East Asia suggests that a new and more active phase is about to open. Will this new phase entail a big diversion of supplies and manpower from other fronts, in particular from "the mass invasion of the Continent from the West." In his Commons survey Mr Churchill spoke eloquently of the problems presented by logistics in the Italian campaign—the return and repair of landing craft, the naval concentrations, the air covers. He characterised the opening of a front across the Channel as a "far more difficult, far larger and more serious operation." The layman is left wondering whether the Allies can really afford to switch much weight from Europe to the Pacific now that the decisive moment in the West is so obviously in sight. Mr Churchill argued that, only if the pressure were kept up on Japan, could the process of attrition—of which there are already signs—be fully maintained. Certainly, the existing degree of pressure should be maintained. It is increased pressure that raises the question whether the only right policy—the policy of one by one—is not going now to be perilously watered down. It is surely better to win without reserve or limitation or delay in Europe and then to strike a completely annihilating blow against Japan than to prolong the European war in the interests of Far Eastern attrition.

Labour Unrest

The present industrial troubles are discussed in an article on page 420. They are in part a reflection of war fatigue, in part due to the widespread impression that the war is as good as won and that employers, at any rate, are thinking already mainly about post-war prospects; more specifically, they represent local protests against the incidence of rules and orders upon the pay and conditions of

particular workers or groups of workers. But slackening of effort and stoppages of work must have the effect of prolonging the war. By the middle of this week, some 20,000 workers were out on strike: 5,000 miners, 4,000 shipwrights and 9-10,000 engineers. The Nottinghamshire miners who struck *en masse* as a protest against the imprisonment of a young surface worker who refused to be directed underground, returned to work on Monday, after the young man had been released and had agreed to work underground. The 1,500 Ashington miners who struck over wage grievances have also returned, but strikes are still going on in other parts of Nottinghamshire and in the Northumberland area. The position on Clydeside has become serious, with some 4,000 shipwrights out. The men's demand is for an extension of the system of payment by results, which would enable them to earn 33½ per cent on their wages; they say that they have tried in vain to obtain their demand by negotiation, and feel that the issue should be investigated by an industrial court. The Clyde riveters, who engaged in a "token" strike in support of a claim for a minimum of 3s. an hour, have sent a deputation to lay their case before the Minister of Labour and the First Lord of the Admiralty. Nearly 9,000 employees at Vickers-Armstrongs' works, Barrow-in-Furness, have decided not to resume work until they have been granted the award of the National Arbitration Tribunal last March. This award was an extremely complicated one and gave rise to great discontent at the time of its announcement. The Engineering Employers Federation and the Amalgamated Engineering Union have jointly asked for an interpretation of the Tribunal's findings, which is to be given next Tuesday and may help to smooth over some of the friction. Over 12,000 women in a North-East engineering factory are threatening to strike unless they are paid "the rate for the job." Meanwhile after lengthy discussions between the Electrical Contracting Employers and the Electrical Trade Union, it has been agreed to submit the men's claim for a 3d an hour advance to arbitration. This is a formidable catalogue of strikes, all against the advice of the union leaders, and the unrest is undoubtedly being fomented by irresponsible elements. It is satisfactory, by contrast, to read of the secret meeting between Sir Stafford Cripps and representatives of the aircraft industry, at which a unanimous pledge was given to provide the greatest possible output of aircraft.

The Vatican Encircled

The Argentine Government, which may very well be seeking a dignified occasion to break off relations with the Axis, is very much concerned about the Germans' violation of the neutrality of the Vatican City. It is difficult to say how far this neutrality has, in fact, been invaded. The Vatican Radio has denied that the German Guard is posted actually on Vatican territory, and although, through the Vatican Radio—the only source of direct information—it is known that there are some restrictions on entry and exit into the Vatican, it does not seem that the Pope's sanctuary has been seriously invaded. Nevertheless, the Vatican is completely cut off, even from postal communication. In such a situation, rumours are naturally rampant. But two facts seem fairly certain: on the one hand, the Pope has not received the German Commander Kesselring; on the other, no use has been made of the Vatican Radio to protest against the German action in occupying Rome, apart from one very moving and extraordinarily strongly phrased sermon given in German a day or two after the German occupation. This, under a very thin veil, was a violent attack upon German imperialism. One can, perhaps, see a note of defiance in the continued appeals for peace which were broadcast for some days after the German action, but since that time, all broadcasts have been cut down from the usual fifteen minutes to about three minutes, and although there is no confirmation of this, it does seem that some kind of pressure has been brought to bear upon the Vatican to preserve the neutrality of silence. It is impossible to avoid the conclusion that with the Italians in their agony, and fighting and devastation following the German troops on every side, the Pope has refused the urgent duty of moral leadership.

The Archbishop's Visit

The visit of the Archbishop of York to Moscow is an astonishing event. Who, prophesying two years ago the course of this extraordinary war, would have pictured an

Archbishop of the Anglican Church alighting from an aeroplane on an air-field near Moscow in order to bring the cordial greetings of his Church to the newly recognised Orthodox Church of Russia? There is every reason to welcome this direct contact between the two Established Churches. Russia has lived so long in such complete isolation that any step which lightens the darkness and brings the peoples of the two countries into open communication with each other is an obvious and valuable contribution of good neighbourly relations. A number of religious issues are, of course, involved. By making this gesture, the Anglican Church will no doubt strengthen the position of their Orthodox brethren. On the English side, there is direct interest in the question of Anglican Orders. As long as the Eastern Orthodox Church had no recognised head, no competent authority existed to give the Anglican Church what it has long wished for—Orthodox recognition of the validity of Anglican orders. It was naturally not the chief purpose of Dr. Garbett's visit to secure this recognition, but it is likely that it will come under discussion in the course of his stay. The Archbishop's visit also throws light on the speed and ease with which the Orthodox Church is returning to its traditional rôle of pillar of the state. Judging by the appeal to all Christians issued by the Council of Bishops on September 8th, which expressed their hopes

that by the exertion of the efforts of Christians of all Allied countries at this favourable moment, when our own Russian Red Army is victoriously ousting the enemy from the homeland and has diverted to itself big enemy forces, the long awaited second front will at last be created and thus bring nearer victory and peace for the peoples—

one can easily imagine that the need of a Second Front will be urged on Dr Garbett and that in this sense his mission will have a political as well as a religious significance. It is also significant that one of the first actions of the official Church was to excommunicate all persons among the Orthodox clergy and laity who had assisted the Germans.

We who are gathered to-day in the name of the Father, the Son and the Holy Spirit reiterate this verdict and resolve: Everyone guilty of treason to the common cause of

APPLICATIONS FOR AGENCIES INVITED

CENTENARY RECORD

1. We have been able to prepare a limited number of copies of **A Commemorative Pamphlet**, which will include (a) all the special centenary articles which appeared in the issue of September 4th, dealing with the history, policy and present views of *The Economist*, and (b) the speeches made at a centenary luncheon on September 2nd by Sir Walter Layton, chairman of the gathering; the late Chancellor of the Exchequer; the Governor of the Bank of England; the Home Secretary; and the Editor of *The Economist*. Copies will be available in a few days (**price 2s., postage 2d.**), and applications should be made to *The Economist*, Brettenham House, Lancaster Place, London, W.C.2. (Temple Bar 3316.)

2. A volume of essays entitled "*The Economist, 1843-1943*," which is mainly historical in character, has been published by the Oxford University Press, price 7s. 6d. (Orders should be placed through booksellers, and not with either the Oxford University Press or *The Economist*.)

the Church and of deserting to the side of Fascism, the enemy of the Cross of God, shall be excommunicated from the Church.

The pattern, into which the relations between Church and State in Russia will fall, belongs to the future, but history lies heavily upon them, with its long tradition of the subservience of the Church to the political community. It is possible that with the restoration of so many other traditions, this will prove no exception.

Soldier and Philosopher

Lord Wavell has already proved himself a general with a philosophy of generalship. His appointment to be Viceroy of India has given him the chance to prove himself also a statesman; and his speech at a Pilgrims' luncheon last week suggests that he has the right philosophy for that rôle too. Most of his speech concerned his testing-ground in India—and he spoke against the background of a famine in Bengal that has reached distressing and disturbing proportions. His three main problems would be, he said, the war against Japan, the day-to-day problems of government, economic and social—

it is an alarming thought to realise that every month, at the present rate of increase of the population, there are an additional 300,000 to 400,000 people to be fed, educated and cared for:

and, thirdly, the political advancement of India—he fully realised the great weight of opinion in favour of loosening the present deadlock. But Lord Wavell also spoke of the approach of the end of the struggle with Hitler and

the beginning of the struggle to save civilisation. . . . One cause of the ills from which we now suffer is that in recent years we have ceased to be wanderers; that we have become too set and content, and that we have lost the pilgrim spirit.

To set the frontier moving again, Lord Wavell urged the abandonment of the "two terrible slogans"—safety first and business as usual.

The years between the two great wars were a period. . . when mind and body grew slack. . . . when cleverness was reckoned of more account than character; when leadership was gained by caution rather than by daring; and when comfort and personal advantage were being preferred to duty.

Lord Wavell has, too, the common touch, for he echoed the feelings of the man in the street—as well as the more sophisticated demand of the economic expert for a policy to promote full employment—when he referred to

the curious fact that money is forthcoming in any quantity for a war, but that no nation has ever yet produced the money on the same scale to fight the evils of peace—poverty, lack of education, unemployment, ill-health.

Famine in India

Food shortage in Bengal has become famine. It is a dreadful state of affairs. True, the situation has been temporarily eased by the import of about a fortnight's supplies of grain by the Government. But the fundamentals of the situation remain unaltered. There is enough food in all India if supplies could be spread evenly, throughout the provinces. This involves the central distribution of all surpluses above local needs, and calls for a degree of authority that neither the Central nor the Provincial Governments of India have hitherto seemed to possess. There are two difficulties, one political, the other administrative. The political difficulty is the reluctance of provincial producers and their Governments to release supplies for outside consumption, and the corresponding reluctance or inability of the Central Government to enforce release; there would be no famine in Bengal if the Punjab's surplus of wheat could be made available. The second difficulty is administrative. It is easy to talk about the central pooling and allocation of supplies, about rationing and even distribution in a tiny, compact, advanced country like Britain. It is enormously more difficult even to begin with these measures in a sub-continent, especially without the goodwill and co-operation of the Indian people; this point has been made in a valuable report by a committee under Sir Theodor Gregory, Economic Adviser to the Government of India, which recommends urban rationing and central control over distribution and, with a minority dissenting, over prices. The Central Government, and behind it Britain, will inevitably be blamed both for the famine and for the stern measures that should be taken to end it. The only course is to pursue the right policy promptly and firmly with-

out heeding praise or blame; it cannot be wrong to feed the starving. But the real test is of the Indians themselves. Here is a major issue of purely Indian concern, social and economic with no real political connotation; if the Indians cannot get together to obtain the right attitude among politicians, administrators and producers of their own nation, then the chances of their coming together as independent Indians on the day-to-day issues of self-government must correspondingly be belittled. This much, however, must be said in addition. No appeal has yet been made by the Viceroy across the gulley that split the Indian political scene for the co-operation of every patriotic Indian in a campaign to feed the starving people of Bengal; at least such an appeal should be placed on the record.

The BMA Meets

Certain sections of the daily press have read into the motion accepted on the first day of the British Medical Association's meeting a categorical refusal to agree to any form of a national medical service. This reading of the vote is very far from correct. The medical profession, as represented by the BMA, has not rejected Assumption B of the Beveridge Report—the establishment of a comprehensive health and rehabilitation service—nor has it gone back on its own proposals for a comprehensive service, outlined in its Planning Commission's report last year. On the contrary, Mr Souttar, chairman of the Council, declared that the Beveridge proposals which affected the medical profession were largely based on the accepted policy of the BMA, and, as Lord Dawson said, the medical profession has advocated a comprehensive service since 1920; it is the Government that has hitherto held back. What the BMA has rejected is the conditions said to have been taken as axiomatic by the Ministry of Health in its first discussions with the medical profession. It has rejected, in other words, the proposal for a whole-time salaried service working under the local authorities, and has adopted a proposal for a corporate body, responsible to Parliament, to administer a national medical service. Mr Souttar stated that there was reason to believe that since the discussions the Ministry of Health had modified its views, and that the forthcoming White Paper would contain proposals far more acceptable. Sir William Jowitt stated in Parliament this week that this White Paper would be ready shortly—another, showing the progress made on the major problems involved by the Beveridge proposals, will be presented in a few months—and until it appears it is not possible to say whether the BMA is being too uncompromising or whether the Ministry is compromising too much. But it is worth noting that the BMA still holds to its axiom that—in the words of Mr Souttar—

A first-class medical service should be obtainable by every individual whatever his economic status.

Food, Health and Income

Sir John Boyd Orr has recently given an encouraging picture of the nutritional state of the people. In his survey of Food, Health and Income, published in 1936 but relating to 1934, he estimated that no less than half the population was not getting a standard of nutrition necessary for health. Considerable improvements took place during the late 'thirties, with increased public health measures, child welfare services and advances in the knowledge of dietetics; and the results of a comprehensive survey in 1939, covering 1,500 families from the north of Scotland to south of the Thames, showed that the undernourished proportion had fallen from a half to a third, and that the worst third were better fed than the worst third in the former survey. The position has been further improved since the war. Sir John Orr attributes this to the scientific feeding policy adopted by the Ministry of Food, based on the nutritional needs of the people; to the equitable distribution of essential foodstuffs, the adoption of more balanced diets, the use of wholemeal bread instead of white bread, the extension of the milk schemes, the development of communal feeding and works canteens; and, above all, to the increased purchasing power in the hands of the working population. Boys of 13 in Glasgow are on the average 0.88 inches taller than before the war, and boys of 5 are 0.44 inches taller; and in spite of congested housing conditions the Scottish infant mortality rate is lower than at any time before. The really important thing is that the lessons of wartime should be carried over into the peace. In wartime, it pays to keep fighting men and working people fit and

healthy. In peacetime, there may not be the same incentives. It would be disastrous if the appalling spectre of poverty and malnutrition that has so long haunted Britain's industrial centres were to reappear. Sir John Orr is outspoken on this point. The recommendations of the Hot Springs Conference that every one of the United Nations should undertake to bring within the reach of every family sufficient food for their subsistence, are, in his view, the most important and revolutionary advances yet made. "If they are not accepted I shall despair of post-war reconstruction, and I shall have no faith in promises of any kind."

Friendly Societies

In his report on Social Insurance, Sir William Beveridge suggested that the approved society system of giving unequal sickness benefit for equal contributions should be abandoned; that friendly societies giving benefit of their own should continue to administer state benefit as fully responsible agents, but that other societies and companies should not. Last Saturday Sir William criticised, with characteristic acerbity, an alternative suggestion put forward by the National Conference of Friendly Societies, by which the existing machinery of the societies would be used for the payment of state benefit. This proposal is in direct conflict with Sir William's proposition that the administration of sickness benefit should not be entrusted to independent bodies by arrangements which do not make them feel direct responsibility for administration, and that an agency administering state benefit should not be associated in any way with any body working for profit. Sir William, in his report, went out of his way to pay tribute to the great services rendered by friendly societies in the past. But the test, in his view and that of many other people, is the relatively high cost of administration under the present system, and the relatively low and chronically uneven standard of benefit. The friendly societies counter-proposal would, in Sir William's view, sign the death warrant of the friendly societies—

Because any agency which is administering public money without any financial responsibility must ultimately come under State control. Under this plan, moreover, the friendly societies, with their long record of disinterested service and

care in sickness, will be associated on equal terms with organisations for business, not concerned in sickness insurance, and interested in pushing another form of insurance, which has been criticised by one independent committee after another as eating up the resources of persons of limited income in excessive costs and in lapses.

Shorter Notes

The Australian Opposition is regrouping after its smashing defeat by Labour in the recent election. The uneasy union between the United Australia and Country parties, whose mutual recrimination was a feature of the election campaign, has split; and Mr Menzies, elected leader of the United Australia party, will now be leader of the Parliamentary Opposition.

Referring to Mr Curtin's suggestion for a new Imperial body to take decisions on behalf of the whole Commonwealth, Mr Churchill stated in Parliament this week that he hoped to arrange a meeting of Empire Prime Ministers early next year.

The following table gives the number of civilian casualties in air raids since September, 1939:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept., 1939-Aug., 1940.	1,494	1,980	3,474
Sept.-Dec., 1940.....	22,282	28,522	50,804
Total, 1941.....	20,863	21,839	42,702
Total, 1942.....	3,221	4,149	7,370
1943:—			
January.....	328	507	835
February.....	252	347	599
March.....	293	439	732
April.....	172	205	377
May.....	584	733	1,317
June.....	201	284	485
July.....	167	210	377
August.....	108	164	272

Totals to date.... 49,965 59,379 109,344

Of those killed in August, 38 were men, 41 were women, and 29 were children under 16.

AMERICAN SURVEY

From Concentration to Monopoly?

(From Our Washington Correspondent)

August 2nd

IS the war programme consolidating monopoly in the American economy? Where is the small independent business going to be when this is over?

The phrase "concentration of industry" has largely been used in the course of the war programme to describe the assignment of current limited production of essential civilian goods—stoves, furniture, farm machinery—to certain firms (usually the smaller ones of the industry) in order to free other capacity for conversion to war uses, or to allow transfer of workers elsewhere if conversion is impossible. But concentration in this sense is a by-product. The outstanding concentration that has been going on is the concentration of the big firms on war orders—the General Motors advertisement concludes "Victory is Our Business."

Under the war programme, the country's dominant corporations have, with few exceptions, become more dominant. Analysis of the war supply contracts of more than \$50,000 in value made from June, 1940, through November, 1942—they added up to \$59,558 million—shows that 70.1 per cent of the total have gone to 100 firms. This list of 100 is topped by the following:—

	\$
General Motors.....	7,251,000,000
Curtiss Wright.....	4,613,000,000
Bethlehem Steel.....	2,954,000,000
Douglas Aircraft.....	2,373,000,000
United Aircraft.....	2,343,000,000

Thus the old giants have become more gigantic—the Bethlehem Steel figure, incidentally, represents mostly the company's shipbuilding activities; its supply of steel to other firms with war orders obviously does not show in an account of its direct contracts with the Government. And there are new giants in the land—the aircraft companies were relatively small businesses before the war.

The reasons why the dominant corporations have become more dominant are several. Concentration in industry is always most active either at the pit of depression or at the peak of production—within a decade, the US economy has seen both. At the start of the military expansion, the procurement divisions of the armed forces tended to channel orders through firms with which they had had previous experience. The succession of agencies which developed into the War Production Board were largely top-staffed by executives of major companies—Knudsen of General Motors, Nelson of Sears Roebuck, Wilson of General Electric. The attraction of bigness, of nationally known names, of existing assembly lines to which more could be added, were all felt.

A further reason why a main destination of funds for new facilities were the industries in which one, or a few, firms were dominant was because those industries had previously been so closely controlled as very nearly to equate productive capacity with the amount the peacetime market would absorb at a given price. A significant number of the acute shortages have been in fields of intense pre-war concentration—aluminium, copper, steel, lead; in the first of these, one

company has been dominant for years; in the second, three—and latterly those three have greatly expanded their proportion of the total output.

Last autumn, activity of the anti-trust division of the Department of Justice was resisted by business on the ground that if top executives had to spend their time preparing cases, energy would be diverted from the war effort. As a result an exchange of letters between the War and Navy Departments, the Department of Justice and the President provided that the Justice Department should submit proposed indictments to the Services—it has also, upon occasion, submitted them to WPB—and should refrain from prosecution for the duration of the war if, in the opinion of those agencies, prosecution now would hamper production.

But the effect of the current pattern of production on the shape of things to come is none the less a matter of public interest. Even in contemporary terms, the question has been kept alive by the fact that the small firm has had hard going. Government war expenditures are running at the rate of about \$7.7 billion a month (including pay, subsistence and travel for the armed forces). Consumer expenditures for goods and services are running about parallel; but they include sales of goods whose manufacture has been for some months shut down—inventories whose exhaustion, as Mr Whiteside, of WPB's Office of Civilian Requirements, recently pointed out, will cut available supplies by some 20 per cent come autumn. The country's smaller plants have therefore been forced to scramble for vanishing raw materials or to find a link with a big plant, to serve as a sub-contractor to a firm that has war orders. Since the head of every small business is somebody's constituent, interest in the problem has been widespread in Congress. Both House and Senate early developed a Committee on Small Business; and when the former began hearings in December, 1941, no fewer than 277 members of Congress appeared before it. Results of the deliberations include the Smaller War Plants Corporation, with \$150 million at its disposal. This organisation performs, for small companies, some of the functions that are self-financed by large corporations: as a Washington agent, to connect orders and plant capacities, as a technical adviser, as a managerial consultant. Units devoted to small business now operate in five agencies: in the War and Navy Departments, the Department of Commerce, the War Production Board, and the Department of Justice. The Reconstruction Finance Corporation Act has likewise been amended to provide certain means of easing hardships caused by freezing of inventories.

To some extent, these developments represent a change of technique in the public policy with regard to maintenance of the small firm. These new units offer positive means of aiding the small firm to improve its position. The units in both the Service branches and the WPB are charged with knowing what needs to be done that small business can do, and knowing what small businesses can do it. The unit in the Department of Justice receives complaints on, say, such subjects as discrimination in the supply of raw materials, investigates alleged abuses, attempts to straighten them out.

As a result of current developments, post-war economic policy-makers seem likely to have these questions on their hands: What permanent disposition is to be made of the publicly financed plant capacity now being operated under lease to private companies? (This question repeats, in

ramified form, the post-1918 question of what to do with Muscle Shoals, finally answered by the New Deal in the establishment of the Tennessee Valley Authority.) If production slackens off, will small firms either die on their own initiative or be absorbed and their capacity be retired by the big units in the industry? If production is maintained at a level high enough to prevent this, will there be control of a wide variety of markets through such devices as price leadership by concerns whose position the war has made more dominant? Is the result of present sub-contracting likely to be proliferation of vertical controls by manufacturers of end-products containing large numbers of accessories or of raw materials?

What about patents? Even before the war, the Temporary National Economic Committee, in its investigation of the concentration of economic power in the United States, noted the use of patents as a technique of domestic market control, and Bills were introduced in Congress looking towards the overhauling of patent law. International liaison of American firms with such Axis establishments as *IG Farben*, as indicated in indictments brought by the Department of Justice and consent decrees obtained, have given the subject additional interest since the US entered the war.

So far, answers to these questions have hardly begun to emerge. The record of the traditional American method of dealing with industrial bigness is a phoney record—phoney enough to provide a basis for Judge Thurman Arnold's ideas about social ritual. It is a record of a contest between public threat and private know-how. It is a negative record of prohibiting certain means of doing business, and regulating others, while leaving initiative as to the next move in business hands. The private know-how has been persistently active; the extent of the public threat has fluctuated with the popular temper and the popular temper has fluctuated with the economic condition of the time—alternating with anger at monopoly has been the American people's admiration of the process of mass-produced standardisation.

American Notes

The President's Lead

Mr Roosevelt's message to Congress, summarising the military and production position, has had a warm reception. In its massive array of facts and figures on the successes of Allied arms and the achievements of the American production programme there was little to which any critic could take exception. Mr Roosevelt evidently felt himself upon solid ground; and it was, perhaps, only human for him to seize the opportunity of pointing out that there are occasions, such as the negotiations with Italy, when the Administration is compelled to be silent under criticism. The fact that the Italian surrender may free Allied naval forces for the Pacific war underlined his emphasis on the fact that there is, in fact, only one war, and one basic strategy; that there is, indeed, no such separate entity as the "home front" divorced from war considerations. He was able, without detracting from the tally of achievements, to point out that final victory is still a long way off, and at the same time to urge on Congress the immediate study of demobilisation problems and of the provision of greater security for the returning soldier and the civilian. The President appeared, for the moment, not as a controversial figure, but in his most popular rôle, that of the successful Commander-in-Chief. In the country, at least as reflected in the Gallup polls, this is having an impressive effect. If the elections were held now, with Mr Roosevelt running for a fourth term, the poll suggests that he would have a 55 to 45 lead over Governor Dewey, who appears as the favoured Republican contender; 59 to 41 over Mr Willkie; and 58 to 42 over General MacArthur. This is a startlingly different picture from earlier election years when the President was at his low point at a similar stage and shot up to first place just in time for the decision.

The House Resolves

By the enormous majority of 360 to 29, the House of Representatives has placed itself on record as favouring the creation of appropriate international machinery with power adequate to establish and maintain a just and lasting

peace among the nations of the world and as favouring the participation of the United States therein through constitutional processes.

The last three words, which were not part of the original Fulbright resolution, were added by a Republican amendment and are intended to show that Congress has no intention of giving the Administration a blank cheque to arrange America's part in the settlement. The passage of the resolution is encouraging evidence of the need that Congressmen, fresh from their constituencies, feel of re-assuring their supporters of some measure of American collaboration. This is perhaps its main importance, for it is the attitude of the Senate, rather than that of the House, which specifically affects the issue; the House vote is only a heartening indication of public pressure. It is, indeed, possible that the Senate may pass a more vigorous version calling specifically for the use of force. The wording of the Fulbright resolution errs, if anything, on the side of caution; with its stress on constitutionalism it goes little beyond the Republicans' Mackinac statement. As Mr Ham Fish—no veteran Internationalist—put it, "No one can vote against the Ten Commandments." The first step has been taken towards participation. But the majority resolution commanded makes it plain that the real issues were not at stake. It is easy to pass well-intentioned generalisations about war and peace. It was done more than once in the 'twenties, in the resolution favouring the Kellogg-Briand pact, for example, which one observer characterised as "fighting howitzers with hymn books." It will be a sign that the heart of the matter has been reached when, after stormy debate, the majority can be counted, not in hundreds, but in tens or even ones and twos.

Budgeting Manpower

The whole weight of the Forces has been deployed before Congress to stem the passage of Senator Wheeler's Bill to defer the drafting of fathers until 1944. General Marshall has testified that to postpone the drafting of fathers until January would force changes in already determined military strategy. Admiral King estimated that nearly half the fathers to be called up would go into the Navy, Marines and Coast Guards, and that delay in their induction would be equivalent to delaying the entry into service of nine aircraft carriers. The eagerness of certain Congressmen to seize upon any alternative to the drafting of fathers was bluntly discouraged by General Marshall, when he rejected suggestions that the Army's physical and mental standards should be reduced or that the 446,000 men wanted might be taken from the production lines. He denied vigorously that the Italian surrender justified a further reduction of the Army's manpower goal from the present 7,700,000 wanted by the end of the year. Although the vote on Senator Wheeler's Bill has been postponed until September 28, the objections advanced by the Service witnesses have almost certainly guaranteed its defeat. It should not be imagined, however, that the heavy guns of the Forces had to be brought into play purely to stop a Wheeler whim. Senator Wheeler and his colleagues know what brings in the votes. A recent Gallup poll showed a 68 per cent majority in favour of drafting single men who are in essential war work before drafting fathers who are in non-essential occupations. The Service witnesses were talking to the country even more than to Congress. Meanwhile, the Baruch manpower report has been published, and committees are already being established in California to carry out its suggestions of community manpower budgets, the readjustment of war contracts, and the setting up of manpower priorities. Some figures recently published in the *Wall Street Journal* make it clear why the West Coast has developed the worst manpower crisis in the country. In the first five months of this year, about \$2,333 millions of additional war contracts were added to the very heavy procurement programme already carried by the Pacific States. More than half of these related to aircraft. Added to the shipping, ordnance, oil, lumbering, and agricultural demands for employment in this area, a manpower crisis was inevitable.

An Economic Foreign Policy

Walter Lippmann has now turned upon American foreign economic policy the same clear and realistic analysis which distinguished his consideration of the post-

war political scene in his book "American Foreign Policy." In a series of five articles in the *Herald Tribune* last month he finds that the major contributions the United States can make towards world economic stability are, first, the maintenance of full employment at home; and, secondly, the development of a foreign economic policy based upon a full understanding of the fact that the United States is now a great creditor nation and must act as such. It is his contention that the failure to find peace, order and steady prosperity after 1918 was due, as far as the United States was concerned, to three main causes: the dissolution of the alliance which had achieved the victory; the failure to realise that the maintenance of full employment had become a paramount necessity of domestic policy; and the unwillingness to act in accordance with the transition of the United States from a debtor to a creditor country. Recognition that the provision of employment has now become a primary national duty has percolated into the thinking of management as well as government; where the strain will come is in the choice of methods. Mr Lippmann points out that full employment can be attained in two ways: by a thoroughgoing collectivism; or by the operations of free enterprise carefully protected and regulated by a Government determined to avoid the tendency toward monopoly and to counteract the tendency to booms and crashes. This Mr Lippmann calls a "compensated economy," and he is firm in his insistence that free enterprise, by itself, will not be equal to providing full and steady employment. This is a point on which there will be loud disagreement from American industry. But Mr Lippmann's interest in full employment, in this connection, is not purely with its domestic aspect, but with its importance as securing that the United States will afford a good market for imports and not be unduly "export-minded" after the war. It is Mr Lippmann's thesis that

The basic principle of an economic foreign policy is that the foreign accounts of a nation must be brought into balance by ordinary economic transactions.

He is anxious because once more the United States is "getting ready, even getting committed, not to have an economic foreign policy after this war."

THE WORLD OVERSEAS

Russia's Triumphs and Tribulations

"THOU hast been poor, and thou hast been plentiful, thou hast been mighty and thou hast been helpless, Mother Russia"—so wrote a Russian poet once in an inspired invocation to his country and people. The triumphant salvos which are now being fired in Moscow almost every day announce to the Russian people and the world Russia's might. This might has shown itself on battlefields stretching hundreds of miles from north to south, which have moved tens and hundreds of miles from east to west. The advance continues. Compared with it, the Russian victory over Napoleon looks almost slight; this time the invader has not been beaten by the Russian climate, but by the Russian people. But the land through which the victorious armies are advancing has been laid waste in the course of many battles. Many great Russian and Ukrainian towns are now heaps of ruins; and innumerable villages have been razed to the ground. It is no wonder that, beside the joy at their victories, the Russians now feel acute anxiety about the future of their liberated territories. When and how can new life be built on the reconquered wilderness? This question is now uppermost in the minds of many Russians who once again see the old shadow of Russia, poor and helpless, creeping ominously behind the spectacle of Russia's might.

To the Frontier

The summer offensive has now lasted two and a-half months. Early in July, the front line ran east of Orel, skirted Kursk from the west, then turned to the south-east, beyond Belgorod and Kharkov, and formed a large bulge covering roughly the Donetz and ending close to the west of Rostov. When the summer campaign began, about four months after the winter fighting had ended, it was almost generally assumed that the battles of the Kursk and Orel salients were operations with only limited and local objectives. The fighting for Kursk revealed the strength of the Russian defence; for the first time the Russians proved able not only to halt a German offensive in the summer, but also to nip it in the bud. But nothing seemed to portend a summer offensive by the Russians themselves. The German line had been shortened by the retreat from the Caucasus and the Volga. It seemed that the four months' lull after the winter campaign had allowed the German High Command to replenish its reserves, to regroup its armies, and to complete the fortification of a defence zone built up during more than twenty months.

To the Attack

Yet the repulse of the German attack on Kursk was the signal for the first striking demonstration of Russian offensive power. On August 4th Orel fell. The first break in the "eastern wall" was made. Violent fighting soon flared up all along the front from Smolensk southwards. In the first stages, roughly until the end of August, the pace of the Russian advance was still relatively slow. The tide was still

beating against the hard outer crust of the German defence belt. The next break after Orel was Kharkov. At the beginning of September the pace of the offensive quickened. During the past three or four weeks the Donbass has been cleared; vast expanses of the eastern Ukraine have been freed; and in central Russia the advancing armies have surged forward and broken into the famous Smolensk gate, where the fate of Russia was decided in so many wars, and into the Bryansk gate, which opens the road to Belorussia.

Two weeks ago military experts were still wondering whether the Russians would be able, in the course of the summer campaign, to spring forward from Kharkov to the Dnieper bend between Zaporozhe and Dnipropetrovsk. The Russian advance is now nearing, not only that easternmost bend, but also the whole middle course of the Dnieper; at some points the Russians are already over 200 miles west

of Kharkov. From Melitopol to Chernikhov, with the exception of the Poltava sector, the front now runs almost parallel to the Dnieper, at an average distance of 20 to 50 miles. The line has been lengthened by at least 120 miles compared with its length at the beginning of the campaign.

What factors have made possible this tremendous advance? First, there is the fact of Russian superiority in manpower. Not fewer than 300 divisions—4 million men—have been thrown into the battle. The number of German divisions engaged on the eastern front has amounted, according to official Russian statements, to 212 divisions; and the number of satellite divisions has fallen from 60 in 1942 to 25. Of the 16 Roumanian divisions (of very low fighting value) some have been engaged in the Kuban, and the rest in police duties behind the lines. The Finnish divisions have been almost inactive this year. The loss of the other satellite forces—Italian and Hungarian—was again, according to Russian claims, made more than good by the addition of 33 German

divisions to the 179 divisions used in the offensive of 1942. This year, however, the German corps and divisions have very often been merely nominal units; and Russian reports frequently speak of "detachments whipped together from auxiliary forces." Even on the basis of nominal figures the Russian margin of superiority in manpower has been of the order of 50 per cent; actually, it has been substantially larger.

Masters at Arms

The other factor which has contributed to the continuous Russian attack has been a change in the technique of fighting. Reports repeatedly suggest a considerable "modernisation" in the weapons employed by the enemy. Fewer tanks and fewer aeroplanes have been employed by the Germans than at any time before. On the Russian side this year's victories have been the triumph of the gun. The concentration of artillery fire on some sectors of the front has been described by Russian commanders as ten times stronger than the concentration at Verdun in the last war;

and artillery will undoubtedly play the decisive rôle in breaking the German defences on the Dnieper itself, and in securing the crossings of the river. This is not to say that the tank and the aeroplane have been absent from the battle. The Russians seem, in fact, to have attained at least equality with the enemy in these weapons. But tanks and aircraft have been much less conspicuous than the gun. The Russian Command has shown the unfailing *coup d'œil militaire* in handling all sorts of arms—from the most modern to the most "primitive"—according to the requirements of the terrain. For the conquest of open steppe, it relied on the tank; for the reduction of strong points and fortresses, on the gun; and for the forcing of the swamps and forests around Bryansk, on cavalry.

The Victorious Pursuit

The further prospects of the fighting in the east seem now to depend mainly on two factors: on the capacity of the Russians to exploit their enormous gains in transport facilities in the reconquered areas; and on the weather. Weather conditions seem to be of second importance. The Russian High Command remains faithful to two Napoleonic principles—that "an army can march anywhere and at any time of the year, wherever two men can place their feet," and that "a general should never allow any rest either to the conquerors or to the conquered." The rainy season can in any case hardly hamper operations on the southern fringe, where a double threat to the Crimea may very soon develop from Novorossisk in the east and Melitopol in the north. The repair of the dense rail network in the eastern Ukraine is being tackled with vigour and urgency.

Whatever enforced interval there may be between the summer and the winter campaigns, the Russians are certain to resume their drive to the frontier with even greater force and speed. The distance between Melitopol and Odessa is roughly the same as the distance between Rostov and Melitopol; and the road from Kiev to the old Polish frontier is very much shorter than the road from Kharkov or Kursk to Kiev. Like Count Platov in 1813, another Russian general may write, in the not distant future, reporting on a victorious pursuit, that "the bones of the arrogant foreigners are scattered from Moscow to the Niemen"—and from Stalingrad to the Dniester.

Building on Scorched Earth

On August 22nd, the Council of People's Commissars issued a decree on "immediate measures for the restoration of national economy in the districts liberated from German occupation." The decree, which filled several closely printed pages in *Pravda* and *Izvestiya*, is in many respects a unique document. It marks the beginning of the "journey back" of the civilian population to the liberated areas. It also reveals something of the desolation and impoverishment which those areas have suffered through war and German occupation. Their economic restoration has been centrally planned, and though the instructions say very little about the general principles on which the work of reconstruction is to be based, they provide an enormous amount of the most detailed and meticulous information about the first steps which are now to be taken.

Strikingly, the decree contains no hint about the restoration of the industrial life in the liberated towns. It deals almost exclusively with the rehabilitation of agriculture and railway transport, and with elementary tasks of housing and sanitation, without which no start can be made with reconstruction. The time for systematic industrial rebuilding has obviously not yet come. Most large-scale industries were evacuated, and their re-evacuation now would entail stoppages in production and upset the war economy. The urgent need is to protect local populations against famine and disease; and local agriculture now takes highest place in economic priorities. The decree shows that the Government has set out to attack the problem with the greatest determination and meticulous care. It also shows the grim situation and the inevitable limitations with which it is faced.

The Great Trek

The first chapter of the decree provided for the return of evacuated cattle to the collective farms in the provinces of Kalinin, Smolensk, Kursk, Orel, Voronezh, Rostov, Stalingrad and Stavropol. The total number of cattle, horses, sheep and goats to be re-evacuated is about 600,000; and in the last days of August an extraordinary and dramatic trek

EXTRA VITAMINS ESSENTIAL TO HEALTH

Colds and influenza cannot be resisted when your diet is deficient in vitamin A: the daily dose of Crookes' ensures you the necessary amount. Adults cannot keep healthy and children cannot grow up with straight bones and strong teeth without sufficient vitamin D: the daily dose of Crookes' keeps your supply well above the safety level.

This extra supply of vitamins A and D will work wonders in building up your resistance and stamina through this fifth wartime winter.

CROOKES' HALIBUT OIL

LIQUID—PER PHIAL—ENOUGH FOR 16 DAYS 2/-

started from the remote interior of Russia, even from Asia. Throughout September the droves of cattle are moving steadily westward, and the trek is due to end on October 15th. Shortage of transport accounts for the fact that the animals cannot be carried by rail; they must be driven on foot for hundreds of miles, sometimes for more than a thousand miles, as, for instance, from Kazakhstan to the district of Voronezh. Veterinary personnel, in limited numbers, have been detailed from Red Army reserves to move with the herds, and various Government departments have been assigned the task of arranging crossings on the Volga.

The extent to which the returned animals will meet the needs of agriculture in the liberated areas can only be properly judged by comparing their total numbers with the pre-war numbers of cattle in the districts. The Orel district possessed 857,000 horned cattle in 1938; it is now to receive 21,000; the Smolensk district had 889,000 horned cattle and receives 48,000; it had 394,000 horses, and now receives 7,000. The table below shows for the main districts the percentages that the numbers of re-evacuated cattle bear to the 1938 totals:—

Province	Horned Cattle	Sheep and Goats	Horses
Kalinin.....	3.5	2.5	2.0
Smolensk.....	6.0	3.0	2.0
Kursk.....	0.3	0.9	0.3
Orel.....	2.5	5.0	2.0
Rostov.....	5.0	10.0	8.5
Stalingrad.....	1.5	3.0	1.0

These totals and percentages are not necessarily final. The Commissar for Agriculture has been instructed to inquire in the undevastated areas what other evacuated cattle have been left behind, and to "establish the number of additional cattle that should be returned." But it is probable that the "additional numbers" will not alter the picture very much. Some kind of compulsory redistribution of cattle between the various parts of the Soviet Union may, perhaps, be envisaged; but, even apart from the social difficulties of such redistribution, while this would tend to spread the incidence of the fall in the numbers of Russia's cattle, it could not remove the heavy effects of that fall on Russian agriculture as a whole. And some provisions of the decree, such as the obligation of farmers in the east to repay for evacuated cattle already slaughtered for deliveries of meat to the state, are very likely to cause friction.

The State of Agriculture

The small numbers of cattle to be returned are probably due to the fact that the original evacuation from west to east was much less successful in agriculture than in industry. Most of the cattle remained in the west in 1941-1942, only to be requisitioned by the Germans or to perish during the fighting. What is perhaps more surprising is the relatively small numbers of tractors (5-10 per cent of the pre-war stock in these districts) to be returned, and the great emphasis placed on supplying the farmers with horse-drawn ploughs. These other agricultural implements must be delivered by the People's Commissariat for Armaments which at the beginning of the war took over the factories producing agricultural implements, and converted them to production for war. Similarly the Supply Administration of the Red Army has been ordered to "allocate from booty" specified quantities of equipment to the reconstructed machine tractor stations in every liberated district—and thus to turn German swords into Russian ploughs.

Further instructions specify in great detail the number of the machine tractor stations to be restored; the materials and spare parts to be delivered to them; the cost of the transfer of workers, allocations of timber and other building materials for the construction of agricultural buildings and dwelling houses for "collective farmers, workers and employees, at present living in earth huts and ruined houses"; the limits of credit (10,000 roubles for a period of seven years) to be granted to families for individual residential buildings, and so on. The many details of the decree, which add up to a vivid picture of the entire position, convey the impression of incredible destitution, destitution which at times seems to be well below any possible standard of human needs.

Another significant feature of the decree is the obvious anxiety to preserve the collective structure of agriculture. In the areas now liberated, the German probably did not have the time to carry out the distribution of land among the peasants that they promised. But the collective farms may well be in danger of disintegration because of the lack of the material conditions for large scale collective farming, and especially because of the lack of tractors. The danger is now

met by the offer of inducements to collective farming such as exemptions and lower rates of taxation in kind, and the institution of fresh deterrents to individual farming, whose delivery quotas are now 30 per cent higher than those of the collective farms.

Some of the rates of deliveries fixed in the decree show the very critical position in regard to this year's harvest. The grain delivery to the Red Army's Corn Fund by the farms of the Kursk province was planned in July at 560,000 tons; in August the rate was reduced to 250,000 tons; and the pre-war grain delivery of this province was 1-1.5 million tons. The Stalingrad province has been exempted from the delivery of most crops; and its arrears from previous years have been written off.

A special chapter is devoted to "measures for the reconstruction of railway stations, halts, signal boxes and other railway buildings." The work is to be carried out by special battalions of railway troops as well as by the populations of the recaptured areas who are liable to be mobilised for that purpose for the duration of the work.

The Issues of Policy

The sharp contrast between military victories and economic desolation is likely to weigh heavily upon the political mood in Russia for some time to come. The triumphs of Russian arms have given rise to strong feelings of national pride, which sometimes tend to develop into an exalted nationalism with a distinct isolationist tinge. The possibility that this state of mind may colour Russian thinking on matters of post-war reconstruction can by no means be ruled out altogether. What the decree on the immediate measures of reconstruction has revealed is the absolute inadequacy of any isolationist approach. The rehabilitation of the liberated areas with the sole help of Russia's own domestic resources would meet with the greatest difficulties. Not even the most efficient planned economy can work miracles in the prompt increase of a decimated cattle population. It should not be forgotten that this is the second catastrophe of its kind that Russian agriculture has suffered within fifteen years—the first one took place during the years of compulsory collectivisation.

There is no evidence so far that any policy on the ways and means of reconstruction has crystallised in Russia. The new decree is hardly more than a short-term, though amazingly thorough, measure to meet the most urgent needs of the moment. Its most characteristic feature is purely administrative and empirical approach. As the victory draws nearer, however, the pressure of economic facts calls for a broader formulation of Russia's programme of reconstruction. This, in its turn, involves the linking up of domestic economic issues with international problems. Russia will unavoidably need the aid of foreign economic resources in the rebuilding of its agriculture, and in the switching over of its industries from peace to war. Indications so far suggest that two parallel lines of action are being contemplated in Moscow. One is directed towards economic co-operation with the Allies; this line of action has found its most distinct expression in the attitude of the Soviet delegation at the Food Conference at Hot Springs. The other is to shift at least a part of the burden of reconstruction on to the shoulders of the defeated enemy, by compelling him to pay reparations and indemnities for the damage done to Russia.

Reparations Demanded

It is highly significant that Moscow has so far been the only Allied capital in which the demand for reparations has been firmly and unequivocally stated. An official Commission has for some time been preparing the list of Russia's material losses, and assessing their size in terms of finance. Ideological considerations, which in the past caused Russia to take a hostile attitude towards reparations under the Versailles Treaty, have now been discarded. The case for reparations was recently stated by Professor Varga, the former chief economist of the Communist International, who bitterly criticised the Versailles reparations for more than twenty years. Professor Varga now declares that Germany could easily have met its financial obligations after the last war, and that the burden of reparations was a myth. At the same time, the Russian economic spokesman has raised the problem of reparations not only for Russia, but also for all the occupied nations. The question is still open whether Russia will ultimately put the stronger emphasis, in its reconstruction programme, on economic co-operation with Allies or on reparations from Germany.

Controls in Canada

(From Our Ottawa Correspondent)

September 1st

THE frank admission by Mr Donald Gordon, chairman of the Wartime Prices and Trade Board, that "our efforts at price control are slipping" has drawn attention sharply to the serious threat that has arisen recently to price ceiling and other control policies. In part, the threat arises from a psychological let-down experienced by the Canadian people with the conviction that the war is practically won. Warnings that hard fighting and reverses may still lie ahead have had little effect in Canada. After four years of war, in the last two of which the restrictions on civilians have been steadily tightened, the people of Canada have begun to behave as if the fifth year will bring peace and the beginning of an end to the controls. To some the simple remedy would be a few bombs dropped on Canadian cities. But no bombs have been dropped in Canada and none are likely. The controls, if irksome, have not involved serious sacrifice. "The plain fact is," said Mr Gordon, in a moment of blunt speaking, "that the great majority of Canadians living comfortably at home are better off right now than they ever were before the war."

The political implications of this new and fierce grumbling against the controls provide a first-rate crisis for the Government. The Co-operative Commonwealth Federation, real winner in the recent Ontario election and in two Federal by-elections, is openly ascribing its success to opposition to the controls, especially on farm prices and wages. The new party in Quebec, *Le Bloc Populaire Canadien*, openly campaigns for a more limited war effort. The Mackenzie King Government has suffered a greater slump in public esteem than at any other period in the war. The conscription crisis of 1942 was fair sailing compared with this. Moreover, the belief that an end of the war will bring an end of controls is obviously mistaken, for the shortages of supply that make control necessary cannot be repaired immediately.

The failure of public support, now frankly conceded by the price controllers, has coincided with a period in which price control is under its severest test. Civilian stocks are shorter than ever before. Inventories have been exhausted. The surplus in purchasing power has risen steadily in a great tide sapping at the dykes of price control. The Wartime Prices and Trade Board estimated that, in 1942, individuals' income amounted to \$6,850 million, of which \$600 million went to personal taxes, \$4,450 million to goods and services, leaving unspent income of \$1,800 million. For 1943, the estimate tentatively shows individuals' income of \$7,600 million, personal taxation of \$950 million, expenditure on goods and services of \$4,050 million, leaving a residue of \$2,600 million for savings and investment.

The record of Canadian price control, up to the present, has been excellent. The Brookings Institute reported recently that the Canadian programme of economic stabilisation had restrained the rise in living costs to 17 per cent, while in Great Britain the rise was 28 per cent and in the United States 26 per cent, since September, 1939. At the end of four years of war the cost of living index had risen 17.9 per cent; in the corresponding period of the last war, 54.5 per cent. During the past two years, since the price ceiling was established with September-October, 1941, as the base, the rise has been less than 3 per cent.

The restrictive effect on farm prices and on wages, the two central issues of price control controversy, has been greatly exaggerated in Canada. This is due, in part, to the propagandist effect of the ceiling itself. The belief prevails that the economic position of virtually every person has been frozen for two years, but the evidence is all the other way. The ceiling control has been concentrated on consumers' prices, and maintained by subsidies and by the "squeeze" of production costs. But both farm prices and wages have risen, and this is admitted frankly.

The war has brought a steady improvement in the economic position of Canadian agriculture. Farm prices in 1943 have been 43 per cent higher than in 1939. If wheat is excluded, since wheat is a special case affected by over-production even in terms of war demands, the farm price level is 50 per cent above 1939. In addition, the transfer from wheat to other crops in the west has been subsidised,

and production subsidies, minimum prices and forms of market support have been applied to virtually all important farm products. At the same time, farm production has increased by 25 per cent on the whole since the start of war, and, in some items, many times that amount. Farm prices are 7 per cent higher than in the 1926-29 boom period. The result of higher prices and increased production is the highest level of farm income in Canadian history. In 1942 farm income reached \$1,140 million, the highest figure on record. In addition, subsidies on production amounted to \$100 million. The 1943 farm income is not likely to be less, though possibly not much more.

As far as wages are concerned, the complaint that they were frozen at an unfair level is one of the current illusions of Canadian politics. The Department of Labour's weighted index number of wage rates rose from 105.3 in 1939 to 108.4 in 1940 and to 119.2 in 1941. Since June, 1941, the Department has compiled average per head earnings in eight leading industries, and the figure rose from \$25.25 per week in the first report to \$30.70 per week in March, 1943. In percentages, the weighted index of wage rates rose 19.2 per cent from 1939 to 1941, and the average weekly earnings by another 21.5 per cent from June, 1941, to March, 1943. In this period the cost of living index showed a rise of 17.2 per cent.

But this is not all. The National War Labour Board has granted 89 per cent of the applications coming before it for wage increases, and the total granted has amounted to \$79,237,104 a year among 1,567,063 workers. This includes cost of living bonuses in certain cases, but, in addition, a general cost of living bonus of 2.4 points, averaging 60 cents a week for 2,500,000 workers, was ordered by the Government in August, 1942, and still prevails. This added at least \$80 million more to Canadian payrolls. Reasons for increased earnings are found in longer hours, overtime, increased production at piecework rates, upgrading and promotions to higher-paid classifications.

The effect of price control upon the consumer, even while farm prices and wages have risen, is best illustrated in the fact that the price of bread (based on ceiling control of the price of flour) represents the cost of wheat at 77.8 cents a bushel. Actually, the market price of wheat is \$1.10 a bushel, and the difference is absorbed by the Government as a drawback to millers. This is a form of subsidy for the consumer. The present discontent with controls in Canada is founded not on economic injustice or unfair controls, but upon conditions of relative prosperity both in agriculture and labour. Since the attack exists almost entirely on the left, the real meaning of it must be found in political reasons, mainly the demand to utilise wartime controls as an agency to promote the advantage of certain groups, such as the farmers and the wage-earners.

Roumanian Harvest

[BY A CORRESPONDENT]

EVEN in peacetime, agricultural statistics published in Balkan countries were unreliable estimates. Since the beginning of the war, estimates both of the area under cultivation and of the yield have become instruments of political propaganda, and the frequent changes in the frontiers since 1940 were made use of to create confusion. Nevertheless, it can be said that this year, as in other Balkan countries,

SUN LIFE ASSURANCE COMPANY OF CANADA

(Incorporated in Canada in 1865 as a Limited Company)

SPECIAL ANNUITY PLANS

Write for particulars to H. O. Leach (General Manager for British Isles)
141 SUN OF CANADA HOUSE, PALL MALL EAST, LONDON, S.W.1

Roumania's cereal harvest has undoubtedly been favoured by the weather, and there is no reason to doubt that there was a good yield of wheat. The weekly bread ration has already been increased from 3½ lb. to 4½ lb. If the maize harvest is only average, it can be estimated that the wheat surplus will amount to some 700,000 tons. It would, however, be wrong to assume that the entire surplus will be available for export to Germany. Agricultural experts in Turkey, reporting on the agricultural situation, estimate that Roumania may perhaps be able to export from 200,000 to 400,000 tons of wheat. Roumanian agricultural authorities seem to favour a policy of husbanding the wheat surplus, and every effort is being made to complete the twenty-seven grain silos which have been under construction since last year. In spite of the good harvest, the control of deliveries has been tightened and the peasants' threshing activities are already controlled so far as is possible in a country predominantly farmed by smallholders. For this purpose, a threshing control book has been introduced.

Official reports state that the 1943 plan for cultivating 11.5 million hectares was fulfilled. The plan laid down the following acreages for the main crops:—

(In '000 hectares)			
Wheat	3,000	Pulse	500
Maize	4,000	Cotton	100
Oilseeds	600		

The remaining acreage is divided between barley, oats, potatoes, sugar-beet, and tobacco. These are the figures published by the Minister for Agriculture, Aurelian Parna, who was replaced a short time ago by E. Marian. It can be doubted whether these figures are correct. The actual acreage under maize, for instance, is probably much smaller and may not even have reached 3,000,000 hectares.

It is, however, confirmed that the agricultural situation showed some improvement this spring. Germany delivered a considerable part of the agricultural machinery promised in former agreements, and the large-scale cultivation of the plots of smallholders combined in the so-called "Village Communities" enforced by the Government last year may have had some good results. There are now 203 of these Village Communities comprising 37,726 hectares owned by 6,400 members. German influence is largely responsible for a considerable increase in the cultivation of oilseeds, flax, hemp, potatoes and sugar-beet. But the experiment in large-scale cotton growing seems to have been a failure, whereas the cultivation of rice is reported to have had some success.

German Aims

The good wheat harvest has placed Roumania in a difficult position. Germany will naturally try to secure as much as possible of it. The Roumanian Government, on the other hand, must first try to buy up the harvest. Legally, only the State Purchasing Co-operatives are entitled to buy up the harvest, but this would mean that the Government would have to provide at least Lei 30,000 millions. Budget resources are not available, and the inflationary issue of banknotes for the purpose would gravely impair the already precarious financial and currency situation. German representatives will undoubtedly use this argument to exact as much wheat from Roumania as possible. In this respect, Germany is still in a favourable position because of the long-term credits, amounting to Rm. 600 millions, which were granted some years ago. If, however, the actual food supply situation is considered it is clear that Roumania would have no difficulty in consuming the greater part of what is termed, under conditions of rationing, an exportable surplus.

During the war, cultivation has shown considerable changes, and from 1940 to 1942 war conditions, combined with unfavourable weather, produced a series of bad harvests. The effect on the livestock population may be seen by the following official figures published a short time ago. The livestock population was as follows:—

(In '000)			
	1940	1941	1942
Pigs	7,970	9,330	2,400
Cattle	2,550	3,400	3,760
Sheep	7,920	9,300	9,780

The enormous reduction in the pig population was caused by the failure of the maize harvest, though the emergency slaughter which ensued eased the position of meat supplies for some time. The increase in the cattle and sheep population reveals the result of German pressure. Germany

encouraged this increase to the disadvantage of livestock breeding in Western European countries, particularly Denmark and Holland, where the livestock population could only have been granted supplies of feeding-stuffs from Balkan countries. This is, however, not the only explanation. The increase in the cattle and sheep population is also due to the fact that the peasants, who had to deliver cereals at fixed prices, found livestock and meat prices more remunerative when set against the general increase in prices. Unfortunately, Roumania no longer publishes wholesale price statistics. The index of the cost of living shows, on the other hand, a 300 per cent increase during the period from August, 1939, to June, 1943. Price control is thus largely fictitious.

This tremendous increase in prices makes Roumania's trade with Germany extremely difficult. Four years ago Germany fixed a very favourable exchange rate, which it cannot change at the moment because of its own financial situation. On this basis, Germany is forced to pay nominally exorbitant prices for Roumanian exports, whereas Roumania could, in theory, import German manufactures at very cheap prices compared with the internal price level. No satisfactory solution has been found at the moment. The system of price equalisation which has been introduced in foreign trade between Germany on the one hand and Italy, Hungary and Bulgaria on the other has also been introduced in trade with Roumania. But the price changes and the ineffective price control in Roumania seem to be a serious obstacle.

Portugal's Foreign Trade

[FROM OUR LISBON CORRESPONDENT]

August 24th

FROM figures (provisional but reasonably accurate) covering 1942 trade an interesting comparison of Portugal's imports and exports, classified in geographical groups, may be made. It should be borne in mind that tonnage as well as values must be taken into account and also the fact that imports of great weight and low value—e.g., coal—may, by their sudden diminution, give a false impression:

	IMPORTS (IN VALUE)		
	1938	1942	Total 3 Years 1940-42
United Nations.....	£ stg. 8,210,000	£ stg. 8,640,000	£ stg. 32,700,000
Axis and Occupied lands	9,660,000	3,970,000	12,450,000
Neutrals (chiefly Sweden and Switzerland)	1,790,000	3,580,000	9,420,000
Portuguese Colonies.....	2,349,000	5,660,000	12,930,000
Unspecified Origin	1,030,000	3,000,000	6,440,000
	23,030,000	24,850,000	73,940,000

Thus, in the three years 1940, 1941 and 1942, supplies from the United Nations accounted for 44 per cent in value of the total against 17 per cent from Axis sources during 1940-42. The main reductions in tonnage compared with 1938 were as follows:

	Tons	
	1941	1942
(Decrease on 1938 Totals)		
Coal	467,000	663,000
Oils	15,000	153,000
Timber	62,000	96,000
Iron and Steel	58,000	68,000
Manufactures and machinery	38,000	33,000
Total decreases	640,000	1,013,000

Exports, which in 1942 were almost four times as great in value as in 1938, are tabulated below:

	1938	1942	Percentage Increase
	£ stg.	£ stg.	
United Nations.....	3,370,000	14,590,000	333
Axis and Occupied lands	4,490,000	11,840,000	164
Neutrals (chiefly Switzer- land)	1,640,000	7,360,000	348
Portuguese Colonies.....	1,370,000	4,500,000	228
Unspecified	540,000	1,000,000	85
	11,410,000	39,290,000	244

In volume, exports show great reductions during the past two years; there was a drop in pyrites and other items of great weight and small value, whereas items such as wolfram, tin and preserved fish account for big increases in value.

THE BUSINESS WORLD

Scotland's Industries

BEFORE the war, the whole of Scotland was in danger of becoming a depressed area. Though the part of Scotland scheduled as "special areas" comprised only three counties—Dumbarton, Lanark (excluding Glasgow) and Renfrew—and sections of Ayr, West Lothian and Midlothian, it contained roughly a quarter of Scotland's total population. Scottish industry is very highly localised, and the fact that most of its eggs were in the basket of heavy industry meant that Scotland was hit even more severely by the industrial depression of the early 'thirties than its more diversified neighbour, and was consequently slower to recover. The re-armament programme brought fresh life to heavy industry and shipbuilding—unemployment in the Scottish special areas fell from 95,000 in 1934 to 58,000 in 1937. But such industries as textiles, which were largely dependent on the export trade, did not share in the general recovery, and schemes for bringing light work to depressed regions developed less rapidly in Scotland than elsewhere. Firms were reluctant to establish themselves north of the border; the Hillington trading estate, near Glasgow, was not started until 1937; and in April, 1939, there were still 240,000 unemployed in Scotland.

The recovery that the war has brought to the industrial north is reflected in the unemployment figures. In April, 1942, there were only 24,000 unemployed in Scotland, a tenth of the figure three years before, and by July, 1943, the number had dropped to 16,000. Heavy industry, iron and steel, general engineering, shipbuilding, ship repairing and marine engineering have been working at full capacity. The once silent yards of the Clyde are again alive with activity. So, too, are the smaller, but none the less important, yards on the east coast. The chemical industries have provided mounting employment. Explosives production, already sizeable before the war, has been expanded and all manner of propellants and bombs are made. Nitric acid, formerly imported from South America, is now produced synthetically both for the manufacture of explosives and for soil fertilisation. The production of aluminium, chromium compounds and magnesium, required for light alloys and incendiary bombs, has been enormously increased. Scotland is also making medicinal chemicals, such as sulphonamide and anti-malarial drugs which act as a substitute for quinine. A huge building and civil engineering programme, for the construction of defence works, aerodromes, docks, wharves, seaplane bases, storage dumps and military camps, mainly in the remote regions of the Highlands, has made heavy demands on building labour.

But Scottish industrialists still complain that Scotland has been relatively neglected, both in the original planning for war production and in the progressive adaptation of industry to meet strategic requirements. It had no shadow factories, and did not receive its fair share of new aircraft factories, which were largely concentrated in the south. In 1941, whereas £70 million were spent on new buildings in Great Britain, Scotland received only about £5 million—less than half the Goschen proportion of 11/80ths. It is alleged that Scotland has tended to become a universal dumping-ground. Out of nearly 5 million square feet of floor space released in Scotland by the concentration of industry in 1941, 91.7 per cent was used for storage, against only 8.3 per cent for production. The concentration on heavy industry and the relative scarcity of light engineering work led to the transference of women to England, where their labour could be more speedily and productively used. In all, some 13,000 mobile women have been moved from Scotland, the majority during the first 2½ years of war. This transference of labour is a very sore point in Scotland, and one on which the Scottish Nationalists have been quick to fasten. After the steady drift of population to the south in pre-war years, the Scots are afraid that their country will become permanently depopulated. It is not so much

resentment at Scottish girls working in England as the fear that they may settle down there, with "Sassenach" husbands.

Several reasons are advanced for the alleged failure to recognise Scotland in the war economy. One has undoubtedly been shortage of suitable buildings. Even before the war, this impeded the development of lighter industries, since firms preferred to take up-to-date premises in the south, rather than old factories and mills equipped mainly for heavy engineering work and far removed from the more prosperous centres of population. Parent firms have naturally tended to establish extensions or ancillary plants in their own neighbourhood; and the overloading of the transport system and the method of railway charges have probably also acted as a deterrent. Considerable importance is attached to the psychological factor. Complaints are made of an attitude of mind in Whitehall which tends to place new work within easy reach of London, since business men dislike the idea of a night train journey when they can reach the Midlands in an afternoon. It is difficult for the outsider to judge how much substance there is in these allegations, or where the blame, if any, should be placed. It may even be that Scottish industrialists were not sufficiently awake in the early stages of planning for war production, or that a tinge of conservatism on both sides prevented the adaptation of resources to newer war purposes. But there are undoubtedly some real criticisms to be answered.

To MEMBERS of the Scottish Widows' Fund

In the past 126 years members have
invested nearly **£95,000,000** in
premiums.

During the same period over
£100,000,000 was paid to members or
their families and the Society still holds
£35,000,000 out of which to pay the
claims of existing members as they
arise.

Increase your stake in this strong
old mutual Society. In most cases
new with-profit policies cover **CIVILIAN**
WAR RISKS WITHOUT EXTRA
CHARGE.

Nevertheless, a considerable amount of new industry has in fact been brought to Scotland. Especially since 1942, the southward trend has been somewhat reversed. Between 160 and 170 new projects, giving employment to about 25,000 people, have been developed since the war. Scotland may have missed the first two waves of aircraft production, which brought manufacturers to the Midlands and to Lancashire; but the third wave, involving the manufacture of aircraft components and accessories, has reached the north. About a dozen concerns in the south, manufacturers of aircraft and components, have opened, or are opening, factories in Scotland. One firm from the London area is making "jerricans" (a type of unburstable petrol can which was captured from the Germans after El Alamein) by mass-production methods, and largely with female labour. Other branches of light engineering recently introduced include ball bearings, machine tools, radio electric equipment, electric batteries, gunsights and paper condensers. An important new development is the manufacture of pre-fabricated ships. Some months ago, it was decided that convoys of merchant ships should have more protection; the normal yards were overloaded, and it was necessary to turn firms which had hitherto made carpets, linoleums and similar products, to building sections of ships. On this work, as in many branches of light engineering, female labour is largely used. But even in heavy industry, the proportion of women has increased—about 16 per cent of the iron and steel industry's labour force consists of women—and in the shipyards many of the initial prejudices against the introduction of female labour have been broken down.

The changes in the production programme are themselves giving fresh headaches to the Scots. A large proportion of their factories are engaged on Ministry of Supply work. The cuts in this department's programme may again upset the geographical balance, while the priority given to aircraft may involve fresh transfers of labour to aircraft factories in the south. Scotland still has some reserves of mobile labour, but the policy of taking work to the workers is difficult to adopt at this stage of the war. It is claimed that there has so far been singularly little difficulty in re-absorbing surplus labour and that the production changes are operating smoothly. On the other hand, there are many criticisms that labour, which could be engaged on useful work in Scotland, is still being transferred to England. Complaints of this kind were made by Scottish delegates at the Trades Union Congress, and last week, at a representative meeting called by the Glasgow Trades Council, grave concern was expressed at the effects of the shift in priority. There is no doubt that this issue will assume very large proportions in the near future, when the full effect of the production changes are felt.

Scotland has benefited considerably from the Ministry

of Labour's wartime legislation to improve working conditions. But there is evidence that the strain and stress of long hours is beginning to tell. In 1942, there were 42,000 reportable accidents in Scotland alone, compared with 21,134 in 1939. Most of the larger firms now have works canteens, but the smaller firms still present a problem. There has been a satisfactory extension of works' medical services and industrial health arrangements. Co-operation between workers and employers over production matters and the establishment of joint production committees seem to have lagged behind the rest of the country, but an increasing number is now being set up and the committees have undoubtedly done useful work. The same cannot altogether be said of the shipyard committees, which have only recently been allowed to discuss production; and there is a tendency among some managements to resent the intrusion of the workers into their province and to belittle their contribution. The signs of industrial unrest, which are now appearing throughout the whole country, are particularly marked on Clydeside, with its tradition of bitterness and struggle. Until the recent outbreak of strikes, the Clyde had been, on the whole, happily peaceful.

Any picture of wartime Scotland would be incomplete without some reference to the vast hinterland of moor, loch and mountain. For obvious security reasons, little can be said, except that it offers admirable terrain for military and naval exercises, and has been fully exploited for these purposes. The contribution of Scotland's forests and farms to the war effort has been substantial. A considerable proportion of the softwoods necessary for war purposes comes from Scotland, and the numbers engaged on timber production have increased by about 350 per cent since the war. Were it not for Scottish supplies, the nation's timber position would be very serious. Agriculture, Scotland's largest single industry, has been greatly expanded. The average farm unit is small, but there have been considerable improvements in efficiency and an increased use of machinery. In Aberdeenshire, for instance, the North of Scotland College of Agriculture arranges training courses for farmers and sends specialists to advise the local farmers, who have, on the whole, been receptive to new methods and technique. In this county, which contains one-fifth of Scotland's arable land, 44 per cent of the land was under the plough at the beginning of the war; this proportion has now been increased by half as much again.

In sum, the war has brought full employment to Scottish basic industries, and it has also hastened the development of light industries, though Scotland considers that this development has been far too slow and that its productive resources are not yet fully harnessed to the war effort. A major concern at the moment is how the present activity can be maintained and improved after the war. Some of the plans for meeting Scotland's problems in the post-war period will be discussed in a second article.

Business Notes

Dear Money Spectre

On certain days of this week the money market has been hard put to satisfy its essential credit requirements from the banks, and the special assistance of the Bank of England brokers has had to be obtained. The occasional spasms of stringency which punctuate the otherwise placid life of the money market have led some commentators to ask whether the credit position is not being driven on too tight a rein; and whether, indeed, the cloven hoof of the dear money school is not to be discerned in the recent history of Lombard Street. Looking at that history in broad retrospect, there is no vestige of justification for this accusation. The credit basis has been kept sufficiently broad to meet the needs of the market, and to allow the banks to sustain the superstructure of credit demanded of them by the claims of war finance. If, on many days, the supply of credit has been inadequate to meet the requirements of the market, it is because the exceptional scale of Government disbursements and revenue makes the task of the day-to-day balancing of these two compensating streams one of extraordinary difficulty. The attempt is made weekly, when decisions are taken regarding the scale of floating debt borrowing for the ensuing week. Though the fullest possible information is given by the various Government departments on the size of the revenue and expenditure for this period, accidents are

bound to disrupt the plans made to achieve the required equilibrium. Moreover, the exact day-to-day balancing of the credit position may be upset by the latitude which is given to the banks in choosing the days of the week on which they make their Treasury deposit receipt payments. Any temporary unbalancing of this Government turnover of funds is bound to be felt in the short loan market, one of whose functions it is to take the shock of such disequilibria and to absorb them. This absorption is now a comparatively painless process, and merely consists in selling bills to the Bank of England broker at the rate at which they would be sold to the banks.

Speculation Once More

Judged by the number of bargains received, the Stock Exchange has experienced a further considerable increase in business. On the basis of these figures, the improvement has occurred, mainly, in two sections: foreign bonds and South African gold-mining shares. In addition, there have been some rather sharp fluctuations in Government stock, but these do not leave the general picture in that market much changed. The revival of interest in foreign bonds occurred mainly in South American securities and is plainly traceable to the news of the Argentine repatriation

and to talk of the Brazilian proposals, of which no details are available. Some of this buying is frankly speculative and must be put in the same class as the rush into Kaffirs, which is being more and more concentrated upon those ventures about whose future the least is known. Meanwhile, the main sections of the market show very little change in the general level of quotations. There is a growing realisation that the prospects of international agreement in the economic field are less good than it was hoped they might be. Now that the time has come for discussions and the reaching of decisions, delays induce a pessimism greater, perhaps, than is really called for. Whether this is so or not, the atmosphere of doubt engendered is inimical to a rise in equities whose yields already discount a considerable measure of recovery. No doubt, pressure of money will cause a fresh rise in due course, but for the moment the new money seems to be going mainly into speculation. The prudent investor is holding his hand.

* * *

Road Hauliers Combine

The conflict of interest between the professional haulier and the ancillary user, the small average size of the unit of management, and the specialisation of traffic have long stood in the way of the collective organisation of the road transport industry. A number of national organisations grew up before the war, representing mainly sectional interests, but these are neither comprehensive in membership nor organised on a clear-cut functional basis. Last week, after prolonged discussion, the following seven national organisations at last agreed to merge into one "powerful federation, thus making it possible for the road transport industry to speak with one voice."

Associated Road Operators; Commercial Motor Users' Association; National Conference of Express Carriers; National Association of Furniture Warehousemen and Removers; National Road Transport Employers' Federation; Scottish Carriers' and Haulage Contractors' Association; Scottish Commercial Motor Users' Association.

Steps are now being taken to organise the industry on a functional basis and to group it into three sections; the Road Haulage Organisation, for public road carriers; the Traders' Road Transport Association, for ancillary users; and the Passenger Vehicle Operators' Association, for passenger vehicle operators. According to the plan, these three sectional organisations would combine to form the National Road Transport Federation. A new road transport organisation, representative of the whole as well as of the parts, has many potential advantages, so long as it is neither exclusive nor inclusive by compulsion, and so long as it is not used for the purpose of making transport dear to the consumer by collective rate agreements between road and rail.

* * *

Argentine Debt Repatriation

The Argentine Finance Minister has announced that he proposes to set aside 500 million pesos to repatriate external bonds of the republic. To this end the exchange resources, and particularly the sterling, accumulated by the Argentine central bank will be used, and the peso equivalent of the repatriated debt will presumably be floated in the form of internal loans. The wartime trend of Argentina's foreign trade has created for that country an exceptional accumulation of foreign exchange assets. In the main this is a sterling phenomenon, because whatever dollars have been acquired as a result of the lack of balance in Argentina's trade with the United States have been promptly converted into gold. No such automatic conversion rights apply to the sterling balances which have been accumulating in the Argentine special accounts in London. According to the 1942 report of the central bank, these balances amounted to £17 millions at the end of 1941. By now they have risen to about £42 millions. The sterling equivalent of the 500 million pesos debt repatriation is slightly over £30 million, and it will thus be seen that even if the whole operation is to be focused on sterling debt, the means to carry it through are abundantly available.

* * *

Future Policy

Argentina's decision to repatriate some £25 million of its sterling obligations caused a rise in Argentine Government stocks, a marked improvement in the first debenture

tures of the Cordoba Central Trust and an even more spectacular jump in the "C" stock of Argentine Transandine Holdings. These two concerns hold the two groups of railway stock which the Government is proposing to pay off. There is no information yet about the method of effecting the redemption, whether by vesting or by individual offers. The redemption of these and other stocks, already envisaged to a total of £14 millions, poses a difficult problem for the investor. There is very little in the way of South American bonds that can replace an issue carrying the guarantee of the Argentine Government, and there are few British industrial debentures which give a comparable yield. The operation marks a further stepping down in the return obtainable outside frankly speculative holdings. Among the stocks to benefit from the news were Argentine railway securities. During the war the British Government has, more than once, let it be known that it favoured the repatriation of public utility holdings, and particularly the railways, as a means of liquidating the accumulation of sterling balances. It is also evident from repeated statements, official and unofficial, that Argentina favours a policy of freeing herself from the payment of interest and dividends on foreign capital and the use of the money to import capital goods which will be owned by her nationals. Hitherto the Argentine authorities have concentrated upon redeeming debt whose service was being met. If there remains, as seems probable, a surplus of sterling after this process is complete, they will be faced with the choice of taking up securities which are not in any sense Government obligations or of using the funds to import capital goods. The latter alternative can scarcely be available until some time after the end of hostilities, and it is very probable that the treatment of the railway, and other public utility stocks, in British hands will depend in no small degree upon the estimated duration of the war and the expectations about the volume and nature of Britain's demand for Argentine goods, for Argentina is at present wedded to bilateral trade agreements which leave little room for the benefits which flow from the division of labour in its fullest manifestations.

Vitamins in chocolate for liberated Europe

The British Government, having examined all the ways in which sufficient vitamins could be provided to the under-nourished children of liberated Europe, have arrived at the conclusion—as Rowntrees did in 1938—that chocolate offers one of the best vehicles for carrying added vitamins. In chocolate, the vitamins retain practically all their potency.

Before the war, Rowntrees pioneered the addition of vitamins to cocoa and chocolate. Their object was to enhance the protective value of these already highly nutritious foods.

Today, when the Allied Governments are faced with the enormous problem of rehabilitating each occupied territory as it is freed, Rowntree's experience of fortifying cocoa and chocolate with vitamins on a large scale is proving of great value. When the war is won, this experience will again be used for the benefit of the British public.

ROWNTREES

The China Gold Incident

Mild surprise has been caused by the Chungking announcement that the Chinese Government has decided to convert into gold the \$200 million balance of its \$500 million dollar credit granted by the United States in 1942. The first interpretation of this move was that the Chinese authorities, finding it impossible or unnecessary to use the dollar resources in financing imports from the United States, now that the essential flow of goods is covered by Lend-Lease, thought it wiser to hold the unutilised balance of the credit in gold. This, it was assumed, would be earmarked in the United States, awaiting reconversion into dollars until such time as wartime restrictions on the transport of goods into China had been eased. If this interpretation did not altogether tally with the alleged objective of the operation—"to arrest inflation in China"—it was assumed that the Chinese authorities had introduced this justification as a polite afterthought, intended to remove any slur on the future of the dollar which their first action might have been held to convey. Subsequent elaboration of the news from Chungking, however, calls for new interpretations of this dollar-gold conversion. It now appears that the gold in actually to be shipped from the United States to India and thence by air to Chungking. The metal must be needed urgently if it is to receive this priority over weapons and essential medical supplies for the very limited air transport available. If the gold is to be used to arrest inflation, the most direct method of using it to this end would be to sell it in the domestic market, taking due care to cancel the notes tendered in exchange for it. Against this it may be countered that \$200 millions of gold would have very little effect as a counter-inflationary solvent in China. It is even probable that the scramble for the metal would cause further depreciation of the paper currency. If the Chinese authorities wish to counter inflation, they have means ready to their hands without going to the trouble and expense of importing gold. If, nevertheless, that trouble is taken and expense incurred, the metal must be urgently needed—perhaps to meet certain outlays of the authorities for which Chinese paper currency has lost its efficacy.

Gaumont-British Accounts

The full accounts of Gaumont-British Picture Corporation for the year ended March 31st are a distinct improvement on any of their predecessors. For the first time, there is a real consolidated statement of assets and liabilities, while the profit and loss account discloses the provision for EPT and the total of interest payments. Previously, only interest in the publicly held debentures was revealed. Against this the split up of income tax and depreciation between the subsidiaries and the parent Corporation is no longer given. Since some at least of the former are not wholly owned, this may be a matter of importance. Two points of more immediate interest deserve attention. The improved accounts contain comparisons for the previous year, but it is quite impossible to carry that comparison any further back. The main outline of the figures is given on page 444, where the original figures for 1941-42 are substituted for the usual third year in the table. No comparison of balance sheet figures is attempted and this raises the second point. A year ago the accounts provided the statutory balance sheet and a statement of combined net tangible assets of subsidiary undertakings. It is quite impossible, with the information available, to make this earlier statement square with the figures now provided for 1941-42. This is a demonstration of the fact that two very different stories can be produced from the same figures and is strong evidence in favour of a large measure of standardisation in the principles underlying the presentation of published accounts. A further point of weakness, common to all consolidated balance sheets which include subsidiaries not wholly owned, is the fact that the total assets and liabilities of these concerns are stated with only a block item for outside interests. The net figure obtained by deducting the latter from the former does not, necessarily, give a clear idea of the real interest of the parent in the subsidiary. In the case where there was a wide disparity between the proportion of net assets held in various forms, for example stock in trade, at, possibly, inflated prices, and cash, and the proportion of the total accruing to the parent differed considerably as between the concerns, a very misleading picture might be presented.

Internal Telephones

At the annual meeting of Telephone Rentals, Ltd. on September 13th, Mr F. T. Jackson, chairman, vigorously attacked the operation of the Board of Trade's licensing system by which the installation of internal telephones is prohibited, except by special permission. He complained that very few licences were being granted, and made great play with the saving of manpower resulting from efficient facilities for telephonic inter-office communication. Mr Jackson said:

What the Civil Service mind does not appear to understand or concern itself about, is that by forcing a war factory to rely wholly on manually operated switchboards, that factory's effective output is reduced by at least ten per cent.

Mr Dalton must have been surprised indeed to learn that he may be housing a gang of saboteurs, for the consumer, usually so vocal about any shortcomings in his Department, appears to have been almost silent, thus completing the conspiracy. It is, of course, quite true that efficient internal telephone systems have many advantages. It is also true that the labour and materials needed for these installations are short. But only the Government, now the chief employer in the country, is in a position to judge how scarce resources can be used to best advantage.

Distributive Trades Manpower

The transfer of workers from the distributive trades has appeared to lag behind others. As late as the end of 1941, when the registration of 40-year-old women had almost been reached, the Minister of Labour announced that women aged between 20 and 25 engaged in non-food distributive trades would be called up for more essential work. It was not until December 17, 1942, that more far-reaching plans were made to transfer women up to 45 to other work, and, in the branches considered more essential, those over 35 were to be left. This decision was taken after what amounted to the failure of the Board of Trade to adopt a plan for the concentration of non-food retail trade, on the lines laid down for other industries. It is possible that this failure resulted in some delay in beginning a substantial contraction of the distributive trades' labour force. It must, however, be remembered that in an orderly and smooth transition from peace to war economy, the position of the distributive trades at the end of the chain of production logically puts it last on the list of trades to be controlled. In the reverse process of transition to peace economy, retail trade will be the last to feel the benefit of increased consumer production. Although it is now nine months since the announcement of rigorous transfers from retail trade, it is not possible to say that the process has been completed. It has been proceeding smoothly, and it is obvious to any shopper that shop assistants have been getting greyer and younger: the elderly and the very young are seen in increasing numbers. By July, 1942, more than half the male employees had left the distributive trades as a whole. At that time, the trades' manpower had hardly been touched, but the position to-day may more nearly approach that of the male employees over a year ago.

Coal Bonus Scheme

The first complete working year under the coal output bonus scheme ended on September 4th. Recommended by the Greene Board of Investigation, the scheme offered an additional payment of 3d. per shift for each complete 1 per cent in excess of standard outputs fixed for each district and based on the highest district outputs in any period of four consecutive weeks during the first half of 1942. These standard outputs were suggested jointly by the colliery owners and by the miners' leaders, and they were accepted by the Greene Board, subject to adjustments to take account of changes in manpower between the selected period and the inception of the scheme, and of tonnage lost through disputes. Moreover, in determining whether or not any district had qualified for a bonus the Ministry of Fuel and Power has had to make allowances for factors beyond the control of the workers as well as for output lost through recognised holidays. The most disappointing fact in the operation of the scheme has been the failure to achieve the national standard output of 4,164,700 tons of saleable coal per week in any four-weekly period. There have been

districts which have exceeded their target figures. South Derby and Leicester did so in each of the thirteen four-weekly periods ended September 4th last, and Somerset in eleven out of the thirteen periods; but in the larger coal-fields the incentive did not prove very effective, and in South Yorkshire and South Wales, the two districts claiming normally the biggest weekly outputs, the gap between production and target averaged over the whole of the period between 4½ per cent and 5 per cent. For the industry as a whole, the average for the four-weekly periods ranged from 4,126,500 tons in the period ended November 28, 1942, to 3,097,800 tons in that ended August 7, 1943 (including the August holidays); for the whole of the thirteen four-weekly periods the average output was 3,851,000 tons, which falls short of the target figure by over 7 per cent. It is impossible to calculate how far this deficiency is attributable to changes in manpower, rates of absenteeism, output per manshift, and the number of shifts worked per week. Statistics are not yet available in sufficient completeness, and inferences drawn from the occasional figures given by the Minister of Fuel and Power may be misleading. In any case, they are now likely to be of only historical interest, for both the miners' representatives and the owners seem inclined to the original view of the Board of Investigation, that a scheme based on individual pits might prove more successful than one based on districts. The Mineworkers' Federation has submitted proposals for this purpose, which, however, contemplate the fixation of targets on the basis of the average weekly output during the twelve months ended June, 1943 (subject to certain operational adjustments), instead of the four best consecutive weeks in the first half of 1942, and the administration of the scheme regionally by a sub-committee of employers, miners and the regional controller instead of, as hitherto, centrally.

Scottish Coal Output

Lord Traprain, Scottish Regional Controller of the Ministry of Fuel, has given a review of the coal position in Scotland, which, he says, could "hardly be more disturbing," and which is, if anything, even more discouraging than the situation in the rest of the country. Output from Scottish mines declined from 30,528,900 tons in 1939 to 26,188,000 tons in 1942, a decline of 14 per cent, while during the same period manpower fell by 5.25 per cent, and the decrease in output per man was about 9 per cent. The latest output figures show a further downward trend; during the quarter June-August, 1943, there was an average decline of 25,000 tons a week, compared with the same period of last year. If this trend continues, it is estimated that the total decline for this year will be about 1½ million tons, which would represent a decrease of nearly 20 per cent from the 1939 figures, and a decline in output per man of about 14 per cent. The fundamental reason for the present position is undoubtedly shortage of productive manpower, but Lord Traprain listed a number of other reasons, put forward by both the miners and the owners. His analysis of the criticisms of both sides is applicable to the country's coalfields generally. In his view, undue prominence has been given to the men's impression that the owners are reserving the best seams until after the war, an allegation which they have been unable to substantiate by evidence. Among the other complaints of the miners were that employers cut piece-rates when production increased, that managements were unwilling to co-operate with the men, whose suggestions at pit production committees were turned down, while mechanical and supply difficulties, lack of food, and the effect of income tax were recurrent grievances. The Scottish controller said that where pit committees worked well, they had proved useful; but he agreed with the view that the men's suggestions often had to be turned down for technical reasons. The owners and managements attributed the decline in output to slackness on the part of the men and general lack of discipline, with men knocking off early and failing to prepare the work properly. Lord Traprain admitted that there was in many cases a serious lack of effort, while the increase in absenteeism (from 3.41 per cent in 1938 to 8.5 per cent to-day, and in the past year alone by 1.5 per cent) was excessive, though a very few pits had as low a rate as 2 per cent. He was not optimistic that the new manpower policy would have immediate effects on output, but thought that there might be good results from the introduction in Scotland of 16 complete schemes of American mechanisation—nearly half the number of

schemes for the whole country. Lord Traprain appealed for a spirit of self-imposed discipline and self-imposed co-operation. So far, however, the conditions that might promote a better spirit and create confidence in the future prospects of the industry are singularly lacking.

Unilever Preliminary

The preliminary statement of Lever Brothers and Unilever for last year shows a considerable measure of recovery, in both consolidated profits, after tax, and the net profit of the parent concern, from the sharp setback of 1941. The consolidated figure is £6,913,003, against £6,299,663 in 1941, and £7,879,659 in 1940, and the net amount earned for dividends of the parent £6,028,834, against £5,835,589 and £6,987,130. It appears that there has been an improvement in the percentage earned on the ordinary capital from 16.7 to almost 20 per cent, but it is as well to await the appearance of the accounts next week before being more precise. In the absence of further figures, it can only be guessed to what the rise in the disclosed profit is due. One decisive factor may, however, be the tax provision. In each of the two preceding years, special allocations were made to convert the basis of provision from the legal liability at the date of the balance-sheet to full cover on all profits earned up to that time. Last year, it was understood that this process was complete and, if this estimate has proved reliable, it may not be necessary to look further for the main cause of the improvement. The dividend on the ordinary capital is maintained at 5 per cent less tax at 9s. 9d. At the current price of 36s. 3d. ex dividend this gives a yield of £1 8s. 3d. free of tax.

Faith in Gold

For a considerable period of weeks, one of the features of the stock market has been the relatively large turnover in the shares of gold-mining companies, mainly those in, or about to be developed in, South Africa. The

latest change in the main direction of this movement is a tendency to concentrate upon concerns with interests in the areas in the Orange Free State, at present in the prospecting stage. The latest burst of activity in this connection arises from statements made by Mr Louis Marks, chairman of the African and European Corporation, at Johannesburg last week. Evidence of a more general character of the growing interest in mining, including diamond mining, is provided by the full accounts of "Johnnies" for the year to June 30th. This company had already announced a dividend of 3s., against the recently established level of 2s., and an even larger rise in net profit. The full accounts show that this is associated with a considerable expansion in total resources and a fuller investment of them in mining enterprises, which is in marked contrast with the picture presented by earlier accounts of this and similar undertakings. The repeated news of finance houses taking fresh participations, and the not uncommon raising of fresh capital, suggest that the Union of South Africa is making a bid, even in wartime, to offset by new discoveries the inevitable decline in the production of the Rand. It is impossible to say to what extent technological improvements, especially as applied to mining at great depths, and any further rise in the quotation of gold, will prolong the life of old mines. But, faced with a very restricted list of alternatives, the Union is likely to do its best to maintain this source of wealth. How far present hopes, based on trial drills, will be realised; how far the investor will be allowed to reap fat rewards, and whether the overseas investor will be as well treated as the Union's nationals are all matters of guesswork and render the present rise in market values extremely speculative.

* * *

The London Metal Exchange

On the occasion of a luncheon to mark his retirement from the chairmanship of the London Metal Exchange, Mr J. D. Wolff made a strong plea for the restoration of free commodity markets after the war. The London Metal Exchange, established in 1877, had indeed rendered great services to the community until the Government prohibited dealings after the outbreak of war. The Exchange became the world market in base metals, providing facilities for national and international dealings, for the distribution of metals from producing to consuming countries, and for insuring the consumers of these metals against unforeseen price fluctuations. It had the incidental, but by no means unimportant, advantage of earning substantial amounts in foreign exchange and of encouraging the accumulation of large stocks of metals—so useful in war—in this country. The volume of transactions on the London Metal Exchange, as the following table shows, has been substantial:—

	VOLUME OF TRANSACTIONS			
	(Long tons)			
	Copper	Lead	Spelter	Tin
1936	457,000	335,000	248,000	82,000
1937	711,000	482,000	594,000	101,000
1938	475,000	387,000	296,000	91,000

If the record of the London Metal Exchange were the only deciding factor, Mr J. D. Wolff would be on strong ground in advocating its reopening once the conditions of normal trading have been restored after the war. But there are other problems which must not be overlooked. One of these is the need for ensuring a greater measure of stability in the incomes of primary producers by preventing excessive swings in prices caused by periodic stocking and de-stocking movements. Another is the need for keeping exchange rates reasonably stable. This is not the place to enlarge upon those problems which form the subject of discussion between the United Nations. But if base metal markets are retained elsewhere after the war, the speedy reopening of the London Metal Exchange might be necessary for this country to regain its former position as a world trading centre.

Training Engineers

The memorandum on the training of engineers, issued by the Institution of Mechanical Engineers after publication of the Government's White Paper on Educational Reconstruction (Cmd 6458), is a timely document, for it emphasises the important role the engineer and craftsman will have to play if Britain is to remain in the forefront of technical progress. The memorandum expresses disquiet

about the scale and timing of the improvements envisaged, revealed by the scanty provision for expenditure during the years following the war. The quality of engineering instruction in university and technical colleges depends largely on the quality of the teaching staff and of their equipment. The engineers point out, rightly, that there is an essential difference between the teacher of engineering and the teacher of academic subjects. The former is, and must remain, an engineer and, in order to attract the best people, his salary should be comparable to that open to him if he follows an industrial career. Moreover, in order to maintain his competence the teacher of engineering must keep in touch with the practical application of what he teaches. Teachers should be available to local industries as consultants. Some subjects are best taught by practising specialists. There is urgent need for an improvement in equipment which, by comparison with other countries, is often "deplorably low." Just as the teacher must maintain close contact with industry if he is to remain a good teacher, the university student can benefit from his lectures and classes much more if he has had previous contact with industry. The recommendation that all those who are able to include a full-time university course in their training as engineers should undertake a period of works' training before they proceed to the university is sound and its application overdue. There should, in fact, be a close and constant relation between practice and teaching for teachers, and between workshop practice and training at schools or university for the industry's recruits. True, the achievement of British industry in war is a high testimony to the quality and skill of its engineers and craftsmen. But these can only be maintained by constant improvements in methods.

* * *

Diamond Production

Statistics about diamonds have never been adequate; the only figures now available refer to the sales of the Diamond Trading Company—the sole selling channel of producers in Africa. Last year these sales amounted to £10,500,000; to this total £4,250,000 was contributed by the sale of industrial diamonds. Hatton Garden estimates expect the 1943 turnover to pass the £16 million mark. This would be a record, some £7,000,000 in excess of the best turnover of the last pre-war decade. In view of the apparent scarcity of diamond labour outside the European mainland, the diamond boom which has developed since 1941 represents something of a paradox, which cannot be explained without access to production, stocks and labour statistics. The recent London diamond "sights" revealed a substantial turnover even in the smallest gem stones, which suggests that the number of diamond workers in the gem trade has shown an increase. There can be little objection to the boom in gem diamonds so long as it does not interfere with the supply of labour for the preparation of industrial diamonds. In this country, the employment of diamond workers is controlled by the Government to assure that the requirements of the war industries are fully met. The bulk of this week's sales of stones under one carat were made to buyers from other countries, such as the United States and Palestine. It is known that the number of skilled diamond cutters and polishers in these countries has risen substantially since 1940; but is there really enough excess labour over industrial requirements to lay the foundation for the greatest boom the gem diamond trade has ever experienced? There is another aspect of the diamond trade about which information seems needed. The demand for industrial diamonds since 1939 has exceeded all expectations and consumption is still rising. But according to a report on abrasive materials recently issued by the United States Bureau of Mines, world production of diamonds fell from 14,250,000 carats in 1940 to 9,350,000 carats in 1941, and in 1942 "probably approximated to that of 1941." Earlier in the war the diamond trade held large stocks of industrial diamonds which supplemented new supplies. Reports that for some time past certain quantities of lower grade gem stones have been made available for industrial purposes seem to suggest that supplies of at least certain classes of "industrials" are getting tight. Such reports may be exaggerated and diamond producers may have taken steps to keep the output of industrial diamonds in line with the growing demand. They can hardly be blamed for liquidating pre-war stocks and for avoiding the accumulation of fresh surpluses. If diamond producers have made adequate provision for meeting the growing demand for industrials, they could easily allay fears and counter criticism by publishing the relevant data.

BENEFACTORS OF MANKIND

ISAAC NEWTON (1642-1727)

Probably the greatest of all scientists, his achievements baffle the analysis of the profoundest of contemporary and modern thinkers. No greater biography exists than the lines by Pope:

*"Nature and nature's laws lay hid in night,
God said 'Let Newton be!' and all was light."*

Experiment

THE name of Newton will always be connected with Gravitation. He developed the laws of celestial bodies upon which Halley based his astronomical discoveries. He was a mathematical genius, the originator of the Differential Calculus. Upon the laws of light, colour, optics, temperature, longitude at sea, tides and theology he applied the vigour of his unusual mind, directing the light of exact knowledge into many dark places. Observation and experiment were his guiding principles, as they must always be in scientific progress. The application of these ideals, we modestly claim, has dominated the development of our own electrical progress through more than half a century.

COMPANY MEETINGS

ANGLO-IRANIAN OIL
COMPANY, LIMITED

EXCELLENT RESULTS

SIR WILLIAM FRASER'S
STATEMENT

The thirty-fourth ordinary general meeting of the Anglo-Iranian Oil Co., Ltd., was held, on the 21st instant, at Britannic House, Finsbury Circus, London, E.C., Sir William Fraser, C.B.E., chairman of the company, presiding.

The following is the chairman's statement circulated with the report and accounts for the year ended 31st December, 1942.

Stockholders must be very gratified by the excellent results achieved in 1942, but I would like to utter a word of warning. As stockholders are doubtless aware, every company has a "standard profit" which it may earn without being subject to excess profits tax. If a company fails to achieve this standard in any year the deficiency is carried forward. In our case the deficiencies which have accumulated since 1939, the year of commencement of excess profits tax, have therefore gone to swell our retainable profit for 1942.

We have taken advantage of the unique net profits for 1942 to increase the Preference stock reserve by £500,000 and also to provide £2,000,000 for extra depreciation, which latter has enabled us to reserve in full for all our assets in enemy and enemy-occupied countries. Furthermore, before arriving at trading profits, £1,000,000 has been placed to a war contingency and which is very desirable in these times. The deferred repairs account, a provision which is very desirable in these times. The balance of profit remaining enables us to recommend a final dividend of 15 per cent., making 20 per cent. for the year, and to increase the carry-forward by £191,548.

CURRENT YEAR'S PROSPECTS

Stockholders may expect me to give some forecast of the probable results for the current year. With all the reservations that are necessary in the uncertainty of conditions to-day, I can say that present indications are that gross profits may not be far short, if at all, of those for 1942, but excess profits tax will, as I have explained, prevent the net profits from rising above the excess profits tax standard.

NEW ARRANGEMENT WITH GOVERNMENT
OF IRAN

During the early part of 1940 representations were made by the Imperial Iranian Government regarding the payments by the company under the concession. As a consequence of the conditions arising from the war, these payments would have been greatly reduced and the Government were faced with a serious loss of revenue. After very careful consideration and consultation, we agreed in the summer of 1940 to certain arrangements which were apart from the concession and which included provision to make up the amount due under the terms of the concession to £4,000,000 sterling in respect of each of the years 1940 and 1941. This action did not of course, affect the terms of the concession in any way. In regard to the period after 1941, it was agreed that the matter should be re-examined in the light of the conditions of the time with a view to reaching an arrangement agreeable to both parties. That re-examination has taken place and we have agreed to the Iranian Government's request to continue if necessary to make up the payments due under the concession to £4,000,000 sterling annually up to and including the year in which hostilities between the United Kingdom and both Germany and Italy cease as a result of the conclusion of a general armistice; or, if armistices are concluded with those Powers separately, the year in which the later armistice is concluded.

The report and accounts were unanimously adopted.

THE ECONOMIST

September 25, 1943

ANGLO-CEYLON AND
GENERAL ESTATES
COMPANY, LIMITED

RECORD CROPS

The fifty-seventh annual ordinary general meeting of the Anglo-Ceylon and General Estates Company, Limited, was held, on the 23rd instant, in London, Sir Edward Rosling, chairman and managing director, presiding.

The following is an extract from the chairman's statement circulated with the report and accounts:—

In Ceylon, our crops of tea and rubber constitute records, and that of cocoa very nearly a record.

As regards rubber, you will see from the body of the report that we produced 523,646 lbs. as against 334,668 lbs. in the previous year, and I think, as a war effort this may be considered quite an achievement.

LOWER AVERAGE PRICES

The average prices obtained for tea and cocoa were lower than for the previous year, in the case of tea the reason being that during last year extraordinarily high prices were received for tea sold on the free market in Colombo. Costs of production show an unavoidable increase largely due to the dearness allowance to labour and the subordinate staff, and the high cost of all kinds of necessary supplies. Another factor has been the necessity to divert part of the standing labour force to the growing of foodstuffs. Food production has added considerably to the work of our depleted staff of superintendents, and it is only through their loyal co-operation that most of the difficulties have been overcome.

In Mauritius the sugar crop was also a record, resulting in a production of 43,767 tons from 360,517 tons of cane. This represents an extraction of over 12 per cent. of commercial sugar, which is an exceptionally good figure and gives evidence of efficient work in the factories. For the current

years a smaller crop must be expected as by Government decree certain cane lands have been turned over to the production of food. We cannot yet say what actual effect this will have, but a committee is sitting to deal with the question of any compensation which may be considered to be due. Both in Ceylon and Mauritius every effort has been made to keep the estates in good order and as far as it has been possible, repairs and replacements to buildings and machinery have been maintained.

DIVIDEND 7 PER CENT

As to the accounts, the gross profit for the year amounted to £222,234, and after providing £180,000 for taxation £42,234 is available for distribution to the shareholders, and we recommend once again a dividend of 7 per cent free of income-tax. With regard to taxation, the computations of the company's liability are necessarily involved, coupled as they are with Excess Profits Tax both in Ceylon and Mauritius, and whilst it was considered that sufficient provision had been made in previous years to meet all liabilities, it appears from figures recently calculated, but not yet agreed, that there may be some additional liability.

The position is under review but it may be some time before matters are finally settled. In the light of these recent calculations, the provision in the accounts not submitted, of £180,000 for tax, is considered adequate, but the directors feel that shareholders would prefer them to deal with any additional liability on past years when such liability (if any) is known and then it can if necessary be met out of the ample reserves which the company possesses.

Many of our staff both at home and abroad are absent on active service, and another has lost his life while serving in the Mediterranean. I would like to record the thanks of the board to our managers and their staffs in Ceylon and Mauritius for their efforts during the past year, and also to our agents in Colombo, and our secretary and staff in London.

The report and accounts were adopted.

MORRIS MOTORS LIMITED

ANNUAL GENERAL MEETING

Accounts for the year ended December 31st, 1942

NET PROFIT - - - - - £1,799,173
TOTAL DIVIDEND - - - - - 17½%, TAX FREE

The Seventeenth Ordinary Annual General Meeting of Morris Motors, Limited was held on the 20th September, 1943, at Cowley, Oxford. The recommendations of the Directors, which were unanimously adopted, included the following provisions:—

An interim dividend of 10% free of income tax on the Ordinary Stock as declared on 18th December, 1942, accounted for £265,000 of the

profit earned. After meeting that sum and the dividend on the Preference Stock (£225,000), Taxation (£796,336), Air Raid Precautions Expenditure (£147,598), and Special Provision for Rehabilitation of Factories for post-war production, (£100,000), there remained a balance of profit of £265,239, to which must be added the balance brought forward from last year of £231,872, giving a total of £497,111.

This sum is dealt with in the following manner:—

By payment of a Final Dividend of 7½% on the Ordinary Stock, free of income tax ... £198,750
By transfer to Dividend Equalisation Reserve Account ... £50,000
and by carrying forward to next year the balance of ... £248,361
£497,111

FURNESS, WITHY AND
COMPANY, LIMITEDOBJECTIONS TO
NATIONALISATION

The fifty-second annual general meeting of Furness, Withy and Company Limited, was held, on the 22nd instant, in London, the Right Hon. Lord Essendon presiding.

The chairman, in the course of his speech, said: The position disclosed in the accounts will be, I feel sure, satisfactory to the stockholders in view of existing conditions and heavy taxation liabilities. The net profit, after making provision for taxation, amounts to £547,308. The directors recommend the payment of a dividend on the ordinary stock of 6 per cent. less income-tax, the same distribution as in the previous year.

A HARMFUL POLICY

I have on several previous occasions referred to the question of nationalisation. I am reluctant to revert to this subject, but it is one that is kept in the forefront of political controversy, and I consider that the adoption of such a policy would be so harmful to the national interest that those who feel strongly opposed to it should lose no opportunity of emphasising the faith that is within them. After the last war several nations attempted the nationalisation of shipping, but, without exception, they had to liquidate their positions as a result of the heavy losses that were incurred.

There is no reason to believe, in fact quite the contrary, that the position would be any different if it became a British policy. It would not be an economical proposition.

To sum up: What benefits are expected to accrue from nationalisation? Will it benefit the community; will it benefit the domestic consumer, or the industrial consumer? Will it increase productivity, or add to the revenue of the State? Will it reduce taxation for the individual? I submit that the answer to all these questions is in the negative.

REPLACEMENT PROBLEM

One result of the present war has been the unbalancing of the merchant navies of the world, particularly illustrated by the reduction in British tonnage, on the one hand and the large augmentation of the United States tonnage, on the other. We must candidly admit that the latter circumstance, from the point of view of the war effort, has been most gratifying, but now that we may hope we are within measurable distance of the termination of the conflict, the shipping industry is very seriously

occupied in contemplation of the replacement problem.

The moneys that have been received for lost ships under the war risk arrangement with the Government will certainly not be sufficient to replace them, although admittedly it will go a good way towards it. But a much greater problem arises in regard to the replacement of ships that have not been lost, but which in the not very distant future will require to be replaced. We regret that we have not been allowed in our hire arrangements some additional remuneration to be utilised for this purpose, but, as I have stated at previous meetings, we are relying—and I think we can safely rely—on the very specific assurances that the industry has received from the Government in this respect.

You will see attached to the report and accounts a notice of an extraordinary general meeting of the company to be held on Friday, October 8th, at 2.30 p.m. As 21 days' notice has to be given of this meeting, it is not practicable for both meetings to be held on the same day, and as it may not be convenient for members to attend both meetings it will perhaps be desirable that I should relate the reasons for the special resolution that is to be submitted to that meeting. This resolution, as you will have seen, is to give the company powers to carry on the business of air transport. The shipping industry considers that their 100 years' experience of passenger traffic organisations will enable them to make a substantial contribution to the management of business of this kind, much greater than they believe, rightly or wrongly, could be achieved through the medium of a single Government organisation.

The industry considers that a wider experience of international transport is necessary for the successful prosecution of such a business. Shipowners possess long-established branch offices with experienced management, together with a number of experienced agencies all over the world, all of which perform for seaborne traffic the same kind of duties that would apply to airborne traffic. Therefore shipping companies should be encouraged to develop air services on those routes where they have developed sea traffic. Cooperation between the two services is essential.

IMPORTANCE OF AIR TRANSPORT

This is a matter of great importance to the national interest, because if air is going to attract an unduly large proportion of the travelling public, shipowners will have to consider their policy in regard to the replacement of passenger ships which will cease to be built if it is likely to prove uneconomical to operate them. In the event of war, this would have a serious effect on the

THE ECONOMIST

future security of the country. It is obvious that campaigns similar to those of North Africa and Sicily could not be carried out if this type of ship ceases to be constructed.

The shipping industry considers that the first declaration of any international air conference should be one putting an end to excessive air subsidies. The country will require both ships and aeroplanes and they should be operated in a manner complementary to each other, and operators from both sides should be invited to confer together and give the best estimate they can of a commercial future of the air and its effect on the routing of passengers by both air and sea. Obviously both services should be under the same Ministry.

Shipowners neither require nor expect any monopoly in this class of business and it is in the hope that they may be permitted to take their part in the management and organisation of these services that we are asking our members to pass the resolution to which I have referred, which will give us the necessary powers in our memorandum of association to utilise when the opportunity arises.

The chairman concluded with an expression of appreciation of the courage of the officers and merchant seamen in facing so bravely and unflinchingly the risks inevitable in times of war.

The adoption of the balance-sheet and report, and the payment of a dividend of 6 per cent., less income-tax, on the ordinary stock, were carried unanimously.

LORD ESSENDON'S DIAMOND JUBILEE

Mr Sydney J. Forster in proposing the re-election of the retiring directors said: I am sure you will join with me in tendering to our chairman to-day our heartiest congratulations on the attainment of his diamond jubilee with the business of Christopher Furness and Furness, Withy and Company, Limited. By his charming personality Lord Essendon always inspires true loyalty and genuine affection in those with whom he works. His unfailing kindness, his freedom from prejudice, and his faculty of seeing the best in every man, and of giving full consideration to the opinions of others, make business transactions with him a source of pleasure and satisfaction.

It has been said that genius is an infinite capacity for taking pains. That being so, Lord Essendon is certainly a genius, as no business problem is too intricate for him to master, or too small to merit his serious consideration. The phenomenal progress which has attended Lord Essendon's career has been entirely due to his own initiative, hard work, and sterling character, culminating in honours bestowed upon him by His Majesty the King, honours which were never more richly deserved.

RECORDS and STATISTICS

INDUSTRY AND TRADE

Continued Education.—The Brush Electrical Engineering Company, Limited, of Loughborough, has decided to implement the recommendations outlined in the White Paper on post-war educational reconstruction for continued education of young persons in industry without waiting for a Bill to become law in the post-war period. A comprehensive programme has been worked out in collaboration with Loughborough College, and by means of courses in the works school and at the College continued education amounting to approximately one day a week is being introduced for all girls and boys below the age of 18. Selected workers over 18 will also be given advanced education.

Theft of Clothing Coupons.—Following the theft of 5,000,000 clothing coupons from an Army depot, the Board of Trade promptly cancelled all five-coupon vouchers in circulation. The fortunate recovery of the stolen coupons enabled the measures taken to withdraw all similar coupons from circulation to be dropped.

Factory Fires.—In a recent speech to aircraft factory fire fighters, Sir Stafford Cripps disclosed that factory fires due to carelessness were decreasing. He stressed the need for continued vigilance.

Children's Shoes.—Leather has been diverted from the manufacture of adult shoes to children's shoes, and some used conveyor belting is to be used for soles for children's shoes, according to a letter from the President of the Board of Trade to Mr Henderson Stewart, M.P. Hitherto, the output has been sufficient only to provide each child with three pairs of shoes a year.

*Highest level reached during 1932-37 recovery

Points Changes.—The points value of biscuits was raised from September 19th. "Welfare" and similar biscuits and unsweetened biscuits are doubled in points value to two and four points a lb. respectively; sweet and semi-sweet biscuits are raised from six to eight; and chocolate biscuits from 12 to 16 points a lb. The points value of dried apples is halved to six points a lb., that of dates, sultanas and dried fruit (other than prunes and figs, which remain at six points) lowered from 12 to eight points a lb. The individual ration remains at 20 points for the four weeks. The "Points Banking System," which was described on page 188 in *The Economist* of August 7th, came into operation on September 19th.

Coal Output.—The output of saleable coal in the four weeks ended September 4, 1943, averaged 3,767,800 tons a week compared with 3,097,800 tons in the previous four weeks.

WEEKLY OUTPUT OF SALEABLE COAL (Weekly Standard Tonnage 4,161,800 tons)

FINANCE AND BANKING

THE MONEY MARKET.—The clearing banks have begun their September making-up this week and this helped to make credit conditions sufficiently difficult to call for special assistance at the beginning of the week. The discount market increased its bid price for Treasury bills to £99 15s. last week and this led to an increase in its proportional allotment from 29 to 41 per cent. By mid-week the credit position had been restored to its accustomed ease and banks were again buying bills. The

 ‡ Five per cent, less tax, 7 1/2 tax free.
 § Based on earnings of group, not on available income of parent.

The company has acquired certain interests, including the right to use the name Drage, from certain of its directors at a large profit to the latter.
 The 5s. ordinary stock quoted at 22s. ex dividend yields £4 11s. per cent.

GOVERNMENT RETURNS

For the week ended Sept. 18th, 1943, total ordinary revenue was £33,834,000, against ordinary expenditure of £95,346,000, and issues to sinking funds of £95,000. Thus, including sinking fund allocations of £6,571,266, the deficit accrued since April 1st is £1,499,243,000 against £1,360,270,000 for the corresponding period a year ago.

Total	5,869,383	2,495,069	2,667,582	95,487	97,046

A change has been made in the method of showing an excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £203,384 to £2,820,831, the other operations for the week (no longer shown separately) raised the gross National Debt by £60,931,301 to £18,343 million.

(Continued from page 444)

Bank return shows bankers' deposits at the relatively high level of £164,395,000, an increase of £10,181,000 on the week. An increase of £8,231,000 in Government securities is the main counterpart to this expansion in bank cash, and probably reflects the special assistance given to the market in the earlier part of the week. It is reported in the market that yet another discount house, Messrs. Allen, Harvey & Ross, are about to increase their capital.

MONEY RATES, LONDON.—The following rates remained unchanged between Sept. 17th and Sept. 23rd:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days 1½%; 3 months, 1½%; 4 months, 1½-1½%; 6 months, 1½-1½%. Treasury Bills: 2 months, 1½%; 3 months, 1½-1½%. Day-to-day money, 1-1½% (Sept. 20-23, 1-1½%). Short Loans, 1-1½%. Bank deposit rates ½%. Discount deposit at call ½% at notice ½%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between Sept. 17th and Sept. 23rd. (Figures in brackets are par of exchange.)

United States. \$ (4.86) 4-02½-03½; mail transfers 4-02½-03½. Canada. \$ (1.36) 4-43-47; mail transfers 4-43-47. Switzerland. Francs (25.22) 17-30-40. Sweden. Krona (18.159) T.T. 16-85-95. Dutch West India. (12-17) 7-58-62; Portugal. Escudos (110) 99-80-100-20; mail transfers 99-80-100-30. Panama. \$ (4.02-04) mail transfers 4-02-04. Brazil. 83-64½ cr. (buying). Uruguay. 7-6597 p. (buying).

Fixed Rates for Payment at Bank of England for Clearing Offices. Spain. Peseta 40.00 (Official rate). Turkey. Piastres 520. Italy. 71-25 liro.

Market Rates.—The following rates remained unchanged between Sept. 17th and Sept. 23rd:—

Egypt. Piastres (97½) 97½-98. India. Rupees (18d. per rupee) 17½-18½. Belgian Congo. Francs 176½-177. China. National \$3-3½. Iran. 12-78-130.

Special Accounts are in force for Chile, Peru, Bolivia and Paraguay, for which no rate of exchange is quoted in London. Rate for payment into Argentine special account is 16-03 pesos.

Forward Rates.—Forward rates for one month have remained unchanged as follows: United States. ½ cent pm-par. Canada. ½ cent pm-par. Switzerland. 3 cents pm-par. Sweden. 3 ore pm-par.

MIDLAND ELECTRIC CORPORATION FOR POWER DISTRIBUTION LIMITED

NOTICE IS HEREBY GIVEN that the TRANSFER BOOKS of the Company will be closed from the 1st to 15th October, 1943, both dates inclusive, for the preparation of Preference and Ordinary Share dividend warrants.

Warrants will be posted on October 14th.

By Order of the Board, F. W. CATER, Secretary.

Toll End Road, Tipton.

9th September, 1943.

Large industrial organisation has vacancies in its Office Administration Department for assistants aged 25 to 30, possessing suitable training and experience. Applications particularly invited from qualified accountants. Only men who have been discharged from the forces or who are not liable for military service on health grounds will be considered, and all must be prepared to work in any part of this country. Liberal starting salary, based on experience and qualifications, and excellent prospects for advancement.—Write, giving details, to Box No. 353, c/o. DAWSONS, 31, Craven London, W.C.2.

Military Approach

IT is recorded of Lenin that, a few weeks before the outbreak of revolution in Russia, he told a conference of students in Switzerland that they might hope to see the revolution, but that he never would. Thus the master of revolution was caught unawares by the revolution which he was later to master. This illustrates a fact about revolt and revolution that is often forgotten, both by the practitioners of political warfare and by those who criticise their practice. Revolution is unpredictable. The hour of the popular explosion cannot be timed. The recent uprising in Denmark and the spring disturbances in Holland, for instance, were obviously ill-timed in the total military situation. But the people who made them were not thinking about timing; they had reached the point at which they had to resist. The same difficulty is partly responsible for the divisions inside every guerilla movement between the *attentistes* and the activists. The long-term military situation has hitherto justified a policy of shepherding resources; but again and again the immediate local situation has compelled the guerillas to act. Much of the criticism of the Allies' political warfare is, for this reason, off the mark. Revolution cannot be handled like a water supply, dammed up until the head of water is high enough and then turned on and off at will.

Yet, even if Lenin could not predict the revolution, he was master of it when it came. He met its various

phases with a brilliantly improvised strategy which was flexible enough to keep pace with the devious developments of the revolutionary process, yet consistent enough to ensure that none of the temporary expedients contradicted the final purpose. It is when criticism is concentrated on the use made in Allied strategy of the revolts once they have developed that the critics are on surer ground. Is Allied strategy flexible enough to exploit a revolutionary situation once it has—unpredictably—occurred? And is the use they make of it such that it in no way contradicts the final settlement for which, whether or not they try to evade it, they are responsible? The evidence so far suggests that both in flexibility and consistency the politico-military strategy of all the great belligerents is frankly bad.

In his analysis of the Italian surrender Mr Churchill made it clear that the Italian collapse did not alter the military time-table. It was, he said, a "windfall" in the harvesting of victory. This is borne out by the fact that, although Badoglio had, it appears, offered not only to surrender unconditionally, but actually to change sides early in August, it was not until August 18th that the Government suggested to the Allied Commanders-in-Chief that they might try to speed up their operations. Again, in the Balkan theatre, it was obvious that the surrender of Italy would entail a temporary collapse of the Axis defence system and a widespread intensification

guerilla warfare and local revolt. The Allies presumably had the advantage over the Germans since they knew when the collapse would occur; yet in the weeks that have followed, one of the most disturbing and distressing puzzles for the unexpert observer is the fact that the fierce struggle in the Balkans has received no reinforcement from outside. For a time, the guerillas held all the hinterland to Trieste and most of the Adriatic ports. The latest news suggests that they are already being thrust back from the lines of communication and the ports and towns. An opportunity has apparently been lost. It is impossible not to ask whether Allied strategy has not failed in flexibility and adaptability, especially when the Allied record is compared with the political and military counter-measures taken by Germany.

Both in Italy, the Balkans and the Greek islands, the Nazis reacted swiftly. Some reports suggest that over 20 divisions have been moved into the Balkans; and men and machines have been spared for an air and seaborne attack upon the Aegean island of Cos. This may very well prove to be an uneconomic demonstration of flexibility; but Cos is the island lying nearest to Turkey, and the Germans have their finger on the Turks' timid pulse. Their political counter-measures—the release and restoration of Mussolini, for example—have shown an equal vigour. Although in the longer perspective of the war the Germans are fighting a losing battle both in Italy and the Balkans, their strategy is still flexible enough to turn particular phases of their inexorable retreat to their advantage.

There are, obviously, many technical difficulties—shortage of landing craft and large-scale air transport, lack of adequate bases and so forth—to slow up the deployment of the Allies' Mediterranean and Middle Eastern forces; but developments in Italy and the Balkans suggest that the apparent failure fully to exploit political collapse and local revolt springs from a consistent underestimate of the importance of political factors. The British and American approach has been, and still is, primarily military. This was perfectly adequate in all the first fighting in North Africa. The Libyan sands and empty stretches of Tripolitanian desert were the perfect setting for a purely military campaign. The landings in French North Africa first plunged the Allies into politics. Since that time, the political pressure on them has increased, and the further they advance into Europe the greater the part that will be played by political factors. Yet they seem to be taking with them their old non-political attitude. The danger is that the non-political approach not only reduces flexibility in dealing with a revolutionary situation, but also makes it highly probable that the temporary measures taken may frustrate, or even entirely inhibit, the Allies' final purpose. Military necessity is not a sufficient criterion with which to distinguish good from harmful expedients. The final settlement of Europe will be a political settlement, and unless some political principles are brought in during the intermediate period of reoccupation the sum of temporary and military arrangements may add up to a negation of the hoped-for political settlement.

It is disturbing that, while full and convincing reports of the state of Italian politics came from the Italian cities before the Allied occupation, no news at all reaches the outside world from Italian territory occupied by the Allies. Does this mean that political activity has been suppressed? If so, why? If there is one thing needed among the dragoned and bludgeoned victims of dictatorship, it is that they should be encouraged to restore the habit of political thought and action. The new Badoglio Government is even more disturbing. True, the King of Italy has broadcast his hope that

as soon as possible the Government will have its basis enlarged so as to make possible for all to take part in the country's political life.

And there might be no harm in appointing a purely military council as a temporary expedient. But what sort of crazy politics is this, to include in the Junta, to which, presumably, the status of co-belligerency is to be accorded, Generals—Ambrosio and Roatta—who earned a

reputation for ruthless terrorism in Yugoslavia, and one of whom has already appeared on the Yugoslavs' list of war criminals? This is to flout political good sense in the grand manner. It puts into the shade every other unsatisfactory Allied political arrangement—for example, the Greek Government's failure to accord representation to the Greek partisans or the extremely doubtful personnel of the Yugoslav "Cabinet of experts" which King Peter has shipped off to Cairo.

The truth is that the military approach is being used as an alternative for a political strategy because the Allies have no political strategy. This has been said so often in Parliament and in the press that politicians and journalists alike are weary of repeating it. The only excuse for returning to the charge is the imminence of the Three-Power Conference, and the possibility that at last, at this eleventh hour, something can be done to secure a unified and coherent approach to the political problems of reoccupation. At present, the picture does not make sense. One day from Russia come the Free German Committee and the German Officers' Union, made up of men captured on the Eastern Front, saying, "Make peace while you can and thus preserve Germany's independence and armed might." The next day, Alexei Tolstoi, in an impassioned broadcast, demands that vengeance should be visited on the German people. The Polish Patriots broadcast attacks on the Polish "landlords and imperialists"; but, at the same time, the co-operation of all Slav peoples is given considerable publicity in Russia, reinforced now by appeals to Orthodox religious unity. Communism and social revolution do not appear—nationalism is the strongest single theme—but neither the tradition of the Revolution nor the practice of 1939 and 1940 can be effaced. On the Anglo-American side the composition of the Allied Governments, but more especially the negative policy of the reoccupying forces, suggest only one consistent policy—a restoration of something very like the 1939 *status quo* both in its good and its very undesirable aspects.

The total picture is thus one of considerable contradiction and confusion. No clear lead is being given to the forces of political resistance in Europe; and the kind of expedients which are taken to deal with political situations when they develop will inevitably contradict each other and frustrate any final settlement. What can the Three-Power Conference do to remedy the confusion? No statements in general terms are needed. Everybody signed the Atlantic Charter, and it has made no contribution to Allied political strategy. Agreement is needed to create procedures in particular foreseeable situations: the entry of the Russians into Poland, of the British into the Balkans and even into Germany.

Such agreements cannot be dovetailed into each without a conception of the kind of Europe they mean to build; and the Conference must therefore undertake the task of deciding the more pressing aspects of the settlement—the use of Three-Power Commission strengthened by the other nations concerned, to determine frontier disputes; the setting up and functioning of United Nations relief and the development from it of permanent economic institutions for Europe; the political organisation of Europe, not in spheres of influence, with Germany in the balance, but on an ordered regional basis. If a unified pattern can be hammered out in Moscow, and all the necessary and practicable guarantees and undertakings given, then the Allies will possess at last genuine political strategy which can be used, not only to check the temporary military expedients of the war, but even to hasten the war's end. Hitherto the political confusion which has prevented the Allies from exploiting revolutionary situations when they arise has also inhibited their attempts to create further revolutionary situations. The Walls of Jericho which were to have fallen at the united blast of the Russian, British and American trumpets remain unshaken at the unnerve-cacophony of a couple of cornets and a Swanee which, if the Conference achieves its results, the trumpets sound at last on a broad, united and triumphant note.

The Upper Regions

IT is significant that the President and Prime Minister found time during their recent meetings to talk in detail about civil aviation. Flying has transformed the earth into "One World," to quote Mr Willkie, who last autumn travelled 31,000 miles in 160 flying hours between August 26th and October 14th. News and views still travel fastest by cable and wireless; the great majority of travellers and the great bulk of goods must still go by land or sea; Mr W. L. Runciman has estimated that the cost per ton-mile for carrying freight before the war was 30d. by air and one-thirtieth of a penny by sea. But the pace is increasingly set by aircraft. The potentialities of aviation for peace are as big as those it has shown in war.

It is significant, too, that, according to report, Lord Beaverbrook has come back to the Government to take charge, perhaps among other things, of British aviation policy, and to work out a common approach with representatives of the Dominions who are to meet in London soon. In their discussions, Mr Roosevelt and Mr Churchill agreed that the principle of world aviation policy should be the "freedom of the air." By this is meant that international air traffic should be open equally to the aircraft of all nations, and that the airports of every country should be used by all planes on through voyages; each nation would reserve to itself only its own internal traffic, on the analogy of coastwise shipping. There are, of course, strong reasons for a more drastic arrangement, by which not only all airports, but also the trunk lines themselves would be internationalised. Strategically, such a solution for civil flying might prevent the development of military aviation on nationalistic lines. Socially, the maximum service could be rendered to the community of nations by the organisation in common of the most effective means of international contact and co-operation. It is more than doubtful, however, whether at the present stage of world development the great air powers are prepared to go so far. Aviation, like armaments, cannot be settled and arranged outside the general context of international relations, and the supersession of national by international air lines will follow and not precede the supersession of national by international air forces. Almost certainly, the highest measure of agreement among the air powers, including the Soviet Union, Holland and France, as well as the United States and the British Commonwealth, will be found for "freedom of the air" as President Roosevelt has defined it.

To rule out internationalisation, for the time at least, and to replace it by international freedom of the air on a national basis, is not to solve the problem. Obviously, it suits the United States, four-fifths of whose commercial flying may be within its own continental frontiers. Is it

so applicable to other countries, four-fifths of whose flying may be external and international? It is natural for a country whose home market spans the resources of an entire continent to favour protection at home with competition and non-discrimination abroad, as the United States does in trade as well as aviation—a condition of membership in the American-proposed investment bank is said to be non-discrimination in trade. It is not so simple for lesser territories. The question for the future of civil aviation is what the unit of organisation shall be. It becomes a choice, not at the moment between nationalism and internationalism, but between nationalism and regionalism. Is the British unit to be Britain, the Empire or the whole Commonwealth? For that matter, is the American unit to be the United States or all those parts of the Western hemisphere embraced by the Monroe doctrine or by "hemispheric defence"? The position of Canada shows at once the technical and political impossibility of drawing hard and fast lines.

Almost certainly, the pattern of organisation must be regional rather than national. The Pan-American and Imperial Airways of pre-war years sprang from technical as well as political considerations. It is just as impossible to imagine that the airways of Europe, when they are restored, can be rigidly split up among the European nations without regional working agreements as it would be to suppose that the air routes of the Soviet Union could be divided out among its various constituent republics. Yet regionalism undoubtedly carries with it great dangers. It is tempting to suggest that the alternative to internationalisation is the division of the skies into exclusive "spheres of influence"—British, American, Russian, Chinese, and so on. But this way lies disaster. Spheres of influence in aviation will be as conducive to war, economic and military, as they are in shipping, trade or diplomacy.

Yet, in aviation as in trade, shipping and diplomacy, some degree of regionalism is unavoidable as a matter of practice. The sterling area, for instance, is a fact of economic life, becoming tighter or looser according to the shortage or sufficiency of dollars available to the British countries—that is, according to the readiness of the United States to buy abroad. The problem of Imperial defence, again, is one which concerns first, and in common, the members of the British Commonwealth. Europe, too, in trade, transport and security, is an entity. The essential requirement is that all working agreements or regional arrangements should look outward and not inward. This is peculiarly the lesson of wartime. Imperial defence was impossible without American aid; the security of the Western hemisphere was impossible without the efforts of Britain, Russia and China. Regionalism

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

can, and should, be much more than half-way from nationalism to internationalism; and it is in this light that the aviation policy of the British Commonwealth and the United States should be regarded.

The trouble is that the right solutions are so often proposed for the wrong reasons. When British spokesmen advocate Commonwealth co-operation in the air or in trade as a means of combating the United States, they speak as dangerously and as foolishly as Mr W. A. Patterson, president of the United States Air Lines Corporation, did the other day when he suggested the lumping together of all the international transport of the United States, both by sea and air, in order to give the United States "maximum strength for competition with foreign Powers." The one justification for regional aviation or regional trade or regional currency and exchange arrangements is technical necessity; and an Ottawa or Hawley-Smoot aviation policy, exclusive, protective and defensive, would be as fatal to aviation as to world peace. Here, as elsewhere, multilateralism must be the aspiration, even if it cannot be the policy. Because of the ubiquity of flying, the considerations that make regional arrangements indispensable make inter-regional agreements no less necessary.

The ideal, therefore, indeed the only sensible practical objective, is the working-out of a chain of regional and inter-regional arrangements which will add up to practical internationalism. It is in this spirit that early talks between the British Commonwealth, the United States, Russia and the air powers of Europe should be carried on. Fear and distrust are the enemies in this as in every other international question. A belligerent nationalism or imperialism is sponsored by some spokesmen here because they do not believe that British aviation can withstand American competition. Actually, on the figures (which were discussed in *The Economist* of June 5th), there is little reason for this apprehension. The costs of civil flying divide roughly into three equal parts: labour and personnel; aircraft, equipment and overheads; operations, fuel and oil. In none of these will the United States have any decisive advantage in cost, and in two the balance may be in favour of this country. The test will be whether British aviation is operated with an efficiency and enterprise equal to that of the Americans. In the past, this

has not always been so. The record of the Air Ministry and its chosen instrument has not been the best of advertisements for public control over aviation. British shipping companies, with their wide experience in overseas transport, have announced their intention, if possible, of operating airlines themselves. The choice between Government-run air transport, public corporations or private airlines is not one to be decided on the basis of prejudice or political doctrine. The only criterion is the efficient use of resources and service to the community. It is likely that, in some form or other, aviation in every country will require some form of state aid, if only in the form of mail contracts; but the precise method of operation is immaterial provided the right results can be obtained. The best direct contribution that the state can make to British aviation is the maintenance of a sufficient military demand to keep in being an efficient and enterprising aircraft industry. If (as was suggested in *The Economist* of August 21st) the Royal Air Force is kept at an establishment requiring an output of some 3,000 aircraft a year, civil aviation, whose annual needs cannot be much more than one-third of this, if as much, need have no fear about the size of its industrial basis. The important need, immediately, is one of quality, not quantity. For wartime reasons, transport planes are not built in this country; and when the war ends, British aviation will be for a time, as now, dependent on American transports. British aircraft designers have already been set to work to fashion four new transport types. It is important in the development of a positive and articulate aviation policy that this work should be pressed on to the point of production as soon as possible.

These are the questions that Lord Beaverbrook, or some other, will have in hand. If the chosen instrument is, in fact, Lord Beaverbrook, then it is essential, first, that his vivid personal experience of Washington and Moscow should outweigh the inveterate imperialism which made the commercial ring forged at Ottawa congenial to him; and, secondly, that in the work of providing civil aviation with an adequate industrial foundation, other Ministers with considerably closer acquaintance of aircraft manufacture should not be elbowed aside. In both world and home politics, the Lord Privy Seal's reported mission is of crucial importance.

The Agricultural Problem—I

What Kind of Agriculture?

IN Wales last week the Minister of Agriculture touched on the double problem that will face British agriculture in the next few years. Immediately after the war, the requirements to be met by the agriculture of all undevastated countries will not differ much from those of wartime. The main aim will still be to maximise the output of energy foods for direct human consumption; the criterion will still be quantity rather than quality or comparative costs. Siege farming and relief farming do not differ much; this was recognised at the Hot Springs Conference. On the other hand, it was also recognised at Hot Springs that the real aim, when the period of transition is over, should be to increase productivity everywhere, which means the application of quite different principles. Broadly, these principles are three: first, that consumption needs should be met from the most efficient sources of production in whatever area, at home and abroad, these may be found; secondly, that, with the utmost safeguards for the conservation of soil fertility, the industrial and economic advantages of any area should determine the kind of farming adopted and the sort of commodities produced; and, thirdly, that, within this framework, there should be a prior charge upon each individual country to produce protective foods of high nutritional value, such as milk, dairy produce, vegetables and fruit, most of which are perishable and best produced near to centres of production. This is a very different picture from that of wartime farming, when barriers to

trade and shortages of transport, manpower, fertilisers and machinery compel self-sufficiency rather than specialisation. The problem, which is at least as political as it is technical, is to provide in advance for the change-over from the present artificial distribution of output to a more efficient allocation of work between the nations, in order to make possible the provision, in both quantity and quality, of a balanced, as well as a sufficient, diet for all the peoples.

This means that an urgent task to-day, while pressing on with food production on wartime lines, as Mr Hudson urged, is to decide upon the kind of agriculture that will best suit this country's abilities and the world's needs when more normal conditions of production and trade return. Unfortunately, the question "What kind of agriculture should Britain aim at?" is peculiarly difficult to ask without arousing a storm. If the question is asked, "What size should the steel industry, or the aircraft industry, be after the war, and on what products should it specialise?" the query is regarded as prudent and timely. But when the same question is asked about agriculture it tends to be treated as blasphemous. It is all the more important, therefore, that the question should be frankly asked—and answered—if only because vested interests have been created in the temporary kind of farming made necessary by wartime exigencies, which, politically, will make the process of change-over difficult in any case. It is a heartening sign that Mr Hudson did

approach the problem of farming's long-term future with some frankness. He pointed out that the war had made this country, predominantly a livestock producer, into mainly an arable producer, and he said that, ultimately, "We will have to go back to grass on a large scale." He laid special emphasis on milk production, which he said would have to have first priority for many years. The Minister's parallel emphasis on the restoration of beef farming was not perhaps so encouraging, and he said little about dairy, produce and vegetables. Nevertheless, he made the most important point, that the present system of wartime farming, though it may be necessary for a considerable period of world dislocation and threatened famine, cannot and should not last, and must be replaced by a kind of farming that will fit better into the balanced and specialised expansion of all the world's agricultural resources.

On the surface, there is a surprisingly broad consensus of view about the kind of agriculture that this country should aim at. The impression is that the Government has at its disposal a ready-made agricultural programme sponsored by opinion drawn from all quarters. Actually, while it is true that the many published plans for agricultural post-war reconstruction indicate a general desire to see the maintenance of a healthy and prosperous agricultural industry, and show general agreement on such matters as the encouragement of agricultural education and research, better housing and rural amenities, the maintenance of a high standard of farming efficiency, and the improvement of methods of distribution, yet they are very much at variance on the real fundamental economic questions at issue. There is no unanimity on the size of the agricultural industry that is to be maintained after the war or on the character of the farming that is to be practised; and there is an equal diversity of opinion about the methods to be adopted for safeguarding the industry.

The Farmers' Claim

The largest claim is put forward by the National Farmers' Union. This body has proposed, as a minimum, the maintenance in England and Wales of 11 million acres of tillage (excluding all leys), together with a dairy herd of three and a-half million, four million other cattle, 20 million sheep, three and three-quarter million pigs, and 60 million poultry on agricultural holdings. The outstanding proposal is the tillage acreage. Fewer than seven million acres were ploughed in England and Wales in 1938 (including bare fallow), so that the NFU envisage a permanent increase in the ploughed area of about 60 per cent over the pre-war level. The proposed increases in livestock are much more moderate—about 13 per cent for dairy cattle, 9 per cent for beef cattle, 11 per cent for sheep, and 7 per cent for poultry on agricultural holdings. The NFU policy is, shortly, one of making the best of both worlds, maintaining the full expansion in tillage that has occurred at the peak of the ploughing-up campaign of the past four years, together with a moderate increase in the numbers of livestock; its cost in terms of subsidies, higher prices and, assuming a successful policy of full employment, in the diversion of resources from more productive uses, would be very large. The proposal that the growing of fodder crops "should be assisted by the regulation of feeding-stuff imports" is a cardinal feature of the NFU policy.

In contrast to the programme of speeding the plough advocated by the NFU, an all-party group of eleven peers suggests a policy based upon nutritional requirements. They do not neglect the need for a certain minimum acreage under the plough, but they place the greatest emphasis on the expansion of nutritional foods:

At the outset the distinction must be laid down between those commodities, e.g., wheat, meat, sugar-beet, and oats in Scotland, of which we must produce a certain quantity in order to ensure good husbandry, but the production of which need not be expanded beyond the limit needed for that purpose; and those other commodities, e.g., milk, poultry products, fruit and vegetables, for which a large potential market is available, and which can and should be expanded to a considerable degree in the interest alike of agriculture and the national health.

They point out that, if all this country's requirements for protective foods were satisfied from home sources, the following increases on pre-war production would be required: Milk 65 per cent, eggs 60 per cent, fruit 70 per cent, vegetables 60 per cent. The Liberal Party report on Food and Agriculture also looks to an increased output of milk, fruit, vegetables, eggs and livestock, especially milk; and, shrewdly, they prefer a policy of storage for wheat and sugar, maize, oil cakes and other animal feeding-stuffs to "keeping under the plough a large acreage of land growing unsuitable and expensive crops."

The recent Conservative Party report, on the other hand, gives more support to the NFU policy of a greatly increased acreage under the plough. No quantitative proposals are made, but the report submits that "corn production on a larger scale than pre-war will certainly be required"; and that, even in areas where "the main emphasis will be placed on various forms of animal husbandry, and, more especially on dairy farming," there should be "increased reliance on home-grown crops for the feeding of livestock." Moreover, this report gives only qualified support to the suggestion that post-war agriculture should be based primarily on a nutritional policy.

It follows that the attempt (if there be) to separate the produce of British farms into two distinct categories, one of which, though deserving protection, does not require it, while the other, though requiring protection, does not deserve it, cannot logically be sustained. Apart from this, to concentrate entirely on nutritional foods would be to destroy the balance of farming, which experience has shown to be vital.

Farming for Food

Is post-war agricultural policy to be designed to produce food for the people or to maintain a pattern of farming which is regarded as desirable? This is the fundamental question. There can be no question that the Liberal report is right when it says "the policy for agriculture, as well as for industry, must be a consumer's policy . . ." It is to-day impossible to return to the agriculture based on horn and corn that existed a century ago. To attempt to do so is to enter a vicious circle: An old Norfolk farmer was once asked by a city visitor why he kept cattle. "Why, to make dung to put on the crops," he replied. "And why do you grow crops?" "Why, to grow corn to feed the cattle, of course."

A minimum acreage must, of course, be maintained under the plough. Equally, the plough must to an increasing extent be taken round the farm on the modern principle of continuous cropping. But no very great extension in the ploughed area beyond the pre-war level is necessary. Strategic necessities require the maintenance of fertility, but not the maintenance of war-scale production. Fertility may require that land should be ploughed, but not necessarily that it should be cropped; and one of the most successful of all pre-war schemes for maintaining fertility was provided by ploughing up old grass land for re-seeding and manuring.

The test of the approach to a sane post-war agricultural policy will depend largely upon the attitude to imported feeding-stuffs and manures. It is not likely that anyone would openly advocate the restriction of imported fertilisers in order to encourage farmers to keep livestock to produce farmyard manure. Yet at least one of the recent reports on agricultural post-war policy did openly advocate the deliberate restriction of imported feeding-stuffs in the interests of maintaining the tillage acreage. Such a policy would, however, cripple livestock production and the expansion of milk and poultry. If imports of feeding-stuffs are deliberately restricted, it will be because they are cheaper than home-produced feeding-stuffs, and the cost of producing the livestock to which the latter are fed will inevitably be increased correspondingly; and the result will be quite inconsistent with a policy of increasing the output of nutritional foods. If, as is probable, assistance is required to maintain even a minimum acreage under the plough in the post-war years, this assistance should be given directly to the tillage

farmer, and not by artificially restricting the supplies of feeding-stuffs required for the development of livestock production, including milk, poultry and eggs.

The best policy for British agriculture after the war is, in short, that summarised in the resolution of the Hot Springs Conference, which, subject to the overriding principles to maintain soil fertility, recommended that each nation should undertake to direct its policies toward:

(c) Fostering desirable changes in the pattern of production designed to give greater emphasis to foods rich in vitamins, minerals and proteins:

(i) By encouraging the production, particularly in areas near consumption centres, of such products as vegetables, fruits, milk, eggs and meat, which are relatively perishable and high in value and which are also the foods required in greatly increased quantities for better nutrition;

(ii) By encouraging the expansion of livestock production in areas capable of growing or economically shipping in the necessary feeding-stuffs;

(iii) By limiting the production of bulky, easily stored and transported energy foods, in areas where they cannot be produced efficiently.

There is every reason both of international policy and of self-interest why British agricultural policy should be founded on these principles. A large industrial population provides an enormous potential demand at the farm doorstep for protective foods and opens the way to an increase

in production 60 or 70 per cent above the pre-war level. The British market for fresh milk and cream is naturally protected. The pre-war competition of nearby continental countries in bacon, eggs and poultry products is not likely to develop for several years after the war—especially as, in the rehabilitation of European agriculture, crop production will have to be preferred to livestock. The protective foods, moreover, are those which are “high in value”; and in view of the relative shortage of foreign exchange with which this country will be faced after the war, it will clearly be advantageous to grow at home the expensive foods, and to import the cheaper foods, such as cereals, feeding-stuffs and sugar. A policy designed to ensure simply the minimum production of the traditional arable crops required in the interests of the efficient management of the land, but the maximum production of the nutritional foods required for national health will be far less expensive to carry out than a programme designed to maintain as large as possible an acreage under the plough.

The economics of the choices that must be made in deciding the kind of agriculture that is desirable are plain enough. The arguments all point one way. How is the right policy to be put into effect? This will be the theme of a second article.

The Means of War

CONSIDERABLE interest was aroused last week by the publication in *The Times* of a statement signed by Admiral Chatfield, Field-Marshal Milne, Air-Marshal Salmond, Lord Hankey and Lord Winster. Its theme was the unity of all arms, including industrial production and civilian effort, in total war—and, by implication, in preparedness for defence in peacetime. No programme of full employment and social security can be complete unless provision is made, within the proposed organisation of post-war Britain, for the maintenance of essential cadres of material, personnel, planning and ideas for the defence of the realm. *The Times* manifesto was based upon two propositions: first, that “we must now consider war in terms of total war and not in terms of the activities of three individual fighting services, each acting singly in its own element”; and, secondly, that “civil power is the sum of all civil efforts to maintain the war machine, and being the very essence of belligerent power is as important as the strength of the Armed Forces.”

It is easy to see how indifference to these two propositions in both the scale and the manner of defence planning before the war almost brought defeat three years ago. On the one hand, the separation of the three Services in command, training, personnel, equipment and productive facilities meant that the initial war effort of this country, too small in total in any case, was made still less effective by its piecemeal and disparate character. On the other hand, the failure to work out in advance a concerted scheme for expanding the productive facilities of all three arms from a peace footing to a war footing meant that, for a perilously long time, the belligerent power of this country was fantastically disproportionate to its industrial resources. This does not mean that, until complete collective security has been achieved, the whole nation must stand in arms in peacetime as in war—which would indeed be a hideous consummation—though it probably does mean the maintenance of standing forces not far short of a million in number. What it does imply is that the means of war-making, in terms of production, trade, finance, food, raw materials, propaganda, civil defence and diplomacy, as well as of strategy and tactics, should be recognised, planned, revised, improved and developed throughout the years of peace. The rôle of diplomacy must be stressed above all. National defence and preparedness for total war make nonsense except in a framework of the utmost collective security and world collaboration; the only sound basis for all that Britain

must do at home to be safe is the assurance of world aid in the preservation of world peace or the winning of world war.

This is the main importance of *The Times* manifesto. It is in effect a plea that the achievements and discoveries of four years of bloody and often blind fighting should not be squandered this time as they were twenty-five years ago, when all the paraphernalia and methods of total war—mass production, mass mobilisation, the tank and the aircraft—were discovered, exploited and then all but jettisoned. The arguments of the manifesto have become familiar, even commonplace, since 1939. During these years of war, the mistakes and shortsightedness of the pre-war period have been very largely remedied by improvisations. There has been neither the time, nor in some instances the understanding, to start again and place the basis. It has only been possible to achieve the nearest possible approximation to the right method in this or that branch of the war effort in the shortest possible time as the necessity has arisen. The essential requirement is that the right principles rather than these empirical approximations should be the basis of all future defence planning.

It is instructive to compare the right principles, as they emerge from the experience of battle, with the improvisations. Broadly, the principles are three: first, that there should be a single plan to comprehend the entire range of war-making from the combined operations of the Armed Forces to the scale, nature and distribution of production, including essential civilian output and the importation of war goods and necessities from abroad; secondly, that there should be a single hierarchy of command covering all three Services, from their recruitment, equipment and training, to actual operations; and, thirdly, that there should be a similar single and central command over the process of war production. In general, these needs have been satisfied during the war, more or less satisfactorily, by the pre-war method of co-ordination by committees—galvanised at critical moments into surprisingly effective activity by the personality of the Prime Minister and the common sense of conspicuous individuals in the Services and the supply branches of the Government. It is, in fact, Mr Churchill and not the Defence Committee of the Cabinet, who provides the cement that combines the three Chiefs of Staff into something not too unlike a single commander, just as the President and the Prime Minister together perform the same function for the joint Chief

of Staff in Washington. The remarkable degree of collaboration on the battlefield between air and ground forces achieved in North Africa was the consequence of *ad hoc* decisions by the generals and air marshals on the spot. It is symptomatic of the wrong approach in principle that “combined operations” have been a separate branch of the Services; and it is proof of the right approach in practice and on the spot that a series of “trifling” operations on the largest scale have been carried out with great, though definitely limited, success in the Mediterranean area during the past twelve months. In home production, too, improvisation, within its inevitable limitations, has worked wonders. The central Ministry of Production was set up too late. War manufacture was already sectionalised between as many as three separate Ministries. But two important requisites for an integrated policy existed: the single control of manpower by the Ministry of Labour and National Service, and the single control of raw materials under the Ministry of Supply. By these basic controls, by the provident establishment at the outset of the war of a Ministry of Food (with power to ration but not, unfortunately, to determine the distribution of food production) and a Ministry of Shipping, and by the installation, so to speak, of a reasonably efficient telephone system between the different production departments, something not too far removed from an integrated policy has been achieved.

It would be very dangerous, however, for the future security of Britain, if these *ad hoc* achievements on the battlefield and in industry were to be allowed to obscure the serious defects of present methods. The fundamental defect is the perpetuation of inter-Service and inter-departmental rivalries, which can only partially be removed by instructions from the top, and which have not infrequently inhibited necessary action or decisions, both in strategy and production. The establishment of a Ministry of Aircraft Production, for instance, was necessary in 1940 for two reasons: first, because there was no time to make the properly rounded plan of battle that was lacking, and the cry was for aircraft to avert total defeat; and secondly, because the new Ministry was the counterpart of the independent and autonomous Royal Air Force, which was then called upon in a matter of weeks to save the world. But the Ministry is none the less an anomaly. It is odd and unreasonable that, at the present time, when labour is being transferred from munitions production to aircraft manufacture, in accordance with strategic decisions at a higher level, the actual business of recruitment and replenishment should have to pass from the officers of one department, the Ministry of Supply, to the officers of another department, the Ministry of Aircraft Production. And this dichotomy in manpower organisation, only partly bridged by the presence of the Ministry of Labour and National Service, reflects a higher separatism, which tends to decide the competing claims of, say, engines for heavy

bombers and engines for landing craft by balancing claims and pressures rather than by the development of a single plan of action.

The plainest sign, politically, of the old dividing lines that still mark the combined operations of even the fifth year of war is the perpetual argument for and against the existence of an independent air force, in general, and the present bombing policy, in particular. It is the belief of the Royal Air Force that anything less than its present independent status would mean the reduction of decisive air power, in strategy, tactics and equipment alike, to a secondary rôle; and, in the existing set-up, this is almost certainly true. In a departmental system, the only safeguard for any department is to be as strong, departmentally, as possible. It is very significant that, in every case where air equipment has not had overriding departmental priority, as in the case of the Fleet Air Arm and Army Co-operation, its provision has been deficient, both in quality and in quantity, and its use has been seriously restricted by traditional prejudice. The remarkable fact about the successes that have been achieved on land and at sea in the Mediterranean in the combined use of all three arms is that they have been achieved in very many cases by the brilliant adaptation of equipment that was not at all designed for use in this way. There has been a significant lack of special purpose aircraft for use in land or sea operations. It is true that the insistence of the Royal Air Force, with its own Ministry of Aircraft Production, upon the overriding priority of its own aircraft requirements has been largely responsible for its unbalance; but it has also been due to the correspondingly departmental attitude of the Admiralty and the War Office. The overwhelming proof of the departmental system's defects, in the use of air power itself, is the grave failure so far to give Allied striking power the mobility, by air transport, that might well have been decisive in shortening the war. Concentration on independent bombardment on the one side, and in naval and military preoccupations on the other, has done much to hamstring the Allies when victory is in reach.

It is impossible at this stage of the war to revolutionise the system of planning and command for either the Service or for production. What can be done, however, is to extend and make lasting every improvisation in planning for operations which, however empirically worked out, leads in the right direction of single central control. Then, when the war is over and peacetime preparedness replaces the furious and inexorable demands of battle, the means of war and defence must be entrusted to a single organisation, embracing within it, from brains to hands, every element in the nation's power to make war. “Only when the true meaning of total war is realised and all allegiances are merged into a larger patriotism can the full strength of a nation's belligerent power be developed.”

NOTES OF THE WEEK

Mr Morrison Speaks Out

The Home Secretary's campaign for recognition as the chief spokesman of progressive thought in official politics, especially on economic and social questions, is approaching the end of its first year. No other Minister, except, perhaps, Mr Bevin, who speaks primarily as a trade unionist with an official programme, has come within sight of Mr Morrison in the expression of positive constructive and independent views. Whatever hesitations he may have shown from time to time as an administrator, Mr Morrison as a politician is above all a pugilist. Like the Irishman, he seeks out a fight, and asks if anyone can join in—or, rather, he joins in without asking. This is not to say that Mr Morrison is a quarrel-monger. Far from it; it is a tribute to his political sagacity and the perspicacity of his advisers that the fights he chooses to enter are the right ones—and he joins in on the right side. There has been some revival in the United States of the old criticisms of the British war effort, strategic intentions and Imperial rôle. (One such criticism, concerning oil supplies, is discussed in a Note

on page 493.) Mr Morrison's answers, to the American Press Association, were plain and specific. The sum of Britain's contributions to its Allies is not far short of America's contribution to Britain. The Empire's manpower in the Far Eastern fighting is comparable with America's own. The war against Japan will be Britain's to the last ounce of effort. The attacks made on colonial exploitation are a generation out of date, though the era of development and welfare is only just beginning.

At Cardiff last Sunday Mr Morrison, joining with gusto in yet another crucial fight, put his finger on one of the most dangerous threats to national prosperity after the war, namely, the indiscriminate demand backed by the unequalled skill of those who make news and views in certain national newspapers, that Government controls should be removed forthwith when the war ends. Mr Morrison's answer was twofold: first, that the conditions of scarcity which make the control and allocation of re-

sources necessary in wartime will continue after the fighting is over, during the period of relief, rehabilitation, re-equipment and restocking; and, secondly, that even when conditions of wartime scarcity have passed away, a measure of control will be essential if full employment and fair distribution, now the aim of everybody's policy, are to be achieved. Mr Morrison might have faced the second point even more boldly. If the people of this country desire, as they seem to desire, the assurance of more regular work than they ever had before the war as well as the guarantee of minimum standards of consumption for every family in every contingency, they must also recognise and accept the degree of planning and official supervision that will be required to secure these objectives. They who will the end must also will the means.

Democracy and Enterprise

It may be, of course, that, when the people are frankly told of the extent to which full employment and fair distribution, as stated by Mr Morrison at Cardiff and, in a different fashion by Mr Bevin on several occasions, involve official oversight over individual rights of choice, some may ask whether the game is worth the candle. This was the view expressed by Mr Geoffrey Lloyd at Peterborough on Tuesday, when he contrasted the "disciplined direction" and "patriotic docility" of Britain at war with the inherently independent character of Englishmen. It is upon ideas like those of Mr Lloyd that the newspapers are building their purely emotive attack against official intervention of any kind whatsoever, an attack which, as Mr Morrison pointed out, is identical with the campaign against "Dilly and Dally" which shattered orderly reconstruction after the last war. Every instance of official blundering, real or alleged, is being used as ammunition for this assault; the furore caused by an Ilford schoolgirl's shoes, almost entirely by press propaganda, is a case in point. The important point is that the issue should be put fairly before the people, who have the right to choose. It is not put fairly by people like Mr Lloyd, who contrasts wartime discipline with a vision of free and independent enterprise, which is largely mythical; the weightiest demands for the restoration of free enterprise come from industries and trade associations which in practice would be the very last bodies to permit the competitive enterprise of which they speak. Nor is it quite fair, on the other hand, for Mr Morrison to say that "the alternative to control is that the man with the richest purse will bring home the bacon"; Mr Morrison's arguments show sometimes the defects of the skilled debater and advocate that he is. Control is not an end in itself; its sole justification is the achievement of purposes, efficiency, equity, service, that could not be achieved in any other way. There is room for a vast area of individual enterprise without any direct Government interference, except by the imposition of a communal code of conduct. The real point is, first, that the community's resources cannot be employed in such a way as to give a guarantee of full employment and a national minimum of consumption without official direction; and, secondly, that the kind of enterprise for which so active a campaign of publicity is going on just now is often the very reverse of the kind of enterprise that the community requires. Enterprise is the

key. While speakers like Mr Lloyd sometimes use enterprise and independence in a misleading sense, Mr Morrison forgets that private enterprise is just as worthy and necessary as public enterprise—and that public unenterprise may be even worse for the community than private unenterprise.

New Sea Lord

Admiral of the Fleet Sir Dudley Pound, who is ill, has been replaced as First Sea Lord at the Admiralty by Admiral of the Fleet Sir Andrew Cunningham. The change was forced by Sir Dudley Pound's ill-health, and in itself indicates no change in naval policy. Nevertheless, speculation about the possible consequences of Sir Andrew Cunningham's advent is inevitable. Sir Andrew, on active service in the Mediterranean, has won a reputation very different from that attributed to the retiring Sea Lord by his critics. It is tempting to suggest the parallel of Beatty and Jellicoe, the one dashing, enterprising and in the public eye, the other cautious, precise and deeply conscious of his responsibility for the Royal Navy. It should be said at once that much of the criticism of Sir Dudley Pound has been wildly beside the mark, as the record shows. Every sea threat has been overcome in four years of war, during a large part of which this country was navally insolvent, in the sense that its resources did not match its world-wide commitments. Given the assumptions that have inspired naval strategy since 1939, Sir Dudley Pound's tenure of office has been outstandingly successful. It is, however, the assumptions that the critics have questioned. Broadly, the plan has been to hold off every threat to the nation's territory and shipping, until a sufficient force is accumulated by the Allies, on land and in the air as well as at sea, to strike an overwhelming final blow. The critics, on the other hand, have called for short-cuts and flexibility, for assaults upon the enemy which, by their precise timing, swift execution and well-chosen direction, would make up for their lack of decisive force. Best known of the spokesmen of daring, harrying and raiding has been Lord Keyes. In action, during his brilliant career in the Mediterranean, Sir Andrew Cunningham has shown something of the same temper. Faced with greatly superior enemy forces in 1940, he promptly decided that the best remedy was to attack on every possible occasion, and his methods rubbed out the Italian Fleet as an effective factor. At the Admiralty, his tasks will be different; but it is not unlikely that his offensive approach to the problems of naval warfare, coupled with the shrewd and successful experience he has gained of sea-air operations, may loosen the departmental traditions that have to some extent weighed down the painstaking labours of the Navy on its ceaseless mission.

The Italian Front

The advance in Italy continues along three routes. The left flank of the Fifth Army has moved along the coast, by-passed Vesuvius which, unlike Etna, has not been tactically exploited by the Germans, and taken Naples. In the centre, the right wing of the Americans followed the slow 15-mile advance from Salerno to Avellino by a rapid jump from Avellino to Benevento. The Eighth Army, in its march from Foggia, has been assisted by a surprise landing from the sea at Termoli. Military experts predict a prolonged German resistance on the River Volturno, 20 miles to the north of Naples, where the ground is marshy and densely cut by mountain torrents. On the other hand, the Americans are said to have crossed the River Calore, which may enable them to turn the German positions on the Volturno; and, according to the latest reports, the Volturno itself has now been crossed by the Fifth Army at one point. The important question at present is, perhaps, not the lie of the land or the barrier on which Kesselring is likely to make a stand in his retreat towards Rome. A problem of much greater consequence seems to be whether tactical co-ordination between the Fifth and Eighth Armies will still be possible during the next stages of the campaign. The farther they go north, the more formidable is the barrier of the Apennines which separates the two forces. It looks as if the tasks of General Montgomery and General Clark were to some extent tactically independent from each other. Judging by the tempo of General Montgomery's advance, one might infer that the task of the Eighth Army is to secure as quickly as possible the possession of the Adriatic coast as an independent objective, which

CENTENARY RECORD

1. We have been able to prepare a limited number of copies of **A Commemorative Pamphlet**, which will include (a) all the special centenary articles which appeared in the issue of September 4th, dealing with the history, policy and present views of *The Economist*, and (b) the speeches made at a centenary luncheon on September 2nd by Sir Walter Layton, chairman of the gathering; the late Chancellor of the Exchequer; the Governor of the Bank of England; the Home Secretary; and the Editor of *The Economist*. Copies are now available (price 2s., postage 2d.), and applications should be made to *The Economist*, Brettenham House, Lancaster Place, London, W.C.2. (Temple Bar 3316.)
2. A volume of essays entitled "*The Economist, 1843-1943*," which is mainly historical in character, has been published by the Oxford University Press, price 7s. 6d. (Orders should be placed through booksellers, and not with either the Oxford University Press or *The Economist*.)

may possibly have been singled out with an eye to operations in the Balkans. The strong German counter-attacks in the region of Termoli are intended to delay the developing threat; but the Germans there have even less chance of driving the landing parties into the sea than they had at Salerno.

Goebbels at Home and Abroad

In previous years, Hitler has used the Harvest Festival for an annual pep talk on the impregnability of a self-supporting Germany, assurance of victory, defeat of plutobolshevism and the rest. This year the Festival falls in the middle of a great silence. Save for the one hysterical outburst against Italy, the Führer has had no bouts of oratory since Stalingrad. The other master of Germany, Himmler, has never made a public speech and probably never will. The indefatigable Dr Goebbels had, therefore, at this year's Festival, to stand in for both his masters' voices, and find something telling with which to break their silence. Yet he had nothing to say. True, he could announce that the grain harvest was satisfactory for the first time during this war. He also pretended that, thanks to Speer's new methods, bombing had in no way interfered with production. But on the subject uppermost in the minds of most of his listeners—war and peace—he had nothing to tell them. There was the usual tirade against Bolshevism, the usual threat of retaliation by U-boat and bomber against the British; but on the general state of the war, the Doctor limply said he could make no forecast because so many unexpected events might happen at any time. However, one phrase had more significance. "The war would be lost," Goebbels declared, "if we were to break off without victory." This flat disclaimer of the idea of a negotiated peace suggests that, whatever the Nazi leaders may think about the war, they will not openly admit at this stage that German arms cannot achieve complete victory. This fact is open, of course, to a variety of interpretations, but it is not unreasonable to imagine that the reason why the German people are not told is because the Government dare not risk the political consequences of telling them.

This silence on the home front is all the more remarkable in that it directly contradicts the trend of German propaganda for foreign consumption. Here the talk is all of a negotiated peace. The Finnish, the Swedish, the Hungarian, the Turkish press and radio have been flooded with rumours and reports to the effect that the war between Russia and Germany has now reached a "phony" phase, that the German retreat was undertaken by joint arrangement between the Russians and the Germans, and will be followed by a separate peace, as soon as the German armies have withdrawn to the old lines of demarcation. General Tojo's recent speech, in which, besides announcing total mobilisation in Japan, he also spoke of a "great diplomatic undertaking," has been freely interpreted in the neutral press to mean the playing by Japan of the rôle of go-between and mediator between Germany and Russia. This talk of a separate peace has been coupled with strong German warnings to Britain and America that the "Bolshevisation of Europe" would follow on a German defeat and a revival of the talk of a "common Western Civilisation." The purpose of all this is fairly clear. The Germans want a negotiated peace. They hope to frighten the Western democracies into negotiations by hinting that they are already on their way to coming to terms with Russia. But Dr Goebbels, cast very inappropriately for the rôle of Fat Boy—"I wants to make yer flesh creep"—is not very convincing.

Interval in Russia

After three months of continuous fighting, the Russian advance seems to be coming to a temporary standstill. At the beginning of the week reports still recorded Russian gains in the region of Mogilev and the encirclement of Gomel; but these gains have not since been followed up by any appreciable advance. Similarly, in the south, the violent battle for the Zaporozhe-Melitopol line has brought no decisive results. The Germans still appear to hold this line in great strength, in their endeavour to frustrate the Russian threat to the Crimea. In the centre, in front of

Kiev, the position is obscure. Some time ago it was reported that the Russians had captured an island in the middle of the Dnieper which, if they consolidated their hold on it, might have served as a stepping stone for the assault on Kiev itself. Nothing more has been heard about the island. It is plausible that the Russians have not managed to hold it; and it would not be surprising if the Germans had launched a counter-attack to the east of Kiev or in the region of Chernigov. The present situation on the Russian front can hardly be described as stabilisation. Neither side can, in fact, afford stabilisation on the Dnieper. The Germans have not yet shortened their front. The Russians seek to dislodge the enemy from the western bank of the river, if only to deprive him of the excellent winter quarters which its great towns afford. Nor has the standstill been mainly caused by the rather mythical autumn rains; the rainy season has not yet come in the Ukraine. What has happened is that the offensive has for the time being spent itself in the most natural way. The pursuers need rest; their ranks need overhauling and reinforcement; their lines of communication must be restored and changed to broad gauge. How long this breathing space may last can only be a matter for speculation. This year, the interval between the winter offensive and the summer campaign was four months. The next interval, however, is likely to be shorter.

Practical Demobilisation

The Conservative Sub-Committee on Demobilisation and Resettlement has made a bold attempt to square the circle. The just and human way to release men and women from the Forces is according to length of service, with provision for age and family obligations. The correct criterion on grounds of economic policy, however, is different and twofold: whether their services and skill are needed in the schedule of reconstruction priorities, and whether there are, in fact, lasting jobs for them to go to. Military considerations, again, offer another standard; are the men still needed in the Forces, for further battles in the East or for police and occupation purposes? Large standing forces will be required after the war, falling only gradually to a million. There will be a preference for volunteers; but conscription will have to continue. The solution of the sub-committee attempts, logically and realistically, to combine these different tests in a single formula. They propose a "points" scheme which provides for the allotting of points for service on or before certain dates, service overseas, age,

marriage, number of children, employment immediately available, one-man business commitments, the demand for personnel in particular trades and professions, and interruption of education; there would be a subtraction of points for the desirability of the men's retention in the Services on military grounds. Whether this scheme would be workable is one question; whether it could be intelligibly explained to the home-sick millions is another. But it is certain that any practicable scheme must in fact be based on precisely this combination of considerations, in one way or another; and it is important that the people and the troops should be told promptly and frankly that there is no simple way out—as Mr Bevin suggested, unfortunately, the other day.

* * *

Strikes and Strikers

The engineers' strike at Barrow has ended. The implications of the pay award which they have reluctantly accepted are discussed in a Business Note on page 499; so, too, are this year's figures of industrial disputes. It is probable that the recent stoppages have got out of perspective in the public mind. In fact, production has been less affected by strikes than it was last year—vastly less than it was during the closing stages of the last war, and much less even than in many peacetime years. Nor is it correct to give recent strikes a mainly political character, as Mr Bevin seems to do. The fact is that these disputes, greater in number than they were, but briefer and more local, are almost exclusively concerned with specific grievances of conditions and remuneration; even when, as often, they are directed against wartime compulsion, the motive is personal rather than political. At Barrow, the strikers were led by their local trade union leaders to believe that the arbitration award was being wrongly interpreted and that, on appeal, they would win their case. They did not, and there was disappointment and resentment. To Mr Bevin, the strikes are political, not because the strikers have political motives in mind, but because his authority, both as Minister and as trade unionist, is threatened by the growth in the number of stoppages. Rightly, he has determined to enforce the law that makes strikes illegal in any circumstances. It would be a pity, however, if his determination to do this, which should have general support, were to be accompanied by allegations of insidious activities which, in fact, have very little to do with the strikers. A few agitators are as always, fanning the flames; but there is nothing to suggest that the politics of these fire-raisers, whatever they may be, have the sympathy of more than a minute fraction of the men concerned. Mr Bevin has no need of a Trotskyite bogey to reinforce his policy, which is quite clear. It is on the one hand, to stop strikes by the force of law and of trade union authority; and, on the other, to make quite certain that, in every specific case, the particular local and personal grievances of the strikers, if real, are put right.

* * *

Depressed Areas

Ministers and trade union leaders would do well to examine carefully the background against which industrial disputes are set. First, and most general, there is the fatigue of the fifth year of war, a restlessness and an impatience with wartime restrictions and discipline, which is expressing itself just now in all sorts of other minor ways in practically every section of the population. Secondly, and more specifically, there is the significant fact that a great deal of present labour unrest is taking place in areas that before the war were distressed and in industries that were depressed; that is to say, the strikes affect men and families for whom the organised privations of wartime have followed the unorganised privations of pre-war poverty and unemployment. The tendency to allot supplies of non-rationed goods on the basis of pre-war demand has meant that, even with the local adjustments that departmental officers have power to make, the supplies available to these people during the war have been based, to some extent, upon a depression standard of demand. Again, the assumption of wartime distribution has largely been that, when the war began, families had a sufficient stock of necessities to start with; the problem was regarded mainly as one of replacement, within the limits set by wartime curtailment of civilian manufacture. In the distressed areas and depressed industries, this assumption was, of course, quite untrue; the problem of these families has been one, not of replacement, but of actual stocking. In the event, in spite of

the efforts which have admittedly been made to meet these discrepancies, it has been far from easy for these men to translate their increased wartime earnings into the commodities which, even before the war, they and their families had to go without. They have lost on both the swings and roundabouts, in the fat years as well as the lean ones—and now, after this experience, they are very worried about the post-war future. They fear that the swings will come again as empty and as unattractive as ever. These are the points that the Government, the civil servants and the trade unionists will do well to note and deal with.

* * *

Pay-As-You-Earn

The pay-as-you-earn proposals of the late Chancellor of the Exchequer have now been given definite shape in the Wage-earners' Income Tax Bill. The text of the Bill does not dispel but strongly reinforces the first view, when the announcement was made, that the proposals should at once be extended to cover all earned incomes. The distinction between weekly wage-earners and others is arbitrary, untenable and unjust. The new proposals apply—so far as non-manual workers are concerned—to all persons whose remuneration in September, 1943, was calculated, either in whole or in the main, by reference to any period less than a month, irrespective of the actual intervals at which payment is made. The purpose of the change in method is to ensure that those whose total remuneration may fluctuate widely from year to year shall not be exposed to the necessity of paying tax on the high wages of an earlier period during a time of low receipts. It is, broadly speaking, true, of course, that, of the various classes of earned income, that of the factory worker fluctuates more widely than any other. But it is not true that in other occupations there is any close correlation between the basis on which the wage is calculated and either security of employment, stability of earnings or rate of earnings. Within any firm, of two individuals doing similar work, receiving similar pay and with equal security, one may, for historical or other reasons, be remunerated on a weekly basis and the other on a yearly one. One firm may decide that everybody shall be paid on a yearly basis, except those whose employment is purely temporary, while another firm may pay everybody from the managers downwards on a weekly basis. Unless all employers are to be allowed to change all payments on to a weekly basis retrospectively, a great deal of injustice between one individual and another will inevitably result from the proposals—in their present form. Even if length of notice to be given to the employee were made the criterion, there would be substantial inequities. The clear fact is that the border line between wages and salaries is so confused that no arbitrary dividing line between the two can be satisfactory. Theoretically, a line could perhaps be drawn by reference to the total taxable income of the employee, or of husband and wife when both were working. But, in practice, the only right way is to include all earned income within the relief and to adjust allowances and rates of tax to secure any redistribution of the burden which was considered desirable.

Finnish Tug-of-War

The Finnish people want peace and since Finland is a democracy, they are saying so very loudly and clearly. This freedom of expression cannot fail to complicate the task of the Finnish Government, which is in the position of trying to conduct delicate and private negotiations in the middle of a room full of shouting people, who are all leaning over each other's shoulders to see what are the latest moves at the conference table. The Germans are in Finland and after the defection of Italy, they will presumably fight tenaciously to prevent another. There are, moreover, a limited number of Finns—Viano Tanner, the Finance Minister, is the best known among them—who still prefer almost anything to an understanding with Russia. They argue that Germany is not by any means beaten; that the shortening of the Russian line has released more troops for the defence of Europe; that Finland would, like Italy, become a battlefield if Finland attempted to negotiate peace; that, finally, the Finns depend upon Germany for food supplies, and the Russians would not have the material, nor Britain and America the transport, to take over the provisioning. Given the complexities of the debate is

probably not the background which the Government would have chosen. But the anti-Russian group is forcing the debate into the open, and it is in any case useful for the Government to be able to get some popular reaction to the various possible peace proposals as they are brought up to the level of public discussion. The Government's strategy appears to be to seek the greatest possible amount of support from the Western democracies and to manoeuvre for position vis-à-vis Russia. No occasion is allowed to pass without some reference to the Finns' friendly feelings towards the West and their complete isolation from Germany's war on Britain and America. At the same time, a number of "peace proposals" have been allowed to appear, partly to test opinion in the West, partly no doubt to secure some reaction from Russia.

*

One such *canard* was the proposal taken by Eero Vuori, chairman of the Finnish Trades Union Council, to Stockholm, and transmitted with the full support of the Finnish Government, to Mr Arthur Deakin, of the Transport and General Workers' Union. It was here suggested that Finland would negotiate on any terms more favourable than the 1940 Treaty, that the Karelian frontier should be redrawn in Russia's favour, but Hango remain with Finland, that Britain and America should guarantee supplies and that Russia and the West should guarantee Finnish independence. The effect of these proposals was an enormous intensification of the public debate in Finland. Thirty-three leading political personalities sent a deputation demanding a separate peace. The Prime Minister, M. Lincomies, tried in a "secret" statement which became public to check the flood of discussion, but it only became greater when after a few weeks' delay, the Russian counter offer appeared in the shape of a proposal, reported "from Russian sources in London" by the London correspondent of the *Stockholms Tidningen*, demanding a military surrender, adequate strategic guarantees to Russia on the Karelian frontier, the setting up of a "democratic government," but conceding Hango to the Finns. This is the point which the manoeuvring for position has reached so far. The publication of the Russian kite gave M. Tanner the opportunity to attack the whole idea of a negotiated peace. Kuusinen replied in *War and the Working Classes* with a strong attack on Finnish capitalists and warmongers. Nevertheless it looks as though the margin of disagreement has been almost covered. Possibly the good offices of Britain and America can be brought into play at this point. The meeting in Moscow provides an admirable occasion.

* * *

Terror in Denmark

On the night of October 1st, a thousand men of the Gestapo and of the Danish quisling organisation, the "Free Corps," started rounding up the Jews in Copenhagen. This was the start of a terror hunt to arrest the Jews of Denmark on the excuse that they had been responsible for the anti-German rising which took place some weeks before. This is not in itself an exceptional step. The Danish Jews hitherto have enjoyed the special status accorded to Denmark as a whole, but when after the summer rising the pretence of Denmark as a model protectorate was abandoned, the Jews lost their relatively favourable position, and it was only a matter of time before they shared the fate of the Jews of Norway and France and all the other Occupied Countries. Many of them had already read the signs of the times and had escaped to Sweden. More are escaping every day, but the great majority must have been arrested. The crisis is remarkable for the reactions it has aroused. The Swedish Government has protested strongly to Germany and offered a free asylum to all who can escape. Even more significant is the reaction in Finland. Hitherto the fact that one Scandinavian country under German occupation was enjoying exceptional privileges gave the Finns a sort of moral justification for their co-operation with Germany. The Danish revolt last month created a strong impression in Finland. The latest outbreak of German terrorism has shocked and alienated public opinion still further. Some newspapers are even calling for a protest, and it may well be that the timing of the German terror in Denmark will have some effect on the course of peace negotiations between Finland and the Allies.

Total Demolition?

Hitler's land forces wreak devastation in the cour of their retreats in Russia and in Italy. Total demolition has become an acknowledged and normal feature of total warfare. The Allied air forces in their continuous day and night bombardment of Germany are acting on the same principle. This week's main targets have been Bochum, Munich, Hagen, Emden, Kassel, Hanover, Frankfurt am Ludwigshafen, Bochum, Emden and Frankfurt were bombarded by day and by night. Allied aircraft started off from both British and North African bases. Blows at the "roofless fortress" are thus converging both in time and in space. Allied communiqués report the weakening of enemy defences with the intensification of the attack. The *flak* has lost some of its reputed strength; and the night fighter defence is said to have been impeded by its dispersal to meet switched attacks. The novel device of flare-paths put up along the direction of attack is said to have been frustrated by diversionary sweeps which lured the German night fighters into the wrong places. The total loss in Allied bombers and fighters for six days up to October 5th has been put at 64, which gives a daily average of only slightly more than 10 aircraft. At the same time, the number of enemy fighters destroyed in one day only, during the daylight attack on Frankfurt, was given as 75. The reports of the United States Air Force speak of the "lowest loss ratio on deep penetrations into Germany." What remains still to be seen is whether the intensity of the attack and the weakening of the defence can be maintained over a period. One communiqué has mentioned the use by the Germans of their new rocket bombs during the attack on Frankfurt; and only experience can show whether this or similar devices will allow the enemy defence to reassert itself. Moreover, the attainment of the ultimate strategic objective—total demolition—cannot yet be taken for granted. What is quite certain is that intensified air attack is forcing the enemy to divert large forces to anti-aircraft defence; and that the concentration of bombing power, coupled with flexibility, threatens to cause an important deconcentration of the enemy's defences.

AMERICAN SURVEY

The Great Contradiction

THERE is no doubt that, on the question of collaboration with other nations to keep the peace, American opinion is undergoing a deep-seated change of heart. Mr Swing has said that it was the "grass roots" that succeeded in moving the "elephant" at Mackinac; and if more evidence is needed, there is the passage of the Fulbright resolution by the House and the strength of the pressure on the Senate to take similar action. The outcome of the debate is not certain. The opposition is vigorous, and on the affirmative side there are so many shades of opinion that any formula for common agreement at this stage is almost unavoidably ambiguous. But the alternatives are more and more clearly understood. The speed with which Congress, after its recess, turned to working out a resolution on post-war policy is proof that the people back home are more convinced of the need of international co-operation than was apparent in Washington.

It comes as a shock, therefore, to find Admiral Vickery, on his return, declaring that he warned British shippers and officials that

we intend to become a maritime nation and stay one; I said we would do it by co-operation, but if they did not want to co-operate we would stay one anyhow.

Admiral Vickery's position is not isolated, and it is not confined to the shipping industry. In political matters the tide is flowing toward Wilson; but in those questions of economic co-operation which are the life-blood of an enduring settlement there are signs of a return to the big stick and the ideology of McKinley.

There is no lack of appreciation of the importance of economic factors in international relations. The need for skilled economic administration in foreign affairs is being met. The appointment of Mr Stettinius, as well as assuring smoother relations with Congress, promises experienced and continuous attention to the economic questions in the State Department. The bringing together of Lend-Lease, the Office of Economic Warfare and the Office of Foreign Relief and Rehabilitation provides the beginnings of an economic staff for foreign relations. What is lacking is the realisation that political co-operation and economic nationalism cannot go hand in hand.

Economic Foreign Policy

Mr Walter Lippmann recently came to the reluctant conclusion that the United States is already "getting ready once more to have no economic policy," in the sense of a policy which would accord with its preponderant place in the world economy and its status as the great creditor nation. His basic principle is that the foreign accounts of a nation should be brought into balance by ordinary economic transactions, which for the United States would imply a willingness to accept imports without pressing its exports on the world. This was catastrophically ignored after the last war, when the United States pursued a policy of maintaining and increasing its tariff walls, promoting exports and collecting debts. He points out that, over the period from 1922 to 1928, an average net payment to the United States of \$472 millions had to be made by foreign debtors, a payment which was only possible so long as the stream of foreign loans continued. The end of large-scale foreign lending by the United States and other creditor countries led by rapid steps to the cutting of imports by these countries, cut-throat competition in world markets, and the strangling of international trade. Economic collapse, revolution and eventually war, according to Mr Lippmann, were the results.

Whatever the attitude of the Government, there are almost no signs that this grim moral has been understood by those Americans who traditionally have determined economic foreign policy—the business men, the shippers, the exporters. They have created a foreign policy in the past as the consequence of individual action and the pressure of

powerful interested groups upon Congress. The influence of the Government has been limited to the very modest success of the Reciprocal Trade Treaty Act in moderating individual tariffs. Far from dissipating these pressure groups, the war has increased their number and strengthened their determination to secure for the United States the advantages to which they feel it—and they—are entitled in the foreign field. This week the Chamber of Commerce demanded that American business men should be permitted to send representatives into the Allied and liberated countries even before hostilities cease, to strengthen post-war trade connections, "in order that they may make their contribution to maintaining employment in the United States." Specific instances of this new aggressive attitude on the part of industry are legion. The vast expansion of productive capacity in shipping, in aircraft, and in synthetic rubber, the outstanding "war baby," provides an almost irresistible pressure toward heightened competition abroad and the erection of new trade barriers at home. The flood of nationalism which the war has released is being very deftly handled to support the claims of industry. It is responsible for a strong current of opinion in favour of "cashing in" on the advantageous position the war has created: using Lend-Lease to secure bases, rights and preferential trade treatment.

The Yankee horse trader is being resurrected as a national ideal; it is urged that the United States be as "realistic" about its foreign interests as other nations allegedly are. Mr Churchill's statement that he did not become the King's First Minister to preside over the liquidation of the British Empire is quoted admiringly, even enviously, as an example of the attitude the United States should adopt. The decline of the New Deal has been accompanied by a return to favour of the businessman, assiduously promoted by industry, which is using its vast publicity resources to ram home the belief that business has won the war by producing the tools, despite the ineffectual harassments of the bureaucracy. The appointments of Stettinius, Harriman, and Crowley are welcomed as heralding businesslike methods and hard-headed realism in international affairs.

The Practical Issue

This explosion of economic nationalism has been stimulated by the war, but it has deeper roots. Those who blame the United States for not cutting its trade to fit its bank balance would do well to remember with what rapidity the change from a deficit to a credit position in international affairs developed. A lag in private understanding and public policy is unavoidable. It should be realised, too, that as a continental power, capable with small exceptions of supplying all its own wants, there is not the same urgency to accept imports that once made Great Britain a stabilising influence in world economic relations. The fact that almost any import can be counted upon to injure some domestic producer has been intensified, of course, by the long history of the tariff which has built up powerful and experienced pressure groups. This economic self-sufficiency, coupled with the relative geographical isolation of the past, has stimulated a belief, which still operates, that, in both the economic and military spheres, the United States can be made invulnerable, and that concessions to the rest of the world are founded on good will, and even charity, rather than necessity.

The prospects, then, of any dramatic and immediate reversal of American economic policy are poor at the moment—poorer perhaps than they have ever been. The realistic foreign policy in economic matters which Mr Lippmann advocates with so much clarity and cogency is a matter for long-term education. But there is another approach which is more hopeful. Mr Lippmann contends that a major contribution to world economic stability is the maintenance of full employment in the United States. As he points out, this has become a political necessity and

the first call upon domestic policy. Given full employment, there will be a growing demand for imports, and, if not a slackening, at least a lack of additional urgency to secure export outlets. Without concurring, or indeed being much aware of the international implications, business is with Mr Lippmann on this point. It understands that the future of free enterprise turns almost solely upon its ability to provide jobs and a rising standard of living. The battle will come over methods, but if it can be successfully resolved without too much domestic friction the United States cannot help exerting a stabilising influence on world economic affairs. There is time, too, for someone to do for foreign economic policy a job of analysis and education comparable to that which Mr Lippmann has done so ably for the framework of political security and order.

American Notes

Re-birth of an Elephant

If the emblem of the Republican party were the Tammany tiger, one could sum up Mr Willkie's *Look* article as a demand that the tiger change its stripes. For what he demands, as the price of his loyal service, "whether as nominee or worker in the ranks" is a complete reversal of all that the Republican party has come to stand for, and a return to its "original tradition, that of the great American liberal party." Mr Willkie's liberalism, as illustrated by his platform, is indeed in some ways the liberalism of the Lincoln period. It begins with civil liberties and equal rights for minorities, which are close to Mr Willkie's heart. It includes a demand for economical administration, and insists that employment should be provided by an expanding system of enterprise with the minimum of Government interference. But it includes some forceful comments on the nature of real free enterprise, which are refreshing from a Republican and a former president of Commonwealth and Southern. He has some salty things to say about those who talk free enterprise and pursue monopoly and restriction. He also takes a firm stand for the extension and strengthening of social security measures. Surprisingly, it is the foreign policy plank that is the vaguest. His demand is that the party should lead the way in formulating a plan for American participation, based on principle and not expediency, backed up by an America strong both in economic and military terms. It should be a plan by which "free men can stand together." His attacks on the Administration's foreign policy are vigorous, but it is notable that they refer almost entirely to the pre-Pearl Harbour era. No doubt Mr Willkie realises that he is hardly the man to defeat the Administration on the grounds of its war-time diplomacy. He is on surer grounds in his attacks on the mismanagement of the home front and his fear that it may lengthen the war. This is an effective and historic document. Mr Willkie is undoubtedly right in saying that, if the Republican party is to survive to win again, it must slough off the association with vested interests which it has accumulated. It is his function to prod the elephant, and to make it perfectly clear where the blame lies if the Democrats are successful in 1944. He has begun well, but the birth of an elephant is notoriously a lengthy process.

The Senators Report

Four of the five Senators who spent the recess touring the war fronts are due to make a report to the Senate in an unusual secret session this week. They have not, however, been miserly of previews to the Press. Some of these statements have made a field day for the isolationists, though it is a fair guess that these gentry made considerably more of the sensational complaints than their authors intended. The charge that America was being stripped of its petrol reserves while British refineries in Persia were working far below capacity has already been destroyed by President Roosevelt's explanation that the determining factor was the tanker shortage. The habitual critics of Great Britain have made much of one charge—that American achievements are played down by British newspapers and radio; and the demand that America should retain foreign air bases was given another airing. Senator Lodge created a stir by urging the need of Russian bases to prosecute the war against Japan. The group appear, however, to have been impressed by the efficiency of Anglo-American military co-

operation, and others of their comments have more practical and constructive possibilities. In particular, the assertion that the failure to provide American representatives abroad with a firm picture of what American post-war policy is to be hampers their activities may well speed up the post-war policy debate. The Office of War Information's foreign branch appears to be due for another shake-up. Senator Lodge was especially bitter about the depressing effect on American troops of hearing persistently over-optimistic reports of the ease with which their battles were won. At the time of the Senators' departure there was some criticism of the waste of taxpayers' money in foreign junketings. These are no longer heard, and it seems likely that the Senate and even the House may be encouraged to repeat these direct contacts with American activities abroad.

The Tax Programme

Mr Morgenthau has laid his new tax proposals before the House Ways and Means Committee, and Mr Doughton, its Chairman, has promptly attacked them, asserting that they are more than the people can bear. The most interesting feature of Mr Morgenthau's plan is the suggestion that social security levies should be increased more than five times, from \$1,150 million to \$6,450 million. The other proposals concern more conventional increases in taxation. These, Mr Morgenthau pointed out, would be affected by the acceptance or rejection of the social security scheme, for if it is accepted his proposals for increases in the lower brackets would have to be adjusted to avoid too great burdens on small income-earners. They aim at raising \$10,560 million. Of this figure, individual income taxes would contribute \$6,530 million from an increase of surtax rates, the reduction of exemptions and dependants' allowances and the elimination of the earned income allowance. Excise taxes should, it is proposed, be increased to yield another \$2,490 million, while corporation income taxes would add \$1,140 million. According to the *Wall Street Journal*, about \$2,500 million of this would be refunded after the war, with a maximum of \$500 to any one individual, and the Victory tax is to be repealed, with the withholding tax increased as a substitute. It is fairly certain that Congress will approve nothing like these increases, and that the usual protracted haggling will cut the totals substantially. The success of the third war loan drive will be used as evidence of the efficacy of voluntary savings; and a blind eye will be turned on the current spending spree which is keeping shops all over the country busy from morning till night.

Orphan Annie

Little Orphan Annie has been getting into trouble. The famous comic strip heroine, darling of the McCormick-Patterson press, has ventured too far into politics. On a well-deserved holiday after finding and destroying a Nazi U-boat nest, Annie got entangled in a feud with a local Office of Price Administration director. This might reasonably have been expected to be a sure-fire hit, considering the unpopularity of gasoline rationing, particularly in the Middle West. But the McCormick press never does things by halves. The OPA director proved a perfect monster who maintained three cars for pleasure driving, and took a hideous delight in depriving innocent citizens of their modest ration. For once the mark was overstepped. The *Louisville Courier-Journal* headed the revolt by throwing the strip out of the paper on the ground that its sponsors

had made it a vehicle of propaganda against gasoline rationing. There were enough other kicks from Annie's potential audience of 20 million to force the publishers to destroy three weeks of Annie's adventures and set her off on more innocent trails than Colonel McCormick's vendetta against the Government. One can only hope that she will not run into any Rhodes Scholars, those pernicious enemies of America whom Colonel McCormick is determined to root out. That might be the end of Annie altogether.

The Administration's campaign to provide for further subsidy payments in legislation for the extension of the Commodity Credit Corporation may be met, according to the Wall Street Journal, by a Farm Bloc move to ban price rollback subsidy payments in the Bill. The President is preparing a message on the 1944 food programme which is expected to go to Congress this week.

Shorter Note

THE WORLD OVERSEAS

"Fascist Republic"

MUSSOLINI is in north Italy and has held his first council of Ministers. His address to this first meeting has been broadcast and was notable for its complete lack of content. He attacked the "traitors" and put retribution as the first point of the new Government's programme. Republicanism came second on his list. For the rest, he declared that this was not the time for carrying out in detail the full Fascist programme, but that the future Italy would be a "stato di lavoro"—a state based upon labour. The council of Ministers then passed five measures: the transfer of the Government from Rome to northern Italy; the subordination of the Army to the Militia; the abolition of the Senate; the extension to non-Fascists of Badoglio's legislation against the illicit acquisition of large fortunes by Fascists; and finally, the creation of a "sindacato unico." These measures have some significance, for they illustrate the deep divisions into which Occupied Italy has already fallen and give some clue to the very chaotic political situation.

Two different trends seem to have emerged already even within the body of the rump Fascist administration. In the course of the last week, one of the old Fascist figures has re-emerged—Ricci, the former chief of the Balilla, now combines this post with that of Commander-in-Chief of the restored Fascist Militia. Ricci was one of the old guard Fascists and ran a gang of his own in Carrara in the old days. At present he is competing with Graziani for a controlling position in the new administration, and it looks as though the old struggle between Mussolini and Badoglio—in other words between the Black Shirts and the Army—has already reappeared. Ricci and Graziani are putting forward two different ideas of how to reorganise Italian resistance. Ricci's idea is to build up a selected Militia, bound together by a fighting faith in Fascism; Graziani is for the reconstitution of the Army on its old basis, the return of the officers to the colours and the recruitment of the ranks by mobilisation and not by volunteering.

Neo-Fascism

This split in military policy is reflected in the social outlook of the new regime. Ricci is identified with an attempt to recover the revolutionary *élan* of early Fascism and to rally the support of the masses—and presumably get them back to work—by promising social reform, workers' control, a single trade union and so forth. On the other hand, apart from the measures passed by the council of Ministers and Mussolini's vague reference to the "labour state," nothing seems to have been done to put this revolutionary programme into practice. New heads—all of them ciphers—have been named to the old Corporations, including the most important corporation, that for Industry, and it looks as though workers and employers are still bound together in a single organisation. In any case, the extremely chaotic conditions in all the Italian towns have made the restoration of the bare essentials of civil life the first charge on the Fascists' social administration. Prefects have now been named for the northern provinces, though the appointments do not extend further south than Bologna, Florence and Pisa. But in the big cities it seems that many of the public utilities, including urban transport and the local postal services, are not yet in working order.

The appointment of the Prefects only to the northerly districts points to another deep division in Occupied Italy—the division between the areas under the direct control of the German military authorities, and those in which some semblance of a Fascist civil administration is being restored. This suggests that the Germans mean to hold a line across the waist of Italy, possibly north of Rome, but certainly well to the south of the plains of Lombardy. If some semblance of Fascism is being patched together in the north, it is only because the Nazis wish to be spared the burden of administration and still hope to get some dividends from Fascism in the shape of volunteers for the labour campaign or for the Army. It is their decision that will finally determine whether Ricci or Graziani gets control of the Italian machine, and it is impossible to say yet whether the German General Staff has decided to attempt the reconstitution of the Italian army or rely on a Fascist Militia. Graziani called an officers' meeting in Rome early in October, which was also addressed by General Stahel. It was announced at the meeting that the Government hoped to restore a fighting army on the basis of the existing Officers' Corps "within a few months"; but it does not seem that anything was done to compel re-enlistment and the lack of action suggests that the old Italian army is for the time being shattered beyond hope of reconstitution. A universal movement of spontaneous demobilisation has sent the men back to their towns and villages, and it is very improbable that an attempt now at remobilisation would have any effect at all.

This is borne out by the effect of the decree of labour mobilisation. The attempted call-up of the fifteen age groups had no success at all; the people simply did not appear. Now the authorities have abandoned threats and are attempting bribes—that the labour force will only be used in Italy, and that they will be paid in cash and not in kind. The German army has withdrawn its *Bankgutscheine*, and the Italians have been promised that they will be paid in Italian money. But in the present state of disintegration, bribes will have little more effect than threats, and the bribes themselves are worthless. As the fighting develops, the north of Italy will be cut off completely from the south and Italian workers can argue that the exile will be as complete as if they were sent to Germany.

Italian Apathy

Underneath all these divisions—between the Fascists and the military elements within the new Italian regime, between the authority of Germany in the south and the delegated authority of Mussolini in the north—lies a single factor of unity, the passive resistance of the Italian people. True, there are practically no reports of active fighting. Even Rome radio has now stopped issuing its warnings against violence. It is probable that most of the ringleaders of active resistance have already been rounded up—the one policy which the Mussolini regime can effectively pursue is that of vengeance—and the Swiss wireless bears this out. The number of Italian refugees who have fled across the frontier—it is already as high as 21,000—suggests that something like a terror is going on in northern Italy, and refugees continue to arrive even across the closed frontiers, at the rate of about three or four hundred a day. But the key to Italian resistance is not violent agitation. It is

passivity. The labour mobilisation has been a failure. The attempt to secure volunteers, either for the Army or for the Militia, has been a failure. The Italian masses will not co-operate, and the Germans will have to fight their rear-guard action against the sullen hostility of the Italian towns and countryside.

Crisis in Croatia

CROATIA has been the one new state on the Continent formed by the Nazis specifically to show that the continent dominated by Germany could function as a block of totalitarian countries. Unfortunately for the Germans, Italy made claims on the Dalmatian coastline, and shortly after the founding of "Independent Croatia," Pavelitch agreed in the Rome Protocols of May, 1941, to hand over to Italy the most important parts of the Dalmatian coast including the main port, Split. At the same time Croatia was made a kingdom. The Duke of Spoleto accepted the throne and was given the name of Tomislav. The surrender of Italy gave Pavelitch, acting without doubt on the advice of Germany, the chance to declare that the territories and towns ceded to Italy would be incorporated into Croatia. In a proclamation, Pavelitch asked for national unity and promised energetic measures to free all Croat territory. The Minister of War, Navratil, issued an order of the day at the same time in which he explained that the Croatian Army would now have to liberate the new territories.

Pavelitch was obviously quick to seize the opportunity to end a smouldering political crisis. Ever since the foundation of Croatia, Pavelitch had been reproached for having ceded Croatian territory to Italy and for having given the crown to an Italian prince. The Duke of Spoleto, however, had never set foot on Croatian soil. Beside Hungary there was thus a second kingdom on the continent without a king. Pavelitch's quick action has not solved the political crisis. Actually the country has never been effectively administered under the Ustasha organisation. Guerilla activities have been sporadic; they have disorganised not only the political and economic administration, but also communications. At present, the country is virtually in a state of war. The Dalmatian coastline had to be conquered in a military campaign by combined German and Ustasha forces against guerillas and Italian troops. Although the main towns have been occupied, the country is by no means pacified. Guerilla activities are reported from all parts of the country. Even Zagreb, the capital, must be kept in a state of military preparedness against eventual attacks.

Double Crisis

As long as German and Italian interests, moving not always in unison, gave Pavelitch some semblance of political independence, the Ustahas and Pavelitch frequently seemed to oppose German domination. The Foreign Minister, Lorkovich, backed by the German Minister Kasche, recently openly attacked the Ustasha and demanded a reconstruction of the Government. German interests would have been served if Lorkovich had been made Prime Minister, and if Machek, still the undisputed leader of the Peasant Party, had entered a coalition Government. Machek declined, and Pavelitch appointed the aged Mandich. Lorkovich, who is completely subservient to German demands, resigned. Two other Ministers and three Secretaries of States resigned also, and at this point in the crisis he Italian surrender happened. Since then, German troops in Croatia have been reinforced, and the Pavelitch administration is obviously no longer free to engage in political intrigue. On paper, Germany will continue to call Croatia independent, but the country is now under the same sort of military occupation as Serbia.

War Economy

Pavelitch probably recognised his impossible position as an independent dictator, and in his own interest tried to make the country more helpful to the German war effort. Total mobilisation for military service has been declared and thousands of young men have been sent to Germany for training as future leaders. In addition, Croat Waffen-SS detachments have been formed, and it seems that for every Croat soldier or recruit being sent to Germany, German soldiers move into Croatia. At the same time, the country being prepared for bombing attacks. Air defence services are being organised, and in towns the black-out is obviously strictly enforced. All these preparations can only become effective if the civil servants co-operate with the occupying

RATIONING MAKES EXTRA VITAMIN SUPPLY ESSENTIAL

The body must have enough vitamins A and D if it is to remain healthy. Before rationing most of us got sufficient of these in our ordinary meals, but wartime diets tend to reduce the vitamin value of our food.

A daily dose of Crookes' provides sufficient 'anti-infective' vitamin A to enable you to resist colds and influenza, it provides, too, the correct amount of 'sunshine' vitamin D to keep adults healthy and to allow children to grow up with strong bones and sound teeth.

CROOKES' HALIBUT OIL

forces. Continued price increases have weighed heavily on the civil servants, and a bonus has been paid to them, as an advance on a promised increase in salaries. The Ustasha movement seems to be purged from unreliable elements and a general propaganda campaign has been started with the aim of strengthening the so-called home front.

As in other continental countries, favourable weather produced a better wheat harvest, which is reported to be half as big again as the 1942 harvest. Although an elaborate system of agricultural control and requisitioning has been worked out on paper, the peasants have continually obstructed this system. At times, the supply of foodstuffs to larger towns was utterly inadequate, and last year small quantities of grain seem to have been imported from Germany. After the spring cultivation had been completed this year, the official prices for important agricultural products were generally increased. A system of premiums was introduced at the same time to induce peasants to grow more oil-seeds and sugar-beet. It is doubtful whether these measures will have had any appreciable result. The harvest period was marked by increased guerilla activity, and it can be assumed that peasant villages and small towns are thrown back on an even more precarious system of self-sufficiency than before the war. Unsettled political conditions have so far prevented the recovery of Croatia's small industry. Resources vital for Germany's war industry, such as bauxite, cannot be fully exploited because of the lack of labour and material. All efforts to stem the rapid increase in prices have failed. Financial control is ineffective and the notes in circulation are rapidly increasing. Special safeguards had to be introduced to secure the liquidity of savings deposits in banks. The financial situation is characterised by the fact that the issue of state debentures needed for covering the budget deficit is completely subscribed by banks.

Russia at War

Arctic Fuel

ON September 17th the Soviet Telegraph Agency announced the completion of work on the North Pechora Railway; 714 persons were awarded orders and medals. The news did not arouse any particular interest abroad. Yet the construction of the North Pechora railway marks an important date in the economic development of the Arctic and Subarctic regions of European Russia. Though the importance of those northernmost areas in Russia's economic life is incomparably smaller than the importance of the new industrial centres of the Urals and Siberia, their development is perhaps even more remarkable.

The new railway starts from the northern tundra of Vorkuta, almost on the border between Arctic Europe and Arctic Asia, about 700 miles to the north-east of Archangel. It runs south-west through the land of the Samoyeds, over the territory of the autonomous Komi Zirian area, which it connects with the provinces of North Dvina and Vologda. In Komi itself, the railway links two new mining basins, one on the river Pechora and the other one on the river Ukhta. It further connects the two rivers with the upper reaches of the Dvina (at Kotlas); from there it runs westwards and links up at Konosha with the Archangel-Vologda-Moscow and Vologda-Leningrad railways. With the completion of the new line, the length of which is 1,847 kilometres, regular rail communication has been established between the still largely unexplored and vast expanses of the Arctic land and central Russia.

Dreams about economic exploitation of the far North fired the imagination of Russian explorers a long time ago. But the vision of a civilised Arctic looked too fantastic to be taken seriously. It was not until 1939 that the first hint of a practical approach to the problem was given. In his speech to the XVIIIth Conference of the Party, Commissar Kaganovich stated:

Comrade Stalin is particularly anxious to start the exploitation of coal on the Pechora. We need the Pechora coal for our northern provinces and for Leningrad. We have to build an Ukhta-Pechora railway to carry the coal and the petrol (there is no lack of petrol in the north) to central Russia. At present, we carry coal from the Donetz basin to the far North and to Archangel.

New Coal Reserve

In the course of that year the first coal shaft was sunk in the Vorkuta region. The work proceeded slowly at first. The main difficulty was, of course, labour. The job was taken over by the so-called building organisation of the Commissariat of Internal Affairs, which transferred masses of convicts to the northern part of Komi. In 1941, the output of the Vorkuta coal mines was about 1,000,000 tons. The plan for 1942 provided for an output of 3,000,000 tons. No figures for 1943 have been given, but it is pretty certain that the plan for 1942 has been fulfilled, and that the expansion has since been rapid. The coal, however, could not be carried away before the railway was finished. It was stored on the spot; and the recent completion of the railway will make it possible to take several million tons southwards.

Measured by the normal requirements of consumption the output of the Vorkuta basin is not yet impressive. But a reserve of several million tons of coal means a lot against the background of the acute fuel shortage that prevails in Russia. More important still, the new railway will undoubtedly help to speed the development of the new coal basin. Labour and mining equipment, until recently transported by the most primitive means of communication, will now be moved more quickly and in greater numbers. It will also be possible to improve the living conditions in the labour camps, which until recently were appalling and caused a very high rate of mortality among the workers. Apart from the Pechora basin, coal mining was begun in 1941, two years later than on the Pechora; and no reports about the results have so far been available. The Ukhta region is, however, more important for its oil than for its coal. Some oil prospecting was done there even before 1914, but soon it was given up because of the extremely high cost. New prospecting was started in 1938;

and since then the oil industry has developed on a considerable scale. In Ukhta itself, a big modern refinery with an annual refining capacity of about five million tons was completed more than a year ago.

The Kola Peninsula

Another important industrial region in the north has been the Kola peninsula. But the climate of the Kola peninsula is milder than that of the Komi region. The Kola peninsula also benefited by the proximity of such great communication centres as Murmansk and Kandalaksha. Industrial development was much easier here and started somewhat earlier. The main mineral wealth of the Kola peninsula consists of non-ferrous metals. The region of Montchagorsk, situated conveniently on the Murmansk-Kandalaksha railway, abounds in enormously rich deposits of nickel, bauxite, copper and lead. Large scale mining was started here in 1938-1941. Grandiose schemes were being carried out when the war broke out. (Preparations were well advanced for the drying out of the Montchagorsk lake, the bottom of which conceals excellent nickel ores.) The output of nickel there amounted to 7,000-9,000 tons in 1941. Copper mining was also expanding very rapidly; and the construction of big, modern bauxite mines and aluminium plants was—with the help of German technicians—completed by the summer of 1941.

The war, however, interrupted for a time the development of the Kola peninsula. Because of their proximity to the Finnish frontiers, some works suffered heavily from enemy action; and others (for instance, the aluminium plants) were evacuated to the Urals. The development of the Kola peninsula will in all probability be resumed with great vigour after the war. The non-ferrous metallurgy of that region will greatly benefit from the development of the Pechora-Ukhta fuel bases. The regions which nature itself has cursed with frost and ice will now provide heat and light for new centres of Russian life.

Vitamins in chocolate for liberated Europe

The British Government, having examined all the ways in which sufficient vitamins could be provided to the under-nourished children of liberated Europe, have arrived at the conclusion—as Rowntrees did in 1938—that chocolate offers one of the best vehicles for carrying added vitamins. In chocolate, the vitamins retain practically all their potency.

Before the war, Rowntrees pioneered the addition of vitamins to cocoa and chocolate. Their object was to enhance the protective value of these already highly nutritious foods.

Today, when the Allied Governments are faced with the enormous problem of rehabilitating each occupied territory as it is freed, Rowntree's experience of fortifying cocoa and chocolate with vitamins on a large scale is proving of great value. When the war is won, this experience will again be used for the benefit of the British public.

THE BUSINESS WORLD

Business Notes

White Plan No. 3

Details have become available of a third revised draft of the United States Treasury's Stabilisation Fund plan, which in some respects mitigates the backward-looking changes of draft number 2. The latest revision softens the blow of the previous provision that 50 per cent of a member's quota should be paid in gold, and makes allowances for the size of the gold reserve of the member countries. The actual gold payments are to be arranged on a sliding scale, depending on the ratio between each member country's quota and its gold and free exchange reserves. For example, countries whose gold and free exchange

Country	Quotas (million \$)	Votes
Australia	149	249
Canada	278	378
India and Burma	367	467
New Zealand	54	154
South Africa	175	275
United Kingdom and Colonies	1,275	1,375
Total British Empire	2,298	2,898
Brazil	107	207
China	350	450
Mexico	63	163
USSR	763	863
United States	2,929	3,029
Rest	3,554	6,454
Total	10,064	14,064

reserves are between twice and three times their quota will pay in gold 40 per cent of their quota, plus 10 per cent of their holdings in excess of their quotas. Special terms are to be offered to countries which have suffered enemy occupation. Their gold payments will be scaled down by a uniform 25 per cent. The most interesting feature of the latest revision of the plan is its tabulation of the quotas and votes to be allocated to the principal member countries. Each country is to have a minimum of 100 votes, plus one vote for each \$1,000,000 invested in the Fund. The results of these calculations are given in the table above.

Secular Movements

There have been few developments in the stock market position in the past few days that call for comment. Occasionally, interest has turned to industrial equities, which touched a new high of 106.1 on October 1st, according to the index of *The Financial News*; but for the most part it has centred on mining shares and South American railway stocks, particularly the prior charges, which are expected to benefit from the continuance of the higher freights. What is more interesting is that, judged by the best indication available, *The Actuaries' Investment Index*, there has been a further rise in industrial equities during September and a very minor decline in almost every category of fixed interest securities. In the latter *The Financial News* shows a modest recovery. It is now necessary to go back six years to get as high a figure for the general equity index. Over that period there have been important changes in the composition of the index and of some of the groups. In particular, aircraft has been brought in and electrical manufacturing has been shifted from the distributive to the productive group. None the less, the broad outline stands, and within it there are five major changes. Building material and electrical manufacturing shares have risen by 12½ and 13 per cent in value, while the yields have fallen from 6.33 to 3.07 per cent and from 4.49 to 3.98 per cent, respectively. Meanwhile coal and

gas shares have fallen by some 15 per cent and iron and steel by 12 per cent. The yield changes for these groups are from 4.06 to 5.63 per cent; from 4.93 to 3.15 per cent; and from 5.11 to 5.82 per cent. The fall in gas stock yields is due to special war conditions from which, it is expected, the companies will in large measure recover. The fall in the average yield for the whole list is surprisingly small at

† Figures not strictly comparable.

0.22 points. It is interesting to compare this change with those in the fixed interest list, but it is necessary to issue a caveat, since the composition of the preference share index appears to have altered greatly over the period.

More Fiduciary Notes

The fiduciary issue of the Bank of England has been raised by a further £50 million to £1,050 million. The movement was clearly foreshadowed by last week's Bank return, which showed the reserve of unissued notes to have fallen to about £13 million. According to the return published this week, this reserve, fortified by the increase in the fiduciary issue, stands at £58,981,000. Whether this will suffice to cover the expansion in the circulation between now and the Christmas peak is a moot point. Last year the circulation expanded by £80,188,000 over the comparable period, so that a considerable slackening in the currency expansion as compared with 1942 will have to take place if the latest increase in the fiduciary issue is not to be followed by yet another instalment before the end of the year. The monotony of these almost routine adjustments in the fiduciary issue has been broken on this occasion by the publication of an official commentary explaining in simple language what is meant by the fiduciary issue and why it should have had to be raised. One may query the "financial authority's" statement that "in any currency which is to command confidence, notes must have a backing of value behind them," a contention whose validity would be severely tested if the note issue in this country were multiplied many times against the backing of "valuable securities" such as those which provide the counterpart of the present fiduciary issue. Limitation of issue of notes, together with the grant of legal tender attributes, provides most of the explanation of the acceptability of a note issue. The great British public know little and care less about the exact form taken by the backing of their currency; otherwise the break with the gold standard in 1931 and the 1939 transfer of all the gold in the Bank

of England to the Exchange Equalisation Account might have caused at least a ripple of concern. For the rest, the "financial authority" treads safe and well-worn paths, explaining how the growth of industrial activity has increased the demand for currency; how unnecessary hoarding has accelerated the expansion in the note issue; and how desirable it is that these hoarded notes should be paid into a bank.

Non-Residents' Investments

In view of the difficulties in which this country was placed, especially after the German drive to the west in the spring of 1940, the non-resident holder of British securities cannot complain greatly of the treatment he has received. There has, however, been an allegation lately that non-residents have been unnecessarily restricted in their choice of the securities in which they may re-invest the proceeds of sales of stock or shares held here. This matter is solely at the discretion of the Bank of England. The holder of an "L" licence to sell may re-invest subject to official scrutiny, which is exercised in order to ensure that the needs of the exchange control are met. The Bank of England, naturally, will not permit conversion from a long dated stock into a short and, broadly speaking, it appears that they regard a desire to switch from one class of security to something entirely different with some disfavour. It is possible to imagine cases in which, from the standpoint of exchange control, this attitude is justified. It is certainly the case that there is no item in the Bank's policy which would indicate that its officers should object to an investment on any other grounds. But the report has got round that, in certain cases, there has been interference, without due cause, in the freedom of non-residents to re-invest. It is extremely difficult to run such cases to earth, although almost everybody has heard reports of them, which are doing no good. It seems that, either through lack of proper explanation of its reasons, or through errors of interpretation on the part of those who carry out its policy, the Bank is achieving a reputation for proceeding in an arbitrary manner with regard to certain individuals who have no means of redress. If, as seems probable, this is being built up on very small foundations, an explanation of the reasons for the restrictions on the transfer would almost certainly make the whole matter plain, with beneficial results.

Engineering Wages Interpretation

In order to clear up a certain amount of confusion that had arisen over the payment of pieceworkers' premiums, and had given rise to the Barrow strike, the National Arbitration Tribunal was invited jointly by the Engineering Employers' Federation and the Amalgamated Engineering Union to interpret certain points in their award of last March. The Barrow contention was that all bonuses should be paid on the consolidated rate of 66s.; the Tribunal's answer has shown that this was not the intention of the award, which was mainly designed to benefit the lower-paid workers. It reaffirmed that piecework prices should be such as to enable the worker of average ability to earn at least 27½ per cent more than the new district base time rates, and workers on time allowances or premium bonuses such bonus or basis times as would enable them to earn 27½ per cent more than the new basic rates. In addition to this payment, the worker would receive the non-consolidated part of the national bonus at the rate of 13s. 6d. for a 47-hour week. Where the inclusive rate worked out at less than that which the worker had received before the award, the necessary adjustment in the percentage would be made to the new basis rates or the bonus or basis times so as to make up the deficiency. The position can be illustrated by the following example. A worker paid before the award on a district base rate of 46s., who was earning a piece rate premium of 60 per cent above the basic rate, i.e., he was receiving a total remuneration of 107s. 1d. (made up of 46s. basic rate, 73s. 7d. basic rate + 60 per cent, and 33s. 6d. national bonus), would after the award receive 97s. 8d. (66s. + 27½ per cent and the new national bonus of 13s. 6d.). But this would not satisfy the clause of the award that he should not get less than his pre-award rate. The maintenance of the former 60 per cent applied to the new basic rate and national bonus would result in 119s. 1d.; the smallest percentage required to yield the same as the pre-award would be 41.8 per cent (66s. + 41.8 per cent + 13s. 6d. national bonus = 107s. 1d.).

Strike Statistics

The *Ministry of Labour Gazette* for September contains statistics of trade disputes in August. They show that the number of days lost through disputes, at 139,000, was not outstandingly high for the year—the record was 178,000 in May—but the figure is large compared with the 38,000 of August, 1942. In the aggregate, since the beginning of the year, fewer days have been lost than last year, 820,000 against 951,000. The number of people involved is almost exactly the same, 306,600 compared with 306,100. It is the rise in the number of disputes, from 810 in January to August, 1942, to 1,081 in the corresponding period of this year, which is most significant. In the corresponding periods of 1938, 1939, 1940 and 1941 the number of disputes involving stoppages were 89, 50, 94 and 118, respectively. The duration of this year's August strikes was short. Of the 139 stoppages ended in that month, 60 lasted one day, and only five more than a week—though even a short strike may have an unsettling effect on production out of proportion to the calculable working days lost. Apart from spectacular strikes, like the Barrow strike, it is the number of strikes rather than the total loss of working days that is indicative of the present widening unrest. The September figures (which will be published early next month) will include three considerable strikes at Barrow, in Nottinghamshire and in Lanarkshire, and the figures of days lost and numbers involved may be much higher than hitherto.

Women Trade Unionists

The Transport and General Workers' Union held their first women's national conference this week. The union now has 300,000 women members—seven times as many as before the war—and organises women in engineering and shell-filling factories, road passenger transport, textiles and general industry. It was feared, when the Amalgamated Engineering Union first opened its ranks to women, that inter-union competition to organise women in the munitions trades might develop. This danger has been averted by an agreement reached between the unions concerned in the engineering and metal industries (Transport Workers, General and Municipal Workers, AEU and Iron and Steel Trades confederation) not to "poach" on one another's memberships, but, aiming at 100 per cent organisation in every establishment, to recruit in fresh fields. A joint committee of the four unions has been set up to deal with demarcation questions. A question which transcends all organisational difficulties is that of women's wages in engineering. This week's conference has discussed both how to raise the low level of wages paid to women employed on work "commonly performed by women" and how to enforce the agreements establishing the "rate for the job." There have been many criticisms that these agreements are, in practice, often evaded by the employers, and the result of the Wark Court of Enquiry, now investigating an alleged breach of the AEU Relaxation agreement in a West of Scotland firm, is awaited with interest. The issue concerns not only women who are employed as "men," but also the men whom they have replaced, and may affect the future structure of engineering wages. The other matters discussed at the women's conference are very practical in character; they include

such day-to-day issues as the effect of long hours on health and production, shopping facilities, nursery schools, canteens, works medical services, ventilation, the employment of pregnant women on light work, transfers and the billeting of transferred workers. The effect of such factors on the rate of absenteeism, especially of married women with domestic responsibilities, is recognised. There is a danger that industrial fatigue and confidence in the outcome of the war may lead to relaxation of effort and increased absenteeism on the part of the workers, while it might tend to make firms less keen to introduce special welfare arrangements for their women employees, whose services they are likely to lose after the war.

Larger Treasury Bill Tender

The Treasury bills offered for tender this week have been increased to £100 million—the first time that round figure appears in Treasury bill history. The weekly issues of bills have been held at £90 million since April 23rd last, after a previous norm of £75 million which, apart from slight deviations, had been maintained since February, 1942. The latest increase in the tender issue of Treasury bills must be regarded as a response to the seasonal factors that still affect this part of the floating debt and not as a step in the secular trend of this issue. The immediate objective of the jump to £100 million is the provision of additional Treasury bill maturities for the benefit of the banks in the early days of 1944. The bills now being placed will mature in the final quarter of the financial year when tax payments are heavy and when the banks look in part to the bill maturities to offset the drain of tax transfers on their cash position. Despite the increase in the issue of tender bills over the past year (they are now outstanding to the amount of £1,170 million as against £975 million a year ago), the banks' holding of bills has declined, the August, 1943, holding of the clearing banks being some £52 million below that for August, 1942. The reason must be found in the greater official demand for Treasury bills now being satisfied through the weekly tender. This demand has been evident in recent tenders when the discount market has had to be content with comparatively small allotments, the figure exceeding 40 per cent on only one occasion since the turn of June. If the task of building up the banks' bill portfolios is to be successfully accomplished, there will have to be a slight reduction in the official competition for bills at the weekly tenders and a certain letting up in the TDR payments required of the banks. Judging by last year's precedent, the latest increase in the offer of Treasury bills should not last for more than 8 weeks and thereafter the figure may come back to £90 million. If, however, the earlier precedent is to be followed beyond that stage, the return to £90 million towards the end of this year should lead to an increase beyond the £100 million mark early next April, that is at the beginning of the financial year, when the floating debt normally expands at its fastest.

Limerick Borrows Short

The City of Limerick, which had outstanding some £900,000 of loan debt at the end of March last, is proposing to issue at 99 £755,000 of 3½ per cent stock redeemable 1956-72 at par. The proceeds are to be used to pay off loans held from the Commissioners of Public Works. Of the issue price 10 per cent is payable on application and the remainder on October 25th. Interest is payable first June and December and the loan is redeemable at par, in whole or in part, between the dates named. The issue takes place in Dublin and the loan will be quoted there. Apart from the fact that the amount seems rather large and that the redemption option is long, there is, so far, little to excite comment. It is, however, a curious feature of the loan that 27 per cent of the total is to be paid off in equal half-yearly instalments over the twelve years commencing December 1st next. Repayment is to be made at 99 and applicants are invited to sign a cancellation agreement that they will consent to surrender of an appropriate fraction every six months. The Corporation is to have the option to accept this agreement or to regard the application as one for the stock without this interesting variant. The Munster and Leinster Bank has agreed to take up to the necessary amount of stock, £203,850, subject to the cancellation clause. Even ignoring the 5s. per cent commission which the bank will receive on its application, it seems to be obtaining a virtual "short" with an average life of some six years, giving yield

of almost £3 10s. 8d. per cent, that is the same rate as is being offered to other investors for a security which has a probable life of 30 years. Although there is a capital profit in this case of rather over 1 per cent, this only raises the return to £3 11s. 1d. per cent. Presumably the Corporation is in the debt of the bank.

Banks and TDR Payments

In the discussion of the relative merits of Treasury deposit receipts and Treasury bills as a liquid asset for the banks, points are sometimes accorded to the former on the ground of the latitude which is given to the banks in choosing the days on which the total amount required of each of them in any particular week is paid. The quarterly debt returns provide an opportunity of measuring the extent to which banks in fact avail themselves of the possibility of helping their cash position by postponing their TDR payments to the latter part of the week. This opportunity arises from two facts: the first is that the quarterly debt returns are dated on the last day of the quarter, which need not synchronise with the end of a working week; and the second, that comparison is always with a previous monthly return which showed the position at the close of a working week. The latest debt return, for example, is dated September 30th, which fell on a Wednesday, and is comparable with the return for August 28th, which fell on a Saturday. The published information about TDR issues shows that in the four weeks from August 30th (inclusive) to September 25th a total of £250 million was paid over in the form of TDRs. The last debt return reveals that, from August 30th to September 30th, TDR payments amounted to £256 million. In other words, the banks paid over £6,000,000 of TDRs in the last four days of September, that is, Monday, 27th, to Wednesday, 30th. Since in the whole of that week the banks were asked to provide £60 million in TDRs, this means that no less than £54 million of the payments were postponed until they could be made in the month of October. In this case, therefore, the banks made considerable use of the latitude allowed them in timing their TDR payments to cushion the credit pressure of the closing days of September and to transfer the major burden of these payments to the early days of October, when the credit position had become appreciably easier. The extent to which this facility has been used over the turn of each half-year since TDRs were first issued is shown by the following table:

Date of Allotment	Amount to be taken up in following week	Amount taken up before end of half year
27 Dec., 1940..	35,000,000	6,500,000 (Dec. 30 and 31)
27 June, 1941..	20,000,000	4,500,000 (June 30)
26 Dec., 1941..	40,000,000	5,000,000 (Dec. 29, 30 and 31)
26 June, 1942..	40,000,000	13,500,000 (June 29 and 30)
24 Dec., 1942..	65,000,000	17,000,000 (Dec. 28, 29, 30 and 31)
26 June, 1943..	40,000,000	16,500,000 (June 28, 29 and 30)

In framing their decision on this matter the banks are torn between two conflicting objectives: the desire to avoid heavy TDR payments in the final days of the half-year, and the desire to have heavy TDR maturities in the final days of the next half-year. This no doubt explains why any payments at all are made in the usually difficult closing days of the half-year. It also explains why those payments are proportionately greater in the last days of June, since these are aimed at getting TDR maturities in the all-important days which precede the end-of-the-year balance-sheet.

Railway Fuel Economy

Fuel is the biggest single item purchased by the railways, and they have, therefore, always paid great attention to the reduction of fuel costs. Their normal consumption of coal before the war amounted to 16,000,000 tons a year. Despite the fact that measures to save fuel were already their constant policy, the railways have made special efforts during the war to reduce consumption. Their contribution to fuel economy is substantial. It is made by economies in operating; for example, the proportion of loaded to total wagon miles has been increased from 67.5 per cent before the war to 73.6 per cent. Firemen and drivers receive special instruction in the economy of fuel. Savings have been made

by the reduction of services. Fewer electric train services save more than 50,000 tons of coal a year. The curtailment of lighting and heating in trains and waiting-rooms, buses, works, offices, huts and hotels has saved large quantities. From less heating of trains a saving of 30,000 tons is being achieved, while hotels contribute 5,000 tons, and supplies to stations and offices have been cut by 13,000 tons. Particular attention is being paid to savings in works, and some remarkable results have been achieved in individual cases. The railways are prepared to take new fuels, particularly open cast coal, which is being mined in increasing quantities. These facts were given at the end of last month by Mr M. G. Bennett, chairman of the Railway Fuel Economy Committee, at the first of a series of railway fuel economy conferences. He declared that the railways hoped to do still more to meet the shortage of fuel.

Odeon Theatre Accounts

Another company of the group of cinema properties under the chairmanship of Mr Arthur Rank, Odeon Theatres, has presented accounts, covering the 52 weeks to June 26th last. Compared with the preceding period, which was a week longer, they show a rise in profit after all tax from £435,000 to £487,000. A feature of the accounts is the inclusion, for the first time, of consolidated statements of profit and loss and of assets and liabilities. Unfortunately, there are no comparative figures for earlier years. It is also to be regretted that the accounts of the parent no longer separate the amount of profit derived from theatre management and that secured from investments. Holdings are almost entirely in cinema concerns, but even so the distinction had some value. There is still no statement of costs of administration, repairs, depreciation or amortisation of leaseholds, but it is now disclosed that a substantial part of the published profits of previous years arose from the fact that they took credit for EPT charged to subsidiaries. This, of course, showed as part of the tax provision of the parent, but the new method of showing the profit net of this figure and deducting the company's own tax provision is better. Unfortunately, there is again no comparison with earlier years. It is also the case that no separation is made between tax provided to cover the legal liability and that which constitutes a reserve against liabilities still to accrue. The explanation that the exact tax liability is not determined is not convincing. It is seldom possible to give an exact value to any rubric in accounts. All that is sought is the best estimate that an adequately qualified accountant can reach. The total profit of the parent of £1,261,535, after the adjustment mentioned, compares with one of £2,163,687 for the group. The total interest charge of the latter is £353,408 and total tax £1,448,993. Other items are little different from those of the parent. The consolidated balance-sheet shows a total of rather over £15 millions, of which £12 millions odd is in fixed assets and a relatively small sum in holdings in other companies. Total reserves of the group stand at only £333,159, against £293,873 for the parent. In his statement, Mr Rank expresses the hope that a scheme, at present in preparation, for the simplification of the General Investment Corporation group will make possible the elimination of a substantial amount of investment holdings and the fusion of the assets of the companies concerned with those of the parent.

Industrial Health and Safety

Although the total number of reportable accidents in industry has increased by 16 per cent in the last year (from 271,298 in 1941 to 314,630 in 1942), there has been a decrease of 17 per cent in the number of fatal accidents. The Chief Inspector of Factories, whose 1942 report has just been published, welcomes the decrease in the number of fatal accidents, which is regarded as an index of the care taken to prevent serious accidents; but the rise in the number of less serious accidents is nevertheless disturbing. This increase is especially high among women. It rose from 42,857 in 1941 to 71,244 in 1942, and represents a percentage increase of no less than 389 over 1938, compared with one of 51 per cent for men, though men are still more subject to fatal accidents. This figure is, in the main, a reflection of the increased number of women employed in industry, and since the accident rate is not published, it is difficult to reach any precise conclusions. It has nothing to do with the fact that women are more "accident prone"

than men, though they have been employed on accident-producing machines; if anything, the contrary seems to be the case. The Chief Inspector attributes the increase in accidents to a number of factors. Most of the accidents occurred in the handling of goods and in falls, while "scalping" accidents due to insufficient head protection were frequent; there was no increase in the number due to power-driven machinery. It appears that the speeding-up of production generally, combined with increased war weariness, the strain on supervisory staffs and the shortage of maintenance staffs, and the increased employment of older personnel are mainly responsible for the present position. The Chief Inspector reaches the conclusion that one remedy lies in educating the workers and developing their accident-consciousness; in this connection, the joint safety committees of workers and managements, with trained safety officers, can make a valuable contribution to the reduction of accidents.

The same broad conclusions can be applied to the section of the report dealing with industrial health. The major industrial and occupational diseases have been kept under control, but there has been a substantial increase in the number of minor ailments and sickness. There are plenty of indications of tiredness, after four and a half years of war, with the cumulative effect of the extraneous duties which have to be undertaken, but there are few signs of such lowering of vitality as would lead to major diseases. For instance, in this war the incidence of toxic jaundice from TNT poisoning has only been 19 per cent of that in the last war, in spite of greater production. The maintenance of industrial health may be attributed mainly to the improved preventive measures taken and to the extension of industrial canteens. The number of works medical officers (850), however, seems small in relation to the requirements of factories. It is satisfactory that 98 per cent of the cases where canteens are legally required should be covered, and that the number of canteens (excluding docks and building sites) should have increased from 5,695 in December, 1941, to 8,481 at the end of 1942. Shortage of canteen staffs (and perhaps the lowness of their wages as compared with factory work) has added to the difficulties, and there is need for more variety in menus and service, to avoid what Dr Mereweather has called the "deadly sameness of boiled cabbage." The general trend of hours has been in a downward direction, though the actual numbers of permissions to work up to the maximum increased during 1942. The health and welfare of railway staffs does not come under the province of the Factory Inspectorate, but it is a matter to which Mr Bevin promised to turn his attention last April, and it would be interesting to know what has been done to extend the provision of canteens, medical services and welfare for the personnel employed in railway transport undertakings.

Laundry Services

Laundry services are by their nature localised. There is only one laundry large enough to employ more than 1,000 workers, and chains of laundries are rare. Only 350 to 400 firms employ more than a hundred workers. The total number of laundries of any size is about 2,000, and in addition there are some 3,000 to 4,000 "cottage" laundries, with less than five employees each. No statistics are available of "washerwomen," who do

Issued by the National Savings Commission, London

much essential work. The total labour force of the industry is about 170,000, and the annual turnover is between £30 and £35 million in normal times. Spread over the country, this is a small amount; per head of the population, it is about 4d. a week on the average. Labour is one of the most difficult problems for laundries, despite the fact that no withdrawals of operatives have been made by the Minister of Labour since April, 1942. More than 90 per cent of laundry workers are women; the gross wastage is about 30 per cent. Since most of the work is relatively unskilled, and the industry lends itself to part-time labour, new workers can be readily absorbed, but the net wastage is now about 5 per cent. The Minister of Labour has agreed to replace lost workers where possible. Previous high standards of work have had to be sacrificed. The fortnightly, instead of weekly, service has reduced the amount of civilian laundry, and this has enabled the extra military laundry to be done. Each soldier is allowed seven pieces a week, the ATS, WAAF and RAF eight, and the American Forces nine, which is far less than the Americans have been accustomed to. Any larger amount would have seriously overloaded the already over-worked laundry capacity. Prices are controlled, and an additional percentage over pre-war rates may be charged. This varies from region to region, from 12½ to 37½ per cent.

September Debt Changes

The national debt return covering the period August 30 to September 30, 1943, is dominated by last month's issue of a £120 million 3 per cent terminable annuity to the National Debt Commissioners for the investment of funds held for the Savings Banks. Previous to this transaction the funds in question appear to have been held largely in the form of ways and means advances, and this item is shown by the latest debt return to have fallen by £53,745,000. In the absence of this transaction, this item would probably have shown a substantial advance. The floating debt on September 30th again included no ways and means advances to the Bank of England. This is the third successive monthly debt return to show nothing owing under this head, and only one of the last six returns, namely, that for June 30th, included such borrowing. Although the month-end debt statements are not reliable criteria of the debt position on the other days of the month, the recent evidence of these returns suggests that, in contrast with the position shown by debt returns published since the outbreak of the war, the Treasury has in recent months had less recourse to ways and means borrowing from the Bank of England. Whatever may be the device by which this has been achieved, it is not by maintaining substantially higher balances with the Bank. On the contrary, these continue to run at a level which represents the greatest possible economy of cash. The September 30th debt return shows that Tax Reserve Certificates continue to prove an exceptionally popular security. The amount raised from this source was £54 million, which was more than the yield of any other of the Government's tap loans. On the other hand, £21,782,574 of these certificates were redeemed for tax payments. The net amount raised carried the total of certificates outstanding to £582,769,000, the highest figure yet recorded.

Adequate Copper Supplies

Encouraging reports have been current of larger supplies of light metals, alloy steels and rubber. The Combined Copper Committee has issued a statement that the extra supply of copper is now roughly equal to the present consumption of the United Nations. There has been a shift of emphasis from the shortage of ore and metal to the shortage of manpower in United States brass mills. The following main reasons for the improved position are given: reduced sinkings of copper cargoes; larger scrap collections; reduced requirements of certain types of ammunition, and the increased use of steel shell cases. Thus the improved physical supplies and the changes in librium between supply and demand—for the first time, since 1941. Consumption is none the less at a record level, and the maintenance of this level depends on attaining the highest rate of production possible. Fortunately, there are indications, borne out in some cases by official figures, that copper mining and smelter production are running at record

levels. The United Nations control all the large copper fields in the world, and current production is at the annual rate of nearly three million metric tons, compared with the pre-war maximum of under 2,300,000 metric tons. The collection of "battle scrap" adds larger tonnages to supplies with every Allied advance. In the refining of spent shell cases, their contamination by the explosive charge presents technical problems which the United Kingdom, from its larger experience, is assisting United States refiners to solve.

Skilled Men for the Services

The Corps of Royal Electrical and Mechanical Engineers was formed just over a year ago, largely as the result of the Beveridge Committee's report on the use of skilled men in the Services. The Beveridge Committee recommended that there should be more facilities for technical training, and criticised the training as not being sufficiently related to the practical needs of the Army. An Army Technical School for boys in Berkshire, which is training men for the REME, is meeting this criticism. The boys, who go through a long and intensive training, under military discipline, finally emerge as highly qualified craftsmen, fitted to perform the very practical tasks which fall to mechanics in the Services. Industry, itself short of skilled manpower, has not been able to supply the Army's requirements, and, in any case, the methods of factory production are completely different from engineering work under Service conditions. The REME is organised in four echelons, and in the front-line echelon especially, urgent repairs have to be carried out, possibly under fire, with a limited number of hand tools and great reliance on individual initiative; farther back, nearer the depots and bases, equipment difficulties become correspondingly less. The Army Technical School caters for about 1,000 boys, beginning at 14½-15½; the length of apprenticeship is about three years, and they are trained as armourers, electricians, fitters, turners, vehicle mechanics and radio and instrument mechanics. After six months' initial training in the workshops, the boys are selected for specific trades, and those of his taking into account the boy's wishes and those of his parents and his aptitude and qualifications, though the needs of the Army for particular classes of tradesmen in the broader sense and on physical training and games, since the Army realises that alertness and intelligence are as important in modern warfare as purely technical ability. The importance attached to the school can be gauged from the fact that its cost works out at about £250 per head per year. But quite apart from its value to the Army in time of war, the training of skilled craftsmen in the Services will be of great significance for the future. When they are 18 the boys sign on for twelve years (eight with the colours and four with the reserves), so that at the age of 26-27 they will have the choice of staying on in the Army or entering industry. Their technical training has been accepted as an apprenticeship by all the trade unions, and if they decide to go into civilian engineering, post-war industry will be the richer by the introduction of the highly-qualified and versatile soldier-craftsmen of the REME.

Company Results

COMPANY MEETING

BIRMI INDUSTRIES LIMITED

MR. C. G. MAUDSLAY'S STATEMENT

The adjourned annual general meeting of Birmid Industries Limited, the controlling company of a group of companies engaged in the manufacture and supply of fabricated ferrous and light alloy materials for the aircraft, automobile and allied industries, was held, on the 30th ultimo, in Birmingham.

The following statement by the chairman, Mr C. G. Maudslay, was issued to shareholders with the report and accounts for the year ended October 31, 1942:—

I deeply regret to have to announce the death of one of our directors, Mr C. R. F. Engelbach, and the retirement of the Marquess of Sligo, owing to ill-health, since our last annual meeting. Lord Sligo has been our colleague on this board and its predecessor for eighteen years, and he will be greatly missed; the lack of his advice and Mr Engelbach's will be a severe loss to us. The directors have taken the opportunity of appointing Mr C. E. Keey, Mr A. E. Pearce, and Mr W. N. Sherlock

to seats on the board, subject to confirmation at the next annual meeting.

THE ACCOUNTS

The legal balance-sheet does not call for any special comment. Shareholders will, however, see from the report it is recommended that an additional sum of £75,000 be taken from the profit and loss account and added to the reserve account, bringing the total to £225,000, thus leaving a carry-forward of £40,179 in the profit and loss account.

In reference to the combined statement of assets and liabilities, I will touch on a few of the principal items—the liquid assets, consisting of stock, debtors and cash collectively show an increase of £648,000 over last year's figure reflecting the considerably increased turnover of the group.

In addition, there is a new item of £236,500 in tax reserve certificates purchased to meet impending liabilities, and in this connection I should mention that provision has been made for all ascertainable taxation in the accounts.

On the other side of the account, creditors and reserves for taxation have increased by £765,000. It will be observed that a further £15,000 has been reserved for contingencies, including deferred repairs. The net effect of all these changes is to

increase the surplus of assets over liabilities by £113,000.

SATISFACTORY RESULTS

I think, on the whole, the results of the year's trading have again been very satisfactory, especially as the difficulties under which we are working, and which I stressed in my last year's remarks, have by no means diminished. Those responsible for the output of the Birmid group have strained every nerve to meet the increased demands for its products, and the directors take a pride in the feeling that their efforts have been successful in this respect. It is unnecessary for me to point out what a difficult year this has been for our staff and workpeople, and I venture to suggest the shareholders have every reason to be grateful to them, one and all, from the managing director downwards.

Despite the recent encouraging news from the war fronts, all in the Birmid group are paying due heed to our leader's warnings that now is not the time to relax in any way, but rather to redouble their efforts.

The sum of £75,000 was transferred from profit and loss account to credit of reserve account, and £40,179 carried forward. The dividend of 10 per cent., plus a bonus of 7½ per cent., less tax at 10s. in the £, on the 685,000 shares was paid on December 17, 1942.

The report and accounts were adopted.

FINANCE AND BANKING

THE MONEY MARKET.

Conditions in the money market have been exceptionally comfortable this week. After the turn of the month the banks resumed their buying of bills and as the discount market obtained no more than 28 per cent of its applications for Treasury bills at last week's tender it has found no difficulty in financing the bills to be taken up this week. The banks had £80,000,000 of Treasury Deposit payments to make this week against effective maturities of about £50,000,000. The latest Bank return shows the changes consequent on the increase of the fiduciary issue (discussed in a note on page 498). Government securities in the Banking department being down by £57,480,000 mainly accounted for by the transfer of £50,000,000 of securities to the Issue department. The note circulation has increased by a further £4,795,000, thus leaving the reserve of unissued notes at £58,981,000 despite its £50,000,000 reinforcement. Bankers' balances at £150,237,000 are £23,187,000 lower, but are still at a level reflecting the exceptional ease of credit conditions in the money market.

MONEY RATES, LONDON.—The following rates remained unchanged between Oct. 1st and Oct. 7th: Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days 1½%, 3 months, 1½%; 4 months, 1½-1¾%; 6 months, 1½-1¾%. Treasury Bills: 2 months, 1-1¼%; 3 months, 1-1¼%. Day-to-day money, 2-1½%. Short Loans, 1-1¼%. Bank deposit rates ½%. Discount deposit at call ½%; at notice 1%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between Oct. 1st and Oct. 7th. (Figures in brackets are par of exchange.)

United States. \$ (4.86½) 4-02½-03½; mail transfers 4-02½-03½. **Canada.** \$ (4.86½) 4-43-47; mail transfers 4-43-47. **Switzerland.** Francs (25.22½) 17-30-40. **Sweden.** Krona (16.159) T.T. 16-85-95. **Dutch West Indies.** Florin (12.17) 7-58-62; **Portugal.** Escudos (110) 99-80-100-20; mail transfers 99-80-100-30. **Panama.** 44-02-04; mail transfers 4-02-04½. **Brazil.** 83-64½ cr. GOVERNMENT RETURNS

For the 12 days ended Sept. 30th, 1943, total ordinary revenue was £94,073,000, against ordinary expenditure of £182,800,000, and issues to sinking funds of £265,000. Thus, including sinking fund allocations of £6,836,266, the deficit accrued since April 1st is £1,588,235,000 against £1,437,206,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £61,049 to £2,881,880, the other operations for the week (no longer shown separately) raised the gross National Debt by £87,956,772 to £18,431 million.

Spices Control.—The Spices (Control) Order, 1943, has been made to control the use of cinnamon, mace and nutmeg, excluding any spice which has been processed in the United Kingdom. The Order requires persons who owned stocks of cinnamon amounting to 10 cwt. or more, and mace and nutmeg amounting to 20 cwt. or more, to make a return. The Order also prohibits persons, except those who own a less quantity than specified above, from processing or selling or otherwise parting with property in these spices, except under licence. Returns of stocks have to be made to the Canned Fruit and Vegetables Division of the Ministry of Food.

Dried Fruits Control.—The Minister of Food has made a new Control and Maximum Prices Order for dried fruit, which

came into force on September 19, 1943. This Order revokes and re-enacts with certain modifications previous Orders dealing with dried fruits. The principal provisions of the revoked Orders are repeated in the new consolidating Order except that the maximum retail price for dates is increased from 7d. to 9d. per lb., and a charge at the rate of 1s. 2d. per cwt. for breaking bulk, where incurred, may be added to the wholesale price for dried fruit. The permitted charge for breaking bulk will not affect maximum retail prices. The provisions of Article 6 formulate more specifically what records of transactions are required to be kept by traders.

Canteen Workers' Wage Increases.—The minimum wages for adult workers in canteens operated by the National Society of Caterers to Industry will be increased by 2s. 6d. a week from

October 11th. The new minimum weekly rates for adult workers, who also receive meals and other emoluments valued at 10s. a week, are: men chargehand cooks, 80s.; men assistant cooks, 70s.; women chargehand cooks, 55s.; women assistant cooks, 50s.; kitchen porters, London area, 65s.; outside London area, 62s. 6d.; women cashiers and clerical workers, London area, 48s.; outside London area, 45s. 6d.; women cleaners and general workers, London area, 43s.; outside London area, 41s. 6d. The agreement provides for annual holidays with pay, sickness pay and additional rates for overtime and night work.

Potato Lifting.—Volunteers are still urgently required to help farmers lift the potato crop. Individuals and employers who can release workers should communicate with any County War Agricultural Executive Committee.

THE CHARTERED BANK OF INDIA AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

CAPITAL (PAID UP) - £3,000,000
RESERVE FUND - £3,000,000

Branches and Agencies throughout INDIA and the EAST
AFFILIATED BANK IN INDIA

THE ALLAHABAD BANK LTD., with 15 Branches & 30 Sub-Agencies
The Bank offers a complete Banking Service and provides exceptional facilities for financing every description of trade with the East.

Deposits for Fixed Periods or repayable at call or at short notice are received at rates which may be ascertained on application. The Bank also undertakes Trusteeships and Executorships.

Head Office: 38, BISHOPSGATE, LONDON, E.C.2

RECORDS AND STATISTICS

Pacific Command

LORD LOUIS MOUNTBATTEN has arrived in Delhi; the end of the monsoons is at hand; and now Mr T. V. Soong, China's Foreign Minister, has joined Lord Louis for consultations at his new headquarters. Is it to be assumed from all this that a new phase will shortly open in the war against Japan? Does it presage a new attack on Burma? It is no secret that the Chinese have been pressing urgently in the last year for more weight and vigour behind the Allies' Pacific campaign. How much more can be done? Mr Churchill told the Commons after his visit to Ottawa that the major part of America's war strength is deployed in the Pacific. That strength is, admittedly, growing very fast; but if there is to be a sudden and decisive increase in Allied strength in the Pacific it can only come from the British side. The British contribution is already considerable. In his recent speech to the Anglo-American Press Association, Mr Morrison reminded the Americans that

the British war effort in the Far East is not something that belongs in the future. Today, in New Guinea, which is for the time being the most active of all Pacific fighting fronts, Australia is supplying the greater part of the manpower and most of the equipment for her own soldiers. In the whole vast Far Eastern theatre, taking British, Australian and Indian troops, the Empire's contribution in manpower is comparable to America's own.

Any further reinforcements from the British side would have to come from the fighting fronts of Europe, and

although the opening of the Mediterranean may have freed a certain amount of naval tonnage for use elsewhere, the European war is dependent at every stage upon shipping. It would be folly at this crucial stage of the European fighting to drain away the manpower and the machines that are needed for the final blow, a blow which, once struck, will release an overwhelming concentration of military power—above all, air and naval power—for use against Japan.

Until this overwhelming concentration of new force can be applied to the Pacific war, it is very doubtful whether the Allies can do much more than they are doing—which is to keep Japan's military resources stretched to cracking point and to wear them down by a steady and sustained attack on the Japanese periphery. There are encouraging signs that this restrained tactic is having increasingly severe results for Japan. The evacuation of Kiska without a fight was, as Mr Churchill pointed out, the first sign of a new unwillingness on the part of the Japanese High Command to waste its resources. Since then, there have been other withdrawals in New Guinea and New Georgia. General Tojo's recent announcement of total mobilisation in Japan was designed, according to German commentaries, not only to step up the output of Japanese war industries, but also to cure the Japanese people of the illusion that easy victories in the first phase had secured them prosperity and success without further efforts. Japan's present strategy in occupied territory also suggests a new desire to shepherd its

reserves of manpower. Gestures of political conciliation have been made to the Burmese, the Siamese, the Filipinos, and the Chinese. "Independence" has been solemnly given to Burma and the Philippines, Siam has received four Malayan States. The French have been compelled to give up a number of their treaty bases and concessions in China, and the International Settlement at Shanghai have been handed over to Wang Ching-wei's puppet government. The motive behind all this generosity is to popularise the Japanese puppet governments and to encourage recruitment for police and auxiliary work among the native peoples. The Japanese already speak of Burmese and Nanking "armies."

These signs of military strain in the Japanese war effort, compared with the blind and spendthrift complacency of the first year, show that the Allied tactic of "nibbling at the edges," however unsensational, is having its effect. But the state of the war in the South Seas and the geographical disposition of forces show that any more daring strategy demands resources which cannot be released until Germany is defeated. General MacArthur's strategy has in the past been reported to be an advance island by island, air base by air base, upon the Philippines. The capture of Munda in New Georgia and of Lae and Salamau in New Guinea were preparatory steps to the capture of Rabaul, Japan's biggest air and sea base on the Australian fringe. The Americans and Australians are now about 400 miles from Rabaul, and it seems likely that a few more months of hard fighting will bring them to their goal. But in a recent statement General MacArthur repudiated the "costly method of island hopping" and certainly the next step is much more difficult. Great distances are involved. Much heavier concentrations of air and sea power will be necessary. The wastage already inflicted on Japan's navy and air force in the New Guinea fighting is already heavy, but it does not seem probable that the Allies have yet achieved a sufficient superiority in the area to launch out beyond Rabaul.

It is, however, true that the Allies' position in the South West Pacific depends upon the degree to which Japan's resources are being wasted elsewhere. Lord Louis Mountbatten's new command covers the ground over which two expeditions were attempted last winter—Brigadier Wingate's commando expedition into Burma and the British advance and retreat in Arakan. Both expeditions illustrated the extreme difficulty of attacking Burma from the Indian land frontier. The defenders possess all the advantages in terrain and lines of communication. The alternative—an amphibious campaign designed to bring the Allies into central Burma by way of Rangoon—would demand a far higher concentration of air and naval force than it has so far been possible to achieve. The strain put on the Japanese navy has prevented it from exploiting its strong position in the Gulf of Bengal; but before the Allies could attempt amphibious operations along the coasts of Burma the Japanese navy would have had to be driven back on Singapore, the Andaman Islands recaptured, and it is probable, too, that the building of air bases on the east coast of India would have to be carried much further. Amphibious operations demand an enormous preparation in terms of air bases and invasion ports, quite apart from the men and air and sea power involved. The eastern areas in India were not in any way equipped to act as the base for an invasion, and the evidence does not suggest that the preparations have reached anywhere near their final stage.

It follows that, for the time being, Lord Louis will probably not be able to do much more than intensify at the other extremity of the Pacific front the nibbling tactics of MacArthur in the south-west. It is not likely that this restricted strategy will draw off enough Japanese men, ships and aircraft to allow for sensational advances beyond New Guinea. And the development of more than a restricted strategy in Burma would be possible only if there were direct and serious diversions from the European front. The creation of the East Asian Command probably does not mark the beginning of a vast new offensive. It will entail a more vigorous prosecution of more limited objectives. But the grand strategy of reconquest must await the end of the European war.

There is another reason why the decisive strategy of the Pacific war must wait for the defeat of Germany. How can any final shape be given to the Pacific struggle until the part Russia will play in it has been established? The Russians, like the British, may intend to switch their vast war effort from West to East. If, however, they decide to remain neutral, the attack against Japan must be launched from the south and will presumably follow in reverse the Japanese advance of 1942, the British re-occupying from India and Burma the Singapore, Siam and Indo-China route to the Philippines, the Americans and Australians the Pacific island route. The reconquest of Indo-China and the Philippines, coupled with the reopening of the Burma Road, would presumably bring the Chinese armies back into play and make possible a joint action by land and sea against occupied China.

It is, of course, impossible to write in any but the most general terms of these broad sweeps of strategy, but one thing can be said with certainty from the first. Whether or not Russia decides to take part in the Japanese struggle, the Allied operation will be a combined operation on a scale never before conceived or attempted. Even without Russia it will entail the co-operation of three Great Powers and of several smaller nations. It will entail the co-ordination of many different, widely separated fronts. It will entail the closest co-operation between all three Services and, particularly in the relations between air and sea power, a radical change in the traditional outlook of the service leaders. General MacArthur has already said that communications in the South West Pacific are "a function of air power with naval support." There are other revolutions ahead for the orthodox. It is difficult to imagine a situation in which more misunderstanding, more inter-state and inter-departmental frictions, jealousies and recriminations would be possible. At present, the framework of the Commands is not likely to diminish the possibilities of conflict. There is an India Command. There is an East Asian Command. The relations between these two Commands are not yet clear. Is Lord Louis Mountbatten's Command to include a separate air and naval Command? If not, what will be his relations with the air and naval officers under the India Command? Is he to control the ferry service, largely operated by Americans, between India and Chungking? Then there is a China Command. And in the south-west, there is MacArthur's Command. Unless there is some rationalisation of this plethora of separate Commands and some very clear principles of integration of their various activities, such as have been achieved in the Mediterranean theatre, there may well be chaos when the time comes to swing every front forward into violent action. As long as all the fronts are relatively static, it is easy to define and fix spheres of influence which do not overlap. But the dynamic period will come. Even now, General MacArthur has raised a minor political storm in America by announcing after Lord Louis's appointment that he was ready "to serve in any subordinate capacity" and Mr Curtin has intervened to say that the South West Pacific Command is not in any way subordinate to Lord Louis. If this can happen in these static days, what will happen when an Allied advance fuses and confuses all the fighting fronts?

While the war in Europe draws to a close, the Allies have in the Far East a blessed period of relative quiet in which to concert their preparations for the great attack. Their first need is a United Nations Pacific General Staff equipped with a planning staff which will consider the total strategy not in terms of this or that nation or this or that service or this or that front, but in terms of the maximum contribution each man, plane and ship can make to the common strategy. The Pacific Command is like a great orchestra of highly temperamental musicians. Without a skilled conductor in the shape of a Central Staff and a central plan, the most appalling disharmony will result. But once such a central authority has been established, the subordinate problem of overlapping commands and rival strategies will fall into place. The enforced lull of this winter can be turned into a guarantee of final speed if the organisational lesson learnt and the right military structure created now.

Coal Comfort

GOD from the machine as ever, the Prime Minister came down to the House, on the second day of this week's coal debate, to silence the critics; and by one of the dearest political performances of his career he got his way. But the coal problem was still unsolved when he sat down.

Nationalisation, Mr Churchill said, is politically impossible without a mandate from the electors. It is also technically impossible to nationalise the mines in time to meet war needs for coal. It has not been proved that nationalisation would necessarily do what is wanted, that is, raise the efficiency of the industry to the maximum. Nor, indeed, has anyone openly asked for it. The obvious answer to Mr Churchill's statement was "Nobody asked you to, sir, she said."

In a sense, the Prime Minister's decision to rest his case mainly on the rejection of nationalisation was just as political an act as a demand for immediate nationalisation would be. The problem is a technical one. More coal must be got from the mines, perhaps as much as 15-20 per cent more every week, to supply military as well as home requirements. The Government certainly has no mandate for the nationalisation of the coal industry; but ever since the Coal Mines Act of 1930 every Government has had a mandate for its rationalisation. If under the blanket of nationalisation, Mr Churchill intended to rule out a more radical scheme of reorganisation than has yet been tried, he was using a political argument to evade a pressing technical issue.

The Prime Minister did give assurances. The crisis in coal production is not, in his view, so serious as the figures and forecasts have suggested: if the domestic consumer is as sparing in his use of coal as he was last winter, the operational control instituted last year by the Government's White Paper plan, together with the recruitment of forced labour as well as volunteers, should see the country through. As Mr Grenfell pointed out, there is no published evidence to back this confidence: the regular labour force is dwindling and ageing, and the trend of output in the next twelve months, if there is no radical change in organisation and methods, will be downward, even with the aid of pressed men—while demand, with incalculable military calls added, will be upward. The Prime Minister promised to consider changes, short of fundamental alterations in the structure of the industry, in the White Paper programme of control; but, like Major Lloyd George, he believes that it has worked satisfactorily—on the somewhat naïve ground that no owner or manager has opposed its operation.

The Prime Minister's guarantees to the miners were frank and friendly. Government control of mining operations, as it now exists, and the national regulation of

wages will continue through and after the war, until a General Election can decide between nationalisation and the alternatives. Rightly, he rebuked those who claim that the shortfall in coal output is due, to any appreciable extent, to wilful absenteeism or strikes. While he soothed the owners' ceaseless and distracting fears of nationalisation, he refused their plea for the restoration in the pits of the big stick, privately wielded; indeed, he probably gave too little support to the campaign of the miners' leaders against irresponsible elements. But the problem of getting more coal had only a small place in this very understanding section of his speech. "Blood, tears, toil and sweat," "Back to the job" and "No political controversy" are hallmarks of a statesman's oratory; they do not add up to a coal policy. It is because the political approach is out of order, because the coal problem is national and technical, not sectional and political, because, as one Member said in the debate, the past of the industry cannot be dissociated from its present and its future, that the Government was in duty bound to offer more towards a solution than cautionary words, warm-hearted assurances and, meanwhile, an extension of conscription to coalmining.

More coal is urgently needed. This means more workers and more coal per worker. Voluntary recruitment has entirely failed; the inducements offered have proved wholly inadequate, and men have preferred "the battlefields to the pits." The Government has decided on a compulsory call-up for coalmining as for the Services, a last resort which, for all its difficulties, it can claim has become inevitable. There is to be a further comb-out of former miners from the Army, but not of operational units; earlier comb-outs yielded only small results. To provide an additional financial incentive to miners, the recommendation of the Greene Committee, published last week-end, that the basis of the bonus scheme should become the pit, instead of the district, is to be adopted, which should have been done from the outset. Major Lloyd George gave no evidence one way or another about how control has in fact worked in terms of coal gained.

The coal problem will never be solved by tinkering, either now or after the war. Past omissions and failures may make drastic *ad hoc* expedients necessary now; but the problem can only be solved in the context of a long-term policy to raise the industry's efficiency by the right methods and incentives. It is, of course, a familiar politician's trick to excuse himself from taking thought for the morrow by stressing the need of to-day; and to go on doing this, year after year, without even being aware of any inconsistency. A long-term policy of reorganisation will not bear immediate fruit, any more than it would have done if it had been introduced a

year ago, as it should have been. But if one had been introduced in 1941 there would have been more coal in 1942, and if one had been introduced in 1942 there would have been more coal this winter. Unless one is introduced now there will not be enough coal next year. Temporary expedients, such as those proposed by Major Lloyd George, must be tried now for this winter; but they are assets that will waste with tragic swiftness, except as part of a positive programme to raise productivity.

What is needed, what has been needed for a generation, is the technical reorganisation of coalmining, an industry which was by-passed by the Industrial Revolution. In the United States, a smaller number of miners produce more than twice as much coal as in Great Britain; in 1937, for example, some 600,000 miners produced 500 million tons, whereas in Great Britain, despite the pre-war speeding-up in the process of mechanisation, some 700,000 miners produce at the annual rate of less than 200 million tons. Experts explain this very large difference in terms of geology, and there is no doubt that the different technical conditions of the American coalfields account for much of the difference in output per head; but they do not account for anything like all the difference. In the past the United States has got cheap coal by mechanisation, while Britain has got it by paying low wages—and in the last pre-war decade by fixing its own prices to consumers statutorily. This is not to accuse mine owners of flagrant exploitation; during the whole of the inter-war period there were more miners than mining jobs; and wages, raised during the war to the union's satisfaction, then reflected the industry's overblown state. But it would be unrealistic to absolve them completely. The Coal Mines Act of 1930 provided for the concentration of production by financial amalgamation; the Coal Mines Reorganisation Commission set up under the Act had to report the industry's unwillingness to carry out this policy.

The question is no longer whether technical reorganisation should be enforced, but how it should be enforced. Obviously the coalfield, not the pit, should be the technical unit. There is a choice between two solutions. One is the compulsory amalgamation of the financial interests in each of the coalfields; the other is the compulsory buying-out of the mine-owners by the state. Half-way measures have been a failure. Last year's coal plan ostensibly provided for "full control over the operation of all coal mines" for the duration of the war. In practice it is little but a superstructure. There is a Controller-General, assisted by regional controllers, paid by the Government and with "full authority." But the managers of individual collieries, the technicians of the industry, are still the servants of collieries; and the plan has not produced the coal. What is the next step? The argument for preferring the amalgamation of private ownerships to state purchase is that this solution would retain private enterprise and initiative as the main incentive, while there is no evidence that state ownership would do better than state "control." But what guarantee is there, after the

experience of the 'thirties, that the owners would really seek and secure maximum technical efficiency?

The Mineworkers' Federation has said

the responses that are required by the nation from the men cannot be forthcoming unless the workmen can be assured that the benefits of these responses do not accrue to the colliery companies.

This is political bargaining, and the miners have no right whatsoever to point a pistol at the nation's head. But "handsome is as handsome does" applies even to mine-owners. The miners' distrust, as Major Lloyd George discovered in going "around the coalfields," is deep-rooted and a fact of industrial life.

Quite apart from politics, and purely on the technical grounds of productivity and the nation's coal supplies, state purchase must eventually be given serious consideration. But this is now ruled out; and financial pooling, subject to price control by the Government to safeguard the interests of the consumer, should probably be given a limited trial first in any case. A permanent increase in efficiency, by whatever means, must be secured. It is in this light that the present scheme of control should be radically re-examined as a matter of urgency. If productivity increases it will be possible to raise wages to a higher level and to improve conditions. Few men will choose coalmining unless the industry can offer more attractive conditions. The lesson has been driven home hard by the small number of persons of military age choosing work in the pits, by the unwillingness of miners to encourage their boys to go into the mines, by the outcry over Mr Bevin's suggestion to draft young boys into the mines, over the recent decision on juvenile wages and over the inadequacy of workmen's compensation in an industry where workers are worn out at an early age and the rate of accidents is grievously high.

Technical reorganisation would not solve this winter's coal problem. But it is inevitable, for efficiency's sake alone, and its introduction now would lay the foundations for an improvement next year; by enlisting goodwill and attracting more voluntary recruits, it would make a modest contribution even during the next few months. The limited comb-out of miners from the Army will produce only meagre results. The conscription of men for the mines, the consequence of previous impolicy, is at best a very regrettable necessity. Existing miners must be induced and helped to produce more coal. Before they can make additional physical effort they should be given more food and, particularly, more meat; and they are entitled to special reward for special exertions. The mine-owners still object to the pit bonus scheme because it would lead "to pressure towards a movement of labour to the more successful pits." Such a movement is precisely what is needed, because the more successful pits will generally be the most productive pits. But these palliatives, necessary though they are, offer no solution of the coal problem. Output may be aided for a few months; but the real issues have once more been shirked.

The Agricultural Problem—II

What Kind of Agricultural Policy?

AN article in last week's *Economist* suggested that the right agricultural policy for this country, after a war and post-war conditions have gone, should be to ensure the minimum production of the crops required for the efficient management and the maximum production of the required for national health. The opposing as large as possible an acreage was rejected as uneconomic, unnecessary even for defence reasons. By policy can the programme of agriculture be desirable in the national effect? lives are well known, and have

been much debated. Broadly, they are three: control of imports by tariffs, bulk purchases or a system of quotas; the stimulation of either production or consumption, or both, by subsidies; and the guarantee of prices in order to maintain output. In general terms, the test should be, first, whether the methods chosen restrict or expand the total supply of food available to consumers from all sources, at prices which they can pay; and, secondly, whether the supply available is of the kind of foodstuffs that consumers want and need. In the context of agricultural policy alone, there is no case at all either for restricting the total supply of food, or for limiting consumption by maintaining prices higher than efficient production requires.

It is possible that, even in the brave new post-war world, exchange and trade difficulties may require, at any particular date, that imports from certain countries should not be allowed to increase; but this will be at best a necessary evil, and should affect foodstuffs and essential raw materials last of all. There are, in addition, as will be suggested later in this article, technical reasons of agricultural practice why the production of limited quantities of certain commodities, in themselves uneconomic by comparison with overseas supplies, should be protected; but the right method here, too, is not to shut off imports, but openly to subsidise home output up to, and not beyond, the level required. The remedy for apparent over-production or under-consumption is not restriction—that is, under-supply—but the maximising of effective demand by the maintenance of national full employment and the redistribution of national income by social security and other measures.

Many of the recent plans put forward by various bodies for the reconstruction of agriculture have leaned, not unexpectedly, towards the control of imports. The National Farmers' Union, naturally in view of its programme for large-scale British production in all branches of agriculture (which was summarised in last week's article), asks for the continuance of state purchases of overseas foodstuffs by a Ministry of Food "for the purpose of regulating post-war supplies," a view shared by the Conservative Party's report on agricultural policy; and there is little doubt that "regulation" in this context implies restriction. The Government will be expected to restrict its imports from overseas in the interests of home producers and, as the Conservative report suggests, to pay differential prices in their favour if it also purchases home produce.

Import boards and state trading have been, and still are, advocated as a method of obtaining bulk supplies of foodstuffs at cheap prices for popular consumption; and, after the experience of wartime, there are obvious benefits to be obtained in this way. But the use of state trading on protective and restrictive lines would carry with it all the disadvantages, national and international, of the restrictive regulation of imports, which, before the war, was a more serious menace than tariffs to world trade. It would invite retaliation against British imports, and gain no agreement abroad. The only right purpose of state purchase is to purchase.

The Role of Subsidies

Agriculturalists view direct subsidies with disfavour because they regard them as carrying some sort of stigma which, for some reason, does not attach to state purchase, quotas and tariffs—and as less permanent. The citizen and taxpayer, on the other hand, will prefer them wherever it can be proved that public aid is necessary; he can see how much money is being spent on assistance to agriculture, and what for. This is the view of the recent Liberal Party report. British agriculture may reach a high level of efficiency—the wartime record is in many ways encouraging—and still require a permanent measure of strictly limited assistance, for purely technical reasons, to certain of its branches. This country is likely to remain largely a country of mixed farming, which precludes specialisation beyond a point. No matter how efficient home farming may become, climatic and economic conditions will result in some of the products it cannot dispense with being more cheaply produced in some other country.

This means that, in respect of these products, special assistance will be required by home producers—though, it should be very strongly emphasised, only to the extent needed to maintain the minimum output dictated by the minimum requirements of good husbandry. If the aim is to maintain a minimum acreage under the plough, the frank, fair and effective way of achieving it is by an acreage subsidy—and there is no technical reason why the total tillage area should be more than 10-15 per cent larger than before the war, despite the NFU

demand for an increase of 60 per cent. If the aim is to maintain a minimum output of particular crops, again for technical reasons, the proper method is a subsidy per unit produced up to a rigid maximum, devised in such a way as to encourage efficiency while stimulating production. And the amount of these subsidies which may be required to maintain the industry's capital, so to speak—to make possible a minimum, and strictly limited, output of certain products in order to keep Britain's mixed farming in good trim—will be much reduced if certain steps are taken by the Government to lower farm costs still further by the spread of mechanisation, the provision of cheap electricity and the cheapening of seeds, phosphatic manures and lime.

Much more important is the kind of policy required to maximise the output of the kind of products, the protective foods, on which British agriculture, for social and economic as well as technical reasons, should concentrate. The market for, say, bread and, perhaps, potatoes had probably reached its limit in this country before the war. The market for meat had considerable room for expansion, provided no barriers were imposed for the protection of home produce, already protected naturally by quality and freshness. The market for milk, eggs, vegetables and fruit was limited only by the purchasing power of the people. Social security, freedom from want and full employment, successfully carried out as state policies, can make this potential demand effective. In Northern Ireland during the war, where the National Milk Scheme to provide cheap or free milk to certain classes of consumers has not been accompanied, as in Britain, by shortage of overall supplies and rationing, sales of milk for human consumption have risen by about 60 per cent. Never again should any section of agricultural policy be based upon the sort of restriction which, before the war, reduced the total supply of bacon available to consumers from 14,000,000 hundredweights a year to a quota of 10,670,000 hundredweights—simply in order to raise prices to a level at which home producers could supply a substantially increased share of the market.

The keynote of agricultural policy should thus be expansion—in the right direction; and the direction will be set by a marriage between agriculture and nutrition. Can British agriculture expand its production of protective foods after the war at prices which will enable potential demand to become effective? There is no reason why not. During the war, expansion of the ploughed area has brought much marginal land into cultivation; and prices have had to be advanced sharply to do this, while in the case of milk, egg and meat production, the absence of imported feeding-stuffs has pushed up costs. After the war, in the case of milk, eggs and pork, renewed imports of feeding-stuffs, enabling more balanced rations

Co-Belligerent Italy

The Badoglio Government has declared war on Germany, and the Allies have accordingly granted Italy the status of co-belligerent. This concession in no way alters the terms of the armistice, nor does it prejudice the extent to which Italy will achieve "self-redemption" simply by adhering to the Allied cause. Italy does not become an Ally. Old claims, old misdeeds and old injustices still stand. The test now is, on the one hand, how far Marshal Badoglio can in reality associate the Italian people with his decision and with his Government, at present wholly out of harmony with the popular will; and, on the other, the degree of active participation given by the Italians in the fight. Nothing in the present situation suggests that very much help will, in fact, be forthcoming. Every report and every observer from Italy confirm the fact that the Italian attitude towards the struggle, apart from militant political activities in some towns, is one of supreme apathy. This springs in part, as did French apathy in 1940, from indifference to the issues involved in an unwanted war. But it springs, too, from famine conditions. In many districts the people are so weak and listless that they hardly help each other, quite apart from giving any assistance to the armies of occupation. Both the Germans and the Allies are hampered by this background of non-co-operation. Kesselring appears to have given up his attempts to mobilise labour and has tried to get round the difficulty by allowing men to volunteer for Italian firms which, in their turn, have contracts with the Todt Organisation. Apathy, too, is shaping the problem of getting men back to the colours. In the struggle between Ricci with his purified Militia and Graziani, with his restored army, it looks as though Graziani has come out on top, for although it has been announced that "the Army will be reorganised round the militia," it has been made clear that the men will be called up in the normal way and will be in no sense Fascist enthusiasts, or even Fascist volunteers—for there are none. The Badoglio Government faces the same difficulties. Bari Radio recently broadcast its first military decree. A number of offences are brought under courts-martial, some with the death penalty attached. Among the offences are, significantly, desertion, cowardice before the enemy and refusal to obey orders. In the main, it is a decree of compulsory mobilisation. Men who left their units after September 8th and do not join up again as soon as their district has been occupied by the Allies, will be treated as deserters. The military value of all this is extremely doubtful. Badoglio's reasons are obvious enough. The larger the contribution made by Italy to an Allied victory, the greater the chances of Italy keeping some remnants of its earlier possessions. But the Italian people care nothing for the Dodecanese or for Zara, or for the Italian Empire in Africa. They simply do not want to fight.

The Great Surprise

The resumption of the Soviet offensive after the short "lull" in the first days of October may be described in the history of this war, so full of surprises, as one of its most decisive and unexpected turns. The Germans pinned many hopes on the lull; and military commentators all over the world had taken for granted an interval in the fighting of some duration, when the Russians announced the capture of Nevel in the north and advances from three consolidated bridgeheads on the Dnieper. The drive to Nevel portends the unhinging of the entire German defence system on the northern sector; further advances there may force the Germans to start a large-scale retreat from the Leningrad province. The consolidation of the Dnieper bridgeheads creates multiple threats to the Germans on the middle and lower reaches of the river. Kiev can now be enveloped by pincer movements from north and south. This will take some time, since the exploitation of a spring-board established across a wide river is the most critical stage of such an operation. But the fall of Kiev—like that of Gomel—can hardly be delayed for long; and the capture of the Ukrainian capital is likely to be followed by a tremendous acceleration in the tempo of the Russian advance. As an administrative and transport centre, Kiev stands to the western Ukraine in the same relation as Kharkov stands to the Ukraine east of the Dnieper. The moral effect of a recapture of Kiev needs no stressing; it would be the climax of the battle for the Ukraine. The Kremenchug bridgehead, further to the south, is a threat to the German rear inside the Dnieper bend. The stubborn and costly German defence

along the Zaporozhe-Melitopol line has now turned out to have been a futile military effort. The line has been breached frontally; and it is threatened by an outflanking move from Kremenchug. These are the glittering prizes now within the reach of the Russian High Command. Prospects for the third winter campaign are almost unlimited; and against this background a recent statement in the *Bolshevik*, organ of the Political Bureau, about "the liberation of all Soviet territories in 1943" deserves attention, even if the view is taken that the actual process of liberation may not be concluded until the early months of next year.

The Portuguese Concession

British ships and aircraft can now use the Azores as a base for their ceaseless harrying of the German U-boats. After making this announcement to the Commons, and recalling ancient treaties back to Edward III, Mr Churchill gave no answer to the suggestion that the example of England's oldest ally should be brought to the notice of England's oldest plantation, Ireland. This concession from Portugal will undoubtedly make the work of the Navy and the Air Force far surer and safer, especially the work of the latter against new attempts from the air. But, since the U-boat menace may well have passed its peak, the importance of the Portuguese concession lies at least as much in the light it throws on the general political and strategic issues of the war as in its immediate military value. Like the Italian collapse, it is a sure sign that the peoples of Europe see the writing on the wall and know that the days of Hitler's empire are numbered. None of the nations which has so far avoided war wants to be drawn into the conflict at this stage. But they are now ready, by "all means short of war," to speed the Allied victory, and in doing so to secure a measure of Allied goodwill. The sympathy of Portugal has never been in doubt. Dr Salazar has on many occasions reaffirmed his country's 600-year alliance with Britain, and since the maintenance of Portuguese trade and the Portuguese empire has long depended on the pacific power of the British Navy, all Portugal's real interests were already engaged on the Allied side. As long as Germany was undisputed master of the Continent, however, any departure from strict neutrality could have been used as an excuse to bring Portugal into the war; and the Portuguese, like all other unattacked neutrals, great and small, were not prepared to take the risk. The fact that the risk can now be taken shows the extent to which the German grip has relaxed. The Portuguese are still neutral, of course, and can possibly claim that their gesture, which is designed to protect the safety of shipping in the Atlantic, is not an unneutral act. The weakness of Germany will be gauged by the nature of its reaction. In the Italian crisis, the Nazis' counter-measures were rapid and effective, but in the Iberian Peninsula the opportunities for action are more remote and precarious. To strike at Portugal would mean an extension of German military commitments into new fields and a new strain upon its depleted manpower. It is certain, too, that the Spaniards would not co-operate in any German venture. There is the possibility that the Portuguese themselves have further measures in view. The largest army manoeuvres in the country's history are taking place, and for months past the fighting effectiveness of the country has been steadily and quietly increased. Posters have recently appeared on Lisbon walls warning the people that it may be necessary to fight; and, even if the Portuguese do not intend any intervention in the European war, there is the Pacific war and the problem of Timor. At the time of the Allies' weakness in 1942, the Portuguese were compelled to accept the Japanese occupation of Timor with only a protest. There have been signs recently of a more intransigent temper, and talk of sending Portuguese divisions to join in the Allied fight. Portuguese intervention in the Pacific war is probably certain sooner or later, but it could be accomplished with less risk if Germany's defeat had already been secured.

A New Phase?

No one, friend or foe, now doubts the quantity of Allied might; the enemy's hopeless inferiority in weight has become too apparent. Some have doubted, friends as well as foes, whether the quality of the Allies' thought and action is equal to their material power. A contrast has sometimes

been drawn between the swift imaginative thrusts of the Germans, when they were top dog, and the more ponderous reliance of the Allies on weight of numbers. Several episodes have lately done something to dispel these doubts. The occupation of the Azores, with the full consent of Portugal, and without any routine flapdoodle about saving the islands from an imminent enemy descent, far exceeds by its ease and friendliness the clumsier, bloodier occupations carried out by the Nazis even in their prime; the pooling of bases against the common enemy, which has been held up by so many inhibitions in the past, is carried an important step forward. At sea and in the air, a fresh forward policy can be glimpsed. The remarkable trip of midget submarines 50 miles into Norwegian fiords to wound and fix the battleship "Tirpitz"; the Home Fleet's dash in strength to cripple a convoy, by air attack, off the Norwegian coast; the bombing of more German warships and naval installations in far-off Gdynia; and the destruction of a vital German aircraft assembly plant thought safe in the east—all these are signs that the rapier may be coming into its own beside the bludgeon.

Talking on Air

With promptness and energy all his own, Lord Beaverbrook has conjured an Imperial Conference on civil aviation almost out of thin air. He is to be warmly congratulated on his un-Ministerial celerity. Talks with representatives of Canada, Australia, New Zealand, South Africa and India have ended. Observers from Newfoundland, Southern Rhodesia and Burma have been sitting in; while Mr Churchill has said that the British delegation included a representative of the Secretary of State for the Colonies. The Prime Minister did not call this a Conference; the proceedings were preliminary and exploratory; obviously, none of the distant Governments could be bound by anything in the nature of decisions at this hastily gathered meeting. The real Conference has still to be arranged—with similar speed it may be hoped. But any dress rehearsal produced by Lord Beaverbrook inevitably tends, if only because of his great zeal and determination, to take on the character of the actual stage performance; and it is very important to know from the outset what the script should and should not include. There is every reason, technical, political, and international, for a regional agreement on the principles of post-war aviation policy between the world-scattered parts of the Empire. There is none at all for the making of prior commitments which may impede inter-regional arrangements with the United States and the Soviet Union. The fundamental question, whether the British Commonwealth is to be a unit or a series of separate units for the purposes of President Roosevelt's "freedom of the air," with national lines reserved for national operators, will have to be decided in Canberra, Ottawa and Washington, not merely in London.

Uthwatt Dismembered?

Mr W. S. Morrison, Minister of Town and Country Planning, gave cold comfort in his advance hints last week of the Government's decisions on the various proposals made by the Uthwatt Committee for the control of land-use in planning. He promised no action at all. He did promise that the terms in which the Government is prepared to accept two of the Uthwatt proposals would be announced shortly. These proposals had already been accepted many months ago, as far back as the time of Lord Reith, much the most positive and practical Minister yet associated with physical planning: local authorities, we are told again, will be given power to purchase all the land in reconstruction areas for redevelopment; land values, it is repeated—with the same iteration as the small boy who cried "Wolf, wolf," to his own ultimate detriment—will be fixed at the level of March, 1939. Meanwhile, speculation in land proceeds without much apparent fear of words becoming deeds. Meanwhile, too, the inter-related Uthwatt proposals for the purchase of development rights in rural areas and for a levy on betterment values stay in cold storage, and have presumably been frozen to death. The Government has a blanker answer to the criticisms inevitably invited by this almost incredible record. These are, Ministers say, one after another, very difficult matters, very complicated and very technical. The fact that they are also very important, indeed crucial, slips from the official mind; nothing is done; no alternatives are suggested; and the certainty that this

will lead, first, to chaotic and costly rebuilding, and, secondly, to the most powerful campaign for land nationalisation that this country has ever known, is entirely forgotten.

The Machinery of Government

The greatest disappointment when Parliament met this week was the absence of any statement about the functions of Ministers in the reshuffled Cabinet. It almost seems, despite the many optimistic forecasts made, that the recent changes were not changes at all—except in faces and names. Probably the greatest single factor in delaying decisions about reconstruction to stopping-point is the absence of any clear-cut authority for reconstruction in the Government hierarchy. The ball can be, indeed must be, deftly tossed from Sir William Jowitt to the chairman of the Home Policy Committee, now presumably Mr Attlee, on to the Minister of Town and Country Planning, and back again to Sir William Jowitt. Inevitably, it falls to the ground and rolls under the furniture. The real reason for this somewhat ham-handed game is the fact that none of the players has been authorised to hold the ball when it is thrown to him, and the Prime Minister has too many other games to play to make this one his affair. Inveterately optimistic, after disappointments, many people had hoped that something was going to be done about this; that the functions of government were going at last to be straightened out and grouped under individual Cabinet Ministers with power to act and decide. They had hoped that, parallel to the Home Policy Committee of the Cabinet, there might be a Reconstruction Committee, with a member of the War Cabinet in charge, not only to correlate all reconstruction work, but to fuse it into a single positive whole. It would be wrong to call Mr Churchill's Government a one-man Government. Few Prime Ministers have left their subordinates so much alone. Unfortunately, without authority, they can only work on and on, as no doubt they do, with nothing really achieved. And now the Prime Minister has told the Commons, in the coal debate, that this is the deliberate purpose of Coalition Government—the maximum of work with the minimum of decisions, which are by and large improper.

Nazi Crisis

It is a Nazi habit to announce a crisis only after it has been mastered. The meeting of party leaders called on October 6th at Hitler's headquarters marked the end, according to the official Nazi view, of a prolonged period of internal instability and the restoration of "order and discipline." The crisis sprang in the first place, of course, from the steady deterioration in Germany's military position. The fear and dissatisfaction aroused by the bombing and by the Eastern retreat were brought to a head by the fall of Mussolini. This event provided a focus for the previous discontent. Lively political interest was aroused by the fact that a dictatorial regime could be overthrown with so little trouble. This type of interest struck at the very roots of party authority. It canalised war discontent; it directed it against the regime and suggested that, after all,

INSURE WITH

7. CHANCERY LANE, LONDON, W.C.2

an end of the regime and an end of the war were not impossible. The fact that release in Italy came through a General was one of the most disturbing factors. For a short time the German people saw the faint possibility of an alternative to the party, whereas hitherto the greatest discouragement to all unrest was the fact that in the "monolithic state" there were no alternatives. The Nazi Party reacted vigorously. Himmler was put in charge of all home affairs, and Goebbels embarked on a high-powered propaganda campaign to kill "defeatism" and bludgeon the people back into the requisite degree of apathy. The two sides of the campaign were not separate. Himmler punished the offences against morale which Goebbels announced, and Goebbels gave due publicity to the punishments inflicted by Himmler. In the course of September, Goebbels published his Thirty Articles of War for the German People—a series of regulations or decrees, all carrying with them severe penalties—"Do not listen to enemy propaganda," "Always think of Germany's struggle for existence," "Do not spread rumours," "Have faith in Germany's final victory," and so forth. At the same time, much more publicity was given to executions for defeatism.

Confidence Restored?

The holding of the October Party Conference suggests that the Nazis believe they have surmounted this crisis of confidence. One after another, the party leaders got up to tell the assembly that all was well on their section of the home front. Himmler is reported to have said that "there is no defeatism on the home front. Individual cases are ruthlessly exterminated." Dr Ley promised that emergency houses were on the way for bombed-out people; Speer guaranteed that the output of weapons would actually be increased by his new methods of mass production; General Milch promised more activity from the *Luftwaffe*; Admiral Doenitz from the U-boats; the Chief of the SA, Schepman, got up to praise the fighting spirit of the SA. The Conference was crowned by a speech from Hitler, who no longer speaks in public. In this case, it is just as well, for the Fuehrer seemed to be using the notes drawn up by Goebbels for his Harvest Festival address. Hitler spoke of the decisive importance of morale and of the rôle of the Nazi Party as the supreme embodiment of the nation's will to victory. An atmosphere of renewed confidence pervaded the meeting. For the time being, the rifts have been closed and the dangerous thoughts of the people driven underground. The Conference was almost a demonstration that the Nazi Party cannot be set aside as the Fascist Party was, that, on the contrary, "In deinem Lager ist Oesterreich"—in their midst is the true Germany. Doubtless the restoration of a Fascist regime in Italy and the re-emergence of Mussolini helped Dr Goebbels considerably, for it showed that, after all, it was not so easy to get rid of the party. But the restoration of "stability" springs more directly from the vigour of the Nazis' own counter-measures. Unhappily for them, it is a very temporary stability and can be overturned again by fresh military disasters.

Clothes Snatchers

For a hundred years Tories have been catching Whigs bathing and have been using their clothes for their own political practices. This, in a single simile, is the story of British government. It is the reason why the Conservatives can claim, with much justification, that the majority of reforms in the past century have been carried out by them; it is also the reason why the pace of progress is seldom, if ever, as quick or as timely as the nation's full needs require. The Conservative Party is the most catholic and adaptable of political organisations, and invariably keeps within its ranks, somewhat removed from the seat of power, a group of earnest and active reformers, crying the name of Disraeli, Randolph Churchill, Joseph Chamberlain or Viscount Hinchinbrooke as the case may be. These are the clothes-snatchers in training. It was the Prime Minister's father who first stated frankly the policy of paying ransom in the shape of political concessions in order to keep power. The present-day Tory outsiders are hard at work; and their work is distinctly good. Too much attention perhaps was paid last week, in discussions of the Conservative Committee's report on demobilisation, to the proposal to release men and women from war service by means of a "points"

scheme. The report was much more than that: it was a practical, comprehensive and simply stated analysis of all, or nearly all, the actual problems that will arise in demobilising members of the Services, including civil defence, civil servants and even factory workers; and in finding a place for them in peace-time work. Training, rehabilitation and resettlement, necessarily dealt with very curtly, were as important a part of the report as demobilisation itself.

"Forward—By the Right"

The same practicality is shown by the report of Viscount Hinchinbrooke's Tory Reform Committee on what they think Tory reforms should be: "Forward—By the Right." The members of this Committee have a clear picture of the relations they seek between the individual and the state, between the parts of the Empire and between nations; they express their politics in terms of the rights and duties that every man and every nation owes to the larger society. They are convinced of the need for social and national security as the first charge upon resources and organisation; and they are insistent that the basis of all political activity at home and abroad must be an expanding economy. Their views, only very briefly stated, on full employment, the future of exports, national planning, public control and the use of land are instances of their "practical approach." They reject the notion that the Conservative Party is "merely a convenient organisation for exposing the fallacies of Socialism"; and they believe that

if there is a broadening field for state ownership of certain monopolies and state direction of the main lines of production policy, there is equally the need to revive at the earliest moment a widespread, healthy and vigorous private enterprise.

They obviously agree with Mr Morrison's recent advice, to Labour Party members, to say always what they mean to do, and not simply what they hope to get or what other people should not be allowed to do. The garments of the Whigs are already almost within their grasp.

Domestic Service

The storm over the registration of the older women has subsided, but there are still minor disturbances threatening the Ministry of Labour's hitherto smooth passage in the mobilisation of woman power. It was reported last week that employment exchanges in Lewes were directing working-class wives into private domestic service in big houses to take the place of servants who had been called up. This allegation is Labour's comeback to the Conservative protest at the registration of non-working-class housewives in their late forties. But the Ministry of Labour has denied the story. "Compulsory directions to private domestic work of this kind are never issued." Women available for part-time work in areas where there is no local war work are asked whether they would be willing to help in household work in someone else's house, and the women concerned at Lewes had all expressed willingness to do so—some of them had been doing the jobs for months. There was perhaps a shade too much horror in the Ministry's denial that people are ever directed to domestic work. Many householders, after all, have been compelled to take in unwanted guests, whether evacuees or war workers, which often means that, in effect, they are compelled to give them domestic service. Is there any reason why a woman of any social status should not similarly be compelled to give a few hours' help a day to a household which is struggling to cope with the sick, the aged or the young? Such work, like nursing, is best done voluntarily rather than under compulsion, but this is no reason why it should not be considered urgent and necessary. If the Ministry of Labour is averse to directing women into other people's homes—to work—it should provide a more satisfactory voluntary scheme than it has so far done, particularly for households where there are young children and babies.

As Others See Us

The British people will be surprised, edified and perhaps rather amused to hear that the American Senators have returned from their world-wide tour of the battle-fronts impressed by the single-mindedness, skill and "teamwork" with which British officials, far and near, from Whitehall to the vast far-flung outposts of Empire, pursue a consequent, detailed and thoroughly digested plan

of action for forwarding British interests. This is not the picture to which the British public are accustomed. They believe that large areas in the Empire were acquired through absence of mind. They know—to their bitter cost—that muddling through on the comfortable margin provided by sea-power was their Governments' grand strategy up to and indeed well into this war. They look in vain for any clear signs of an emerging British foreign policy, capable of fulfilling the demands made by the revolutionary changes of this century. Even when, as usual by happy chance, some new instrument of a progressive foreign policy is set up—for example, the Middle East Supply Centre—they find that few officials are interested in its potentialities, and that, far from working as a team, the various Government departments concerned with the Centre at the London end have evolved no common machinery for exploiting the opportunities it offers. And, far from the Government fighting tooth and nail for British interests, many people in Britain have criticised it for showing an almost maladaptive tendency to bow to the wishes and projects of the Russian or the American Governments. Perhaps the British are wrong. Perhaps there is a vast British plan and a vast machine to implement it. All they say is that they see no evidence of either. Strangely enough, what they sometimes think they see is far-sighted planning, not always perhaps by the American Administration, but by powerful American private interests. It is a national belief in Britain that wherever you go in the British Empire you will find an American engineer building an air base with one hand and nailing down a concession on the other. In some places, the entire ground staff at the military aerodrome is rumoured to be Pan-American Airways in heavy disguise. Now some of the Senators are adding to the British myth by suggesting that the bases "acquired with so much sacrifice" on British and other territory abroad should be retained after the war. The British shake their heads. "Smart chaps, these Americans. And to think they planned it from the start." Can it be, perhaps, that neither nation is as Machiavellian as the other believes?

The Balkan Scene

The relatively slow tempo of the Allied advance in Italy seems to have given the Germans much desired opportunity and time for strengthening their position in the Balkans. Though the military and political odds are, on the whole, heavily against them, they still tackle their tasks with energy and thoroughness. They have, first of all, made it clear that they do not intend to retire from the Balkan coasts to the Danubian plain in case of an Allied invasion. The occupation of Cos is pointed to as an illustration of the German resolve to defend the coastline everywhere in the Balkans. The visit of the German Minister of Communications, Dörpmüller, was presumably connected with the adaptation of transport to new defence needs. At the same time, not insignificant successes have been scored in the fighting against partisans on the Dalmatian coast. All this has temporarily restored some of the German prestige in the Balkans and some of the fear they used to inspire. The risks connected with premature "jumping from the train" (Dr Goebbels's *bon mot*) have visibly gone up. The cauldron has not stopped boiling. Guerilla activities seem to have assumed an altogether spontaneous character. While the partisans have been forced to evacuate some of their strong points on the Dalmatian coast, they have intensified raids on islands in the Adriatic as well as on towns in Croatia, Slovenia and Istria. It would, however, be premature to regard those penetrations as anything more than forays, which cause a great drain on enemy resources, but cannot result in any solid occupation of territory. So far the fighting has been done by the partisans of the People's Army of Liberation, and not by the forces of General Mikhailovitch. General Mikhailovitch himself has stated that, in agreement with the Allied Command, he still keeps his forces back in readiness for an Allied invasion. It may well be that conditions in Serbia, the terrain of General Mikhailovitch's command, still justify the tactics of caution; but this is no longer as certain as it was some time ago.

Shorter Notes

In opening the debate on the Wage Earners' Tax Bill on Thursday, Sir John Anderson pointed out that, if opinion favoured it, he was ready to extend the application of the

"pay-as-you-earn" scheme to lower salaried employees. This is the merest common sense; there would still be a justifiable sense of injustice at the higher levels of income, but in the present unreformed tax system, the application of "pay-as-you-earn" above, say, £420 or even considerably higher, desirable though it undoubtedly is, would be fraught with great administrative difficulties, because of multiple sources of income.

The vital statistics of the nation continue to be good. Live births in the second quarter of this year totalled 180,691, which gives a crude birth-rate per 1,000 of the population of 17.5, against 16.2 in the second quarter of last year, and an average of 15.7 for the June quarter of the five years prior to 1942. The infant mortality rate, at 46 per 1,000 live births, was the lowest ever recorded for this quarter, being nine below the average of the ten preceding second quarters. The death rate of 11.0 per 1,000 compares with an average of 12 for the same quarters during the five years prior to 1942. But an ominous sign for the future of the birth-rate is that fewer marriages took place. The total of 82,120 was 19,334 lower than the average for the same quarter during 1937-41; and it has yet to be determined whether the increase in the crude birth-rate in recent months marks a change in the long-term population trend, or whether it merely reflects the big increase in the number of marriages immediately preceding the war and after it had been declared.

The following table gives the number of civilian casualties in air-raids since September, 1939:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept., 1939-Aug., 1940.	1,494	1,980	3,474
Sept.-Dec., 1940.	22,282	28,522	50,804
Total, 1941.	20,863	21,839	42,702
Total, 1942.	3,221	4,149	7,370

1943:—

January	328	507	835
February	252	347	599
March	293	439	732
April	172	205	377
May	584	733	1,317
June	201	284	485
July	167	210	377
August	108	164	272
September	5	11	16
Totals to date....	49,970	59,390	109,360

Last month's casualty total was the lowest since May, 1940. Of those killed, 2 were men, 1 was a woman, and 2 were children under 16.

AMERICAN SURVEY

Priorities in Labour

(From Our Washington Correspondent)

September 20th

A FEW weeks ago a 225-pound man was drafted. His comment was: "I heard they were scraping the bottom of the manpower barrel. Now it looks as though they've come for the barrel."

Until this fall, the manpower claims of industry, agriculture, extraction and the Services have been asserted in anticipation of shortage, on the grim assumption that only the Services could be sure of getting all they wanted. But by means of deferments in agriculture, extension of hours from 40 to 48 a week in sixty odd industrial centres, absorption of unemployed, use of school-age youth through the summer, and recruitment of women, it has until now been possible to avoid the situation where labour supply comes to determine the order in which war goods shall be produced, or even that some shall not be produced at all.

From now on, the story will be different. Unemployment is down to about 1,000,000, close to the limit of employability. Schools have reopened. While the passing of the peak in construction of camps, airfields, quartermaster depots in this country has made available a certain number of building trades workers, of whom many are well adapted to employment in shipyards and elsewhere, overall production for the war programme is not scheduled to reach a plateau for some months to come, and inductions into the armed Forces are continuing; schedules for the fiscal year 1943-44 envisaged an addition of some 4,000,000 persons to the armed Forces and munitions industries before next July. Yet the estimated civilian labour force for August, 1943, was 54.9 million, compared with 55.5 million in July and 56.2 million in August, 1942; and only 10,000 of the 600,000 drop between July and August was in agriculture. Since the late spring, the monthly reports of the chairman of the War Production Board have shown that the percentage increases in production anticipated for the latter half of 1943 have not been building up—in aircraft particularly; this has been closely related to manpower.

Various methods of meeting the situation are finding advocates. For a considerable period there has been talk of a National Service Act—the Wadsworth-Austin Bill is a specific result of this discussion. There is considerable feeling, however, that an overall approach through national legislation would have its drawbacks.

Local Supply and Replenishment

The case for local treatment of the problem is built up from a number of angles. First, a War Manpower Commission survey of areas where labour shortage is acute, where there is labour stringency or will be in six months, where stringency is expected after six months, and where no foreseeable shortage is in sight shows that practically all states, except the Pacific Coast, contain areas falling in each of these categories. With that exception, therefore, the problem appears to be one of location rather than quantity of personnel—towns like Scranton and Berwick in Pennsylvania have empty houses and unemployed workers, while the Philadelphia area has both housing and hiring problems of an acute order.

One view of the matter insists that if the housing problem were solved the hiring problem would be on the way to a solution—people are reluctant to move to areas where shelter, transportation, day care of children, service facilities generally, are rare to non-existent. Moreover, they contend, if progress were made on this line people would not only come to be hired, but would stay hired after they get there. With labour turnover as high as 100 per cent per year in some plants, and with absenteeism also cutting an imposing figure, investigation of local causes of this situation might add manpower without adding more people.

A second approach concentrates on management conditions in the plants. Much war production has been under-

taken on a cost-plus basis; padded payrolls have therefore been no deterrent to keep firms from hoarding labour. Consequently, distribution of workers according to actual need might discover considerable additional manpower in a given locality.

Then there are wage differentials. The fact that average hour earnings for all manufacturing at 94.4 cents contrast with 53.4 cents for laundries, 54.3 cents for general merchandising, 66.7 cents for retail food, has served to draw workers into the munitions industries. Over the country, this doubtless means a shift from less to more essential work, but in the congested munitions areas service industries are a necessary adjunct to war factories if absenteeism is to be cut. Moreover, within the war industries variations exist between plant and plant whose historical basis bears little relation to the relative importance of what is being made. Most graphic of these is the differential between pay at the Kaiser shipyard and the Boeing aircraft factory in Seattle. The two establishments are separated by only the width of a street—but their hourly rates differ by a broad margin.

A Labour Budget

The Baruch Report on West Coast Aircraft Manpower, dated August 19th, proposes use of a local approach in applying priorities to labour supply. Its labour budget plan would put labour on the list of considerations to be taken into special account, on an area basis, by the War Manpower Commission, the War Production Board and the Services, in planning armament schedules. Basic principles of the plan are:

1. A recognition that the problem is a local one and essentially not one that can be handled on a national basis.
2. On the labour supply side of the budget, a system of priorities rating the comparative labour needs of all employers in each critical labour community.
3. To operate these priorities, in each community a Labour Priorities Committee on which all Government agencies concerned sit.
4. The community itself should name the chairman of its Priorities Committee, a strong citizen who has won public confidence and whom both management and labour trust.
5. On the basis of the priorities laid down, the War Manpower Commission should direct the flow of labour to those plants whose products are most essential and whose labour needs are greatest, and in such a way as to stimulate the use of women workers; curtail the use of labour in activities least essential to the war; end hoarding of labour; make for more effective utilisation of labour in plants, and as a guide to draft deferments so that war production is not jeopardised by disruptive drawing of workers into the Army.
6. Employers retain the right to do their own hiring, but they must hire workers from the pool, referred to them by the War Manpower Commission on the basis of priorities.
7. Prompt action by the Priorities Committee, under the leadership of the community chairman, on all local problems affecting manpower, such as housing, transportation, the erection of day care shelters.
8. On the production side of the budget, prompt determination by the War Production Board and other procurement agencies of the priority for war of all products made in these areas.
9. A review of all production programmes on the West Coast and, where necessary, the shifting of contracts to bring production needs into balance with labour.
10. The curtailment of less essential activities.
11. A constant review of all new contracts involving any increase in employment in the area before they are let, as to whether labour is available. If labour is not, the contract should not be approved unless the procurement agencies can curtail other production demands proportionately so that the labour budget is kept in balance.

At the same time that available labour is budgeted and allocated, efforts to increase the total number of workers will go on, with particular emphasis on further employment

of women. In August, 1940, there were 10.8 million women employed in a total of 47.7 million employed persons; in August, 1943, there were 16.9 million women in a total of 53.9 million employed persons. The extent to which they were employed in manufacturing industries related to the war is shown by the table below:

WOMEN IN INDUSTRY		Proportion of Women Employed	
Industry		May, 1940	May, 1943
Total, all Industries below		14.6	27.2
Mining	1.2	1.7	
Contract construction	2.3	3.6	
Manufacturing	16.0	28.4	
Ordnance and accessories	16.3	26.2	
Guns	10.1	17.6	
Ammunition, except for small arms	26.6	34.2	
Tanks	5.0	12.0	
Explosives	15.7	18.2	
Small arms ammunition	37.1	46.0	
Firearms (calibre .60 and under)	15.3	33.3	
Food and kindred products	21.4	33.9	
Textile-mill products	44.6	48.7	
Apparel, and other finished products made from fabrics and similar materials	69.9	77.2	
Rubber products	26.9	39.3	
Leather and leather products	40.1	48.2	
Iron and steel and their products	7.8	15.4	
Aircraft and parts	10.5	32.8	
Ship and boat building and repairing	2.4	9.5	
Electrical equipment for industrial use	24.4	38.5	
Communication equipment & related products	40.1	58.0	
Machinery (except electrical)	9.4	19.3	
Scientific instruments	25.7	43.3	

Expansion of the number of women employed, by firms where such employment is practicable, is likely to be a condition of such firms being allotted more labour under the priorities system. This undoubtedly means considerable adaptation of present working hours to the needs of workers who run a home as well as hold a factory job.

American Notes

The Five Senators

The main, and unexceptionable, theme of the five globe-trotting Senators, now back at home, is the urgent need for a strong, clear, national policy for the United States in its dealings with other nations. It is their contention that the failure to develop and act on such a policy hampers American representatives abroad and gives other nations an unfair advantage in consolidating their political and economic interests. They protest, moreover, with an air of injured innocence, that their criticisms of foreign countries, especially Britain, are in reality not aimed at those countries at all, but at the Administration for not defending American rights more realistically and ruthlessly. Unfortunately, it is by no means certain that this is the main impression left on a public which has been bombarded by illustrations of British guile and is dis-

Government by Allegation

Many commentators have found much to be regretted in the incident of the five Senators. Perhaps the most unfortunate aspect of the whole affair was its pseudo-secrecy which gained a brighter limelight for the actors, apparently suppressed nothing of any sensational nature, and yet left the public with the feeling that no doubt even more horrid revelations were made in the closed session than ever found their way into the press. The *Herald-Tribune* points out that this is final proof of the impossibility of the detailed conduct of foreign relations by a deliberative assembly. The "political tinge" which the *Tribune* finds inescapable was certainly very evident. Although superficially bi-partisan, the senatorial trippers contained one Democrat, Chandler, who is the mouthpiece of the Pacific First group, and thus anti-Administration; and it also contained Senator Lodge, Republican, whose isolationist antecedents are well known. Neither of these has wasted his heaven-sent opportunity of attacking the Administration's

conduct of the war, hitherto its relatively strong point. The apt phrase "government by allegation" was coined by Walter Lippmann to characterise a tendency which he fears may be fatal in view of the extraordinarily complicated and extensive relations between Britain and the United States. Admitting that frictions are inevitable, he suggests that a suitable substitute for "*ex parte* statements like those of the Senators" would be the creation of a mixed judicial commission to sift complaints and insinuations in an orderly and responsible fashion. Mr Lippmann is certainly right in anticipating further tensions, particularly in view of the heightened political tension this year in the United States and the strengthening determination of the Senate to take a more active part in foreign relations. One advantage of a judicial commission over such replies as those of Mr Roosevelt at his conference would be to take the answers out of domestic politics to some extent. But it is as well not to be too optimistic. The most judicial denial, belated as it must be, can never entirely catch up with the original insinuation. The freedom of Senators to speak first and think later may well be a price of American collaboration.

Political Warfare

Three proposals now before Congress, carrying the President's recommendation, will, if passed, make historic changes in American policy toward the Chinese and toward two American possessions, the Philippines and Puerto Rico. To some extent the changes are of policy, and less so of practice; their importance is largely in the field of political warfare. The repeal of the Chinese Exclusion Laws, which have prohibited the entry of Orientals except for students and traders, would, by putting the Chinese on the same basis as other nationals, only admit about 100 a year, beside granting citizenship to Chinese residents, but in President Roosevelt's words it would

correct a historic mistake and silence the distorted propaganda of the Japanese. . . . Action by Congress now will be an earnest of our purpose to apply the good neighbour policy to our relations with other peoples.

The President's proposal to Congress to authorise him to advance the date of Philippine independence—at present fixed at July 4, 1946—as the war permits would accomplish the same end of rewarding a friend and depriving the Japanese of a propaganda weapon. There are complications, however, of two kinds. There is, first, the question of assur-

ing Philippine independence in a secure Pacific. Mr Roosevelt has therefore also asked authority to take steps to provide for the "mutual protection of the islands and the United States and the future maintenance of peace in the Pacific." There is also the thornier question of Philippine livelihood. The islands have in the past been developed to depend upon the American market; and the shadier side of some of the agitation for Philippine independence has been the desire of domestic producers—notably the beet-sugar farmers—to shut out Philippine products. It has looked, in the past, as though independence and starvation might go hand in hand. Congress is now asked to

make provisions for determining adjustments in the law to assist in making the Philippines economically secure.

It remains to be seen what inroads Filipino gallantry has made on the domestic sugar *bloc*. The third recommendation comes in the form of a report favouring self-government for Puerto Rico. This follows a report from Governor Tugwell that the United States was in danger of "suppressing an angry people" and keeping them "in humiliating suspense."

Shipping and Strategy

Estimates of a total shipping tonnage of over 50 million tons available to the United Nations have been submitted in a report by the Senate Committee on War Mobilisation. Pointing out that there has been a "windfall" of three million tons, owing to the drop in submarine sinkings and increased output, the report states that with the most efficient use of ships the despatch abroad of an American army of 5,000,000 can be achieved six months ahead of schedule and a decisive blow struck in Europe this year. In order to make the best possible use of every cubic foot of shipping space, the report urges that cargoes must be allocated more efficiently, and the system of dividing responsibility not only between nations, but between domestic agencies such as the American Army, Navy and War Shipping Administration, should be superseded by an inter-Allied shipping strategy board. One of the most useful aspects of the report is its insistence on the fact that shipping can be employed three times more efficiently in the shorter distances of the Atlantic than in the Pacific. There is a vast armada available, but while it is sufficient for mounting several limited offensives in one theatre, it will not stretch to more than one front. It is healthy to have these truths re-affirmed.

stationary and of which barely two-thirds are really settled. In fact, most of the administrative improvements have been due to British guidance and tutelage. Financially, too, Trans-Jordan has been from the beginning dependent on the British Treasury. In addition to a general subsidy, it is receiving a number of grants-in-aid for specific purposes—the maintenance of the Trans-Jordan Frontier Force; Trans-Jordan's share of the Ottoman public debt; the hydrographic survey of the country; the construction of the Trans-Jordan section of the Haifa-Baghdad road, and so on—and the sum total of these grants, which were made to enable Trans-Jordan "to cover legitimate expenditure which the territory was unable to meet with its unaided resources," has amounted during the years 1921-22 to 1941-42 to £P3.35 million, that is, to almost a third of the country's total expenditure.

These open subsidies do not, moreover, include the financial assistance which Trans-Jordan is receiving in many indirect ways. It has been given a disproportionately large share in Palestine's customs receipts and currency profits. The Trans-Jordan section of the Hejaz railway is administered and maintained by the Palestine Government, though it involves a regular deficit which has up to now accumulated to some £P300,000 to £P400,000. Palestine participates to the extent of five-sixths in the maintenance expenditure of the Trans-Jordan Frontier Force and has sole responsibility for paying the High Commissioner, whereas the cost of the British Resident at Amman and of his staff is now charged to Imperial funds. And though, admittedly, some items included in the Trans-Jordan budget have a common Imperial importance, it is beyond doubt that left to itself the country could not maintain even the local services.

The Palestinian Market

Nor is this dependence of a purely financial character. The increase of the Trans-Jordan wheat crop, from 51,000 tons on an average in 1930-32 to 122,000 tons on an average in 1937-39, would not have been possible but for the extraordinary growth of the population of Palestine, which provided an ever-expanding market—it now absorbs over 50,000 tons, against some 10,000 tons ten years ago. Other products of Trans-Jordan agriculture and fisheries (grapes, eggs, fish, sheep and goats, lentils, etc.) also find an excellent market in Palestine; the phosphate rock from the Roseifa deposit is being worked up at a factory near Tel-Aviv; Palestine altogether accounts for well over 90 per cent of Trans-Jordan's exports and for about a third of its imports. Moreover, large numbers of Trans-Jordanians are continually crossing the western border to find in Palestine seasonal or permanent employment as labourers in agriculture or in the towns.

As a result of the war, Trans-Jordan's seclusion and relative self-sufficiency have been further shattered, and its economic future will depend on its ability to exploit and develop its natural wealth. To this end, the most important step would be the utilisation of the country's water resources for intensification of agriculture and rural settlement. According to reliable estimates, it is feasible to irrigate, with an outlay of some £P500,000 to £P750,000, an additional area of 300,000 dunums, which would provide space enough for some 20,000 new settler families. But the capital necessary for this colonisation would have to be supplied from abroad, as well as the instructors and most of the prospective settlers.

Mexican Oil

[BY A CORRESPONDENT]

October 6th

THE United States State Department announced recently that an agreement for the final settlement in the US-Mexican oil dispute had been reached. It provides for the payment by Mexico of an additional \$20,137,700, which, together with the sums paid last year, raises the total compensation for the expropriated United States oil properties in Mexico to roughly \$29 million. Out of this total, the compensation proper amounts to \$23,996,000, while the remainder is accounted for by interest at the rate of 3 per cent from March 18, 1938, the date of the expropriation of the properties. Out of the final award, \$3,796,000 was handed over to the United States Government last week, while the remainder will be paid by Mexico in four equal annual instalments, the last instalment falling due on September 30, 1947.

Although cabled reports refer to the arrangement as "a new agreement," it should be pointed out that the "final settlement" represents no more than the putting into effect of the award made last year by a Joint United States-Mexican Commission. That Commission had valued the former properties of the five United States oil groups in Mexico at \$23,996,000, which compared with the original demands by the companies concerned of more than \$150 million and the original offer by the Mexican Government of less than \$15 million. The great difference between these two sums was due to the fact that the Mexican Government recognised only the surface installations as the properties of the foreign oil companies, while the companies found that, under the Mexican law at the time of the expropriation in March, 1938, they had a claim to be also compensated for the sub-soil oil reserves they had developed. The exchange of telegrams between President Roosevelt and President Camacho after the "Cook-Zevada Award" left no doubt, however, that the two Governments regarded the calculations of that Joint Commission as a just basis for a "final settlement" of the expropriation dispute. But the United States oil concerns were less satisfied, and in September, 1942, rejected the award as inadequate. The Cooke-Zevada scheme is based on an agreement under which the two parties release each other from all reciprocal claims, except those of the Mexican Government for taxes unpaid by the companies. It thus required the United States oil concerns to deliver all documents and titles referring to their former properties in Mexico before the compensation payments are handed over to them, and the final steps have still to be taken. After last week's formal agreement, however, it is unlikely that any new difficulties will arise, and the dispute, as far as it concerns the United States and Mexico, can be regarded as solved.

The position is different with regard to the expropriated British oil properties in Mexico. The Shell Trading and Transport Co., which represents the interests of the Mexican Eagle Oil Co., has from the beginning taken the view that it cannot agree with a settlement which is confined to the surface installations only. Now that a final settlement of the dispute between the United States and Mexico has been reached it is difficult to see how the British interests can

THE WORLD OVERSEAS

Trans-Jordan's Economy

[FROM OUR JERUSALEM CORRESPONDENT]

September 15th

ON the face of it, Trans-Jordan is now an independent country with all the paraphernalia of sovereignty. It has its own army and customs barriers, a Legislative Council, and, since a recent date, its own diplomatic representatives abroad. It has been recognised by the mandatory power and by all the neighbouring states, and even the initial

tension between the local population and the foreign Emir has been steadily dwindling during the twenty years of his reign. Moreover, the administration of the country must be credited with many notable achievements. Efficient control of the Bedouin tribes has practically put an end to raiding, and the new security has induced the villagers to improve their methods of harvesting and to increase their own flocks. A fiscal survey of the settled area has been completed, and land settlement operations, together with a registration of holdings and rights, are proceeding satisfactorily. The old system of tithes and other Turkish taxes has been superseded by new taxation on real property, graded according to the categories of land and to the yield of buildings; and a simple form of income tax on salaries has also been introduced. Educational and health services have been extended, and attempts are being made to encourage the settlement of nomads. The population of Amman, the residence of the Emir, has increased from 5,000 in 1915 to over 20,000, and the enhanced importance of the desert routes to Basra and to Iraq has helped it to obtain a flourishing overland trade. On the other hand, the country has been spared internal conflicts, for there is no industrial proletariat nor any racial differences. To many observers it looks indeed a model Arab state in the very heart of the turbulent area of the Middle East.

This opinion cannot, however, be accepted without some corrections. It should not be forgotten that Trans-Jordan is still the most primitive of the Middle Eastern countries, with a very sparse population—only 3.5 inhabitants per square kilometre—totalling some 300,000, which is almost

Finger-tip
CONTROL

To meet and beat post-war competition you will need business equipment that is as efficient as the methods you will have to employ. That is why the trend will be more than ever towards steel. Only ball-bearing steel can provide that finger-tip control of drawer and door which never intrudes between intention and action. Steel furniture is durable and strong, fire-resisting, vermin-proof, and keeps clean. And Sankey-Sheldon will show in their post-war programme that steel furniture can be beautiful as well with new contours, new colours and coverings to please the eye and touch.

be compensated on a basis more favourable than that accorded to the United States concerns.

The desire of the United States Government to settle its oil dispute with Mexico is not surprising. The dispute had long been felt as an obstacle to friendly relations between the two countries, and when the war made the United States dependent on supplies of strategic materials from Mexico, it became necessary to arrive at a final solution of the oil conflict. Mexico's entry into the war on the side of the United Nations, and the development of Mexico's resources with the direct assistance of United States capital, experts and equipment, created a favourable platform for such a settlement, and the two Governments were not slow to grasp the opportunity. A mixed Commission of economic experts was appointed to study the foundation for long-term co-operation. Its report, published early in July, 1943, and adopted by the two Governments, contained a reference to future relations. It says: "The days of exploitation or economic imperialism, whether by nations or by powerful private groups, are past, and no future Mexican or United States Governments will condone or permit their re-appearance." Consequently, only if Mexico sees an economic advantage in their readmittance can foreign oil companies expect to resume operations in Mexican oilfields. In this connection the oil law promulgated by Venezuela earlier this year (described in *The Economist* of May 29, 1943, page 691) may have an influence on the future oil policy of the Mexican Government.

Lack of capital and shortage of experts and equipment caused serious difficulties in Mexico's oil industry in the years following the expropriation of the foreign companies. The "Petrleos Mexicanos (known as Pemex), the Government operating company of the expropriated fields, lost huge sums in its trading operations between 1938 and 1941, and during most of that period was unable to pay even its tax obligations. Production, which had reached 46,907,000 barrels in 1937, the year prior to the expropriation of foreign companies, fell to 38,506,000 barrels in 1938, and never recovered its former rate. Last year, it did not exceed 32,955,000 barrels, but this may be largely explained by the smallness of exports resulting from the tanker shortage. A report on Mexican oil operations in the first five

years of Government control, published early last summer by Señor Efraín Buenrostro, general manager of Pemex, did not conceal the difficulties encountered since 1938. But the report claimed that the Mexican authorities had done what they could to improve the situation. New investments in the five-year period to March, 1943, were given at close on 145,500,000 pesos, of which the National Exchequer provided 60 million pesos. Helped by United States supplies of equipment since 1941, some 91 new oil wells have been sunk since 1938, of which 54 yielded oil. The refinery capacity has been increased from 120,000 barrels daily at the time of expropriation to 150,000 barrels daily early this year. The capacity of the pipe lines has been extended, and rail and road tank facilities, as well as oil storage facilities, have been improved. The known oil reserve this year is estimated at 750 million barrels, which is twenty times the annual average output of the last few years. Nevertheless, it seems that since 1938 no new sources have been located in Mexico, and that the technical equipment of the Mexican oil industry has deteriorated much in the past few years.

American Help

The need for war supplies and the desire to ease the strain on United States oil wells have induced the American Government to assist the rehabilitation of the Mexican oil industry. After the grant of priorities for supplies of oil industry equipment to Mexico since 1941, a United States Government Commission, known as the De Golyer Commission, made a thorough study of the Mexican oilfields in August and September, 1942. In May, 1943, officials of Pemex visited the United States to conclude negotiations for large American supplies of equipment, and in recent months huge Mexican contracts, said to exceed US \$50 million, have been placed in the United States on the basis of the De Golyer Commission's findings. These contracts include the equipment for a 100-octane aviation petrol refinery to be erected in Mexico City, as well as equipment for drilling the wells, and for the improvement and modernisation of the existing Mexican refineries. There can be no doubt that this rehabilitation programme, which includes the exploration of entirely new areas and the concentration of refining and storage centres at the places most conveniently situated for both the domestic market and for exports, will put the Mexican oil industry on a new basis. But it is the position of the international oil market after the war which will eventually decide whether the Mexican Government will continue to look after its own oil affairs or whether it will enter into some new arrangement with non-Mexican oil interests.

"Independent" Slovakia

[BY A CORRESPONDENT]

SLOVAKIA'S politicians have changed the tune of their political propaganda in this, the fifth, year of their country's formal independence. The Bratislava newspaper *Slovak* made this comment on the breakdown of Fascism:—

We see, after all, that Italy remains though Fascism has fallen. Similarly, we are inclined to think that Slovak liberty will, under any conditions, continue to adorn the political horizon of Europe.

The ideology of totalitarianism has been practically discarded by official spokesmen, and national independence has been adopted in its place. Indeed, a Swedish newspaper correspondent, commenting recently on the Slovakian situation, said that, whatever their political creed, all political leaders favour the idea of Slovakian political independence after the war. The Czechoslovakian Government has made it clear that the Slovak people themselves are to decide on the question of national autonomy, and it seems by no means unlikely that a majority will be found for the maintenance of some sort of national independence.

But Slovakian independence needs reinterpretation if it is to fit into a new democratic world order. Politically, Slovakian independence has meant, to all intents and purposes, a complete subservience to the Third Reich, coupled with an active chauvinism which has led to sporadic outbursts against Czechs and Jews and to a permanent tension with Hungary. Furthermore, the organisation of this small state on quasi-totalitarian lines has involved the building-up of a vast bureaucracy which, in the words of a Slovakian politician, would be sufficient for a country of eight times as many inhabitants; there exists one civil servant for every 44 persons—not counting the numerous

communal officials or the officials of the state party. The maintenance of such an apparatus is a very serious burden on a country which, economically, has been left almost unaided by its "protecting power," and, therefore, has had no alternative to the pursuit of autarky.

Forestry is the only really important industry of the country, and a recent survey of the Slovakian Institute for Business Research has clearly illustrated the fallacy of an autarkic food policy for Slovakia. The national deficiencies have been calculated as roughly 20 per cent in the case of cereals, potatoes, milk, sugar and most kinds of meat other than beef; only 14 per cent in the case of eggs and vegetables, but 24 per cent in the case of fruit, and hardly any foodstuff is normally produced which would meet the modest needs of the Slovakian people. The Institute makes it clear that "the lack of discipline of producers, dealers and consumers" makes the position worse in present circumstances. The official rations per head per week consist of about 14 ounces of meat of any description (of which, however, only half is usually available); 2 ounces of fats; 3 lb. of bread and flour; 6½ lb. of potatoes; 6 to 9 ounces of sugar (according to the locality); and 3 eggs. Rations for heavy workers are only slightly higher. Milk, butter and white bread are entirely reserved for priority consumers; while vegetables other than potatoes, fruit, poultry and game are only rationed by their exorbitant prices. Many people supplement their rations on the black market, which, according to some critics, is about as large in size as the controlled sector of trade; but, as real wages are estimated to have fallen by 30 per cent since the outbreak of war, it is doubtful whether an ordinary industrial worker can afford to buy many of the black market commodities.

Some show has been made with a recent agricultural reform programme, but the obstacles in its way are formidable, and even the Governor of the National Bank has admitted that it will be difficult even to maintain the present agricultural output in the near future. For the present year, the worst seems to have been avoided owing to what is described as a comparatively good harvest. The fodder shortage, which is the most urgent question in the agriculture to-day, is to be overcome by an increase in the area under cereals; but the peasants are reluctant to sell their produce on the official market at the fixed prices. Grain production, in general, is made particularly difficult by the fact that the countryside is parcelled into 17 million strips of land, and though a recent law forbids further partitions, no real immediate remedy has been provided for the land problem. There is, above all, a severe shortage of fertilisers, ploughs and all sorts of industrial products; and the rise of industrial prices has been considerably more pronounced than that of agricultural prices.

Industrial Programme

To correct this, the Government has embarked upon a policy of higher industrial output; 2,500 million crowns were invested in Slovakian industry between 1939 and 1942, which is rather more than the equivalent of the annual industrial output at the beginning of this period; and the index of industrial production was 121 for 1942, compared with 100 for 1939. The main industries favoured by the investment programme were the wood industry, which mainly works for export, and, to a lesser extent, the chemical and metal industries. The number of miners has increased by 50 per cent, but the output of most minerals, particularly of coal, is still inadequate. Considerable progress, in the face of great difficulties, seems to have been made with regard to the exploitation of the national water power. Finally, 15,000 workers are said to be employed on railway construction—to the great discomfort of Hungary, which considers this a strategical measure directed against itself.

But the process has its limitations. No further overall progress has been made during 1942 and 1943; the food industries are only employed to 50 per cent of their capacity, the leather and cement industries to about 70 per cent. More important still, the recent annual report of the Association of Slovakian Industry makes it clear that "the profitability of some branches of industry has dropped considerably," and the higher cost of production has largely contributed to the increase in the price level which has proved to be so detrimental to agricultural development. It is significant that, in spite of the important recent investments both in agriculture and industry, and in spite of an increase in the nominal national income from 8-9,000 million crowns in 1939 to 15-16,000 million crowns in 1942, this national income, if expressed in terms of real value, would be found to have decreased.

Shorter Notice

"The Trial of Mussolini." By "Cassius." Gollancz. 2s. 6d.

Bodily, Mussolini has, for the time being, been saved by Hitler; but this has not saved him from the spiritual rigours of an imaginary trial convened by a forceful and pseudonymous British clerk. The moral indictment of the Duce himself is easy. The difficult and complex characters in the trial are the men who appear in the imaginary witness-box, which for them changes almost into a dock as the proceedings reveal the full extent of connivance on which the Duce could count at the various stages of his criminal career. The men are the leading politicians and statesmen of British conservatism. They are made to make their statements about Mussolini and Fascism in words which they really used. The procedure is embarrassing but perhaps not unfair. But the list of witnesses-cum-defendants is quite certainly incomplete and one-sided; with the British Conservative Ministers, the convener of the trial might have brought into the witness-box, say, the Soviet Ambassador to Italy, who ostentatiously entertained Mussolini only a few days after the assassination of Matteotti. The coterie of "guilty men" is far less exclusive than the Carlton Club. This procedure would have put the problem of guilt in the right perspective, and replaced excessive hounding of guilty men by frank criticism of the guilty system. The closing speech of the judge does include that criticism as well as a brilliant plea for "morality in international affairs."

An announcement by THE NUFFIELD ORGANIZATION
A CORNERSTONE OF BRITAIN'S INDUSTRIAL STRUCTURE

Russia at War

Before the Conference

UNTIL lately the Soviet press kept complete silence about the approaching Three Power Conference in Moscow, though *War and the Working Classes*, the periodical famous for its polemical comments on foreign affairs, discussed at great length a number of issues directly or indirectly connected with the Conference. On October 13th, *Pravda* broke the silence and made it clear that, in the Soviet view, military and not political questions should occupy the Conference agenda.

Pravda's warning is in some contradiction to the barrage of purely political statements which have recently been made in Soviet newspapers, suggesting that the raising of political issues need not necessarily impede the United Nations' war effort.

The most specific comment has concerned the rôle and functions of the Algiers Committee, to which M. Vyshinsky has been appointed as Soviet delegate. It is stressed that the term "Mediterranean Commission," used in Britain, restricts the scope of the new body in a way which hardly corresponds with the Soviet view. Russian commentators prefer to speak of the "Military Political Commission" without adding any geographical qualifications. The Commission

will concentrate all its activities on further strengthening the collaboration between the belligerent Allied countries and all States struggling against Hitler Germany and its satellites, both in the period of the war and in the post-war period.

The Commission, it has been further stated, must be invested with very wide powers. *War and the Working Classes* leaves no doubt that in Moscow this is regarded as the *sine qua non*; and that Russia would object to any reduction of the status of the Commission to that of an advisory body. The paper goes on to say that both Soviet and British official statements have defined the "jurisdiction of the Commission" in a more or less identical way; the tendency to consider the Commission merely as an advisory body is, by implication, attributed by these Soviet commentators to the American State Department.

The Revolutionary Bogey

The tenor of these comments can be best described as showing eagerness to achieve the closest possible collaboration with the Allies, mixed with irritation at the obstacles which Russia is alleged to encounter. Now and then this mood finds the most unexpected and striking expression. A highly original article in *War and the Working Classes*, for instance, has reproached some Allied quarters with provoking social upheavals and revolutions in Europe. This argument was elaborated with great emphasis in a criticism of Mr Harry Hopkins' statement that victory over Germany and Japan will be won in 1945. The Russian critic states frankly why Russia cannot accept the prospect of a protracted war—because of the devastation of Russia's richest areas and the fact "that every day of war means the loss of many Soviet lives." He goes on to describe the risks incurred by the other Allies as well in case of an unduly protracted war, the risk of revolutionary processes which the Governments will not be able to control. War brings in its wake upheavals in defeated countries such as the collapse of Tsardom and of the Central European monarchies in 1917-18. The first World War was followed by social convulsions even in the victorious countries; more violent and eruptive convulsions threaten if this war lasts much longer.

The argument is, of course, put forward in support of the demand for a Second Front. Even so, its novelty in the columns of the Soviet press of all places, and its deeper significance, can hardly be missed. It would perhaps be paradoxical to say that the "Bolshevik bogey" has now been raised simultaneously in both Berlin and Moscow. But the argument is meant in all seriousness to convey a warning to the British and American circles whose political outlook is, in the Russian view, dominated largely by the "fear of revolution." Russia, the warning implies, may well be able to act as a force of law and order in Europe

if the war is brought to an early conclusion; she may have to wash her hands, however, if, by unduly prolonging the war, the Allies themselves let loose the revolution.

That this warning should have been uttered almost on the eve of the Moscow Conference is hardly a matter of chance. Russian diplomacy is most anxious to clear the ground of any ideological prejudices that may still be lingering; and to state its views and claims at the conference table in terms of a national policy which is based on Russian interests only. But at the same time, as the *Pravda* article shows, the issue of the Second Front continues to dominate the Soviet approach to all matters of foreign policy.

If the discussion in the Russian press can provide any clue to Russian policy, it may be claimed that the Soviet attitude has crystallised in a number of points. Russia seems to be ready to assume co-responsibility for Amgot, though not without reservations. What may be demanded is a partial revision of the principles on which Amgot has so far acted. The Amgot ban on political activities in the liberated areas was strongly criticised in Russia some time ago; recently, however, the criticisms have been quietened. M. Vyshinsky's task, it has been hinted, is to see that such happenings as the escape of Mussolini do not occur in the future. The Free German Committee has, so far, not been given any status suggesting that it is regarded by the Russians as a body equivalent to Amgot. The activities of the Committee have not transgressed the limits of propagandist expediency. Its appeals to the German people have carefully avoided any socially radical slogans; they have been addressed to the German officers' corps rather than to the rank and file of the German army; the official flags of the Free Germans in Moscow are, significantly enough, the old Imperial and not the Republican flags. And the propaganda of the Free Germans has been strikingly contradicted by the quasi-Vansittart utterances of many leading Russian personalities.

Pan-Slavism

The one trend which seems to be quite definitely crystallised is Pan-Slavism. This trend is reflected in the contrast between Russo-Czech and Russo-Polish relations, as well as in continuing Russian hostility towards any schemes of an eastern-central European federation. The victories in the Ukraine have served as the opportunity for a curious anti-Polish demonstration, connected with the institution in the Red Army of a new high order ranking next to the Orders of Suvorov and Kutuzov. The new order has been named after Bogdan Khmyelnitsky, the Polish nobleman, who three hundred years ago led the Ukrainian Cossacks in revolt against Polish rule, and brought about the union of the Ukraine and Russia. In the peculiar east-European atmosphere, in which historic symbols and reminiscences weigh heavily on practical politics, the institution of the Order of Khmyelnitsky possesses the eloquence of a highly political act. It signifies a further stiffening of the Russian attitude in the frontier feud with the Poles, as well as an appeal to a very strong Ukrainian tradition. The i's have been further dotted by the *Pravda* statement that—

everyone ought to know that the borders of the Soviet Union can no more be a question of discussion than can the frontiers of the United States or the status of California.

In the old Tsarist days the Pan-Slavist policy was mainly directed against the Habsburg monarchy. The Czechs were chief adherents of Pan-Slavism among the western Slavs, while the Poles—oppressed by Tsardom—were its principal opponents. Here, too, the traditional pattern reasserts itself now. Schemes for eastern and central European federations are regarded in Moscow merely as a new version of the Habsburg monarchy, with its centre of gravity in Warsaw instead of Vienna. And again in harmony with tradition, the Russian sympathy for the Czechs has now been strongly voiced in the comments of the Russian press on the postponement of President Benes' visit to Moscow ("because of objections raised by the British Government"). The old shadow of Pan-Slavism will fall on the agenda of the Three Power Conference as it used to fall on the agenda of so many diplomatic gatherings in the course of the nineteenth century.

THE BUSINESS WORLD

World Capital Bank

TO the blue-prints for international clearing and exchange stabilisation has been added the draft for a United Nations Bank for reconstruction and development. This was published in Washington last week-end—not without the prompting of the usual unauthorised leakages in the London press—and is the work of United States Treasury experts headed again by Mr Harry D. White. It was known that the ideas of certain British Treasury experts had been moving in the same direction, and the first reaction has been one of relief that, on this occasion, the two camps have avoided the mistake of rushing in with separate versions. This should safeguard discussions of this particular aspect of post-war financial reconstruction from the barren and needless recriminations that have handicapped efforts to reconcile the Keynes and White currency schemes. The Keynes scheme clearly envisaged the setting up of some institution for providing medium and long-term capital assistance to countries whose economic position needed such help from other nations. The Clearing Union proposals were regarded as one leg of a financial reconstruction tripod, the others being a Board for International Investment, with which the Union would be linked, and an international commodity control to keep prices steady and maintain buffer stocks and "ever normal granaries." The British delegation to the Hot Springs Conference elaborated the first draft of a commodity stabilisation scheme.

The United Nations Bank scheme closely follows the pattern of the US Treasury's Stabilisation Fund scheme. It is essentially a lawyer's draft, going into minute details of capitalisation, management, voting rights, permissible business, conditions of membership and the like. This concern with detail does not, however, obscure the vision of fundamental economic needs which the bank is expected to satisfy. The motif running through the draft plan and its explanatory memorandum is that the bank is not intended to displace private capital; it will only intervene in schemes that lie outside the scope of private investment or where such investment would only be made at prohibitive cost. Wherever possible, the bank would collaborate with private investment and guarantee private loans in preference to granting direct facilities.

The objectives of the bank are to provide capital for the economic reconstruction of member countries; to strengthen their monetary and credit structures by redistributing the world gold supply; to help in the task of stabilising prices of essential raw materials; to eliminate the danger of world-wide crises of financial origin; and "to raise the productivity and hence the standard of living of the peoples of the member countries." Membership is to be opened to countries which participate in the Stabilisation Fund scheme and are at peace with other member countries. The bank is to have a capital of \$10,000 million subscribed by member countries according to an appropriate formula. An initial payment of 20 per cent of its quota is to be made by each member, partly in gold and partly in its local currency. The proportion to be paid in gold will be fixed in accordance with a schedule which takes into account the adequacy of the gold holdings of each member country, but will in no case exceed 20 per cent of the amount payable. Further calls on the issued capital may be made as and when the bank requires additional funds for its operations, but in no case will more than 20 per cent of the capital be called up in any one year. It is provided that the local currencies, acquired by the bank through the capital subscriptions of member countries, must be repurchased by these countries against payment in gold at the rate of 2 per cent per annum.

The business of the bank will be conducted exclusively with Governments or their agencies. In passing judgment on applications to guarantee, participate in, or make, a loan the bank is to consider, not merely the soundness of the investment project which the loan is intended to finance, but also the budgetary position of the Government con-

cerned and the prospective balance of payments of the borrowing country. The bank may guarantee loans made with private capital to any member Government, and through that Government to any of its political subdivisions and to business enterprises in the member country. All loans that the bank guarantees or makes must fulfil the following conditions: payment of interest and principal must be fully guaranteed by the Government of the borrowing member country; the project must have been investigated by a competent committee; the terms of the loan must be reasonable; on guaranteed loans, the bank must be compensated for the risk it assumes. It is stipulated that the bank will impose no conditions on the country in which the proceeds of its loans are to be spent. No loan may be made in the currency of any country without its approval.

This, in very brief summary, is the draft proposal put forward by the US Treasury as a basis for discussion with technical experts of other countries. The first query which this plan raises is whether the admirable objectives which the bank is designed to serve can best be achieved by erecting this elaborate piece of mechanism, or whether better results might not be achieved by starting more modestly and perhaps more realistically with certain specific loan operations—to China, for example—and by building up the structure of the new organisation from the experience thus gained. The contrast between this kind of doubt and the less sceptical approach of American experts was

NEWS of WHITE HORSE

Supplies of White Horse were growing old when this war was young

If you have wondered how it is that you can still get White Horse Whisky from time to time, and how it is that the quality and flavour of this famous whisky were never better than to-day in this fifth year of the war, here is the answer in one word . . . age.

All the flavour, fullness and smoothness of the White Horse you have known in the past is in the White Horse you may buy to-day. For to-day's White Horse is itself a whisky of the past. In the early days of the war it was already growing old. It has been ageing ever since.

It was the stocks of maturing whisky, laid down in years gone by with a prudent eye on the future, which provided the great blend that is White Horse to-day. And our unrelaxing, provident care of the whisky still maturing is your assurance that this famous Scotch will remain as always — whisky fine as a fine liqueur.

FIGHTING AND THINKING

"Fighting now is winning the war
Thinking now can win the peace.

To-day millions of Service men are fighting for 'a better world to live in'. Other millions of individuals are performing miracles of production through the united efforts of management and wage-earners—all of one mind—for 'an unconditional surrender'.

To-morrow these millions will be permanently employed in peacetime pursuits provided they—all of one mind—dictate sound peace terms calling for sustained prosperity.

If the world is to prosper, there must be the same cohesion among the United Nations during the transition period and thereafter as now exists during the world-wide conflict. Internal stability here and in other nations can be gained and maintained only by sustained industrial production and by economic interdependence.

The people of this country, in common with the people of other lands, will prosper materially and spiritually when this war is ended but only if insistence, world-wide in scope, is now voiced for a JUST AND DURABLE PEACE."

★ ★ ★

The above statement has been issued by the International Nickel Company of Canada and is widely published in Canada and the U.S.A.

We reproduce the statement here because we believe that all engaged in industry in Britain will approve its principles and desire to collaborate with all the United Nations in formulating plans for "a just and durable peace."

illustrated in the respective character of the Keynes and White currency plans; it is the contrast between the instinctive attitude to such issues of a country with a written constitution and of one where the constitution has just grown up. But though there are differences about ways and means, however important they may be, they cannot do away with the fact that the broad objectives of the British and American experts concerned with this problem are identical. It is recognised in both Treasuries that if a reasonably effective job is to be made of the task of economic reconstruction at the end of this war, a great deal of capital will have to be made available from one group of countries to another. And it will have to be provided in circumstances in which the normal mechanism of private investment will be quite incapable of facing the task involved.

In the immediate post-war period the provision of capital—that is, of new machine tools, of herds of cattle, of seeds, of the bare minimum of raw materials required to restore the economic life of devastated countries to even the most modest rhythm—will have to be part and parcel of a vast relief programme; it will be an extension of mutual aid. Thereafter private foreign investment may start to get into its stride again, particularly in the United States; but after the shocks of defaults, currency depreciations and exchange controls during the last few years, private investment cannot be expected to provide all the facilities for which world rehabilitation will call. Official intervention in one form or another is inevitable and essential, especially as in most countries the exchange position will demand a continuance of control over international capital movements after the war. International capital movements or, in their real terms, the international trade in capital goods, will have to get under way again as a necessary preliminary to the successful operation of any exchange stabilisation and clearing scheme. The rehabilitation of poor and impoverished countries will in any case demand the provision of capital on much cheaper terms than those which could reasonably be demanded of private capital, given the risk involved by such investment.

The problem is to bring home to the people of capital-granting countries—which, in large measure, means the United States—that to make loans on these terms will probably return far greater dividends than the modest interest rates charged. It is a political as much as a financial problem that has to be tackled, and it is when viewing the bank scheme from this angle that one may doubt whether the US experts have chosen the best way of presenting the case to their public. The effect of this ambitious and grandiose design may be to frighten American opinion, which in these matters is all too readily convinced that their country is being made the world's milch cow. Despite the ambition of the design, the US Treasury proposals are, in fact, severely limited in their scope. These limitations are set by the fact that the bank would merely supplement private investment. It is no part of a comprehensive world investment plan. The political framework into which such a plan could be fitted has not yet been designed. Nor is the world capital bank to be regarded as the instrument for setting in motion the movements of funds required to restore equilibrium in balances of payments. That must be the function of the Clearing Union or Stabilisation Fund, in whose proposed organisations are to be found means for corrective action which would be wholly lacking to the capital bank. In itself the bank plan is neutral; it will have no positive investment policy, no plan for repayments (a crucial point when the automatically favourable nineteenth-century situation of rising populations and rising demand in creditor countries for debtors' products no longer exists). It is one piece of a machine; and judgment must wait until the whole machine has been set up and its uses defined.

Meanwhile, the sense of urgency with which world investment projects should be viewed is being heightened by the dramatic progress of the war. Before many months have gone, the Allied Powers may have to tackle, not simply a blue print of a world capital bank, but the specific tasks of rehabilitating countries like Poland, Greece and Czechoslovakia—countries whose capital equipment has been largely destroyed, whose currencies and banking systems will be virtually bankrupt. If the experts are still debating the voting powers of a new world bank when that stark situation stares them in the face, and if the particular approach chosen to this problem proves to have impeded the making of the plans that will then be needed on the spot, it will be little short of disastrous. Even the best of intentions are not enough when great emergencies press.

Business Notes

Gold and Capital Bank Plan

Although the US Treasury proposals for the establishment of a world capital bank are not directly concerned with questions of currency—which are the province of the Stabilisation Fund scheme—there are many points where the scheme touches on this problem and, in particular, on the position of gold. In the first place, the claims of gold in the post-war currency world are strengthened by the provisions which require part of the capital subscriptions to be made in gold, and for the whole of the capital to be ultimately contributed in that metal. Even more important is the specific mention in an explanatory memorandum to the plan of loans made at exceptionally low rates of interest—1 per cent is mentioned—to finance the redistribution of the world's monetary gold reserves. Such loans are justified on the ground that they would promote monetary stability in the borrowing and gold-importing country, and that they would, thus, indirectly promote the flow of private capital. The memorandum considers the position of gold as a monetary standard and defends the metal against the claims which have been made for a new international monetary unit. In particular, it contests the view that gold is too expensive a standard to use.

It may be possible to develop a satisfactory international medium of exchange that costs less to produce than more gold, but certainly not significantly less than gold already in monetary stock.

The memorandum, thus, makes a significant distinction between gold already in existence and gold yet to be mined. The first has already been paid for and is inexpensive to use, since even the cost of its shipment from one country to another can be avoided by ear-marking. But, argues the US Treasury memorandum,

the situation is quite different with respect to further additions to the gold stock—and more complex. Obviously there is a real cost as well as monetary cost involved in mining and refining gold. In so far as the gold would not be produced had it only commodity value, and in so far as the labour and material used in gold mining would be used for some other purpose, it is true that additions to our monetary gold stock are expensive. The solution to that, however, is simple—namely just limit or control the additions of newly mined gold to the world's monetary stock. This is not the place to discuss the method; suffice it to say it is entirely feasible should it ever be deemed desirable.

The gold producing interests have hitherto been content to regard the prospects for their metal as being safe in the fact that, while the United States holds the bulk of the world's stock, the British Empire produces by far the greater part of the world's output. The line taken by Mr Harry White's memorandum suggests that these two gold partners may not present so unbroken a front as had been assumed.

Brown on Housing

The address to the National Housing and Town Planning Conference last Sunday, given by Mr Ernest Brown, Minister of Health, was in the nature of a progress report on the Government's policy for the alleviation of housing shortages. More than 2,500,000 houses damaged during air raids had been given first-aid repairs and of these more than one million had had extended repairs. He informed his audience that a Cabinet Committee had approved a scheme whereby available labour and materials are to be concentrated on essential housing work; the decision about the work to be carried out and about priorities will rest with the local authorities. Mr Brown did not comment on the extent to which local housing shortages have been alleviated by the better distribution of available accommodation. Last August local authorities were given power to requisition houses, either furnished or unfurnished, "for the purpose of improving the conditions of families at present inadequately housed." The concentration of available building resources on housing work is a step forward, for, in addition to their requisitioning powers, local authorities will now have the means for repairing, converting and adapting existing houses, for completing half-finished houses and, if necessary, for building new ones. Shortages are still acute; they can only be overcome by making better use of and by

increasing the supply of available accommodation. The billeting of transferred war workers with families is a different but not a bit less important problem. War production depends entirely on the ability to recruit, move, house and keep the workers needed to maintain the staffs of local factories week by week, despite all wastages. The Government has relied mainly on voluntary billeting; in some cases compulsion has been adopted, but the efficacy of the measures taken, not unnaturally, varies from district to district. Mr Brown said that during the past few months local authorities had drawn up preliminary programmes for the construction of new houses which could be carried out quickly when the resources become available; so far these programmes comprise a total of 150,000 houses. In his view, it should be possible to build the three to four million houses needed to give every family a separate house during the first 10 or 12 years of peace, but if the programme is not to be jeopardised, costs must be reduced. Mr Brown was right in drawing attention to costs; a large proportion of the war-time rise in costs is due to special circumstances, and there is no technical reason, despite the pessimism of very many experts and the extraordinary revelations that have been made about the low speed of wartime bricklaying, why productivity in building could not be increased after the war.

★ ★ ★

Post-War Shipping

Rear-Admiral Vickery, of the United States Maritime Commission, and other American spokesmen have recently stated in forthright terms that America means to have a large merchant shipping fleet after the war. Estimates of the size of merchant fleet America should aim to maintain after the war vary. The yardstick frequently mentioned is the tonnage needed to carry half of America's sea-borne trade. On the basis of pre-war trade, this would mean an increase of about two-fifths over America's 1939 tonnage of 9,000,000 gross tons, which was then equivalent to about half the British pre-war tonnage. It is a matter entirely for Americans to decide whether the United States is to "become a maritime nation and to stay one"; if it involves an out-of-pocket cost, it will be they who will have to pay it. The British Government and the British shipping industry are not only willing, but anxious, to collaborate with the United States in a policy that would ensure equal opportunity for all. One aspect of shipping on which a new international agreement is desirable is the conditions in which merchant seamen have to perform their job. It has been said that one reason why America has been unable to recover her nineteenth-century position as a maritime nation is that American shipowners are required by law to provide better conditions than Great Britain. It is, of course, quite true, as *The Economist* has pointed out in the past, that

Britain has lagged behind the best practice, and, especially, behind Scandinavian practice. Steps were being taken before the war to improve these conditions and to eliminate the "coffin ships"; one of the difficulties was that old ships could not be sufficiently improved. After this war there will be comparatively few of the old ships left, and it should be possible to introduce substantial improvements and a measure of uniformity. It should not be too difficult to conclude an international agreement on adequate minimum standards for all shipowning countries. But the provision of amenities for seamen is only one item in the cost of operating a ship. There are wages and salaries, which are related to the different level of earnings in different countries. And there is the cost of stores and the capital cost of the vessel, all of which are bound to vary. Last, but not least, there are differences in efficiency, which vary from owner to owner, as well as from country to country. It is comparative efficiency, in fact, not challenging speeches, that will decide how large a mercantile marine each nation can keep without crippling charges upon its exchequer. British owners have stated frequently that they are not afraid of competition, provided there is no discrimination against them. A race in subsidies after the war would be as regrettable—and as costly—in shipping as in civil aviation or any other industry; and the heaviest cost would fall upon the least efficient shipping nation.

Air Transport and Shipowners

A statement issued by the General Council of British Shipping towards the end of last week makes it clear that the shipping industry is considering preliminary plans for using its powers to enter the field of air transport after the war, provided that conditions permit of such a course. The conditions in view are, presumably, the amount of subsidy granted to any competitor. The statement shows that general policy will be the concern of the Council, which will confer with the Government about the conditions in which the participation of the shipping industry would be feasible. So far the discussions can scarcely be said to have begun, but the authorities appear to have undertaken not to reach any final decision about the future of air transport without giving the shipping concerns an opportunity to state their case. This somewhat strengthens the presumption that some place may in fact be found for them, but there are no indications, as yet, what that place will be. Pending any further development on that side the Council has

made arrangements for those who desire immediately to take part in air transport to work out their proposals through the appropriate organisations in each category. The Council will remain charged with the duty of submitting to the Government the proposals formulated by the different groups, or sections, of the industry concerned, and pressing for the right of shipowners, as a whole, to participate in the development of air transport.

That presents a clear picture of the position as it is to date. It is, perhaps, reasonable to assume that the "appropriate organisations" are the various shipping conferences, or similar bodies if these are not already in existence. While there is nothing in the actual statement of the Council to indicate the scope of the proposed activities of the shipping companies, the fact that the conference is

commonly regarded as the proper body to deal with the problem suggests that the air services in view would cover areas comparable in extent to those with which the conferences have dealt in the past, that is to say, a very extended network of routes. But it is possible that, in some cases, other organisations with a less extensive scope are what the Council has in mind.

On Nationalisation of Transport

In his inaugural lecture as president of the Institute of Transport, Sir William Wood, president of the LMS Railway, took objection to the views of those who hold, without the necessary analysis of the facts, that the nationalisation of transport would automatically ensure the most efficient service.

I should have thought that before there was agreement among politicians there would have been reasoned consideration in a practical way of the merits or demerits of the existing transport facilities from the point of view of the public using them. Surely the proper course is to consider the merits of what has been provided by private enterprise, to inquire whether it has fallen short of public needs and, if so, in what ways, and then whether the responsibility rests with its owners or with Parliament.

Sir William's objection is sound and the procedure he suggests is logical. There is nothing to be said for nationalisation for the sake of nationalisation; there is everything to be said for private enterprise where it is most appropriate, and for public enterprise where it provides the most efficient service to the consumer. But when Sir William adds that he cannot see present transport standards being maintained under state ownership, he expresses a personal opinion which the layman can neither confirm nor deny. In view of the controversy about the future of inland transport, the time has surely come for a thorough examination of the facts by an independent committee which can give full weight to the argument of the providers and consumers of transport, and of the technical experts.

Underwriting and Stagging

In view of the complete suspension of new issues by the normal peacetime process of advertisement, it is not surprising that little has been said of the need for revision of the law on points arising out of pre-war practice. There are, however, points on which action is necessary. Apart from additional requirements about the information to be included in a prospectus or offer for sale, these fall under two heads; provisions as to underwriters and regulations affecting subscribers. Contrary to what appears to be the legal attitude towards underwriting, financial quarters regard it as, essentially, an insurance against incalculable risks arising from matters over which the concern raising the money and the issuing house have no control. It is generally accepted that every issue should be underwritten, but it is equally accepted that all underwriters must be capable of fulfilling their contract. As the law stands at present, there is no obligation on the principal underwriters to accept responsibility for those to whom they sub-let part of their contract. The spreading of the risk is essential, but the existing law makes for irresponsibility on the part of the main underwriter in the choice of sub-underwriters, and so tends to vitiate the whole object of the underwriting contract. The law ought, therefore, to be amended so that, in the event of default by sub-underwriters, the principal underwriters remain liable. The second point concerns mainly stagging, and the insurance that, so far as may be, all investors have a reasonable chance to lodge applications. There can be no doubt that the whole business of issue is made vastly more complicated by the practice of subscribers putting in a large number of applications in different names, and by the practice of entering applications with the fullest intention of withdrawing them if the issue does not seem to be going well, or if there is any adverse development, that is to say by stagging. A number of brokers refuse to allow their clients to withdraw applications, but the practice is still general. The law should insist that all applications should be irrevocable. This would not only get over the stagging difficulty, it would also greatly reduce the number of applications lodged by any one applicant, since to apply for more than it was intended to take would be very dangerous if the application could not be revoked.

Progress at Montreal

A number of despatches from Canada suggest that considerable progress is, at last, being made towards the resolution of the differences between the Executive Committee of the City of Montreal and the bondholders on both sides of the Atlantic. Two points emerge from these statements, both of which are encouraging. First, it now seems probable that different action will be adopted for the British loans from that advocated for the numerous Canadian and American issues. Insofar as the latter were sold in small parcels and enjoy scarcely any market, a measure consolidating them into a marketable security would be of real advantage to the holders. No such considerations apply to the British issues. Further, it is far from certain that the terms of the issues on the other side were so carefully thought out to provide full protection as were those which had to pass the scrutiny of the London new issue market. Even more important for the British bondholder is the second point. It is now suggested that Messrs J. O. Asselin, chairman of the executive committee, and G. C. Marler, vice-chairman, have agreed on a scheme which closely resembles the plan of the London Committee. As these two gentlemen have been advocating divergent plans ever since their return to Canada over a year ago, this is good news indeed. If, as is reported, the principal difference between their new suggestions and those of the London Committee is that the Montreal officials both reject the proposal for control of the executive by bondholders' representatives during a period of rehabilitation, it is very probable that their alternative will meet with acceptance here. The London Committee was, it is believed, not unanimous on this point. Sound finance is the one certain guarantee for the future value of the bonds and the peace of the bondholder. But, whether sound finance can be imposed on a committee which does not believe firmly in it—and which is in any case subjected to divergent political forces—is more than doubtful. Certainly it is very difficult to believe that pressure could for long be successfully exerted by representatives of overseas bondholders. The best hope is that Canadian provincial and municipal finance will be improved, and that, after this unfortunate experience, Montreal may take a lead. The real alternative is a surrender of sovereignty in this matter to the Dominion Government, as happened through the Loan Council for the Australian states.

£1,000 Million of TDRs

The clearing bank statements for September, which appear on pages 536 and 538, are chiefly notable for their revelation of the increase in the banks' Treasury deposit receipt holding. This item has risen by £88 million and thus crosses the £1,000 million for the first time. The latest total for this item is £1,044,500,000, at which level it is beginning to challenge investments for first place in the ranking of bank assets. Investments last month fell by £2,320,000 to £1,160,104,000. This item has been comparatively stable for the past three months and will, presumably, maintain that stability until disturbed early in 1944 by the next national savings campaign. If it is assumed that TDRs continue to expand over the next three months at the rate maintained over the corresponding period of last year, they should exceed the total of investments by the end of the year. Bills discounted have fallen by £12,814,000 over the month and at their latest total, £208,739,000, are £67,765,000 below the level at which they stood a year previously. This comparison underlines the need for the expansion in the weekly tender for Treasury bills which has just begun. Money at call and short notice has fallen by £7,686,000 compared with August, but, at £148,064,000, is still £21,305,000 above the level of September, 1942. On this evidence, the banks are financing a larger holding of bills held by the discount market, while allowing their own bill portfolio to fall. The additional facilities given to the discount market are in part a corollary of the increase in the aggregate capital of the market over the past two months, but in addition to this explanation there seems to be a conscious policy on the part of the banks to keep a larger part of their "quick" assets in short loans at the expense of their bill portfolio. Advances, at £733,294,000, show an increase of £1,714,000 on the month—too small a movement to suggest that the long term fall in this item has yet been halted. The net effect of these changes in assets has been to raise deposits by £67,028,000 to £3,737,036,000, a new high record in British banking history.

Anglo-Italian Payments

A Treasury Order has been issued, cancelling previous instructions regulating payments from this country to Italy. Before the war a payments agreement had been negotiated between the two countries. This set up an Anglo-Italian clearing office through which, by virtue of a Treasury Order, all payments from the United Kingdom for imports from Italy were compulsorily canalised. When war broke out between Italy and the United Kingdom all payments between the two countries ceased, but debts from this country left outstanding on the outbreak of war still had to be settled through the clearing office. The only difference made by the war was that the clearing office, instead of holding sterling paid into it for account of the Italian creditors, began to hold it for account of the custodian for enemy property. Now that the possibility of trade between Britain and Italy has been restored, it has been thought desirable to make a complete break with the previous payments system. The recent Treasury Order, thus, stipulates that payment for goods imported after October 8, 1943, is not to be made through the Anglo-Italian clearing. For the time being such trade will be handled exclusively by the military authorities, or by a Government department, and a special method of payment is being arranged. The clearing office remains the channel through which debts arising before October 8th must be settled.

Bombay Bullion Prices

The rise in Bombay gold and silver prices has again assumed spectacular proportions this week. On Thursday the quotation for gold was Rs. 82/14 per tola and for silver Rs. 127/15 per 100 tolas, as compared with prices of Rs. 78 and Rs. 124/14 respectively a week previously. The recovery in bullion prices has been making steady headway from the lowest points touched towards the end of August, when the market was at its weakest, following the ban on forward and option dealings and on loans secured by bullion. These restrictions on the market caused a substantial amount of selling, representing the liquidation of outstanding bull positions. This selling was,

however, gradually absorbed, and the subsequent recovery gains in significance from the fact that it has been built up on the basis of genuine cash buying. This fact should be borne in mind when comparing the highest prices touched this week with the all-time records created last May. In that month silver touched Rs. 138/3, but this price was underpinned by a considerable speculative position. The appreciable recovery in bullion prices from the lowest points reached after the Government's anti-speculation campaign emphasises once again how impossible it is to subdue and suppress the symptoms of monetary inflation by forbidding speculation and other similar devices. The persistent rise in the price of gold also suggests that the official sales of the metal designed to mop up redundant purchasing power can as yet have attained only modest proportions.

Disposal of Surpluses

One of the errors of 25 years ago that should be avoided after this war is to allow speculators to take a hand in the disposal of surplus materials and machinery. Such stocks, if they have to be liquidated, should be liquidated by an orderly process over a period, and not "thrown on to the market." There are indications that the Government is fully alive to this problem, and is making the necessary arrangements. For example, the Board of Trade recently agreed to the formation by wholesale textile distributors of a company for the purpose of acquiring from Government departments, and distributing, new textiles and clothing which may become surplus to their needs. This company, the Surplus Textiles Corporation, Ltd., will have the task of ensuring that surpluses are equitably allocated to firms which normally trade in the type of goods concerned, and that they are distributed as widely as possible among retailers. So long as the materials available for disposal by the Government are scarce, the need is for their equitable distribution at reasonable prices. But there may be other materials, such as machinery, whose disposal may have to be spread over a long period after the war, if it is not to dislocate the industries that are producing them. Clearly, the method of disposal of the different types of surpluses must be that which is most appropriate to each.

Diamonds Once More

The past few days have witnessed a sudden transfer from some of the more speculative Orange Free State mining ventures into diamond shares. No explanation of profit taking in the former is necessary, but the position with regard to diamond shares appears to be complex. Informed opinion favours the view that diamond shares will benefit from the continuance of the war, both because it reduces the outlets for luxury expenditure and because it keeps up the demand for industrial diamonds. It is typical of the market outlook that Russia's successes are ignored and the hold-up of the British and American forces

in Italy is regarded as a bull point for diamonds. Further, the present rally is associated with talk of final payments, which are likely to be large. A final point is the fact that there is an exceptionally heavy demand for gem stones at the present time. If this is due, as is asserted, to the report that the USA is to put a 30 per cent luxury tax on jewellery, that would explain a rush for diamonds, but it is surely only in the shortest possible run that it is a stimulus to the demand. A rise of 30 per cent in cost to the final buyer will tend to reduce demand. So it may suggest a cut in supply as an alternative to a lower net. There would appear, however, every reason why such a tax should be imposed, for it is clearly desirable to reduce such outlets and to make those who indulge in such expenditure contribute to the finance of the war. In the case of diamonds, it appears that there may be a definite, further reason for imposing such a tax. At present it is certain that the trend of demand for gem stones is upward. It is also the case that America has complained of shortage of industrial diamonds. America has been importing uncut gem stones. If these are, in fact, cut and used for jewellery, America might attempt to switch some of its own diamond cutters from gem to industrial work, on the assumption that this type of skill is not so highly specific as to make such transfers useless. If this were done the supply of gem stones might decline.

"Settling-in" Grants

On October 11th, the Ministry of Labour introduced a new scheme of "settling-in" grants for women and girls who have been transferred to industrial work beyond daily travelling distance of their homes. During the first week in the new area, the grant will amount to 25s.; during the second week, 20s.; during the third week, 15s.; and during the fourth week, 10s. Previously, a transferred worker had received 10s. on her arrival and 14s. 6d. at the end of the first week, so that the new scheme means an addition of 45s. 6d., spread over four weeks. The increase should be of material assistance in easing the problems involved in removal from one area to another and in adjustment to new surroundings. The changes in the production programme are entailing the transference of mobile labour to an increasing extent, and the Ministry's scheme is, therefore, very much to be welcomed. It does not, of course, do anything to compensate the worker for any financial loss which might be incurred as the result of change of employment. In practice, this is working the other way. Labour is being transferred to higher paid work in aircraft production, so that complaints on this score are not likely to arise.

Developing South America

The suggestion of the Petroleum Press Service, in its monthly bulletin, that after the war South American Governments will indulge in an aggressive drive to secure foreign capital for the development of oil resources, is a matter which should interest all investors. There are few parts of the world in which British investments have, over an extended period, suffered so heavy a fall in value as in the South American republics, and it is commonly agreed that a part of this decline in value is due to unwillingness of the borrower to give a fair deal to foreign capital. While the opening up of new enterprises with foreign capital and the lending of money to South American authorities cannot be made dependent upon such treatment as will render old enterprises profitable, it is difficult to imagine a situation in which there is a complete divorce between the attitude of the country seeking finance towards new lenders and towards those whose money is already sunk in development of the country's resources. Apart from the fact that the two sets of investors will overlap, no adviser on investment could ignore past experience, however favourable the new offer might appear. While the bulletin restricted its comments to the development of oil, most South American countries, and notably Brazil, will certainly require large sums for general development, unless their nationals are satisfied to keep down their standard of living and develop their resources solely out of savings on the Russian model. How far they realise the implications of the need for new capital from outside and are prepared to encourage it, will be shown as much by the plans for the treatment of old investors as by the terms which they offer to new. In this connection, some encouragement may be extracted from the recent increase in charges permitted to the Leopoldina Railway. More severe tests will be the outcome of the

(Continued on page 535)

THE SCIENTIFIC PREVENTION OF COLDS

THOUSANDS who used to catch colds easily will again experience a winter free from colds. They are users of SEROCALCIN tablets and each Autumn they take the immunising course which gives complete protection against colds in 8 out of 10 cases.

How it is done

SEROCALCIN acts by stimulating the natural defence powers of the body. It enhances the resistive capacity against invading organisms that cause colds and prevents a cold before it happens.

Simple and Safe

The immunising course consists of 60 SEROCALCIN tablets taken at the rate of two daily for thirty consecutive days. In 80 per cent. of cases this course gives complete immunity against colds for a period of 3 to 4 months. There are no "drugs" in SEROCALCIN—it is perfectly safe both for adults and children.

Proved by Tests

Tests by Doctors in private practice, Hospitals and Factories have established the claims made for SEROCALCIN and confirm its ability to give successful results in 80 per cent. of cases.

Supplies and Prices

Hospitals, Schools, Munition Factories and export trade have first claim on supplies, but most Chemists have adequate stocks. The immunising course of SEROCALCIN (Reg. Trade Mark) costs 8/5½ inc. tax. Industrial and School Medical officers, nurses, welfare workers, Labour Officers and interested members of the public are invited to write for a booklet "Immunity from colds" which will be sent on receipt of 1d. stamp.

SEROCALCIN PREVENTS COLDS

HARWOODS LABORATORIES LTD., Rickmansworth Rd., WATFORD, HERTS.

Vitamins in chocolate for liberated Europe

The British Government, having examined all the ways in which sufficient vitamins could be provided to the under-nourished children of liberated Europe, have arrived at the conclusion—as Rowntrees did in 1938—that chocolate offers one of the best vehicles for carrying added vitamins. In chocolate, the vitamins retain practically all their potency.

Before the war, Rowntrees pioneered the addition of vitamins to cocoa and chocolate. Their object was to enhance the protective value of these already highly nutritious foods.

Today, when the Allied Governments are faced with the enormous problem of rehabilitating each occupied territory as it is freed, Rowntree's experience of fortifying cocoa and chocolate with vitamins on a large scale is proving of great value. When the war is won, this experience will again be used for the benefit of the British public.

ROWNTREES

Would

THEY FIND THEM IN YOUR FACTORY?

One of the Ministry's Regional Fuel Efficiency Committees analysed the reports of their visiting engineers to find the most common causes of fuel wastage in industrial steam generation and transmission. From the first 300 reports on inspections of boiler plants and pipework this is what they found:

235 instances of unlagged boilers and unlagged steam supply pipes; of damaged or defective lagging.

219 instances of steam leakage at pipe joints and valves; some small but many serious.

226 instances of defective brickwork settings, causing air leakage and reduced efficiency.

139 instances of defective dampers; 88 cases of damper controls located away from firing floor.

84 instances of badly-fitting fire doors; and 98 instances of insufficient draught.

199 instances of condensate being wasted; 98 instances of defective economisers.

218 instances of boiler-houses without instruments; 227 instances of non-recording of boiler performance.

RESPONSIBILITY OF MANAGEMENT

May we urge management to make fuel saving their personal responsibility? Are you in close touch with your Regional Fuel Efficiency Committee or your Trade Association's Committee? Have you read the Ministry's Technical Bulletins? Have you arranged for the free inspection of your plant? Have you and your staff attended the Ministry's instructional courses?

The security of the fuel position is in your hands.

The Ministry's Regional Offices are at:—

GLASGOW • NEWCASTLE • MANCHESTER • LEEDS • BIRMINGHAM

COMPANY MEETINGS

ASPRO, LIMITED

INCREASING DEMANDS

The eighth ordinary general meeting of Aspro, Limited, was held, on the 12th instant, in London, Mr H. F. Middleton (the chairman) presiding.

The following is an extract from the chairman's statement, circulated with the report:—

Shortly before the close of the year under review your company suffered a grievous loss by the sudden death of its chairman and managing director Mr G. M. Garcia. This loss will be felt, not only by those who were in daily touch with him, but in wide and various circles. Mr Garcia was devoted to the interests of the company and unremittingly bent all his energies and capacities to its development and progress.

The profit on trading for the year under review is £278,701 after provision has been made for the estimated EPT liability. After deducting depreciation, directors' fees and pension fund contribution, amounting in the aggregate to £10,981, there remains a sum of £267,720, which, with the sum of £18,842 brought forward from last year, makes a total available balance of £286,562.

Your directors recommend the transfer of £155,000 to income-tax reserve, £25,000 to general reserve, and a grant of £10,000 to the pension fund. This will leave an available balance to the credit of profit and loss account enabling your directors to recommend the declaration of a final dividend on the Ordinary stock of 15 per cent., less tax, which brings the total distribution for the year up to 25 per cent., less tax.

HIGH REPUTATION OF PRODUCT

In spite of war-time restrictions, you were informed last year that our export trade had been maintained. To-day, factors governing exports are, if anything, more difficult, but I can say that with the limited field available, we have kept our hold on the export trade and strengthened the foundation for post-war development in this direction.

The high reputation of our product has been fully maintained, and, as the figures show, the demand continues to increase notwithstanding the policy of percentage rationing of orders which we have been compelled to adopt. During the year, we formed a subsidiary company, which has acquired, on satisfactory terms, the rights in this country and the other territories in which your company operates (including certain countries now in enemy occupation) to use the special method of packing employed for our products, together with the full complement of machines. This acquisition accounts for the increase under the heading "Investments in Subsidiary Companies" in the balance-sheet.

We have continued our activities in the production of foodstuffs for our staff canteens and in the provision of feeding facilities for a large number of workers in adjacent factories. We are also able to make free supplies, through the local social centre, to the local hospitals and others in need of fresh vegetables.

STAFF'S SOCIAL ACTIVITIES

I am sure you would wish to join me in paying tribute to the social activities conducted by our staff, who continue to provide concerts and amusements to raise funds for the support of many charitable organisations.

During the past year our staff has suffered further depletion by the calls of the Services and Labour Ministry, but those who remain with us continue to give us the same high standard of service as before, and I would like to express our appreciation of their loyalty and efficiency.

The report and accounts were unanimously adopted.

ODEON THEATRES, LIMITED

PLANS FOR POST-WAR EXPANSION

The sixth annual general meeting of Odeon Theatres, Limited, was held, on the 14th instant, in London.

Mr Arthur J. Rank (chairman of the company) presided.

The following is an extract from the chairman's statement circulated with the report and accounts: The trading profits of the group amounted to £2,163,687, as compared with approximately £1,700,000 last year, an increase of approximately £463,000, which figure I am sure you will agree is most satisfactory. The increase in profits over last year has kept pace with the increase in the amount required for taxation.

Odeon Theatres, Limited, has earned a trading profit, after charging Excess Profits Tax of £629,243 to its subsidiary companies, of £1,261,555. The total available for appropriation is £320,249, out of which the directors recommend the payment of a dividend on the ordinary shares of 15 per cent. (less income tax).

POSSIBLE INTERESTS IN POST-WAR EUROPE

I mentioned last year the important part which the cinema industry plays in the life of the nation, and the responsibility which attaches to the directors of companies such as yours. During the year there has been some discussion as to the activities of those companies which I control. The last thing that I want to see in this industry is any one company so powerful that free and fair competition ceases to operate as an incentive to maximum effort. But I do want to see a sound British industry so firmly established that we can be proud to have played a part in its building, and young men and women when leaving school or university will seek places in our ranks with the knowledge that they will have as good a chance of making a serious contribution to our national life as any of their friends who make their livelihood in industries with longer histories, and I do want to see your company maintained in its proud position as one of the leading exhibitors with, it practicable, a modern theatre in all the major cities of this country.

It is with this in view that we have, during the year, extended our interests by the purchase of additional theatres, and have been exploring the possibility of becoming interested in theatres in Europe, as it shakes itself free from the yoke of Nazism. In this way I believe we could ensure that British pictures will get fair representation in those countries.

WIDESPREAD FUTURE OF BRITISH FILMS

In our British-made films, now so rightly popular with our audiences, we have the means of showing the best of our ways of thought and living. It is the duty of those who believe in them to see that they go all over the world, and in my judgment we shall not build up a successful industry unless we do send our films to all countries that are ready to receive them. But we must see to it that we make films that audiences want to see, and so organise their distribution that audiences are given the chance of seeing them.

I believe that, so far as the United States is concerned, our American friends are willing to collaborate with us, realising that if the two great English-speaking nations are to go forward in friendship, an exchange of films can make an important contribution to mutual understanding.

Although this year will doubtless provide many problems and difficulties, I feel that, taking all things into consideration, we may look forward to the future with every hope of improving and increasing the success of the organisation.

The report was unanimously adopted.

LEVER BROTHERS & UNILEVER LIMITED

REPORT OF ANNUAL MEETING

The annual general meeting of the members of Lever Brothers & Unilever Limited was held, on the 7th instant, in the board-room, Unilever House, E.C.4.

Mr Geoffrey Heyworth presided.

The notice convening the meeting and the report of the auditors having been read, the chairman suggested that the directors' report and statement of accounts and the chairman's review for the year ended December 31, 1942, which had been issued to the members should be taken as read and the members agreed.

The chairman moved and Lord Leverhulme seconded that the directors' report and statement of accounts for the year to December 31, 1942, now submitted be received and adopted.

The motion was put to the meeting and carried unanimously.

A dividend of 5 per cent. for the year 1942 on the ordinary stock payable on October 12, 1943, and a dividend of 5 per cent. for the year 1942 on the preferential certificates outstanding under the co-partnership trust were declared; the retiring directors were re-elected and the auditors, Messrs Cooper Brothers and Co., and Messrs. Price Waterhouse and Co., were re-appointed.

At the conclusion of the meeting, Mr A. Carroll-Marx proposed and Mr Francis R. Newbery seconded a vote of thanks to the chairman, directors, and all officers and staff of the company. Mr Newbery asked whether the company had any system of long service awards.

Replying, the chairman thanked the members for their vote of thanks and said that the company had had for many years a system of long service awards, and during the war it took every step to keep in touch with the numerous staff who were away on military or other national service, augmenting the service pay of married employees and conferring other benefits on the unmarried, and the time of absence was counted towards long-service awards and pensions.

HEALING THROUGH RESEARCH

With the clinical resources of the largest Cancer-treating Hospital in the Empire, research into Cancer is unrelentingly pursued at the Christie Hospital, Manchester. Funds are urgently required and your donation earmarked "Cancer Research" will be gratefully acknowledged.

October 16, 1943

ATLAS ELECTRIC AND GENERAL TRUST, LIMITED

IMPROVED VALUATION

The thirty-fifth annual general meeting of the Atlas Electric and General Trust, Limited, was held, on the 13th instant, in London.

Mr Donovan M. Touche, who presided the absence through illness of the chairman, Mr W. Sandford Poole, said that the gross income amounted to £274,919, which was £8,985 less than in the previous year. That decrease was more than counted for by the reduction of £12,848 the dividends received from countries

at present in enemy occupation. Fortunately there had been a reduction of £6,192 in the charge for taxation, so that the net income showed little change at £155,139 from the corresponding receipt of £157,932 for the previous year.

The general investments stood at over £5,700,000 and showed a depreciation of under one seventh of 1 per cent. at the date of the balance sheet. A year ago the depreciation had amounted to no less than 21½ per cent. A subsequent valuation made as at August 31st last revealed that the market quotations for the securities then held showed a surplus of £279,393 over their book cost.

The gross receipts for the year to March 31st last of the Sociedad Com-

ercial de Montevideo amounted to 5,763,838 pesos, an increase of 885,746 pesos. The increase in traffic had been mainly due to the reduction in the bus services on account of the petrol shortage, but it was only fair to state that it was also due to some extent to the improved facilities provided for the public by the management in agreement with the municipal authorities.

The financial outcome of the operation of the tramway system had been less unfavourable than it had been for a long time and had resulted in an operating profit, subject to depreciation, of 276,959 pesos. That compared with a loss of 98,299 pesos for the previous year.

The report was adopted.

Engineering Wages

At the end of last week, it was announced that an agreement had been reached between the firm of Vickers-Armstrong and the trade unions concerned for the replacement of the premium bonus system at Barrow by a time piece system, thus bringing Barrow into line with the practice at other Vickers factories. Under the old system, which had been in operation for 40 years, the time taken for a certain task was agreed and, if the worker completed it in less, he received a bonus; 50 per cent of the time saved was translated into wages, the other 50 per cent accrued to the firm. The new system means the introduction of straight piece rates, which should provide a far greater incentive to effort. It has been claimed in some quarters that this change represents a major victory for the strikers, whose stoppage had lasted 18 days and cost over a million man-hours. In fact, the Barrow workers have not gained anything by striking which they could not have won by negotiation, and the firm had actually made an offer on these lines some months before. Some, but not all, of the workers will be better off as a result of the new system, and of the correction of certain minor wage anomalies, which had nothing to do with the Tribunal's award. Many post-mortems have been held on the strike; one fact which emerges is the complex nature of engineering wages. The district base rate of 46s. for a 47-hour week, up to the Tribunal's March award, which raised it to 66s., had been accepted as the standard for negotiation purposes; increases on the rate have been in the form of periodic additions to the national bonus. The rate for an adult male labourer is fixed, and so is that for a woman engaged on woman's work. But no rates are fixed for the various machine and assembly processes, many of which have been introduced in recent times. Mr Jack Tanner stated at the AEU National Committee meeting in June that the union was preparing a new wages structure, which would grade the various processes and would consolidate national bonuses in the basic rates.

Coal Mining Technicians

A committee of the Institution of Mining Engineers has been examining the question of the training of mining engineers. During the proceedings of the Rockley Commission on Safety in Coal Mines (1935-38) the existing system of examinations for certificates of competence came in for some sharp criticism. Mr G. Forster, the chief witness of the National Association of Organisers and Full Time Teachers of Mining, expressed the opinion that the present system of examination "allows people to get through without any real evidence of their having adequate scientific training." In its final report, the Commission emphasised the view that ultimate responsibility rested on the mine owners, who, if they

really want to strike at the root of the problem, and to ensure a steady flow of good university men into the industry, can only do so by instituting an organised scheme of recruitment coupled with some reasonable assurance of future prospects for the entrants.

The recommendations of the committee have in view the future supply of an increasing number of men for positions as colliery managers and higher officials who have not only had a sound general

education and technical training, but possess also a broad outlook and, in a high degree, the qualities of leadership.

It suggests that training should in future qualify students for membership of the Institution, and that the examinations should be conducted in three stages, namely, at 18, 22 and 26 years of age. The first of these examinations would be in pure and applied science, the second in mining engineering subjects, and the third, mainly oral, would test the student's grasp of mining, his general suitability and his knowledge of mining legislation. The technical education would normally be at a university or technical college. The scheme would be under a board and director of training appointed by the Council of the Institution, and provides for (1) examinations at the cost of the Institution, (2) scholarships to selected students while in residence at universities or attending technical colleges, and (3) minimum rates of remuneration to students during the time they are in employment and gaining practical experience. The committee assumes that after this the fully trained and qualified young man of proved ability will be able to demand, and will have no difficulty in obtaining, a very much higher salary as manager, with a prospect of securing later one of the higher posts in the industry.

Shoe Repairs

The need for shoe repairs has naturally grown with the rationing of clothing and the inferior quality of shoes now being produced. Paradoxically, the fact that few lowest grade shoes are now produced has also accentuated the demand for shoe repairing—shoes bought at 5s. or less were thrown away when worn out, but it is worth repairing their more expensive substitutes. The number of shoes repaired is not known exactly, but it is probably approaching a total of 350 million pairs a year, from a pre-war level of, possibly, 250 million annually. The additional amount of work is being done—as in all trades—with a reduced labour force. Workers now number about 65,000, a reduction of approximately 10 per cent since the war. As many as 27,000 of the total of about 8,000 establishments are one-man businesses, and at the other end of the scale some 300 employ more than ten workers. The labour force is now relatively stable, and local need is the guiding factor in further withdrawal of labour. The difficulties inherent in controlling a trade so widespread and composed so largely of one-man units, have not proved insuperable. A directorate of shoe-repairing under the Directorate of Civilian Footwear was set up in September, 1942. Its job has been to distribute the limited supplies of repairing material, which it does on a quota system, and to take any necessary steps to ensure that a repairing service continues. In December, 1942, restrictions on the type of repairs were laid down, which not only saved material, but also meant that nearly five pairs of shoes could be repaired in the time previously taken on four. The average time a repairer keeps a pair of shoes is probably now only ten days, although the variation is wide and reaches two months in some cases. It is fairly certain, however, that essential repairs are done with all possible speed.

ROYAL BANK OF CANADA

DIVIDEND No. 225.

NOTICE IS HEREBY GIVEN THAT A DIVIDEND of 1½ per cent., being at the rate of 6 per cent., per annum, upon the paid-up Capital Stock of the bank has been DECLARED for the three months ending 30th November, 1942, and will be PAYABLE at the bank and its branches on and after 1st December, 1943, to shareholders of record 30th October, 1943.

By Order of the Board,
E. B. McINERNEY, London Manager.

6, Lothbury, London, E.C.2. October 14th, 1943.

* October 3, 1942 and October 2, 1943.

False Premises

READERS of Poe will remember the famous letter
hidden by being put in the most conspicuous place
possible. The trick is as familiar to students of politics
as to connoisseurs of crime. It consists in placing a false
premise boldly in the forefront of an argument in the
hope, usually justified, that it will escape notice. Some-
thing of the sort is apparent in the Prime Minister's plea
that his Coalition Government, formed to fight the war
on a basis of national unity, has therefore only a limited
liability in matters of government.

Mr Churchill took the opportunity of last week's coal
debate in the Commons to state the doctrine: "Every-
thing for the war, whether controversial or not, and
nothing controversial that is not bona fide needed for the
war." He laid it down that his Government has no right,
"except with a very general measure of agreement," to
step outside "the one function by which its continued
existence is justified, the prosecution of the war." In this
argument, there are two "hidden letters," two doubtful
premises. The first is that the prosecution of the war is
the one function by which the existence of the present
Government can be justified; the second is the assump-
tion that to the many questions which are being pressed

upon him there are no answers that command "a very
general measure of agreement."

It is worth while recalling what happened in May,
1940. Briefly, Mr Churchill replaced Mr Chamberlain
as Prime Minister and leader of the Conservative Party,
and the Labour Party joined the Government. It is surely
not suggested that either Mr Churchill or the Labour
Party made it a condition that the policy of the Govern-
ment should thenceforth be confined exclusively to war
requirements. According to the Prime Minister's present
argument, Mr Chamberlain's Government, despite the
war, could have made decisions and taken legislative
action on any question, simply because it was Conserva-
tive and not Coalition, but the appearance of himself at
the top and Labour Ministers by his side at once re-
stricted its province. This is surely almost a travesty. It
is not the new men but the old ones, the backers of
Chamberlain before Churchill, who have made conditions,
if any have been made. What Mr Churchill must mean is
that reconstruction is inhibited, not by Coalition, but by
Conservatives, and then only by a section of the Party—
which also contains the Tory Reform Committee, born
last year to press for the Beveridge proposals.

The truth is that, apart from several rows of Conservative backbenchers, there is the very general measure of agreement required by the Prime Minister for release from the self-denying ordinance that he has fallaciously accepted on behalf of his Government. No sensible person will deny that the Prime Minister is right to resist attempts to introduce revolutionary changes by a "side wind," under the guise of war necessity; but equally it is wrong, both logically and politically, to use war necessity as an excuse for stopping urgent and widely agreed reforms. Coalition or party, a Government, in war or in peace, can set no limits to its duties other than the nation's needs. "No election is needed (General Smuts has pointed out) to prove that the British people are united to a man behind the greatest leader they have ever had." Mr Churchill need not be diffident and retiring about reconstruction; he has a mandate of his own.

Admittedly, there is very much more than politicians' logic in Mr Churchill's standpoint. All his energies and most of his imagination are taken up by the overriding task of waging and winning the war. Day-to-day administration he leaves to his colleagues who, except on the most immediate war problems, probably do not, unfortunately, reflect the measure of agreement on other questions that exists in the country. The Cabinet, like the Commons, is out-of-date; and Mr Churchill is to this extent correct when he says that only the refreshment of a general election can put things really right. In recent Cabinet discussions on the relations between the state and certain industries, there have been clashes between doctrinaire Ministers on the one hand, and intransigent Ministers on the other; and the public by-product has been undignified wrangling about the future of controls. In this situation, there may appear to be some *prima facie* justification for the Prime Minister's refusal to permit the great preparations for reconstruction that are going on to approach the point of actual decision.

Unfortunately, however, it is not possible to let sleeping dogs lie. Neutrality is no more possible in the business of government than it is in world affairs. The saying that Britain acquired an Empire in a fit of absence of mind can have its sequel—in the opposite sense. By postponing policy on questions of domestic reconstruction, a wrong policy is in fact accepted. Moreover, by the policy of drift, however well-intentioned, the best is made the enemy of the good. The Beveridge, Barlow, Scott and Uthwatt Reports are well-worn instances; by deciding that major decisions on these proposals can only be made by a more popularly elected Parliament than the present one, reforms are blocked which have been urgently needed for a generation, and are now generally desired, in unemployment insurance, workmen's compensation, national health insurance, education, town and country planning and the rest. In fact, political dialectic apart, the true test is, first, whether this or that question requires governmental action and, secondly, whether there is a sufficiently general measure of agreement that the appropriate action should be taken. The best proof, of course, would be a general election. But is it seriously questioned that a majority of people in this country wish to see the implementation of the Beveridge Report (not simply earnest research into the many problems to which it gives rise); the making of a positively planned housing programme to begin on the day labour and materials are available; and the fashioning of a demobilisation and full employment policy to operate as soon as the first soldiers, war workers and ships can be released from national service? If these plans are not laid now, the chance may be lost for ever.

Moreover, it is nonsense to say that decisions, outside military necessities, cannot be taken. In fact, they are being taken—internationally. Is the argument that foreign relations, even in this democratic age, are something apart, reserved for Executive action? More likely, the reason is that, in foreign affairs, the inescapable link between war and peace, which exists no less in domestic affairs, cannot but be seen. The agenda at Moscow this week will be as broad as the Three Powers can bring each other to allow, and every decision will affect this nation's future as directly and as "controversially" as decisions on the Beveridge, Barlow, Scott and Uthwatt

Reports would do. The economic discussions in Washington, which are nearly ended, have covered commercial policy, international currency, world investment, raw materials and full employment, all of them vital and "controversial" determinants of the destiny of Britain. What is settled or not settled at Washington about economic policy, will fix the limits of what will be practicable in policy here at home. While, on the one hand, domestic reconstruction goes by default, on the other, it is settled abroad. If, for instance, in the interests of an agreement with the United States, the British Government, through its experts, has accepted restrictions of the budgetary or exchange policies that post-war full employment may require, a decision of major importance will have been made. If it has been agreed, as a matter of principle, to abandon the sterling area as a unit of monetary and trade policy, without securing in return a guarantee that the United States will make available to its commercial and investment arrangements all the dollars that the nations may require, the substance of national security will have been surrendered for the shadow of internationalism.

The talks at Washington have gone well, and it is possible that a compromise may have emerged between the British and American plans for post-war international payments. The danger is that such a compromise may very well embody the defect of both these plans for restoring world economic equilibrium, namely, their under-estimate of the size and persistence of the excessive debit and credit balances that are likely to arise from the "normal" processes of international trade—unless there is a radical change in economic policies, especially in those of the United States, the biggest creditor. Provision for large capital loans, as proposed in the American world bank project, might put off the day of reckoning, but it cannot solve the problem; and, until the problem is solved—that is, until unfettered multilateralism (which is, of course, the ultimate aim of every sensible economist and politician) becomes a practicable proposition—this country cannot, for its own sake, renounce the expedients of bilateral trading, exchange control, Government purchase and regional currency arrangement that may be forced upon it.

No government, in short, can surrender or separate its responsibilities. Policy is indivisible, and cannot be dealt with departmentally, in time or in space. What is done or not done now, determines what will be possible when the war ends. What is settled to-day in Washington or Moscow, determines what will be practicable in London to-morrow. This is not to say that international agreement should not be grasped at eagerly; it is the condition precedent for all peace and prosperity. But it is to say that a balance must be held between reconstruction at home and abroad, that they must march together in step, that if decisions can be taken in Washington or Moscow, they can, and must, be taken in London too.

As it is, the left hand does not know what the right hand is doing. In the first and last resort, the responsibility is Mr. Churchill's simply because, as General Smuts said, he wields the power and holds the keys. He cannot wash his hands of these questions, without counting the consequences; he must decide whether to be the pilot or Pilate. But, next in responsibility, there are his colleagues. He rules, and they are divided. Not even the Labour group has a policy. Mr. Bevin wishes to preserve the status quo, with the workers' wartime gains, by collective bargaining in the corporative style. Dr. Dalton, with oversight of industrial reorganisation, believes he can accept monopoly and then tame it. Mr. Attlee, supporter of social and international justice in general terms, is inclined to support the wrong policies for the right reasons. Mr. Morrison has stated the proper objectives, full employment and fair distribution, but he has not induced his party superiors to fashion a coherent and practical home and foreign policy for the best and justest use of the nation's resources. Until progressive forces can be united in their presentation of the popular will, Mr. Churchill may not after all be entirely wrong to say that the present Cabinet, and Parliament, are incapable of making decisions without perilous controversy.

Il Faut en Finir

THE background of the Moscow Conference is set on the battlefronts; the overriding question, which the three Foreign Secretaries cannot themselves decide, is how soon victory can be achieved. As General Smuts put it at Guildhall on Tuesday:

Time is short. The time factor in this fifth year of war has become all-important, and from now on every moment counts. If Europe is to be saved from immeasurable disaster we must look upon the earliest ending of the war as of first importance.

General Smuts gave his own forecast and time-schedule of events:

We may confidently reckon on still further advances, especially in Southern and South Eastern Europe, and by the coming winter we shall have closed in upon Hitler's central fortress of Europe, and be making our dispositions for the grand assault by all arms next year.

Is this statement a signal that the shortest way to victory, by concert among all the Powers, has now been found? It may be; but even this confident pronouncement will disappoint and puzzle many people in Britain as well as in Russia. The material superiority of the Allies over Germany in every branch is now beyond doubt. Their war production is more than double that of German-controlled Europe, their air power at least three times that of the Luftwaffe. They are masters of the Atlantic and the Mediterranean—they have at least a dozen warships for every German one; and they can muster 450-500 divisions against the German and satellite maximum of 350. The enemy is retreating on every battlefield, in Russia and Italy, in the air and at sea, and not least on the battlefield of ideology. Yet the official sirens still sound the political alert—"the most difficult phase of the war is still ahead of us," "we must not expect the end of the war—yet." At this stage the difference between three more months of war, six or twelve is very great.

How do the warnings of the Prime Minister and his colleagues, on both sides of the Atlantic, square with the overall picture of the war? How is it that journey's end may not yet be in sight even though most of the milestones have been passed? The reason best known is the geographic division of the Allies from each other and—except in the case of Russia—also from their chief enemy. But this is not all. The Allies have been divided from each other by more than geography. Their tradition and method of conducting war is fundamentally different; and this, as much as anything else, has led to differences between Moscow and London over the Second Front, over the tempo of the war, and over the respective share of the burden of war carried by each of

the Allies (which General Smuts discussed on Tuesday). The Russian and the German way of war—in the Second World War—is based on land power plus air power. The British and American way of warfare has so far been based on sea power plus air power, or it might almost be truer to say air power plus sea power.

This distinction has conditioned both the method of Allied warfare in the west and the form of assistance given to Russia. Both the Russian and the German war machines were constructed as a whole: they were made up of an offensive air force whose success could be exploited immediately by a mobile army served by adequate road and railway systems. Not so the war machines of Britain and America; they do not appear as the outcome of some centrally co-ordinated plan. They have not yet shown at this late stage of the war an adaptation to the need of co-operating with a great European land power conducting war according to the principles and tempo of modern war on land.

The great Anglo-American air offensive, now in full swing, is a typical example of this different conception of war. The day and night raids on Germany's industrial centres are generally cited as a classic example of economy of force in modern warfare. The small casualties, both absolutely and relatively, with which the Allies have paid for the heaviest attacks on German industry compare well with the blood-letting of the indecisive battles of the last war; and they inflict, at the same time, tremendous shocks on the enemy without any equivalent cost to the attacking force. All this speaks volumes for the skill and bravery of the men who plan and execute these attacks upon the enemy.

But in modern total warfare economy of force cannot be measured simply by the isolated results of a single or even a series of actions. It is not only the damage inflicted that is the measure of success, but still more the extent to which each operation contributes to a decisive defeat of the enemy. This is where the weakness appears of the air-sea combination in relation to the air-land combination, both when they are opposed as in the case of Britain and Germany, or allied as in the case of Britain and Russia. The pace and development of a war based on sea power is fundamentally different from one based on land power. Last May, three Ministerial pronouncements were made on this subject. Mr Churchill, on May 19th, said:

Opinion, Mr President, is divided as to whether the use of air power could by itself bring about the collapse of Germany and Italy. The experiment is well worth trying so long as other measures are not excluded. There is certainly no harm in finding out.

Mr Eden, on May 20th, said:

The programme we have prepared for Germany is night and day bombing, day by day and hour by hour, continuously, relentlessly. Germany is being bombed not only round the clock but round the map.

Sir Archibald Sinclair, on May 21st, said:

There is only one hope of getting to Berlin without the slaughter which the land battles of the last war entailed, and that is the paralysis of German war power by Bomber Command.

One of the chief features of this policy is that the attacker—in this case Bomber Command and the United States Army Air Force—though active all the time, depends for decisive victory upon the effect on the enemy's morale. The bombing of Hamburg was a classical example of the inability of quick, decisive exploitation after a great air attack; like the effects of blockade, those of bombing are cumulative and may take considerable time before they strike down a nation such as Germany. The question is not whether the damage done is tremendous and terrible—it undoubtedly is—but how long it must go on.

The Russian view of the war is different. It is based upon a great culmination of effort to break the military backbone of Germany. The Russians are, as it were, using every opportunity to gain a decision in the shortest possible time. Without a concerted decision about what kind of war the Allies together intend to fight and win, Allied economy of force might well prove an illusion. Air attack, though not involving great loss of life and direct damage to machines, is absorbing the greater part of Allied manpower and industry, and has diverted effort which might otherwise have gone to shipping, guns or tanks. The question now to be asked is whether, in this favourable situation of the war, with the enemy out-matched on the field and in the air and at sea, as well as on the home front, the Allies have the weapons and the strategy to exploit the advantage in time, to strike decisive blows to tune in with the Russian attack?

One common error has been to oppose two conceptions of this war; first, the comparatively "cheap" attack on the heart of Germany by means of long-distance air assault; and secondly, the costly invasion of Europe by land, using the air only as support for army operations. The third alternative is to combine Allied sea-air power with the land power of the Red Armies in a combined operation. The whole history of war between the land power on the Continent and the sea power of Britain points to the conclusion that, for a decisive victory, the sea power of Britain has to be reinforced by

the land power of a continental Ally. It was so in the case of Napoleon, in the case of the Kaiser and now, in the case of Hitler. Britain has often been able to "contain" itself by sea power alone, but never to redeem Europe as well without Continental aid.

Would it be wrong to suggest that it has been reliable in on sea plus air power that has explained the long-distance perspective of the war still officially given? Alone, it is bombing of Germany does not offer any prospect of an early finish—though it may of a certain and complete finish in time. Land warfare and sea-air warfare, on they are proceeding in Eastern Europe and Western Europe have been out of step in their timing. General Smuts has suggested that the United States, "latest and freshest and most potent newcomer in the field," may have to play "the decisive part in the concluding act." This may well be so; but Anglo-American superiority in the air and at sea, for all the great devastation and attrition achieved, cannot exercise an immediately decisive influence at this stage of the war; only the Russian margin over the German land forces is at present in a position to do this. Allied effort is dispersed in Europe. Where Allied superiority is most marked in the air and sea—in the Mediterranean—it is bringing least direct pressure to bear upon the enemy. The pin-point of Allied attack in Italy is concentrated on six enemy divisions and on territory neither vital to the Allies nor to the enemy.

It is impossible to make radical changes at this stage but the full fruits of the Red Army's successes, of the Anglo-American air attacks on German cities and industries, and of Allied command of the sea, will be harvested only if it is being made possible for Britain and America to threaten German land power with superior land forces of their own. Anglo-American sea and air power already means ability to transport armies to theatres where they can be usefully employed; but Anglo-Soviet-American land, sea and air power together would spell ability to transport and march forces to theatres where they could be decisively employed. To achieve this calls for adjustments and changes within the present war machine and with the existing weapons. It calls for political, strategic, tactical and organisational adaptation to new conditions. Above all it calls for a single Allied strategy of victory against Germany with combined concentration of effort and with dovetailed time-tables. General Smuts may have indicated to the world that such adjustments are even now being made and such a time-table set in motion. If this is so, it was a historic statement; if not, it was simply the apology of an Elder Statesman.

An Economic Civil Service

IT is now a matter of common agreement that the State will have, in future, a larger rôle to play in the economic affairs of the community, whether by way of direct management, of control and supervision, or by less direct methods. Insufficient attention has been given to the implications of these developments for the administrative mechanism of the State and its personnel.

Before 1929 there was very little direct intervention by the State in the affairs of industry, other than a number of purely supervisory activities that were necessarily of a semi-legal nature. The industry with which the State had most concern, though it stopped far short of management, was coal-mining, and there a special corps of servants of the State—the inspectors of mines—was created for the purpose. In the decade before the Second German War broke out, State intervention in one form or another was found necessary. This was true of a number of individual industries—for example, in iron and steel, in shipbuilding and in films, apart from the manifold interventions of the State in agriculture, which may perhaps count as a special case. But it was also true of industry in general, both in the Special

Areas and throughout the country, as a result of the Import Duties Act, the form of which required the State to make up its mind whether to give or withhold protection in the case of each individual industry that made application.

For all this growing department of public policy the State had no experienced and informed servants. The industrial departments of the Board of Trade, the Import Duties Advisory Committee and the other departments concerned were staffed by members of the home Civil Service, who had a fund of practical experience on methods of avoiding the waste of public money but little or no experience in handling industrial problems, and no considered and corporate body of doctrine on the proper economic policies of the State. That the Government in these years had no consistent economic policy was largely due to the fact that it could get no advice on the subject from the Civil Service. It was this lack of personnel, too, more than any deliberate choice of policy, that led to the rapid growth in cartellism in this period. The Government was placed in the position of admitting that, for a number of industries, something in

the nature of central organisation was needed, of being unable to provide the central direction itself and consequently of pushing off on to the industries its own responsibilities to the public. In one or two cases the gesture was made of appointing an "independent chairman" (drawn from the City). But the independent chairman was given no staff to assist him.

This problem has been tackled during the war by the inflow of temporary civil servants, through whose medium the Government is now running a substantial part of British industry. In far too many cases—as *The Economist* has consistently complained—men drawn from an industry have been set to run their own industry. But this has not been true in every case, and some of the most successful administrators of industrial policy have been drawn from outside of industry altogether—from the universities, for example. This wartime experience has shown that the problem can be solved—that there are people capable of serving the State in these departments of policy—but it has not provided a solution, since the temporary civil servants—or, at least, the best among them—will leave the service of the State at the end of the war. The baby will be handed back to the permanent civil servants.

This presents a real dilemma. The permanent civil servants are woefully too few in number for the tasks that will present themselves. They are not suited by their training and experience or (with rare exceptions) by temperament to handling industrial and economic problems. With the exception of finance, where the Treasury has long experience and great skill, and which is, in any case, more a matter of ordinary commonsense than its practitioners will usually admit—with this exception, economic and industrial questions almost always involve some technical knowledge and some acquaintance with the practical problems of the market-place. Of these things the civil servant is ignorant and knows he is ignorant. Faced with questions that involve them, he is apt merely to play safe, to work on precedent and to avoid any adventures into the unknown. He could hardly be expected to do otherwise. But if, in view of this, the Government relies, in its industrial policy, on advice given *ad hoc* from industry itself, then it loses all possibility of having an independent policy.

The way out of this dilemma is by the recruitment to the permanent service of the State of a special class of civil servant with some experience of industrial and commercial affairs who would be the advisers of the Government on economic questions and the executants of its policy. Such an Economic Service might well stand to the home Civil Service in much the same relationship as the new Foreign Service or the Colonial Service. It would, that is to say, have the same status and broadly the same conditions of service, and it would stand in the same relationship to Ministers. But it would be a specialist service, with its own principles and body of experience, and a man entering it would normally find his whole career in it. Like them, too, it would have its own special conditions of entry and means of recruitment. As with all the higher administrative services, the first requirement would be a good general education and a high level of intelligence, but to this would have to be added some practical experience of affairs. For this reason it would not be practicable to recruit at the age of 22—or certainly not at that age only. Possibly the best field of recruitment would be among men in their early thirties who are beginning to feel their feet in industry or commerce; alternatively, men could be recruited earlier and sent out to acquire experience for a number of years. Some would necessarily be sought in academic circles, and this would require a narrowing of the gap between theoretical and applied studies. Effective chairs of Applied Economics at the universities, realistically filled by professors of the first calibre, without the present derogatory distinction between the pure and the "technical" aspects of the subject, are needed; so, too, is applied research by students into specific industrial problems, in the form preferably of positive reports or actual experience in local or industrial

administration. Nor should young men, industrial or academic, be debarred by their administrative functions from having "political" opinions on matters which are inevitably political in several senses. Throughout, the salaries paid would need to be sufficient to attract and hold the best type of man, and it would have to be a condition of service that resignation to enter employment in an industry with which a man had had any official dealings was forbidden.

In the methods by which such a service would work there is a strong analogy with the Foreign Service. There would be the central department to staff, as the Foreign Service staffs the Foreign Office. (Possibly it is more realistic to speak of the central departments than of one alone, since it is difficult to imagine the Board of Trade handling both its commercial responsibilities and the industrial policy of the Government; a Ministry of Industry will almost certainly be required.) From the central department the members of the Economic Service would be posted *en mission* to a great number and variety of "out-stations," where—the analogy here is with the Colonial Service rather than with the Foreign Service—they would provide leadership and stiffening for "locally" engaged staff. These "out-stations" would be of many kinds. There would be Industrial Boards and Commissions of various kinds, temporary and permanent, for which the Economic Service would provide secretariat and staff and, in some cases, members. There would be seats to be filled on the boards of corporations and companies where the State exercised a right to a watching brief. (There is no reason why seats on such companies as Anglo-Iranian Oil and the Suez Canal should be filled by civil servants only after they have retired.) Members of the Economic Service could be seconded to, or "bedded-out" in, public corporations—a valuable school of experience. They could be used as what Mr Herbert Morrison calls "efficiency auditors" wherever public funds are applied to private industry.

In general, such a service would provide a body of public servants cognisant of the general interests of the State and capable of mastering the problems of any industry, and of giving Ministers fully expert and impartial advice. From the public point of view it would be the means of ensuring that the community's interest was effectively asserted and that a coherent policy was pursued on all economic matters—an essential prerequisite, as has often been pointed out, of a successful full employment policy. From industry's own point of view such a service would be the means of ensuring that its problems were handled by Government Departments with real knowledge of the issues and without "bureaucratic timidity."

It is a commonplace of modern historians that an efficient and honest Civil Service is essential to the strength of a modern State. Germany in one way, and Britain in another, have gained immensely in this respect in the past century, and other countries have lost as much by the lack of a reliable machinery of administration. The home Civil Service has come in for a great deal of criticism in recent years. Much of this has been due to the fact that, designed to deal with general administrative and political questions, it has been driven by the circumstances of the age to tackle economic problems for which it is not suited. It would be a relief to the Civil Service, as well as a gain to the community, if these problems could be recognised as a distinct province of administration to be handled by specialists.

CENTENARY RECORD

A volume of essays entitled "*The Economist, 1843-1943*," which is mainly historical in character, has been published by the Oxford University Press, price 7s. 6d. (Orders should be placed through booksellers, and not with either the Oxford University Press or *The Economist*.)

International Trade Unionism

THIS week, the representatives of the British, American and Soviet Governments are meeting in Moscow to discuss highly important matters of military and political strategy. It seems more than a little illogical that whereas representatives of these three Governments can thus meet in conference, it has so far proved impossible to arrange any kind of meeting between the trade union representatives of the same three countries. There is a joint Anglo-Soviet Trade Union Committee, on the one hand, and there is a committee of the British Trades Union Congress and the American Federation of Labour, on the other; but there is no direct liaison between the American and the Russian unions.

Trade unions in Britain have become a recognised partner in war administration, while in Russia the trade unions are, and always have been, an integral part of the constitution. Each movement tends to reflect the politics and policies of its Government; and questions of international trade unionism in 1943 cannot be approached from any other angle than that of inter-Allied relations. At the Southport meeting of the Trades Union Congress this year, M. Shvernik, the Secretary of the All-Union Central Council of Trade Unions, urged the British to press for the immediate opening of a second front in Europe. He was repeating the demand which the Soviet Government has persistently put forward. When Sir Walter Citrine advised Congress to leave the time and place of the offensive to the military experts, and stressed the success of the bombing policy, he was echoing the views of Downing Street. The speech of Mr Isidore Nagler, delegate from the American Federation of Labour, reflected the present state of Soviet-American relations. If there were a second front in Europe in the Russian sense (described by M. Shvernik as meaning offensive operations which would divert a third or at least a quarter of Germany's military strength from the eastern front) many of the difficulties between British and Russian trade unions would disappear. Similarly, if Russia were at war with Japan, the relations between the American and the Soviet trade unions might well take a new turn.

The Soviet delegation at Southport suggested that the Joint Anglo-Soviet Committee should be extended to the unions of Allied countries and Latin America. This Committee was formed late in 1941, for the purpose of exchanging views and information, and providing regular contact and co-operation on trade union matters. The Committee was formed with a limited objective, and the General Council of the TUC are opposed to its extension; since, in any event, it would not be easy to call regular conferences of 38 trade union movements in wartime. Instead, the British advanced the possibility of convening a world conference "in order to promote the widest possible unity, in aim and action, of the international trade union movement," as soon as war conditions permit. This suggestion, which was adopted by the TUC, is less specific than the Soviet proposal. It does, however, represent an important decision which will be welcomed by the trade unions of other countries, especially those of Latin America which sent a telegram to the TUC asking for a world labour conference to be summoned.

The real difficulty lies deeper than geography and the war. Sir Walter Citrine said that the Soviet proposal was tantamount to the formation of a new International. The biggest obstacle is the relationship between the American and Russian trade unions. The Americans have consistently opposed the admission of Soviet trade unions into the International Federation of Trade Unions, on the ground that they are not democratic and free unions; and it has been feared that Russia's affiliation might strengthen Communism. At its Convention in Boston, the AFL has reaffirmed its decision not to join the Anglo-Soviet Committee, for these very reasons. The roots of this

distrust go back twenty-four years, to the Amsterdam Conference of 1919, when the IFTU was given its present constitution. The Soviet trade unions left the Federation and established their own International at Moscow in 1921, in opposition to the Amsterdam Conference, which they denounced as reformist in tendency. The organisation of Red unions, known as the Profintern, never made much headway in the west, even in Germany where the Communist party was relatively strong, though it gained some support in France. The preponderating influence was Russian, and it consisted mainly of a few Communist trade unions, minority groups and illegal associations. But ever since Hitler's accession to power, after Russia had joined the League and supported collective security, the Soviet trade unions have been prepared to associate with the counsels of world labour. This came nearest to success in 1939, at the Zurich Congress, when the British tried to get the IFTU to send an invitation to the Russian unions. The proposal was opposed by the AFL, and by the representatives of several smaller European nations, though it was supported by the French, whose Communist and Social Democratic unions had made an alliance in 1936.

In addition to the Soviet-American difficulty, there is the peculiarly complex position inside the American labour movement. Attempts made by the British to bring about closer co-operation between the American Federation of Labour and the Congress of Industrial Organisations have been abortive, and British intervention, with Sir Walter Citrine as go-between, appears to have given rise to considerable resentment. In the absence of co-operation between the two wings of the American movement, the General Council of the TUC decided to continue collaboration through its joint committee with the American Federation of Labour, with which the TUC has long had close and cordial relations, and which represents America on the IFTU. The CIO is excluded from representation on the International Federation, although it participates on such bodies as the International Metalworkers' Organisation. The Federation is largely a skeleton organisation. It was revived in London shortly after Dunkirk, when trade union leaders from occupied Europe began to arrive in England. Since it obviously could neither function normally nor hold its triennial congresses, it operates through an Emergency International Trade Union Council. This body has held two meetings so far, one in September, 1942, and the other in April, 1943.

This is the background against which the decision to consider summoning a world trade union conference has been taken—a background of chequered history and somewhat strained relations. The difficulties in the way of achieving international trade union co-operation are formidable, and many prejudices will have to be broken down. The first step would have to be the reconstitution of the present International Federation and the inclusion of the representatives of the Russian and all the American unions. The task of co-operation has perhaps been facilitated by the dissolution of the Comintern—the Profintern has apparently just been allowed to lapse. It is in the interest of future international relationships that the conference should be summoned expeditiously and be widely representative. As the end of the war approaches, the problems of freeing Europe, of relief and reconstruction, loom larger and will demand the greatest measure of international trade union co-operation. The united trade union movements of the world could count some 65 million members.

Trade unionism, by its very nature, must have an international, and not a national, outlook. Its international rôle has been stressed by Mr Bevin, who at Southport urged that the unions must see that they are "in on" the peace treaties. A new world order cannot be established if the labour movements of the world march out of step.

NOTES OF THE WEEK

France and Italy

The recognition of Italy as a co-belligerent met with an immediate rejoinder from Algiers. A semi-official communiqué declares, among other things, that it is militarily inexpedient. Marshal Badoglio, the argument runs, will not be able to make any contribution to the war that would justify the step now taken by the Allies: the fighting capacity of the Italian army is non-existent, and the Italian navy had already surrendered. But this is not the main point of the protest. An analogy is drawn between Darlan and Badoglio and objection raised to the granting of rewards for twelfth-hour conversions to the Allied cause. Algiers was not consulted, and does not feel itself bound by that decision of the Three Powers. This view is understandable. France was the main sufferer from Italian intervention, and it would seem fair that Frenchmen should have had a say in settling the terms of Italian redemption. On the question whether General de Gaulle, in fact, represents France there are, of course, differences of opinion; but the omission to consult the French Committee of National Liberation in this case hardly squares with the decision of the Three Powers, Russia, Britain and the United States, to include a French representative on the Mediterranean Commission. France has an obvious and vital interest in the future relation of naval forces in the Mediterranean. The French navy was scuttled at a time when the passage from Toulon to Algiers or Oran was barred, not only by the Luftwaffe, but also by the Italian fleet, then co-belligerent on the other side. The assurance that Italy's co-belligerency does not entail any change in Italy's status as a defeated enemy or in the terms of the surrender may not carry full conviction with Frenchmen, who may still ask what is, after all, the practical meaning of co-belligerency. On the other hand, General de Gaulle's objection to the new Allied attitude towards Italy should not be taken as an indication of an anti-Italian policy. His speech in Ajaccio on October 8th was couched in conciliatory terms; and, some observers believe, the idea of a Latin bloc, which tempted so many French politicians in the past, may still find a place in French politics after the war. It may be wrong to read too much into General de Gaulle's conversations with Count Sforza or into his reported decision to send an envoy to Madrid; but both episodes are significant indications of the revived activity of French diplomacy.

The Balkan View

Objections to the recognition of Italy as a co-belligerent have not come only from Algiers. The Emperor of Abyssinia has not minced his words in describing the record of Marshal Badoglio—a record which would clearly qualify him as liable to punishment as a war criminal, if the continuity of the war from the invasion of Abyssinia to the present stage had been accepted by Allied diplomacy. But, apart from this moral point, the protest from Addis Ababa raises no specific political problems. Abyssinia and Italy, fortunately enough, possess no common frontiers which might make for diplomatic conflict. The only thing which Haile Selassie and Victor Emmanuel once possessed in common was the title of the Emperor of Abyssinia. Provided there are no more over-zealous Italian officials to insert the full title of their sovereign, as it was written in the last years of Fascism, into official documents, this "incident" may be regarded as closed. A more delicate situation is bound to arise over the Greek and Yugoslav protests and claims. The formula accepted by anti-Fascist Italians is "return to the 1919 frontiers and renunciation of Fascist acquisitions." In some instances, the formula provides clear guidance for the solution of territorial disputes; in others, however, it does not. Albania and Corfu are clear cases. They were both conquered and legally incorporated by Italy after the advent of Mussolini. But there are territories which were acquired long before the Fascist era but not formally incorporated until later on. The Dodecanese Islands and Rhodes were occupied by the Italians as far back as 1912, but only recognised by the other Powers as Italian possessions in the Treaty of Lausanne of 1923. Does the formula "frontiers of 1919" imply the cession of

those territories to Greece? Count Sforza leaves no doubt about the sincerity of his views when he states:—

When I speak of the national integrity of Italy, I admit that the Dodecanese Islands were never an integral part of our country. Mussolini's crime of invading Greece was so stupid and unpardonable that the free Italy of to-morrow will gladly cede the Dodecanese to the Greek nation.

Fiume is another dubious case. Ought it to be incorporated in Yugoslavia, as the Yugoslavs are certain to demand, or would its reconstitution as a free state be preferable? The Greeks claim some slices of Albania. Is this territorial demand, which has nothing to do with Italy's aggression against Greece, to be granted, simply because Albania was unfortunate enough to fall a victim to Fascist aggression somewhat earlier than Greece?

Peaceful Solutions

The possibility of lasting solutions for these problems depends only slightly on Italy's being or not being "co-belligerent." Primarily, it depends on public opinion in the countries concerned. The defeated aggressor country must prove its change of heart by adopting an attitude similar to that represented by Count Sforza. The victorious victims of previous aggressions will themselves have to learn the art of moderation if they do not intend to sow the seeds of new wars by excessive territorial demands and by thirst for vengeance. The character of the regimes which the Allies will help to establish in the Balkan countries and elsewhere will play a decisive rôle in moulding public opinion there. Military dictatorship, the rule of authoritarian cliques, would almost inevitably be accompanied by the whipping up of frenzied nationalisms among the liberated peoples. Professional generals, especially those who will have spent the greater part of the war in inactivity, will need cheap laurels to bolster up their dubious prestige. In territorial acquisitions, which their countries will hardly be able to digest, they are most likely to find the badly needed elements of their artificial greatness. A Greek Government, truthful to the tradition of Metaxas, will tend to raise the most extravagant territorial claims; and the reported "resignation" of the Greek Government in Cairo in protest against the recognition of Italy's belligerency by the Allies gives a foretaste of the policy which may be pursued. Gestures of this kind can only result in the inflammation of nationalisms in the Balkans and in a new series of the familiar local wars after the end of the world war. It is hardly likely that the representatives of the popular movements of resistance, whom the Greek King and the Prime Minister, M. Tsouderos, have refused to include in the Government, would have agreed to participate in so incalculable a policy. The adherence to the Metaxas tradition by the Greek Government has already resulted in mutual fighting between two sets of guerrillas, a feature already familiar in Yugoslavia and Poland. To steer the authoritarian course means to incur the danger of civil strife and external adventure in countries which will, anyhow, be exhausted by war and enemy occupation. Thus some of the Allied countries may after victory become far less democratic than the Axis countries after defeat. Count Sforza's voice has already a more progressive sound than the voice of M. Tsouderos.

In Conference

The Three Power Conference in Moscow started in an atmosphere of calm, free from the polemical comments which had filled the columns of the Russian press for some weeks past. The negotiations are expected to last about a fortnight, which seems to point to a businesslike and detailed agenda. Whether military or political matters figure more prominently on the agenda it is impossible to say. The Conference appears to be regarded as the job of the Foreign Ministers exclusively—Marshal Stalin is likely to remain in the background and to reserve his contribution for the projected meeting with President Roosevelt and Mr Churchill. Guesses about the outcome of the Con-

ference will probably fluctuate between pessimism and optimism, simply because the negotiations are going on in the complete secrecy that most stimulates the imagination of journalists. Probably the Conference of Ministers will settle some points and leave the most debatable issues to the more authoritative meeting of the Heads of States; and expectations of sensational results from the Conference may well be disappointed. A good augury for the Conference may perhaps be seen in the reported reply of the Soviet Government to the British-American suggestion of the resumption of diplomatic relations between Russia and Poland, in which the Soviet Government expresses its willingness to put an end to the abnormal state of "suspended relations" with another Allied Government. A concession has also been made, according to report, on one of the points which has caused considerable uneasiness among the Poles; that is, it is agreed to recognise the Poles who have been transferred to Russia from Western Poland as Polish citizens. Apparently the Soviet attitude towards former Polish subjects from Eastern Poland remains unchanged, which suggests that Moscow is not prepared—at least for the time being—to curtail, let alone to withdraw, its territorial claims.

Fresh Start in India?

It is not necessarily any aspersion on Lord Linlithgow to say that the end of his protracted period as Viceroy, completed this week, is a great opportunity for both India and Britain. Nothing has been plainer during the past four years, when war conditions have harmed, first, the polity and now, through inflation and famine, the economy of India, than the fact that Indian distrust has become attached to British personalities—to Lord Linlithgow and Mr Amery especially. Political judgments are seldom fair, and history will decide merit or blame. Meanwhile, the melancholy procession of events—which began with the maladroit drafting of India, unconsulted, into the war; went on to the withdrawal of Congress in a huff from provincial administration; proceeded, despite negotiations, to the wretched deadlock which ended the Cripps Mission; and passed on to the imprisonment of Mr Gandhi and his colleagues after threatened revolt—has taken perhaps the ugliest turn of all. The only way to end the dreadful Bengal famine is to provide sufficient food at prices which poor people can pay. Months too late, food is being shipped to India, and exports to the Middle East have been stopped. The problem of price control is apparently much more difficult. The remarkable Indian war effort has been financed by means which have multiplied Indian purchasing power, while the stock of goods for purchase has fallen very sharply. Whatever the responsibility for the failure to mobilise, move and distribute India's food resources—and the provincial administrators, traders and growers, all Indian, must bear a big share—Britain and the British authorities will be held responsible, politically, for those who die of starvation from now. This is no time for moralising, but for the promptest and firmest action. Out of this latest episode, as out of the other Indian misadventures of the war years, one fact emerges clear as day: there has been an almost incredible lack of both foresight and understanding, not only on the British side. Perhaps Lord Wavell can bring a new sympathy and forthrightness to British policy; he has to hand an Executive Council which Lord Linlithgow has very largely Indianised and made responsible. If Lord Wavell fails, the last years of British rule in India will be shabby and embittered.

Electoral Machinery

The Parliament (Elections and Meetings) Bill which was presented to the House of Commons last week is concerned exclusively with the machinery of elections. Its object is to give legislative effect to the Government's recently announced decision to establish a system of "continuing registration" for civilian electors and a Service register for members of the armed forces and merchant seamen. Such a register should "reflect the shifting state of the population which now exists and may be expected to continue into its immediate postwar period." The Bill provides for a residential qualification of two months and brings into operation the national registration machinery. Service voters would be enabled to vote by post or by

proxy, as at present, and the Bill would cover seamen and civilians engaged on war work abroad. Most of its clauses deal with technical and administrative details, and the Bill is in the nature of an emergency wartime measure. It is incredible that it should have taken so long to devise what seems a comparatively straightforward scheme for bringing the electoral register up to date. The Bill does not go into the more fundamental issue (the second aspect of electoral reform on which the Vivian Committee reported)—the redistribution of Parliamentary seats. This matter is, however, bound to be raised when the House discusses Mr Morrison's Bill. There is general agreement among the parties that the present basis of distribution, which dates from the Speaker's Conference of 1917, is in drastic need of reform, the most glaring examples of anomalies being Romford, which returns one member, and Southwark, which has three. But there is less agreement about the method and timing of reform. Labour on the whole should stand to gain from a redistribution based on population; but on the basis of one member to 54,000 voters which would probably be adopted there would be a loss of about 16 seats in the London boroughs, that have long been a Labour stronghold. If the L.C.C.'s own rebuilding plan goes through, London's population would be further reduced. It is argued, with some justification, that the present distribution after evacuation, call-ups, transference may be no criterion for the future distribution, which cannot be foreseen, and that the Government should first give a decision on the Barlow and Uthwart Reports. But 1939 is surely a better basis for the next crucial election than 1917, and the issue transcends party politics. For the Labour Party to obstruct reform for party reasons would be disastrous folly. One solution would be to effect a redistribution on the 1939 basis, making provision for periodical and automatic revision, so as to ensure that the distribution of seats kept pace with the distribution of population.

Pay-as-You-Earn

The Government's decision to substitute a pay-as-you-go system of collecting income-tax for the present method of deferred collection was widely welcomed during the second reading of the Wage Earners' Income Tax Bill last week. Criticism fastened on two points. First, it was urged that the application of the scheme, as described in the White Paper (Cmd 6469), should not be confined to weekly wage-earners, but extended to all salaried employees. Sir John Anderson, Chancellor of the Exchequer, then expressed his willingness to extend the application of "pay-as-you-earn" to persons in receipt of salaries up to £600 a year. There is no justification for discrimination between existing taxpayers; as it is, the limitation will not in any case apply to new taxpayers starting with salaries of £600 or less, for the Chancellor has adopted the principle, "once on pay-as-you-earn, always on pay-as-you-earn." During the committee stage of the Bill, on Wednesday, an amendment, designed to apply "pay-as-you-earn" to all persons charged under Schedule E, was strongly pressed by members of all Parties. Sir John, in reply, expressed his sympathy with the principle of non-discrimination and wisely promised to reconsider the scheme before the Bill reaches the report stage. He raised no objection on administrative grounds. The second criticism is not so much a criticism of principle as of arithmetic. The examples given in the White Paper, and in a letter to *The Times* on October 9th by Mr A. T. Haynes and Mr R. J. Kirton, show that the tax tables in the original scheme do not in fact achieve what they are intended to achieve and what the White Paper claims they would achieve. Instead of tax deductions being "lower in the weeks in which the wages are lower and higher in the weeks in which the wages are higher," they often are not proportionate to weekly incomes at all. The deduction of substantially different sums on almost identical wages in different weeks would cause great irritation and perplexity and bring the whole system into disrepute. The absence of the pretended direct correlation between tax deductions and wages is a serious defect. Fortunately it is a defect which is not inherent in the cumulative principle of calculating tax, and it is one that can be removed simply by better arithmetic. During the second reading of the Bill Mr Ascheton, Financial Secretary to the Treasury, promised that the tax tables would be recast "to eliminate some of this trouble as far as possible."

Democratic Planning

It is refreshing indeed to find an expert planner who is anxious to give the people what they want and not what the professionals think they ought to have. There are, of course, limits to democratic choice in technical matters, simply because the ordinary citizen is not technically skilled; the details of world currency arrangements, for instance, cannot be decided by majority vote. But the objectives, even of currency plans, must be decided by the citizens; and in the case of physical planning—that is, the design and arrangement of the places in which ordinary men and women have to live and work—democratic choice should have the deciding voice in the details as well as the objectives. The responsibility of town and country planners, therefore, is to focus public opinion upon these problems in order to marry popular preferences with expert programmes. This was the important point made by Mr F. J. Osborn, of the Town and Country Planning Association, in a recent speech to the Town and Country Planning Summer School; he is worried about the extent to which planning programmes and popular preferences have got out of step since the bomb damage done in 1940 and 1941 made rebuilding a matter of common concern and widespread enthusiasm. Mr Osborn has already made a distinctive contribution to town planning principles on the economic side, by his demonstration to all kinds of audiences, including the Barlow Commission, of the inevitable economic effects of business congestion in city centres, in terms of the choking of traffic, the sprawling of suburbs, the waste of time, energy and health, and the destruction of amenities. Now, he has turned to the politics of planning.

*

There is, he argues, an almost universal desire for better living conditions, a revolt against squalor and congestion. But, he claims, the majority of planners are translating this desire into terms that have no reference in the popular will and imagination; they emphasise specialised problems of design and lay-out, architectural and other fashions, while the mass of the people, with whom they are out of touch, remain prepared to accept suburbs, ribbon building and long journeys to work, in return for decent houses and gardens. In other words, Mr Osborn believes that, in their preoccupation with "design," these planners have ignored the individual home, the house and garden type of dwelling that most ordinary families want and need. "I am myself a partisan in this matter of aims," Mr Osborn admits that his "bias" is against the provision of flats instead of houses in order to make "tidy" plans possible, and other planners can reply, with undoubted justification, that the rebuilding of cities entirely in terms of houses and gardens is an impracticable proposition. But Mr Osborn is surely right in his contention that planning must be practical politics, not a cult, and that the bias should always be towards what the people want—which is, without doubt, houses with gardens, wherever possible.

The Catholic Schools

Further criticism has been made by the Roman Catholics about the White Paper proposals for the non-provided schools. In an address last Saturday, Dr Downey, Archbishop of Liverpool, described them as unjust, as placing a staggering burden upon the Roman Catholic community, as asking them to undertake a huge financial liability,

the precise magnitude of which it is impossible to forecast, the only certainty being that it is something quite beyond our capacity to bear.

Dr Downey was himself unfair to the Board of Education's proposals, or he would have admitted that they improve the financial position of the non-provided schools considerably. At present, the churches have to provide the cost of all repairs, alterations and improvements to their elementary school premises, except repairs which come under the heading of fair wear and tear, and are then undertaken by the local education authority. The latter also pays the teachers' salaries and is responsible for other items of maintenance. Under Alternative B of the White Paper, which was expressly drawn up for the benefit of the Catholic community, maintenance charges will continue to be paid by the LEA, and in addition a 50 per cent grant will be made from the Exchequer for alterations and improvements,

while, as regards repairs, the churches will only have to be responsible for external repairs—and half of these will be met by the Exchequer—the LEA paying the cost of indoor repairs and repairs to playgrounds and so on. Thus, only a small part of the upkeep of the schools will rest on the churches, which, however, will continue to appoint their own teachers and retain the right to give denominational religious instruction. Moreover, these proposals will also apply to Catholic secondary schools, which now receive a *per caput* direct grant from the Board. It is difficult not to feel that Dr Downey's prediction of a huge financial liability was, in these circumstances, a little misleading, particularly as steps are being taken to standardise the planning of schools, which should limit "the precise magnitude" of the liability.

*

It is the case of completely new schools that is, as Dr Downey said, really troubling the Catholics, because they will have to bear the whole cost of building them. Yet they should realise that the financial assistance already given to the churches is considered over-generous by a large section of the people. If the state were to use the taxpayers' money to make grants or interest-free loans for the building of new schools by all the various religious denominations—for it could not be restricted to Catholics alone—it would merely be perpetuating and aggravating the evils of the dual system and would create widespread opposition. Moreover, the Catholics so far seem to have been able to borrow the money they want for educational purposes from other sources. Between 1903 and 1908, the number of new Catholic schools increased by 208, when those belonging to other denominations fell by nearly 4,000.

Ukrainian Manganese

Nikopol, the centre of the Ukrainian manganese district on the west bank of the Dnieper, is 45-55 miles from the present battle front between Zaporozhe and Melitopol. Before the war this district supplied more than a million tons of manganese ore of an average metal content of

JAEGER

Facts

1. Wool does not become damp like cotton or linen.
2. Wool is warmer in winter and cooler in summer because it is a slow conductor of heat.
3. Wool ventilates the skin, so keeps it in good condition.
4. Wool is just as important in bed.
5. Wool therefore is best for health and comfort.

J.W.B.

30 per cent; and roughly one-third of Russia's total manganese output, the biggest in the world, came from the Nikopol mines. Manganese is an indispensable ingredient in steels that must be particularly resistant to shock and wear. For more than two years Germany has been in possession of the Nikopol area which was during that time far removed from the battlefields; and there is no doubt that special efforts were made to put the mines back into working order. In November, 1942, the German press reported that a total of 165,000 tons of manganese concentrates containing 48 per cent of metal had already been shipped to Germany, that is, roughly a third of the ore produced annually before the war. At the end of August this year the *Deutsche Allgemeine Zeitung* stated in general terms that an appreciable output had been achieved. On the other hand, it was admitted that, because of the destruction of the processing plants, output had not reached expectations. It seems likely that, under German administration, the Nikopol mines produced only a small part of its former output. During the two years total output of ore may have amounted, on the basis of the various German statements, to some 300,000 tons. Between 1935 and 1938 Germany imported, on an average, 400,000 tons of manganese ore a year. Home production was negligible. In other words, Germany secured from Nikopol in two years the equivalent of three-quarters of its pre-war annual imports. Austria and Czechoslovakia produced 200,000 tons of ore before the war. If the pre-war output of Roumania, Italy, Hungary, Yugoslavia, Bulgaria and Greece is added, the pre-war production of Germany and the countries under German domination amounted to 300,000 tons of manganese ore, again three-quarters of Germany's pre-war imports. Probably production in Slovakia, Austria and Roumania has been considerably increased. The likely loss of the Nikopol area will throw Germany back on the resources available before the attack on Russia. This means considerable fresh difficulties, but no immediately crippling effect.

Bombs on Ball Bearings

The Flying Fortress raid on Schweinfurt on October 14th struck at the heart of German war production. Its objective was the destruction of the important ball and roller-bearing manufacturing plants of the Kugel Fischer AG and of the Vereinigte Kugellagerfabriken AG (which includes the Fichtel and Sachs company), the large German subsidiary of SKF, Goeteburg, the Swedish ball-bearing combine, which is the parent company of most of the world's manufacturing plants. Ball-bearings and roller-bearings are vital for every moving part of military equipment, such as aeroplanes, tanks, guns and armoured vehicles. A serious reduction in the supply of ball-bearings would cripple output much more effectively and rapidly than the destruction of individual aircraft, tank or other munition assembly plants which, normally, produce only a comparatively small proportion of total output. The effect of the raid on Schweinfurt depends on the actual damage done to its factories and on the proportion of Germany's total supplies of ball-bearings obtained from them. Photographs taken suggested that at least half of Schweinfurt's ball-bearing and roller-bearing manufacturing capacity had been destroyed; and later reconnaissance indicated that the damage was even more extensive. Last Sunday Brigadier-General Anderson, Commander of the United States Eighth Army Air Force, Bomber Command, pointed out that all the works had stopped work, and that it would take some time to restore even "25 per cent of normal productive capacity." According to this account, supplies from Schweinfurt have been virtually eliminated, at least temporarily. General Anderson also said that the Schweinfurt factories contributed "over half of all Germany's bearings." This estimate must be regarded with some caution, for Germany, like Britain, has attempted to reduce the vulnerability of vital productive capacity and to ensure continuity of supplies in case of damage by decentralisation. The fact that several large concerns were domiciled in Schweinfurt does not necessarily mean that all their plant was in that town. There are factories in other industrial centres whose combined output is substantial, but it is impossible to give any precise estimate of their contribution to total supplies. Schweinfurt was the central source of supply, and even if output elsewhere can be stepped up, it cannot be increased quickly. Moreover, it is quite possible that Schweinfurt supplied more than half of the bearings used in specific mechanisms,

and that its destruction will seriously affect the manufacture of these. Apart from its own supplies, Germany also obtains ball-bearings and roller-bearings from Sweden, Switzerland and France. Sweden supplied Germany mainly through its subsidiary, and it is doubtful whether direct exports cover more than 5 per cent of German needs—though it should be added that the type of bearings supplied by Sweden is vital to Germany. Switzerland's contribution is considered to be less important than Sweden's, and that of France has been substantially reduced as a result of the damage caused last September to a factory in Paris, which apparently produced half of the output of France. In sum, while anything like a detailed assessment of the effect of last week's raid on Schweinfurt upon German war production is impossible at this stage, such evidence as is available suggests that it may be very serious indeed.

Producers' Agreements

The defence of agreements among producers creating *de facto* monopolies has shifted on to fresh ground. It has been argued, in an article in *The Times* and elsewhere, that cartels, international agreements on production and prices, are a boon to all. Output is stabilised; costs are reduced; prices are steadied. This can, of course, be so; producers can secure enhanced efficiency by working together, and the consumer may benefit. The test is whether he does or not. *The Times'* article argued that "the more stable price level may be lower than the mean of an unregulated curve of high and lower prices." So, indeed, it may be; but is it? There is no case at all for relying upon the word or "conscience" of monopolists, national or international, about their desire to employ their plants fully, and so to reduce costs and prices. What is imperatively needed is ways and means of putting these aims to the test on the community's behalf. "The higher gain in reduced costs is forgotten by critics," says *The Times* correspondent; is it also forgotten by the cartel producers? Publicity for all cartel agreements, proceedings, production and price arrangements is indispensable. In addition, Government representatives should be present at their meetings, and expert Government bodies should supervise their activities and check their prices. The apologists of national monopolies and international cartels now accept these controls in principle; and their offer—made in the heat of argument, it is true—should be promptly accepted.

Retailers' Poll

In a poll taken by the National Chamber of Trade retailers have voted, by four to one, to retain a system of licensing for shops after the war. The main reason given is that the restriction of numbers this way would be "preferable to the chaos and inequity otherwise to be feared." A breakdown of the votes reveals one very significant fact: while the trade associations voted by six to one for licensing, individual retailers supported it by only two to one; shopkeepers have never been so sure as their associations about the virtues of restraining trade, ostensibly in their interests. The only doubt expressed by established retailers about the future of licensing is the dislike of its operation by the Government; it is widely held that local committees of restraint of shopkeeping, its preservation for present shopkeepers, with an exception in favour of admitting ex-Service men, an urgent matter which is, however, being used to confuse the issue. The issue is, quite simply, that by one means or another would-be shopkeepers are going to be debarred from business, if the trade has its way. It is an under statement to say, as the Chamber suggests, that "such a measure of recognition and assistance would also involve a measure of control"; and the more directly licensing powers are exercised by interested parties, the greater and more stringent must the measure of Government control be.

Post-War Exports

After the last war, two reports, one in 1918 and the other in 1925, laid stress on the need for state aid in the improvement of commercial facilities for British traders abroad. The same need will arise when this war ends. The first requisite for successful exporting is, of course, efficient

manufacture; and skill, enterprise and efficiency are far more required than State aid to secure this. But, for the next step, selling abroad, some help in strategy and tactics is demanded. Mostly, the export problem is discussed in defensive terms, with proofs of the necessity of protection against foreign competition, fair or unfair. The positive technical points made in a recent article in the journal *Engineering* are much more relevant. Even the best and cheapest goods cannot be sold abroad unless they are the goods that foreigners want. Better Government assistance, through the foreign and consular service, in examining markets and selecting agents is desirable; indeed, it would be practical wisdom to attach to every Embassy and Consulate a commercial department, staffed by men with practical experience to advise manufacturers and traders. Nor will it be possible to sell even the goods that foreign purchasers want if the exporters of other countries can give better terms of credit. The Government must be prepared to extend credits and take risks in sound business transactions much more flexibly and freely than in the past. As in so many other instances, such a policy will require the recruitment and use of quite new kinds of administrators, a problem which is examined, for the home Civil Service, in an article on page 544.

Standby Duties

Last Saturday's statement by the Ministry of Home Security limiting stand-by duties in the Civil Defence services is welcome so far as it goes. But it is doubtful whether it will do much to relieve the strain upon part-time personnel, who are already fully occupied in doing their daily work. In the first place, it is simply a request to local authorities; it will be construed and action taken upon it by full-time salaried personnel, whose attitude to the question is very different from that of the part-time unpaid volunteer who still does the bulk of the night-time work, at least in the wardens' service. But even if the spirit, as well as the letter, of the Ministry's intentions is carried out, there will remain two main grounds of complaint, in both of which the local authorities have fallen far short of the intentions of the Ministry—although where the fault lies is another matter. They are the character of the training and the conditions during duty at the post. On the former point there is more than ample insistence, extending in some cases to threats of prosecution for non-compliance (which should not be gratuitously extended to volunteers), upon attendance at lectures and exercises, but very little attempt to ensure that either the lecture or the exercise shall do anything to increase the efficiency of those who attend. The supply of good lecturers is limited; but, even if it is assumed that civil defence personnel are incapable of absorbing information through the written word, it should not be impossible to supply those who have the time to lecture with the necessary material to make their statements comprehensive, and to attempt some measure of codification of the host of disjointed instructions at present issued. Conditions at the posts, again, are frequently not such as to allow those who are not required to be awake to obtain adequate rest, and the practice of keeping one watcher awake for every square mile of territory covered, as is frequently done in the case of wardens, might well be reconsidered; one in every four, or even nine, square miles would be equally effective to give a district alert on the rare occasions when the sirens fail to provide adequate warning.

The Hereford Case

Hard on the discussions in the press about the right age for magistrates of juvenile courts came the rebuke given by the High Court to the juvenile magistrates of Hereford. These magistrates had convicted a boy of 11 of breaking and entering certain premises, stealing goods and doing malicious damage and had sentenced him to be birched, taken away from his parents and handed over to the control of the local education authority until he was 18 years old. This was a monstrous and stupid sentence to impose on an eleven-year-old child, but it was not only the terms of the sentence but the manner of the conviction that was at fault. In the words of the Lord Chief Justice, the action of the justices went far beyond irregularity of procedure and amounted to a denial of natural justice. . . . There was not only a neglect of the statutory provisions, but a lamentable breach of the principles for the administration of the criminal law with which all justices ought to be familiar.

Everything was done wrong that could be done wrong. . . . The proceedings were irregular throughout and the conviction must be quashed.

To the discussion on the right age for a magistrate of a juvenile court, the Hereford case contributes very little, though it is worth noting that all three magistrates concerned were aged about 60. The gross blunder against justice and good sense that they committed is just as likely to have occurred if they had all been ten or more years younger. A wise magistrate and a humane magistrate does not lose his wisdom and his humanity with his youth, provided that his capabilities are unimpaired, and the lesson of the Hereford juvenile court bench is not that the magistrates ought to have retired when they reached the age of 50 or 55, but that they ought never to have been appointed at all.

A further point raised is whether the principle of bringing children before juvenile courts for all offences, major or minor, is having the effect that was intended. Juvenile courts were set up, said the Lord Chief Justice in his judgment, to secure the welfare of the child. The very worthy aim behind them was that an attempt should be made to get behind the charges of destructiveness, pilfering and so on, to find out the home and social background of the young offender, and to treat the case accordingly. But, owing to the character of so many juvenile benches, all that is happening is that far more cases are being brought to the courts without any advantage accruing to the offenders; in fact, the psychological atmosphere of the whole proceedings often leaves the child in a worse state than before even if he is discharged or placed on probation. If he is so unfortunate as to become a *cause célèbre*, the daily press, for its own ends, then makes him a national hero and in the warping of his character finishes off what the magistrates began.

Workmen's Compensation

The Workmen's Compensation Bill came up for a second reading this week. It was first planned to come into

NEWS of WHITE HORSE

*Supplies of White Horse were growing
old when this war was young*

If you have wondered how it is that you can still get White Horse Whisky from time to time, and how it is that the quality and flavour of this famous whisky were never better than to-day in this fifth year of the war, here is the answer in one word . . . age.

All the flavour, fullness and smoothness of the White Horse you have known in the past is in the White Horse you may buy to-day. For to-day's White Horse is itself a whisky of the past. In the early days of the war it was already growing old. It has been ageing ever since.

It was the stocks of maturing whisky, laid down in years gone by with a prudent eye on the future, which provided the great blend that is White Horse to-day. And our unrelaxing, provident care of the whisky still maturing is your assurance that this famous Scotch will remain as always — whisky fine as a fine liqueur.

operation on August 30th, but had to be postponed. The Bill is admitted on all sides to be a compromise, and it has been accepted by the Trades Union Congress and the Labour party in that sense, that is, without prejudice to the fundamental reform of the Workmen's Compensation Acts which is so long overdue. Under the terms of the Bill, the rate of compensation for single persons is increased from 35s. to 40s. a week, at the end of thirteen weeks of incapacity; married men are to receive an increase from 35s. to 40s. from the beginning of incapacity, which will be raised to 50s. after thirteen weeks; children's allowances are raised from the present level of 4s. for the first two children and 3s. for the others to a uniform rate of 5s. per child; and the minimum in fatal cases is raised from £200 to £300 and the maximum from £300 to £400. These increases would, it is estimated, cost the employers from £16 million to £20 million a year. The Bill has been severely criticised by Labour, and in particular by miners' M.P.s. They consider that the amounts of the increases are totally inadequate and that the proposals are an unjustifiable discrimination against the unmarried man. In coalmining, in particular, a high proportion of accidents happen to youths of 18-20, and over three-quarters of the accidents are of less than thirteen weeks' duration. The miners are also pressing for an increase in the allowance for fatal accidents and for a revision of the whole procedure of litigation; they want to substitute a Board for single referees. Compensation was one of the demands raised by the Mineworkers' Federation in their recent memorandum to Major Lloyd George. The long-term reform of the Acts will probably give rise to equal controversy. Workmen's compensation was the chief point of disagreement between the Beveridge committee and the National Council of Labour. The Beveridge proposals are certainly more generous than the present rates or those proposed under the new Bill. Under the Beveridge scheme a single man would get 24s. a week; a man, wife and two children would get 56s. a week during the first 13 weeks, and thereafter a disability pension of two-thirds of the man's earnings up to a maximum of 76s. and a minimum of 56s. per week. At present a man earning £3 a week and over with a wife and two children gets 43s. and, under the new Bill, 50s.; after thirteen weeks, they now get 43s. and would under the new Bill get 50s., or 60s. in the case of earnings of £4 a week and over. Labour's proposal is 30s. for a single man, four weeks instead of thirteen weeks before the disability pension is introduced, and 75 per cent instead of 66½ per cent of earnings with a maximum of £5 a week and a minimum of £3 a week.

Shorter Notes

Lord Beaverbrook's report to the Lords on Wednesday about last week's informal Commonwealth Conference on civil aviation was encouraging. Complete agreement was reached, as it had been earlier by Mr Churchill and President Roosevelt, but nothing will be decided until an international conference can meet—including, particularly, Russia; and "any international air transport authority" will be associated with, and responsible to, "any United Nations security organisation which may be established."

The third agreement for the provision of Allied supplies to Russia was signed in London this week. It continues the existing arrangements, but for the first time Canada is one of the signatories. Hitherto, Canadian supplies have formed part of the commitments of the United Kingdom or the United States, and the recognition of the Dominion as a supplier in its own right is a measure of its increasing industrial importance.

In a debate on the Fire Guard Regulations, 1943, this week, Mr Herbert Morrison announced that payment for fire guard duty is to be standardised. Hitherto, whereas most fire guards are paid 3s. subsistence allowance a night, some, who entered into agreements with their employers before fire guard duty became compulsory, are paid considerably more, and the existence of different amounts of pay among the same body of fire guards has caused a great deal of dissatisfaction. From about next April 1st, all fire guards will be paid the standard rate of subsistence allowance.

On Wednesday, a meeting of representatives of the Governments of Australia, Belgium, Canada, China, Czechoslovakia, Greece, India, Luxembourg, the Netherlands, New Zealand, Norway, Poland, South Africa, the United Kingdom, the United States and Yugoslavia, and of the French Committee of National Liberation, decided on final arrangements to set up in London a Commission for the Investigation of War Crimes.

AMERICAN SURVEY

The Senate Goes In

A statement closely resembling the Fulbright Resolution has been presented by a sub-committee to the Senate Foreign Relations Committee. The operative sentence reads:

It is resolved by the United States Senate that the United States, acting through its constitutional processes, shall join with the free and foreign nations in the establishment of an international authority with power to prevent aggression and to preserve the peace of the world.

Even those who had hoped for a more forthright endorsement of the use of force, and deplore the cautious wording, agree that anything more drastic would stand small chance of securing a two-thirds majority in the Senate. In its present form, Senator Connally has expressed his confidence that it will be adopted. Meanwhile, the Senate has set machinery in motion for hearings on Lend-Lease before the Truman Committee and the Appropriations Committee. According to Senator Nye, all funds made available to foreign countries will be investigated, whether through Lend-Lease or other agencies. The charges which have made the greatest impression and probably will be the subject of the hearings appear to be these: that Britain has taken credit due to the United States for Lend-Lease supplies; that she has resold Lend-Lease products abroad; that she has accepted under Lend-Lease supplies like

petroleum which the Empire could provide; that Britain has been reimbursed for some cash purchases, which were eventually charged to Lend-Lease; that there is no guarantee of access after the war to airfields built abroad by the United States; and that, finally, reverse Lend-Lease is not all it might be. No doubt if the investigation is full and free, the air may be cleared, although it should be said that Senator Nye's participation is no guarantee of freedom from bias. That bias is not, unfortunately, confined to Senators. The most alarming thing about many of the statements attributed to the five Senators and to critics of Lend-Lease like Senator Ellender is not the specific charges themselves or the hard feelings they cause. It is the way they tend to confirm and reflect the suspicion of other countries which as yet is endemic in the United States. No matter how clearly a charge is shown to rest upon faulty or incomplete information, there are too many Americans who will persist in thinking "no matter about the figures; the underlying intuition is right; no smoke without fire."

Common Ground

It is very striking that in their remarks on foreign policy last week both Mr Willkie and Mr Sumner Welles spoke of the dangers of exclusive alliances, and urged that all the material and moral resources of the United States

should be bent towards creating a firm understanding between the four Great Powers as a nucleus round which there can be built a world organisation of all the nations. Both saw, as the only alternatives, chaos or a temporary balance of power system which would divide the world and lead once more to war. Both emphasised that the importance of security from aggression was to provide a basis for the expanding economic activity that is the only permanent guarantee of peace. Mr Willkie's address is widely regarded as the opening of his election campaign for 1944; it followed the form of a political platform and dealt largely with the future of the Republican Party. Mr Welles, on the other hand, was speaking purely on foreign policy to the Foreign Policy Association, and he had more scope for developing his ideas. Briefly, these were that the "irreducible minimum" which Americans must demand of victory is security from future aggression, security for American institutions, and the development of American resources. In his view, this requires that, in the near future, the four Great Powers come to a clear-cut agreement covering the task of immediate post-war policing; arrangements for the reduction of armaments; a policy of realistic justice for the Axis Powers; an understanding that none would take independent action affecting the sovereign rights of any nation without the concurrence of the other three; and, finally, steps towards the creation of a universal world organisation in which the proposed Four-Power Pact would eventually be merged. Mr Welles argued that, without this final step, the securing of the confidence and participation of the rest of the world, such a Four-Power Alliance stood in danger of becoming a Four-Power Dictatorship. Both Mr Welles and Mr Willkie made powerful pleas for the Government to make clear its belief in these objectives, and to take a bold lead. It is all to the good that there should be this pressure, from such diverse sources, for a more courageous stand on foreign policy than the Administration has yet felt it prudent to adopt. To this end, Mr Welles and Mr Willkie make an effective team. With his experience, his authority, and his unquestioned ability, Mr Welles may yet prove to have nearly as profound an influence on shaping foreign policy outside of office as he had in.

The Darker Side

There is a darker side to the agreement between Mr Willkie and Mr Welles upon the need for a Four-Power agreement. It is unlikely that either would have spoken so vigorously had he not been conscious of a dangerous trend toward the idea of exclusive or partial alliances. Mr Willkie is thought in some quarters to have been answering Governor Dewey's cautious endorsement of a continuing Anglo-American military alliance. In the narrow view of party politics this may be true; but he certainly is also aware that more unsavoury elements are preparing to climb on the band wagon of "collaboration" to divert it to their own ends. It is worth noting that the *New York Daily News*, the most influential organ of the isolationist press, has recently announced its conversion to the idea of a continuing Anglo-American military alliance. In the definition of the *News*, such an alliance would involve common action where the safety of both is at stake; but where the United States felt its interests were not involved it could go its own way. This is not only a policy of excluding Russia, although that is an integral part of it. It is a policy of partial insurance for a game of power politics, which would rule out any recognition of American responsibility for the creation of a free, secure, and prosperous world order. It is a policy which is tailor-made for those interests which regard the post-war world as America's oyster. It is collaboration for exploitation; and it is attractive to those who wish to retain the maximum of freedom of action with the assurance of a friend at hand in case of trouble. Happily, there is another school of thought which can be counted upon to settle for nothing less than all-out collaboration with all freedom-loving peoples, and it is fortunate to have the leadership and encouragement of men of Mr Welles's and Mr Willkie's calibre.

Coal Deadline

Last week's strike in the Alabama and Indiana coal-fields was a sharp reminder that this winter's coal is still in jeopardy through the failure to agree upon a new con-

tract, and that the deadline—October 31st—is not far off. This is the end of the "truce" fixed by Mr John L. Lewis after the end of the third strike last spring. This last stoppage was short-lived, but the credit for that goes to the mine-workers' chief and not to the authority of the Government. Mr Lewis's message to the miners makes it clear, however, that he has retreated no more than the miners from his earlier grievances: "Each mine-worker will again sacrifice his personal interest and subordinate his righteously outraged feelings and return to work." The occasion of this last stoppage was the return of the mines to private ownership, according to the provisions of the Smith-Connally Act. Mr Lewis agreed to the extension of the truce to the end of October, on the assumption that the mines would continue to be held by the Government—an escape clause which was later explained by the *Mine Workers' Journal* to be designed to protect the miners against "chiselling" of wages and standards by the operators. The calling of the strike—unauthorised as it was—cannot have been entirely unwelcome to the mine-workers' leadership. It heightens the pressure on the War Labour Board to publish its decision on the Illinois contract, and to make its findings favourable. The contract provides for an average increase of \$2 a day, on the grounds of a longer working day; and it includes payment for time spent in underground travel—the "portal to portal" pay which the War Labour Board has already declared impossible to accept because "it constitutes a hidden wage increase." To become operative, the contract must secure the approval of the Office of Price Administration, as well as that of WLB, as it will necessitate a rise in the price of coal. Approval would be a bitter pill for the WLB to swallow, and it might increase the restlessness over wages which is already noticeable elsewhere. But Lewis is in a strong position. He has chosen his time well: because of the difficulty of storage, the onset of winter is the traditionally favourable moment for negotiating a new contract. He has followed his old trick of getting the consent of the relatively well-placed mid-western operators as a means of forcing the southern operators into line. It will tax the ingenuity and courage of the Administration to reconcile justice to the miners and coal for the war with the demands of the anti-inflation programme.

THE WORLD OVERSEAS

Algerian Rehearsal

SINCE the guarded recognition of the French Committee of National Liberation by the Allied Governments Algiers has had the taste of sovereignty. The capital of North Africa has become the temporary capital of France, the seat of an authority that grows more and more real with every day. At first, there was a sense of emotional exhilaration and enthusiasm which tended to hide the hard issues of very difficult realities. By now, the emotional mist has been nearly dispelled; the first spontaneous hailing of La France Combattante and its leader is over; and the minds of the Committee, as well as of the people in the overcrowded towns of the North African coast, have turned rather more closely towards the very concrete economic and political tasks with which they are confronted.

Corsican Stepping Stone

The liberation of Corsica was received with justified joy. The distance between Overseas and Metropolitan France has been shortened. But the situation in Corsica on the morrow of its liberation—the difficult food position and the political complications—has served as a reminder that the process of liberation of France will leave only very little time for holiday-making, and that the grey background of a land devastated and impoverished by hostilities and

enemy occupation will not be the most fertile soil for superficial *mystiques* and personal cults.

Food for the People

In North Africa the most important problem is still food. In normal conditions, North Africa used to provide a considerable export surplus of foodstuffs. Under Vichy, this food surplus helped Metropolitan France to cover part of the deficits caused by German requisitioning. In theory, North Africa ought now to be able to feed its own population. The Allied armies should not have caused any crippling drain on the country's resources, since, according to all statements, they rely on their own imported supplies. True, the output of local agriculture in the current year must have been below normal, because of the call-up and the shortage of labour, and because agricultural machinery and tools have not been renovated for a long time. Tunisian farming may not have recovered from the effects of fighting.

Even so, there seems to be general consent in North Africa that the grave food position is not due to the decline in production, but to maldistribution. This has partly been caused by the dilapidation of civilian transport. The lorries of the farmers have not been repaired or renewed for some years; the railways have to give priority to military traffic. Civilian goods traffic would normally require a turnover of a thousand trucks a day, and the number of trucks available is 350-400. The position has partly been relieved by the detailing of military lorries for the transport of food. It seems, however, that the main cause of the insufficient supply of agricultural produce lies in the fact that the producers' demand for industrial goods is unsatisfied, a difficulty which cannot be overcome quickly.

In the meantime the black markets are flourishing—to quote the description of a French correspondent, "even more than they did under Vichy." People have to resort to the black market if they want to maintain a normal standard of living; "and one only wonders how people with low wages make ends meet." The economic agencies of the Committee of Liberation pass resolution after resolution about the need to combat the black markets; in practice, the matter does not seem to have gone beyond this stage. Nor does the political atmosphere favour an improvement. The press is not free to discuss the food position frankly or to reveal civilian malpractices or the inefficiency of the Administration.

Against this background the far-reaching plans made by some members of the Committee have a touch of economic escapism. Some days ago the Commissioner of Labour, M. Tixier, outlined a broad programme of nationalisation for all the key industries of France. It does not seem likely, however, that M. Tixier's *exposé* has the official support of the Committee of Liberation as a whole—though it did seem to reflect pretty accurately the radicalism of the trade union audience to which M. Tixier was speaking.

The Franc

Another economic issue, the exchange rate between the franc and the pound, has recently been discussed by M. Istel, the French delegate to the inter-Allied negotiations on currency. M. Istel has argued that the wartime decline in the purchasing power of the franc has not been substantially greater than the similar decline in the purchasing power of the pound; and that at its 1939 rate (176 francs to the pound) the franc was an under-valued currency. M. Istel did not make clear the purpose of his statement. He neither mentioned any suggestion about any further devaluation of the franc, to which his statement might have conceivably been a rejoinder, nor did he himself suggest any revaluation of the franc. But it is obvious that, with the food position, the currency problem is a

major preoccupation at Algiers; and both problems are likely to be discussed by M. Monnet in the course of his present visit to Washington.

The Political Issues

The political issues on which public interest has recently centred have been the proposed reshuffle of the Committee of Liberation and the recently announced creation of a Consultative Assembly. The outstanding feature of the present position is that, after a period of eclipse, the political parties are now reasserting themselves in France as well as in North Africa. There seems to be less and less ground to expect that General de Gaulle's organisation will really be able to substitute itself for the old party system. True, Fighting France is the leading organisation of resistance in France itself, and, as such, it is recognised by most political movements. But there are many indications that these movements are not prepared to abdicate in favour of Fighting France—though they are anxious to secure close collaboration with it. The Socialists in France made their attitude clear some time ago. A similar line has now been taken by the Radicals, whose representative, M. Marc Rucart, has arrived in Algiers. M. Rucart was one of the foremost leaders of the Radicals before the war, and he played an important part in rebuilding the party in Underground France. His arrival at Algiers fills what was until recently a very important gap in the political set up there, for he speaks with the full authority of the great and influential movement which was the main element in the history of French parliamentary democracy.

The Communist Party, too, has pledged its full support to the Committee of Liberation, after the ban on its activities was raised on June 25th. At the same time it has been critical of the political ambitions of *Gaullisme*. The balance of political forces in North Africa has undoubtedly been somewhat distorted by the chance preponderance of the Communist Party on the spot. While the other political groups have their "general staffs" and parliamentarians in France itself, the CP has benefited from the fact that its leaders and deputies, imprisoned by Daladier and later transferred to Algiers, have now been freed. The leading Communist group, consisting of 27 deputies, has now been strengthened by the arrival of André Marty from Moscow. This gives the Communists relatively more weight and influence in North Africa than they would have obtained in conditions in which all political tendencies enjoyed an equal start.

Democracy and De Gaulle

However incomplete or accidental the representation of the political parties in North Africa may be, the mere fact of their presence is beginning to tell. Some reshuffle of the Committee of National Liberation which would leave more scope for general political activities is envisaged. At the same time, the decree of the Consultative Assembly of September 23rd provide for mixed representation of the political movements and of the Gaullist organisations of resistance. The decree caused a great deal of well-justified criticism. The functions of the Assembly are to be only advisory; the responsibility of the Committee to the Assembly has been conceived in a somewhat Pickwickian manner; the duration of the sessions and the right of the deputies to question and control the Commissars are elaborately restricted. Paradoxically enough, an Executive, which itself cannot claim any normal, constitutional origin, denies to its own quasi-parliamentary body the right of effective control, on the ground that that body has not been elected in a constitutional manner.

There can be no doubt that General de Gaulle has not yet gone even half-way towards meeting the demand for more representative and responsible Government. Yet, it is clear that this demand has not been altogether ineffective; and the fact that the Consultative Assembly is only a half-measure is not only due to the tendency towards personal rule, but also to the fact that democratic counter-pressure is still inadequate. The reassertion of the political forces of French democracy is still in an early stage.

The same situation is reflected in the strange contrast between the freedom of speech and assembly which is now reported to prevail at Algiers and the denial of freedom to the press. In the extraordinary duel between democracy and a personal *mystique*—a duel which accompanies the wider struggle for the liberation of France—democracy is slowly regaining ground. Whether it will be able to consolidate and extend its gains will depend entirely on its own self-confidence and courage.

CORRECT LIGHTING is an extra eye

WHEN eyes have to be "everywhere at once"—as they need to be on so many jobs—a third eye would be immensely valuable. Unfortunately, nature consistently refuses to provide more than two eyes. But workpeople can be given perfect *seeing* conditions, and that is often as good as an extra eye.

EASY SEEING CURBS WASTE— People who have not made a study of lighting are sometimes difficult to convince that correct lighting makes an enormous improvement in working conditions and output. But in factories where careful tests have been made it has been established that improved lighting has sent

output up by as much as 25%. Furthermore, there is evidence that "good seeing" reduces accidents—accidents to personnel, materials and machinery—and also, by eliminating strain, reduces the number of workers absent through minor ailments.

—AND RAISES EFFICIENCY

In good light—which is fitness-for-purpose light—a worker's interest is sustained; because he or she does not suffer from premature fatigue. Manual dexterity is increased; reactions are quicker; the whole standard of efficiency improves, particularly where trainees and elderly people are employed.

All who are interested in "BETTER SEEING" are invited to communicate with:—

Eire's Post-War Economy

[FROM OUR DUBLIN CORRESPONDENT]

October 4th

THE post-war economic policy of Eire is doubtless receiving attention in official quarters, although no public signs of that attention are very evident. The problems that will need solution may be exceedingly difficult, and may demand a revision of accepted standards along totally novel lines. For example, it is by no means certain to what extent Irish agriculture will retain its old status as a great exporting industry. It is generally agreed that Great Britain will maintain agricultural production at some level higher than before the war, and there will be eager and intense competition for the reduced British imports by agricultural countries all over the world. Eire is, relatively to some of these competitors, a closely settled country of small farms, and therefore a high cost producer. Its export of many commodities has been maintained only by means of subsidies. The one farm product that can defy all competition is store cattle. This is, however, a product of extensive farming, and Irish agricultural policy after the war will almost certainly aim at more intensive farming in the interest of giving employment to a growing population, and possibly to numbers of returned emigrants. All recent experience indicates that the interest of the export trade will be regarded as secondary to that of providing employment.

It is not suggested, of course, that Irish agricultural exports will not continue. Their continuance is absolutely necessary, and must be encouraged by every measure of research and education that can be devised. What is suggested is that it may become essential to discover new varieties of exports to supplement agricultural exports in paying for future imports. The only invisible export which might be expanded is the tourist industry. The question arises—and it certainly is easier to ask than to answer—whether some new exporting manufacturing industries could not be established. Eire is not the only agricultural country faced with this problem to-day.

The problem of providing employment for the population which is in excess of that necessary for agricultural production has hitherto been solved in two ways. The first way has been emigration, which wedded Irish labour to capital abroad. Emigration is not likely to be maintained at its present level after the war, and, in any event, it is devitalising and undesirable. The second way has been the protection of a large range of secondary industries. It is unquestionable that these industries have provided much employment. From the point of view, however, of helping to preserve equilibrium in the balance of payments, they have proved disappointing. The depression which they have experienced during the war demonstrates the extent to which they depend upon imports. These industries have been encouraged at, in some cases, much cost, and there is no question of their being abandoned or relinquished. But the time has surely come when the most searching investigation should be made into the possibility of establishing other industries specially adapted for export. Several such industries were built up in Ireland during the nineteenth century. Irish ships, linen, poplin, spirits, stout, biscuits, mineral waters and other goods had a world market, and there does not seem to be any reason why similar high-grade specialities should not be developed in future. One result of the growth of such specialised industrial exports would be a diversification of external markets with the capacity to acquire directly non-sterling currencies. Irish agricultural exports have access to no market except the British, and command no foreign currencies except sterling, with which Eire is already abundantly supplied. An increase of direct foreign trade would enable Irish importers to bypass any British exchange control retained after the war. The problem of the international provision of capital will not be easy of solution, but in the case of Eire no such problem exists. Apart from large holdings of external assets held before the war, Eire has built up large reserves of sterling in the last four years. When imports are available again, it will be a matter of the greatest urgency to ensure that these reserves are wisely and productively employed and not merely frittered away in bridging over a continuing, and possibly an increasing, adverse balance of payments. Those Irish economists who have been sceptical regarding the wisdom of "repatriating" Irish capital invested abroad have never questioned the propriety of using such reserves to develop truly productive enterprises at home. The development of

specialised exporting industries would involve considerable expenditure on research, education and marketing.

But such expenditure would, it is to be hoped, ultimately result in activity which would be truly productive, in the sense that it would increase the national income without exerting an adverse pressure either on the Budget or the balance of payments. It should be borne in mind that among the comparative advantages that Eire enjoys should be reckoned a potential capacity for great technical efficiency and abundant supplies of cheap capital. Among its comparative disadvantages should be included high wages, modelled on British standards, and a relatively narrow range of raw materials.

Letter to the Editor

Local Government Reform

TO THE EDITOR OF THE ECONOMIST

SIR,—The reaction of any responsible person connected with municipal authorities to the suggestions contained in *The Economist's* articles on Local Government Finance on September 25th and October 2nd will be at least definite.

Those of us in the large local authorities simply will not have regional government at any price, unless we ourselves form and control those regions locally and without any such fifth wheels added to the administrative coach as regional commissioners. We have had too much experience of the utter incapacity, the complete lack of knowledge and the general inefficiency displayed by regional authorities to think otherwise. We will not only resist, but we will definitely sabotage any attempt to impose control from above on us after the war. Your statement, therefore, that a regional solution can hardly be attempted is sound.

Failing regional control, however, you suggest that the local authorities should have imposed on them more direct control by the Central Government. In the name of commonsense, why?

The average local government official in a big municipality is far more competent than the civil servant from Whitehall supposed to supervise him. He ought to be. Local authorities pay higher salaries than Whitehall. They attract better brains, and in addition to attracting better brains, the man on the spot knows more about local problems. Local government staffs are usually permanent, as against the "general post" method of staffing the local administration of Government departments. Any suggestion, therefore, that the larger local authorities will tolerate any further curtailment of their powers can be dismissed at once.

It is not just a question of retaining powers in the hands of existing authorities. If it could be demonstrated that a change would result in better government, the case would be unanswerable. Wartime controls, however, have demonstrated that they do not result in better government, but in much worse government, far more inefficient and costly.

Take the Fire Services as an example. Mr Herbert Morrison has never dared to give the comparative cost of administering the National Fire Services against the old local government fire services. Figures at a recent conference of municipal authorities showed that the cost under the Government as against that under local authorities has increased many times over.

There is a strong case for local government reform, but in the direction of increasing the powers of the local authorities, not of curtailing them.

We have endured the sheer, utter, stupid incompetence of the Regions and of Whitehall because there is a war on. As far as the local authorities are concerned, we know our own minds. We will not tolerate undemocratic control, either from Whitehall or the Regions, and anyone suggesting it is asking for trouble.

City of Birmingham.

Germany at War

Speer's War Economy

UNDER Minister Todt the material basis of Germany's war effort was expanded by territorial conquests. The war economy was fed, in addition to home resources, by booty from occupied countries, and foreign labour supplies seemed almost without limit. This gave flexibility to totalitarian organisation. Dr Todt's successor, the youthful Albert Speer, an architect by profession, came on the scene immediately after the first winter reverse in Russia. In February, 1942, Speer could not know that his task was going to be a ceaseless struggle to maintain war production on an inexorably contracting material basis. By setting up an Armament Council he tried to achieve the greatest possible concentration of industries in the shortest possible time for a knock-out blow against Russia. There was no knock-out blow, and Speer was forced to realise that from then on all his assets were wasting.

The German economic situation, as it developed during the winter of 1942 to the summer of 1943, called for great mobility and flexibility in production because of the worsening military situation and the sustained Allied bombing attacks on Germany and German-occupied countries. In addition the husbanding of manpower and material resources became imperative. Organisation was in itself no solution. In the autumn and winter of 1942-43 Germany's war economy suffered more than ever from over-organisation. Flexibility had vanished after the initiative of employers and workers had been dangerously clogged by endless rules, regulations and bodies and by a bureaucracy grown out of all proportion, even in a totalitarian country.

Speer concentrated the manufacture of weapons and munitions in the most efficient factories, which he placed under purely technical control. Events culminated in Speer acquiring virtual control over all war industry. He was appointed Minister for Weapons and War Production, and the system of purely technical control is being extended from the war industry proper to all industry. The Speer committees, formerly confined to armament and munition factories, are being set up in other industries. A committee has already been formed for the building industry. The district chambers and industrial federations have lost, or are losing, any practical economic importance. They simply provide a framework for the compulsory organisation of employers, who are now in the same position as the workers occupy in the Labour Front.

Nazi Technocracy

The advance of the Speer committees is first explained as the logical transformation of the policy of "steering" the economy into a system of central planning. At the same time it is almost plaintively repeated that the Speer committees are a wartime institution that will disappear at the end of the war. Before Speer's phenomenal rise, Nazis were emphatic in the belief that their totalitarian economy was organised in such a way that its main principles served peace and war needs equally well. What has happened in Germany is not the result of personal or other conflicts between Speer and Funk. It cannot even be said that Speer wields supreme powers. These changes, forced by events, are being done in the name of Speer. He formed his ideas about economic organisation under the Nazi regime, and displays the supreme contempt of the Nazi totalitarian bureaucrat against employer and worker alike. He is a technocrat, and believes that technocratic principles must be decisive, in a Nazi context. Direct political control over human factors in the economy is growing. The district chambers, for example, are under the immediate political control of district advisers, who must be members of the Nazi party, and work with a steadily growing staff of local and district representatives. At the top is the Nazi Party Chancellery under Bormann.

Speer himself works in collaboration with representatives of the Wehrmacht and leading industrialists. His Armament Council is made up of seven generals and eight leading industrialists. The Central Planning Department, an offshoot of Goering's Economic General Council, has come into sudden prominence. These organisations are more

powerful than any of the individuals directing them, and Speer's new prominence is the result of a process in planning and control. It began long before the war with the allocation of raw materials. The industrial federations ther collaborated in this task; the use of scarce materials was prohibited, but factory managers were still free to find the best method of production within these restrictions. Now the Central Planning Department, with its infinite variety of subsidiary bodies, plans the finished articles and the method of production down to the smallest details. The factory manager is told which materials he must use, and is ordered to employ manufacturing processes which have been worked out by Speer's controlling engineers. It is an extraordinarily laborious method of control. Stoppages, breakdowns and miscarriage of orders and material are frequent. To counter-balance this "shock methods" are used. Speer's committees work with highly mobile engineers, working staffs and special detachments, who can take over whole factories. Where they appear urgent work ordered by the Wehrmacht, approved by the Armament Council, and distributed by "order steering departments" is done to the disadvantage of all other work in this particular factory, or even in a whole branch of industry.

Speer's methods cannot be used in all industries. They are mainly confined to manufacturing. This explains why there is still a great variety of controls of both the old and new type. At the top, centralisation has been carried a step forward. The Wehrmacht is no longer supreme in placing orders. Army and Navy orders are finally approved by Speer's Armament Council, on which the prominent pre-war Wehrwirtschafts-Generals have a seat. Only the Luftwaffe has maintained some independence for its supply services. In industry as a whole the distinction between armament works and civilian works has gone. Technocratic principles have become supreme, which although wasteful in the extreme still ensure the manufacture of a considerable volume of weapons, munitions and military equipment.

Vitamins in chocolate for liberated Europe

The British Government, having examined all the ways in which sufficient vitamins could be provided to the under-nourished children of liberated Europe, have arrived at the conclusion—as Rowntrees did in 1938—that chocolate offers one of the best vehicles for carrying added vitamins. In chocolate, the vitamins retain practically all their potency.

Before the war, Rowntrees pioneered the addition of vitamins to cocoa and chocolate. Their object was to enhance the protective value of these already highly nutritious foods.

Today, when the Allied Governments are faced with the enormous problem of rehabilitating each occupied territory as it is freed, Rowntree's experience of fortifying cocoa and chocolate with vitamins on a large scale is proving of great value. When the war is won, this experience will again be used for the benefit of the British public.

ROWNTREES

THE BUSINESS WORLD

Experiment in Price Control

PRICE control, at every stage from raw materials to finished goods, civilian as well as munitions, has played a crucial part in war economy. It has had three different purposes: to assist in the restraint of inflationary processes; to facilitate the fair distribution of necessities; and to prevent undue profits from being made by manufacturers and traders. Applied to every conceivable kind of commodity, from the costing of munitions to the limitation of retail margins, price control has assumed a great variety of forms, including the stabilisation of the cost of living by direct Government subsidies to hold down the prices of particular foodstuffs. One of the most ambitious schemes yet devised for the control of the manufacture of consumers' goods is the Wool Yarn and Cloth (Maximum Prices and Charges) Order which came into force on September 6th. It provides for the control of prices of almost the whole of the output of the wool textile industry, including non-utility as well as utility cloth. The significance of the scheme goes beyond the industry concerned, for it illustrates the whole range of problems to be solved by price control.

In the case of standardised articles, such as many raw materials and foodstuffs, the control of prices presents no insuperable difficulties. The problem becomes easier still when the Government decides to acquire all available stocks; it is simply—or perhaps not so simply—one of adding arbitrary margins for distributors. But when it comes to articles, such as cloth, which cannot be standardised and, hence, not clearly defined, the task of fixing maximum prices becomes complex. The price controller must take account of a multiplicity of similar but different products, of variation in methods and costs of production between one manufacturer and another, and in technical and working conditions between one district and another. Especially, he must make sure that the methods of control he applies do not have the effect of causing the goods to be produced in the wrong proportions.

In the worsted yarn spinning section, exceptionally, conditions were found to make possible the use of a method of fixing maximum prices analogous to that employed in the control of many raw materials and foods. Wool is strictly controlled by the Government and released at fixed prices to the trade; the number of types of worsted yarn, though large, is limited; worsted spinning is a fairly homogeneous industry in which the processes and costs of manufacture do not differ greatly from one producer to another. In fact the Wool Yarn and Cloth (Maximum Prices and Charges) Order has defined and fixed specific maximum prices for every type and count of worsted yarn, such as white botany yarn on "cheese," coloured botany yarn on

"cheese," white crossbred yarn on "cheese," mule-spun botany yarn, and so on.

For the control of prices in the other sections of the trade, the Board of Trade has decided to use a blend of the "standstill" principle, by which maximum prices are fixed by reference to those charged on a given date, and the "cost plus" method, by which they are based on cost of production plus an agreed profit. Experience has shown that, almost always, neither of the two methods is satisfactory if used singly. The "standstill" method can only be employed effectively where all the elements entering into the final price, including the volume of turnover, are also fixed, and when the final product remains unchanged in quality. The performance of services, for example, is often standardised and is capable of treatment by the "standstill" method. Thus, in the new Order the maximum price for the performance of certain services, including commission woollen spinning, is fixed at the level of June 30, 1942; this price is subject to an increase—12½ per cent in the case of commission woollen spinning—which takes account of the rise in the cost of coal and other materials, and of the decline in turnover. For woollen spinners, other than commission spinners, and for the weaving section of the industry a blend of "standstill" and "cost plus" methods is employed. There is a separate scheme for each of the half-dozen different categories of weaver, taking account of differing circumstances. Broadly, maximum prices have been fixed by aggregating these four items: raw materials cost; conversion costs; amounts paid to other persons for services rendered; a profit calculated as a percentage of the sum total of the first three items. The raw materials of the spinning industry are controlled and fixed in price by the Ministry of Supply; these are tops for the worsted section and tops, together with a multitude of miscellaneous materials from which fibres can be recovered, for the woollen section. The price of yarn, the raw material of the weaving industry, is controlled by the Order itself.

The formula for calculating conversion costs is in many respects the most interesting. On the one hand, the woollen spinner or the cloth weaver has to assume that his factory is working at a given rate of capacity for the purpose of meeting his overhead expenses. The given rate of capacity varies between the different sections of the industry, but within each section every manufacturer, whatever his actual rate of operation, has to cost on the basis of the rate fixed by the Order. On the other hand, by applying the "standstill" principle an upper limit has been put to conversion charges; these must not exceed by more than a fixed percentage the cost that would have been incurred in carrying out the same process on June 30, 1942, at a given rate of operation. In other words, the manufacturer may calculate his costs either on the basis of his current cost, assuming a given rate of activity, or on the basis of costs at the end of June, 1942, also on an assumed but different rate of activity, plus a percentage on such cost, whichever is the smaller.

The third item in costs—the amount paid to other persons for work done on commission—is controlled by the Order, either by the "standstill" method, outlined above, or by the combination of the "standstill" and "cost plus" methods here described. The last item in costs—the profit—is equivalent to a percentage of the sum total of the first three items; this percentage is fixed for each section of the trade, ranging from 4½ per cent in some sections to 6½ per cent in others.

The scheme, which has been devised by the Central Price Regulation Committee, is certainly ingenious. It is a courageous attempt to go beyond the fixing of wholesale and retail margins and to extend price control right back to the process of manufacture. It has yet to be seen how it will work out in practice. It attempts to prevent price inflation at each successive stage of production, and, if successful, could be adopted for a whole range of other

industries. But, in its present form, it is designed, quite rightly, for the scarcity conditions of wartime, when the prevention of inflation may be more important than the reductions in cost that might be secured by other methods. Its relevance to "efficiency auditing" in peacetime conditions is not less certain. After the war, once the period of scarcity has passed—which may not be for some considerable time—the emphasis should properly be on securing reduc-

tions in real costs. Competition is still much the most effective device for bringing about such reductions and, when it can fairly and genuinely be restored, the need for price-control schemes of this kind will go. But when effective competition cannot usefully be restored some form of price checking will have to be evolved; and this experiment in controlling the cost of wool textiles on the basis of costing and plant activity may be of considerable value.

Business Notes

Lord McGowan on Chemicals

As reported by *The Engineer*, Lord McGowan, chairman of Imperial Chemical Industries, Limited, has defined the conditions in which the chemical industry should be allowed to carry on its business. In an address on the future of the industry on October 12th, he said:—

If the chemical industry is to discharge its responsibility as one of the great servants of the community, it must be granted the opportunity to earn, in the face of all fair competition at home and abroad, enough to reward its workers adequately, to apply adequate funds to research and development, to provide the public with the best article at the right price, and to yield a fair return to the shareholders who had adventured their money in it.

To a large extent ICI is the British chemical industry, and Lord McGowan's statement is a definition of the conditions in which his combine should be allowed to do business. Competition in many fields of the British chemical market has been largely eliminated by the emergence of ICI and by tariffs on imports; and competition on the international markets has been reduced to a minimum by cartel agreements. The concentration of production is, of course, a tendency inherent in the development of modern industry and, provided the economies of large-scale production are not negated by the inefficiency bred by security of markets, it can be welcomed. The chemical industry is in many respects a young industry, which requires for its full development a spirit of enterprise and initiative not usually associated with monopolies. This does not mean that ICI has been unenterprising since its formation, but it does emphasise the dangers of monopoly, and of a blank cheque from the community to enable ICI to enjoy a position of privilege. Lord McGowan, like the Parliamentary and Scientific Committee in its latest report, emphasised the need for research, and for the maintenance of "the maximum flow of inventions." But he went on to say that, in his view, remedies for the abuse of patents had been provided on an "ample scale" in the Patents Act. He was not aware of abuses which had not been foreseen, but if any made their appearance, the remedy was to obtain an extension of existing safeguards, and not to seek revolutionary changes which would do "far more harm than good." Lord McGowan's address, obviously, is a plea for the maintenance of the *status quo* in the organisation of the British chemical industry, that is to say, of the privileged position attained by ICI. He evidently believes that ICI is generating sufficient driving power "within" to deserve such a position in the British chemical industry.

The Future of Coal

In an interesting address on the future of coal in this country on October 18th, Mr J. P. Bennett, Director of the British Coal Utilisation Research Association, made this statement:—

We may expect to see coal regarded as a high-valued product produced in much smaller quantities than at present, but used to greater advantage and sold at a higher price. The effect of scientific research will be to improve the earnings of miners, and to make the coal industry far more attractive to young men as a career.

Mr Bennett's forecast is soundly based in the sense that there is immense scope for technical progress. The utilisation of coal as a source of energy and its scientific treatment as a chemical compound are still at an early stage. He gave impressive details of recent progress in combustion research which holds out great promise, adding the comment of the Deputy-Director of the US Bureau of Mines that in solid fuel combustion research Great Britain was "years ahead" of anything done in America. A one per cent increase in the

efficiency of utilising coal over the present average of about 30 per cent would save more than five million tons of coal a year in this country. But if Mr Bennett was optimistic about the technical possibilities in the utilisation of coal, Lord McGowan, of ICI, a large consumer of coal, expressed anxiety about the rise in the cost of producing coal, amounting to no less than 70 per cent during the past six years. He made the astonishing statement that pithead prices in the United States were lower than in this country by the equivalent of 10s. a ton, that is by an amount little less than the pre-war cost of coal at the pit in this country. Yet the wages of coal miners in the United States are appreciably higher than in this country. Lord McGowan's statement once more emphasises the pressing need of technical reorganisation in the British coal-mining industry, not merely to meet wartime needs, but also to prevent the coal-consuming industries from being handicapped after the war by a high price of coal.

* * *

Research and Industry

The Parliamentary and Scientific Committee has done valuable work in advancing the co-ordination of scientific research at all levels and its application to practical war problems. Recently it has turned its attention to the role of science in post-war reconstruction. The Committee issued a valuable memorandum on coal utilisation in July, and has now produced a report on "Scientific research and the universities in post-war Britain," which argues the case for the encouragement and expansion of scientific research after the war. The report is a timely reminder that this country's future industrial position depends largely on its ability to apply science and technique in production. Britain, as has often been said, spends only one-tenth as much on scientific research as the USA and very much less than Russia. The Parliamentary Committee concludes that "we should certainly look forward to spending at least ten times as much annually after the war if we are to provide the basis without which neither our agriculture nor our industry can effectively meet the needs of the future." This applies equally to fundamental research, hitherto left to the generosity of private benefactors; to agricultural research, otherwise "the cost of the protection that will be necessary to make British farming pay may prove unacceptable"; to industrial research, at present almost entirely financed by private firms, and to university research. The Committee emphasises that the first need is for an expansion of scientific personnel, through the universities and technical institutions. It estimates that a capital sum of £10 million for university buildings and equipment would be necessary during the first five post-war years, and recommends that the annual Treasury grant to the universities of £2,250,000 should be increased to £6,000,000 or £7,000,000. At the same time it hopes that, in addition to developing graduate and post-graduate work, the recommendations of the Norwood Committee that "natural

science should find a place in the education of all pupils" and that steps should be taken to increase the supply of science teachers, will be adopted. It recommends that scientific workers should be given high priority in demobilisation—it would be interesting to see how this can be squared with the principle of "first in, first out." The report, which is being presented to the Ministers concerned with demobilisation, post-war planning and educational reform, concludes that expenditure on the scale suggested "should be an essential investment of high priority in the post-war world, yielding in the long term a much higher return than in any alternative field." But it is not only the scale of expenditure that matters; it is equally important that money should be spent wisely to yield the best results.

* * *

Big Money Turnover

The turnover of credit in the money market continues to be high, and is providing a severe test of the authorities' technique for maintaining an even keel in the day-to-day credit position. Last week's Government expenditure appeared in the Exchequer returns at £99,800,000, after a figure of £140,000,000 for the preceding nine days. These totals do not give a true picture of the flow of Government outgoings, since many of the items in the expenditure of supply services are net figures. With tax revenue at a seasonal low ebb and the flow to Government loans running rather sluggishly now that no organised stimulus is being applied to it, the scale of floating debt borrowing has increased. Allowing for effective maturities, the fresh money raised by bills and TDR's last week is estimated to have exceeded £60,000,000, while this week's figure is estimated to have been between £35,000,000 and £40,000,000. Although a reasonable balance between income and expenditure has been obtained over the week as a whole, some temporary maladjustment is indicated in the latest Bank return which reveals an exceptional immobilisation of credit in Government accounts, the item of public deposits having risen by £16,157,000 to £23,609,000 over the week. There have, in consequence, been days when unexpected disequilibrium had to be adjusted by special open market operations. The money market found itself in very short supply of credit towards the end of last week, and, on the first days of this week conditions again became difficult. The necessary assistance has been given in a variety of ways. The discount market has sold bills to the official agents, while special help has also been forthcoming by official purchases of bills from the clearing banks which, in their turn, have both extended their loans to the market, and increased their purchases of bills. One of the clearing banks, which would, in the normal course, have been making up for its October statement this week, has postponed the performance until next week when credit is expected to be more abundant. The technique of the authorities in ironing out the inevitable day-to-day disturbances in the credit situation has, therefore, been fully deployed during the past week.

* * *

Ownership of "Kaffirs"

Circulars received from Rand Mines and Transvaal Consolidated Land show that these two companies are taking steps to alter their Articles of Association with a view to restricting foreign ownership and control of their companies. The alterations have two main objects in view: to give the board power to refuse transfer into the ownership of any foreigner or any foreign, or foreign controlled, concern, and to ensure that no foreign holder shall have power to attend meetings or to vote in person or by proxy. A foreigner is a person who is neither a national of the Union of South Africa nor a British subject. The reasons given for taking these steps are that many holdings, in the form of bearer warrants, are believed to be in the possession of persons in enemy-occupied territory and that there must

be no chance that voting power will be used contrary to the interests of the company. This is intelligible enough, but is it necessary to impose a permanent ban on foreign ownership—including ownership by Allies whose territory is in no apparent danger of occupation—to achieve the end in view? It would seem not. Evidently the gold-mining industry is a matter of the first importance to the Union, and action which would prevent control falling into the hands of those outside the country appears to be justified, if there is in fact any danger of that occurring. This position would seem, however, to be met by the removal of voting power, or even by restricting it so far as foreigners are concerned. The power to limit transfers, if it is used, would result in a material limitation upon the export of capital, and any impediment of that sort is more usually associated with economic nationalism than with the kind of world which it is hoped to create after the war.

* * *

Reserves and Provisions

The Council of the Institute of Chartered Accountants is making this week a further set of recommendations to its members, designed to improve and to standardise practice. On this occasion the matters dealt with are of even greater importance than the previous recommendations on War Damage and taxation; namely, reserves and provisions. After stating that a true appreciation of a balance-sheet may be rendered impossible owing to insufficient distinction between free reserves, capital reserves, provisions for known contingencies and provisions for the diminution in value of assets in excess of normal or estimated requirements, they go on to recommend that the term *reserves* should be used only to denote amounts set aside out of profits, or other surpluses, which are not designed to meet any liability, contingency, commitment or diminution in value of assets. The term *provisions* would be used only to denote amounts set aside to meet specific requirements the amounts of which can be estimated closely and specific commitments, known contingencies and diminution in values of assets existing at the balance-sheet date where the amounts involved cannot be determined with substantial accuracy. They further recommend the general adoption of the strict definition of a *reserve fund*, which would restrict its use to those cases where the monies were invested in readily realisable and earmarked assets. They deprecate the establishment of a variety of reserves as defined above, but state that capital reserves not available for distribution as dividend should be separated from those of a revenue nature. The Council recommends that all reserves should be disclosed, and that, as a general principle, the same should apply to provisions. They do, however, make an exception that in cases where disclosure of the amount of a particular provision or of additions to it would clearly be detrimental to the interests of the company this provision may be included under some other item, such as creditors, provided that the heading states that provisions are included. In all cases the utilisation of both reserves and provisions proved to be redundant should be disclosed in the accounts. They further recommend that, where practicable, fixed assets should be valued at cost and provisions for depreciation or diminution of values should appear as separate deductions from them.

*

Clearly, these recommendations, if generally adopted, would go a great way towards making the balance-sheet an intelligible document and a valuable guide to the investing public. They are, of course, purely recommendations without power to bind the Council's own members, let alone other auditors or boards of directors. In view of the deliberations of the Cohen Committee, it may, however, not be out of place to consider their value as amendments to the Companies Acts. In that respect it would be necessary to require proof to an independent body that the detriment to the company caused by disclosure exceeded the detriment to the public interest of non-disclosure, or at least to insist upon a certificate from the auditor that such was the case. On the matter of depreciation allowances and diminution of the value of assets, the recommendation is sufficient, or would become so with the lapse of time, provided that fixed assets are itemised into groups of like elements and that the appropriate provision is stated separately for each.

Export Credits

The announcement that the Export Credits Department assumed liability up to a maximum of £5,903,228 in respect of contracts, policies and guarantees amounting to £12,427,747 in the quarter ended September 30th last comes as a reminder that British export trade has not been entirely stifled by the war. These figures also show that part of this trade is still handled by private firms, since the facilities of the Export Credits Department are, for obvious reasons, not used by official trading agencies. The turnover of the department has inevitably contracted with the growing intrusion of Government departments into the sphere of overseas trade and with the sacrifice of export trade to the more urgent needs of war industry. During the war, that turnover has fallen as the need for maintaining exports in order to gain exchange has progressively declined. The latest total of policies issued by the department, £12,427,747, compares with a quarterly average of over £22 million for the three years to March 31st last. In some ways, however, the exceptional circumstances of war have brought the department new types of risk to underwrite, in particular, those arising from enemy action over which the exporter could exercise no control. The most important of these was the risk of non-payment by the purchaser, owing to the occupation of his country by the enemy. This "calamity risk," as it was christened, was a very real one in the early days of the war, when the export drive was still regarded as part of Britain's war effort. Another risk against which the department arranged cover was the frustration of voyage risk which crystallised when, owing to circumstances over which the exporter had no control, the ship carrying his goods was diverted to a port other than that to which they were consigned, and additional transport and insurance charges were consequently incurred. The new guarantees given since the outbreak of the war have been incorporated in a comprehensive war emergency scheme. When this was launched, it was not expected by the department that the business would be on a self-supporting basis, and the special facilities were intended as an indirect form of subsidy to export trade. Experience has shown that these fears were somewhat exaggerated and, as Mr Harcourt Johnstone told the House of Commons earlier this year, the war emergency scheme up to last July had resulted in a deficit of slightly more than £1,000,000, a figure which would be substantially reduced and might even be converted into a surplus by recoveries. The Export Credits Department has kept its mechanism in good working order and should be ready to play its part in the post-war drive for the recovery of export markets.

* * *

Mutual Finance Deal

The directors of Mutual Finance Limited have received from the banking firm of Higginson and Company an offer to purchase the "B" preference shares and ordinary shares of the company. The price offered is 6s. 6d. per preference share of 13s. 4d., and 6d. per ordinary share of 1s. The directors of Mutual Finance have recommended the shareholders to accept, pointing out that the offered price of 6s. 6d. per "B" preference share compares with a break-up value of 4s. 7d., and that the present break-up value of the ordinary shares is nil. The offer, which is understood to have been made by Higginson and Company on behalf of a group formed by them, is made subject to acceptance by shareholders holding 75 per cent of each class of shares or such smaller proportion as Higginson and Company may decide. It is evident from the terms of the offer that the business of Mutual Finance is being taken over as a going concern and that it is the intention of the purchasers to nurse it through the difficulties of the war period. This firm carries on a hire-purchase finance business, and, in common with most undertakings in this line of business, has suffered seriously from the war. In 1939 no less than 82 per cent of its business was the finance of motor car purchases, and about three-quarters of this related to passenger cars. The impact of the war, first, in the shape of inevitable defaults by hire-purchase customers, and, secondly, in the virtual cessation of private passenger car sales, was exceptionally serious. Substantial reserves had to be made for defaults and contingencies, losses took the place of profits, and by the end of 1942 a debit of £105,644 had been accumulated in the profit and loss account. The company has, however, done its best to adjust itself to war conditions by reducing expenditure and by seeking new business, such as the financing of sales of commercial

WILL OF THE PEOPLE

The will of our soldiers assures an unconditional surrender . . .

The will of our people can assure a just and durable peace.

To-day the United Nations are joined in their determination to win a decisive victory. On every battle front and on every farm and in every production centre a singleness of purpose is speeding "unconditional surrender."

To-morrow millions of soldiers and workers can have steady employment if they also unite with determination to bring about "a just and durable peace."

Prosperity can be realized only through the will of an informed and a united people. With their courage and their determination, the people's will to accomplish a righteous peace is irresistible.

People here, in common with people of other lands, can prosper materially and spiritually after the war ends—but only if now the peoples of the United Nations make loud their demands for "a just and durable peace."

* * *

The above Statement has been issued by the International Nickel Company of Canada and is widely published in Canada and the U.S.A. We reproduce the Statement here because we believe that all engaged in industry in Britain will approve its principles and desire to collaborate with all the United Nations in formulating plans for "a just and durable peace."

vehicles and machine tools to war industry. Consequently, a certain goodwill is being taken over by the purchasers of the shares, and this accounts for their readiness to pay appreciably more than the asset value.

New Rupee Loan

The Government of India has this week announced the issue of a 3 per cent funding loan, redeemable in 1966-68, for Rs.25 crores, that is, £18,750,000. It is being issued at 98 and will be repayable at par. The object of the loan is to fund temporary liabilities created by the repatriation of sterling debt. It may be instructive, taking this rupee loan as a specific illustration, to trace the sequence of operations which follows the decision to repatriate part of the Indian sterling debt held by investors in this country. After the vesting order, the securities in question are handed over by the holders to the Treasury, which, through the Bank of England, pays them the price fixed in the order. This sterling is made available by the Government of India, which in return takes the vested securities. The Government of India will have obtained the required sterling from the Reserve Bank of India, which since the beginning of the war has accumulated substantial sterling assets. The Reserve Bank has to be reimbursed in India for the sterling which it has thus placed at the disposal of the Indian Government. This can be done in many ways. The account of the Government of India may be debited. Such drafts on existing rupee resources are unlikely to account for any appreciable part of this compensation, since the amounts in question have been substantial (some £350 millions has been repatriated since the outbreak of the war) and since the Government of India has had to borrow in order to cover its own budget deficit. The immediate alternative is to hand over to the Reserve Bank specially created rupee securities of the Government of India. In the early part of the repatriation campaign, the securities thus created were the exact rupee counterpart of the vested sterling securities, corresponding with the latter in such matters as rate of interest and redemption dates. But, more recently, the choice of the financial authorities in India has not been restricted in this manner, and the securities handed as compensation to the Reserve Bank have taken such form as was thought most convenient and appropriate. It would have been unsound finance for the Reserve Bank to make a permanent holding of this counterpart of repatriated securities, and the policy has been to market this rupee paper and to find a permanent home for it with Indian investors as and when market conditions permitted. Another method of financing the repatriation has been to place short-dated rupee paper with Indian banks. The actual course pursued has been dictated by the condition of the money and investment markets at the time. The issue of a medium-term rupee loan is intended to repay short-term debt placed with the Indian banks, and represents the final link in the chain of financial operations involved by the transference of securities from the hands of British investors to those of investors in India.

Dorman Long Finance

The decision of Dorman Long to finance the redemption of £3,031,560 5 per cent mortgage debenture stock by the issue of ordinary shares represents one of the largest operations undertaken for some time. The debentures, repayable at any time on three months' notice at 105, are to be redeemed in those terms on January 17th, mainly by the issue of 2,094,334 ordinary shares of £1 at 27s. These shares are offered to holders of the preferred ordinary and ordinary capital of the company on the basis of one new for every one old of either class. Renunciation letters are to be issued. The prices of the shares rose to 53s. and 32s. respectively on the announcement, only to react to 50s. and 29s. Even so, although the old ordinary are cum dividend, while the new will only rank from October 1st, it is evident that the market considers the offer contains an appreciable element of bonus. It seems to be assumed that Dorman Long are taking the opportunity to reduce their commitments. This is only temporarily the effect of the operation. In fact, it clears the way for a fresh issue of debentures at a more favourable rate once these issues are permissible. For the time being, it calls for the provision of some £355,000 in cash from the company's own resources. There appears to be very little advantage from the standpoint of dividend to the old shareholders of the company.

The saving on interest and sinking fund will probably rather more than cover a dividend on the new capital at 8 per cent, at which payments were resumed in respect of 1941-42. The ability of the company to pay a higher dividend will be reduced, rather than increased, by the operation. As stated, the redemption does open the way for cheap borrowing later, for there will be some £7,700,000 of share capital against less than £1,000,000 of loan capital.

Long-Distance Road Haulage

The road haulage scheme, designed to economise rubber and petrol in long-distance transport—that is to say, in traffic of a distance of 60 miles and more—introduced last November, is now in full operation. The scheme, it may be remembered, envisaged the transfer of as much traffic as possible from road to rail; the concentration of the remaining road traffic on the fewest possible vehicles; and the maintenance of a reserve of laid-up vehicles in serviceable condition available for immediate use in case of need. The scheme is operated through a regional organisation; there are twelve divisions, coinciding with the Civil Defence Regions; and each division has been subdivided into suitable areas and vehicles grouped into units of about fifty, each centred for operational purposes on a haulage firm with the requisite facilities. Unit controllers drawn from the industry are responsible for ensuring that no traffic is accepted which should be carried by some other means of transport; these officers collaborate in accepting traffic with the Regional Transport Commissioners, who also supervise the issue of fuel to the units. As a means of providing the operating and office facilities for each unit of vehicles, the Ministry, on the advice of the Regional Transport Commissioners, has selected suitable haulage firms which have been taken over bodily at a rent based broadly on their net profits for the average of any two years between January 1, 1935, and March 31, 1939, subject to appropriate adjustments for any change in the capital value of the assets employed by them. In order to make up the strength of the units the Minister has hired additional vehicles from other firms on the basis of an agreed schedule of rates. At the end of September, 353 units were actually in operation; the remaining four, which would complete the total originally envisaged, are expected to be created in the near future. When the scheme was introduced it was provisionally estimated that it would eventually include a total of about 25,000 vehicles; but, partly owing to an overestimate of the number of vehicles and partly because some of the vehicles offered to the Ministry for hire were found to be unsuitable, the organisation, when completed, is expected to comprise about 20,000 vehicles, that is about one-seventh of the "A" and "B" licences. Some 17,600 vehicles, including approximately 11,100 vehicles belonging to the haulage firms taken over bodily and approximately 6,500 vehicles hired individually, have already been brought into the organisation. The hire of vehicles is proceeding rapidly, and a further 2,500 vehicles are expected to be hired within a few weeks. Although the scheme has only been in operation for a short time, it has already justified itself by the economies achieved. For example, it has been possible during the summer to stand-off on the average more than one-tenth of the number of vehicles in the organisation. When the scheme was originally announced, it was suggested that, if successful, it might be extended to short-distance traffic. Apparently, however, this extension is not envisaged in the near future.

Bread and Potatoes

The national loaf has saved shipping space, and it is now proposed to save some 400,000 gallons of petrol annually by a rationalisation of wholesale deliveries of bread. In some cases this will involve the transfer of retailers' registrations to new wholesalers, with the result that some members of the public may get loaves of a shape and texture new to them. This is likely to be a small hardship. Generally speaking, the public has taken with good grace every adjustment which has been made in the production and distribution of bread. The "Eat More Potatoes" campaign has resulted in an increase in the consumption of potatoes, although reduced bread consumption—its proper counterpart—has been nothing like proportionate. Potato consumption in 1942-3 was over half a million tons more than in 1941-2, an increase of 12 per cent, and an increase of 50 per cent over the average consump-

tion for the years 1934 to 1938. Consumption is still rising, and last August was 14 per cent above that of August, 1942. During May and June, the Ministry of Food inquired about the effects of the potato campaign on 2,000 rural and urban households. No fewer than 1,200 had eaten more potatoes during the previous six months, 89 per cent of the total from a desire to save shipping space. To achieve additional consumption, a more versatile use of potatoes in the kitchen has been made. Of the 2,000 housewives, 32 per cent declared their households' consumption had risen as a result of the cooking of potato dishes, 22 per cent by the serving of potatoes for breakfast, 10 per cent by the use of potatoes as a part substitute for flour, and 47 per cent by their greater use as a plain vegetable.

Opencast Coal

The Prime Minister said in last week's coal debate that opencast or "outcrop" coal was already making a substantial contribution towards meeting the deficit in deep-mined coal production, and that output might be expected to reach between 10 and 15 million tons during the next coal year. Mr John Innes, Director of Opencast production at the Ministry of Fuel, hopes that the target of 15 million tons may be reached, as a result of the introduction of about £3 million worth of American machinery, which Major-General Appleyard, his opposite number at the Ministry of Works, negotiated during a recent visit to the United States. (The Ministry of Works is responsible for actual operations in opencast production, which is a civil engineering and not a mining process.) Production of opencast coal has been steadily rising, and reached a peak this summer of 135,000 tons a week. The Ministry hopes that, in spite of weather conditions, which might impede operations, output will be maintained at around 100,000 tons a week this winter. It will, therefore, not ease the coal problem to any extent this winter, but next summer, with output not far short of 500,000 tons a week, it should be possible to build up stocks for the winter of 1944-5. Industries were at first slow to use opencast coal, and objections were raised to its quality, which arose chiefly from the fact that it was often mixed with clay and soil. When properly screened and sized, however, a great deal of outcrop coal is of first-class quality, and eminently suitable for gas-producing and steam-raising plants. The railways are using it to a limited extent. Moreover, it enables the release of the highest-grade coal for essential purposes. The chief problems that have to be dealt with, and which the Ministry is hoping to put right before the spring, are transport and supplies of screening plant. The railway system is already heavily burdened, and is handicapped by a shortage of waggons. It is proposed to build and extend railway sidings and to make more use of road transport facilities. Industries and combustion engineers are being asked to co-operate in utilising outcrop coal, and to conserve deep-mined coal for stocks. Opencast sites are generally worked out within a few months, and the land is then put back into agricultural production; it is said that the operations actually enhance its value. It is satisfactory to know that the Government is tackling opencast production with such energy, though it is difficult to avoid the suspicion that there has been some delay in realising the possibilities of a development which has largely been left to a few enterprising private contractors to initiate.

The Rate for the Job

The court of inquiry, headed by Lord Wark, which was appointed in July to investigate a dispute that had arisen in a West of Scotland engineering firm over the "rate for the job" has issued a somewhat inconclusive report. To the Amalgamated Engineering Union, which had regarded this as a "test case," the report may be something of a disappointment, though in some respects it substantiates the contention that the firm had been evading the terms of the union's agreement of May, 1940, with the Engineering Employers' Federation. This "relaxation" agreement provided that where a woman was employed on a man's job she should be paid the full man's rate after 32 weeks, if she performed the job without extra supervision or assistance—rates in proportion to the men's were laid down for the initial period and according to the degree of supervision required. The difficulty has arisen from the interpretation of the phrase "work commonly performed by women." The employers' case was that most of the processes were new ones, for which no rates had been laid down, and that

AN ESSENTIAL OF WARTIME DIET

Stored in this tiny capsule are two vitamins without which it is impossible to maintain health. They are 'protective' vitamin A and 'sunshine' vitamin D and, unfortunately, they are not always readily obtainable in a wartime diet.

A daily dose of Crookes' Halibut Oil—one of the richest natural sources of these vitamins—will build up your resistance and stamina and prove of inestimable value during this fifth winter of war.

CROOKES' HALIBUT OIL

Obtainable only from chemists

CAPSULES — PER BOTTLE OF 100 — 8/6

LIQUID — PER PHIAL — ENOUGH FOR 16 DAYS 2/-

the factory had been designed to be operated largely by unskilled labour; the proportion of skilled labour employed is as low as 4½ per cent at the present time. The court of inquiry found that the company failed to observe the agreement in respect of a number of jobs performed by women, and that, though many of the operations might be regarded as "commonly performed by women," this was certainly not applicable over the whole factory. On the other hand, it agreed that many of the jobs were so new that it was impossible to determine whether men's or women's rates should be applied. It, therefore, recommended that negotiations should be resumed upon a system of grading and classification, with resort, if necessary, to an arbitrator. As mentioned in *The Economist* of October 16th, the AEU itself is very anxious to secure a grading of the various machine and assembly processes in engineering. Negotiations have already commenced between the employers and the representatives of the AEU and Transport and General Workers' Union at the factory in question.

Drapery Profits

Unlike most of the stores, companies of the Debenhams group make up their accounts in July or thereabouts. In consequence, the figures and comment just published carry the story a step further, and it is rather surprising that the change in the six months since the January contribution became available is slight. Group profits and those of the company show a rise on the year. Group figures are only available for two years, but the rise shown a year ago in the net figure of the parent is now fully maintained, while the stock in trade of both parent and group continues to rise. A large part of the improved result must be due to the three West End subsidiaries, Debenhams, Marshalls and Harvey Nichols. The fact that all of these do better and better is a reflection, not only of increased spending power, but, in some measure, of the growing realisation that economy of coupons can be secured by buying the best that is available. This is as anticipated, but it is rather surprising that there continues to be a sufficiently large supply of better-class goods to permit of the results disclosed. The same argument applies, perhaps in equal measure, to some of the provincial stores controlled by the group, which are, largely, situated in seaside resorts and county towns. In considering the figure of stocks it must be remembered that purchase tax is largely responsible for the high level, but this is likely to be a diminishing factor in view of the growing preponderance of utility goods. The group is not, however, without interests in the suburbs and other provincial towns where the demand is perhaps mainly for utility goods. It seems very doubtful whether total profits can be maintained, as the clothes ration will be running at a rather lower level than the average for the year just ended, and the percentage of utility goods will, presumably, increase still further. Indeed, the chairman discloses the fact that results so far show a falling off, but he is none the less confident that the final result will be reasonably satisfactory.

Pulp and Paper Supplies

In August, 1943, the Combined Production and Resources Board and the Combined Raw Materials Board jointly appointed a committee

to ascertain and report in correlated form the facts concerning the requirements and supplies, uses, production and distribution of products of the pulp and paper industries of the United States, Canada and the United Kingdom.

This decision caused no surprise, for the paper shortage, which has been pronounced in this country since the early days of the war, and especially since the loss of the Scandinavian supplies of wood-pulp and newsprint, has recently become more serious also in North America. Canada has reduced its paper shipments to the United States, and at the current level of consumption the latter is unable to close the gap between supplies and demand. According to the US War Production Board, the production of paper and paper board in the United States declined from 8,843,278 short tons in the first half of 1942 to 8,398,594 tons in the corresponding period this year. The main reasons for the North American pulp and paper shortage seem to be the shortage of manpower and electricity in all stages of production, from the cutting of the pulp-wood to the finishing of the paper. A number of steps have been taken to adjust consumption to supplies. Thus, newsprint consumption by the larger American newspaper publishers, which so far had been limited to 100 per cent of the

tonnage used in printing "the net paid circulation" during the corresponding quarter of 1941, plus a 3 per cent allowance for waste, was reduced by 5 per cent from the middle of this year. Moreover, since August 1st, maximum stocks of newsprint in the hands of publishers have been reduced from 75 to 50 days' requirements, and since September 1st commercial printers who have unused paper quotas are no longer allowed to utilise these for magazines and books. New standards and maximum weights of the six chief categories of writing and printing papers were officially introduced in the United States on September 1st. This decision, while maintaining the weight of production at the previous total, has increased "the area of paper" available by no less than 15 per cent. Some alleviation of the position is also expected from an extension of the paper salvage campaign to all states east of the Mississippi River and to several states beyond. The US War Production Board has initiated a "Special Timber Production War Project" to increase supplies of wood, including pulp-wood. The present shortage in some classes of timber, including building, boxing and crating timber, is now more serious than that of paper, so that the new timber production drive will hardly be concentrated on the cutting of pulp-wood. In these conditions, the prevailing optimism in this country that the improved Allied shipping situation will soon lead to a substantial increase in United Kingdom supplies appears premature, although restrictions on paper consumption in this country are far more stringent than the mild limitations recently imposed in North America.

Political Adviser for Unilever

By inviting Professor Mitrany to act as their adviser, Lever Brothers and Unilever declare their wish to study the wide social and political problems in which their vast organisation is necessarily involved. The company's interests stretch all over the world, and their raw material subsidiaries bring them in touch with native affairs in Nigeria, the Congo and the Pacific; this means that they are a powerful force to be reckoned with in British colonial administration. In many respects they hold the position of a state within a state in these areas, since the impact of such a body upon the lives of natives is more thoroughgoing than is usually realised. This being so, Professor Mitrany's expert knowledge of the international sphere will stand him in good stead. He is to be free of business responsibilities, but will pay special attention to ways of improving local conditions, which are of course closely related to business factors. Nobody who knows the Professor's distinguished career can doubt that, given the facilities, he will achieve much important research. The value of his appointment, however, will depend upon how far the company make use of his suggestions, even when they conflict with maximising profits, as most reforms inevitably will on anything but a very long-term view. It is quite true, as the company remarks, that "the most desirable policy for a business organisation is one which helps to improve local conditions in the country in which it operates," and in the very long run this aim may be worth initial financial sacrifices. Possibly the group can afford to ignore purely financial considerations in view of its quasi-monopoly powers. However, the improvement of conditions is also the function of the state, and the hope seems to be entertained that Professor Mitrany will act as liaison officer between the company and the authorities in this field and point out, perhaps, where the latter can help. The appointment is at least designed to increase co-operation between private enterprise and public authority "in the guidance of the economic process," and this co-operation to be an effective partnership must require a real disinterestedness on the part of the company as well as a willingness to be guided on the part of the state. Granted that any concern should have the power greatly to affect the lives of so many people, that they should have an adviser of this calibre is certainly a good thing, and it is to be hoped that Lever Brothers and Unilever will make full use of a type of service which they rightly regard themselves as being unique in possessing.

Correction

In a Note entitled "Shoe Repairs" on page 535 of *The Economist* of October 16th, it was said that "As many as 27,000 of the total of about 8,000 establishments are one-man businesses." The latter figure should have been 38,000.

(For Company Results see page 568)

BENEFACTORS OF MANKIND

GEORGE STEPHENSON (1781-1848)

Stephenson wrote: "I have fought for the locomotive single-handed for nearly twenty years. I have put up with every rebuff determined not to be put down." His memorial is in the iron ribbon which runs over the face of Great Britain, and in the mighty locomotives evolved since the "Rocket".

Foresight

MODERN rail transport in Great Britain owes its growth largely to the foresight of George Stephenson, known as "The Father of Railways". He fought stubbornly for the locomotive against cable haulage for rail transport. In the end he triumphed brilliantly. The form of haulage was decided by competition, which was won by the famous "Rocket". The Scotsman records: "The experiments at Liverpool have established principles which will give a greater impulse to civilisation than it has ever received from any single cause"

In the world of Electricity the products of The BRUSH Electrical Engineering Co. Ltd., have been developed for the future as well as for the present needs of humanity.

* From March, 1942, figures are exclusive of men classified as unsuitable for ordinary industrial employment, and women unsuitable for normal full-time employment.

† From January 1943 the figures are published at quarterly intervals.

(a) 1937, average January to August; figures for September-December not comparable owing to revised method of counting adopted in September, 1937.
 (b) From January, 1940, includes former Southern and South-Eastern divisions.
 (c) Includes Southern division before January, 1940.
 (d) From September, 1939, Grimsby instead of North-Western England.
 (e) From December, 1941, High Peak Parliamentary Division of Derbyshire included in North Midlands.
 (f) Ordinary and self-balancing revenue and expenditure. Annual figures are totals for financial year, beginning in year shown.
 (g) Average of weekly figures.
 (h) Annual figures for 1929 and 1932 do not include District Bank.

Fish Division.—Mr John Adamson, Director of the Fish Division of the Ministry of Food, is relinquishing his duties, and Mr F. S. Anderson, at present serving as Divisional Food Officer in the North-East of Scotland Division, will succeed him on December 31, 1943.

Corsets Restrictions.—A General Licence (S.R. & O. 1943

No. 1408) has been issued under the Making of Civilian Clothing (Restrictions) (No. 16) Order, 1942, to relax certain restrictions on manufacture, with the object of stimulating the production of more durable garments, particularly in heavy types of corset. The points covered have been discussed with the trade. The principal change is that the weight of metal in certain laced corsets has been increased.

LONDON ACTIVE SECURITY PRICES AND YIELDS

Allowance is made for net interest accrued, and for redemption for fixed interest stocks and for changes in interim dividends for ordinary stocks.

The House of Commons

THE House of Commons has been busy this week with its own origins, its length of life and its place of meeting. On Tuesday, a second reading was given to two Bills, one to provide a continuously up-to-date electoral register, the other to prolong the present Parliament's maximum tenure of life by one more year. These Bills do not raise matters of substantial controversy. True, the first makes a General Election possible while the second makes it unnecessary. But the contradiction is only apparent. As Mr Morrison said "it would not be particularly creditable if we were driven to a general election during the war . . . but this Bill does provide that if the House could not live with the Government or if the Government could not live with the House, there would be nothing in the way of organisation to prevent a General Election taking place."

On Thursday the House debated a Government motion:—

That a Select Committee be appointed to consider and report upon plans for the rebuilding of the House of Commons and upon such minor alterations as may be considered desirable, while preserving all its essential features.

The physical task here envisaged raises almost equally little controversy. Members of Parliament, both past and present, have a great deal of affection for the chamber that was destroyed in 1941, and there is no doubt that it served its purpose most admirably. Its major defect was, in fact, its greatest advantage, since the fact that only about two-thirds of the members of the House could

find a seat in it at any one time was merely a reflection of the fact that it was small enough to permit of informal debate and personal contact, which lie at the root of the British system of government. There were, indeed, certain defects that should be remedied—the ventilation and lighting were not good and the gallery space was most inadequate. But it would be a mistake to build a new chamber, of substantially different proportions and arrangements from the old. Moreover, the rest of the Palace of Westminster is still standing and in use, and the new chamber will have to take its place in the middle of the existing building. This alone would make any large change impossible, even if it were not undesirable on general grounds. It may be interesting to speculate what might have been done if the whole building had been destroyed—some may even regret that the Luftwaffe was not, in this instance, a little more efficient—but such speculations are wholly academic. The practical task is that of rebuilding the Commons Chamber on the same site and in the same shape, and on that practical task there is very little disagreement.

The motion, nevertheless, serves as an inevitable occasion for somewhat wider discussion. In some quarters the very wording of the motion has been taken as an indication of the Government's aversion from all change in any sphere. It is being said, in particular, that their attitude towards the economic structure of the country is the same as towards the physical structure of the House of Commons, that of contemplating "minor alterations . . . while preserving all its essential features." This is a matter

THE FINANCIAL NEWS

though in short supply can still be purchased daily up and down the country. Should any difficulty arise write to the Publisher at 20, Bishopsgate, E.C.2, and he will guarantee to supply the

for after-dinner witticism rather than for serious argument; but it may not be so much out of order in public discussion as it would have been in the Commons' debate to enquire whether it is only in its physical meeting place that the House of Commons requires reconstruction.

Is any substantial change required in the nature, functions, procedure, composition and duties of the House of Commons? Is Great Britain in need of an amendment of its Constitution? The answer is No. Parliament has done its duty well; in the war years it has been, in the Prime Minister's words, a rock of support. It has neither impeded the policies of the executive nor neglected its constitutional duty of reflecting the will of the people. Its functions have been rather those of advice and admonition than of decisions on policy or even of legislation, save in the formal sense. But to say this is not to derogate from the merit with which Parliament has performed its duty; for the functions of Parliament in the present age are, and should be, precisely those of advice and admonition which the present House exemplifies. When this view was last expressed in *The Economist*, Mr Pethick-Lawrence wrote a letter (printed in the issue of September 18th) giving a list of occasions on which the present House of Commons had exercised "direct power" over the course of events. He instanced the demand for national war damage legislation and the changes made in the Bill, the abolition of the household means test, the rejection of fuel rationing, the securing of equal compensation for women in war work, and others. If he were writing today, he could add the extension of "pay-as-you-go" to the list. But Mr Pethick-Lawrence has mistaken the point. It is not that Parliament is without power; but that its functions are exercised through advice and admonition. Every one of Mr Pethick-Lawrence's examples is an instance of Parliament persuading the Government to take a certain decision, not of Parliament taking the decision itself. Even the supreme instance, that of the replacement of Mr Chamberlain by Mr Churchill, falls into that category, for Mr Chamberlain was never defeated in the House and, even in the final debate, got a majority larger than many Prime Ministers have worked on. In every other example in Mr Pethick-Lawrence's list, had the Government dug its toes in and refused to yield, the strong probability is that it would have got its way. In substance, the power of Parliament today is that of warning the Government that unless it does thus and so it will alienate the people. In these days, Parliament does not exercise sovereignty so much as give

a continuous indication to the day-to-day wielders of sovereignty (the Government) of the attitude likely to be taken by the ultimate possessors of sovereignty (the people). This is the proper rôle for a representative assembly in a twentieth-century democracy, and the House of Commons performs it very well.

This is not, of course, to say that all is well with British politics—on the contrary, there is much that is very wrong. But the defects do not arise from anything in the functioning of Parliament, nor could any changes in Parliamentary procedure do very much to correct them. One major defect lies in the meaningless state to which party politics have degenerated. There is not much faith in either of the major parties today—or in any of the minor parties either. If, instead of two viscous confederacies of vested interests, the country had a choice between active parties expressing real and vital differences of policy, there could be a renaissance of political life. But it is the re-forming of parties, not the reform of Parliament, that is needed to achieve that end. Another great defect in present-day politics is the gradual disappearance from the House of Commons of any but the professional politicians. The House is becoming a gathering of agents and representatives instead of a microcosm of the nation. One way of attracting into the House men and women of every walk of life who would go there without thought of a political career, but to serve their community, would be to convince them that they would have interesting and useful work to do. It may be that changes in procedure—in particular, an extension of the committee system—would assist in this aim; but their contribution would be small, and the real solution is again to be found in what happens outside, rather than inside, the House.

When the revival of politics comes, when the British people discovers political instruments appropriate to expound its twentieth-century faiths, new parties will find awaiting their use a constitutional mechanism that will serve them as well as it has served previous centuries. It is difficult to think of another country where the system of government (as distinct from the content of politics) has adapted itself with more smoothness and efficiency to the quite unprecedented demands of the present age than in Great Britain. Reform is required, in greater or less degree, in the social and economic structures of Britain, and a revolution is needed in party politics. But one area where "minor alterations while preserving all the essential features" are all that is needed is in the constitution and functions of Parliament itself.

Co-Belligerent Italy

EVER since the Darlan episode, it has been clear that one of the most important points upon which the Allies must reach agreement is the type of government in occupied and liberated territory with which they are prepared to deal. This is not only a question of avoiding the existence of two or three rival governments, each backed by a different Great Power and competing for the same territory. The type of government determines the nation's attitude towards foreign policy. The more liberal, the more rooted the government is in the popular will, the more it tends to work out its foreign policy in a non-aggressive and co-operative spirit. The aftermath of German control throughout Europe, but particularly in Eastern Europe, is an enormous increase in the number of grievances and frictions between peoples and their neighbours and between each nation and its own minorities. The existence anywhere of a militarist authoritarian government, set on exploiting the grievances of its people, is a certain guarantee that the problem of knitting Europe together into a peaceful community will be frustrated.

It follows that Marshal Badoglio's statement to a *Times* correspondent on the future of the Italian regime and its relations with its neighbours is a matter of some importance. The position of the Marshal, the type of men advising and surrounding him, the status of co-belligerency, have been giving rise to serious misgivings.

British soldiers, arrived at last in Italy, who thought they were fighting Fascism all the way from Alamein, are disconcerted by the prevalence of the Fascist salute and the re-appearance, under the auspices of Amgot, of Fascist officials in the liberated towns. Count Sforza spoke strongly in an interview in Italy of Marshal Badoglio's "evil counsellors." The status of co-belligerency seemed—and seems—to many to have been somewhat easily earned in comparison with the actual aid afforded by the Italian military forces and to have created with the Allies' associates—the French, the Yugoslavs, above all, the Greeks—heartsearchings and suspicions enough to weigh heavily against the military assistance, which would, presumably, have been given in any case.

Marshal Badoglio's statement touches a number of these points. He made it quite clear that he does not intend to carry on a military government into the future.

As soon as hostilities cease, I shall resign as head of the Government to allow that there should be an exclusively political ministry for the purpose of holding elections throughout the country.

Moreover, even in the interim period the Marshal does not intend to continue his present purely military administration. Before he was compelled to leave Rome, he apparently received declarations "of sincere and complete collaboration" from the old parties—the Liberal, the

Christian Social, Socialist and Communist parties and the Party of Action. These groups coalesced in a common front to expel the Germans, and the Marshal repeated the guarantee he gave in his proclamation of October 13th, that as soon as he reached Rome, and the delegates were free to join him, he would complete his Government "with the most authoritative representatives of these parties, none excluded."

All this is obviously satisfactory, although it would be reassuring if more news reached the outside world from the towns and districts already liberated by the Allies. It is peculiar but true that more news of the fight for freedom reaches this country from enemy territory than from Sicily or Southern Italy. What steps are being taken by Amgot and the Italian authorities in such areas as Naples? The first and most urgent job is, naturally, to restore the physical conditions of urban life after the Germans' shocking devastation. But are the authorities doing what they can, even on a local and limited scale, to restore the shape of democratic society? The Marshal mentioned the fact that some of the "authoritative representatives" of whom he spoke are in Naples, and there have been reports of the association of the old parties with the municipal government. It is to be hoped that they are true, for, whether in Italy or elsewhere, the real hope of restoring a liberal and constitutional way of political life lies quite as much in the local communities as at the level of national government. Indeed, it may well be that the reconstitution of local and regional self-government is the only sure and manageable way of restoring a free society. The lack of news on this topic is serious. It is impossible to judge either the good work of Amgot or the good intentions of the Italian Government without concrete evidence from liberated territory.

Marshal Badoglio's intentions in home policy are reassuring as far as they go; but a more doubtful light is thrown by the ineptitude of his remarks on Italy's future foreign policy.

I am convinced that Italian policy towards France, Yugoslavia and Greece after the war will be a policy of cordial and open friendship, and that there will no longer be in Italy anyone who would want to revive any territorial claims against them.

This is baffling. Does the Marshal seriously suppose that a policy of "cordial and open friendship" can be based simply on Italy's renunciation of "Tunis, Corsica and Nice"? Does he mean merely that the Italians will not ask for more than they have managed to secure already? Or does the renunciation mean justice to Albania, to the Greeks in the Dodecanese, and to the Yugoslavs in Slovenia and Dalmatia? It is possible that the Marshal intended his statement to be read in this light; but it would have shown a much clearer grasp of the political realities of the international situation if he had been as explicit as Count Sforza in denouncing the aggressions

of the former Government, promising not merely a cessation of claims but a restitution of stolen goods.

Perhaps the truth is that Marshal Badoglio cannot be wholehearted in his rejection of Italy's former foreign policy because he was personally responsible for the execution of a great part of it. He did not resign when Italy entered the war against France, nor even when the attack on Greece was launched. He resigned not in November, 1940—as he affirmed—but in December, when the Greek war began to go badly. There is nothing in his career to suggest that he was outraged at Fascism's aggressive foreign policy until it failed. It is true that, in his statement, Marshal Badoglio attempted to exonerate the Army, and with it himself, from all responsibility for Mussolini's actions. "None could rebel," he said, "seeing that all the instruments of power were in the hands of the Government." But when in history has the Army not been an instrument of power? If Badoglio, personally, as Chief of Staff, with the vast bulk of the Army and the people behind him, had refused the Duce, is it not obvious now that Fascism would have had to compromise and make concessions? The Army was powerless in 1940, not because "the instruments of power" lay solely with Mussolini, but because it accepted an aggressive and expansive foreign policy as long as it appeared to have a chance of success. Marshal Badoglio's very tepid statement on foreign policy makes sense in this context. He cannot make the right kind of statement now for he has still to realise what the right kind of foreign policy is.

It is surely obvious now that the Allies must exercise a high measure of vigilance and responsibility to ensure that the intentions of this or any future Italian Government fit into the broad framework of Allied policy—if any such framework has yet been conceived. Their responsibility is perhaps even more direct here than in the closely related problem of securing a popular and peace-loving Italian administration. Pressure on the Badoglio regime to broaden its basis is coming from the Italian people, probably even more insistently than from the Allies. Democratic freedom and responsible Government can become the rallying points of popular movements inside Italy. But the issues of foreign policy are far more confused. It is not likely that Italian townspeople will stage demonstrations to "give back the Dodecanese" or to get "justice for the Yugoslavs." The pressure for sound foreign policy must come primarily from the Allies. Unfortunately several factors inhibit them at present. First of all, they have still to establish a proper political liaison with the Badoglio Government. The contacts for the time being are military, and there is no machinery, not even the machinery of ordinary diplomatic relations, to link up the political will of the Allies with the political practice of Badoglio. What is needed now is some sort of political commission, representing Britain, the United States and

Telephone: TEMple Bar 0381

Russia, to officiate at Badoglio's headquarters and ensure that the right kind of pressure is exercised on the direction of Italy's policy towards the Allies, great and small.

The effectiveness of such a commission presupposes, however, that the Allies themselves know what kind of pressure to exert. So far, quite palpably, they do not. Nowhere is Italian policy more crucial and more equivocal than in the Balkans. Nowhere, too, are Allied intentions more bleared and shapeless. Until the Allies have come to some conclusions about the type of regime to be encouraged in Yugoslavia and Greece, the kind of territorial and minority settlement to be achieved in the Balkans, the general pattern of security to be sought in the Mediterranean as a whole, it is useless to hope that the co-belligerent Italians will give an open and satisfactory reply to the anxious queries in the minds of the Greeks, the Yugoslavs and the French. The Moscow Conference is presumably taking cognisance of the Balkan muddle and working out a joint policy for the fusion of the guerilla

movements and the organisation of post-war Balkan co-operation. But if these topics are not to be discussed either at this Moscow meeting or at the subsequent meeting of the Heads of State, then it is quite certain that something like a head-on collision awaits the Powers, between the Badoglio conception of what co-belligerency entails and deserves and the reactions and policies of the other Mediterranean Governments and peoples.

The Badoglio statement is not an unhelpful document. Provided the guarantee of widening the Government and including the parties is carried out, Italy will have an administration capable of working out peaceful relations with its neighbours. But however popular the Italian administration, it stands to reason that the broad lines of policy, and even the initiative, cannot come from enemy Rome. The hopes of a decent Mediterranean settlement depend primarily upon London, Moscow and Washington. If the issue is shirked there, it will not be retrieved anywhere else.

Hungry Millions

LORD WOOLTON gave good news and a warning at Dumfries on Sunday. Food exports to Britain are only half what they were in April, 1940, but the people have all they need and their health is good. But, the Minister went on, "We are running into a world shortage." Military calls on shipping are multiplied; and the structure of world agriculture has been distorted by enforced wartime policies and weakened by lack of transport, labour and equipment.

In India, food shortage, always present, has become famine with disease in its train. Only the Punjab and Sind are wholly free; in Bengal, Cochin, Travancore and the Deccan, hundreds of thousands are starving. In a book three years ago, Mr Colin Clark very roughly divided world population into world output, and reached the obvious conclusion, in reply to talk about the Age of Plenty, that "the world is found to be a terribly poor place." Few places were poorer than India, even in peacetime, and Indian poverty, during the war, has become tragic destitution. On the one hand, there is dearth of food, not only grains but meat, eggs, milk and vegetables, scarce and extravagantly costly; on the other, there is grave shortage of all domestic necessities and even of the most primitive farm equipment. Supplies are short, and prices beyond the reach of the great majority of the people.

There is no prompt cure for India's present ills. The only sure solution of Indian poverty, as of the poverty of all the teeming backward areas of the earth, is increased productivity, more output per person to consume or to exchange for consumers' goods. This was the basic principle of the proposals of the Hot Springs Food Conference; a double programme to raise consumption and living standards by raising productivity and freeing world exchange. In a single year before the war over 800,000 people died in Bengal from cholera, malaria, tuberculosis and enteric; disease and death were encouraged by malnutrition and very low living conditions. The industrial transformation that is taking place in some Indian cities, under the stimulus of war requirements, as cotton manufacture grew during the American Civil War and between 1914 and 1918, has given, and offers, no solution in itself to Indian poverty. Nine-tenths of India's population live in 700,000 villages; more than six out of every ten workers are agricultural. A long-term solution can only be found by raising industrial and agricultural productivity side by side, making it possible for rural workers to buy more and more of the products of town or village manufacture. At the best of times, the "surpluses" with which Indian peasants pay their rent and debts and buy town-made necessities are pitifully small, and only exist because the peasants and their families are themselves underfed. India is a land of very small margins indeed; and the war, by wiping out the margins from which the cities and landless labourers were fed, has transformed grievous poverty into the gravest distress.

Agrarian revolution cannot be accomplished in a year or a decade. No short-term remedy which ignores long-term needs will be realistic; but the immediate requirement is to increase supplies of food—and other necessities—and make them available to the poor. This was the view of the Gregory Committee on Foodgrains Policy which reported a month ago. Mr Amery has said that efficient distribution is the key; but first there must be supplies to distribute. The Committee's most urgent recommendations were the cessation of all food exports, even to Indians serving abroad in the hungry Middle East; the importation of one-and-a-half million tons of food in the first year, and a million tons annually thereafter; the importation of plant to manufacture 350,000 tons of ammonium sulphate yearly; the importation of tractors, fuel and oil; and the promptest possible increase in the supply of necessary consumers' goods to induce cultivators to sell in order to buy—though, as in the past, these "surpluses" can still only be tempted out at the cost of much peasant privation. Moreover, efficient distribution of food supplies is only possible if the authorities can take control; and the Committee suggested, with 500,000 tons of the first year's food imports held as a Central Reserve, it would be possible to open traders' hoards by the threat of falling prices.

Prices have been pushed up by many causes: by Government purchases for military requirements without effective price control; by the pressure of the higher incomes of war workers; in short, by the old familiar wartime situation of increased purchasing power and decreased supplies of all goods except munitions. Consumption has increased; underfed cultivators, unable to buy manufactured goods, have kept slightly more food for their families to eat; war workers have, if possible, increased their diet. Hoarding, too, has grown. To call cultivators hoarders who hold back for their own consumption what they formerly spared for sale may be an abuse of language; but the effect of this withholding has undoubtedly been to cut down available supplies out of all proportion to the decline in total food stocks. And food has been held up on its passage from field to market; by traders in wait for larger profits, and by provincial administrations seeking, naturally, to protect their own people against possible famine. The climate of opinion, too, has been adverse. Fear of invasion and fighting has caused people to lay hands on all food possible and to hold it; the worst areas of famine are those nearest to the theatre of war. The means of transport, by land and water, by which the smallest surpluses are moved in normal times to deficit areas, have been much depleted to meet military requirements.

This is the situation with which the authorities have hitherto failed to cope. The official British explanation, stated by Mr Amery and others, is a nice blend of statistical and political special pleading. It is based upon three

propositions: that imports have never played more than a small part in Indian food supplies; that the Government of India could not, democratically, use its special war powers to override Provincial Governments, even to feed the people; and that "the problem, so far as we are concerned, is essentially and entirely one of shipping." All three are plausible, but misleading. To relate food imports to total supplies shows misunderstanding: as the Gregory Committee pointed out, certain areas, Bombay and the Malabar coast, have depended disproportionately on imported supplies; and over all India the internal surpluses available for trade are each so minute and so precarious that imports, by their effect on psychology—and thus on prices—and by their availability to stop up holes, are a crucial element in the unstable structure of Indian food economy; their importance bears scarcely any relation to their relatively small size. Mr Amery's political disclaimer, intended to place the blame upon Indian mismanagement and discord, is not less disingenuous. A Government that can imprison and punish as this one has done, necessarily, to preserve order cannot in honesty refuse firm action to prevent famine. Nor is the shipping argument, in general sound, more convincing in detail. Mr Amery claims that "substantial" quantities of shipping were allotted to take food to India early this year; but nothing that is known, by the Gregory Committee or anyone else, about actual imports, bears this out; and there is no evidence that demands for tonnage, commensurate with the famine that was already spreading a year ago, have ever been made to the Allied shipping authorities in London or Washington.

The fatal flaw in the official attitude has been twofold: first, the belief that the worst could be prevented by the same ingeniously planned distribution which in peacetime just held famine back, in most years, by irrigation and railway building; and, secondly, the confidence that, if this could not be done, the fault would now belong to the Provincial Governments, and not to Britain or the Viceroy. The official view seems to have been, cynically, "You made your own bed (when you secured the Constitution of 1935). You must lie on it." If there were unmistakable signs that this attitude had changed, it might be scarcely worth repeating past history. But Mr Amery's speeches inspire small confidence; and many friends of India in London are desperately troubled at the lack of boldness and imagination that still seems to persist. Large offers to supply patent and concentrated foods, requiring only small shipping space, have, it is reported, been rebuffed because of finance. Constant harping on Indian hoarding, the black markets and Indian maladministration,

all admittedly factors in the crisis, gives no promise of a stronger, more effective and more responsible policy. Steps have, it is true, been taken: imports have begun; exports have been suspended; and rationing in the large cities, proposed by the Gregory Committee, has started in Calcutta. More than a million Indians are being fed by relief; and Regional Food Commissioners, working with the Food Department set up a year ago, are trying hard to get supplies moving to market and from province to province. The right gestures are being made, as indeed they have been made, piecemeal, for many months; but, on the question of enforcement, stressed above all by the Gregory Committee, the Governments, both in Britain and India, remain horrified at the notion of imposing a "basic food policy" from the Centre upon the Provinces.

Only a fool or a knave would deny the immense difficulty of feeding India's 400 million people. The logical solutions for food shortage, common in countries with ample diets and developed institutions—rationing, requisitioning, priorities, price control and the rest—are only very partially workable in India. Moreover, the story of India and every analysis of India's food position must be that there is not enough food available, and not enough purchasing power in the hands of the poor, to prevent tragically many deaths from starvation and disease, in good or bad times. The quickest growth in population ever recorded swallows up every increase in supplies, and forces people back to subsistence and below. The villager, chronically in debt, accepts scarcely more than subsistence when crops prosper in return for little less than subsistence when they fail. There is a vicious circle: the Indian people will not be appreciably better off until the checks to population that have emerged in other countries begin to operate in India, while, by historical analogy, these checks will not begin to operate there until the Indians are better off.

The only real cure is an economic revolution, in country and town, as wide-ranging and drastic as the modernisation of Russian agriculture by co-operative means and with state capital. But, even if the British, in the last period of their expiring lease in India, can do little more than scratch the surface, they can at least begin the process of reconstruction—and they must all the more give every proof that they are doing all that is possible, both for now and for the future. In both this country and the United States even the austere principles of war economy give the bare necessities of civilian life at least as high a priority as munitions themselves. In India the belt has been tightened when there was less than no slack to take in.

Infant Mortality

A FEW weeks ago, the Registrar-General's return of vital statistics for England and Wales showed that a new low record in the infant mortality rate had been set up for the second quarter of the year. The rate was 46 per thousand live births, compared with an average of 55 in the ten preceding second quarters. Nor is this improvement a flash in the pan. The rate for the whole of 1942 was 49 per thousand—the first time the annual rate has fallen below 50—and compared with 59 in 1941 and 56 in 1940. Ten years previously, the rate was over 60.

A fall in the rate after three years of war is a considerable achievement. But before it gives cause for complacency it should be recalled that in the United States it had fallen below 50 before the war, in New Zealand it was round about 40, and had been as low as 35, in Sweden it was falling steadily and had reached 39, and in Holland it was regularly below 40.

There are other reasons for disquiet. A short time before the Registrar-General's return was issued, a book was published* giving the results of R. M. Titmuss's

investigations into infant mortality statistics over a period of twenty years. He has been concerned to analyse the annual rate, which is the average for the whole of England and Wales, by splitting it up into the rates for the different social classes graded according to the censuses of 1911, 1921 and 1931. His first analysis is shown in the following table reproduced from the book. (Class I comprises the upper and middle classes; Class II is intermediate, comprising elements of I and III; Class III is the skilled labour; Class IV is intermediate, comprising elements of III, V and agricultural labourers; Class V is the unskilled):—

	Death Rate per 1,000 Legitimate Live Births			Per Cent of Rate for All Classes		
	1911*	1921-3	1930-2	1911	1921-3	1930-2
All Classes	125	79	62	100	100	100
Class I	76	38	33	61	48	53
Class II	106	55	45	85	70	73
Class III	113	77	58	90	97	94
Class IV	122	89	67	98	113	108
Class V	153	97	77	122	123	125

* "Birth, Poverty and Wealth." By R. M. Titmuss. Hamish Hamilton. 118 pages. 7s. 6d. net.

* In 1911, agricultural workers, miners and textile workers were classified separately and are omitted from the data for that year.

Thus, although the rate declined, in the period covered, for all classes, it fell more for the first two classes than for Classes IV and V, and the excess of Class V over the average grew.

Having established his main thesis—that inequality in infant mortality among the different classes of society has widened since 1911—Mr. Titmuss proceeds to analyse the inequality more closely. He begins by splitting up the rates among the different age groups comprised in the first year of life. He finds that in the death rate under one month—the neo-natal rate—the position between the different classes has hardly changed over the twenty years; in fact, one method of analysis showed that the excess of neo-natal mortality in Class V over Class I fell from 58 per cent to 50 per cent between 1921-23 and 1930-32. But in the next eleven months of life, a very different result was found. Between 1911 and 1930-32, the mortality rate of infants of one to three months in Class I fell by 71 per cent, whereas that for Class V fell by only 54 per cent. This means that the worst rate exceeded the best rate by 92 per cent in 1911, 263 per cent in 1921-23 and 205 per cent ten years later. In the next age group—3-6 months—the widening of inequality is even more pronounced; the worst exceeded the best by 142 per cent in 1911, 312 per cent in 1921-23 and 287 per cent in 1930-32. In the last six months of the first year of life, the inequality is greatest of all. In this age group, the worst rate exceeded the best by 173 per cent in 1911, 324 per cent in 1921-23, and by 439 per cent in 1930-32. Thus, at this stage of the life of an infant born into Class V, there is not even the small improvement shown, at earlier stages, in 1930-32 compared with 1921-23.

From this analysis of infant mortality by classes and age groups, Mr. Titmuss draws the following conclusion. He points out that 80 per cent of total deaths during the first month of life were caused by premature births, congenital malformations, birth injuries, convulsions and congenital debility. In other words, the neo-natal death rate, which, as has been stated, shows if anything a diminishing inequality between the worst and the best, is hardly influenced by environmental factors, whereas environmental diseases, including measles, whooping cough, diarrhoea and enteritis, tuberculosis, bronchitis and pneumonia, and other infections, accounted for 64 per cent of all deaths in the ages of 1-12 months. Moreover, if deaths from these groups of diseases are analysed by social classes, Mr. Titmuss finds that the excess of Class V over Class I was only 61 per cent in the neo-natal or non-environmental diseases in 1930-32, but was as much as 453 per cent in the environmental group. His conclusion is, therefore, that in their physical make up children are born, if not equal, at least not vastly different, whereas they grow up in a world where a wide gulf separates one class from another in matters of housing, nutrition, clothing, education and medical care. In other words, he claims that Francis Galton's dictum, that "nature prevails enormously over nurture," has been completely disproved.

Mr Titmuss's battery of statistics is so imposing, and his methods of checking one analysis by another so industrious, that one hesitates to dispute his conclusions. Moreover, it hardly needed all these tables to show that the children born to the upper and middle classes have a better chance of survival than those born to the poor, nor even that the former are better fitted and better able to take advantage of the tremendous advance in medical knowledge, particularly as it affects the newly born, in the period covered by the analysis. But one cannot help

feeling that the main purpose of the book was not so much to draw conclusions from comparative statistics of infant mortality as to give statistical support to conclusions that Mr Titmuss formed many years ago—that England is divided into the privileged and the under-privileged by the unequal distribution of wealth, and that a new social order is needed to end the inequalities.

If his implied thesis—that inequalities of wealth in this country have increased, are increasing and are likely to be increased further—is taken first, it is only necessary to refer him to the recent Budget White Papers which tell a very different story. Mr Titmuss hardly gives enough weight to the fact that his third comparative year, 1930-32, was the lowest point of the economic depression, and that whatever may have been true of disparities in wealth then has been completely falsified by the redistribution of wealth during the war. Moreover, among all his array of statistics, he gives no indication of the comparative sizes of the different classes in proportion to the population at the beginning and end of his period. It would be an advantage to know whether there has been any progression from Classes IV and V to the higher income classes before his presumed conclusion can be accepted.

But even on the narrower ground of comparative infant mortality there are some notable gaps in his analysis. For instance, he does not discuss the influence on his Class V statistics of the "problem families" with their high birth rate and high death rate. Yet these families, which form a peculiar problem of their own that has nothing to do with the redistribution of wealth, are all included in Class V. It is true that they existed in 1911 as well, but it is very possible that they formed a smaller proportion of the total unskilled class then than they do now, both because of the smaller birth-rate among the other unskilled since 1911, and because many of the latter may have progressed from Class V to higher classes in the twenty years.

The weight which these problem families give to the Class V statistics may be illustrated by the following case histories taken from the Burns report on infant and maternal mortality in Durham. One mother of 35 had had ten pregnancies; four children had survived, but six premature children, who were born within four years, had died in a few days. Another mother of 34, notified as a mental defective, had had eight children, of whom five had died and one was stillborn. One mother of 44 had had twenty pregnancies, and eleven children alive. In a less extreme case, a mother of not quite 20, the wife of a hysteric, was imminently expecting the birth of a second child when visited, though the first was less than a year old. She herself was dull and lethargic, and had hardly managed to cope with the care of one baby.

The point about these problem families, whose histories could be multiplied all over the country, is that, though they are poor, they are not a problem of poverty and unemployment. They are rather families likely to be permanent pensioners of the state and as such should be treated as a class of their own. Yet Mr Titmuss not only ignores their influence on his statistics; he hardly goes into the question of the rate of breeding among his Class V families, though this, which is again not so much a problem of poverty as of social custom and ignorance, has a considerable effect on infant mortality, both on biological grounds and because of the falling off in maternal efficiency when babies follow each other in rapid succession.

Yet, with all its prejudices and omissions, Mr Titmuss's book will serve a valuable purpose, because at least it shows that in the saving of infant life this country has still a long way to go. In the endless debate of nature versus nurture, or heredity versus environment, he may perhaps come down too heavily on the side of nurture and environment and dismiss the influence of nature—which it would be preferable to call predisposition—too categorically. But at least he is right in his statement that environment is within man's power to control, and that not until every child born in this country has a right to grow up in a decent environment can we rest on the fatalistic assumption that it is heredity which is at fault.

NOTES OF THE WEEK

The Moscow Conference

By all reports, the Moscow Conference has opened well, and is "going smoothly," to quote Mr. Stettinius. It is, of course, impossible to say whether the really difficult problems, such as the Polish frontiers or the partisan troubles in resisting Europe or the future treatment of Germany, have come under consideration so far, but at least the Allied statesmen realise the urgency of securing agreements, and know that deadlock now will have in it the seeds of another war. That the preservation of peace depends upon the ability and determination of the Great Powers to hold together was emphasised in a recent number of *War and the Working Classes*. It recalled the events of the inter-war years, and concluded that the failure of the Great Powers to hold together, and to back peace with their combined strength, was the real cause of the war of 1939. It went on to underline the point so often stressed in Britain and America in recent months that

The union of these Powers which lead the anti-Hitlerite coalition is naturally called upon to become the nucleus around which all peoples of the world who desire reliable peace and security will rally.

This is true; but it is on the outcome of the detailed agreements reached at Moscow that the effectiveness of the nucleus will depend. The Three Powers together present so formidable an agglomeration of power that unless the other nations are convinced by practical proof that the power will be used justly and constructively, they will not accept the Great Powers' leadership. It is admirable that the general sentiments of all participants should be so unexceptionable. But they are at Moscow precisely to turn general principles into hard and convincing fact.

* * *

The Super-Battle

The Russian offensive in the south is still in full swing, and nothing seems to suggest any weakening of its impetus in the next few weeks. The credit for this truly gigantic and sustained effort goes to the Russian supply services. It is the supply services that undo the effects of the devastation left behind by the retreating enemy, and the methods that have enabled the Russians to maintain this continuity of supply deserve the closest study by Allied quartermasters. The operational and tactical pattern is less novel—it is almost classical—but not less brilliant. While the German Command still seemed to have the illusory hope of holding the Zaporozhe-Melitopol line, it found its flanks turned by the broad wedge which suddenly sprang southward from Kremenichug, threatening the Germans with an immense disaster. The pace of the Russian thrust from Kremenichug toward Nikolaev was so great that for some days the encirclement of the at least 60 German divisions still inside the great arc from Kherson and Nikolaev to Dniepropetrovsk and Melitopol—to say nothing of the forces left behind in the Crimea—seemed to be a very real and imminent danger. Theoretically, two replies might have been given to that danger. The first would have been a counter-stroke to flatten out the Kremenichug wedge; this was beyond the power of the German Command. Such a counter-offensive could have been built up only by drawing on the forces which are defending Kiev, and the weakening of the Kiev front at this stage would have created even graver risks for the Germans later on. The alternative reply has been an attempt to extricate the threatened forces, an attempt which has so far been made with only very limited success.

*

Two delaying battles—at Melitopol and at Krivoi Rog—seem to have been of vital importance. The battle of Melitopol lasted nearly a fortnight, and it enabled the Germans to withdraw part of their garrisons in the Crimea—Melitopol itself was defended by some of the units evacuated from the peninsula. What proportion of the German forces is still left in the Crimea is still unknown; now that Melitopol has fallen, the evacuation can be completed only through the awkward bottleneck of Perekop, the place where Wrangel's army was "driven into the sea" in the Civil

War. With the Russian advance across the Nogaish steppe—an advance which is certain to be very swift—the Perekop outlet, too, will be sealed soon. The other delaying battle at Krivoi Rog—inside the Dnieper bend—is still in the balance at the time of writing. While the battle lasts, the roads of retreat from the Dniepropetrovsk salient are still open. Even so, the retreat must have become to some extent disorderly. For the first time the Russians speak of villages left intact by the enemy, because of the haste of his withdrawal. The next spot vital for the fleeing armies is the famous centre of manganese ore mines—Nikopol—through which runs the railway to Nikolaev; and this is now threatened from both Melitopol and Krivoi Rog. While it is still too early to strike the final balance of the "super-battle," it is already clear that the enemy has suffered tremendous losses in equipment; and that his losses in manpower are likely drastically to change the relation of forces on the whole Ukrainian front. And there can be little doubt that the battle for Kiev is also approaching its final phase.

* * *

Post-War Transport

The air has been full of rumours about grand designs for the compulsory reorganisation of the railways after the war, by nationalisation or further amalgamation. It is not likely, for both technical and political reasons, that they are true. The railways are only one branch of inland transport and, in any scheme for post-war reorganisation, the various branches must be regarded as so much, often interchangeable, carrying capacity. This point was made by Lord Leathers in the House of Lords on Wednesday, when Lord Listowel asked whether plans were being prepared by the Government "for the post-war development and co-ordination" of the inland transport system. Lord Leathers admitted that the details of the post-war scheme had not yet been worked out; they would have to be fitted in with the Government's wider plans for reconstruction, which are not yet ready. True, it may be premature to elaborate all the details of transport reorganisation after the war; but the time has surely come to lay down the principles on which reorganisation should be based. Even on principles the Government does not seem to have made up its mind. All that Lord Leathers did was to set out the aims of policy. But even within those narrow limits this week's debate was useful; Lord Leathers was able to demonstrate the futility of the sectional approach. Merely to nationalise the railways, to substitute public for private managers, would solve nothing. Similarly, any further amalgamation of the four railway companies would not solve the railway problem, and even less the national transport problem. The aim in any scheme of reorganisation should be to provide efficient and cheap trans-

WORLD OVERSEAS

Features in this week's articles on overseas developments include:

November in Germany ... page 587

port for transport users. And its solution should be sought, not on the basis of political slogans, but on the basis of technical and economic facts. Any form of public control, to be of use, will have to be founded on these practical considerations.

The Army at Home

Not so long ago, Sir Walter Womersley, Minister of Pensions, was the object of violent Parliamentary criticism. Now, this place has been taken by Sir James Grigg, Secretary of State for War, who was violently attacked last week by Mr Quintin Hogg for unsympathetic treatment of the widow of a serving specialist drowned at sea. These two Ministers have more in common than this exposure to criticism; they are, admittedly, efficient and conscientious Ministers. Why, then, the criticism? It arises, not from their personal failings, which are few as Ministers go, but from, first, a sentiment and, secondly, a fact. The feeling that men who have fought for their country deserve fair treatment is, fortunately, very deepset; there is all the weight of thousands of families, deprived of the health or life of their men; behind the pressure for decisions on pensions and in Army organisation in favour of those who have gone out to fight; and there is the memory that, last time, neither the wounded nor the dead received their right reward. The fact behind this pressure is the knowledge that, though the Army overseas, tried and tempered in the fires of battle, has become a notable instrument of efficient warfare and soldierly comradeship, the Army at home remains, in some respects, as hidebound, as unsympathetic and as favourite-ridden as ever. The old complaints, from the last war, of promotion and favour by luck, personal manoeuvre and arbitrary accident, rather than by merit, remain as strong as ever in this war, away from the battle-fronts, in both the men's and women's services. Men have much greater chances of advancement at home than abroad, provided they know the right people. Soldiers in high positions at home err publicly, and survive with rank and pay, provided they are "good chaps." This is the staple of the criticism against the Secretary of War, just as the feeling that men who have bled or died deserve more than mere justice has vastly exaggerated the misdeeds of the Minister of Pensions. These are powerful political forces. Wrongly handled, they will do more than anything else to wreck the popularity of the Government, and to open the way for incalculable political movements, in perilous shapes and forms, to right soldiers' wrongs.

The Nation's Debt

At the close of any war, a democratic government stands poised between two evil courses. One is, by narrow and legalistic definitions, to undo in its deeds the praises easily bestowed upon fighting men in a thousand speeches and war memorials. The other is to play for votes and favours by creating a new privileged class, the men who fought as against those who did not, and to break national unity and weaken justice by dividing the people, at the nation's expense, into two rival and warring groups. After the last war, one at least of these dangers was avoided; no political or fascist movement grew from the organisation of ex-Service men. Field Marshal Haig and the British Legion preserved Britain from the political excesses attached in Germany and France—and the United States—to combatant bodies. But against these political successes was set a serious failure. Not even the simplest justice was done in the event either to ex-soldiers or to ex-war workers. Unemployment and distress were the proof of failure; ex-officers and other ranks begging in the streets were only the most obvious sign. Those who have fought and worked—and died—during the war ask for no privilege or charity, but for a society in which there will be peace abroad and, at home, work to do and a decent life for them and their families to live. This more than anything else is the reason why it is wholly fantastic for any man, from the Prime Minister downwards, to say that decisions on post-war policy would be premature. The men who have come back maimed and disabled this week from enemy prison camps ask above all, not for philanthropy, but for a chance, rehabilitation and self-respect. The many more, some of whom will come back and some not, ask, too, for self-respect and the chance of independence—for collective security, full employment and social assurance. These are

the challenges, in home and foreign policy alike, that no Government can ignore without risking the whole of the democratic future, and inviting the worst passions and the worst misrule.

A Pay-as-You-Earn Point

Rumour (which may or may not be reliable) has it that the Chancellor of the Exchequer will yield to the evident wish of the House of Commons and extend the "pay-as-you-earn" scheme to all incomes taxed under Schedule E, whatever their size. If this is correct, it will be a popular and a wise decision. But there are many pitfalls for those who unwarily tamper with the complex structure of the income tax. One relates to the position of temporary civil servants. Income tax on civil service salaries is already assessed and collected "as-you-go." A man entering the Civil Service, say, in April, 1943, would start paying income tax at once on his income for 1943-44. But he would still have seven months of collection of tax on his income of 1941-42 to endure, and for this period—which in many cases coincides with a reduction of income—he would have double payments to make. This is not a matter of double assessment (though such cases can and do arise), but of the overlapping of periods of collection. Many thousands of temporary civil servants have had to endure this imposition. The Inland Revenue should, of course, have relaxed its practices to prevent the case arising; but it is of a piece with the whole treatment of the temporary civil servant by the Treasury and the Inland Revenue that no effort was made to do so. The sufferer was encouraged only by the reflection that his period of double collection during the war would be offset by a period of no collection at all when he left the service after the war, and it is precisely this that will now be taken away by the "Pay-As-You-Earn" scheme, if it is extended to cover all salaried workers. This would be a monstrous injustice to a class which has deserved far more of the state than it has ever received. It could be avoided by a provision in the Bill allowing any individual taxpayer in certain defined categories to contract out of "pay-as-you-earn" and to be assessed, for a number of years, as he would have been under existing legislation. This would, no doubt, make for administrative complications, but they would not be very severe, and in any case it is better to have complications than injustice.

Slogging up Italy

The campaign in Italy has yielded only relatively slight returns since the capture of Naples by the Allies. The lack of greater tactical success may spring either from tactical mistakes or from a strategic misconception or from both. General Alexander, in a recent interview with the press, pointed to the purely tactical aspect. He revealed a major fault in reconnaissance or intelligence during the first and most critical stage of the campaign. At Salerno it was apparently not the Allied attack but the German defence that enjoyed the advantages of surprise. The Allied Command did not expect the enemy at Salerno.

When the landing was planned the area was free of German troops. Had it remained free the Fifth Army could have driven across Italy and cut off the German divisions in the south as well as driven north to Rome.

Two questions are raised by this statement. There is, first, the obvious gap in information between the planning and the execution of the landing. Secondly, there is the fact that Salerno—as the Prime Minister pointed out to Parliament at the time—was the northernmost limit for the use of Allied shore-based aircraft. As such it was *a priori* the most likely invasion point; and common sense probably told Kesselring to watch Salerno. Nevertheless, a third of Italy has been occupied at the cost of some fifteen thousand casualties against the twenty thousand suffered in Sicily. General Alexander went on "All roads lead to Rome, but all the roads are mined." The roads are mined by the enemy as he withdraws, and the only really effective weapon against this would be so high a rate of advance by the Allies that the enemy would have no time to do his mining. "Slogging up Italy is a slow job"; and the only alternative to slogging is racing. There the tactical difficulty leads back to a major strategic issue. Would not a precipitate advance to the north expose the Allied armies to the risk of a powerful German counter-stroke? This, in its turn, depends on the size of Rommel's forces. General Alexander spoke of about thirty-five to forty German divi-

sions diverted from the Russian front to Italy and the Balkans. It is not clear, however, how many of those divisions are in Italy itself available for a counter-stroke; and to this extent the risk of racing northwards is also an unknown quantity. The awkward dilemma between choosing the slow but steady way or the risks of a swifter advance was from the beginning inherent in the choice of Italy as the main theatre of operations at this stage of the war. The narrow peninsula does not afford much elbow room for the quick and wide outflanking moves that have been the feature of modern lightning warfare. Thus the tactical difficulties discussed by General Alexander point back to the crucial strategic issue—what is to be the direction of the main Allied thrust against the German fortress?

The Demand for Teachers

It has been officially stated that 70,000 additional teachers will be needed to carry out the plan for educational reconstruction proposed in the Government's recent White Paper. This is a formidable figure, which amounts to about one-third of the existing number of teachers, but it may well prove to be an underestimate. The British Association's Committee on Post-war University Education has issued a memorandum which estimates the probable shortage as over 120,000, if provision is made for the teachers needed in universities, young people's colleges and polytechnic schools, and in adult people's colleges—in other words, those needed to cover the needs of the population between the ages of 2 and 22. Moreover, by far the greater part of the 324,000 teachers which the Committee reckons will be needed will be teachers in primary and secondary schools, young people's colleges and universities; that is, they will require a university degree course, together with a two-year training course afterwards. Thus, the Committee estimates that to maintain the supply of teachers, and allow for wastage, some 9,000 men and women must enter the profession every year, which means that the number of would-be teachers undergoing a four-year course in the universities—the second training year would be spent outside the university—would be 36,000 at any given time. Against this, the total number of undergraduates in the universities, university colleges and medical schools in England and Wales in 1938-39 was only 30,000. Even if vacancies in the universities can be expanded to cover 54,000 undergraduates—the number envisaged in the Committee's estimate of the teachers needed—there will still not be room for 36,000 potential teachers, unless vacancies for training for the other professions are reduced almost to nothing. Whether the Committee has proposed the right solution for this problem—that half of the future teachers should be intramural students of their university, while the other half would work for the degrees and diplomas of the university of their neighbourhood in local colleges and training colleges—cannot be discussed here. What is of prime importance is, first, that a vast number of new teachers will be wanted; secondly, that it is undesirable that there should be any relaxation of standards in preparing them for their profession; but that, thirdly, it is equally undesirable that the universities should be flooded with student teachers, both from the point of view of the future teachers themselves, and of the would-be entrants into other professions. Nor is it desirable that the present system of committing students to teaching as a condition of receiving a Government grant should be retained. How does the Board of Education propose to solve this problem?

* * *

Free Shopkeeping

It is pointed out by the National Chamber of Trade that the recent vote of their members in favour of the continued licensing of shops after the war (discussed in *The Economist* of last week on page 550) did not mean that retailers desire the permanent restriction of entry into shopkeeping. The vote was for a transitional arrangement during the return to peacetime conditions. This should, of course, be made plain and well noted. If it implies that the trade associations as well as individual retailers now favour real freedom of retail trade, it is good news for shoppers, and, in effect, a grand renunciation of the many restrictive practices—the fixing of margins and the war against price-cutters and competition by stop-lists, black-lists and boycotts—which before the war, without licensing, restrained

retailing. It would be still better news to hear this said in so many words. Unfortunately, until it is said, there may be doubts; and, cynically perhaps, many people will wonder whether the temporary aid of licensing is not bound to take on the permanent character of, say, the temporary aid of tariffs.

* * *

Towns and Cities

Mr F. J. Osborn, of the Town and Country Planning Association, gained possibly unwanted publicity in the press last week-end when he was sternly rebuked for being rude to London. The occasion of his misdemeanour was a conference on the place of country towns in national planning policy. His point was that many spokesmen for London are so narrowly "provincial" that they would rather keep the muddled millions of the present metropolitan sprawl, muddle and all, than accept the policy of deliberate decentralisation recommended by, among other bodies, the Barlow Commission. The purpose of decentralisation and of the control of industrial location—also a Barlow proposal and already accepted, in the most general terms, by the Government—is to make life worth living and work worth doing, both in London and in the rest of the country. The theme of last week's conference was the use of established country towns as "reception areas" for people and industries, moderately sized "neighbourhood units," capable of civilised amenities and nicely balanced between the activities of town and country. It is no longer believed by the Town and Country Planning Association, which began with the example and experience of Letchworth and Welwyn garden cities, that the only way of loosening and dispersing over-dense towns is to create new ones; they lean rather towards building the better Britain upon organic communities already in existence. The press outburst last week against Mr Osborn's "treachery" to his native London was not irrelevant, though his real point was perhaps missed. Many people feel that his insistence on a degree of decentralisation sufficient to accommodate practically every family in a house and garden, not a flat, would mean not simply the dispersal but the break-up of the traditions and economic life of the cities. Obviously, the solution must be a balance between these two views. If Mr Osborn makes Londoners again conscious of civic pride and responsibilities, good will be gained. If he allows his campaign against flats to be merged into a campaign against the London County Plan he will have done both London and the cause of planning, which he has deeply at heart, a grave disservice. Meanwhile, there is urgent need for specific Government decisions on these planning issues and for clear judgments on the relations between decentralisation with controlled industrial location and the policy of full employment with maximum output.

Workmen's Compensation

The comparative calm with which the Workmen's Compensation (Temporary Increases) Bill passed its second reading on Thursday of last week was followed by a storm in the Committee stage on Wednesday. The second reading had shown that most members only accepted it with bad grace, but the violence of the opposition shown this week was unexpected. A Labour Member moved an amendment to provide that a supplementary allowance in the case of a week falling within the first 13 weeks of disablement should be 10s. instead of 5s. The Government refused to accept the amendment, but after Members of all parties had pressed for

Trusteeships and Executorships Accepted.

it Mr Morrison moved to report progress. This was negatived, but when the amendment was carried to a division, it was defeated by 153 votes to 42—probably many Members who spoke in favour of it refrained from voting against the Government after Mr Aneurin Bevan's violent denunciation. In the event, progress was reported, but the debate was a warning to the Government that this sort of storm is likely to occur every time it produces a measure which merely tinkers with social service payments. A year ago, its excuse for delay was that it was waiting for the appearance of the Beveridge Report. Now its excuse is that it is making up its mind about the Beveridge proposals. This attitude cannot go on indefinitely.

Exchange Control Relaxed

This week marks the turning of the tide in exchange control. Amendments to the regulations which came into force at the beginning of the week permit some relaxation in the restrictions on the use of sterling assets held by non-residents. A considerable number of payments which formerly had to be made to blocked accounts are now to be transferable into foreign currencies. Balances held here for Continental refugees who, after passing through this country, have taken up their residence abroad, are to be freed. Non-residents who hold sterling securities are being given greater freedom than they have enjoyed hitherto in the choice of securities into which they may exchange their existing investments. The details will be found in a Business Note on page 591. These concessions do not make much of a dent in the apparatus of exchange control. Moreover, they do not apply to any remittances to Canada, Newfoundland, Argentina or Switzerland, which are still subject to the tightest restriction. Nevertheless, they are significant for several reasons. The first is the indication they give that the authorities are far from wedded to exchange control for its own sake. On the contrary, they regard it as a *pis aller*, applied regretfully under the compulsion of hard necessity, but relaxed at the first opportunity. The blocking of certain types of sterling had inevitably led to many contrivances by the owners of that sterling to circumvent the regulations

and get their money out of this country. A large variety of compensation deals had been devised, each involving some form of black market in sterling, and each, therefore, reacting adversely on the prestige of the currency and on world confidence in it. The elimination of a considerable part of blocked sterling held for private account is therefore a notable step in the reinstatement of sterling as a world currency. The second implication of these relaxations is their suggestion that Great Britain now commands a somewhat ampler exchange reserve than it did when the restrictions had to be applied. This easing of the exchange position is not a recent phenomenon and is far from universal in its incidence—as witness the four specific exceptions made to the extension of greater freedom to transfer. The main improvement has occurred in the crucial sector of the US dollar. This does not mean that Lend-Lease has been used to excess or Reciprocal Aid too sparingly. It is the result, in the main, of the spending of their pay by the large and still growing American armies located in the sterling area.

* * *

Guilder-Belga Alliance

The monetary agreement signed in London last week by the Governments of the Netherlands, of Belgium and of Luxemburg is notable, not only as the first such agreement to be entered into between any of the United Nations, but also as a token of the sectional approach, as opposed to the global, to the problem of the post-war exchanges. The agreement (of which details are given on page 591) provides in the first place for a stable rate of exchange between the guilder and the belga. Each Government undertakes to supply the amounts of its currency needed, in exchange for the other, in pursuance of their mutual trade. Provision is made for the investment of any balances, held in one country by the Government of the other, which come into existence as a result of any temporary lack of equilibrium in the volume of funds flowing each way. There is also provision (though in very general terms only) for the restoration of equilibrium if these balances are found to persist and accumulate on one side or the other of the account. The agreement thus represents the practical application, on a modest scale, of the principles underlying the all-embracing schemes that have been propounded for international currency stabilisation; in the wide scope of its provisions it is a true microcosm of those more ambitious schemes. Nor should the scale of the agreement be minimised. Allowing for the inclusion of the Dutch colonial empire on the guilder side and of the Congo and Luxemburg on the other, it will be found that by this agreement a weighty contribution has been made to the cause of post-war monetary stabilisation. The signatories, moreover, invite other countries to adhere to the agreement, and it is not improbable that in time the document signed in London last week may be regarded as the seed of a monetary agreement embracing the whole group of nations once known as the Oslo Powers. There is no essential conflict between this local exchange agreement and the wider objectives sought in the British-American plans and discussions. The text specifically states that

there is nothing in the present agreement to impede the Netherlands and Belgium adhering to multilateral international agreements relating to the stabilisation of exchanges. They pledge themselves to do so only jointly.

Indeed, the smaller the number of monetary units which that wider agreement will be called upon to weld together the easier will it be to bring to birth. Belgium and the Netherlands are therefore to be commended for their realistic decision to anticipate the conclusion of a wider agreement and to find a solution for their bilateral exchange problem, a problem which may well crystallise when the Treasury experts of the larger countries are still immersed in their blue prints.

* * *

Shorter Notes

In the House of Commons on Thursday of last week Mr Morrison announced that a special public inquiry will be undertaken by Lord Justice Goddard into the Hereford juvenile court case, commented on in *The Economist* last week (page 551). In the meantime he asked that judgment should be suspended. He corrected, however, the im-

pression that the magistrates had sentenced the boy to be placed in charge of the local education authority for seven years. What happens in such cases is that the period of care by the LEA is indeterminate, and subject to review, but must cease at the age of 18. Thus, seven years would, in the case in question, have been the maximum period of care by the LEA, not the period imposed by the sentence.

Brigadier R. E. Laycock has been appointed Chief of Combined Operations in succession to Lord Louis Mountbatten. He is 36 years of age.

The Archbishop of Canterbury, in his presidential address to the Canterbury Diocesan Conference this week, described the Government's White Paper on education as giving "a glorious opportunity" to the Church schools. He said that if the proposal that the Church should retain complete control of its schools, provided it could find half the cost of readjustment and maintenance, had been suggested ten years ago, it would have been regarded as merely visionary. He was, therefore, amazed at the lack of enthusiasm which this provision in the White Paper had evoked.

AMERICAN SURVEY

Political Trends in American Labour

(From a Labour Correspondent)

New York, September 4th
AMERICAN labour appears to be thoroughly aroused by recent developments on the domestic front. The passing of the War Labour Disputes Act (Smith-Connally Bill) by the 78th Congress is perhaps the central point in the irritation. (Incidentally, the law seems to be backfiring very considerably: instead of preventing strikes in war industries its provisions appear to be inducing strike votes, tending to relax the restraining influence of responsible national union leadership and to encourage provocative minority action.) But the Act is not the only cause of vexation in the labour field. The inadequacies of the price-control system, the tax policies of the Government and the failure of the Congress to place a check on inordinately high industrial war profits, are feeders of growing discontent.

The net result of the situation has been a significant move on the part of American labour in the direction of political activity. The Congress of Industrial Organisations (CIO) has set in motion two national committees, one on *Congressional Action* and the other on *Political Action*. The president of CIO, Mr Philip Murray, has stated the purpose of the undertaking to be "to mobilise the five million members of the CIO and to enlist the active support of all other trade unions for effective labour action on the political front." Both committees are officered by high-ranking leaders of the most important affiliates of the CIO. The second of the two committees, the more significant and powerful of the two, has Mr Sidney Hillman, president of the Amalgamated Clothing Workers, as chairman, Mr Van A. Bittner, assistant president of the United Steelworkers of America and next-in-command to Mr Philip Murray, as vice-chairman, and Mr R. J. Thomas, president of the United Automobile, Aircraft and Agricultural Implement Workers International Union, as secretary. The presidents of the rubber workers' and the radio, machine and electrical workers' unions are likewise serving on the committee. It thus represents an array of the most powerful, numerous and influential unions in the basic and mass production industries. A working fund, close to three-quarters of a million dollars, has been underwritten by the co-operating unions and more money will be supplied as the need arises.

The leaders of the CIO political movement know that to prove truly effective they must not seek to "go it alone." Mr Sidney Hillman said at the regional conferences: "It will be one of the major purposes of the CIO political committee to achieve united political action with the AFL and the Railroad Brotherhoods. Labour unity will not only mobilise the 14 million members of organised labour, but will stimulate and rally broad non-labour groups and help give effective political voice to millions of farmers, consumers and progressives of every walk of life."

To what extent this ambition will materialise soon and fully is not easy to see. In fact, the President of the American Federation of Labour, Mr William Green, has indicated that the Federation would not join any such combination. It is possible, however, that some of the railroad brotherhoods, if not all, may consider joining; they acted similarly in past years. Even if the three groups do not make a formal alliance for unified action, a measure of national co-ordination will be effected by each group

engaging in parallel action and informally co-ordinating major steps, and there is reason to assume that formal unified action of practically the entire labour movement may be consummated in a good many important industrial centres. Unified labour leagues or committees have been functioning with considerable success in Philadelphia, whose voting strength is a determining factor in the pivotal state of Pennsylvania, and in Cleveland, Ohio; and in the vital industrial state of New Jersey a state-wide United Labour League has been set up, in which AFL unions are represented, although the CIO constitutes the major part.

A conspicuous leader of the Committee on Political Action, when asked if the Committee is a pro-Roosevelt affair, observed, "I have no candidate." But it is generally taken for granted that labour will overwhelmingly support the re-election of President Roosevelt for a fourth term, if he chooses to run, or a candidate of his choosing if he himself does not stand for re-election. A recent Gallup Poll posed the following question: "If the Presidential election were being held to-day, and Roosevelt were running for President on the Democratic ticket against Wendell Willkie on the Republican ticket, how do you think you would vote?" With Mr Willkie the only Republican figure (for the present at least) that labour men might consider, the answer of skilled, semi-skilled and unskilled workers was 65 per cent for Roosevelt and 35 per cent for Willkie. The vote of union members on the same question gave Mr Roosevelt 71 per cent and Mr Willkie 29 per cent; it would seem that the leaders of labour do not, in this respect, deviate much, if at all, from the rank and file.

Of the labour leaders who are habitual Republicans, only two have much influence, and for the present they have no candidate. Mr Willkie is too much of a New Dealer for Mr William Hutcheson, the powerful president of the International Brotherhood of Carpenters and Joiners, AFL; for Mr John L. Lewis, the powerful miners president, who supported him in 1940, Mr Willkie is as bad as Mr Roosevelt with regard to international policies. Mr Lewis, however, is a resourceful man. He is unalterably opposed to any of the works of Mr Roosevelt and the New Deal. He is nowadays antagonistic to the CIO and to any and all of its outstanding leaders. And he has lately had further reason to dislike most of the leaders of the AFL because of the obstacles they have placed in the way of his re-affiliation with the AFL, for which his application is pending. It is not known or clear what he plans to do. However, he has a very powerful union with tremendous financial resources at his disposal. If he chooses to mobilise them for action and decides to spare no effort or money, he can do a great deal to upset other plans. The miners are situated strategically in states like Ohio, Pennsylvania, Illinois, West Virginia, whose election results often play a determining part in the total national outcome. His district 50, an all-inclusive labour movement in itself, comprises workers in all kinds of industries, including farmers, and thus he has avenues of approach to influence in states other than those where his coal diggers are engaged. One will recall his reference, made in 1940, to "50 million sunken bellies" for whom he considered himself a natural and authorised spokesman. Many of the 50 million bellies have ceased to be shrunken

Vitamins in chocolate for liberated Europe

The British Government, having examined all the ways in which sufficient vitamins could be provided to the under-nourished children of liberated Europe, have arrived at the conclusion—as Rowntrees did in 1938—that chocolate offers one of the best vehicles for carrying added vitamins. In chocolate, the vitamins retain practically all their potency.

Before the war, Rowntrees pioneered the addition of vitamins to cocoa and chocolate. Their object was to enhance the protective value of these already highly nutritious foods.

Today, when the Allied Governments are faced with the enormous problem of rehabilitating each occupied territory as it is freed, Rowntree's experience of fortifying cocoa and chocolate with vitamins on a large scale is proving of great value. When the war is won, this experience will again be used for the benefit of the British public.

ROWNTREES

in these wartime, all-out-production years; but if the election should coincide with the end of the war he will have a talking point. He would make a strong appeal by picturing the threatening horrors of Demobilisation Day.

There is some similarity between the overall political features of the American labour situation to-day and that of Britain in the day of the Labour Representation Committee and the Taff Vale case, and speculation on the resemblance naturally leads to the question whether labour is seeking to form a party of its own. To this the leaders of the present movement say emphatically no. The Chairman of the Committee on Political Action has emphasised this in his formal statement:

"It is definitely not the policy of CIO to organise a third party at this time. Such a party, to-day, would only serve to divide and divert labour and progressive forces, resulting in the election of political enemies."

The official statement of the whole committee, speaking for the entire CIO, is equally emphatic on this point:

"United labour action should not take the form of a third party at this time. For even apart from the technical problems of placing a third party on the ballot nationally in 1944, such a party would to-day serve to divide and divert the labour and progressive forces from our main task, unity for the election of progressive win-the-war candidates who fully support our Commander-in-Chief, regardless of party affiliation."

There is, of course, the teasingly recurring refrain "at this time." But it is likely to be more than "this time" before different action will be counselled by the existing leadership. Apart from the disinclination of most leaders toward "taking a plunge into the unknown," American election laws present some very considerable difficulties. The electoral laws of most states do not permit candidates for the presidency or the Congress to appear simultaneously on more than one party ticket, nor do they provide for any second balloting, or transfer of votes in the event that no candidate secures an absolute majority. The result is that in most states (including most of the largest and politically important states, except New York) a third party must run candidates alone, outside of any coalition, and win or lose independently, with the risk of splitting the vote. The several attempts at establishing third parties which have thus far achieved a measure of success, such as the Farmer-Labour party of Minnesota and the Progressives in Wisconsin, have either been free of the election law handicap or achieved their results in state politics; because New York State laws permit the running of a candidate on more than one ticket, it has been possible for the American Labour Party to assemble enough of a vote to play the part of a balance-of-power party there in some instances. In general, however, independent action holds no prospect of sizable success; there is hardly a district in the industrial sections of the United States where a labour candidate could be elected independently. But the labour vote, when combined with other liberal insurgent votes, can either cause the defeat of a candidate or sometimes effect the election of a candidate. Under these circumstances a movement which is out for something better than moral victory is obliged to plan its work within the confines of one of the older parties.

American Notes

Senate Participation

Senator Connally seems to have succeeded in framing his Senate resolution to draw the least fire. Although the debate may become more acrimonious, the first two days were marked mainly by the dissatisfaction of those who felt the resolution did not go far enough and was not sufficiently precise. Significantly, this group is led by the Senators who first conceived the idea of a Senate resolution favouring post-war collaboration, and who have laboured most devotedly, in and out of Congress, for its passage. Senator Ball, joint author with three other Senators of a more strongly worded document, has gone so far as to argue that the present phrasing—

join with free and sovereign nations in the establishment and maintenance of international authority with power to prevent aggression and preserve peace

—points toward a multilateral military alliance, rather than collective security; he insisted that the American people would be willing to participate in a democratic world organisation, but not in a "Power Politics" alliance. Senator

Pepper, on the other hand, characterised it as a Mother Hubbard, which covered everything and touched nothing. The truth seems to be, as Senator Vandenberg said, that it is the lowest common denominator and its sponsors refuse to insert even a preposition for fear of detracting from this magic quality. If it passes with an impressive majority, as is now prophesied, it will be a proof of a national change of heart substantial enough to impress even the former isolationists in the Senate. But no one will pretend that it does not raise more questions than it settles. This is the preliminary rather than the final stage of the debate on foreign policy. The body and substance are yet to come. In part this filling in of the framework will be the work of the Administration, and the Senate will pass upon the blueprints rather than formulate them in detail. But in such matters as the investigation of Lend-Lease, and the investigation into world communications (most unfortunately delivered over to Senator Wheeler), the Senate already has the opportunity of demonstrating how much the admirable generalities it has subscribed to mean in practical relations with other countries.

The Rising Tide

A heavy new attack on the wage stabilisation programme is developing. The primary threat comes from the as yet unresolved position in the coal industry. The warnings of the War Labour Board and the requests of the union leaders alike have failed to end the stoppages in Alabama and Illinois, or, indeed, to prevent their spread. The "truce" deadline, after which Mr Lewis considers himself free to call an authorised strike, is now less than a week off; and the prospects of a new contract being signed have been put off once again by the War Labour Board's rejection of the Illinois contract. The coal situation is becoming so dangerous that the Board may be compelled to recommend that the Government reassume control of the mines. This might satisfy that section of the miners which is unwilling to work for the operators without a contract, and it would be the first step toward making the strikes subject to the penalties prescribed in the Smith-Connally Act. Presumably it is this threat which has made Mr Lewis so urgent in his pleas that the miners return to work in the interests of the war effort, and "certainly in the best interests of the union." A recent report from the Combined Coal Committee has made it clear that, without a major coal strike, consumption of US bituminous coal, at over 600 million tons in 1943, will exceed a production of 590 million tons and necessitate withdrawals from an already reduced stock-pile. By January reserves may have fallen to 40-days' supply. Already Mr Charles Wilson, of the War Production Board, has warned that steel mills have only a two weeks' supply of coal. The position in coal is not the only danger. This week the leaders of the "big five" unions of operating railroad employees have decided to order a strike vote against the award of a wage increase of only 4 cents an hour, against a claim of 30 cents. These unions comprise 350,000 members. The unions of non-operating employees, with a million members, are also engaged in an attempt to reverse a recent decision of the Stabilisation Director, which set aside an award to them of an 8 cent an hour increase. Despite the WLB's brave stand, both the coal miners and the railwaymen constitute such a crucial part of the war effort, and of the civilian economy, that the Government may be forced to make concessions against which it has, in principle, set its face. And these will, unavoidably, stimulate demands elsewhere.

The Cost of Living

The core of Labour's attack on wage stabilisation is the charge that the Administration has not as yet proved its determination and its ability to roll back the cost of living. Stabilisation officials point with pride to the decline in the cost-of-living index, which in May, 1943, was 6.2 per cent above September 15, 1942, and in August was only 4.6 per cent above that level (to which the Government has promised to reduce the index). In a recent conference with labour leaders, Mr Roosevelt reiterated that the roll-back would be continued until this was achieved. Labour, however, is not convinced that the index is a fair test of prices paid, and the President was forced to agree to an examination of the statistics to determine their reliability. Whether, in fact, the Administration will be able to carry out its

promise of further reductions is doubtful. The failure to secure a realistic tax programme puts both the rationing and price control programmes in jeopardy. Beyond this, to cut prices back, new subsidy schemes will be necessary, and not only has there been no relaxation of the hostility of Congress to subsidies—largely stimulated by the farm bloc—but a bill has already been reported out by the Banking and Currency Committee of the House which would prohibit the use of federal funds of any agency to subsidise the production or distribution of food. Mr Roosevelt's warning that he would veto such a bill has been promptly answered by the reported determination of Congress to pass the bill over his veto. An out-and-out battle between the President and Congress over price control, in the tradition of Leon Henderson, has no place in the President's campaign strategy. The tendency is rather to a toning down of controls and restrictions wherever possible, and appeasement of the malcontents. Mr O'Neal, of the Farm Bureau, recently argued that a little inflation would hurt no one, and the President very properly answered that a little inflation was like a little cocaine; it was habit-forming. But the capacity of the Administration to avoid it in the present political situation seems to be weakening.

Taxes: Nobody's Baby

The prospects for a realistic tax programme, never very bright, are fading rapidly. Whatever virtues the Treasury proposals may have possessed are immaterial now that the House Ways and Means Committee has flatly declined to increase the income-tax, from which the

Treasury had expected another \$6,530 million, and has declared its devotion to a policy of reduced spending rather than increased taxation. As non-war expenditures in fiscal 1943 are estimated at only 5 per cent of the total, the call for economy is almost meaningless. Obstructive as the opposition is, the Treasury's skirts are not entirely clean. The facts are simple. Government spending in the current fiscal year is estimated at \$106 billion, revenue from taxes at about \$38 billion, or about 36 per cent of the total. National income is running at the rate of \$150 billion. There is no dispute about where the new money is going: Mr Morgenthau pointed out that four-fifths of the national income was received by those earning less than \$5,000 a year. Yet the Treasury proposals would have repealed the Victory tax, thus releasing nine million wage-earners from the obligation to pay taxes, and the proposed income-tax increases were designed to bear most heavily on those with incomes between \$5,000 and \$25,000 a year. A sales tax is still being stoutly resisted by the Treasury on the grounds that it would provoke demands for wage increases. The raising of new tax revenue in an election year is painful both to the Administration and Congress. Apparently it is not going to be seriously attempted. Congress will write its own Tax Bill, which will, at the very best, procure about half the new revenue the Treasury asked for. The fresh blitz upon the nation's savers, although launched with all the resources of publicity, including mock invasions and air-raids, is not likely to fill the gap. The last War Loan was made inaccessible to the commercial banks, and was oversubscribed, but judged by the available indications, the proportion contributed by individual savers is not likely to prove substantial.

THE WORLD OVERSEAS

The Midcontinent Looks Ahead

(From Our Ottawa Correspondent)

September 19th

THE Canadian and American Mid-West is vitally interested in the international relations of the post-war world. It is largely rich prairie-land producing important agricultural surpluses. On the Canadian side particularly, the wheat farmers' fortunes are intimately tied up with the economy of Europe. It is, therefore, not surprising to learn that a special study of the interests of this region in the peace settlements has been made jointly by the Universities of Manitoba and Minnesota at the request of their respective governments. The unanimous report submitted by these economists of Manitoba and Minnesota finds that the areas on each side of the international border have basic problems in common, and recommends joint action in urging its proposals upon the United Nations. Regional studies within a federation are not new, but this is the first regional study on this continent which straddles national boundaries, and it symbolises a new sense of common interest which has grown up between Canada and the United States.

Naturally the report, "The Midcontinent and the Peace," is written from a regional viewpoint, but its proposals concern two important products of national interest in both countries—wheat, the principal export of Canada, and automobiles, a leading export of the United States. The economists signing the report, Arthur R. Uppgren, of the University of Minnesota, and William J. Waines, of the University of Manitoba, find that both countries have a common interest in these commodities, and urge that they should tackle the problem together. They advance three general proposals for earnest consideration:

1. A proposal that the countries of Western Europe shall greatly increase their importations of wheat, lard and pork from the surplus-producing countries, including Canada, the United States, Argentina and Australia.

2. A proposal that Canada and the United States co-operatively reorganise their automobile-producing industries by means that will secure for Canada maintained employment for her workers in her automobile factories and secure substantial reductions in the cost of automobiles to Canadian buyers; the United States section of the industry likewise will secure a larger output of automobiles and some, though perhaps slight, reduction in costs.

3. A proposal that the agriculture of the Prairie Provinces of Canada and of the Central North-West United States continue after the war to follow further the lines of agricultural specialisation that will have been developed by each of them during the war.

The authors of the report advance the familiar contention that the agricultural resources of Western Europe have been for years largely misapplied to the production of wheat at costs from two to two and one-half times of what it would have been in Canada, the United States, the Argentine and Australia; that the prosperity of both world export and world deficiency areas would be enhanced if agriculture in Western Europe (including Britain) were reorganised so as to release the land for more profitable uses; that a necessary concomitant would be a substantial reduction of tariffs by such countries as Canada and the United States upon those commodities which Western Europe could offer in exchange.

They recommend the consideration of agreements whereby all the Western European countries, including Britain, will undertake within a specified period, perhaps fifteen years, to receive certain agricultural products, wheat, pork and lard, for example, from producing countries in specified maximum amounts. The producing countries would assist in the reorganisation of European agriculture to permit the import into Europe of larger than pre-war imports of such agricultural products, and would under-

take to press for reductions in their own tariffs to permit payment to take place in the form of goods. They contend that the benefits inuring to both parties will extend even to those engaged in agriculture in Western Europe because of the active demand for other foods which would arise and which European agriculture could more profitably supply. The authors attempt an estimate of the recent cost of economic self-sufficiency in Europe, to which must be added the cost of those policies in North America which a glut of unexportable products made necessary. They cite "Government payments" to US agriculture for the years 1933 to 1940 as \$3,859 million, of which a considerable part went to the US wheat grower for not growing wheat. They estimate that for Germany, France and Italy the cost of their policies of self-sufficiency in wheat (in all three countries), and in barley and pork in Germany, was no less than \$1,517 million in 1936, based on the assumption that their needs could alternatively have been supplied by North America at current export prices.

Pooling the Motor Industry

The proposal to "pool" the automobile industry of North America so as to obviate the impediments of border tariffs offers, in the mind of these economists, a series of benefits. The consequent reduction in costs of production would enlarge both domestic and external markets. The increase in industrial employment thus engendered would in turn improve the position of Canadian and American agriculture by enlarging the home market. The Canadian farmer would benefit by a substantial reduction in the cost of automobiles and farm trucks. The American farmer would benefit less substantially in this item, but he too would find his production costs somewhat lowered.

A few years ago such a suggestion would have seemed chimerical, but the authors of this report are able to point out the extent to which, under war pressures, the industrial activities of these two countries have been integrated. There has always been a particularly close link between the parent automobile factories in the United States and their branch plants in Canada. It is here proposed in a general way that, after the war, the joint managers of the automobile industry in both countries should undertake only those productive processes in Canada which could compete with cost levels in the United States, with the reservation that established levels of employment be not lowered thereby. The result would presumably be to limit the number of makes produced in Canada, and perhaps of the models of those makes. If the proposal were confined to the assembly process, parts would flow freely across the border tariff-free, as would the completed cars.

The joint managements of the industry would undertake to achieve in those productive operations in each of our countries [say these economists] what is commonly called best, most efficient, or "optimum" size. Such optimum size is simply another way of saying lowest possible cost levels, and, therefore, price levels. The re-arrangement of the industry on the Canadian side certainly can yield, with the known highly efficient labour and management available in Canada, a volume of production capable of maintaining past normal levels of employment.

It is a far cry from the blue-prints of provincial economists to accomplished fact in such sweeping proposals, but it may not be without some significance that the Canadian provincial Premier who launched this inquiry, and whose views may be assumed to harmonise with the basic principles of this report, has since accepted the national leadership of the Progressive Conservative Party of Canada, and stands at least as good a chance as anyone of being the next Prime Minister of Canada.

Canadian Metals

[BY A CORRESPONDENT]

IN an article published in *The Economist* of February 13, 1943 (page 211), it was pointed out that the value of Canada's mineral output in 1942 reached a new record of \$564,200,000, compared with \$470,179,000 in 1939. Almost seven-tenths of last year's production was accounted for by metals. The Dominion Bureau of Statistics does not publish detailed figures for individual metals, but recently Mr C. D. Howe, the Canadian Minister of Munitions, for the first time lifted the veil over some of the Dominion's most important metals.

Mr Howe stated that Canada's production of aluminium is now running at an annual rate of 503,000 short tons, compared with less than 100,000 short tons in 1939. The rise during the war has been continuous. By 1940 production had reached 109,200 tons. It increased to 212,300 tons and 335,800 tons respectively in 1941 and 1942, and, as Mr Howe's statement on current output shows, the rise continues. The extent of the increase during the past four years can only be fully realised if it is remembered that the current Canadian output is not much smaller than the entire world output of aluminium in the years preceding the war. The increase in Canada's aluminium production has been in part financed by the British and United States Governments. During the war, Canada supplies the bulk of its production to Great Britain and the United States, but there is every reason to expect that, after the end of the war Canada will look to the British Empire, and particularly the United Kingdom, for its chief market. The United States will then be self-sufficient in aluminium, and is unlikely to continue to import any large quantities of the metal. Already, before the war, Canada was the United Kingdom's largest supplier of aluminium.

Refinery Output

Other figures released by Mr Howe on Canadian metal production refer to the refinery output of the three leading non-ferrous metals as well as of nickel. In nickel, Canada has for long been the world's leading producer, and it is certain that, as a result of the huge expansion programme carried out by the International Nickel Company between 1940 and 1943 at a cost of \$35 million, the Dominion's share in world production has been raised well above the 80 per cent it accounted for before the war. In 1942, its output of refined nickel amounted to 93,300 tons, against 64,500 tons in 1939. For copper, Canada's refinery output reached 270,600 tons in 1942, compared with 232,000 tons in 1939. At the same time, its production of zinc advanced from 175,600 tons to 216,000 tons, while that of lead rose from 191,000 tons to 243,800 tons. For lead, the 1939 output was slightly below the potential maximum, but Canada's refinery production of nickel, copper and zinc in 1939 had reached 100 per cent of the rated capacity of the available smelting and refining plants. The wartime advances, therefore, show that during the past three years the Dominion must have expanded its refining works very considerably. Nevertheless, the production figures for refined metals do not reflect the whole expansion in Canada's metal production since 1939. Some of Canada's ore supplies have always been refined in other countries, in particular, in the United States and the United Kingdom. It can be assumed that these shipments of ore abroad, especially to the United States, have risen during the war.

Canada's Contribution

There are no official details of Canada's recent production of other metals, but it is known that the Dominion is now supplying 20 per cent of the total United Nations' output of mercury, a metal not produced in Canada before the war. Moreover, Canada's silver and platinum—the Dominion is the world's largest platinum producer and supplies far more than half of the world output—are now essential to the Allied munitions production. The Dominion has also started to produce magnesium and tin, and its supplies of a number of steel alloy metals—tungsten, chromite, molybdenum and vanadium—are known to have reached a considerable size. This year a new and intensive search for strategic mineral deposits has begun, which includes for the first time the areas opened up by the Alaskan Highway and its subsidiary road system.

Germany at War

November Days

THE twenty-fifth anniversary of Germany's sudden and unexpected collapse in November, 1918, occupies public opinion in all the belligerent countries. Among the peoples of the United Nations there is the hope that Germany may again collapse on another fifth November of another world war. In Germany the leading Nazis know that November, 1918, has not been forgotten; they are not sure that history cannot repeat itself.

In November, 1918, the semi-feudal Empires of Germany and Austro-Hungary collapsed. Bulgaria began armistice discussions on September 26th, Austria and Germany approached the President for an armistice on October 5th, and Turkey on October 25th. Austria concluded an armistice on November 3rd, and Germany on November 11th. Before the appeals were made each country had changed its Government, and in each case the new Governments had either promised or actually made concessions to popular democratic demands.

In both Germany and Austria opposition to the war had started when the war started in the autumn of 1914. At each stage of the war parliamentary and public opposition gathered strength and found new expressions. In 1917 the German Reichstag debated a Peace Resolution which was endorsed by 212 deputies of the Socialist, Liberal and Catholic-Centre parties against 126 votes by members of the various Conservative parties. At the same time, the Imperial Government was forced to introduce equal, direct and secret suffrage; the semi-feudal three-class voting system in Prussia was abolished. After nearly three years of "Burgfrieden" the trade unions returned to active politics. Their membership increased, and a wave of strikes, frequently with political aims and directed against the war, culminated in strikes by munition workers in the big industrial centres in January, 1918.

There was, throughout the war, a strong democratic tide against the Imperial regime, which was held responsible for the war by the mass of the people, represented by active democratic parties. The effects of the blockade, military defeats, and the defection of allies speeded and deepened these tendencies, which finally found expression in democratic revolutions out of which new Governments came. In other words, Germany collapsed after a long process, in which popular democratic forces were ultimately victorious against a semi-feudal Imperial régime. Outside Germany there was the Russian revolution, which gave the German people a concrete example of how the war could be ended and a feudal regime overthrown; and President Wilson's Fourteen Points served as the basis for appeals to end the war by a democratic settlement.

Totalitarian Crisis

In November, 1943, the political and military scene is entirely different. The totalitarian regime came to power and developed its strength on the disappointment of the people in democracy. Political opposition is not allowed to take on any organised form, and the social cohesion of groups and classes has been superseded by totalitarian organisations. This regime has been waging war for more than four years. The period of military successes during the first phases of the war left the people unmoved, and the period of military reverses, the impossibility of ending the war, and the defection of Italy, together with the steady weakening of the material situation and Allied bombing have put the Nazi regime to very severe tests. At times there have been acute crises, military as well as political.

The disaster at Stalingrad and the fall of Mussolini produced such crises. Stalingrad signalled the end of the purely military approach; the Nazis had until then been confident of winning the war because of their military success. After some hesitation the regime decided to adopt a military policy of active defence, and a political policy of attack, with the object of splitting the coalition of the United Nations. This explains the long inactivity on the Eastern Front in 1943, and the liquidation of the African campaign. The German attacks in Russia, which began on July 5th, were intended mainly to forestall a Russian offensive. The new plan, military defence and political

attack, was thrown out of gear by the unexpected fall of Mussolini, which opened the possibility of the loss of positions in southern Europe, whose loss would have been fatal at the time of a determined Russian offensive. There was a crisis in Germany more dangerous than the crisis of Stalingrad. The way this domestic crisis was held, at least temporarily, shows the profound differences between the years 1918 and 1943. If there had been democratic tendencies and movements in Germany, the regime could not have recovered; defection would have spread from Italy, where the regime broke down under the impact of the Allied advance, and where the institution of a monarchy provided a point of concentration against Mussolini.

Disappointed generals and leading business men certainly saw, during these days, the first rays of hope for replacing the Nazi Government. But the absolute centralisation of political and military command made it possible for the Nazis to adjust themselves and survive. A general withdrawal in Russia was prepared and subsequently executed; the military advantages of this move could be questioned, but the political implications were obvious. Approaches would now be made, alternatively, to Russia and to the western democracies. The Russians, the Nazis thought, could be tempted by the offer of all their lost provinces; or the Western Allies could be scared by the Bolshevik bogey—with the Soviet steamroller moving swiftly westward.

This was almost certainly the plan. But Russia did not comply. The Russian armies followed the German troops with tremendous determination, and slowly but surely the tempo and the character of the planned withdrawal changed. Military considerations were forced again upon the Germans, and the present position of the German armies is very critical. Fewer German troops are actually engaged in Russia now than in 1941 and 1942, and their fighting morale still seems unbroken, but they are in great danger.

At home, influential opponents of the Nazis, in the home establishments of the Wehrmacht, leading business men and others probably still believe that the regime is by no means stable. But broad masses of the population still show an almost unbelievable apathy, not roused either by the privation caused by bombing or by the tightening of police control. Numerous conferences of party leaders and home military commanders, of judicial officers and of propagandists, together with a concerted propaganda campaign at public meetings, show that the regime, so far still secure because the Army is still unbroken, is determined to regain and keep full hold. Some successes against bombing attacks, and the slow progress of the Allied troops in Italy, have helped to ease the situation; so, too, has the windfall of a better bread-grain harvest.

It is, however, clear that a real and more lasting political recovery must call for some successes in the military field. The stabilisation of the Eastern Front would be such a success. The infliction of reverses on the Allied armies in Italy or a "pacification" of the Balkans would be another. But if the Russians continue their advance, and if the Allied armies in Italy also make progress, the spectre of November, 1918, in its meaning of sudden collapse, may become uncomfortably real for the Nazis.

The Nazis proclaim, of course, that the situation is different from 1918, and that the November days cannot be repeated. This is the main object of their present tremendous propaganda campaign. They protest too much. The situation is different. But it is an open question whether the Nazis are not themselves captives of the tradition of 1918. Nazi ideology, with its racial beliefs, and stupid barbaric nationalism, is really a bundle of superstitions. Having now no clear conception of why Germany collapsed in 1918, they are naturally uneasy lest history should in fact repeat itself. They have convinced themselves, falsely, that the German armies left the field unbroken and unbeaten in 1918; and they have never understood the complex interplay of the effects during 1914-18 of democratic opposition, the blockade and the military reverses. So now, with the army this time still unbroken in fact, they are worried and anxious as another November approaches. In the absence of a concerted Allied blow, they may recover their balance; but they are looking over their shoulders with alarm.

Russia at War

Soviet Commonwealth of Nations

THE Soviet armies have nearly won the Battle of the Ukraine. The liberation of Belorussia has started. As long as fighting was confined to Russian territory emphasis in Soviet policy was on the rôle of the Russian people in the war. It is not surprising that, with the new turn of the war, a new tone has appeared in Soviet political warfare. Very distinctly, the emphasis has been shifted to the multi-national character of the Soviet state; and Moscow speaks, not only on behalf of Russia, but on behalf of the vast agglomeration of nations and peoples that might very well be called the Soviet Commonwealth of Nations.

An analogy between the British and Soviet Commonwealth of Nations is as tempting as it may be misleading. The historical conditions, the economic backgrounds, the legal and political frameworks of the two systems are too different to allow for any neatness in comparison. Yet there are similarities. Moscow, like London, and to an immeasurably larger extent, is a centre and metropolis. The countries which form the Soviet Union represent as many and as different stages of development as the countries which are parts of the British Commonwealth. The Ukraine and White Russia, or Trans-Caucasia, might perhaps be compared with Canada and New Zealand or South Africa. Apart from Russia, they were the two most advanced parts of the Soviet Union before the war. The great Asiatic land mass, with its variety of races, peoples, languages, and with its economic and cultural backwardness, held a place in the Union of Soviet Socialist Republics similar in some respects to that of India in the British system.

To say that the liberation of the Ukraine means to the Russian people as much as the liberation of Canada from enemy invasion would mean to the British would be an under-statement. The Soviet Union is one land mass, not separated by seas and oceans. The political and psychological distances between Kharkov and Moscow or Kiev and Leningrad are relatively small; and this gives the measure of the effect which the liberation of the Ukraine will have on Russia.

Soviet Centralisation

The other important difference lies in the degree of economic and political centralisation. Tsarist policy aimed at the Russification of non-Russian nationalities. The Revolution proclaimed their equality and independence. Lenin's policy was marked by a sense of guilt, the guilt of the "Great Russian nation" towards oppressed nationalities. The demands of the various nationalities for independence were generously granted; and, until 1923, their union within the new Soviet state was maintained on the basis of a far-reaching decentralisation of political power. The Governments in Kiev and Minsk enjoyed a relatively wide autonomy. For several years diplomatic envoys of the Ukraine and Belorussia functioned beside Russian ambassadors in a number of Soviet legations abroad.

The constitutional change that took place between 1922 and 1925 marked a big step towards increased centralisation. The federal structure of the multi-national state was replaced by a much closer union. The new centralisation reflected to a very large extent the needs of a new period. Economic reconstruction demanded a high degree of central planning as well as a restriction of the powers vested in various non-Russian governments. In the late 'twenties and in the 'thirties the process of centralisation passed by its own impetus beyond the limits dictated by purely economic or administrative needs. In the course of the Second and Third Five-Year Plans the autonomy of the Ukrainian, Belorussian, Georgian or Tadjik Governments dwindled almost to nothing. The Governments themselves were on many occasions purged, reshuffled or replaced exclusively on decisions taken in Moscow. True, this super-centralised regime was not directed particularly against non-Russian nationalities. Russians, too, were affected by it. And in the ruling stratum in Moscow itself Russians enjoyed no special predominance. Ukrainians and Georgians, men of the once

oppressed nationalities, occupied, and still occupy, commanding governmental posts beside Russians. Even so, the fact that total control over the whole life of the USSR was exercised from Moscow was bound to give rise to friction, which in the non-Russian regions sometimes took the form of ineffective opposition to Moscow.

While Kiev, Minsk or Baku in the pre-war years were far less independent than any Dominion or even colony in the British Commonwealth of Nations, all the non-Russian Republics could nevertheless claim unparalleled achievements in economic development and in education. Under Tsarist rule only the western borderlands were developed. The eastern lands remained beyond civilisation. The western borderlands, mainly the Ukraine, had been developed as areas of primary production; their manufacturing capacity was insignificant. Under the Five-Year Plans, the Ukraine, as well as the other Republics, benefited, not only from the expansion of primary production, but also from the development of large-scale manufactures. In 1939, the secretary of the Ukrainian Party, Krushchev, could say:—

In the course of the second Five-Year Plan the output of pig-iron in the Ukraine has increased two and a half times. The output of pig-iron in only one of our metal plants (the Makeevka) is twice as big as the output of all the metal plants of Poland. . . . The output of steel has been almost trebled in the course of the same period. The plants of the Ukraine produce as much steel in a year as all the plants of Japan, Italy and Poland taken together. Machine building has grown by 30 times compared with 1913. The coal output of the Ukraine is twice as big as that of Poland.

Russia and Non-Russia

Ukrainian nationalists spoke, in spite of these figures, about the "economic exploitation of the Ukraine by Russia." They based their argument mainly on the fact that the share of the Ukraine in total Soviet production had fallen because of the industrial development of new areas. But there is no evidence to show that the development of other areas took place at the expense of the Ukraine. The economic expansion benefited all the Republics—Russian and non-Russian—though in varying degrees. The indices of industrial growth over a number of years were even lower for Russia (R.S.F.S.R.) than for most of the non-Russian Republics; and the indices of the Ukraine kept pace with those of Russia. In the last year for which detailed figures are available, 1941, the indices of planned capital construction told a rather interesting story. The increase in capital construction for the Russian federated Republics was planned at 50 per cent; the corresponding figure for the Ukraine was 76 per cent, for Belorussia 45 per cent, for Georgia 101 per cent, for Armenia 135 per cent, for Azerbaijan 122 per cent, for Tadjikistan 83 per cent, for Kazakhstan 51 per cent and for Kirghizia 132 per cent.

The economic predominance of the Russian metropolis was over the other parts of the Soviet Commonwealth distinctly waning. No competitive motives restricted the industrial development of the non-Russian Republics, and the general economic expansion left enough scope for simultaneous growth in all parts of the USSR. The old industrial centres of Russia were intensively developed, new manufacturing industries sprang up in the Ukraine, and in the Asiatic Republics modern industries were superimposed upon the background of a primitive, and not infrequently nomadic, mode of life. It is obvious that standards of life were incomparably lower in the east than in the west up to the outbreak of the war. But the industrialisation of the east, which has been speeded up by the war, undoubtedly created the preconditions for a progressive advance after the war.

The Soviet Commonwealth of Nations has shown an amazing vitality during the war. The super-centralised political system would by itself hardly have been able to achieve this success without the background of a common economic expansion throughout the whole of the Soviet Commonwealth. On the contrary, excessive centralisation has probably cost Russia considerable overhead expenses. The great problem which will confront the USSR when all its lands are liberated is whether in the course of time it will be able to become as genuine a Commonwealth in the political sphere as it already is in the economic field.

THE BUSINESS WORLD

Building Societies in Reconstruction

IT is a remarkable and disturbing fact that Britain, having planned so successfully its part in victory, still lacks the instruments for planning reconstruction. True, much is being done towards the preliminaries of post-war planning; there is general agreement, from Prime Minister downwards, on the broad priorities; a handful of Ministries, interested in a score of different aspects, are co-ordinating themselves. On the administrative level, minutes and recommendations abound; progress reports of potential policy are appearing. But of clear-cut decision, of precise undertakings on such critical matters of policy as the Uthwatt report, of any hint of detailed application of a rehousing policy, there is no sign.

Should we plan, and if so, in what direction? The question is a vital one in housing policy, and the answer crucially affects the part which the building societies are destined to play in it. So far, the undertaking is provisional and general. The Government has in mind a prospective labour force in the building industry of 1½ millions. *The Economist* has estimated that this force, which would be well in excess of the pre-war boom level, would be capable of producing between four and five million houses in the post-war decade, at a cost of, say, £250 million annually, or more if costs settle down at a level substantially above the pre-war. How this volume of new house building would be financed (assuming that it was realised, which is doubtful) by the Government, by local authorities, and by building societies, and other financial agencies, is impossible to guess. Assuming that half of the houses built were financed by building societies (as they were between the two wars), the movement would be responsible for, say, £125 million of new mortgage business annually compared with its 1937 peak lending of £137 million. Doubtless, it would be ready to face this task. As new building has ceased during the war, so, virtually, have mortgage advances. At the same time, the societies are restricting the amount of idle money they are prepared to receive from investors. Meanwhile, old mortgages have been steadily repaid until, at the end of 1942, they represented no more than £608 million out of total assets of £753 million. Thus non-mortgage assets (mainly cash and realisable securities) now represent nearly 20 per cent of the whole. In the heyday of the lending boom, 5 per cent was regarded as respectable, and even the purists did not advocate more than a 10 per cent cash reserve.

Clearly, release from financial controls would enable the societies to finance £1,250 million of new housing in the post-war decade. Removal of restrictions on the intake of new funds would, on past precedents, provide all the needed cash. But the prospects are not so clear cut as this statistical thinking aloud might suggest. There are still imponderable factors largely outside the societies' control, such as the level of post-war building costs and the construction of houses for rent; within the movement there are potential improvements in finance and organisation which could greatly enhance their contribution. Perhaps the prospective level of building costs is the most critical single factor. Money wages in the building trades have increased sharply, and labour costs even astoundingly, during the war; it would be optimistic to expect a sharp reduction in either immediately peace comes, unless there is a revolution in building methods. Equally disturbing is the rising cost of land, attributable in no small measure to official equivocation on the Uthwatt proposals. Assurances have been repeated that local authorities will be able to buy any land in reconstruction areas for redevelopment at values determined by the level of March, 1939. How these guarantees are likely to assist the provision of cheap housing by private enterprise in undeveloped areas is a moot point. The Uthwatt report has been described by one building society spokesman (speaking, incidentally, for himself and not for the movement as a whole) as a "mortal blow" at the principles of house ownership, to be opposed "tooth and nail." But if the incipient boom in land values continues unchecked, it is questionable if post-war housing needs will

ever be met by private enterprise, and certain that confusion, and not control, will prevail.

Although the Building Societies Association has declined to follow this line, it has not, on the other hand, expressed any clear view on the practical measures necessary to keep building costs as low as is consistent with good quality building. Indeed, two of its preoccupations suggest that high costs will be an unavoidable evil in the early years of peace. The first is the suggestion of a subsidy to stabilise the price of building materials—which would benefit private building and encourage local authorities' rehousing schemes at low rents. The second is the formulation of an interim lending policy designed to prevent any support to inflated property values. But the societies also recognise that the provision of houses for letting is likely to have first priority after the war. This is a new, largely untried field, in which the movement has offered its assistance. It involves, doubtless, guarantees by central or local authorities, on the one hand, to replace the personal covenant of the individual borrower; on the other hand, the length of life and the financial terms of such lending would presumably be much less favourable to the societies. Nevertheless, it may be an important part of the societies' business in the period immediately after the war, for if Government policy gives a priority to the building of houses for letting, there will be few new houses for sale, and therefore little scope for the societies' normal business, while the inflated values of existing houses will make prudent lending on their security very difficult. For a few years, lending on houses for letting may be one of the largest outlets for building society funds. The pros and cons of building subsidies lie outside the scope of this article, but it seems at least debatable whether a subsidy on building materials would be acceptable, despite its theoretical merits, in preference to a flat rate subsidy on houses, despite its demerits. If this line of speculation proves correct, we may expect that the building societies would increase their advance business gradually but steadily in the first few years of peace, and work up to their maximum potential in, say, five years. This might well prove to be the optimum timing for the full-scale resumption of private enterprise building, after essential industrial and rented domestic building arrears had been largely satisfied.

But the official plans remain unpublished, and these questions are conjecture, not policy. What can the societies do, meanwhile, towards improving their service? Already the Association, through a complex of sub-committees, is considering many aspects of reconstruction policy, guided by general principles of planned housing improvement and a more selective lending policy than in the pre-war boom. Presumably, the question of interest rates is included on its agenda. There is general agreement that a policy of low interest rates should be maintained in the post-war period. Despite reductions in the tax-free rates of interest offered on shares and deposits, these are still fairly high in relation to the returns on other forms of popular saving. On the mortgage side, there is an important threat of competition from

**FOR ALL

NEEDS**

Head Office:
LIVERPOOL LONDON
North John St. Lombard St.

the Co-operative Permanent Society, which now offers a mortgage rate of 4 per cent over a thirty-year term—roughly one per cent less than normal and for twice as long. These terms should not necessarily be dismissed as a bad thing merely because they are disturbing to the habits of thought of some societies. Low interest and a long term greatly ease the burden of the mortgagor, and that may be a material consideration when other elements in building costs are unduly high. True, thirty years seems the very limit to which mortgages could be reasonably extended on typical house property. But some reduction in mortgage rates should be possible. Assuming that advances are in future given only to those whose economic position justifies them—and the movement would readily admit that many borrowers in the past would not so qualify—the improved quality of borrowers' accounts should justify some reduction in the advance rates. In general, the interest rate structure of building society finance threatens to be too high in a post-war context of cheap money. Reductions in rates can only be carried out with full safeguards of security, and preferably by general agreement. The method of achieving this result, however, seems a matter for present consideration by the movement.

A final point concerns the internal reorganisation of the

movement. There are some who advocate a rigid regional grouping of local societies, to work co-operatively with planning authorities in their regions. Among a number of objections to this proposal one stands out: the bulk of building society advance business has long since ceased to be done by local societies. House purchase is financed by the Halifax on the South Coast, and the Abbey Road doubtless have mortgage borrowers in Yorkshire. Yet there is still room for the grouping of the small local societies who present separation springs more from sturdy independence than from any economic motive. The object is not to produce super-sized building societies—the large societies are probably large enough—but to encourage the growth of moderate-sized units, with keen local interests, strong finances, and more efficient management. This process must be enforced and gradual; it should involve neither aggressive empire building nor the marriage of giants.

Building societies have always prided themselves on the service which they render to the community. The movement will undoubtedly be guided by this spirit in the years of reconstruction, reinforced by the results of its current deliberations on post-war policy. Fortunately, its leaders are well aware that on these results hang gigantic social issues and crucial questions of personal well-being.

Business Notes

Minimum Prices

As part of its contribution to post-war reconstruction, a firm of London stockbrokers has launched what may fairly be described as a campaign for the removal of minimum prices for gilt-edged and similar securities. Their case for removal is that minimum prices are only suited to a crisis which must be of short duration, whereas, after the war, there may develop a sustained pressure to sell gilt-edged. Minimum prices would only suspend sales until such time as the pressure became so great that, either the minima would have to be lowered, or far-reaching action would have to be taken in other fields. Essentially the argument is a plea for a reasonable elasticity in long-term interest rates. This has brought an immediate defence from other quarters, which oscillates between the not incompatible statements, (i) that minimum prices are a good thing since they give time for further action to be taken, and (ii) that, in any case, the market becomes frozen in practice, since gilt-edged jobbers are not capable of taking up indefinite amounts of stock, and, consequently, drop their prices to a point where no reasonable person will sell unless he is under extreme pressure. Taking the second point first, it is surely not the function of a jobber to resist what he believes to be a long-term trend. If he does so he merely causes the price curve to move in jumps instead of smoothly. The first point is one of substance provided that the prime objective, to be pursued *à outrance*, is in fact the maintenance of the existing long-term rate of interest. If that is not the policy—and there is no reason so far to suppose that complete rigidity in this particular factor is intended—it would seem an unwise procedure to withdraw from a particular type of investment its character of marketability. So long as this is retained, there is little reason to suppose that the choice between remaining illiquid and facing a heavy capital loss will, normally, be decided in favour of the latter alternative.

"Window Dressed"

The money market has been thoroughly window-dressed this week and the process has in parts been rather painful. Barely had the credit position recovered from the previous week's overestimate of the Exchequer's requirements (this overestimate was apparent in the exceptional immobilisation of funds in public deposits in last week's Bank return), when it was assailed this week by the clearing banks' window-dressing for the October returns. The attack has been particularly violent on this occasion, because one of the larger banks, which normally makes up in the penultimate week of the month, decided for certain reasons to postpone that performance to the current week, with the result that last Tuesday two large clearing banks were making up together. Hitherto the process of making up has been made tolerable owing to the careful spread of its incidence. A given amount of bank cash has thus done valiant service trotting from one bank to another during the making-up period, creating the illusion of a uniform 10 per cent cash ratio without unduly inconveniencing the market or the authorities. But when more than one bank lays claim to this hard-worked surplus on the same day trouble is bound to arise—as it arose this week. The market, therefore, was again compelled to seek assistance from the authorities. This was given partly by direct purchases of bills from discount houses and also by purchases from the clearing banks, which, in turn, helped the market by loans and bill purchases. The credit dislocation caused by this week's special circumstances, tends to increase rather than diminish. According to the calculations of the true cash position (the basis of which was explained in *The Economist* of September 12, 1942), the ratio to deposits dipped below 8 per cent for the first time in the months of August and September for each of which the published ratio was 10.4 per cent. One effect of the past fortnight's spasm of stringency in the money market has been to divert the stream of additional Treasury bills issued by tender for the benefit of the clearing banks back to the source from which it came. An amount at least equal to the additional issue of bills has made its way back to the authorities as a result of the special assistance they have had to give to the market—a somewhat ludicrous procedure, and therefore quite in keeping with the factors which have given rise to it this week.

FBI on Research

The widespread realisation of the importance of fundamental and applied research as the key to industrial progress is encouraging. The recent memorandum of the Parliamentary and Scientific Committee, summarised in *The Economist* on October 23rd, dealt mainly with the supply and training of research personnel. The latest con-

tribution, the report of the Industrial Research Committee of the Federation of British Industries, examines the methods and scope of research carried on in industry. Broadly, scientific research as organised by industry is carried on independently by individual firms and collectively, mainly through industrial research associations which, in addition to subscriptions from their members, receive grants from the Department of Scientific and Industrial Research. On the whole, the Committee expressed satisfaction with the present organisation of research, but it is far from satisfied with its scale and with the use made of existing machinery. Its detailed recommendations are generally sound, and deserve careful consideration. They are summarised below. But the Committee, realising that machinery is only a means to an end, went right to the heart of the problem.

Industry (it says) must not only be willing to exploit the machinery at its disposal; it is even more important, both nationally and for the individual firm, that it has the will to develop the results of research to the uttermost, and to take such risks as enterprise in new fields of endeavour must involve. To be first in the field of application is of even greater advantage to a country than to have been the birthplace of the discovery.

The advice is excellent. It is up to the members of the FBI to follow it.

Recommendations

The Research Committee of the FBI has made six recommendations:

Every manufacturing firm should take stock of its position and devote to research and development in its own research department the maximum effort and funds commensurate with its resources and with the nature of its problems.

Firms in industries which have their own collective research associations should consider carefully now whether their contribution to them, either in money or in other ways, is commensurate with the work which, if adequately supported, they could perform in furthering the general interests of their industries.

Every industry which has not yet created a collective research association should set up a committee to consider whether a research association would be of advantage to the industry, or whether collective research problems could be solved by some other means.

The Department of Scientific and Industrial Research should make the maximum use of its wide powers both in regard to the amount of grant which can be made available in relation to the countervailing contributions from members of a research association, and in regard to the eligibility for grants of types of organisation for collective research in which, though not research associations in name, are in fact fulfilling similar purposes.

The Government should allocate to the DSIR an annual sum of at least £1,000,000 for the maintenance and expansion of its activities.

A Bureau of Industrial Research should be set up in the immediate future. This should be national in scope, and though financially supported by those principally concerned, such as research associations, Government research establishments, universities and others, it should be entirely objective in its activities, which would include, among others, the publication of a year-book on research, educational publicity on research, advice on research problems, and the creation of a liaison between research workers in related fields.

Apart from these six recommendations, the Committee made a number of other suggestions. Rightly, though not unexpectedly, it supports the principle that research and development expenditure should be treated as an item of cost for taxation purposes. Moreover, the Committee found it "still necessary" to point out that—

The best results can only be obtained from a firm's research personnel if they are taken fully into the confidence of the management, and given a definite standing in the hierarchy of the organisation.

Belgian-Dutch Monetary Agreement

The monetary agreement signed between the Dutch and Belgian Governments, of which the general principles are discussed in a note on page 582, provides for the stabilisation of the two currencies at one guilder to 16.52 Belgian francs (3.304 belgas). No change is to be made in this official rate except by mutual consent. Buying and selling rates are to be applied on the markets controlled by the two Governments; these rates may not differ from the official rate by more than $\frac{1}{4}$ per cent either way, and the two Governments undertake not to exchange guilders or francs against foreign currencies otherwise than at the rates

dealt in on the official market. The monetary authorities of each country will make available the exchange required to finance the mutual trade of the guilder and Belgian franc areas (comprising the colonial territories of each country and Luxemburg in the case of the latter). The funds thus made available will be cleared through a centralised account, balances being struck on the last day of each month. That part of the credit balances which exceeds 30,250,000 guilders or 500,000,000 Belgian francs, will bear interest payable by the debtor country at the official rate of discount of that country. If the credit balance exceeds 1,000,000,000 Belgian francs, or 60,500,000 guilders, the two Governments are to consult together with a view to eliminating the disequilibrium. No gold or other collateral is to be demanded as security for these balances, but on denunciation of the agreement any balance would be invested in 3 per Cent Treasury bonds of the debtor country. The debtor country will have the right to meet its balance in gold, or subject to agreement, in foreign currency reckoned at the official rates. If an alteration in the official guilder-franc rate is decided upon, the balance of the clearing account outstanding at the time is to be readjusted in the proportion of the variation to protect the creditor from the agreed depreciation of the debtor's currency. Subject to agreement, the clearing account may be drawn on by each country in order to make payments to other countries, thus giving the agreement a multilateral character. In order to maintain equilibrium between their currencies at the official rates, and, in turn, between their currencies and those of other countries, the two Governments agree to consult on all questions of monetary and economic policy, and to co-ordinate such measures as they may decide to apply. The agreement is to run until January 1, 1949, but may then be terminated subject to two years' notice.

Blocked Sterling Releases

A batch of foreign exchange notices issued by the Bank of England by virtue of the Defence Regulations introduces considerable changes in the treatment of sterling funds which, since November, 1940, have been dealt with through

Consolidated Main Reef Mines and Estate, Limited.

(Incorporated in the Union of South Africa.)

Extracted from the Annual Report for the Year ended 30th June, 1943

Capital, £1,247,602 in 21 Shares, all issued, fully paid.

Tonnage Milled, 2,320,000.

		Per ton milled.
Total Working Revenue	£2,862,429 5 5	£1 4 8
Total Working Expenditure	2,335,475 14 11	1 0 1
Working Profit	526,953 10 6	80 4 7
Total Profit for the Year		£540,151 13 8
Balance unappropriated at 30th June, 1942		386,279 15 2
Forfeited Dividends Account		342 10 11
		£936,773 19 9

This amount has been dealt with as follows:

Expenditure on Capital Account for the year	£5,089 12 1
Miners' Pensions—Provision on account of Outstanding Liability as at 31st July, 1942	11,886 5 10
Taxation	236,449 16 1
	£253,425 14 0
	£683,348 5 9

Dividends declared during the year:—
No. 66 of 11½ per cent, and No. 67 of 10 per cent.

Leaving a balance unappropriated of £416,232 17 3

Available Ore Reserve re-estimated at 30th June, 1943:	Tons.	Value, Dwt.	Width, Inches.
Main Reef	969,900	3.5	58.9
Main Reef Leader	2,677,800	4.3	53.7
South Reef	2,256,400	3.9	49.0
Bird Reef	2,971,000	2.7	70.4
Total	8,875,100	3.6	57.4

There are in addition 1,110,100 tons of payable ore valued at 4.3 dwt. per ton contained in shaft and safety pillars not at present available for stoping.

Compared with the previous year, the available reserve shows a decrease of 959,900 tons, the average value is higher by 0.1 dwt. per ton, and the estimated stoping width is 0.9 inch less.

A severe shortage of native labour restricted underground operations throughout the year, resulting in a serious reduction in the tonnage crushed. To augment this tonnage, 199,522 tons of low grade ore were crushed. To augment this tonnage, 199,522 tons of low grade ore were taken from old development rock dumps and sent to the mill.

The full Report and Accounts may be obtained from the London Secretaries, A. MOIR & CO., No. 4 London-wall-buildings, London, E.C.2

POST OFFICE & TRUSTEE SAVINGS BANKS ISSUE

3% SAVINGS BONDS

1960—70

Issued by the National Savings Committee, London

blocked sterling accounts. Where such funds are the proceeds of capital transactions, such as redemptions of securities, legacies, sales of real estate, surrender of insurance policies, the Bank of England will now be prepared to consider applications for their release and transfer. If funds previously in blocked accounts have been invested in any of the authorised securities, an application may now be made for a licence to sell these securities and transfer the proceeds of the sale. In addition to this retrospective release of blocked sterling, it is provided that funds arising from the same list of capital transactions will in future be eligible for transfer. These concessions do not apply to blocked sterling funds held for residents of Argentina, Canada, Newfoundland or Switzerland. Other notices concern the accounts of foreign nationals who have left the United Kingdom, but whose assets have been frozen by previous regulations. While these accounts remain blocked, transfers from them may be made to the country where the foreigner now resides within a maximum of £15 per head of family per month and £50 per month for a family. In addition, the Bank of England is now prepared to consider applications for the redesignation and release of such accounts. The effect of these relaxations will be to remove the greater part of the blocked sterling now held for persons residing outside this country. The amounts involved, though appreciable, are not substantial in relation to the abnormal sterling balances accumulating on overseas account in this country. All but a minute fraction of that sterling represents the holdings of central banks and Governments within the sterling area and South America, and these are not affected by these concessions.

Non-Residents' Investments

Three weeks ago attention was directed to certain complaints which had arisen with regard to what were felt to be undue restrictions placed upon the re-investment of certain funds by non-residents. It was then suggested that, although there was some fire behind the smoke, it was probably not extensive, and that an explanation would put the whole matter in perspective with beneficial results. At the end of last week the Bank of England was able to produce something better than an explanation, namely the removal of virtually all restrictions, those retained arising out of the requirements of a continuing exchange control. The effect is that as from the beginning of this week the sole restrictions are that holders of blocked sterling securities who wish to sell and re-invest may do so in any security so long as it (i) does not carry an option to take payment in dollars and (ii) runs for at least ten years. The relaxation is retroactive in effect. This step is part of a much larger one, discussed in the preceding note and on page 582, which will free for transfer something like 80 per cent of the total of blocked sterling balances and security holdings of non-residents. The three principal categories which are not freed are pre-war security holdings, balances and securities of non-residents who require the payments to be made to Canada, Newfoundland, Switzerland and Argentina, and certain refugee holdings, and all these categories are free to vary their investments subject only to the two restrictions mentioned above. There is still no full explanation of the earlier limitations, but, insofar as they did not arise from the requirements of exchange control, their *raison d'être* lay, probably, in the fact that, in the past, bearer securities might more easily have found their way into enemy control than is now the case.

The Pit Bonus Scheme

A solution of the problem of the substitution of a pit for a district bonus scheme in the coal mining industry has been complicated by questions raised by the Minister of Fuel and Power over the application of important administrative changes suggested by the Greene Board of

Investigation. Under the original district scheme, output adjustments to meet the effects of abnormal but temporary occurrences were made by the Ministry of Fuel, usually at its own discretion, and those of a more permanent character by district reviewing authorities consisting of an independent person and three assessors nominated, respectively, by the Minister, the employers, and the workers. In its recent report, the Greene Board suggested the scrapping of this machinery and the administration of either a pit scheme or a combined scheme through the regional organisation of the Ministry of Fuel and Power.

We are strongly of opinion that the Regional Controller of the Minister of Fuel and Power, acting with two assessors, one appointed by each of the two associations, representing employers and workers respectively, would be the most suitable authority for determining questions relating to adjustments.

The Greene Board reported to the Ministry of Labour as well as to the Ministry of Fuel and Power, and it appears that both these Ministries have doubts about the advisability of the adoption of this new procedure, and they are waiting for the views of the owners and the workmen's leaders before reaching a decision. Meanwhile, the Minister of Fuel has drawn their attention to the "constitutional and other difficulties involved," and has intimated to the Mineworkers' Federation and the Mining Association that he could not ask his controllers to undertake this duty unless there were a definite agreement that the decisions reached by the controllers would be regarded as final and binding, that any questions raised will be referred for settlement "only within the self-contained machinery provided by the output bonus scheme," and that such questions would be regarded as being "entirely outside the jurisdiction of the National Conciliation Scheme or any other procedure relating to the settlement of trade disputes." Clearly, there must be agreement on the procedure to be adopted for taking into account the effect on production of special factors; but it would be ridiculous if the substitution of the pit for the district as the basis of calculating bonuses were delayed by indecision about procedure.

Combined Coal Committee

Not unexpectedly, the demand for coal is growing in the United States as well as in this country. The United States, in spite of its vast oil and hydro-electric resources, is consuming about three times as much coal as Great Britain. Moreover, coal is causing headaches in both countries. A Combined Coal Committee was recently appointed in Washington to consider the coal resources of the United Nations in relation to combined requirements, and plans are being prepared to meet the requirements in the Mediterranean area, and other countries in Europe which are still to be liberated. The United States, it is suggested, is to supply a major part of the coal needs in the Mediterranean area—India and South Africa might possibly contribute—while this country is to supply the needs of North-Western Europe after its liberation. It is well that requirements are to be met jointly by the United States and Great Britain. The aggregate needs in the two areas are likely to be substantial and they can only be met adequately by an expansion of output both in Great Britain and in the United States.

Fisheries After the War

While livestock herds have been seriously depleted in many countries since 1939, fisheries are reported to have been substantially replenished, as during 1914-18, due to the curtailment of fishing. Well-stocked fishing grounds will, therefore, form a valuable reserve after the war, which should be drawn upon heavily until livestock herds are replenished. But this need not involve wasteful fishing, such as the inclusion of young and small fish in the catch, which was practised after the last war. There is, therefore, much to be said for the Government's desire to secure a measure of supervision over fisheries after the war. At its invitation, an international fisheries conference was recently held in London, with the object of drafting a new international convention, embodying, for example, the convention of 1937, which prescribed the use of appropriate nets in order to prevent the catch of young and small fish. Representatives of the Governments of Belgium, Canada, Eire, France, Iceland, Holland, Newfoundland, Norway, Portugal and Spain took part in the conference, which was also

attended, as observers, by delegates from the United States, Denmark and Sweden. The draft convention is to be submitted to the Governments concerned, and it is hoped that it will be given final shape at a further conference. An agreement for the resumption and regulation of whaling has already been concluded between representatives of the British and Norwegian Governments. Moreover, in order to develop the colonial fisheries, the Secretary of State for the Colonies has appointed a Colonial Fisheries Advisory Committee.

The Harvest

The Minister of Agriculture, in a broadcast talk on October 22nd, said:

... we shall, by the end of the year, have gathered the greatest harvest the country has ever known ... from the smallest acreage of land devoted to agriculture known since official records have been kept.

The purpose of the talk was to thank volunteers who helped, and are helping, to gather the harvest, which is estimated to produce one million tons more bread corn than last year's, and an additional quarter of a million tons of potatoes. The contribution of these quantities of food to the war machine can be judged by the fact that the space saved by this extra one and a half million tons is sufficient to ship abroad the equipment of eight to ten divisions. A great debt is owed to volunteer harvesters, but it cannot be overestimated that the appeal for 500,000 volunteers has been answered, although Mr Hudson declared that he has "every reason to believe that we shall get the full half million." He said that 150,000 adults have passed through the standard harvest camps, and 50,000 children have worked from school camps. Potatoes and sugar beet still remain to be harvested, and help is urgently required to harvest these crops. The Minister looked forward to an even larger crop next year, especially in view of the world shortage of food.

Great Universal Explanation

The explanation of the transactions between Great Universal Stores and two of its directors, called for by the Committee of the Stock Exchange, London, in advance of the annual meeting, has now been produced. It will be recalled that the original report stated that large profits

had been made on the sale of certain investments for which the company had paid, in round figures, £550,000. The explanation shows aggregate profits, before deducting certain losses, of just under £150,000, accruing to directors and their families. These were earned on three transactions, of which two produced respectively £33,000 for Mr Wolfson, the managing director, and £111,841 for his wife. The former concerns an investment made ten years ago, and there has to be deducted from the profit interest payments of £14,000. The second Wolfson transaction arose from the desire of the company to take over in April, 1940, a concern which was, evidently, none too prosperous. The Treasury refused consent and Mr Wolfson financed the operation, agreeing that his wife should take over the shares. In all she bought 129,280 6 per cent preference shares of £1 for £44,049 and 165,120 ordinary shares of 5s. for £14,670. In April last the company bought the whole holding at approximately par, thereby giving Mrs. Wolfson a profit of £111,841. The company held, however, an option to resell to her the whole of the preference shares at par, and this option has now been exercised, thereby reducing the profit on the whole operation to £26,610 plus whatever Mrs. Wolfson can obtain for her preference shares in addition to the purchase price. The date at which the option was exercised is not disclosed.

The third operation to yield a profit concerned Mr Sampson, not then a director, who bought an undertaking in February, 1942, for £17,750 and announced his intention of running the concern he had acquired as a competing business on his own account. Mr Sampson eventually decided to remain with the company and sold his investment in December, 1942, including retained profits for that year of £9,596 subject to income tax and NDC, for £27,850. On seven other transactions detailed no profit is shown and some are understood to have resulted in a loss to the vendors, estimated at £23,000. Most of these transactions are expected to result in profits for the company, but it is to be noted that in respect of the operation which was to have yielded Mrs. Wolfson £111,841 the estimated profit to the company during the current year was only £20,000. This has been reduced to £12,250 by the resale of the preference shares. There are other points which call for clarification, but the important aspect of the affair is that shareholders have, thanks to the action of the Committee and the Press, received the account a fortnight before the meeting. Had it been presented at the meeting, as the directors intended, there is very little chance that anyone could have digested it in time to make pertinent inquiries.

NEW MODDERFONTEIN GOLD MINING COMPANY, LTD.

(Incorporated in the Union of South Africa.)
Extracted from the Annual Report for the Year ended 30th June, 1943.
Issued Capital, £1,400,000, in 2,800,000 Shares at 10s. each.

Unilever Earnings

In dealing with the accounts of *Lever Brothers and Unilever* on page 474 of *The Economist* of October 2nd, the percentages earned on the ordinary capital for the three years 1940-42 were given as 34.1, 16.7 and 19.6 respectively. These figures are based on the net retained profit of the parent company and ignore sums retained by the subsidiaries, which have always been substantial and have varied considerably from year to year. It has never been clear whether it could be assumed that the amounts so retained were in fact free for distribution if the directors so wished, and, so long as any doubt existed, it was felt better to make the estimate conservative rather than liberal. We are now assured that the amount transferred to the parent is merely the nearest convenient figure which covers the provisions which the board has decided to make in the accounts of the parent, and that every penny of the amounts expressed as being the parent's proportion of undistributed profits retained by subsidiary and allied companies is as much available for the ordinary shareholders of the parent as the sums transferred to it. This being so, it is proposed in future to base the earned percentages on the consolidated profits. This gives gross amounts available equivalent to 47.8 for 1940, 23.7 for 1941 and 33.1 per cent for last year. It may be pointed out that even these large figures are, on the basis of the published accounts, an underestimate. In each of the past two years certain sums were set aside to convert the tax provisions of earlier years from the legal liability to sums covering estimated tax on all earnings to date. It is not possible, on the figures given, to distribute this charge properly, but it is hoped that in future provision for past taxation will be small.

US Banks' Reserves

The most notable feature of the banking position in the United States is the persistent diminution in the margin of excess reserves held by member banks of the Federal Reserve system. On October 14th, this excess over present minimum reserve requirements had fallen to \$1,610 million, a reduction of \$1,100 million from the figure twelve months ago; at their peak towards the end of 1940 these excess reserves were about \$7,000 million. A large factor in this contraction of American banks' cash reserves has been the increased demand for currency which, in the first place, is satisfied by banks drawing on their reserve balances with the Federal Reserve banks. Over the past year, the expansion in Federal Reserve notes has been of the order of \$4,476 million, or 41 per cent. The contracting effect of this on the banks' reserve balances has been heightened by the accompanying reduction in the Reserve banks' holding of gold certificates. This item has fallen by \$692 million to \$19,875 million during the past year, the movement reflecting sales of gold abroad, mainly to South American countries. This double impact on reserve balances has been approximately neutralised by an increase of \$5,252,000,000 in the Federal Reserve banks' holding of US Government securities. The fall in excess reserves is, therefore, a reflection of the increase in the deposits against which member banks have to maintain reserve balances with the Federal Reserve banks. Between the end of June, 1942, and July 21, 1943 (the latest date for which figures are available) the deposits of weekly reporting member banks rose from \$25,878 million to \$30,802 million. Given the persistent expansionist trend in US currency and credit, it seems safe to predict that within a matter of months the margin of member banks' excess reserves will have disappeared. Fortunately there is plenty of slack in the existing reserve requirements. Ever since October, 1942, the percentage reserve requirements against demand deposits have been 20 per cent for both central reserve, and reserve, city banks, and 14 per cent for country banks. These could be reduced to 13, 10 and 7 per cent respectively. Against time deposits a reserve of 6 per cent must now be kept by all member banks. This could be reduced to 3 per cent. Thus, by reducing reserve requirements to the minima demanded by the Federal Reserve Act, member banks could be put in possession of excess reserves at any given moment. That instrument of adjustment is likely to be used in the near future, unless the U.S. authorities prefer the alternative of increasing the Federal Reserve banks' holdings of Government securities, and thus inflating the credit basis.

Group Aircraft Production

Many aircraft of the same type are manufactured by groups of firms. The organisation of the Halifax bomber "group" provides an example of this method of production. This group originated with the manufacture of the Hampden as long ago as 1937/8 by Handley Page, Ltd., and later by a few other firms. The Hampden was replaced by the four-engined heavy bomber Halifax in 1940 and production was greatly enlarged. There are now five companies (this "five" includes Handley Page, Ltd., the parent factory) engaged in its manufacture, each having equal status, with Handley Page, the parent firm, acting as general co-ordinator and central technical body. One of the daughter firms is in itself a composite group of engineering concerns which were formerly engaged on motor and coach body building. Considerable administrative and organisational problems are involved in the growth and operation of such a group, and measures have been taken to bring about liaison between the various units. The parent firm's outside production department was formed in 1940 to deal with the expansion of production; it arranges for key workers to receive training in production methods and inspection—a substantial proportion of the labour in the new factories is inexperienced. It supplies the daughter firms with technical information, drawings, schedules, components, templates and sample parts. No fewer than 15,000 drawings are needed before the 25,000 parts of the Halifax can be made and assembled. The principals in the group meet regularly under the chairmanship of the Director-General of Aircraft Production. There is a Group Materials Committee and a Group Spares Committee to deal with questions of allocations and shortages. The group also has a repair organisation and a service department. It was apparently found more convenient to allow each member of the group to arrange its own sub-contracting than introduce a planned scheme for sub-contracting from a single firm for the group as a whole. The teething troubles of the Halifax group have, in the main, been overcome, and its output record is now satisfactory. The need for constant modifications in design and structure, and new devices to ensure operational supremacy are all the time involving adjustments in production—it is highly desirable that firms should wherever possible follow the example of Sir Stafford Cripps who, in his recent meeting with joint production committees, explained frankly to the workpeople these difficulties of production continuity.

Biscuits

The output of biscuits has been cut by more than half the pre-war tonnage, and the demand does not appear to have lessened. Biscuits have been rationed "on points" since August 23, 1942, and the raising of their points value has never created a situation where they are always available in the shops. The changes which have been made in their points value are given in the accompanying table. Even at the highest value, the relation between demand and supply is such that retailers sell them only to their registered customers, unlike most other points rationed foods which are in the shops in sufficient quantities to be sold to

	POINTS VALUE OF BISCUITS		
	Plain, etc.	Sweet, and Semi-sweet	Chocolate Covered
Aug. 23, 1942	2	4	8
Oct. 18, 1942	1	4	8
June 27, 1943	2	6	12
Sept. 19, 1943	4	8	16

all comers. Instead of raising the points value of biscuits even higher, the Ministry of Food has lowered the value of canned meat of the "Spam" type, to attract points away from biscuits to "Spam." The seeking for biscuits as an outlet for points argues a food position which is good, since in no sense can biscuits provide the basis of a meal in the way that most other points rationed foods can. Biscuit manufacturers are licensed, and those producing more than twelve tons a year are required to be members of the Cake and Biscuit Manufacturers' War Time Alliance, Ltd. About six months ago the production of biscuits was concentrated under a scheme which did not require any firm to close down, but left the trade's labour force less than

COMPANY MEETINGS

THE UNITED STEEL COMPANIES, LIMITED

PRODUCTION WELL MAINTAINED

SIR WALTER BENTON JONES'S STATEMENT

The annual general meeting of the members of The United Steel Companies, Limited, was held, on Wednesday, the 27th instant, at the Iron and Steel Institute, Grosvenor Gardens, London, S.W., Sir Walter Benton Jones, Bt. (chairman and managing director), presiding.

The secretary (Mr R. Gresham Cooke) read the notice convening the meeting and the report of the auditors.

TIBUTE TO LATE SIR ROBERT HILTON

The chairman said: Ladies and gentlemen, it is with very great regret that I have to record the death of Sir Robert Hilton, which occurred after a very short illness on October 10th. Sir Robert had occupied the position of managing director from his appointment in 1928 until September, 1939, when he retired and was appointed deputy chairman, and he held this office until the end of 1942.

Sir Robert was a man of great energy, imagination and organising ability; he applied himself without stint to helping the company through the difficult times which followed his appointment as managing director and continued for a number of years. He earned the gratitude and respect of all concerned and will long be remembered by those who worked under him, as well as by his colleagues on the board, not only for his ability but also for his sincerity and friendliness.

You have all received the statement which I have made and which has been circulated with the report and accounts. I do not propose to add anything further to it, and it only remains for me to propose that the report and accounts be adopted.

The following is the statement by the chairman which had been circulated with the report and accounts, and was taken as read:—

In following the procedure adopted last year of making a statement to accompany the directors' report to the shareholders, there is little I can add about the operations of the works and mines. In spite of increasing difficulties, production has been well maintained. Again our staff and operatives have shown their willingness to assist in a common cause and their determination to do their best, and again we wish to record our appreciation of their work. Among our employees there is now a large number of women who have come to our aid and have undertaken work of all kinds; we have nothing but praise for their adaptability, constancy and enthusiasm.

ACQUISITION OF ST. HELENS COLLIERY COMPANY

In Cumberland we have acquired the St. Helens Colliery Company, which lies between our new Solway colliery at Workington and our Rishow colliery near Maryport. This acquisition will enable us to work the whole of the large field of coal lying under the sea from Whitehaven to Maryport, a distance of 11½ miles, as a single development. We have also completed the sinking of a new hematite iron ore mine, and it is now producing a regular output of ore. A number of schemes to facilitate essential production have been carried out at the various works.

The report and accounts are in the usual form, including a statement of combined assets and liabilities. In the balance-sheet provision for all tax payable is included

BRISTOL AEROPLANE COMPANY, LIMITED

SPECTACULAR SUCCESSES

The thirty-third ordinary general meeting of The Bristol Aeroplane Company, Limited, was held, on the 25th instant, at Bristol, Mr W. G. Verdon Smith, C.B.E. (the chairman), presiding.

The following are extracts from the chairman's statement circulated with the report and accounts:—

The profit and loss account shows a net balance of £282,290 (compared with £284,869 in 1941). Your attention has previously been drawn to the fact that the available balance bears little relation to the scale of the company's activities, as provision has had to be made for excess profits tax at 100 per cent. and income tax at 10s. in the £, levied on figures which differ considerably from the trading profits by reason of provisions which your board consider advisable to charge in the company's accounts, but are not allowable in full as deductions for taxation purposes. Out of the available balance £100,000 has been transferred to general reserve, £15,000 distributed as dividend for the year on the preference stock and £66,000 as an interim dividend on the ordinary stock. Your directors recommend a final dividend on the ordinary stock of 6 per cent., less income tax.

EXPANSION OF PRODUCTION

During 1942 further expansion of production took place. Factories under the company's management, both owned by the company and managed on behalf of the Ministry of Aircraft Production, were operated to their maximum capacity. Your company's products continued to play a leading part in service with the Royal Air Force and the Fleet Air Arm. In particular, Beaufighters achieved spectacular success in many different rôles, whilst Hurricanes and other types of Bristol engines operated successfully all over the world, proving themselves the equal of all comers in performance and reliability.

The achievements of the aircraft industry during the war constitute a record which is unparalleled in industrial history, and the industry has now settled down to a wartime level of maximum production in relation to the labour resources available.

You will no doubt have observed that your company has been invited to design the large transport aircraft which Lord Brabazon's Committee has recommended to the Government should be used on the transatlantic air services. This project, which is of the very greatest importance in the future programme of Empire air transport, will involve your company's Aircraft Division in extensive research and development. In addition, your company's Engine Division is planning to meet future requirements for all types of power plant, it being fully recognised that important departures in aero engine design are not far distant. Other possible lines of development are also receiving the closest attention.

RESEARCH AND DEVELOPMENT

Your board has always recognised that progress in aircraft and aero engine design will not be achieved without the latest and best equipment and test plant, and for this reason we have for many years past adopted a conservative policy in the distribution of profits. The present burden of taxation is an anachronism in relation to large-scale modern industry in that it has such a seriously limiting effect upon provisions for development. The need for research and development was never greater than it is to-day, and it is of the highest importance that British industry should not be prevented by restrictive taxation from equipping itself for world markets. In the past, and especially in the war, our products have been successful throughout the world on account of their technical superiority, and our first endeavour must be to maintain this lead in the future.

The report was unanimously adopted.

among creditors instead of in the reserve for taxation, so that this reserve is now for the single purpose of covering future taxation on profits not yet brought into assessment. Certain reserves made in previous years to meet unascertained liabilities have proved to be more than was necessary, and the balances not required have been utilised to make additional provision for depreciation and for other purposes.

DIVIDEND OF 8 PER CENT.

The report and accounts were unanimously adopted and a final dividend of 5½ per cent., making with the interim dividend 8 per cent. for the year, less tax, was approved.

The retiring directors, Mr Langton Highton, Mr Peter Lindsay, Mr A. C. Macdiarmid and Mr N. H. Rollason, were re-elected; and the auditors, Messrs Peat, Marwick, Mitchell and Company, re-appointed.

A vote of thanks to the board, staff and operatives concluded the proceedings.

NEEPSSEND STEEL AND TOOL CORPORATION, LIMITED

MR STUART C. GOODWIN'S REVIEW

Mr Stuart C. Goodwin, chairman of the Neepsend Steel and Tool Corporation, Limited, presided at the twenty-third annual general meeting held at the company's offices, Sheffield, on the 27th instant. In his statement, which had been circulated to stockholders, he said, *inter alia*:

On the assets side the total of sundry investments is £344,427, an increase of £63,565 over that of last year. This is accounted for by the purchase of additional investments less certain redemptions. The market values of securities have not depreciated any further and the present reserve more than covers any fall in their values. A further £75,000 has been utilised in the purchase of Tax Reserve Certificates.

Cash at bank and in hand stands at £43,033, which together with £23,221 in the bank and cash accounts of our subsidiary companies makes £66,254, which the directors consider ample.

On the liabilities side there is a net amount of £163,897 of our subsidiary companies' moneys in the hands of the Corporation, an increase of £105,950, which is reflected in the increased investments and Tax Reserve Certificates total. A reduction of £27,377 in the net revenue available for distribution does not in any way reflect a falling off in the earning capacity of the company, but is solely due to the fact that the incidence of 100 per cent. E.P.T. liability now becomes fully apparent.

The consolidated statement shows that reserves, excluding the balances of profit and loss accounts of the subsidiary companies, amount to £216,449, or approximately 64 per cent. of the issued capital of the corporation.

The report and accounts were adopted.

one-third of its pre-war total. The scheme, as well as releasing factory space, provided for a reduction in output to little more than half its level early in 1942. The output of biscuits was reduced gradually, but has been stable since the introduction of the concentration scheme. The distribution of biscuits was first zoned on June 1, 1942, saving sixteen million ton-miles a year, and 500,000 gallons of petrol, and a more stringent scheme, introduced on June 28, 1943, saved thirty-one million ton-miles. Less than one quarter of the pre-war ton-mileage is now being used for the transport of biscuits. A system of classifying biscuits and maximum prices were introduced on May 4, 1943.

Odeon Correction

In dealing with the figures of Odeon Theatres, on page 502 of *The Economist* of October 9th, it was stated that this concern was a member of the Gaumont-British group under the chairmanship of Mr Arthur Rank. Odeon Theatres state that the first half of this description is entirely inaccurate, although the second half is correct. Strictly speaking, it has always been evident that the means by which Odeon Theatres is controlled is not that of a direct majority share holding, but it is perhaps excusable if "Gaumont-British group" and "chairmanship of Mr Arthur Rank" have become interchangeable terms. *The Economist* has repeatedly urged upon those responsible a clarification of the position, pending its simplification. Until that is provided, while agreeing with the managing director of Odeon Theatres that it has erred, *The Economist* is in a

similar position to the gentleman who, while admitting that the *Iliad* was not by Homer, asserted that it was almost certainly by someone else of the same name.

FINANCE AND BANKING

THE MONEY MARKET.—The clearing banks have been calling funds from the market this week in preparing for their October returns and credit has been in short supply. The previous week's accumulation of funds in Government accounts has, however, been corrected by a reduction in floating debt borrowing. Treasury Deposit calls this week amounting to £15,000,000 only, or some £15,000,000 less than the effective maturities. The market obtained a 41 per cent allotment at last Friday's Treasury bill tender. It was taken up thanks to special assistance in the first part of the week and substantial bill purchases by the banks in the second. The Bank return reveals the wasteful immobilisation of credit consequent upon window dressing in a rise of £49,625,000 to £190,324,000 in bankers' deposits. The counterpart to this is a reduction of £18,232,000 in Public deposits and an increase of £28,100,000 in Government securities, reflecting official assistance to the market and, probably, to the Government. The circulation continues to climb, the past week's jump of £5,032,000 taking the total within £2,000,000 of the £1,000,000,000 mark.

MONEY RATES, LONDON.—The following rates remained unchanged between Oct. 22nd and Oct. 28th:—
Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1½%; 6 months, 1½-1½%; Treasury Bills: 2 months, 1½%; 3 months, 1½%; Day-to-day money, ½-1½%. Short Loans, 1-1½%. Bank deposit rates ½%. Discount deposit at call ½%; at notice ½%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between Oct. 22nd and Oct. 28th. (Figure in brackets are par of exchange.)

United States. \$ (4.86) 4.02½-03½; mail transfers 4.02½-03½. Canada. \$ (1.36) 4.43-47; mail transfers 4.43-47. Switzerland. Francs (25.23) 17.30-40. Sweden. Krona (18.15) 11.15-16.85-95. GOVERNMENT RETURNS

For the week ended Oct. 23rd, 1943, total ordinary revenue was £44,743,000, against ordinary expenditure of £90,535,000, and issues to sinking funds of £196,630. Thus, including sinking fund allocations of £7,794,860, the deficit accrued since April 1st is £1,797,425,000 against £1,662,352,000 for the corresponding period a year ago.

A change has been made in the method of showing the excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £3,047 to £2,776,001, the other operations for the week (no longer shown separately) raised the gross National Debt by £6,137,400 to £18,640 million.

Unscrambling Politics

MR CHURCHILL mixes statesmanship and politics in the grand parliamentary manner. His speech at the Mansion House on Tuesday was a sober and stately appreciation of the last grim, costly stage, which has still to come, in the greatest struggle in the history of human conflict; it was also, by implication, the first broadside in an election campaign. On domestic policy, it was, in effect, a forecast of the King's Speech that will soon open a new session of Parliament, probably the last before Germany is beaten, and quite possibly the last before the first post-war general election.

Just as in time of peace, plans for war and measures of defence ought to be in readiness for any sudden emergency, so in time of war we must make sure that confusion and chaos do not follow the victories of the armies or stultify the surrender unexpectedly early by the enemy. I regard it as a definite part of the duty and responsibility of this National Government to have its plans perfected in a vast and practical scheme to make sure that in the years immediately following the war food, work and homes are found for all. . . . They must be prepared now during the war. These plans must be prepared, and they must come into action just like, when war breaks out, general mobilisation is declared. They must come into action as soon as the victory is won.

Mr Churchill's great quality, in office or out, throughout his crowded career, has been his resilience and democratic adaptability. Time and again during the war, he has defied his critics and opponents with complete suc-

cess and then, bowing to popular opinion and right views, he has accepted their recommendations. This has been one secret of his strength as a war leader. These words from his speech might have been taken from any one of a score of articles or speeches reproving his own unwillingness to make positive plans for immediate post-war requirements. It is only a few weeks since he himself said that a wartime Coalition was incapable of making such decisions without the refreshment of a mandate from the people in a new election. He has bowed again; he has recalled from twenty-five years ago the dangers of "leaving a void behind" when the fighting ceases.

It remains to be seen what form his plans will take and how far they will go towards meeting the urgent needs and wishes of the nation. Parliament will reassemble for the new session with two convictions: first, that, in Mr Churchill's own words, "1944 will see the climax of the European war"; and, secondly, that an election will follow soon thereafter. Whether the nation will be ready when the immense tasks of peacetime readjustment start, hard upon the war, depends upon the nature of Mr Churchill's "vast and practical scheme"; so, too, in complicated ways, will depend the fortunes of the parties.

While peace and the election were still remote, it was widely taken for granted, and announced by the leaders of all the parties, that the Coalition would continue for some time after the war. Mr Churchill's view then was that reconstruction was too national in importance and too complicated in execution to be conducted on party

lines. This was never a sound doctrine. It is precisely because reconstruction is so important and so difficult that it should be carried out by the healthful process of that it should be carried out by the healthful process of genuine party politics, with all the issues fairly and fully stated for decision by the electorate. The Prime Minister has now discovered this for himself. He has found the impossibility, even in his solid and united War Cabinet, of reaching a sufficiently high measure of agreement on both principles and details to make the bold decisions required; he has stated the belief that action must be based upon a majority of opinion, and not upon unanimity; and he looks to a prompt general election as soon as practicable to show what the majority wishes. The difficulty is that it is impossible to hold a general election without an opposition. Even in the Khaki Election of 1918, the Liberal and Labour Opposition was vigorous, though soundly beaten. A coalition cannot fight an election without a truce between its wings; but an election in which most returns were unopposed would be a farce. Confronted with this choice between a continuance of coalition and a free election, the majority opinion in both parties seems to be swinging towards an election.

But this puts the Labour Ministers—and, to a lesser degree, the Labour Party—in a painful dilemma. The “vast and practical scheme”—and the winning of the war—will be the banner under which Mr Churchill will contest the election, whatever the composition of his following. It is common ground that the coalition cannot be disrupted while “the most severe and most costly campaign” has still to be fought in Europe. But if Mr Attlee and Mr Morrison, Mr Bevin and Mr Dalton, remain in office and press forward with the implementing of post-war plans, will not their every effort accrue to the credit of Mr Churchill and, through him, of the Conservative Party? Various fancy suggestions for avoiding this dilemma are being put forward. There are even, for example, some who believe it possible to end the party truce without ending the Coalition; but if this were possible at all, it could not last many months. The Prime Minister himself has hinted at another solution—that men of all parties, but independently of their parties, should join him in continuing a National government. But, in substance, this amounts to a suggestion that the Labour Ministers should do what Mr Ramsay MacDonald did in 1931, and the fate of Mr MacDonald is a sufficient deterrent. There was a moment when Mr Churchill had an opportunity to build around himself a new political structure, free of the vested defects of the two major parties and capable of strong and popular government in peace as in war. That was when he became Prime Minister without being a party leader. But he accepted the leadership of the Conservative Party and the opportunity passed. There have been indications recently that he regrets this grievous error; but it cannot at this late date be undone. Whether he has a few Labour supporters or is followed by the whole party, Mr Churchill cannot go to the polls as anything but the leader of the Tories. If anything were needed to confirm that view (which is, in any case, inherent in the nature of party politics), it has been supplied by Mr Churchill's own dogged

obstinacy in obstructing the path of preparation for reconstruction. His opposition have been based on pre-occupation with strategy, but it has looked like Conservative prejudice.

The way by which the Labour Ministers could have escaped from their dilemma—and conceivably still can—is not by any of these shifts and devices. They should have taken care, while doing their duty in the Government, to see that the country got a clear and consistent exposition of Labour's views and policies for the post-war period. It could have been done—for one of them, Mr Morrison, has done it. But he has not been supported; no one knows whether he speaks for the Labour Party as a whole; and what is chiefly visible to the public about the leaders of the Party is their mutual dislike. It is perhaps not quite too late to remedy the defect. But if the Labour Ministers are to convince the country that they are a team; that they are a team that is capable of governing; and that they know what they are after (three separate propositions), they will have to begin at once and work very hard.

It is, of course, far too early to guess what the electorate's verdict would be, if it came to a contested election. The Conservatives would have the enormous prestige of Mr Churchill's name, still further enhanced by victory attained. But against the Conservative Party (in so far as it can be distinguished from the person of its leader) and its now quarter-century-old supremacy, the tide of popular thought and desire would seem to be running very strongly. But can the Labour Party find the men and the measures to catch it at the flood? The time is too short for any other alternative to appear in the election of 1944 or 1945; none of the other parties hopes to win more than a handful of seats. At present the anti-Conservative trend is not visibly complemented by a pro-Labour trend; and until it is, the issue must remain in doubt. Unless and until there is someone to displace him, Mr. Churchill will remain in possession of the field.

This issue is likely to be decided by a mixture between what the Government *does* and what the Labour leaders say. Inevitably, the chances of the Conservatives will be largely determined by the legislative and administrative performance of the Government in the next few months. If the Government's plans turn out to be still as tentative and provisional as they have been during the past twelve months, the sentiment of opposition, and with it the electoral chances of the Labour Party, will gain ground rapidly, however much individual Labour Ministers share in responsibility. And if the Labour leaders can convince the country that they have something more than a collection of outworn slogans to offer by way of policy, they may win the day. But if Mr. Churchill is this time in earnest about “food, work and homes for all,” and if the Labour Party continues to devote more energy to its internal feuds than to its responsibilities to the community, there will be a Conservative triumph at the polls. The position is confused and contradictory. But so are all coalitions; and the problems of unscrambling wartime politics will be no less complex than those of demobilising either the forces or the factories.

The American Temper

THE Moscow Agreements achieved more, overnight, for the internationalists in the United States Senate than they had been able to accomplish for themselves over a period of many months. They had been struggling, with imperfect success, to give the Connally Resolution a more specific meaning than the rather ambiguous generalities of its authors. After the announcement of the results of the Moscow Conference, Article Four of the Agreement was embodied in the resolution almost without dissent, and the whole passed by the emphatic vote of 85 to 5, only 6 senators not being recorded. The Senate is thereby on record as favouring American participation, with other free and sovereign nations, in the establish-

ment of international authority with power to prevent aggression, and as recognising the necessity of a general international organisation for the maintenance of peace.

The vote is very impressive. Moreover, if the Connally and Fulbright resolutions are considered together, one of the most striking facts that emerges is the non-partisan character of the majorities. Among the Democrats in both Houses of Congress, the vote was 244 to 5; the combined Republican vote was 197 to 29. Post-war policy is being studiously excluded from the domestic political arena by the opposition, and that too is an enormous gain. There was a deliberate, and possibly ominous, refusal to allow the Senate resolution to go to the President as a

statement of the Senate's “advice,” and a clear reminder that any treaty to effect the purposes of the resolution could only be made by the advice and consent of the Senate, two-thirds of its members concurring. Nevertheless, the important point is that all but eleven Senators have been impelled by the pressure of public opinion to accept a resolution that is flatly in favour both of an international organisation (the word “an” is important) and of American participation in it. In view of the distance that American opinion has travelled in four years and the speed at which it is still moving, it may well advance further. The President has given every evidence in recent months of avoiding battle, if he possibly can, on all issues of domestic policy in order to increase his chances of succeeding, where Woodrow Wilson failed, in foreign policy. His strategy is succeeding; and most of the credit for the recent votes in Congress rightly belongs to him. One may lament the chaos into which his policy of appeasement is bringing the home front, especially in its economic aspects. But no sane man would have him act any differently. Certainly no sane Englishman would prefer him to put the international settlement into jeopardy by fighting the New Deal battle on the domestic front.

To this generally encouraging picture there is, however, one serious reservation to be made. In the strong tide of sentiment in favour of international collaboration there is an unpleasant, and possibly alarming, cross-current. There has been a distinct recrudescence in recent months of criticism of the conduct and intentions, of the policies and practice, of Great Britain. In part, this is the fruit of the desperation with which the hard and unscrupulous core of the isolationists regard the trend of events, and, as such, comparable to the flood of calumny of Britain with which they tried to obstruct the development of American policy in 1941. But, on the surface at least, the anti-British talk is meeting with a certain response. The sympathy that was felt for Britain in 1940 and 1941 has been replaced by an appreciation of British strength and toughness—and that carries with it a certain wariness lest the subtle and clever Englishman (for in such colours the portrait is still universally painted) may succeed in getting the better of his trusting and unsophisticated partner (another fabulous survival).

The question that any British observer must ask himself is whether this tendency of opinion will prove strong enough or deep enough to obstruct the contrary tendency towards collaboration in a world system—for, of course, there can be no question that the two tendencies are utterly incompatible with each other in the long run. The answer can be given with some confidence, and it is a reassuring answer. The move towards collaboration is a profound change in fundamental conviction. The criticism of Britain is a surface and transitory phenomenon. That it should appear at all in the middle of a desperate war, fought in intimate alliance, can be explained only by an aspect of American public life which Englishmen always

find puzzling and for which they never make sufficient allowance—namely, its all-pervading irresponsibility. No one who plays any part in British public affairs, however small, can fail to be aware of the thread of responsibility that links him to the Cabinet room. But there is only one responsible man in America. No Senator is responsible—in the sense of being answerable, now or in the future, directly or indirectly—for what he says or does. It is, therefore, almost inevitable that British observers should attach to the remarks of American public men far more significance than they deserve. They are a very poor guide to the action that will be taken.

Nevertheless, the situation has two dangers. The first lies precisely in the irritation of the British public. No lion has ever been so tolerant of the twisting of his tail. But the British people are getting tired. They have borne very heavy burdens for four long years, and they are in no mood for badinage. They do not forget that for a year they bore their burdens alone, or that even now their load, though doubtless lighter than that resting on the European Allies, is far heavier than that borne by the American people. There is a limit to the amount of criticism to which they will submit without answering back. And they have material for answering back.

The second danger arises from the position of Mr Wendell Willkie. By present indications, Mr Willkie is likely to get the Republican nomination for the Presidency in 1944. He is not fundamentally anti-British, and has never delivered himself in public of anti-British views (his private utterances are another matter). But two forces are driving him in that direction. The first is the passionate sincerity of his belief in the doctrine of “One World”—that is, of the equal rights of all nations and of all colours—and the curious conviction he holds that British opinion stands in opposition to his view. The second is the necessity he is under of proving that, even in foreign policy, he is different from Mr Roosevelt. In a close electoral campaign, the charge against the President of being under British influence is too full of votes and too difficult of disproof to be neglected. There is a danger lest Mr Willkie's campaign take this turn—and if it is accompanied by some asperities from this side, much harm may be done.

That harm will not, in any case, extend to the fundamental realities. There is no possibility of shaking the bases on which British-American friendship and collaboration rest. There is no likelihood that Britain and America will cease to be the two powers which have more in common than any others in the world. But there is a danger lest the superstructure that could—if the opportunity is fully taken—be built on these foundations in the next few years may be less ample and secure than the wartime success of collaboration would justify. It is a danger that can be guarded against by moderation and responsibility—on both sides of the Atlantic.

The Future of France

AT the first meetings of the Consultative Assembly at Algiers, deputy after deputy rose, in the wake of General de Gaulle, to express their disappointment at France's exclusion from the proposed London Commission. They echoed his statement that it is France's profound conviction that non-recognition of its interests and its rank would be both an injustice and an error... that any European settlement made without France would not be a good settlement.

This dissatisfaction must not be dismissed as the oversensitiveness of a suffering nation. The issue is deeper than this or that general or passing political manoeuvres. It is France's status, its relations to the other Great Powers and its influence in moulding post-war policy. France is not as strong a power as Russia or America or the British Commonwealth of Nations. But France has been and will be, and in many respects is even to-day, a more potent factor in world affairs than any other of the United Nations save only these three. The disaster of 1940 may possibly have removed France from the very first category; but it has not in any way abridged the French claim to be included whenever more than the three major allies are summoned. Still less has it affected the fact that France is a vital factor in Europe. If the tripartite European Advisory Commission is intended—or if, without the intention, it is allowed—to become both a permanent body and also the chief organ through which decisions on European affairs are reached, then the exclusion of France is not only a humiliation for the French people but also a bad British blunder. If the British are to play a constructive rôle in Europe, they need French collaboration at every stage. The two nations' interests coincide. Both nations need a free and ordered continent and are far more likely to achieve a measure of constructive leadership if their economic, political and moral resources are used jointly. Both would suffer from the division of Europe into uneasy spheres of influence with Germany exploiting the balance. They, more than any other of the Great Powers, need to put an end to that extinction of Europe in men's minds which Hitler's action and Pétain's betrayal have brought about.

After the last war, France was the chief architect of Europe. French statesmen have been criticised for their unrelenting search for security after 1919. It has been said that their attempts to organise the smaller states of Europe, through Little or Balkan Ententes or dual treaty relations with France gave Germany the excuse of encirclement and undermined the League. The criticisms are unjust. France's attempts to underpin the League failed because the general system of security was lacking. Russia was in isolation. The United States had withdrawn. So, to a lesser extent, had Britain. Had the Great Powers provided the underpinning, France's concern with the European nations would not have proved ineffective. So long as the French influence was really active—until the time of the Depression—it was consistently liberal in tendency. The repercussions of economic collapse shattered the Versailles system, but France cannot alone be blamed for not realising the need for constructive economic policies for Europe and the world. None of the Great Powers did so.

This time, it seems possible that the Great Powers will underwrite a framework of security. The danger now is lest the smaller powers should take fright and come to believe that their claims and rights and responsibilities are being left out of account. Europe is not a species of vacuum or no man's land into which anything decided by three wholly or mainly extra-European powers can be projected. In the particular circumstances of the moment, it may be sound policy to confine membership of the European Advisory Commission to America, Britain and Russia. But before decisions are taken, the other European members of the United Nations must be consulted. At their head stands France. To bring France into consultation, wherever that proves possible, would be not only a perfectly justifiable recognition of France's own

status but a reassuring gesture to all the nations of Europe. France can be the spokesman of the European community in a far more direct and effective way than either Britain or Russia. It is not so overwhelmingly strong that the other nations need fear its military power. Nor will they fear to be ruined by the pressure of its economic competition. This cannot be said of either Russia or the Western democracies.

Yet all the advocacy for France on the part of the other nations will make not a jot of difference if France itself does not emerge from this struggle in a fit state to exercise leadership. After this war, Europe will be politically, economically and morally shattered. The restoration of a functioning European system is naturally France's first interest, but the nation's ability to make a constructive contribution will depend upon the policies it adopts itself. In the economic sphere, Europe needs at the international level to find a way out of the impasse of economic nationalism, and at the national level, an escape from the stultifying struggle between planning and *laissez faire*. In the political sphere, the European peoples are crying out for deliverance from the tyranny of militarist authoritarian systems based on the support of a mass party and the terror of a secret police. Morally they need, above all, to pass beyond the bitter hatreds and passions which Nazi occupation and quisling co-operation have left behind. These are the minimum terms of a new Europe.

To what extent can France give the kind of leadership that is needed with such urgency? After the recent reshuffle at Algiers (which is discussed in greater detail on page 644) it is clear that the National Committee of Liberation will have a preponderant part in moulding post-war France. In "excellent spirits," General de Gaulle has referred to himself as "*chef de gouvernement*" and it is on his record and the record of the Committee that one must judge the likely trend of French development. Frankly, it is not very reassuring. In the economic sphere, it is true that there is apparently considerable popularity inside France for making use of the unifying tendencies of the Nazi war economy and of such organisations as UNRRA to create a more unified and co-operative European system. This idea has been expounded by the *Comité Général d'Etudes*, the research organisation of the Underground. It is also possible that General de Gaulle's reference in his speech at the opening of the Consultative Assembly to the exercise of national sovereignty "untrammelled by the pressure or corrupt intrigues of coalitions and private interests" may finally end up in a proper balance between state authority and private enterprise. But in the social and political field, the outlook is dark. The insistence in Algiers on purging and the rising ferocity of the clamour for the death sentence for "traitors" bode very ill indeed for the restoration of tranquillity and tolerance in post-war France. In the political sphere, it is still impossible to say which of two tendencies—the Gaulliste tendency towards an authoritarian Fourth Republic—and the tendency towards a reformed but substantially restored Third Republic will win the day. In the reaction of party leaders and groups it is possible to see how strong is France's attachment to the traditions of political freedom. But the tone of General de Gaulle's references to the Third Republic, in which he seemed to dismiss it as the *ancien régime* suggest that his own and the Committee's views on restoring republican traditions must be understood in a very equivocal sense.

France's future greatness depends only in part on the readiness of the other Great Powers to recognise its status. It depends far more on the kind of France that emerges from the war. It is a fundamental British interest to work with France and to insist on France being consulted when the fate of Europe is decided, but no amount of British backing and co-operation would increase France's standing if its postwar regime were an untimely reproduction of those very political systems the war has been fought to destroy.

NOTES OF THE WEEK

Three Voices

Stalin, Hitler and Churchill have all spoken to their countries and the world during the past seven days. Never in speechmakers have differed more in dress and discourse—the Marshal in his fine new uniform, at the workaday Moscow Soviet; the Führer in creased and crumpled Nazi outfit at the furtive Munich beer-hall; the Prime Minister dressed at the Mansion House as City men dress, war or no war. In Moscow there were many more uniforms than formerly, in London fewer, with the Mayoral panoply cut down to austerity dimensions. In Munich all the decade-old uniforms were still there, tawdry badges of adventurers despairing and defeated. The speeches themselves (discussed on pages 633, 641 and 648) mirrored the war in sharp outline even more than the garb and the scene—Russia triumphant, warlike, national but Socialist still; Germany in retreat, gloomy and mystically frenzied; Britain resolved, confident and half aware of the morning after victory, now assured.

The Air Front

Marshal Stalin has paid tribute to the effectiveness of the Anglo-American bombing of Germany; and Mr Churchill, at the Mansion House, laid stress on its unique rôle in wrecking German war economy and shredding German morale. Air Marshal Harris, of Bomber Command, stated the goal of the bombing in a speech last Saturday:

We propose to emasculate entirely every centre of enemy production, forty of which are centres vital to his war effort, and fifty that can be termed considerably important.

The process is "well on its way"; three million able-bodied men are engaged on defence and repair in Germany, and, calculates Air Marshal Harris, every ton of bombs dropped will save the lives of ten British or American soldiers in the final invasion. It is no longer the view, apparently, that bombing alone will do. The Prime Minister spoke on Tuesday of the biggest and bloodiest battles of the war, outside of Russia, still to come in Western Europe. The suggestion that the strategy is to try for victory through air power, with invasion as an alternative, is not borne out either by the facts of the bombing offensive or the speeches. The aim is rather to render the enemy, wounded almost mortally by the blows of the Red Army, incapable of resisting attack in the west. The problem is entirely one of timing. The economy of lives given by bombing has to be related to casualties, civilian as well as military, in the occupied countries as well as on the eastern front; and the bombing programme must be directly related to the means proposed, by sea and land, to translate its effects into a decisive military success as soon as possible. Bombing in Allied hands has become the most dreadful and devastating weapon in history, and the published records of factories destroyed give no conception of the ruin done to life and all aspects of living in Germany. Britain's ordeal in 1940, the experts say, was slight in comparison; it is the people of Germany who have "taken it." The justification will be, must be, the quickest possible end to the war in Europe.

Climax in the East

The recapture of Kiev by the Russians marks the climax of the campaign in the east. In relation to the western Ukraine, Kiev stands like Kharkov to the eastern Ukraine. It commands the way to the Polish frontiers, and serves the Russians as an ideal base for a series of alternative thrusts. Fortunately German demolitions in the Ukrainian capital proved less heavy than was originally feared. The enemy here was threatened by a surprise encirclement from the north and west, and he evacuated the city without being able to wreak too much destruction. Kiev has been the most invaded city in the history of the Ukraine; and in every invasion the recapture of Kiev invariably opened the final stage in the clearing of the whole

country. The last invasion of Kiev was by Marshal Pilsudski's armies in 1920, and the Polish retreat from Kiev to Warsaw then lasted only a couple of weeks. Probably no such pace can be expected now, but the speed of the present Russian advance towards Zhitomir, Korosten, and Vinnitza is equal to the greatest ever attained during the entire pursuit from Stalingrad and the Caucasus. The Germans are still holding out far to the south east, inside the Dnieper bend and in the Crimea. Their chances of restoring their positions there have been reduced almost to nothing by the fall of Kiev. The purpose of their tenacious and prolonged resistance can perhaps be explained as part of their delaying tactics, which may aim at pinning down considerable Soviet forces, and gaining time for the main German forces to organise their defence somewhere farther to the west. During the first phase of the war, the Russians used similar tactics when they left the Bialystok pocket far behind their retreating armies; and the reward was then substantial. Can the German High Command still hope for a similar reward? The Germans themselves seem to have replied to this question in the negative; they have admitted that all along the front they are confronted with overwhelmingly superior forces.

President Benes's Mission

After long preparations and delays President Benes is leaving for Moscow. Officially, his purpose is to conclude a military alliance between Czechoslovakia and Russia, on the lines of the British-Soviet Treaty of May, 1942. Dr Benes's mission raises important political issues which bear upon the post-war settlement in eastern and central Europe. During all of his political career up to Munich he was by far the most western-minded statesman in that part of Europe. Now he has radically changed his orientation. He looks east rather than west. Memories of Munich may, in part account for this. Opinion in Bohemia appears to be convinced that Russia was prepared to rescue Czechoslovak independence in 1938 but was prevented from doing so by the attitude of the Western Powers. More decisive factors in determining the Czechoslovak attitude, however, are the geographical proximity of Russia and Soviet military predominance in the area of Europe with which Czechoslovak interests are most closely connected. Dr Benes takes it for granted that, in a sense, Czechoslovakia belongs to the Russian sphere of influence. The reconstitution of Czechoslovakia in its pre-war shape will not be easy; Russian influence may be instrumental in re-uniting the various nationalities of the republic; and the relations between Czechs and Poles depend entirely on Polish-Russian relations. Negotiations of the Polish-Czech federation were "suspended" on the morrow of the "suspension" of Polish-Soviet diplomatic relations last spring. The Czech-Soviet Alliance, it is said, will provide for the adherence of any other state. For the Poles this provision is, of necessity, unreal as long as their frontier dispute with

Russia is not settled. The alternative to a triple Russo - Polish - Czech agreement may be the now discussed Danubian federation. The idea of such a federation finds considerable response among the Czechs. Economically, Czechoslovakia would be the strongest industrial partner among the Danubian states, despite the intensified wartime industrialisation of both Austria and Hungary; and a federation would provide markets for Czech industries, whereas a Polish-Czech federation might give rise to more industrial and agricultural competition. Even so, a federation without Poland would from the start suffer from important political handicaps; and it still remains to be seen whether Russia would take a more favourable view of a Danubian federation than of a Polish-Czech federation.

The Cairo Talks

For the last year Turkish policy has been dominated by two fears, fear of becoming involved in the war and fear of being left out of the peace. The two trends cannot be reconciled, for a place at the peace table is presumably only earned by some concrete contribution to victory; and such a contribution, to have any weight at all, must entail some risk of reprisals. There is no point, however careful the diplomacy, at which a nation can enter a war with enough military effect to earn it post-war influence, yet with so little military risk that no damage is incurred. In the spring of this year, when the Anglo-American offensive in the Mediterranean was being mounted and the Russians had pushed forward as far as Kharkov, Turkish policy, hitherto pro-Ally in colouring, though neutral in content, took a plunge towards complete neutrality. Propaganda offices were closed down, foreign papers banned, comment on both sides was frigid and correct. This stiffening was probably due to the fear that, now the tide was turning in the Allies' favour, Turkey might be called upon to join in. The show of neutrality was a warning that, in spite of Allied supplies, in spite of Mr Churchill's visit to Adana, Turkey was not going to risk becoming involved in the war. Since then, the tide of victory has flowed so fast in the Allies' favour that the worth of any possible Turkish contribution has been very considerably lessened. It is a question of military expediency. Would the use, say, of Turkish airfields offset the possible disadvantage of having to reinforce the Turkish army against a German thrust? If the answer is yes, then presumably Mr Eden made it clear to Mr Menemjoglu at Cairo that the time to implement the Alliance had at last come. If not, then Turkey's last chance of making an effective contribution has passed, and with it the likelihood that the Turks will have in future either the influence or the degree of economic assistance they have enjoyed in recent years. President Inonu's statement that "we want civilisation and humanity to be victors in this struggle," that "Turkey has kept faith in liberty when all the world had given it up," and that "she is prepared to make still greater sacrifices to this cause" may mean that the Turkish Government does intend more active participation. On the other hand, the tone of the Turkish press comments on the Moscow Conference was very reserved.

Reciprocal Aid

The Government's "Report on Mutual Aid," which was issued simultaneously in London and Washington on Thursday, is an attempt to give some quantitative form to the fact of "British Lend-Lease." That the report has been so long delayed is mainly due to the dilemma from which the present Report admittedly suffers—that so much of the British contribution to the war effort of the United Nations does not lend itself to any measurement, least of all in monetary terms. There are two main reasons for this. First, an important part of the British contribution (apart altogether from the contribution, on which all the rest is based, of standing alone in the breach) has been in the provision of experience and information. As the Report very temperately remarks,

This is not a service which can be valued in money, but it has cost more in blood and effort than most aid, since its value to the recipients lies in the fact that it is the fruit of battle experience.

Secondly, a very large part of the more tangible aid is not in fact valued or recorded. American lend-lease consists very largely of goods, ordered on bulk contracts, and passing through the ports where they can be counted, valued and recorded. British lend-lease consists largely of services,

rendered in small units over an enormously dispersed area. Even in the United Kingdom, no attempt is made to record every item, since this "would involve a misuse of manpower which could not be tolerated at the present stage of the war," and in the battle areas detailed accountancy would be even more absurd. The figures that are presented in the Report are therefore most incomplete. Moreover, in comparisons with the United States, it should also be remembered that American costs of production exceed the British, on the average, "by more than 50 per cent."

When these qualifications are borne in mind, the figures are very impressive. A further account of them will be given in *The Economist* next week, and for the moment it must be sufficient to give a few of the totals. The recorded part of the aid given to American forces in the United Kingdom in the year ended June 30, 1943, amounted to £816 million. This excludes all reciprocal aid to American forces in overseas theatres of war, and supplies of raw materials, etc., which are only recently supplied on lend-lease terms. Aid to Russia amounted to £179 million up to June 30th last, and aid to other Allies had reached £186 million by December 31, 1942. In addition, British expenditure in overseas territories (for such things as the pay of troops and cash expenditure on military operations and supplies) had, by the middle of 1943, reached the enormous sum of £2,250 millions in excess of sums received from these countries. Here, then, are four figures none of which is complete or strictly comparable with the others. The sum of them—namely, £2,831 million—is certainly a wide under-estimate of the external war effort of the United Kingdom. As the Report remarks, the total war efforts of the nations are not to be measured by the size of their external fractions (as witness the fact that the Russian effort outside the borders of the USSR is very small indeed). Nevertheless, if comparisons are to be made, the Report concludes with the most embracing that is possible.

In the President's Report to the Congress of May 25, 1943, he gave figures to show that lend-lease expenditures up to that date made up 12 per cent of America's total war expenditure. The proportion of British war expenditure currently devoted to mutual aid is 10 per cent.

Planning for Homes

The campaign in Parliament for statutory action to make possible the planned control of building and land-use has been stimulated by the Prime Minister's open confession of the need for a "vast and practical scheme" for "food, homes and work." Lord Balfour of Burleigh in the Lords and Mr John Parker in the Commons returned to the charge this week with new heart, and the Government's response was, perhaps, not entirely discouraging. The acceptance, in principle, of Lord Balfour's demand for early legislation to permit the prompt acquisition of reconstruction areas "at prices related to pre-war values" merely repeated many earlier pledges; but the impression is that this obvious and essential measure, in itself non-committal with regard to the larger issues of national planning, will soon be made law at last. Lord Balfour's balanced and persuasive speech also drew an admission from Lord Snell that "the Government accepts the principle of national planning without qualification" and the Barlow Commission's planning proposals with qualifications—again not news but welcome hearing to many who feared that the pigeon-hole had triumphed. Mr Parker asked on Wednesday whether the vesting in the state of the rights of development in all land outside built-up areas (proposed by the Uthwatt Committee) was "barred as a possible subject of legislation by the present Parliament," because of its controversial character; and the Prime Minister answered simply "No, sir." Mr Churchill will find it hard to resist these pressures after his Guildhall speech; if nothing is done, he will be condemned out of his own mouth.

Folly?

Sir Walter Citrine was echoing the sentiments of many people when he told a trades council conference at the week-end that he regarded it as the "height of folly" that millions of people should be called out night after night after a hard day's work and compelled to firewatch. Home Guard duties he similarly disposed of as "senseless drills." There can be no doubt that both fire guard and Home Guard duties are at the worst a serious hardship and at the very least a constant source of irritation. But can they be relaxed? So far as firewatching is concerned, many people think that, in short sharp fire raids on the scale

inflicted by the RAF, firewatchers will be useless; it will be a case of taking cover while the raid is on, and then leaving everything to the National Fire Service. Sir Walter Citrine, with his usual air of authority, says that the Germans are not capable of inflicting large-scale raids. But it does not follow that they cannot return to fire-raiding. Mark 1940-41, and an official announcement to the effect that firewatching could be relaxed would be an invitation to them to do so. The Home Guard is in a somewhat different category. When the second front starts, the defence of this country will rest entirely upon its members, so that the need for it cannot be called in question. On the other hand, its duties impose a far more serious hardship than firewatching, which, in the absence of an alert, at least allows a person a night's sleep, and does not encroach unduly on his leisure time. Would it not be possible to give the Home Guard shorter and more intensive training, with periodic refresher courses, and then allow them to forgo the week-end parades and drills? The question of how much the country should insure for in home and civil defence is a difficult one to decide. If the Government, with its superior knowledge—even to Sir Walter Citrine's—of what possible surprises the Germans may have in store, decides that firewatching and Home Guard duties are still essential, then they must be undertaken with the "efficiency and devotion" for which Mr Churchill called this week. But those on whom the obligations are imposed have a right to expect that their spells of duty should not be spent in any irrelevant exercises and vigils.

Pay-as-you-earn Difficulties

The general welcome rightly given to the Government's conversion to complete "pay-as-you-earn" has been tempered, in the course of further reflection, by a juster appreciation of the difficulties involved. In the Lords debate on the Bill last week, several speakers, especially Lord Perry, protested against the enormous burden of computation that is to be laid on the shoulders of employers. The Lord Chancellor, with his confirmation that the tax tables, of which half a million copies are to be distributed, will be "rather like a telephone book" (he presumably meant both sections of the London directory), did not allay this anxiety. Indeed, it cannot be allayed. Only a very small fraction of the employers of the country have yet realised what they have been let in for, and they are aghast. When the majority realise the burdens involved—that is, when the scheme is due to start next April—there will be an explosion, and what its consequences will be it is impossible to predict. That is, of course, an objection to the particular scheme evolved by the Inland Revenue rather than to the principle of "pay-as-you-earn."

Another cause of disquiet is the character of the Exchequer's forecast that, as a safeguard against evasion, an extra assessment will be levied on any increase in remuneration in 1943-44 over the previous year. The objection to this is twofold. First, it is illogical. What will happen when "pay-as-you-earn" starts in April 1944 is substantially this: in respect of the year 1944-45, the taxpayer will be assessed on his earned income in 1944-45 and not (as the present law would require) on his earned income in 1943-44. (There is also a change in the period of collection—as distinct from the basis of assessment—but that is not relevant to the immediate point). It follows that if the taxpayer derives any unearned benefit from this change, whether by deliberate evasion or by way of windfall, it must arise out of the relationship between his income in these two years. Only if his earned income in 1943-44 is (or can be made) higher than his earned income in 1944-45, will he escape any taxation or pay less in 1944-45 than he would otherwise have done. The year 1942-43 is without any relevance to the problem at all; yet it is by reference to this irrelevant year that the Chancellor is proposing to levy his additional assessment. If the point were merely one of logic, it might perhaps be overcome by practical considerations. But there is also, secondly, the risk of grave injustice. This can be seen by taking the case of a man who, in the normal course of events, received an increase in salary in the course of 1943-44. Under the Chancellor's proposals, as roughly outlined in his speech last week, such a man will not only have to begin paying tax at the higher rate appropriate to his higher salary seven months earlier than under the present dispensation (i.e., in April instead of November 1944), but he will also have an additional assessment levied against him

in respect of his increased income in 1943-44. How serious this might be can be illustrated by a particular example of a married man with two children whose salary was raised in April 1943 from £600 to £800 a year. In the nineteen months from April 1944 to October 1945, this man would, under present legislation, pay £285 in income tax. Under "pay-as-you-earn" he would apparently pay £424 in the same period. Nor is this likely to be an unusual case, since 1943-44 has been a period of rising incomes. It is surely wrong that ten innocent men should suffer in the attempt to catch one evader.

In any case, the remedy is simple. For the class of evader mentioned by the Chancellor of the Exchequer (the man who is able to shift part of his income in 1943-44 from Schedule D into Schedule E), it could be provided that where the increase in Schedule E income in 1943-44 exceeds the increase in total income in that year, an additional assessment would be levied on the difference. That would not catch the evader who is able to bring his earned income forward into 1943-44 (e.g. by getting large advances on salary). But the way to catch him is by taxing the excess of 1943-44 earned income over that of 1944-45—though to do so would again penalise those whose incomes fell between the two years not through evasion but through bad luck. In no case should 1942-43 be brought into question. To make the comparison with 1944-45 means that the Inland Revenue may have to wait two years before the transition problems are liquidated. But this would be a small price to pay for the avoidance of injustice.

End of Amgot

The constitutional problem in Italy is still unsolved. The King has not abdicated, and Badoglio as a result has still to broaden the basis of his Government. Meanwhile General Eisenhower has cleared up some of the uncertainties relating to Amgot, or Allied Military Government of Occupied Territory (AMG for short) as it is now to be called. Immediate administration behind the advancing armies will be entrusted to AMG, but as soon as possible will be

You can't afford FRICTION in your office

There will be no latitude for friction in post-war business. Drawers and doors that are stiff and stick mean a loss of temper and time. Ball and roller-bearing steel furniture is the answer. ●Sankey-Sheldon will have a range of steel business furniture to offer you after the war—furniture that will add to the strength and efficiency of steel a new comfort and elegance. New contours, new colourings and warm coverings will give your office a new note of functional beauty to tone with the times.

transferred to the local Italian authorities. However, this will not mean unrestricted Italian control, for a wider body has now been set up, Anglo-American and military in composition. This Allied Control Commission will supervise all Italian administration, and ensure that the armistice conditions are loyally fulfilled, that Italy's entire resources are thrown into the fight against the Nazis. This is the complete picture of military control. Non-military matters will be referred to the Advisory Council for Italy, on which representatives of the three Great Powers, of the French National Committee, and later of Greece and Yugoslavia will sit. Its task is apparently to "make recommendations to co-ordinate Allied policy with regard to Italy." These recommendations are not necessarily binding, and, for the present, military considerations must prevail. The important thing now is internally to hasten the process of broadening Badoglio's Government and, externally, to create a working partnership on the Council effective enough to be carried over in spirit to the far more difficult problem of occupied Germany.

UNRRA Begins Work

The formal setting up of the United Nations Relief and Rehabilitation Administration is a milestone in the working out of joint post-war policy. This is the first piece of executive machinery to be established, and although it deals with a limited and practical field of action—the immediate relief of post-war needs—its structure, perhaps, reflects the general pattern of post-war co-operation. The Central Committee consists of the four Great Powers with authority to take decisions through a Director-General—Mr Herbert Lehman will probably be appointed to this post—subject to approval by a general assembly, or Council, of all the participating Powers. The Council will work through a number of sub-committees—for example, on supplies, representing the principal supplying nations—and through regional Councils, for Europe and the Far East. This inclusion in the structure of UNRRA of the regional principle and the concerting of relief plans on a regional basis can have a revolutionary effect on post-war economic policy. So far, however, very little ground has been covered. The whole organisation has still to be set up and this will be the first work of the Conference at Atlantic City. Colonel Llewellyn is the British representative on the Central Committee with Sir Frederick Leith Ross as alternate. Mr Dean Acheson and Mr Francis Sayre are the American delegates. The small amount of preliminary work accomplished by the Allied Post-war Requirements Bureau and the Relief Department of the Foreign Office has already established two chief obstacles to the smooth working of UNRRA. One is on the side of the consumers. Some nations have gold or other reserves. Some have none. Is need or purchasing power to be accepted as the criterion of priority? Can competitive bargaining for supplies be avoided? Can the wealthier nations be persuaded, in the interests of the general European community, to take less than they could afford, under ordinary market conditions, to buy? The other great difficulty is on the side of supply. Mr Walter Lippmann has been provided with some interesting preliminary bulk estimates of need and of the services of supply. According to him, Europe will need 46 million tons of supplies, of which 23 millions can come from Europe itself, 9,500,000 from North America, 3,500,000 from the United Kingdom, 6,000,000 from the Mediterranean, and 4,000,000 from the rest of the world. Yet the truth is that by the end of the war there will be only relatively small reserves left for relief. Lord Woolton has reminded Britain that "we are running into a world food shortage." Coal is already insufficient for the needs of Britain and the United States. The Board of Trade has stated that there are no stocks of consumers' goods in this country. Until demobilisation, the situation cannot get better and will probably get worse. It is a question of spreading evenly and fairly a very thin layer of essential supplies.

Domestic Service in Hospitals

Before the recruiting campaign for nurses was launched at the beginning of this year, it was estimated that 10,000 additional nurses were needed. No estimate has been made of the shortage of domestic staff in hospitals, but it is equally serious and, moreover, it intensifies the shortage of nurses, for it means that the latter have to perform an

excessive amount of non-nursing duties—which again acts as a deterrent to recruitment to the nursing profession. Hitherto, the Minister of Labour has found it impossible to take effective steps to remedy the shortage of domestic staff—that is, to use his powers of direction—because of the absence of recognised rates of pay and conditions of service in a large part of the field of institutional domestic service, a problem similar to that of staffing industrial canteens without set hours of work and remuneration. The Hetherington Committee has now recommended uniform rates of pay for manual domestic work in the school meals service, and in hospitals and institutions, where no agreements are already in operation. Mr Bevin has accepted the recommendations. For cooks and assistant cooks in the school meals service, the rate is to be 1s. 4d. and 1s. 2½d. an hour respectively, and for general maids 1s. 2d. an hour or £2 12s. 6d. for a regular working week of 48 hours. In hospitals and establishments for the care of the sick, aged and disabled and young children, the resident wages of a cook are to be £100 a year; of an assistant cook £86; of special maids £80; of general maids £60 rising to £73 after two years' experience; and of maids aged 15-18 £26 to £45. An addition of £70 a year is made to the wages of non-resident workers over 18. It is interesting to compare these proposed wages with those adopted for nurses under the Rushcliffe scale. A cook, for instance, will receive as much as a staff nurse receives in her first year after registration—and, incidentally, as much as a newly qualified doctor receives for a "house" job. Assistant cooks, special maids and general maids will all receive more than a probationer, who starts at £40 at the age of 18 and rises to £60-£70 after three or four years respectively. A maid of 17 will, in fact, receive £5 a year more than the probationer of 18. It is true that a probationer is paid while she is being trained for a skilled profession, at the top of which, as matron of a big hospital, she may receive as much as £700 a year (resident); moreover, the emoluments received by nurses are given a higher value than those received by the domestic staff, nor do the latter come under a superannuation scheme. But, from the point of view of attracting recruits into the nursing profession, the comparative rates of pay for domestic workers and the junior ranks of nurses should be borne in mind.

* * *

Rewards for Service

The National Union of Teachers has estimated that at least 85,000 more teachers in schools will be needed after the war, its estimate being about half-way between the official estimate of 70,000 and the British Association Committee's estimate. To find them, it recommends that men and women now in the Forces should be invited to train, which is, indeed, the Board of Education's policy. But men and women will not be attracted into the profession unless it is made financially more worth their while than it is at present. Sir Richard Livingstone points out in a letter to *The Times* that the maximum to which a secondary school teacher outside London can rise under the Burnham scale is £480 a year. For women it is less. This is a poor prospect for the person of intelligence and personality who is wanted for the teaching profession, particularly for the mature and experienced members of the Services. Clearly, before a recruiting campaign for teachers is undertaken seriously, the Burnham Scale must be drastically revised to provide for a higher maximum, which should be reached much earlier in a teacher's career than at present. A strange contrast is being established during the war between the rates of pay for those who can be directed into a national service and those who cannot. In the former case, for instance, in the catering trades and institutional domestic service, Mr Bevin, rightly, sees that the rates of pay are adequate and just before he uses his powers of direction. But in those forms of national service which must rely on voluntary recruitment—they cover all the professions—there is official apathy on the question of pay, though recruits are no less urgently wanted. It has taken years of agitation for nurses' salaries to be revised. The Burnham Scale for teachers was never, even in the twenties, attractive enough, apart from its illogical distinctions between the sexes, different localities and different forms of teaching. It is small wonder, therefore, that the medical profession is anxious lest, if it is placed on a salaried basis, persons of enterprise and skill should be deterred from entering it. In any revision of the rewards for service, the claims of the professions should not lag behind.

Strikes and Authority

The stoppage of Scottish aero-engine workers came to an end on Monday, and the 24,000 strikers have gained nothing by their action. This emphasises the pointlessness of this and other strikes. There was very little enthusiasm among the strikers, and it seems that war fatigue and lack of interest played a large part. The Minister of Labour did not intervene, except to send a telegram, in reply to an appeal from the shop stewards, urging the strikers to return to work. The negotiations, which had been started and broken off, have been resumed, and the grievance, which is a real one—the non-payment of "the rate for the job"—may now be settled by constitutional means. One factor in these strikes, which although not their initial cause at any rate prevents a speedy solution, is the slowness of the present negotiating machinery, which was set up before the last war. At last week's special conference of the Amalgamated Engineering Union, the need for speeding up the negotiating machinery and bringing it up to date was stressed by the President, Mr Jack Tanner. Another outcome of this conference may be the appointment by the Union of more full-time officials and organisers, in order to cope with vastly increased membership—now nearly a million strong. A great part of the present membership consists of new war entrants, who have no previous experience of industry or of trade unionism, and it is, perhaps, not surprising that they should not be very amenable to trade union discipline. It is obvious that trade union authority cannot be imposed from outside; it must come from within. It is also obvious that merely exhorting strikers and reproaching them with unpatriotism and complacency is ineffectual. Perhaps a national conference, and a lead by the Trades Union Congress, might straighten the tangle.

* * *

Bombs on the Vatican

The Vatican has been bombed by an unidentified aircraft which, diving from a considerable height, dropped a few bombs on the Vatican City in such a way as to kill nobody and do remarkably little damage. Since only the Germans have any interest in bombing the Vatican, presumably the Germans did it, and the whole apparently pointless affair is a useful reminder that they intend to exploit the position of the Pope and of Rome in order to get what propaganda value they can from the explosive emotional forces which the subject of either Rome or the Pope can release. With the city itself, it is the problem of the Germans using their hold on it to delay the Allies' advance and place them in the awkward dilemma of having to put military considerations before their respect for the Eternal City. With the Pope, the Nazis may have darker things in mind. The first reaction of the German press to the bombing was the suggestion that the Pope would have to be taken away to safety. After the abducting of Mussolini, any coup is possible, and it is a practice not unknown to gangsters to collect valuable hostages as they prepare to stage a getaway. The Allies have not yet come to the end of their embarrassments and it is to be hoped that they will be as clearly foreseen as the present bombing incident which Mr Churchill predicted, down to the finding of British bomb splinters, as far back as 1941.

* * *

Hitler Speaks Again

The anniversary of the 1923 Putsch has more significance than usual for Hitler and his party leaders this year. In November, 1923, the first Nazi attempt to get power was a complete fiasco which virtually dissolved the party and landed Hitler in a fortress. Yet ten years later, the Nazis were in power. This sequence has stamped itself on Hitler's mind as a sort of miracle. The impossible once happened. It can happen again. However desperate a situation, it can be restored, partly by miracle, partly by the ruthless action of the mass political party under iron discipline. So, to-day, as the front is crumbling in the east and disasters are breaking over Germany on every side, Hitler went to the Munich Bierhalle to reaffirm his faith in miracles and his confidence in the Nazi party. God had not raised him up so miraculously simply to cast him down. In no other speech has Hitler spread himself so vigorously at the expense of the Almighty. But the core of the speech was his reliance on the Nazi party to hold together, to crush all opposition, to lead and encourage the masses and to repeat the miracle of 1923. This he said, in effect, is the reason why November, 1918, will not be repeated. Then there was weakness and opposition and division. Now there is none—only the invincible

Party which bases itself on the broad masses and will ruthlessly exterminate the doubters and waverers. The speech was a declaration of war on defeatism or, rather, a continuance of an existing state of war. That is its chief relevance to the German people. Otherwise he had nothing to offer them but bombs, casualties and death and somewhere, somehow, a rosy future.

* * *

Catering Wages Commission

The first action of the Catering Wages Commission appointed in July has been to recommend to the Minister of Labour the setting up of a wages board for workers employed in industrial canteens. The Commission, which was the teacup of a political storm earlier in the year, is purely advisory in character; it can recommend the establishment of wages boards where it finds that no adequate joint voluntary machinery exists, such boards to be charged with fixing rates of wages, prescribing meal and rest intervals and making provision for holidays in the various sections of the catering industry. The Commission has, very sensibly, started by turning its attention to industrial catering—the question of boarding-houses, hotels and restaurants may present a more difficult problem at a later stage. Works canteens have now become an integral and accepted part of industrial life. They may be run by the firms themselves or by outside caterers. When the canteens are run by the firms themselves in scheduled work, their staffs automatically come under the Essential Work Order, but Mr Bevin has hitherto steadfastly refused to schedule the workers employed by outside catering firms, on the ground that wages and conditions were not properly regulated. These firms have denied this charge and there have been many complaints of the difficulties experienced in securing and keeping canteen staffs, and the quality of the canteens has undoubtedly suffered. The setting up of a wages board—if the recommendation is adopted—and the improvement of canteen workers' wages and conditions will be an important contribution towards the adequate staffing of these canteens, and, in some cases, towards raising the standards of the meals supplied.

AMERICAN SURVEY

Thunder of a Distant Boom

(From a Correspondent in Iowa)

THE past history of the American West has more than once shown that the most insidious threat to the ownership of farms by the men who do the work is the farm land "boom." People are debating whether or not the beginnings of such a boom are now in evidence.

Bad times and low prices bring a flood of mortgage foreclosures, but good times and high prices set the stage for them by encouraging overcapitalisation and heavy mortgaging. Good times and high prices also lure speculators who are not farmers into the farm land market, to bid up the price and make it harder for an ambitious tenant to buy land for himself. The guaranteed market and prices for the chief farm products that prevail in wartime make farming so much less uncertain a venture and farm land so much more attractive an investment.

The evidence that a boom is now in the making is threefold: rising farm land prices, rising volume of farm land sales, and rising number of sales to absentee owners. Farm land prices have been inching up for years now, and though they are still moderate, the Federal Department of Agriculture's Bureau of Agricultural Economics already sees a "striking parallel" to the price rise during the previous war, which culminated in a boom in 1919-20 and a sharp deflation afterwards.

The Bureau's index of values of farm land per acre (1912-14=100) shows the sharpest yearly increase since 1920 in last year's 8-point rise:

1933	73	1942	91
1941	85	1943	99

These are March 1 figures, and the process has been continuing since. In the second quarter of 1943, Iowa farm land prices were up 11 per cent over the second quarter of 1942, and farm land prices in Illinois, Michigan, and Indiana were up 8 per cent, as a survey by the Federal Reserve Bank of Chicago showed. Incidentally, second quarter sales in Iowa were 40 per cent for cash, in Illinois 60 per cent. Until 1943 price rises for corn belt land were moderate and for wheat belt land prices scarcely rose at all, though farm income had gone up faster in these areas than elsewhere. In the semi-arid wheat belt, the chief restraining factor was the fact that much land was still being offered for sale by banks and insurance companies which had foreclosed mortgages during the hard times of the 1930's.

Farms Changing Hands

Rising velocity of turnover is characteristic of booms. The Federal Agriculture Department's "index of voluntary transfers" shows this, too. Yet these two tests, price and velocity, cannot be taken as conclusive by themselves. Those who pooh-pooh talk of an incipient boom insist that, as long as most of the farms are bought for operation by the owner (as they still are), and as long as owner-operators as a group are paying off old debts faster than they are acquiring new ones (as they are), no dangerous boom is in the making.

Several voices, while admitting these facts, point to the increasing proportion of sales to other than owner-operators; 25 per cent in the period 1934-40, 40 per cent by 1941 and 1942—close to 50 per cent in some of the eastern corn belt states. Even if farm labour, machinery, and management shortages have slowed the process in 1943 (which is dis-

puted), it is often cumulative, and farmers are always at a disadvantage when city men in numbers compete with them for ownership of the available farms.

These same voices suggest various governmental taxes and controls for the purpose of discouraging heavy borrowing, frequent sales, and especially sales to non-operators, but no serious political support has developed for any such thing.

Free Trade in Land

Politically, such a move would be very difficult. The "farm-bloc" in Congress is powerful and rambunctious. The right to buy and sell land and borrow money on it is cherished by American farmers, especially the commercial farmers of the corn and wheat belts. The intermittent outcries against the moneylenders concern the terms of the bargain, not the process itself, and governmental measures of the last ten years have made the going terms quite favourable to the farmer. Agrarian and socialist theorists who argue that commercial farming, with free sales and mortgaging, leads inevitably to squeezing out the owner-operator, have not convinced midwestern farmers in spite of the secular rise in farm tenancy since 1880, when the census first included tenancy figures. The farmers still think a little tinkering with prices and interest rates will set all to rights—and since the middle 1930's owner-operators have been regaining lost ground in the midwest.

American agricultural history is full of the wrecks of land policies which tried to mould landholding into some preconceived form. The compact village settlements of old New England did not long stand up before the atomising force of the back country. Primogeniture and entail were early and decisively smashed in Virginia. The canny schemes of colonial, state, and federal governments to make revenue producers of their unsettled lands had to bow again and again to "squatters' rights." Even the Homestead Act of 1862, by which the Federal Government finally decided to give away its vast remaining lands in 160-acre batches to settlers who could cultivate or live on their "claim" for 5 years, was shattered on the geographical fact that the semi-arid and arid regions of the west could not be farmed in such small patches unless irrigated.

In times of distress, American farmers will support mortgage moratoria and many other types of governmental assistance, but they want to be free to buy and sell land and borrow money as they please—above all in good farming years. Thousands of Iowa farmers sold out at boom prices last time—often to relatives—and retired to live in Southern California on their incomes from the mortgages even though it made hard the lot of the next generation of farmers, thus burdened with debt for grossly overcapitalised farms.

The National Socialists in Germany found it good politics in the 1920's and '30's to talk about "hereditary farms," but the commercial farmers of the American corn and wheat belts do not think in those terms at all. Some of them have been on the same farm for several generations and take a certain pride in it; but even these let their youngsters choose their careers for themselves, and at least half of them must normally leave the farm in any case. Farm families by the hundred thousand move from farm to farm, from farm to city and back again, with bewildering rapidity. They do not wish to be tied down, or to have farms tied down.

If they remember the last boom and its aftermath, they figure they will be smarter this time, and not buy too heavily, or else sell in time—and anyhow, with a market assured for several years after a war still far from won, the collapse of the boom is "a long way off."

American Notes

The Omens for 1944

The final returns from last week's elections show an even greater Republican sweep than appeared at first. Even Kentucky has a Republican Governor. The Republicans are convinced that this is a prophetic November. Mr Willkie has said that the elections showed that the country is tired—very tired—of the Administration. The Democrats have been quieter. They have had forced upon them once more the fact that the Democratic party, without Mr Roosevelt, is very much less than the whole. They have consoled themselves with talk of local considerations, of the young Democrats who are in the Services or in war work, and debarred from voting. All these consolations are valid, to a degree. To these apologetics, however, should be added two factors. There is the comparative complacency of the party. Many Democrats, and particularly many New Dealers, have forgotten the lean years before Mr Roosevelt's long ascendancy; they have had a not inconsiderable scorn of the steady backstreet work that brings in the votes on election day. Many of them are political amateurs compared with the hungry and experienced Republican bosses. The primary essential for a Democratic victory evidently is that Mr Roosevelt should run again. From his own point of view the prospect of a hard-fought and doubtful election is not inviting; but Mr Roosevelt will not willingly see a Republican enjoy the fruits of world victory. The Republicans have gained several substantial advantages. The elections have given a real lift to Republican morale. They are now in possession of a majority of the state governorships, with the prestige and patronage and influence that go with them. Finally, the seeming removal of foreign policy and post-war collaboration from party politics, which has been signalled in the votes on the Connally and Fulbright Resolutions, will enable the Opposition to concentrate on home affairs, the front on which the President is weakest. The surrender to Mr Lewis and his miners is a plum which will be made much of in the farm states.

The High Price of Coal

Coal is to be mined, but the price which has been exacted by Mr Lewis and his miners is high. The increase in the price of coal which it appears must follow the new contract is the least part of the levy which has been extorted. Despite Mr Roosevelt's order to the miners to be back at work on Wednesday, there was no response until a contract had been negotiated between Mr Ickes and Mr Lewis and the union policy committee had ordered the end of the strike. This defiance of the government has paid good returns. The new contract grants Mr Lewis almost as much as he got in the Illinois contract, the \$1.12 award of the War Labour Board being raised to \$1.50 increase per day. The reduction of the miners' lunch hour from half an hour to 15 minutes, the extra quarter of an hour to be paid for at time and a half, is a face-saver which deceives no one. The brutal fact is that the Administration has failed to support the War Labour Board, not only in the matter of wages, but by disregarding one of its basic principles, that no case is heard while workers are out on strike. The Administration seems to have thrown away all its trumps. For the present contract is no guarantee of permanent peace. It operates only for the duration of Government control. When the mines go back into private hands, a new contract will have to be drawn up; and it is certain that the miners will refuse to work for private enterprise at rates less favourable than those they have enjoyed under Government control. If another strike were threatened at that time, the heaviest sanctions of the Smith-Connally Act, which refer to plants under Government control, will cease to apply. The immediate results of the miners' triumph are not difficult to see. The CIO last week demanded the elimination of the "little steel" wage stabilisation formula on the grounds of the failure of a strong policy of price control and rationing. The way is open for renewed assaults on the wage structure. The steel workers are said to be demanding a 15 cents an hour rise. The railwaymen have turned down a new increase in the hope of something more substantial. The President's committee to investigate the cost of living index is to make its report within sixty days. But by that time the retreat from the line that was to be held may have gone too far to be retrieved.

Lend-Lease Debt

The Truman Committee to investigate the defence programme has maintained such a high standard in its enquiries, and stands so high in public esteem, that its attitude toward Lend-Lease deserves more attention than the opinions of individual and sometimes irresponsible members of Congress. The Committee's comments last week were neither as destructive nor as final as some British newspapers have suggested. They were a part—and only a small part—of a report on problems of the changeover from war production to peacetime conditions, not a full-dress investigation into Lend-Lease. This is still to come. What the Committee said, in connection with the replacement of American resources, was that Lend-Lease beneficiaries, in particular Britain, who were dependent on American supplies because of the shipping shortage, and could not find dollars to pay for them, might in return transfer title to reserves of petroleum, and deposits of nickel, copper, tin, and iron outside the United Kingdom. It was also suggested that the United States might acquire the right to manganese supplies from Russia in return for Lend-Lease goods. The references to rubber were less judicial. Here the Committee gave new life to the accusation that the British and Dutch not only did not accumulate stocks, but hindered Mr Jones from building up American reserves. The Committee expressed its concern lest the United States become once more a victim of a resurrected Stevenson plan, under which exorbitant prices had to be paid for rubber while the United States was being denounced as a Shylock. The question of methods of repayment of Lend-Lease debt obviously waits upon the decision whether there is to be any repayment at all, and, indeed, whether there is any debt. The British White Paper published this week may show that Britain's contribution to the common pool for war is not far behind that of the United States, and that, in the British view, at least, there is no case for repayment. It is as well to be prepared for the refusal of many Americans to accept this point of view. For one thing, concern over the depletion of American resources, particularly of petroleum, is very deep and very real. For another, it is inescapable that there is still

Vitamins in chocolate for liberated Europe

The British Government, having examined all the ways in which sufficient vitamins could be provided to the under-nourished children of liberated Europe, have arrived at the conclusion—as Rowntrees did in 1938—that chocolate offers one of the best vehicles for carrying added vitamins. In chocolate, the vitamins retain practically all their potency.

Before the war, Rowntrees pioneered the addition of vitamins to cocoa and chocolate. Their object was to enhance the protective value of these already highly nutritious foods.

Today, when the Allied Governments are faced with the enormous problem of rehabilitating each occupied territory as it is freed, Rowntree's experience of fortifying cocoa and chocolate with vitamins on a large scale is proving of great value. When the war is won, this experience will again be used for the benefit of the British public.

ROWNTREES

*M. M. Regan and A. R. Johnson: *The Farm Real Estate Situation, 1939-40, 1940-41, and 1941-42*. Circular 662, US Department of Agriculture, November, 1942.

†E.g., William G. Murray: *Land Boom Controls*, 34 pages, Iowa State College, May, 1943; M. M. Regan and Fred A. Clarenbach in the *Journal of Farm Economics*, November, 1942, February, 1943. Also many county "extension directors" in Iowa.

a deep-seated objection in many quarters to regarding the European theatre as a primarily American war. To these critics victory will certainly not be the only coin in which repayment is expected, and to an even larger number the Truman Committee's suggestions will appear an eminently reasonable application of the narrow idea of Lend-Lease, that is, the return of the implements and sinews of war. Compared with what may emerge from the coming investigations into Lend-Lease, the Truman suggestions may be shown to be the expressions of a comparatively liberal and realistic approach.

THE WORLD OVERSEAS

Brumaire 18 at Algiers?

NAPOLÉON THE FIRST got rid of his rivals of the Directory on Brumaire 18 (November 9, 1799), shortly after his return from Africa. General de Gaulle became sole President of the French Committee of National Liberation while he was still on African soil. General Giraud, still undisturbed Commander-in-Chief, was removed from the Committee on Brumaire 18, 1943.

So were two other generals—Georges and Legentilhomme—as well as two civilian commissioners of Giraudist views. Most of the seven new Commissioners belong to the Gaullist persuasion, and, though the fact that the new Commissioner for War—the Socialist le Troucquer—is a civilian harmonises well with a good French democratic tradition, there can be no doubt that the Commission born on another Brumaire 18 represents a striking political success for General de Gaulle.

The coincidence in the dates—Brumaire 18, 1799 and 1943—remarkable as it is, should not be made the basis for too close an analogy, any more than too much should be made, say, of the fact that the Consultative Assembly, now in session at Algiers, has eighty-four members, almost the same number as Napoleon's Senate convened under the Constitution of the Eighth Year, shortly after his *coup-d'état*. The traditional disposition of ambitious generals to repeat the gestures of the Great Emperor is well known, and it should not, perhaps, be given an undue political importance.

Controversy Begins

But the fact remains that the opening of the Consultative Assembly at Algiers on November 3rd immediately became a preliminary round in what promises to be a protracted struggle over the future political outlook of France. The war and the fight for the liberation of France form the general background. France is still under enemy occupation, ruled by a treacherous authoritarian Government without authority. The representatives of all political groups at Algiers have one common war aim. All are equally anxious not to allow political differences to impede the French war effort. The opening of the Consultative Assembly was a striking demonstration of this unity of purpose among French patriots. But it is also true that some crucial political controversies do not lend themselves to postponement. They arise inevitably as the practical tasks of political reconstitution come to be tackled.

Moreover, most of these controversies cannot be solved democratically as long as there is no possibility of appealing directly to the verdict of the French people. Of necessity, French politics at this stage resemble a trial in which neither side can produce evidence for its claims. Personalities and groups charged with authoritarian ambitions can always reply that no truly representative institutions can be set up as long as the French people cannot be consulted in elections. No artificial devices can obviate this difficulty.

The dilemma has been strikingly reflected in the composition of the Consultative Assembly. The Assembly consists of eighty-four members, of which sixty represent France and twenty-four the colonies and French organisations abroad. Of the sixty representatives of France, only twenty come from the ranks of former deputies; among

Shorter Notes

The House Appropriations Committee is preparing to introduce the new Tax Bill this week. It provides for tax increases totalling \$2 billions, which is \$8 billions less than the Treasury requested.

The Senate Committee on Territories has reported its unanimous approval of legislation authorising President Roosevelt to declare the Philippines independent as soon as they are liberated from Japanese control, and to negotiate for the acquisition of bases.

them are seven deputies of the moderate Right, five Radicals, five Socialists, and three Communists. The proportions correspond to the composition of the last French Chamber. One might argue that the Assembly at large ought to reflect more closely the relation of forces in that Chamber, and that former deputies are entitled to more than a quarter of the seats. But how far the former relation of political forces is valid in France to-day nobody can say. The political parties also have representatives among the forty deputies who derive their mandates from the Conseil de Résistance in France. The Résistance is represented by eleven delegates of the parties and by twenty-four members of purely Gaullist organisations (Combat, Franc Tireur, Ceux de la Résistance, etc.), as well as by four trade unionists. One may perhaps doubt whether the influence of Gaullist organisations inside the Résistance is really twice as large as the influence of all the parties together. On balance the composition of the Assembly allows for the most complicated arithmetical manipulations, which are all eventually likely to result in a Gaullist majority. It would be difficult to prove that the Assembly is fully representative of French opinion, and equally difficult to prove that it is not.

The Third Republic?

There was an equivocal note in the first political statements made in the Consultative Assembly. General de Gaulle spoke about the error committed by those "who fancy that France, once liberated, would regain the same political shape as before." That the experience of the old parliamentary see-saw which allowed no stable Government in France was unhappy, and that the French parliamentary system will need thorough reform to become efficient, no Frenchman can be inclined to deny. But the real question which underlies the discussion is whether the Third Republic ought to be improved and reformed, without its fundamental principles being thrown overboard, or treated as an *ancien régime*, to which there should be no return.

General de Gaulle's statement to the Assembly, for all its vagueness, betrayed his anti-parliamentary bias. He was most emphatic about the "means to govern with enough strength and continuity to impose the supreme power of the state upon everybody"; and his speech contained a somewhat slighting reference to those members of the Consultative Assembly who belonged to the milieu of the *anciens systèmes*, but who, he hoped, would nevertheless help to build a new system. Yet, at the same time, the General's speech contained so many appeals to French democratic tradition that, to some of his listeners, he must have appeared for a moment almost as the General Monk of the Third Republic.

Meanwhile, the status of the Consultative Assembly is such as to give rise to apprehension. The Assembly can meet only for one weekly session at two monthly intervals. Otherwise it can be convened only on the demand of two-thirds of its members (Article 21). Only Budget estimates and state loans are obliged to be submitted to the Assembly; rejection by the Assembly puts the National

Committee merely "under the obligation to reconsider" the estimates (Article 18). Even as a purely consultative body the Assembly has been given an unusually modest rôle. Napoleon used to say that "the constitutional limitations of the executive power ought to be written as shortly and obscurely as possible"; the author of the decree on the Algiers Assembly has preferred not to insert any constitutional limitations at all.

The Proper Use of Purging

The other great issue which has overshadowed the first days of the Consultative Assembly is the *épuration*, the purge. The deputies from France have given vent to their disappointment at seeing Vichy men still in responsible positions in North Africa. Their feeling against opportunist converts to the Allied cause is extremely strong; and it is because of that feeling that M. Charles Vallin, former Vice-President of the *Croix de Feu*, who joined the Gaullist movement in 1942, has been compelled to resign from the Assembly. (The decree on the Assembly says that "no deputy who, on July 10, 1940, voted for Pétain's plenary powers can be elected to it.") Similarly, the campaign against Vichy's former Minister of Internal Affairs, M. Pucheu, has assumed a very sharp form. The demand has been voiced that Pucheu, as well as other prominent ex-Vichy men, should be condemned to death for acts of treachery. Meantime, a recent decree has extended the powers of the military tribunals in order to enable them to deal with similar cases. A number of very high officials, police officers and public prosecutors have recently been dismissed from their posts.

The purge has now reached a critical point. The surprising thing is that, after so many months, Vichy men should still hold so many responsible posts in North Africa. In the Government departments, where weeding out is essential and urgent, it has been proceeding slowly so far; and it is only right and expedient that it should be speeded up and carried out thoroughly. On the other hand, the campaign for victims has grown disturbingly vociferous and violent. The demand for death sentences against Vichy men threatens to create a demoralising atmosphere of terror, where only justice is needed. And there is also the danger that, instead of a radical but calm overhaul of the administration, the campaign may degenerate into a hysterical hunting of individual scapegoats. This might still "popular anger" without really cleansing the Augean stables of the *Révolution Nationale*. It is perhaps significant in this connection that the Communists who, until recently, headed this campaign have now adopted a much more moderate attitude, and it is to be hoped that the Consultative Assembly will tackle the problem of the purge in the right, reasonable, sober and useful way.

Last week's session of the Assembly was interrupted because not all its members had managed to arrive at Algiers in time. On its resumption this week it found that the agenda had, in the meantime, been changed. The original agenda provided for a discussion on the election of a Provisional Government on French soil, and on the Budget. Now the Assembly will be asked to discuss the international situation of France before all other issues.

Egypt's Financial Position

(By OUR CAIRO CORRESPONDENT)

By far the greatest factor in Egypt's wartime prosperity is the country's extraordinarily favourable balance of payments. Semi-official computations put the net balance at over £E55 million for 1941; the assessment of the 1942 balance has not been completed, but there is no doubt that the figure will be appreciably higher despite a further sharp increase in the trade import surplus.

These figures should be compared with those for the country's foreign trade:

	Exports £E	Imports £E
1937	39,759,066	38,038,098
1938	29,342,485	36,934,373
1939	34,831,000	34,091,000
1940	28,322,000	31,377,000
1941	22,611,997	33,127,335

It should be remembered that during the years immediately before the war the balance of payments showed a distinct

deficit, owing to the flight of foreign capital. Moreover, the greatest contribution to the present favourable balance of payments has been the expenditure of the British forces in Egypt, estimated at £E63,400,000 in 1941 and at over £E100 million (including the expenditure of the American forces) in 1942. It has been possible for Egypt to take full advantage of this expenditure, thanks to the exchange control, the stoppage on dividend payments to Continental European holders of Egyptian securities and the almost complete cessation of foreign travel.

These wartime developments are reflected in the increase in purchasing power:—

CURRENT AND DEPOSIT ACCOUNTS
(£1,000)

Total	33,092	45,750	59,163	86,053‡
Less 10 per cent. of current accounts	3,655	4,887	7,745	10,867
Net total	29,437	40,863	51,418	75,186
Total purchasing power	84,810	108,052	150,022	206,133

† These figures include notes which are circulating in the Sudan and perhaps, to a small extent, also in Eritrea and Abyssinia.

‡ Currency notes are not included, since their value is represented in the Government balance at the National Bank of Egypt.

During the first half of 1943, this purchasing power increased at a faster rate than previously. On July 31st, the note circulation stood at £E89 million.

In the absence of a firm anti-inflationist policy, the phenomenal increase in the purchasing power of a semi-isolated country, whose production has not expanded similarly, has resulted in a very sharp rise in the cost of living. The index for July, 1943, was 242.

Anti-Inflation Steps

Until the middle of 1943, the Government had not taken any energetic steps except in the case of cereals, first, because it had not gauged accurately the perils ahead, and, secondly, because the owners of the instruments of production have an overwhelming representation in Parliament. With the steady deterioration in the situation, and the spreading discontent among the middle classes, a stronger line was adopted, partly as a result of the leadership of the Middle East Supply Centre. To-day, the Government's main preoccupation is probably the fight against the excessive cost of living. Up to September, 1943, only kerosene and sugar had been rationed, and quite liberally at that, but oil and tea have since been added to the list. Price control has been extended, and is more rigorously en-

forced. The profits from the manufacture and distribution of several important articles have been limited. Hoarding is more severely prosecuted. This policy has met with a fair measure of success, but some of the credit for it must go to the Allied victories which have restored confidence in the currency, and brought nearer the restoration of international trade, thus depriving speculators of two of their main stimulants. The price of sterling gold coins declined within a few months from PT 580 to PT 445, and, for a time, minimum prices had to be introduced on the Stock Exchange to avert a panic.

There has, however, been a very notable exception in the downward movement of prices. For the new cotton crop, the Government has raised its purchasing price from 25 to 30 tallars for f.g.f. Griza 7 and from 20 to 24 tallars for f.g.f. Uppers. Although last season's exports totalled only 2,070,095 cantars, out of a very curtailed crop of 4,232,787 cantars, against 4,609,473 cantars for 1941-42, and about 7½-8½ millions in normal seasons, domestic consumption increased only from 843,630 cantars in 1941-42 to 889,566 cantars in 1942-43. The official reason for the rise in the official price is the need for compensating growers for the stabilisation of the cereals price since 1942.

As the accepted technique of rationing, price-fixing, heavy taxation and enforced savings could not be carried far enough in Egypt, owing to the inadequate administrative organisation, the enormous differences in standards of living, and the opposition of the ruling class, the Government has been repeatedly advised to resort to "sterile" borrowing in order to absorb at least part of the excess liquid funds. By the end of the fourth year of war, however, the advice had not yet been followed. On the contrary, the growing Budget surpluses have been used to refund prematurely part of the moderate sums that were borrowed to finance the 1941 and 1942 cotton crops.

The new Minister of Finance, Amin Osma Pasha, has now come forward with a plan to refund the 3 per cent guaranteed debt, the 3½ per cent and 4 per cent Egyptian Tribute, the 4½ and 4 per cent Cotton Loans, totalling £E11,587,000, and the conversion of the 4 per cent Unified and 3½ per cent Preference Sterling perpetual debts, totalling £85,884,440, into a single 3½ per cent Loan M.I.E. payable in 30 years. At present, out of the £85,884,440, £32 millions are held abroad; £14 millions in Great Britain; £13 millions by the General Reserve of the State; £7 millions by the Postal Savings Banks; and £14 millions by the issue department of the National Bank. On the eve of the first world war, four-fifths of Egypt's national debt was held abroad. It appears that the repatriation of this debt, which began then, will be brought to a satisfactory conclusion by the end of the present war. It is not yet clear whether, in order to absorb some of the excess liquid funds, borrowing will be carried beyond the refunding and conversion needs described above.

The requisitioning by the British Government of the £14 millions of Egyptian State Funds held in Great Britain will reduce by that amount the very large sterling sums which have accumulated to Egypt's credit since the beginning of the war. On July 31, 1943, the banking and issue departments of the National Bank held between them £E195,638,283 of securities which, except for a few millions, were all British. It is the hope of enlightened Egyptian leaders that a rational use will be made of these credits for the post-war development of the country, and that they will not be squandered on the luxury purchases and in the speculation which marked the period after 1918. As far as the state is concerned, the large Budget surpluses since 1941 have been used to increase the General Reserve from which will be financed some of the extensive renewals of equipment needed after the wear and tear of the war, as well as the ambitious post-war economic and social programme.

Eire's Wheat Supplies

[FROM OUR DUBLIN CORRESPONDENT]

October 25th.

The position of wheat in the area tilled by Irish farmers has been one of economic policy since the outbreak of France and twenty farmer was compelled to till 12½ per cent abroad. Of this in 1941, this percentage was increased to twenty come from in 1943 to 25, and in 1944 it will be 37½ as a farmer tilled this amount he was

deemed to have observed the law. The growing of no particular crop was required, but wheat was encouraged by a satisfactory guaranteed price. The area under wheat increased from 255,000 acres in 1939 to 574,000 acres in 1942. The preliminary estimate of crop areas for the present year indicates that, although the total area tilled has increased by 30,000 acres, the area under wheat has decreased by 67,800 acres, or 11.8 per cent. The area under potatoes has also decreased by 20,000 acres, or 4.8 per cent. While it is probable that these estimates are slightly exaggerated, there is no doubt that the food situation has deteriorated. The harvest has not been very good and yields are probably below average. There is no possibility of raising the percentage of wheat extraction in milling, because the present extraction is already 100 per cent—to the disapproval of some dietetic experts, who state that it is 15 per cent too high. Although it is possible for some barley to be added to bread next year, it still remains imperative that the production of wheat should be increased.

Higher Wheat Price

With this object in view the price of wheat in the coming season has been raised from 50s. to 55s. a barrel. When allowance is made for the scheme of fertiliser credits, this comes to 57s. 6d. a barrel. Experience proves that a high price is not in itself enough to encourage Irish farmers to grow wheat in the quantities required. The acreage necessary to enable Eire to dispense with imports of wheat is 700,000, and it is doubtful if this target can be reached. It certainly could not be reached by the stimulus of a high guaranteed price. Wheat-growing is not traditional with the majority of farmers in the south and west. Both soil and climate are more naturally favourable to oats and potatoes. Wheat is believed to be wasteful of the fertility of the land, and it suffers more than other crops from the risks and uncertainties of the wet and capricious Irish climate. The Government has therefore ordered that every farmer must, in the coming season, sow a minimum area of wheat, varying from one-tenth of his holding in some counties to one twenty-fifth in others. A similar requirement in respect of potatoes might be desirable, but it has not been imposed.

The production of wheat has therefore been made compulsory. There is a tendency in some quarters to blame farmers for the shortage of wheat, but such blame is quite unjustified. All they were required to do was to till a certain portion of their land without any reference to the production of any particular crop. They are perhaps more to be blamed for withholding food from the market in order to feed it to livestock. Doubtless the new order will increase the acreage under wheat next year, but it is doubtful whether the volume of wheat will be proportionally increased in view of the extension of cultivation to less fertile land and the shortage of fertilisers and machinery. Any failure in the programme of wheat production will have the most serious consequences. At present, the total space available in the few Irish ships that have survived the risks of wartime navigation is utilised in transporting wheat from America, and any further decrease in the volume of Irish tonnage, pending next year's harvest, would expose the country to a dangerous shortage of bread.

Raw Material Shortage

The necessity of devoting all available shipping space to wheat has increased the embarrassments of Irish manufacturers who require supplies of raw materials from overseas. Although imports of such raw materials have been dwindling, especially since the United States entered the war, small but useful quantities of cotton yarns, cotton piece goods, paper, paper pulp, tobacco leaf, raw sugar, materials for paint and polish, chemicals and drugs have continued to arrive. If shipping space cannot be found for these articles, unemployment will be inevitable in many industries, for example, the hosiery, weaving, shirt-making, tobacco and paper industries. New ships are, for all practical purposes, unobtainable, and the present exigent and depleted tonnage is therefore a vitally important lifeline. The deliverance of Eire from this perilous position depends upon the exertions of her farmers. It is devoutly to be hoped that their labour will be helped by a favourable season and an abundant harvest. Anything in the nature of a widespread failure of crops would be a disaster comparable in magnitude only to the Great Irish Famine, now approaching its centenary year. If such a failure were to take place, the "hungry forties" would become a grim reality rather than an unhappy memory.

Each Day's March

nearer Victory and Peace increases the importance of the Trade and Technical Press, which includes no group of journals more influential than those published by the House of Benn. A glance at the list below reveals at once their significance for peaceful purposes as well as their contribution to the war effort:

Russia at War

Marshal and Gensec

ON September 11th *The Economist* published an imaginary chapter from the book on "Russia at War" that a future Russian historian might write. The subject of that chapter was the revival of the old ways, and, in particular, the Holy Synod. Another such chapter, a little later in the volume, might well deal with Marshal Stalin's speech last Saturday, on the twenty-sixth anniversary of the Russian Revolution. It would run something like this: "On the eve of the twenty-sixth anniversary of the Revolution, Marshal Stalin was awarded the Order of Suvorov—¹ for correct leadership of the operations of the Red Army. The Order of Suvorov was introduced in the course of the war; and it was a token of Russia's reconciliation with the past, a tribute to the war lord of the old Empire. On the evening of the anniversary, Stalin, as usual, appeared before the Moscow Soviet to deliver an address. In the past he had always spoken to the Soviet in his capacity as Party leader. This time he appeared in his Marshal's uniform. He wore epaulettes embroidered with gold, and stars adorned with diamonds and jewels.

"To the older members of the Soviet, this must have been an unfamiliar and exciting sight. They probably remembered Lenin in the workman's cap that he would never change for an ordinary hat; the dress of the old leader had symbolised his ideological outlook—he was the spokesman of the proletariat. They must also have remembered Stalin himself in his commissar's cap or his high fur hat; he, too, had remained true to his origin, and dressed in a modest and workmanlike way. The anniversary audiences in the Moscow Soviet changed from year to year. Some of the veterans of the Revolution had died a natural death; many more had fallen victims to the purges. But, through all these changes, the members of the Moscow Soviet still remained Bolsheviks, Russia's Jacobins, the makers of a revolution and the builders of a new order. Makers of revolutions sometimes attach much importance to outward appearances, dressing to distinguish themselves sharply from the 'aristocrats' and upholders of the old régime. So dressed the Roundheads, so the Jacobins and so the Bolsheviks, too. And so dressed Stalin throughout the long years during which he stood at the helm of the Party.

Bolshevism in Uniform

"Now for the first time he was appearing as the Marshal, in his shining uniform, and with the glory of unparalleled victories. Shortly before the Moscow Soviet gathered for the celebration, loudspeakers in every Moscow street had announced the capture of Kiev by the Red Army.

"In the evening fireworks in profusion and salvoes of gunshots had greeted the victory. In the general mood of triumph and enthusiasm the new military rank of the old Gensec (General Secretary of the Party) was very real; and some of the Bolsheviks present must have been strangely

affected. War seemed to have relegated the Party to the background. The people, they might have pondered, were hailing the Army, as if to forget that the Army, too, was the Party's creation. New names, the names of the young Marshals and Generals, never prominent in the Party, were now on everybody's lips; their pictures on post-cards were sold at all kiosks. Everything seemed to be overshadowed by the passion for the Army, its deeds, its ways, and its modes. Even the Gensec seemed now to pay little attention to the Party. It was for the Army that he spoke almost daily in his Orders, and showered on it praises of which he was never so lavish to the Party. Now he had come to address even the Moscow Soviet in his new military capacity.

"Yet, when Stalin spoke, they all recognised in him the old Gensec. His manner was as unassuming as ever, his speech was, as usual, somewhat colourless, but businesslike; it was drily that he announced that 'in the course of the past year . . . nearly one million square kilometres of territory, almost two-thirds of the enemy-occupied land, had been liberated.' He went on to speak of the 'behests of the great Lenin.' He made no single reference to Suvorov, Kutuzov or the great Russian traditions of which there had been so much talking and writing. He was reporting on the war, but he spoke in the same accents with which he might have addressed the seventeenth or eighteenth Party conference before the war. He paid his tribute to the civilian population which, by its sustained and self-sacrificing effort, was winning the war no less than the Army. He praised the workers, first of all, the workers who, after the evacuation of the industries from the west, managed to run the war factories and give the Red Army superiority in arms. He turned to the peasantry, and laid stress on the role of collective farming in keeping the Army and the people supplied with bread. He briefly remarked on the war effort of the intelligentsia. He pointed to the equality and friendship of all—the Soviet peoples, a fundamental principle of the Revolution. As he went on he spoke more and more frequently, and with particular piety, of Lenin, his principles and his party. Finally, the speech became a vigorous vindication of the Revolution and of the Socialist State.

"As in the years of peaceful construction so in the days of war, the leading and guiding force has been the Party of Lenin. No other party has ever enjoyed . . . such prestige. The Party . . . the inspirer and organiser . . . Herein lies the source of the strength of our state. . . .

"The Marshal was making it quite clear that he was still the Gensec of the old days. He turned to the tasks of reconstruction, described the grim devastation done by the enemy, promised punishment to the war criminals, and proclaimed again his Socialist faith:

"The lessons of the war show that the Soviet system is not only the best form of organising the economic and cultural development of the country in the years of peaceful construction, but also the best form . . . in wartime.

"The rest of the Marshal's speech must have had an equally encouraging effect on his Party listeners. Russia lived during those months in impatient expectation of the 'Second Front in the West.' For weeks on end the Russian press had argued that the Western Allies were not pulling their full weight. And now the Marshal told them that what the Allies had done so far—in the Mediterranean and in the air war over Germany—was 'something in the nature of a Second Front,' and promised that the 'real Second Front . . . was not far off.' Russia's long agony was coming to a close; the Marshal already spoke about freeing Lithuania, Latvia and Estonia, the outlying republics that before 1941 had not had the time after their occupation to become properly assimilated in the Soviet Union.

"The writers of that period used the word 'monolithic' to describe the ideological outlook of Russia. The description was only partly true. Beneath the uniform surface there was a variety of trends. The war had brought to the surface the trend towards national tradition, the Army and even the Church, and Marshal Stalin encouraged and stimulated it. But at the same time he sought to counter-weight it by upholding inside Russia the more recent tradition of the Bolshevik Revolution; and it was for this that his speech on the twenty-sixth anniversary of the Revolution was so remarkable."

THE BUSINESS WORLD

The Newspaper Industry

THE business of producing newspapers for sale to hundreds of thousands or millions of readers every day is one of the large industries of the country. But it is also one that is an exception to nearly every rule. Its product, for example, is sold well below its cost of production. The overhead costs of the industry are not very heavy, but it has a large "overhead income" in the form of advertising revenue. The industry is highly competitive, but the object of the competition is not solely—at times it has seemed to be not mainly—the attainment of maximum profits. Other criteria, such as political influence and even personal power, enter into the equation. The net effect of these remarkable circumstances is to produce a lively time for newspapermen, but an erratic living for those who depend upon newspaper profits. The Stock Exchange has always regarded newspaper shares as being well within the speculative class, and this judgment was only confirmed by the events of the ten years before the war, when the costs of "buying circulation," whether by armies of canvassers, through insurance, or presentation sets of the works of Charles Dickens, were much heavier than ever before.

A newspaper's dominant asset is its goodwill, but in a modern press context the term "goodwill" has a peculiar meaning. It refers not so much to an established connection among readers, as to the ability to transmute that kind of "custom" into revenue from advertisers, which will more than suffice to offset the expense of securing it by selling newspapers for less than they cost. The process of building up a large circulation newspaper, in pre-war circumstances, involved "development expenditures" running into millions. Although at least one big group had successfully risen from near the bottom to very near the top in the inter-war years, it seemed likely that the large units already established in the field would be left to fight the matter out between themselves. But it had become clear that, in the popular newspaper world, "the same arts that do gain" a circulation "must it maintain," and that, for each newspaper, every new reader secured, or every old reader held, above a certain minimum figure, is liable to make a disproportionately large contribution to running costs.

Finally, for an industry in which goodwill—which, after all, is an intangible and fluctuating asset, however great its earning power—counts for so much, the capital structure of many large newspaper publishing groups is highly geared. Fixed interest issues like debenture and preference stocks bear a distinctly high ratio to equity stocks, and in some instances pre-equity obligations are further swollen by guarantees given to property-owning or newsprint-producing subsidiaries of the main holding companies. Consequently, while in pre-war days the larger newspaper companies, operating in an expanding market both for readers and advertising, paid satisfactory and sometimes handsome dividends, the staid kind of investor, preferring penny plain to twopence coloured, tended, on the whole, to give their shares a fairly wide berth.

During the war, the financial experience of the press has been determined by factors unlike those of any other industry. The newspapers, in the unexpected company of the brewers and tobacco manufacturers, have been officially treated as purveyors of national morale. True, their supplies of essential material—newsprint—have been cut far more drastically than those of either hops or tobacco leaf. With a ration of approximately one-fifth of pre-war supplies, indeed, the industry has approximated more closely to the position of some of the "concentrated" consumers' industries, but with two essential differences, which together have gone far to give it the best of both worlds. In the first place, the authorities have made no attempt to apply concentration to the press, either directly or by depriving it of the minimum labour force necessary to carry on. In the second place, the press has been able largely to pass on the burden of reduced supplies directly to

readers, who have paid the pre-war price for papers greatly reduced in size, and to advertisers, who have submitted more or less cheerfully to significantly increased charges for the limited amount of space available. The exact increase in newspaper advertising rates is difficult to determine. The following table, however, gives a reasonably accurate picture for a number of London daily newspapers, and suggests that, although the increase is greatest in the case of newspapers of largest circulation, it has been broadly of the order of 100 per cent—or rather more, in some instances, if allowance is made for the reduction in width of the wartime column.

paper preparation and publication has, at the same time, risen steeply, but in terms of total expenses this tendency has been more than offset by the striking reduction in the physical turnover of the industry. Thus, the total wages bill has tended to fall, because releases of staff for national service have more than counter-balanced the effect of salary rises and the payment of a moderate war bonus. The cost of newsprint has approximately trebled. But the size of the popular penny dailies is now rather less than, say, one-quarter of the pre-war figure. But war makes good news, and not only have readers been prepared to pay the peacetime price for a wartime product, but some newspapers have had a demand from would-be new subscribers which they have, until recently, been unable completely to satisfy. At the same time, they have been rationing space to advertisers, under the ægis of an official control which has insisted that specified maximum ratios of advertising to editorial matter shall not be exceeded.

Recovery in Profits

The upshot of all this has been that newspaper profits—which had, on the whole, been tending to fall in the couple of years immediately before the war, and seemed likely to be set back further at its outset—have shown a very considerable recovery. This is exemplified by the results for some of the leading groups given in the table at the foot of this page. The precise trend of newspaper profits is difficult to determine from published accounts, partly because the companies involved are usually holding concerns whose disclosed earnings figures do not necessarily reflect the full rise in the profits of subsidiaries, and partly because the published totals are given after various internal provisions (and sometimes after deduction of taxation) which almost certainly are greater today than in peacetime.

Even after all such allowance for under-disclosure, however, it will be seen that, with few exceptions, earnings for the last complete war year were higher than in the last year of peace, and in some instances exceeded those of the best peacetime year. The recovery from the worst year of the war is very striking. In some cases, dividends are lower than in the last pre-war year, but in others they significantly exceed the pre-war figure. The presumption is, however, that, allowing for the increased scale of internal adjustment as well as the more obvious ploughing back of disclosed profits, financial policy is appreciably more conservative than in pre-war times. The yields on representative newspaper equities, which are shown in the last column of the table, are still, on the whole, above rather than below the average for seasoned industrial shares generally, despite the upward tendency of newspaper share prices on the Stock Exchange in the period immediately before the present general setback to market activity. The "expected yield" in some instances is higher than the figures given in the table, which are based on the last complete year's dividend, because the market is looking for a further moderate increase in published earnings and dividends when results for the latest period of operation are available.

On the whole, the investor does not appear to have abandoned, even under wartime conditions, his traditionally conservative approach to newspaper shares. And on any reasonable estimate of post-war probabilities, his caution does not seem wholly out of place. The industry, for obvious

reasons, is likely to be among those where competition, rather than any form of state control, is likely to prevail after the war. It is hard to imagine that, in Great Britain of all countries, the State will ever attempt to impose central control, financial or otherwise, on the national press. But, despite the growth of large financial units in the industry in the last three decades, and the effective bar on new entrants which the heavy cost of establishing new papers imposes, newspaper production, as an industry, has never lent itself readily to cartelisation. Certain attempts are being made to continue into the post-war period some of the co-operative, or at least non-competitive, practices that have been forced upon the industry by the war. These attempts may succeed for a time. They may outlast the period of transition from war to peace. But few who know Fleet Street will have much confidence that they will last indefinitely. Indeed, competition among the large circulation papers may well be more rather than less keen after the war, and it must, from the nature of things, be competition in service to the reader and, through him, the advertiser. It would be wholly contrary to previous experience if advertising rates, having been raised during the war, were to be reduced appreciably when the war was over. If those in control of the popular newspapers live up to their good intentions and continue to abjure the less rational methods of circulation-buying (and that is a matter on which individual investors may have their own opinion) "competition in service" is likely to mean only one thing—an increased number of features of the non-news type and larger papers. And, given anything like the pre-war number of pages in the average newspaper, costs of newsprint, printing and salaries will, almost inevitably, be higher than in pre-war days.

All in all, the link between newspaper profits and advertising may be found to have been drawn closer, if anything, by the events of the war. There is still considerable scope, over the long period, for a significant further increase in the quantum of press advertising. Experience both in this country and elsewhere seems to show that the volume of advertising grows more than in proportion to the national income—this is natural, since a higher national income means a greater fund of purchasing power to be spent in directions where the consumer has a choice that can be influenced—and there is no new competitor in sight for the advertiser's money who seems likely substantially to reduce the newspapers' share. But whether the volume of advertising to be secured is static or rising, the connection between advertising and profits involves the large-circulation newspaper-owning companies in a race without a finishing post, in which the positions of the first four or five runners may frequently change, and the leaders themselves are never entirely satisfied with their turn of speed. Within comparatively recent years, leadership in circulation has changed more than once, and apparent outsiders have come up to leading positions in the field. The war, whatever else it may have done, has not changed these conditions fundamentally. A recent increase of approximately 11 per cent in paper supplies has been followed by a proportionate rise in the circulation of one or two newspapers, but no rise at all in that of some others. Some papers, it would appear, have been bought only *faute de mieux*, and the increased supplies now available of the papers the public wants have led to a transfer. Such conditions may make for exciting and colourful events in Fleet Street, but they are not the best recommendation of newspaper shares to the conservative type of investor.

Growth of the UKCC

If evidence were needed of the increasing scale of activities of the United Kingdom Commercial Corporation it is provided in the recently published report from the Committee of Public Accounts. The closing passages of that report are devoted to the Corporation. After summarising the history of the UKCC, it is pointed out that "very large sums have now been issued to the Corporation and its subsidiaries out of monies provided by Parliament." The Committee cannot admit that "expenditure of the nature and magnitude now being incurred, wholly financed from public funds, should be entirely exempt from control and examination on behalf of Parliament." Representations on this score met with partial success, as a result of which the Committee were given confidential particulars of the work of the Corporation and the following arrangements were made:

- The Comptroller and Auditor General will be furnished with copies of the audited accounts of the UKCC and its subsidiaries and will be granted access to their books.
- The Treasury Accounting Officer, in appearing before the Public Accounts Committee in connection with the vote of credit providing funds for the Corporation, will be accompanied by the chairman and such other members of the board as are necessary to enable the committee to have a full explanation of the transactions undertaken by the Corporation with the public funds at their disposal.

The remarks of the Committee imply two things: that the scale of the UKCC's operations has greatly increased and that, concurrently with their growth, they have become less commercial and have had to depend on heavy direct subsidies. Indeed, the Committee "do not think that the main functions and objects of the Corporation can now be correctly described as commercial." It is questionable whether, despite its name, the Corporation can ever have been regarded as a "commercial" proposition. It was conceived in 1940 in order to promote British trade with certain neutral countries, chiefly in the Balkans, as a rather belated answer to the German economic *Drang nach Osten* which had by then put the Balkans safely "in the bag." From the start, the UKCC was regarded as part of the armoury of the Ministry of Economic Warfare. It was neither intended nor expected to engage in directly profitable commercial operations. Its nearest approach to commercialisation occurred during the period of the export campaign directed to obtaining the foreign exchange resources which, in those pre-Lend-Lease days, were still a high priority article of war. The main export drive was to South America, but it exhausted itself quickly, partly because the need for foreign exchange diminished after the Lend-Lease Act was passed, partly because Lend-Lease aid carried with it demands for self-restraint on British exporters' part, especially in the South American markets and, finally, for more urgent reasons, such as the shortage of shipping and of exportable goods.

The third phase in the UKCC's development—all these phases were part of a process of gradual evolution in which the lines of demarcation were blurred and a great deal of overlapping occurred—provided a complete jump away from commercialisation. It was the phase of pre-emption, during which the UKCC competed actively against the enemy in neutral markets for goods which the Allies had good reason to see denied to their opponents. This was the period of open and flagrant competition with German buyers in such countries as Turkey, Spain and Portugal, when the UKCC became a more positive part of the economic war waged on the enemy. Like all warlike operations, it was a costly form of activity. It was symbolised by such deals as bidding up the price of Portuguese wolfram from £300 to £6,000 a ton and by the more comic episode when the agents of the UKCC forestalled those of the German Government in clearing Spanish and Portuguese shops of their stocks of warm woollen clothing in the harsh winter of 1941-42 when Germany was scouring Europe for clothes to keep her soldiers warm on the Russian front. Pre-emption is, by definition, uneconomic in terms of immediate profit and loss, but though this type of activity may have been responsible for some of the UKCC's biggest apparent losses, it was not its least useful contribution to the war effort of the Allies.

The main expansion in the UKCC's operations, however, occurred with its tackling of the twin tasks of supply to the Middle East and, via the Middle East, to Russia. After the

collapse of France, the entry of Italy into the war and the virtual closing of the Mediterranean in 1940, the problem of supply to the Middle East acquired new magnitude and new urgency. The trade between the Middle East and Axis countries was gradually severed, the process being completed after the Allied occupation of Syria, Iraq and Iran. The economic foundations of these large and vital areas had begun to slip and required immediate underpinning. The most urgent need was for foodstuffs to repair the shortages caused by bad harvests, by hoarding and by the increased needs of large numbers of occupying Allied troops. Fertilisers had to be imported to increase local production of cereals; industry had to be fed with raw materials. These new tasks had to be tackled at a time when shipping was being seriously reduced by enemy sinkings, and when the efficiency of the available tonnage was reduced by the need to make the long voyage round the Cape. The immediate need was to economise shipping, and this could best be achieved by centralising the requirements of these countries and satisfying them in accordance with a carefully thought-out plan which, by making Egypt the main redistributive centre, would use local shipping and transport facilities to the greatest possible extent and so reduce the burden falling on the ocean-going tonnage. The economic general staff which directed this vast programme of supply was the Middle East Supply Centre with the UKCC as its admirably adapted and, by then, well-tried, operative organisation.

In certain bulk trades such as shipments of wheat, sugar and fertilisers the UKCC exercises an effective monopoly in these countries. Supplies are imported to the main clearing centres and then redistributed by the UKCC, which sells direct to the Governments concerned. These articles are subject to strict rationing in all the Middle East countries, and the Governments in question control their further redistribution until the point at which they reach the consumers. Other essential goods such as clothing and various kinds of foodstuffs are not bought in bulk direct by the UKCC but are handled as far as possible through private enterprise, the UKCC intervening only where its services are required and then as far as possible using the normal trade channels. The trade in non-essential goods has largely disappeared, though import permits are granted for a number of articles, such as beer, for which, however, no shipping priority is provided. Here again, the UKCC comes into the picture if required, but leaves the problem of redistribution wholly to private traders. The main concern of the MESC has been to economise shipping in satisfying the essential needs of the countries for which it is responsible. Consequently there has been considerable emphasis on attempts to increase the self-sufficiency of this area. To increase the productivity of local agriculture by importing fertilisers has meant an economy of shipping space compared with the alternative of importing the grain. To serve the same object, ambitious irrigation projects have been undertaken. The UKCC has also become a clearing centre for the surpluses of Middle East countries, encouraging the trade between these countries as another contribution to solving the problem of economy of imports and shipping.

A tremendous extension in the work of the UKCC in the Middle East followed the German attack on Russia. The Middle East route to Russia at once became one of the main arteries of supply to the new ally, and the UKCC was put in charge of organising this enormous task. It meant in the first place a vast programme of road building and railway extension and the import of a fleet of trucks and rolling stock. Then the stream of supplies of war materials, foodstuffs, clothing, chemicals, began to flow over the new route. This flow of goods is controlled by the Allied Supplies Executive in collaboration with the Soviet Trade Delegation in London, but the bulk of it is handled by the UKCC. In supplying the vast needs of the Russian armies through this route every attempt has been again made to economise shipping. This led to the development of new industries in the Middle East, a striking example being the setting up of a substantial leather tanning and boot industry in Iran, which, with supplies of hide from East Africa and tanning material from Turkey, is now supplying millions of pairs of army boots for Russia. There has also been considerable industrial development in Palestine, from chemicals and diamond polishing to light engineering, in which the UKCC has played a prominent part.

What of the future of this organisation? In its present form, it is a product of war and of economic warfare. It will in the course of its belligerent activities have acquired a strong political flavour which may not make it the most palatable instrument of peace-time commerce. The possibility of its adaptation to peace trading must await the answer to fundamental questions about the character of the post-war merchanting system of this country. If it is decided

to continue inter-Governmental bulk trading in certain essential commodities, the UKCC may be found useful in filling the rôle of a British Arcos. If the organisation is disbanded, its personnel, nine-tenths of whom consist of merchants borrowed from the trades in which the UKCC deals, will shed no tears, but will return to their various markets enriched by their war-time experience of what can be achieved by centralised planning of foreign trade.

Business Notes

Railways and Civil Aviation

While the shipping companies have been staking out claims for a share in international civil aviation after the war, little has been heard from the railways. This silence is not due to any disinclination to go "off the rails," but to the fact that the railway companies were given authority to "take to the air" as long ago as 1929, and have already achieved a dominating position in inland air transport. During the summer months before the war their associated air companies operated about 70 per cent of the inland route mileage for which licences were issued, and an equal proportion of the railway aircraft mileage on these routes. Since then, the railways have strengthened the position by further acquisitions and amalgamations, so much so that they are now operating all the authorised inland routes, with one exception. Altogether they have contributed some £750,000 to the development of this side-line. The main concerns in which the railways have invested capital are:

Railway Air Services, Ltd.
British and Foreign Aviation, Ltd. (this concern also owns Air Commerce, Ltd., and Olley Air Service, Ltd.)
Channel Islands Airways (owns Jersey Airways and Guernsey Airways).
West Coast Airways Holdings (owns West Coast Air Services, Ltd.).
Isle of Man Air Services, Ltd.
Scottish Airways, Ltd.
Western Isles Airways, Ltd.

Associated with the railway companies in the development of air services are coastal shipping companies, including Coast Lines, Ltd., the Isle of Man Steam Packet Co., Ltd., David McBrayne, Ltd., and the North of Scotland, Orkney and Shetland Steam Navigation Co., Ltd. During the war, inland air transport has been restricted, and the services still permitted are operated by five of the concerns under the general direction of the Associated Airways Joint Committee, on which each of the companies is represented by one of its directors. The few available aircraft in service—some 21 machines—are pooled and their maintenance is under central control to ensure the best use of the limited equipment. Despite wartime restrictions, however, the air services associated with the railway companies operated during the past three years 4 million aircraft miles, carried 163,000 passengers and some 4 million pounds of urgent mail and freight. After the war, it is understood, the railways wish to go further afield and provide air services to the Continent for those who no longer wish to use their ships. There would seem to be very little reason why they should not do so. The co-ordination of different forms of transport is all to the good, and it is evident that the railways have neither the wish nor the power to treat civil aviation as they treated the canals.

Gamblers Getting Out

The weakness of equities, which began to be manifest in the second week of October, gained momentum during

NORANDA MINES LIMITED

DIVIDEND NOTICE

Notice is hereby given that an interim dividend of One Dollar (\$1.00) per share, payable in Canadian funds, has been declared by the Directors of Noranda Mines Limited, payable December 15, 1943, to shareholders of record at the close of business, November 15, 1943.

By Order of the Board,
Toronto, J. R. BRADFELD, Secretary.
November 4, 1943.

the first third of the current month. Every scrap of good news from the war fronts seemed to add to the number of those who wished to take profits or increase their liquidity. The result is, according to the index of *The Financial News*, a fall in value of industrial equities of 2.15 per cent in seven working days and one of virtually 6 per cent in five weeks from the October peak. The index is now back to the level of four months ago. So far as can be judged the falls have been heaviest in the securities which improved most and which gave the lowest yields. This invites the explanation that doubts are arising whether EPT will be removed, or at least whether the authorities will not impose some device for levelling out profits from different types of enterprise. There is, however, no indication that any such thought is the motive for the sales, which seem to arise from a widespread determination on the part of operators, both within the market and among the public, to sell all equities which show a profit. The argument, so far as there is one, is that there are so many uncertainties that it is better to be liquid until the intentions of the authorities are revealed. At the beginning of the fall, some five weeks back, the jobbers were mostly short of stock. Recently they have found the supply coming in with embarrassing speed, and it is due as much to their desire to avoid taking more stock on their books, as to any increase in selling, that the rate of decline has been accentuated. In the middle of this week there was a distinct pause in the selling, which may be the first sign of a turn in the tide. With the general level of equities down some six points per cent in some five weeks, and many shares down twice as much, it is difficult to believe that there will not soon be a substantial number of buyers prepared to back their own estimate of the course of events in the immediate post-war period. In this connection the Prime Minister's Mansion House speech contained at least two matters of interest. He suggested that the war is likely to last considerably longer than some speculators appear to believe, and he created the impression that he is personally more concerned with reconstruction than has hitherto appeared possible.

Store Company Prospects

The recent general fall in equities has not spared the shares of store companies, and although these are in most cases still no lower than they were six months ago, the general level of industrial shares was, according to the figures of *The Actuaries' Investment Index*, still some 3.8 per cent up on that period at the end of last month and has probably not yet lost the whole of that improvement. The one notable exception to the rule in the case of stores is Woolworths, and this is significant, because Woolworths is the one store which, without a more radical departure from peacetime policy than it has yet made, cannot enter the luxury market. True, profit margin may be considerable and the limits placed on the price range have been much relaxed, but it is still not catering for a real luxury trade. In a lesser degree this argument applies to Marks and Spencer. For these stores the progressive limitation of supplies must, it would seem, reduce profits still further for the time being. But when one leaves the field of the chain store and enters that of the department store, there is a possibility that the threatened fall in profits will be delayed even longer than seemed probable six months ago, when the long-term outlook for stores in general was considered in an article in *The Economist* of May 29th. Reports of London companies, relating to periods after the middle of the year, have shown an astonishing power to maintain, or even to increase, gross profits. Turnover in goods must have fallen substantially compared with a year before and the Board of Trade figures of retail trade show a decline in non-food sales of 6.2 per cent for the eight months February to September inclusive, against virtual stability for the preceding twelvemonth. But the London stores have, even

according to that index, been doing relatively better than any others, and most of the quoted securities in the department store group are those of concerns whose main business is in London. It seems to be the case that so far clothes rationing has more and more stimulated people to buy what is expensive rather than what is cheap, in the hope that the expensive article will be more durable than the other. Scarcity of coupons, coupled with a plethora of cash, could scarcely have any other effect. The stores, both those who normally cater for the luxury trade and those which in the past attempted to produce "cheap" imitations of what was considered the real thing, have not been slow to cater for this taste for the costly and are probably making very large profits on all those luxury articles on which the profit margins are not controlled. The short run post-war outlook for the companies appears excellent. In so far as there has been any special selling of stores shares it is, presumably, based on the fact that the average yield is considered too low. At the end of last month it was 3.30 per cent against an average for all industrial equities of 4.35 per cent.

Investments v. TDR

The clearing bank statement for October, which is published in detail in the Records and Statistics section, discloses that Treasury deposit receipts at £1,135 millions—an increase of £90,500,000 over the previous month and the highest figure yet recorded—bid fair to overtake investments, now standing at £1,158,133,000, as the largest item in the banks' assets. Bills discounted registered the substantial decrease of £27,711,000, compared with the September figures and are now at their lowest since last May and £95 millions below the October 1942 figures. The weekly issue of Treasury bills, however, was increased from £90 million to £100 million in the first week of October and remained there until the end of the month. The banks' low holding must, therefore, mean that the discount market is carrying more bills in its own portfolio; this is borne out by the increase of £3,355,000 in money at call. The reduction in bills also reflects the heavy sales effected through the agents of the Bank of England during the latter part of October, when window dressing was in full swing. Advances show a welcome upward tendency, but it is doubtful if this comparatively slight increase can be looked upon as the beginning of a consistent trend. Total assets have now passed the four billion pounds mark. Deposits at £3,812,688,000 exceed the September figures by more than £75 million.

Argentina Repatriates Gold

Indications of an increasing coolness in the relations between Argentina and the United States are not lacking in the financial sphere. Last week came news of the blocking of the dollar assets of the Banco de la Nación and of the Banco de la Provincia de Buenos Ayres, two official Argentine institutions. This week it has been announced that Argentina is withdrawing from the United States the whole of the gold kept earmarked for its account in that country. The amount in question is 850,000,000 pesos, equivalent to £50,000,000, and is the product of the exceptionally large surplus of Argentine exports to the US over imports from that country which has accumulated since the beginning of 1942. The Argentine trade balance for the first eight months of this year showed a surplus of exports of 652,404,000 pesos, compared with 310,063,000 pesos and 237,221,000 pesos in the corresponding periods of 1942 and 1941 respectively. The surplus accruing in the shape of US dollars has apparently been automatically converted into gold and this metal is now being taken home. The other main symbol of Argentina's export surplus has been the volume of sterling accumulating for the most part in the special account in London. There is no provision whereby this sterling can be immediately converted into gold, but it has the protection of a gold clause. The official communiqué issued in Buenos Ayres, with the news that some of this blocked sterling would be used to repatriate sterling debt, gave further information on the size of these blocked sterling funds. On September 16, when the announcement was made, the balance in the Banco Central's special account amounted to £42,800,000, and it was then estimated that the credit would have risen to £55,000,000 by the end of this year, without allowing for the debt repatriation which would mop up some £16,000,000 in the near future and a further £9,000,000 in February, 1944.

Gold Sales in India

The scale of official sales of gold in the Bombay bullion market has recently been increasing, and the policy of the authorities in thus implementing the recommendations of the Gregory Committee on Foodgrain Supplies is now taking clear shape. The Gregory Committee suggested that:

though it would be preferable to supply the cultivator with goods which he needs, whether as producer or consumer (in order to induce him to sell his surplus grain), yet if the supply of these cannot be increased adequately, it would be advisable for the Government to secure supplies of the precious metals for sale to the cultivator.

Official sales of gold in the Bombay market began about a month ago, but it is only during the past fortnight that they have attained any size. The gold is sold through the Reserve Bank, and at present such sales are not being made below a price of Rs. 78 per tola, which is equivalent to £15 12s. per fine ounce. On October 20th the Bombay gold price was Rs. 86/7, and it was at this point that the Reserve Bank's sales began to affect the market. The quotation declined steadily until it reached Rs. 77/13 on Thursday of last week. At this point the official sales of gold ceased and a recovery to Rs. 78/6 occurred. The daily turnover in the Bombay market last week reached 50,000 tolas, or about £300,000, and, as the selling has been provided almost wholly by official quarters, the gold being pumped out into the open market is beginning to reach substantial proportions. The returns of the Reserve Bank make it quite clear that, though the official sales are handled by the Reserve Bank, it is not Reserve Bank gold that is being sold. The only alternative gold available for these official operations is newly mined metal, and it is probable that South African gold is being made available through special arrangement with the British Treasury. If the Government of India were buying such gold, it would pay for it out of the accumulated sterling resources of the Reserve Bank of India, and, in fact, the last three weekly returns received from that institution show a decided diminution in the rate of increase of these sterling assets. By diverting gold in this direction, not only is the problem of India's excessive sterling reserves being attacked—albeit in comparatively modest terms—but gold is being sent up country and may induce much-needed unloading of stored grain.

Second Thoughts in Chemicals

A year ago Mr C. M. Merriam, as chairman of the Association of British Chemical Manufacturers, invited the views of members on these subjects:

Whether it is desirable for membership of a trade association, such as the ABCM, to be compulsory for all firms in the industry; whether such an association should be in a position to enforce its decisions; whether it should exercise control over production and prices.

At this year's annual meeting Mr Merriam reported that the great majority of members were "strongly averse" to compulsory membership of a trade association and granting of compulsory powers. He said no more about the control of production and prices. Indeed, he went much further. It appeared to him not "beyond the bounds

of possibility" that, if an industry receives special help from the Government in the shape of protective tariffs, import quotas, guaranteed prices or in other ways, it may expect some kind of Government control or supervision in order to ensure that assistance is not abused. He therefore advised members of the chemical industry to undertake a thorough overhaul of their firms in order to improve their efficiency; it would be necessary to consider what plant should be scrapped, what new processes adopted, and what additional funds could be allocated to research, to examine the possibilities of co-operative research and marketing, to review export marketing methods, and the education of chemical workers. Clearly, Mr Merriam's second thoughts are different from those that might be inferred from last year's questionnaire. They suggest a significant change in attitude of mind, significant because the tide of public opinion is beginning to grow strongly against restrictive practices.

Steel Survey

On behalf of the combined Steel Committee (a joint committee of the Combined Raw Materials Board and the Combined Production and Resources Board) an Anglo-American mission has made a special survey of the production and use of steel in several of the Dominions, in India, and in the Middle East. The objects of the survey were to ascertain, first, whether lend-lease shipments to these countries, as well as locally produced steel, were used for essential purposes, and, secondly, whether they made the best possible use of their own steel-producing capacity. The mission drew attention in its report to the progress made in the control of steel supplies, but its recommendations suggest that a closer alignment of practice in the Dominions with that in Great Britain and the United States has been found desirable. First, the mission advocates the establishment in Great Britain of a clearing-house of information on the British and American steel controls for the benefit of the Dominions. Secondly, it suggests that the Dominions should report to this organisation any economies they have been able to make. Thirdly, it recommends that, in order to save shipping space and to reduce their steel demands upon Great Britain and the United States, Dominions with surplus capacity might assist in meeting the needs of others. Lastly, it suggests that on the completion of the standardisation of the steel controls in the Dominions steps should be taken to improve the machinery by which their steel requirements are submitted to this country and the United States. The British countries round the shores of the Indian Ocean have greatly increased their metallurgical capacity during the war. It is only common-sense that both their production and their requirements should be regarded as part of the great integrated scheme which it is the duty of the Combined Boards in Washington to manage.

Three Million Tons of Copper

The Copper Development Association, formed ten years ago by the leading Empire copper producers to stimulate the use of copper in industry, has now held its annual meeting. In view of the wartime expansion of the world's copper-producing capacity and the prospect of keen competition from other metals and plastics, the meeting, not unexpectedly, reached the conclusion that after the war the copper industry would require the backing of all the research and development that could be brought to bear. In this work the Association, in co-operation with similar institutions in other countries, including the efficient United States Copper Institute, can play an important part. Copper production has risen steadily since the beginning of this century. In 1900 world production was slightly less than 500,000 metric tons; at the outbreak of the last war it was 1,000,000 tons, and by its close another 500,000 tons had

been added to capacity. In 1939, the world's copper mines were capable of producing close on 2,500,000 tons a year, and at the end of this war their annual productive capacity is likely to exceed 3,000,000 tons. The rapid expansion in supplies during the past four decades is a reflection of the useful properties of copper, amongst which the excellent conductivity of heat and electricity, its resistance to corrosion, and the easiness with which it can be worked, are the most important. In peace copper is used in almost all branches of industry; hitherto the electrical industries have absorbed the greater part of supplies. During the inter-war period, however, the transport industries—with motor cars ranking first—and the building trade made rapid headway as copper consumers, and in the years preceding this war accounted together for over one-quarter of total consumption. Besides the older outlets, these new ones offer scope for further expansion. There are numerous smaller fields in which copper may find opportunities for increased application. Indeed, it is by no means impossible that, within a comparatively short period after the war, world consumption of copper will reach or even exceed 3,000,000 metric tons, especially if copper producers succeed in keeping their prices on a competitive basis. As the production of copper at low cost has been greatly expanded during the war, producers should have the opportunity of meeting this basic condition for expanding consumption.

Mishandled Publicity

At the beginning of last week the chairman of the International Nickel Company of Canada, Mr Robert C. Stanley, made a statement, apparently in Montreal, to the effect that the earnings of the third quarter amounted to 45 cents per common share—compared with 52 cents in each of the two preceding quarters—that the fourth quarter showed no improvement and that it might be necessary to reduce the dividend next year. Under wartime conditions this statement took forty-eight hours to reach the newspapers of this country, and even then only by news services which are not universally taken. On Tuesday last week the price fell three points in Montreal, New York being closed. With the reopening of Wall Street on Wednesday the quotation dropped there two points, but it was not until Thursday that the adjustment took place in London, when the fall was 3½ points. In view of the extensive holdings of these shares in both the UK and the USA, it seems that the most elementary principles of justice should have suggested a simultaneous release of any statement in the three countries. In this particular case, where the statement announces a further sharp fall in net earnings, the procedure adopted appears particularly unfortunate. Since the cat had been let out of the bag by the chairman's statement, it is possible to maintain that the release of the details of the usual quarterly statement lost some of its importance. It is, however, alarming to discover that, although publication was arranged for yesterday, copies of the return were available in London—and actually enjoyed a limited circulation in the market—on Thursday, November 4th. Granted the difficulties of wartime transport, there would appear to be no reason why the chairman's statement should not have accompanied the quarterly report or why arrangements should not have been made for simultaneous release in all three countries. As to the actual figures, trading profit, which had risen until it reached a peak of \$US19,833,000 in the fourth quarter of last year, has fallen quarterly since then, and last quarter dropped over \$US1,500,000 to under \$US16 million. In the first quarter of this year the net profit suffered a fall of \$US850,000, while it was maintained in the second and experienced a further drop of \$US1,030,000 in the third, owing in large measure to the fact that the tax charge fell less rapidly than the gross figure.

Debentures Into Ordinary

A further instance of the repayment of debenture capital by the issue of ordinary shares to existing holders, that of Joshua Hoyle, suggests that there exists a fairly widespread belief that less capital will be required after the war. In this case, as in the others, the offer is made on such terms that the cost of maintaining the dividend is fully covered by the saving in interest and sinking fund. Indeed, in this instance, as the sinking fund is heavy, there is an appreciable margin to spare. But a sinking fund is not just a current expense. It improves the capital structure. Further,

"THE NEXT ITEM IS THE HEATING SYSTEM..."

Fortnightly meetings of a works' Fuel Efficiency Committee

"THAT'S A JOB FOR OUR FUEL WATCHERS"

"Even in a mild season, room heating can run away with a good slice of our fuel. We know from what we've read in the Fuel Efficiency Bulletins that much can be done without making working conditions uncomfortable.

"We are now putting in thermostatic control throughout the factory, but until this is fixed the heating system must be the fuel watchers' job. We know the minimum temperature we need, and it's up to the fuel watchers to keep an eye on the thermometers. The important thing to ram home is this: *If the temperature rises only one degree higher than we need, we may be wasting no less than 5 per cent. of the fuel used.*"

Here are the pointers they gave their fuel watchers:

- Check the room thermometers at least four times in every shift:
- See that doors are not left open needlessly, and that somebody isn't opening windows just to cool the place down:
- To hold back a rising temperature, turn down the radiator valves or switch off the unit heater fans (but do not forget to shut off the unit heater steam as well or else heat will be wasted through the roof):
- Shut off the whole system towards the end of the shift, and put on again 15 minutes before the next shift starts.

Without proper control a works' heating system can be a real fuel waster. If you have not yet put in the thermostatic control, see that your fuel-watching team controls room temperatures. If you need advice, get in touch with the Regional Fuel Efficiency Committee.

Saving is certain through planned Fuel Watching

as the yield on the ordinary shares of Joshua Hoyle is under 5 per cent, it is evident that an increase in dividend is anticipated. Evidently, as soon as the cost of the dividend on the new ordinary capital exceeds the saving on the debenture issue, the prospects of the old ordinary shareholders are damaged by the operation. It is, of course, possible that all three companies, Dorman Long; Richardsons, Westgarth; and Joshua Hoyle, are repaying loan debt in the expectation that they will later be able to borrow more cheaply, but if that is so, the holders of the old equity are paying a high price for a moderate saving unless there is every assurance that a sharp expansion in business is to be looked for. The price is particularly high in the latest case since, after the operation, there will remain only the ordinary shares and a small quantity of short-term notes. Evidently, however, if the company expects to pay smaller dividends than those now current the conversion is an advantage to the old equity holders, and one would normally assume that boards would only engage in such an operation if it would benefit the existing equity. But there is abroad at present a dislike of fixed charges which accumulate arrears during periods of depression, and with this goes a desire to finance companies solely by the issue of ordinary shares. Such an outlook is unlikely to survive even a short period of reasonable prosperity, but at present it undoubtedly exists.

Argentine Estates Prospects

Although the total gross weight production of sugar fell again in 1942, this time very heavily from 28,762 to 15,958 tons, Leach's Argentine Estates suffered a fall in trading profit only from £189,388 to £176,658 for the year to March 31st last. This makes it possible to maintain the 6 per cent dividend, but the transfer to reserve is reduced to £18,231, while there are drafts upon it, to cover exchange loss on dividends remitted and by transfer to the reserve to cover the depreciation of net assets held in Argentina, of £24,067. It is estimated, however, that current exchange requirements will involve a loss of only £16,000. The fall in the sugar crop was due to the most severe frosts for many years, which affected equally the citrus and banana crops, although losses on these were offset by a rise in the price of timber—the company's other subsidiary business—due to the international situation. The "not unsatisfactory" profit for the year was helped out by the sale of 13,000 gross weight tons of sugar of the 1941 crop, which results in a drop in stocks of sugar and alcohol from £195,819 to £59,302. This is not serious in view of the fact that the 1943 crop is proving much more satisfactory than its predecessor, and is estimated to yield 26,000 tons. Unfortunately this has little relation to the long term prospects of the company. Variation in the yields of crops for climatic reasons will continue indefinitely. What is required is a change in the politico-economic background. Since the date of the accounts a strike of temporary crop labourers has forced a 10 per cent increase in their wages, and cost of materials and equipment has also risen. The 1942-43 profit was helped by a slight rise in selling prices, but, following the recent political changes, sugar prices have fallen. Further, there is still no improvement in the exchange position. Despite the better crop, the chairman is not hopeful about sugar profits for the current year, unless the Committee, appointed by the Government to investigate costs of production, secures a "legitimate adjustment of the selling price in the producers' favour." Unfortunately, it is difficult to believe that, even if the Committee finds in favour of the producer, the Government will necessarily implement its findings. The future of all Argentine concerns under oversea ownership appears to be bound up with the resolution of the political problems, both domestic and external, with which the rapid changes of recent decades have faced Argentina.

A Scottish Ordnance Factory

The thirteenth report of the Select Committee on National Expenditure reveals a disturbing state of affairs at a West of Scotland engineering factory. The factory was built and is owned by the Ministry of Supply, but is operated for the Ministry by a private firm, as one of a group. It has two distinct parts—a steel-making side and an ordnance side, but the Select Committee's criticisms relate solely to the ordnance side. As disturbing as the descrip-

tion of the factory's unsatisfactory production record and low efficiency is the account of departmental delay in dealing with a situation which had been causing concern for a long time, and the complete lack of co-ordination between the various interested departments, each of which has shown a "tendency to look upon themselves as being quite separate entities." The Committee admits that the factory was handicapped by having been laid out for a larger type of gun than is now in production and was affected by changes in the production programme. But even allowing for this disadvantage, production was unnecessarily slow and costly. The number of man-hours taken to manufacture a certain gun barrel were 66 per cent more than at the best Royal Ordnance Factory, and, taking into account the machinery difficulties, at least 23 per cent more. The Committee also states that wage rates were fixed too high. The factory's labour consists in part of skilled men drawn from the firm's parent factory, but mostly of unskilled older and immobile labour. The rate of absenteeism is abnormally high—more than 12 per cent and on Saturdays rising to 40 per cent. Industrial relations seem to be unsatisfactory; the lack of co-operation is illustrated by the fact that the production committee had not met since March. The Committee does not attempt to apportion the blame, though it observes that the management has been high-handed and the shop stewards difficult. The solution recommended in the Select Committee's report is the closing down of the Ordnance section. This proposal has occasioned concern in Scotland.

Training for Mechanised Mines

A training scheme in connection with the drive for increased mechanisation of the mines is being started by the Ministry of Fuel together with the Ministry of Labour. With the introduction of new equipment and machinery of American type—much of the machinery is actually coming from the United States under the Lend-Lease agreements—it is essential that there should be sufficient numbers of properly trained men available, especially as it is a condition of the Lend-Lease agreements that the mechanised units should be worked on a double shift system. A special centre is being set up in Sheffield and the first course, which will start in the middle of November and last from three to four weeks, will give training in maintenance. The course will accommodate about 24 men at a time and the twenty or so concerns which are about to introduce American methods have been invited to send in nominations for training; the men will return to their collieries not only to look after the new machinery, but to train other men in handling it. The second object of the training centre is to provide for young miners to become shift maintenance engineers or coalface machinery engineers by giving them an intensive course in electrical and mechanical engineering, with special regard to the types of equipment used at the coalface. This course, which is to start in January, will last about six months and will deal with about 300 men. Managements are being asked to select young men with at least two years' experience below ground, with some mechanical aptitude and suitable character. Finally, it is proposed that the centre should provide training for selected new entrants with previous experience of mechanical or electrical engineering, when they have completed their initial training at a Ministry of Labour mine training centre. After a month or six weeks' training, the men would be attached to colliery electricians or mechanical engineers as their assistants, until they are capable of working on their own. These men would have their wages and expenses paid by the Ministry of Labour during the training period; in the first and second groups, the employers would pay the wages on condition that the trainees agreed to return to their employment after training. This scheme is very welcome—if anything it is overdue—and it is to be hoped that managements, the unions and the trainees themselves will co-operate to make it a success.

Food Standards

Scarcity is the happy hunting ground of the profiteer whose devices include the "corner" and the marketing, at high prices, of inferior substitutes. But when he makes his appearance on the food market, the public requires protection. This is the job of the Ministry of Food, which is responsible for providing the public with a supply of food which is adequate in quantity and satisfactory in quality. On the whole, the Ministry has been successful in ensuring

SHOW THEM THE TOOLS

The best of tools are not alone sufficient to ensure the best production. The best of workers handling those tools still need the right working conditions if they are to produce the results expected of them; in particular they need to be able to see both clearly and easily everything that they have to do. Industrial lighting, in which Benjamin are the outstanding experts, is of the greatest importance in achieving quality and quantity in output.

Almost every movement made by a worker is controlled by sight and any difficulty experienced by him in seeing is reflected and magnified in inaccuracy or slowness of movement. One of the first steps necessary to avoid waste, whether it be of material or of time, is to make sure that the lighting in factories is both adequate and suited to the particular circumstances of every operation.

To-day when the skilled workers of industry have been diluted by many recruits lacking the knowledge and experience of the older hands it is all the more important to ensure for them the right conditions so that they can acquire the requisite degree of skill or practice. Lighting of the right kind and to the right degree is the most outstanding feature of these conditions.

Benjamin provide industry with a lighting service backed by many years of experience in lighting factories of every size and type all over the world.

BENJAMIN LIGHTING

fair distribution of limited supplies of food at reasonable prices. And, as the White Paper "The Labelling and Advertising of Foods" (Cmd. 6482) issued this week shows, it is determined to protect the public from being offered inferior or harmful substances "marketed" with the assistance of misleading labels or advertisements. To this end the Minister will use some of the powers already conferred upon the Minister of Health and the Board of Trade. The Food and Drugs Act, 1938, enables the Minister of Health to stipulate the manner in which foods are to be labelled and to regulate their composition, and the Sale of Foods (Weights and Measures) Act, 1926, empowers the Board of Trade to prescribe the labelling of pre-packed foods, with an indication of their weight or measure. By the recently issued Defence (Sale of Food) Regulations (S.R. & O., 1943, No. 1553), the law has been strengthened to enable the Minister of Food to prevent the exploitation of scarcity by unscrupulous persons. The Minister of Food will issue Orders prescribing standards for foods as the need arises. To secure the necessary expert advice he has created an advisory committee, consisting of representatives of the Ministry of Food, the Ministry of Health and the Government Chemists' Department, and of public analysts nominated by the Society of Public Analysts and other analytical chemists. Consideration is to be given, as hitherto, to responsible trade opinion. Moreover, it is proposed to require by Order that, in general, pre-packed foods shall bear a label showing, (a) the name and address of the packer, (b) the common or usual name (if any) of the food, (c) the minimum quantity of food in the package and (d) the common or usual names (but not the proportions) of the ingredients of the food. The tightening of control by laying down quality standards where desirable and by insisting on a proper description of pre-packed foods was overdue, not only as a wartime measure, but as a necessary reform in peace.

West African Currency

The report of the West African Currency Board for the year to June 30, 1943, reflects the continued currency hunger of the colonies in question. During the year the Board issued £6,190,500 of currency in West Africa against payment in sterling in London, following issues of £4,192,000 in 1941-42. In both these years no currency was returned to the Board's stocks in exchange for sterling payments in London. The circulation of notes rose from £4,198,380 to £6,811,486 during the year. The actual shipments of currency to West Africa have been on a larger scale than these figures of currency issue suggest, the coin alone sent during the year totalling over £6,000,000. The Board has been called upon to meet an exceptional demand for currency, and due care has been taken to maintain local stocks. The demand has been particularly heavy for shilling pieces and low value coins. At the close of the 1942-43 year, demands for currency still continued, and steps have been taken to meet expected heavy requirements for new currency during the year 1943-44. The heavy demand for currency in British West Africa is explained

in the report of the Currency Board as resulting mainly from the purchase and exportation of local commodities for use in connection with the war effort and to military expenditure. It is also attributed to hoarding, consequent upon restrictions on imports which have reduced opportunities for spending. The stimulus to exports and the accompanying restrictions on imports are also reflected in the assets of the Currency Board. On June 30, 1943, these assets included sterling securities of a nominal value of £23,179,275, this item showing an increase of £6,200,000 over the preceding year. The Board subscribed £4,000,000 to new war issues during this period. In addition to these sterling securities, the Board had on current and deposit account £3,293,517 on June 30th last, compared with £3,197,767 twelve months previously. The economic impact of the war on the West African dependencies thus matches on a modest scale that observed in other parts of the sterling area, notably in India. Since June 30, 1939, the sterling assets of the West African Currency Board have risen by £12,051,000, thus approximately doubling themselves.

Fruit Production

The foods the lack of which is most felt in the wartime diet are meat, eggs, fats and fruit. The last has been a "Cinderella," since it cannot be considered an essential food. The average imports of fruit in the years 1934 and 1935 were 2,432,000 tons, or 77 per cent of total consumption, which was nearly 2½ lbs per head per week. Perhaps the most popular fruits were citrus fruits, with an average consumption of 110 per year, apples, 100 a year and bananas, 60 to 70. About half the apples were home-grown. Imports of fruit were stopped in 1940, except for small supplies of oranges for children, and only home-grown fresh fruit has been available for general consumption. It has been greatly missed from the diet, and the Minister of Food has realised that fruit has at least a psychological value in adding variety and flavour to a somewhat monotonous diet. Although English fruits, apart from blackcurrants, have a poor vitamin C content—citrus fruits are the richest source—the Government has decided to encourage the increase in production. Orchards have been classified either "A" (excellent), "B" (room for improvement) or "C" (derelict). Some "B" orchards have become "A"; derelict orchards are improved where possible, or grubbed, and the land turned over to other crops. Research has played a decisive part in increasing war-time production. Thinning, spraying with insecticides and fungicides, and the use of fertilisers are the first means adopted to improve orchards. Thinning and spraying are done by the Women's Land Army. Since no more land can be allowed for fruit growing, an increase in supplies can only be achieved by raising the yields of existing orchards and fields. There is a large body of information which has been obtained by research, and the county technical development committees of the county war agricultural committees are taking the improvement of backward orchards under their wing.

supply and, undoubtedly, the scarcity will be further accentuated in the near future. Our future policy and plans will be affected by the discoveries of new materials and new adaptations resulting from the exigencies of war, and therefore we must and will apply to peace-time conditions the lessons we have learned in war-time.

The chairman moved the adoption of the report and accounts.

Mr Isaac Wolfson (managing director) seconded the resolution and, after the chairman and the managing director had replied to shareholders' questions, it was put to the meeting and carried unanimously.

The retiring directors, Sir Archibald Mitchelson, Bt., Mr S. Sussmann and Mr J. L. McAdam, were re-elected; the auditors, Messrs Deloitte, Plender, Griffiths and Co., were reappointed, and the proceedings terminated with a vote of thanks to the chairman.

HARRISONS AND CROSFIELD, LIMITED

Mr. H. Eric Miller, the chairman, in his review states that although the cessation of the company's activities in Malaya, the Netherlands East Indies, British North Borneo and parts of China has had an adverse effect on earning capacity, the net profit of £241,709 indicates that other sections of the business have been particularly well employed. A final dividend of 7½ per cent. on the deferred ordinary stock is recommended, making 10 per cent. for the year.

The review shows how India and Ceylon have risen to the occasion and provided maximum crops of tea and rubber. Mr. Miller defends Ceylon producers against the false charge that they have not been turning out as much rubber as they could, and regrets that those accusations are made without any serious effort to check their accuracy.

COMPANY MEETINGS

GREAT UNIVERSAL STORES, LIMITED

ENCOURAGING RESULTS AND PROSPECTS

IMPRESSIVE PROXY SUPPORT

SIR ARCHIBALD MITCHELSON'S SPEECH

The adjourned twenty-fifth ordinary general meeting of the Great Universal Stores, Limited, was held, on the 9th instant, at Winchester House, Old Broad Street, London, E.C.

Sir Archibald Mitchelson, Bt., the chairman, presided.

The secretary (Mr L. A. Renshell) read the notice convening the meeting and the auditors' reports.

The Chairman said: Ladies and gentlemen,—This is the twenty-fifth annual general meeting of our company called for September 28th and adjourned to this day for reasons of which you are fully cognisant. I hope you will agree to take the directors' report as read. (Agreed.)

You have already had an unusual amount of detailed information supplied to you, and I would hesitate to burden you with any further remarks were it not for certain comments in the press in relation to the affairs of our company.

RESULT OF VOTING

Let me begin by imparting the information to you which, no doubt, you are most interested to know—namely, the result of the voting by shareholders which your board has invited. We have had over 2,000 proxies, representing 1,073,000 stock units, in favour of passing the accounts, and only 162, representing 62,400 shares, against; a majority of 1,010,600 stock units.

I venture to suggest that if any testimony were needed from our shareholders regarding the conduct of their affairs by your board, nothing could be more eloquent than the figures I have quoted.

CONFIDENCE IN THE BOARD

May I therefore say that your board is much encouraged by this impressive vote of confidence, and you may be assured that no effort will be spared in the future as in the past to further develop and consolidate the success achieved by the company.

In so far as the general body of our shareholders is concerned—and I am not unmindful of the fact that our first duty and main concern lies in giving them full satisfaction—there would be little more to say, but being a public company whose wide-flung activities do necessarily attract public notice, I feel I must say a few words to clear up some of the points raised by the press relative to the subject matter of our circular dated October 25th.

On the whole the press has shown praiseworthy understanding of the problems involved, but more information was asked for to enable a full appreciation to be made of some of the complex matters which passed under review. It was argued, for instance, that if the businesses acquired by your company had been named, it would have been easier to judge of their respective merits. That may be so, but I can assure you that most careful consideration was given to this particular matter, and only after consultation with our experts, who have to attend to our daily problems, was it decided that the best interest of shareholders was being served in withholding these names. We have since again weighed the pros and cons and feel our decision was right, more particularly in the light of the ever-growing keen competition met with nowadays.

Then comes the question whether, in valuing the shares of a company, the book values figuring in the balance-sheet should

be taken as a guide, or should the assets be independently appraised. We have considered both, and chosen the method more advantageous to your company. Independent advice is invariably secured in support of transactions entered into by your board.

JAYS AND CAMPBELLS (HOLDINGS)

Why was the option to re-sell the preference shares mentioned in transaction 7 only recently exercised? The reason is that, due to the acquisition of the ordinary share capital of Jays and Campbells (Holdings) Limited, our group requires more cash, and that was one of the most convenient ways of raising some part of it.

I may add that this purchase, which involves nearly £1,200,000, will be financed in the main out of our current resources, but the major portion of the cash purchase consideration is not due for another year. For the time being, therefore, it is not contemplated to create or issue any securities in our company or in any of its subsidiaries.

With the addition of this strategically located chain of distributing units the company stands to benefit very materially, and I feel confident that this acquisition will prove most valuable, especially in the post-war era. (Hear, hear.)

RECORD PROFITS

And now, ladies and gentlemen, let us turn to our more immediate business already too long delayed—namely, the consideration of our past trading results and prospects for the current year. Both are highly encouraging. In my remarks attached to the balance-sheet I have briefly dealt with the salient features of our trading position and the record figures of profits achieved by our group for the past year.

Seven months of the current year have already gone by, and I am glad to say that if there is no unexpected setback during the concluding period of the year our results should be at least equal to, if not better than, those incorporated in the accounts before you.

COMPOSITION OF THE GROUP

As I informed you in my recent letter, your group comprises 340 branches and will employ in normal times some 20,000 people and cater for over 4,000,000 customers, with the watchword always well before our eyes to supply the "best merchandise at the lowest price."

There are limits to every expanding organisation dictated by sound business principles, and it is certainly not our intention to infringe upon these; but, on the other hand, we see no impediment to building up an organisation in this country such as there are in America in our line of trade, and whose names have become household words.

That, ladies and gentlemen, is our goal, and I hope you will agree we have already travelled a long way towards it, and I think you will agree that this is wonderfully satisfactory when you bear in mind the problems with which we are surrounded. (Applause.)

I conclude by thanking shareholders for their attendance here today, and I express the hope that when we meet again next year we may do so in happier circumstances and with the nightmare of this world war well behind us. (Hear, hear.)

Report and accounts unanimously adopted.

Vote of thanks to the chairman and the board passed with acclamation.

EXTRACTS FROM REPORT

The following are extracts from the statements of the chairman and the managing director circulated with the report and accounts:—

The combined trading profit for the year amounts to £722,648, compared with £685,602 in the previous year. Your directors are pleased to recommend a final dividend of 7½ per cent., free of tax, making a total for the year of 10 per cent., free of tax, which is the same net distribution as last year. The cash position as shown in the consolidated balance-sheet, including Government securities and tax reserve certificates, continues to be adequate at £729,085, and the volume of stock is satisfactory. The sound financial position of your company has been fully maintained. The charge for taxation of £439,424 substantially provides tax in full on the profits earned during the year under review.

GOVERNMENT CONTROL

Government control, as you are aware, now extends to almost every phase of commerce and regulates both selling prices and profit margins, including the rationing of raw materials and the direction of manpower. If then, in spite of these heavy handicaps, our organisation has not only stood the test of four difficult years of war trading but has gathered strength, expanded steadily, and acquired added goodwill, it gives us every justification to view the future with well-founded hope of further success.

In the opinion of your directors it is of first importance to be effectively prepared for post-war conditions. Accordingly, we are now investigating new sources of and avenues for fresh business, together with new methods of production and selling, with a view to meeting the requirements

(Continued at foot of preceding page)

COMPANY MEETINGS—continued

of a post-war public. The members of our staff who are now serving King and country have our admiration. To their families and friends we tender our heartfelt sympathy.

EFFECT OF COUPONS

"People," as Mr Ernest Bevin has put it, "do no longer think about money. They think about points, coupons, and the like." Coupons have indeed become the controlling factor in trading and retailing, so that spending power is no longer limited by the earning capacity but by the ration book. If, in the national interest, the total of coupons issued to the public is to be reduced, it will necessarily follow that the volume of general trading will further shrink.

Essential non-coupon merchandise has, in almost every category, been short in

RECORDS and STATISTICS

INDUSTRY AND TRADE

Commodity Insurance Scheme.—The Board of Trade have, with the approval of the Treasury, decided that in respect of the period beginning December 3, 1943, and ending March 2, 1944, the rate of premium payable under any policy under the Commodity Insurance Scheme shall be at the rate of 5s. per cent for three months (or 1s. 8d. per cent per month). The new rate is a reduction of one-third on the rate for the current period.

PICCADILLY CIRCUS BRANCH, 16/18 PICCADILLY, W.

LLOYDS BANK

LIMITED

EXECUTORS AND TRUSTEES

The appointment of individuals as Executors and Trustees imposes on them heavy burdens and duties which they are not always in a position to fulfil. Especially is this the case in wartime, when life is so uncertain and so many difficulties arise in the administration of estates.

When the Bank is appointed, continuity is assured and a Testator can rely on his estate having the benefit of skilled and experienced management in connection with his investments and with the many other matters incidental to its administration.

The services of the Bank's Executor and Trustee Department are available to customers and non-customers of the Bank. A pamphlet giving terms and particulars will be sent free of charge on application to any Branch.

Head Office: 71 Lombard Street, London, E.C.3

THE ENGLISH, SCOTTISH & AUSTRALIAN BANK, LTD.

Head Office: 5 Gracechurch Street, E.C.3

Lord Woolton's Task

THE appointment of Lord Woolton as Minister of Reconstruction, with a seat in the War Cabinet, is both a shrewd move and a popular one. There have been many demands for a Minister of Reconstruction, whose existence would be taken as a sign of serious intentions on the Government's part to speed up the process of preparing for the outbreak of peace. To appoint to the post a man of Lord Woolton's reputation for energy and efficiency is to give the public a pleasant surprise. There have been a number of signs recently, as was remarked in these columns last week, that the Prime Minister has at long last been converted to the necessity of putting an end to the period of trifling with reconstruction, and that he is now ready to take it seriously. He has left it very late indeed, for the number of people who are frankly cynical about the possibility of any real reconstruction emerging from Mr Churchill's Government, or from his party, is already very large. But if the Prime Minister's intention were no more than to correct this impression, he could scarcely have done better, in the public mind, than he has done by this appointment. Nobody can possibly say that it has been made too early; but it may not be altogether too late. Much more hard preparatory spadework has been done in the departments than the public gives credit for. On nearly every large question the data have been

assembled and the issues sorted out. On a whole range of subjects, decisions could now be reached very quickly—if there is a will to decide.

Whether Lord Woolton will measure up to his task will be one of the most interesting and important speculations of the next few months. It is certainly a great opportunity for him, and a very great test of his capacities. Notwithstanding his record at the Ministry of Food, Lord Woolton is very much of an unknown quantity so far as this new and very different task is concerned. At the Ministry of Food he had three great advantages. The first was that—granted one or two basic decisions of principle, which were taken before he became Minister (for example, the decisions to have complete rationing of all basic food-stuffs except bread, and to engage in trading on the Government's own account)—the task of the Ministry was very largely one of administering a defined and, in the round, simple policy. The second was that, of all sections of the war economy, this was the one that had been most thoroughly thought out and prepared for before the war began. The third was that the Ministry was blessed with a very competent higher staff. These things do not detract from Lord Woolton's achievement; but they do point the contrast between the conditions in which he has worked hitherto and those of his new appointment. Few of these advantages will follow him. He will, indeed, have

the great advantage of the preparatory work that has been done. But the work of the Food Defence Plans Department, on which the Ministry of Food was built, included many of the major decisions of principle; the preparatory work done by Sir William Jowitt's staff apparently includes no decisions at all. Staff will be Lord Woolton's first and most constant anxiety. It is no disrespect to the present Reconstruction Secretariat to say that, in numbers and in eminence alike, it is wholly inadequate to the task; yet, at this stage of the Whitehall manpower problem, the Minister will find it exceedingly difficult to find recruits.

The crucial difference is that the task of the Minister of Reconstruction, unlike that of the Minister of Food, is not administrative. It is not administration that is now lacking in reconstruction. For one thing, administration can hardly begin until the war is over, and for another the existing departments are standing ready to do all the administration that is necessary, once the decisions of policy are made. It is these decisions that are lacking, and it is Lord Woolton's task to see that they are taken without delay and that they are the right decisions. If a Ministry of Reconstruction were to attempt to administer all the decisions that will have to be reached on reconstruction matters, it would soon embrace, or duplicate, every department of the public service.

The taking of decisions is, in the highest degree, a political task, poles apart from administration. It requires both the statesman's vision, to see problems in the dimensions of history, and the politician's art of assessing the practical possibilities of getting things done in the present. The successful Minister of Reconstruction must be equally at home in the lobbies of Parliament and in the grand perspectives of posterity. Lord Woolton is a successful and resourceful administrator. Whether he is a politician and a statesman he now has an opportunity to show.

The first question he will have to decide is whether to create a Ministry of Reconstruction and to press for "powers." To many people, the creation of a separate new Ministry is, in itself, a step towards the solution of a problem. There are, indeed, cases when the splitting off from an over-large and unwieldy department of one or more specialised sections, and their constitution as a separate Ministry, is of assistance. But it does not always work out favourably. It is questionable, for example, whether the effect of setting up the Ministry of Town and Country Planning has not been to impede rather than to assist progress in this department of policy. The Ministry is under-staffed; and the weight that a new, junior and

largely amateur department can carry in Ministerial and official discussions is almost always small. It is sometimes better to have one quarter of, say, the Treasury's attention than the undivided energies of a department that has no authority. If this is so in the case of a subject which, like town and country planning, has recognisable boundaries, it is far more true of reconstruction, which has no limits. It is wholly impossible to deal with, say, the reconstruction of the health services in a separate compartment from the ordinary work of the Ministry of Health. Industrial reconstruction cannot be divorced from what is being done every day in the Board of Trade and in the munitions departments. Full employment policy lies at the centre of reconstruction; but it is inextricably involved with financial and fiscal matters which are proper to the Treasury. On all these matters and many more, the decisions can only be reached on the advice of the departments chiefly concerned. Lord Woolton's job is to see that the decisions are taken, not to try to take them himself. This does not mean that his duties are limited to the blessed word "co-ordination." He should inspire, insist, stimulate. To form a Ministry of his own, with powers and responsibilities, so far from stimulating the departments, would give them a perfect alibi for inaction. The Minister of Reconstruction will be wise if he takes as his model the Minister of Defence, who achieves his purposes through a very small, but very influential staff.

Of one thing Lord Woolton can be quite certain—that he starts his task with universal good wishes. The quality that should chiefly be enjoined upon him is boldness; that does not mean that he should be a headstrong doctrinaire; far from it. But this, by all the signs and portents is one of those rare historical moments when the shape of a whole century can be set. The metal of which the social framework is cast has been brought by the fires of war to a molten state, and the mould in which it is allowed to cool will be with us, for good or for ill, for many years to come. There are in this island more of the materials for solving the riddle of the twentieth century than anywhere else on earth; but they are still molten and unformed. A bold and courageous statesman could forge a framework on which new empires could be built. A timid and small-minded man will let the metal cool in the form of a cage for the spirit of the people.

This is, in Mr Herbert Agar's phrase, a time for greatness. The two qualities that a democracy must have to be great are clear thinking and courage—*la lucidité et l'audace*. The civil servants will provide the clear thinking; let Lord Woolton supply the courage.

The Lebanese Crisis

IN the early hours of November 11 French troops broke into the house of the President of the Lebanon and placed him under arrest, while others arrested the Prime Minister and all the Ministers of the newly elected Lebanese Government. A crisis thus began which involves not only the status of Lebanon but the future of the Middle East as a whole, and with it the future of Anglo-French collaboration in this area. The background of the crisis can be quickly told. The French mandate over Syria was established after the last war. The French split off the predominantly Christian community of Lebanon from Syria, and set it up as a separate entity, but included in it such completely Moslem areas as the town and coastal areas of Tripoli. This separation created very difficult economic and political relations between Syria and Lebanon. The Christian Lebanese feared the Syrian Moslems. Economically, Syria was cut off by a customs barrier from its natural outlet at Beirut. Both were united in their desire to get rid of the French mandate, and both accused the French of making use of their difficulties to postpone the granting of independence. In 1936, the French Popular Front Government negotiated treaties of independence with both Syria and Lebanon, and democratically elected Governments were set up which ratified the treaties. Then, however, before

French ratification, the Paris Chamber hesitated. There were further negotiations. The affair dragged on. At the beginning of the war, it had not been settled, and in Syria the Government had abandoned the pretence of governing. This was the situation in the first year of the war and under Vichy.

The Allies conquered Syria and Lebanon in the name of Free France in the summer of 1941. It was then that new guarantees of independence were given by General Catroux in the name of General de Gaulle, and strongly endorsed by the British authorities. Since the giving of these guarantees, preparations have slowly been made for the holding of free elections. These took place a few weeks ago and both in Syria and Lebanon strong Nationalist Governments were elected. The issue which in both Syria and Lebanon united the whole fantastic mosaic of religions and races was independence and sovereign rights. The newly elected Lebanese Government decided to make a test case of their status and announced their intention of deleting from their Constitution all reference to France's mandatory position. This they felt had been abrogated by General Catroux's very explicit guarantee of genuine independence, given two years earlier. M. Helleu, the French Delegate General in Beirut, went to Aleppo, the Lebanese Government did not wait for the counter-proposals he was supposed to be bringing back with him. They voted the modifications of the Constitution. It was at this point that the entire Lebanese regime was arrested by the French.

The French authorities may justly plead that the Lebanese Premier should have awaited M. Helleu's report, and that his action was an attempt to present the French National Committee with a *fait accompli*. General de Gaulle has further spoken of himself as trustee of France and declared that nothing of its pre-war status can be modified without the consent of the French people. Yet even if the Lebanese Government acted precipitately, they had been waiting for an independence explicitly promised since 1936, and even more solemnly granted in 1941. The reservations made by the French Committee must have sounded suspiciously like the old, old story to them. As for the question of France's mandatory power, the exact status of France in Lebanon—Vichy and non-Vichy by turn—may quite justifiably have appeared

confused to the Lebanese. In any case, the excuses which can be made for the French action are quite outweighed by its violence and extremism and by the fact that in a matter of vital British concern (for British troops still occupy the country) the French made no attempt to consult their ally.

Some attempt may be made to switch the blame on to M. Helleu. Those who are acquainted with the Delegate General declare him to be constitutionally incapable of acting outside his instructions, or of conceiving for himself so vigorous an act. Moreover, he has told the press explicitly that the arrests were decided on in Algiers, and that when he warned the Committee that there would be trouble, General de Gaulle told him to go ahead. The Lebanese crisis is thus the first example of policy executed independently by General de Gaulle. The decision to arrest the Lebanese Government is high-handed, violent, and utterly undemocratic. The failure to consult the British shows how small is the value set by General de Gaulle on easy and comradely relations with Britain. Above all, the whole affair is stupid from the standpoint of France's

vital interests. General de Gaulle has succeeded in alienating France's best friends in the Levant, the Lebanese Christians. He has made the name of France a term of reproach throughout the Middle East. He has manoeuvred France into a position from which only the greatest tact—and the help of the British—can extricate it without a very damaging loss of prestige.

It is to be hoped that both the tact and the help will not fail. There has been a rather disagreeable tendency in this country to take ironic advantage of France's discomfiture and to pose in the role of protector of the weak. It is true that General de Gaulle's peculiar ineptitude has for the time placed the British in

the position of guarantor of Lebanese independence, and the protests which have come in from almost every Middle Eastern Government have all been directed to Britain with earnest pleas for intervention. But, basically, Britain can have no interest at all in self-righteously exploiting the situation against the French. France's problem in the Middle East is the same as Britain's problem, and if both states are going to

carry through their policies to a successful end they need to work together intelligently, closely and in complete loyalty.

The problem which faces them both is that of finding ways to put an end to the state of tutelage which still exists in Lebanon, Syria and Palestine, and to build up a new relationship between themselves and the Middle Eastern states which will contribute to the peace of the whole area, safeguard the vital strategic interests of the European Powers, and at the same time create a framework for the steady progress of the Arab communities. Britain and France must work together to secure this new Middle Eastern relationship, not only because the failure of either to terminate its mandate would react unfavourably on the other, but because any solution for the Middle East must be the work of more than one Great Power if it is not merely to look like a new form of disguised imperialism. The Middle Eastern states stand at the parting of the ways. Behind them lies dependence. Ahead of them lies either the illusory independence of small states, economically weak, militarily

impotent, balkanised, squabbling, a prey to the first predatory Greater Power; or the real independence which can be secured only through co-operation and interdependence, co-operation of the states among themselves, and sound treaty relations with the Great Powers outside.

Obviously, this last solution requires all the resources of Allied statesmanship. Co-operation and interdependence come as hardly to the states of the Middle East as to the economically far more advanced and politically far more mature communities of Europe. Action by the Powers must, moreover, be very cautious, for it is necessarily suspect. Yet one of the hopeful aspects of Middle Eastern politics to-day is the existence of a number of pointers towards a more co-operative future. It is on these that Allied policy must concentrate. One of them is the precedent already established by Britain in Egypt and Iraq and reaffirmed with very wise generosity after the Rashid Gailani rebellion. This is the establishment of treaty relations which, while safeguarding the security of the area by the presence of garrisoning troops, nevertheless recognises the full sovereignty of the state in question. There is no reason why other Great Powers should not join in the garrisoning and transform the treaty relationship into a wider system of collective security. Another pointer is the existence and the expansion of the work of the Middle East Supply Centre. The United States is already associated with Britain in its working. Properly developed, it could provide a series of economic links drawing the Middle East together into a co-operative regional framework. The French are already associated with the work of the Centre in Syria and Lebanon. Their participation could be increased.

Finally, there is the undoubted local interest in the possibility of Arab federation. Various schemes are being discussed in the Middle East to-day. Formal talks have been held in Cairo, and a Congress is to be summoned next year. By far the most concrete and practicable is the plan elaborated by the Iraq Government, which corresponds in many ways to an earlier plan discussed by a group of Arabs and Jews in Jerusalem under the leadership of Dr Magnes. The core of both schemes is the restoration of a single Syria by bringing Lebanon, Syria, Palestine and Transjordan together in a single state. The Iraq plan suggests that the new Syria should federate with Iraq in a union open to other Arab states, and it provides for elaborate minority guarantees, specifically

for the Jews in Palestine. This or any similar plan stands little chance of success without some backing from the Great Powers concerned with the Middle East. For one thing, no minority, Christian or Jewish, would accept such a scheme unless treaty relations were established with the British, French, and if possible the Americans, which guaranteed the presence of their garrisons and gave them at least an unofficial oversight of minority rights. If, on the other hand, the influence of all the Great Powers is exercised in the direction of a united Syria and a co-operative Middle Eastern system backed with outside economic and military assistance, then there is better hope now than ever before of achieving a really constructive settlement in the Middle East.

For Great Britain, the great test is Palestine, with its Jewish minority. For the French, the test is Syria and Lebanon, with their Christian minority. The French have had their test to meet before the British. The world has heard a great deal in recent weeks of France's status as a Great Power, of its claims to equality and recognition, of its importance in the settlement of world affairs. France's Allies are ready and anxious to concede all these things, but they must depend to a great extent upon the nation's own performance. The immediate task is to restore the situation in Lebanon, to release the Government, and find the face-saving formula. General Catroux is in Beirut. He has seen Mr Casey. There can be little doubt that the right solution will be found. But what are the long-term plans of the French National Committee? Do they intend to join with the British in assuring a co-operative solution for the whole area? Or are they going to follow the promptings of a narrow and jealous national pride and try to insist on a solitary position of power in one corner of the Middle East alone? Is their outlook constructive or particularist? Will they use their influence to exploit the Lebanese Christians' fears of their Moslem neighbours? Will they encourage disunity so that they may retain a foothold? Will they treat their British Allies as potential rivals? Will they suspect every move and work in the dark to prepare elaborate counter-measures? If so, there is little hope of a creative settlement in the Levant; little hope either of France proving by its policy that its greatness is unimpaired. The errors of this first crisis can still be repaired, but there must be far more generosity and realism and frankness in Algiers if the broader issues are to be brought to a happy conclusion.

Mutual Aid

THE British Government's White Paper on Mutual Aid was published at such an hour last week that it was not possible to include in *The Economist* more than a hasty note. A document of such importance deserves, however, more extended notice, and subsequent pages of this issue of *The Economist* contain a full summary of its contents. It was published in Washington at the same time as in London, and the President also sent to Congress a report containing additional detailed information on the reciprocal aid received by the United States.

Requests for information on the scope of "reverse lend-lease" or "mutual aid" (the latter is now the official description) have been made ever since it became apparent that lend-lease was a two-way transaction. The requests have been more frequent in America than here, and to be able to quote strictly comparable figures would certainly be of great assistance to the American public in appreciating the true meaning of the whole complex of reciprocal assistance. But demands for information placed the British Government in a dilemma, of which the present White Paper still shows traces. Aid given by America to Britain is valued and recorded almost in its entirety. Much of the aid given by Britain to America inventions and battle experience) or else is not in fact recorded and valued, since it is rendered in small items over such a widely dispersed area that to keep records would require an army of clerks and accountants. Any

figures that can be quoted from the British side are therefore necessarily incomplete. Nevertheless, if published, they will inevitably be set alongside complete American figures. This dilemma cannot be fully evaded and some of the false comparisons are already being drawn in America. The authorities have, however, waited until the figures are so large that they can hardly fail to tell their story even through the cloud of innocent or malicious misconception.

The story that the White Paper has to tell is certainly impressive. The three items set out in paragraph 31, representing the cost to the British Exchequer of the recorded portion of goods and services provided for the United States forces in the United Kingdom in the twelve months to June 30, 1943, amount to £216 million (not £816 million as it appeared, by a printer's error, in last week's Note). This is roughly equivalent to £4½ per head of the population of the United Kingdom. Or it can be expressed in still another way as \$1.50 per head per month. In the period of about 28 months from the passage of the Lend-Lease Act (March 11, 1941) to June 30, 1943, the value of goods exported from the United States to the United Kingdom on lend-lease terms was \$4,458 million, or about \$1.18 per month per head of the population of the United States. These two *per capita* figures cannot properly be compared; one of them includes some services, but omits unrecorded items, the other includes all goods but no services: it

may be that the exchange of goods and services in theatres other than the UK itself is strongly in favour of one or the other of the parties; and in using money figures to express real magnitudes, account would have to be taken of the much lower British costs of production for identical goods. The only conclusion that can safely be based on figures such as these is that, if a strict comparison were possible, it would probably show that, relatively to her resources, Britain has helped America as much as America has helped Britain. Further than that the principle and the practice of Mutual Aid cannot go.

The White Paper, in addition to its figures on mutual aid in the strict sense of the term, also mentions the very large financial obligations of an external character that the United Kingdom has assumed. A figure of £2,250 million is given, and though the description of what it represents is very ambiguous, it can be assumed that this is the total of the British adverse balance in account with all the United Nations over the whole period of the war. This is, indeed, war expenditure, in the sense that it would not have arisen but for the war. Some of it represents direct assistance by the United Kingdom to the war effort of other countries. This, for example, is true of the enormous debt to India, which must be much the largest item in the total, and reflects, broadly, the assumption by the United Kingdom of a large part of India's war costs. But other parts of the total represent aid to Britain rather than aid from Britain, since they are the measure of the goods that other of the United Nations have been prepared to ship to this country without present payment. In the Note in *The Economist* last week, the £2,250 million was added to the sum of the specifically "mutual aid" items, and the comment was made that the total of £2,831 million "is certainly a wide under-estimate of the external war effort of the United Kingdom." This is perfectly true; but in view of the very disparate nature of the two items it seems more prudent, on reflection, to keep them separate—certainly in any discussion on mutual aid.

The most that can be claimed for the mutual aid that Britain has given—and in the ultimate analysis it is all that need be claimed—is that, according to our means, we have given second to none. But precisely because the means of Britain are so much smaller than those of America, the absolute total of American aid is, and will remain, larger than that of British aid. When the war is over, and the accounts of Lend-Lease and Reverse Lend-Lease are finally agreed, there will be a balance out-

standing against Britain. It is open to any Englishman to say that such a balance should be disregarded, and that victory should be taken as full payment. It is not open to him to say that that was the basis on which the bargain was originally struck or the agreements signed, and it is only a few weeks since President Roosevelt deliberately recalled and disowned a report that had gone out under his name with an expression of just that sentiment. Lend-lease, as originally offered and accepted, carried with it deliberate, though somewhat unspecific, provisions about repayment, and if these provisions are not to be observed, the agreement of both parties is required. It may be that the American public will come to the opinion that the question of repayment should not be raised. It may be that last week's White Paper will assist in this process. But they have not yet changed their mind. The President's action, the results of several polls of public opinion and Congressional statements all point in one direction. It is as well for everybody in this country to realise that a time will, in all probability, come when Washington will ask London to make suggestions for repayment. When and if that time comes, there could be no more lamentable mistake than for British opinion to react with an indignation that might well be truly righteous, but would inevitably appear, across the Atlantic, to be self-righteous. The bargain was struck with open eyes; it should be honoured.

Moreover, the conditions of repayment that have been envisaged are eminently reasonable. As laid down in the Agreement of February 23, 1942, they are to be "such as not to burden commerce between the two countries." That phrase may be interpreted as ruling out any repayment in dollars or in gold, or in any way that would diminish Britain's ability to earn dollars. Payment cannot therefore be made either in capital assets (such as oil reserves) or in goods, such as whisky and fine textiles, of the types that are normally sold by Britain to America. In short, the only form of repayment that would seem to conform with the terms of the Agreement would be deliveries of goods of types that America has not hitherto bought from Britain—metal goods, machinery and common textiles.

Whether America would be ready, when the time came, to accept free deliveries of British manufactures, presumably to be sold on the domestic market in competition with American products, is an interesting speculation—for Americans. The course of wisdom on the British side is to be prepared, in all sincerity, to make such an offer if repayment is required.

A Report on Mutual Aid

[The following is a full summary of the text of the British Government's White Paper, published on November 11th under the above title (Cmd. 6483; 2d. net).]

I—The Pooling of Resources

THE principle of mutual aid and the pooling of resources was instituted by the "Act to Promote the Defence of the United States" (the Lend-Lease Act) of March, 1941, which empowered the President to transfer without payment materials needed for winning the war to the Governments of those countries whose defence was deemed vital to the defence of the United States. The strain upon our financial resources placed by the purchase of munitions and food is indicated by the fact that, despite the help of lend-lease, we have spent, since September, 1939, some £1,500,000,000 in the United States on supplies of all kinds. In Canada, our difficulties of payment were solved by the provision in 1942 of a money gift of \$1,000,000,000 for war needs and by the Canadian Mutual Aid Act of May, 1943, which provides for the transfer to the United Nations without cash charge war supplies to the value of a further \$1,000,000,000.

The British Government recognises that the transfer of goods and services without charge or calculation is necessary to the efficient planning of the war, and its policy is to apply

the principle wherever possible to the United States and to other Allies.

II—The Range of Mutual Aid

With the United States, the position has been defined by the Mutual Aid Agreement of February 23, 1942 (Cmd. 6341), Article II of which reads:

The Government of the United Kingdom will continue to contribute to the defence of the United States . . . and will provide such articles, services, facilities or information as it may be in a position to supply.

On September 3, 1942, there was an exchange of notes, which stated *inter alia* that the British Government would provide the United States with the following types of assistance as reciprocal aid:—

- (a) Military equipment, munitions and military and naval stores.
- (b) Other supplies, materials, facilities and services for the US forces. . . .
- (c) Supplies, materials and services needed in the construction of military projects, tasks and similar capital works required in the United Kingdom or the British colonial empire. . . .
- (d) Supplies, materials and services needed in the construction of military projects, etc., in other territories to the extent that the United Kingdom or the British Colonial Empire is the most practicable source of supply.

In addition to the items listed above, Britain supplies as reciprocal aid a large number of shipping services. To begin with, raw materials and bulk supplies of foodstuffs were excluded from the agreement, since the dollar receipts from US purchases were needed to meet the liabilities on pre-lend-lease contracts in the US; but these contracts are by now largely fulfilled, and reciprocal aid will be extended to raw materials and foodstuffs purchased by the US Government from the United Kingdom and the colonial empire as well as to the cost of British shipping services for bringing these materials from all parts of the British Commonwealth.

The cost of reciprocal aid in the colonies has been entirely borne by the United Kingdom. The Dominion Governments have made their own arrangements with the United States. The Australian and New Zealand Governments signed reciprocal aid agreements on September 3, 1942; the South African and Indian Governments are giving reciprocal aid without any formal agreement.

The aid received from the US under lend-lease can for the most part be measured in terms of large contracts, since it consists mainly of armaments, foodstuffs and raw materials, the orders for which are presented in bulk to the US Government and which are requisitioned individually before they are supplied. In contrast, British aid to the US is mainly the provision of services and of a wide variety of items transferred in the daily intercourse of the war effort and on the battlefield itself. It is a decentralised and flexible system designed to meet the needs of armed forces at war in many scattered countries. Unlike American aid, therefore, British aid cannot be valued with any accuracy.

Examples of such British aid to the US are:—

Information—particularly the experience of the battlefield which has cost more in blood and effort than most aid. Before the US was at war, their models were tried out in actual combat, which helped in the development of, for instance, the Sherman tank and the Flying Fortress.

"Servicing"—the provision of transportation, accommodation, airfields, facilities and local supplies to American forces in the British Isles and the colonies.

Transportation—the transport of hundreds of thousands of American troops overseas, and the provision of harbour and repair facilities, fuel, stores, etc., to American naval and merchant vessels.

Construction—the provision of sites and building materials and the construction of airfields, barracks, repair shops, hospitals, etc., for the accommodation and use of the American forces in the British Isles and Colonies, also the cost of maintenance of light, heat, water, telephone and other services, and the provision of various foodstuffs which can more conveniently be provided locally than imported specially from the United States.

Amenities—premises for American Red Cross Clubs, NAAFI canteens, etc.

Medical supplies, including hospitals and ambulances.

AID TO OTHER ALLIES:—War material has been furnished by the United Kingdom to Russia free of cost since Russia entered the war. This was regularised in an agreement of June 27, 1942. By the end of May, 1943, 4,690 complete aircraft (including losses in transit) had been sent to Russia with appropriate supplies of spares. We have opened up a route to carry these supplies across Persia, and have sent large quantities by the sea route to North Russia, which has frequently involved a major and very hazardous naval operation.

Arms, munitions and military equipment are being supplied free to China for its forces in China, though transport from India is at present very restricted. In addition, in Burma and in India, Chinese troops have been given their local requirements, including rations, and their pay in local currency, together with cash for local purchases, on lend-lease terms. Sea and land freights for British and American lend-lease military supplies to China are also provided.

Holland, Belgium, Norway and Yugoslavia pay for all we give them. Certain other allies are supplied under credits, but the bulk of military supplies are made available free, only to be returned if they still exist and we want them after the war. This applies to the armed forces of Greece, Czechoslovakia and the French Committee of National Liberation, and similar arrangements have been offered to Poland and Yugoslavia. Military supplies are being furnished free to Turkey, which, together with France, has also had made available in the past considerable civil and military supplies on special credit terms.

We have also on loan to our Allies 1 cruiser, 17 corvettes, 14 destroyers, 6 submarines, 16 motor torpedo boats, 17 motor launches, 19 mine-sweeping vessels and 4 frigates.

III—The Amount of Mutual Aid

It is clearly impossible, because of its nature, to estimate fully and accurately the value of the reciprocal aid given by the United Kingdom. Moreover, what estimates are given should not be compared with the value of Lend-Lease received from the United States, except with circumspection. For one thing, the price in the US of labour and materials are considerably higher than over here, and American book costs probably exceed British costs by more than 50 per cent.

Subject to these qualifications, the cost of reciprocal aid given to the United States, but excluding transfers and services in overseas theatres of war, can be classified as follows:—

Capital Installations in the United Kingdom.—The total programme is estimated to cost more than £150 million. By June 30, 1943, the value of work done is estimated at £92 million, consisting of barracks, hospitals, etc., £31 million; air ports £55 million; aircraft repairs, depots, etc., £5 million; and other installations £1 million.

Goods and Services Transferred in the United Kingdom.—Up to June 30, 1943, these are valued at £82,000,000 as follows:—military stores £21 million; food and other army supplies £10 million; aircraft and aeronautical equipment £20 million; industrial, naval and other goods £13 million; and miscellaneous services £18 million.

Shipping Services.—Freight services up to June 30 are estimated at £36 million, and disbursements, including bunkers, at £6 million, a total of £42 million.

The amounts supplied to Russia, up to June 30, 1943, are as follows:—vehicles and tanks £93 million; guns, ammunition, etc., £16 million; aircraft and aeronautical equipment £65 million; industrial materials and naval supplies £5 million—a total of £179 million. This does not include the very large expenses incurred in conveyance and in keeping open the routes.

Our credits to our other Allies up to December 31, 1942, together with such lend-lease assistance as we gave before then, amounted to about £186,000,000.

IV—The Limitation of Mutual Aid

The amount of mutual aid which a country gives is not a measure of its war effort. Some of the United Nations are so close to the enemy or have such small resources compared with their needs that almost the whole of their war effort is applied directly. Others, not so placed, can best help by putting part of their production in the common pool. Mutual aid is for the most part confined to the provision by one country to another of its own produce. It thus falls short of a financial pooling of overseas expenditure, for, in particular, the pay of troops and the vast and growing cash expenditure in third countries on military operations and supplies are outside its scope. Of this burden the United Kingdom has had to bear a particularly heavy share, and it should be considered in addition to mutual aid in assessing the financial weight of the war on this country. Up to the middle of 1943, the burden thus assumed by the United Kingdom, in the form of payments made to other members of the United Nations in excess of sums received from them, amounted to over £2,250 million. To this extent, the United Kingdom has burdened its future commerce by parting with gold and other capital assets and by incurring liabilities to other members of the United Nations.

V—Summary

The part which the British Commonwealth has borne in the field of mutual aid cannot be measured in terms of money. Financial sacrifice is not the most valuable part of what any of the United Nations is called upon to contribute to total war—for they should give all they have.

But the size of the British financial contribution should not be underestimated. In the President's Report to Congress of May 25, 1943, he showed that lend-lease expenditures to that date made up 12 per cent of America's total war expenditure. The proportion of British war expenditure currently devoted to mutual aid is 10 per cent. This excludes the very large contribution to the external finance of the war made by the United Kingdom in cash expenditures abroad, but, apart from that contribution, what we give to the United States as mutual aid in relation to our national income does not fall far short of what the United States gives to us as lend-lease in relation to its national income.

NOTES OF THE WEEK

The Government Changes

Lord Woolton's appointment as Minister of Reconstruction is the subject of a leading article on page 665. He is succeeded as Minister of Food by Colonel J. J. Llewellyn, whose place as Minister Resident in Washington for Supply is taken by Mr Ben Smith, at present Parliamentary Secretary to the Ministry of Aircraft Production. Mr A. T. Lennox-Boyd, somewhat unfortunately associated in the public mind as one of Mr Chamberlain's young men, is appointed to the latter post. These changes follow from the appointment of Lord Woolton. But at the same time an unexpected and welcome change has taken place at the Ministry of Health which Mr Ernest Brown has vacated to become Chancellor of the Duchy of Lancaster. The former Chancellor, Mr Duff Cooper has resigned and is expected to go to Algiers as representative of the British Government to the French Committee of National Liberation. The new Minister of Health is Mr H. U. Willink, K.C., a Conservative backbencher, who has only been a Member of Parliament for a little over three years. Politically, he has chiefly made his mark by his chairmanship of the Commons' Select Committee on the question of giving women equal compensation with men for war injuries. Publicly, he is chiefly known as Special Commissioner for rehousing London's homeless during the blitz. In fact, from what is known of his interests and from the comments on his appointment, he seems likely to be a Minister of Housing rather than a Minister of Health, especially as he takes office at a time when the Government's views on the future of the health services have already been drafted in a White Paper, which is due to appear at any moment. Mr Willink may find his lawyer's skill useful in arguing with the doctors, but any policy-making for which he may be responsible in the near future would seem to be associated with housing—and, perhaps, local government—rather than with the prime function of his Ministry.

* * *

Cos, Leros and Samos

The loss of Leros is a grievous blow to the Allies, much more grievous than the immediate military significance of the island would suggest. The eyes of all the Balkans—and of Turkey—were centred on the fighting there; and failure in the Dodecanese is bound to depress friends and sympathisers of the Allied cause, encourage enemies and throw the hesitant back into indecision. Leros has been lost—as well as Cos, which fell six weeks ago—because small Allied land forces could not be given the protection of short-range fighters; and the Germans were once more free to use dive-bombers as they did in 1940 and 1941—and to reassert the old air menace to Allied warships. Coming now this is a most melancholy and disturbing episode. When Italy was invaded, the choice of Salerno as the landing-point was dictated by the range of fighter aircraft; and no risks were taken by landing farther to the north without air cover. Why was the risk taken in the Dodecanese? Why were these skeleton land forces sent unprotected to probable destruction, for all their great gallantry? Why were they left there when the danger became painfully obvious? And what is now to be the fate of the garrison sent to occupy still more distant Samos? The occupation of Cos, Leros and Samos had sense only as part of a wider and more powerful operation, with the conquest of Rhodes as its minimum objective and essential condition. Rhodes was not taken, largely because Italian aid was overestimated, but the occupation of the islands was continued, as a wasteful and sacrificial dispersal of men and material, as events have now shown. Explanations will be sharply and angrily asked for, with justice, for, with tremendous superiority at sea and in the air, the period of apprenticeship in the elementary strategy of concentration should have been over long ago.

Labour and the Nation

London's Mr Morrison still courts the provinces, especially the industrial north and midlands; the only Labour spokesman of a Labour policy, despite his position as Coalition Minister, he is bidding for the national status in the Party that he has never had. At Manchester last Saturday he spoke as "one Labour man to Labour men and women of

the north." He coupled a warning against dissension in the Party with an appeal for statements of Labour policy in plain, unmistakable language, not liable to misrepresentation. He called, too, significantly, for the "national" approach:

It isn't a case of "we are going to build Jerusalem, we ourselves alone, if only we can get ourselves the chance." Nor is Socialist vision summed up in a call to "vote for us and see what you'll get out of it." It is "this nation can and will do it, and we will hope, and work, to be a fit and chosen instrument of the national will and purpose."

Labour's weakness, as well as strength, has been its appeal to a single class. It has never yet had a hope of winning a national majority. Mr Morrison spoke frankly to the trade unions:

If they and the Party decline into a condition where their great aim is the achievement of narrow sectional objectives, they will split.

The application of his advice to Labour's immediate future is not quite clear. It may mean simply that the Party must appeal to all and not to some, which is wise counsel. Or it may mean that Labour must be content to play a part in Coalition in framing a National policy of reconstruction—pointed advice from the Party's only policy-maker on an issue that the Party has still to settle.

* * *

Beveridge Plus or Minus?

At Bolton, when on circuit in the north, Mr Morrison talked of the Beveridge Report, this time as spokesman for the Government. The Report's proposals have been closely examined, one by one, and a White Paper will be published in the coming session of Parliament stating the points the Government can accept—and those it cannot, because they are, in its view, impracticable. Mr Morrison emphasised, quite rightly, that the Beveridge scheme for a minimum

JAECGER Facts

1. Wool does not become damp like cotton or linen.
2. Wool is warmer in winter and cooler in summer because it is a slow conductor of heat.
3. Wool ventilates the skin, so keeps it in good condition.
4. Wool is just as important in bed.
5. Wool therefore is best for health and comfort.

money income for everyone in all contingencies is not the alpha and omega of social security. The provision of "food, work and homes" is most important; the standard of living of the nation depends upon the state of employment and the size of the national income; the goods must be there to be bought. But Sir William Beveridge saw this at least as well as Mr Morrison or Mr Churchill. It is quite wrong to say that the redistribution of money incomes proposed in his Report must first be "earned" before it can be carried through; it would have been feasible before the war when unemployment was larger and the national income smaller than they should be after the war. The point is that the bigger the total stock of work and goods, the more generous can be the assured minimum and the larger the fund of resources for other purposes after security needs have been met. Provided it is not used as an argument to reject the prevention of want in money terms by a comprehensive contributory scheme, as it sometimes is, the stress laid by the Government on the positive, practical and real aspects of social policy is very welcome. It echoes the emphasis placed in the Beveridge Report itself on good employment, doctoring for all and housing; and may even herald action at last to secure proper treatment for sufferers under national health insurance and workmen's compensation. Mr Bevin's announcement that the proposals of the Tomlinson Report for the rehabilitation and re-employment of the disabled are to be embodied in a Bill points in the right direction.

The Consultative Assembly

Events in the Lebanon (discussed on page 666) have overshadowed the second week of the Consultative Assembly at Algiers. Even so, domestic issues were still prominent in its proceedings, especially as the debate arranged on foreign affairs was postponed. The aim of the Assembly was clearly to obtain somewhat more elbow room for itself than is allowed by its constitution. The length laid down for a session is one week; the Assembly decided to sit in extraordinary session for eight days more. The main domestic question was the participation of the Communists in the National Committee. The Communists originally rejected the proposal that they should take over the Commissariat of Production and asked for the Commissariat of Information instead. This demand was rejected by the National Committee. For a while it looked as if the Communists were going to apply the tactics of the Popular Front period, when they preferred to exert pressure from outside without sharing responsibility for government. But they eventually took the Commissariats of Production and Health, and they have restated their pledge of full support for the National Committee. They have not, however, made it plain whether they endorse the Committee's criticisms of the results of the Moscow Conference; and it will be interesting to watch whether they will back the Committee's announcement that it will not feel itself bound by any decisions taken without France's direct participation. The other chief preoccupation at Algiers has been the position of General Giraud and, generally, the relations between the Army and the National Committee. General Giraud has repeatedly protested against the spreading of the purge to the Army; and he is said to have tendered and withdrawn his resignation as Commander-in-Chief several times. The internal crisis is not yet over.

Polish-Soviet Deadlock

Mr Cordell Hull has stated to the press that the problem of Russia's western frontiers should be left in abeyance until the end of the war. "Many things will be settled as the war goes on; patience is necessary." This seems, in fact, to be a necessary condition for the resumption of Polish-Soviet relations—which becomes the more urgent the nearer Soviet armies approach to Poland. It is therefore difficult to see what useful purpose was served by the statements on the Polish frontier problem made by both the Soviet and Polish Ambassadors to Mexico on the same day that Mr Hull pleaded for patience; and it is no easier to see what good can be done to Polish-Soviet relations by hints in the Soviet press encouraging what might be regarded as a London branch of the Union of Polish Patriots in Moscow. Polish-Soviet relations is, and must remain, an issue between the acknowledged Governments of the two countries; and to use unrepresentative and artificial bodies can only make confusion worse confounded.

The fact that so authoritative a paper as *Pravda* is able to quote against the Polish Government an obscure Polish periodical in London is hardly reassuring. The Polish Government, on the other hand, does not show any great awareness of the urgency and gravity of the problems with which it is confronted. It still continues to yield to the pressure of an irresponsible, and mainly military, opposition which wants to destroy any chance of repairing the breach between Poland and Russia. The stiffening of a completely unrealistic attitude—"We shall not cede an inch of our territory"—will lead the Polish Government nowhere; and the activities of the various Polish Societies for the Defence of the Borderlands, which have been organised under the auspices of highly placed Polish personalities, are only apt to hamper the freedom of movement of which Polish foreign policy may soon be badly in need. It is a puzzling fact that nearly all the Polish papers published in this country reflect the extreme viewpoint of Polish nationalists, while the Polish Government itself possesses almost no platform from which to state its own attitude and urge the need for compromise with Poland's eastern neighbour. Nor can the continued pursuance of the old "Ukrainian policy" by some departments of the Polish Government, in which the survivors of the old Beck régime are still very active, be justified. An unequivocal statement of the British attitude is urgently needed. There is some risk lest the Poles should be misled by the encouragement to intransigence that they receive from those British official representatives of whom they naturally see most. This is not the policy of His Majesty's Government—or, if it is, it ought not to be.

Retreat and Counter-Stroke

The Russian front has now assumed a very odd shape indeed. In the south the Germans are still holding out in the Crimea and on the eastern bank of the Dnieper. Inside the bend of the river the fierce battle for Krivoi-Rog is still undecided, though a Russian advance from the north is now reported. If it is true that the Russians have thrown thirty infantry divisions and five tank divisions into the narrow corridor between Krivoi-Rog and Nikopol, then this battle, which has now lasted nearly a month, will prove one of the most tremendous and destructive operations of the war. Farther to the north, the huge Kiev salient is now being extended and widened. The Russian jump from Kiev to Zhitomir was accomplished in less than a week; and there the Russians now stand half-way between Kiev and the old frontier. But the extension of the Kiev salient has given an opportunity to the Germans to launch the long-threatened and long-delayed counter-stroke. This has now been delivered in the region between Fastov and Zhitomir on the southern flank of the salient. The Russians have, in the meantime, extended the northern flank towards Korosten; but the centre of gravity has now clearly shifted to the south of the salient. The cutting of the railway west of Gomel seems to foreshadow an early evacuation of that town, which is the Germans' last important strongpoint in front of the Pripiet marshes. A revival of fighting is also reported from the Smolensk-Minsk road, where the Russians are pressing towards Orsha. Meanwhile German preparations for an even deeper retreat are reported from the Baltic countries and from eastern Poland. But whether or not such a retreat will become an immediate necessity may well depend on the result of the counter-attack in progress to the south of Kiev, which may even aim at the recapture of the Ukrainian capital.

History of Liberty?

The declaration of the Three Power Conference on the restoration of Italian democracy has had a very strange sequel in Italy itself. Victor Emmanuel has for the time being saved his throne; and Marshal Badoglio remains in office, without having brought in any representatives of the six parties with whom he had been negotiating. All the political parties, which now seem to enjoy relative freedom of organisation and printed opinion, have refused to serve under the old King, though it is not quite clear to what extent this refusal is based on opposition to the dynasty or merely springs from an aversion from Victor Emmanuel and the Crown Prince. Possibly the more radical sections of the Italian people in the north would now support a purely republican programme; and Mussolini, when he launched his Republican Fascist party, probably hoped to exploit anti-

monarchist feelings. In southern Italy, with its predominantly agrarian and conservative population, the anti-monarchist trend is probably almost absent; and this has obviously helped Victor Emmanuel to reassert himself. Neither Count Sforza nor Benedetto Croce, with whom Badoglio negotiated, is a republican. They have asked for the abdication of the King in favour of his grandson and the establishment of a Regency. Marshal Badoglio, in his statement on his new provisional Government, gave more than a hint that "military expediency" has played some part in the postponement of the dynastic crisis; the present regime is meant to be "temporary" as well as "expedient," and the freeing of Rome is apparently to be the deadline for a more democratic change. In the meantime, Marshal Badoglio has dropped General Roatta and is about to dismiss General Ambrosio, both Generals being listed as war criminals by the Yugoslav Government. But the Marshal has been unable to fill the posts in his Government with men of any political standing. All the Ministries will be temporarily directed by expert under-secretaries, presumably minor Vicars of Bray from the civil service. The coalition of six parties in Naples has unanimously protested against this set-up; and Benedetto Croce has issued a gloomy warning about the danger of a new Fascist era. The old philosopher to whom so many anti-Fascists looked for guidance under Mussolini and after his downfall, is now left to wonder whether the new chapter in Italian history will really be "the history of liberty."

Employment

During the war all appointments in the professions, industry and commerce must be filled through the organisation of the Ministry of Labour. This is necessary to make war mobilisation assured and complete. But it is, for many posts of a personal or specialised character, inconvenient and not very efficient from the employer's standpoint; and it is not good news that the Appointments Department of the Ministry is not intended to be, after the war, a monopolistic agency. Mr Bevin, who made this announcement last week, is very aware of the permanent need for his Ministry to find workers for all kinds of jobs and jobs for all kinds of workers; and it is essential that the Ministry's vacancy work should remain comprehensive and become more skilled. But, at the same time, employers and employees should be entirely free, if they can, to make their own arrangements. Much the most important need is that there should be jobs for all, and this is the Government's, not Mr. Bevin's, business. The law is about to be extended to make all employers of serving men (why not women?) liable to take them back to their old posts on demobilisation. In fact, their old jobs will in many cases not exist, or have been filled in four or five years by several persons all now serving and entitled to be taken back. The post-war structure of industry and trade may be very much altered; and the crying requirement is not for legal compulsions to restore the old structure but for an effective and successful policy of full employment.

Work for the Disabled

One of the most important points made by Mr Bevin in his Wigan speech last week-end was his statement that the Government intend to introduce legislation during the coming session to make the employment of disabled persons compulsory. This question has been given topicality by the return of the wounded prisoners from Germany, and the urgent need to restore them to full physical and mental health. The shortage of personnel and equipment for this healing work presents an immediate difficulty, which will increase with the mounting casualties that must inevitably result from the development of the European offensive. In conditions of wartime full employment, of course, there should be little difficulty in absorbing the physically disabled, who can work on a part-time basis if they cannot do full-time work, or who can do light jobs which do not involve the use of their injured limb. But the definition of "light work" and the finding of suitable jobs for men injured in industry or the mines has always been one of the most thorny features of workmen's compensation. Moreover, in peacetime, the employment of disabled men depends upon a high level of general employment; when trade gets slack, a man whose capacity is impaired in one way or another is the first to be discharged. Mr Bevin's hint may be taken as meaning that the Government is going to implement that part of the report of the Tomlinson Committee on rehabilitation and resettlement, which makes pro-

vision for the employment of disabled persons. As well as advocating improved and extended facilities for hospital and post-hospital treatment, including the equally necessary non-medical treatment, the Committee proposed that restrictions should be laid upon the engagement of non-disabled persons by an employer who is employing less than a prescribed percentage of registered disabled. Legislation on the lines of the Tomlinson Report would be an important measure of reform in a field which has been grossly neglected in the past.

The Tuberculosis Scandal

It is just over a year since the report of the Medical Research Council's committee on tuberculosis in wartime was published. Its main recommendations—early diagnosis by mass radiography, prompt treatment by an extension of sanatorium accommodation and the completion of a cure by the grant of special allowances to encourage sufferers to be treated and to permit them to stay away from work until they are cured—were accepted by the Government, and it was thought that a campaign against TB was under way. Yet as soon as the scheme for granting allowances was put into force, it became apparent that the Ministry of Health was determined to be as cheequeing as possible. Since the distinction between the curable case, which is eligible for an allowance, and the chronic case, which is not, was pointed out in *The Economist* on August 21, 1943, (page 233), a storm of protest has been made in press and in Parliament—most recently in a Commons debate last week—but the Ministry of Health's only reply is that the scheme is only intended to enable persons to give up work temporarily for treatment, and cannot include those whom further treatment will not benefit. When it is pointed out that this places medical officers of health and others who administer the allowances in the invidious position of telling a TB sufferer that he is ineligible for an allowance because he is incurable, the Ministry of Health says that such a person is always eligible for assistance from the local authority—which in most cases means the public assistance that, whether curable cases or not, TB persons will go to

any lengths to avoid. In other words, quite apart from the inhumanity involved in telling a person that he is incurable, the Ministry of Health is encouraging chronic cases to find work even if they have positive sputum and are likely to spread the disease among their fellow workers, and in the present state of the labour market they have no difficulty in doing so. The Ministry could be excused for whittling down the Medical Research Council's other recommendations—mass radiography and improved sanatorium facilities—because they are dependent on factors such as skilled staff which are at present very scarce. But there are no such limitations on the grant of financial allowances, and the Ministry has only itself to blame if the medical profession points to this blunder as an example of what may happen under a state medical service.

Civil Liberties

One remark in Mr Churchill's Mansion House speech, ten days ago, has strangely escaped notice. Pleading for all-out effort in the war, he belittled by way of example the undue attention paid, say, to the rights and wrongs of procedure in juvenile courts. Here the Prime Minister, democrat and Parliamentary by nature and life-long experience, surely nodded. The distinguishing mark of free nations at war, despite the dire compulsions imposed by military and economic needs, is the constant care still taken for individual liberties. If it is necessary, for instance, that there should be a Regulation 18B to hold suspects for security's sake, it is no less necessary that there should be constant and critical watch on its working. If it was needful, for safety and order in India, to imprison the Congress leaders without trial, it is imperative that the proceeding should be regarded as, at best, a necessary evil—and, perhaps, that it should now be asked whether the time for *habeas corpus* and open trial has not arrived. War blunts and destroys many standards, more no doubt than we yet realise, in the thick of it. It is the more important that, war or no war, the public and, above all, Parliament—at question time and in debates on the adjournment—should seize and take up every instance where the rights of citizens, of whatever age or sex, may have been offended. It is part of the process of winning the war, with all its hateful necessities, that the soul of democratic law and order should not be surrendered.

International Airways

Mr Churchill and Mr Roosevelt agreed not long ago on the need for "freedom of the air," the right of aircraft on through voyages to land at any airport and cross any territory, but not to ply for hire within national frontiers. Lord Beaverbrook, whose new Ministerial province apparently includes both civil aviation and, in some aspects, lend-lease, obtained agreement at an undress Imperial Conference to a common regional policy for the Commonwealth and Colonies; and his next moves will be in Washington and Moscow, where a decision whether the British nations are to be regarded for flying purposes as a unit or a congeries of nations is a most urgent preliminary of international accord. There is much more than politics in the translation of "freedom of the air" into legally and technically acceptable terms in the languages of all the flying nations. The Royal Institute of International Affairs, Chatham House, has done good service by putting out a book (*International Air Transport*. By Brig.-Gen. Sir Osborne Mance and J. E. Wheeler, Oxford University Press, 117 pages, 7s. 6d.) which lists the problems to be solved and sets out the background of facts. There is need, first, for a new world-wide convention on principles and technical regulations; for comprehensive international machinery to apply the convention; for agreed definitions of freedom of passage, prohibited areas, airworthiness, competence in personnel, standards of ground organisation and traffic rules; for agreed judgments on the law of liability for accident and damage; and for common standards of customs enforcement. The biggest and most important chapter in the book records the international and regional services operating before the war and compares State expenditures and subsidies—which shows the payments of the United States, including its heavy home transport by air, three to five times above those of the United Kingdom, with Italy surprisingly high and Holland surprisingly low. The book's conclusion—mostly its purpose is purely expository—is unexceptionable: that the future of world civil aviation

depends, first, upon military decisions, and, secondly, upon the degree of international political agreement that can be achieved.

Inland Transport

Neither Lord Leathers, Minister of War Transport, in his speech on the future of transport in the House of Lords on October 27th, nor Mr Philip Noel-Baker, Parliamentary Secretary to the Ministry, in his address before the Institute of Transport on November 12th, was able to provide much of an outline of post-war policy. Lord Leathers correctly stated the aim of policy—that is, the provision of a transport system that will give "the best possible service for the least real cost to the community as a whole." But there are a number of recurrent phrases about the need for "co-ordination" in both speeches which suggest at least a drift of opinion away from competition, and in favour of treating rail, road and water transport facilities as a pool of carrying capacity to be utilised to the best advantage. Lord Leathers significantly welcomed the organisation of the scattered units of commercial road transport into national associations, an essential condition of co-ordination, and Mr Noel-Baker emphasised the need for finding some means of avoiding "unnecessary duplications" of transport facilities. These phrases are not new; what is interesting is their repetition in recent Ministerial pronouncements. But they do not amount to a policy. An efficient transport system is of tremendous importance to Great Britain, as a means of making the best of its compactness and short distances, one of its greatest natural advantages. Future policy cannot be shaped hastily, partly because the importance of transport is matched by its technical, financial and administrative complexity, and there is everything to be said for the fullest possible debate before decisions are taken. But public debate—as was revealed again by the speeches in the House of Lords on October 27th—has not yet come to grips with the real issue, which is the need for translating into practice the aim expressed by Lord Leathers. There is an urgent need for a definite lead from the Government, for if co-ordination came to mean nothing more than an integrated rate structure, designed to ensure a profit, however reasonable, on the capital invested in transport, the aim could not be achieved. The solution to the problem, as to many other industrial problems, is to be found in the technical approach, based on a careful analysis of the comparative facilities and costs of the various means of transport. Unfortunately, the necessary data, expertly analysed, are not yet available to the public. It may well be, however, that they would suggest, as a broad technical solution, the organisation of transport on a functional basis, with the administrative separation of long-distance from local transport, whereby long-distance traffic would be carried chiefly by rail and slow-moving traffic by water, and local traffic mainly, though not exclusively, by road. The implications, far-reaching in their financial and administrative aspects, must be thought out without delay.

The Balkan Maze

Conflicting claims of guerilla fighting and larger scale military activities come from various parts of the Balkan peninsula. Political intrigue and military matters are hopelessly entangled and there is a lack of reliable news. Shortly before Mussolini's fall, guerillas in the central and northern parts of the Balkans had been forced into inactivity, whereas in Greece fighting had flared up again. The surrender of the Italian army to the Allies changed the situation. Guerilla groups came into possession of Italian equipment, weapons and munitions. The districts of Gorizia, Trieste, Fiume-Susak and the province of Ljubljana were left temporarily without any controlling administration. Large towns were occupied by guerilla bands. Then specialised German detachments started a series of campaigns which have so far secured the reconquest of the entire Dalmatian coast as well as some of the important islands. In the north, fighting is reported to have shifted to districts near the Hungarian, and even the Roumanian, border. Another scene of activity is eastern Bosnia. In Greece rival factions among the guerillas, in possession of large parts of the country, are sometimes actively fighting each other. The Germans have been forced to divert considerable numbers of troops to the Balkans; but most of them have moved to the south, presumably to take up defensive positions against invasion and to attempt the re-

conquest of the Aegean islands. Only small German detachments have been left in the north to deal with the guerillas, and most of the latter have fallen back into the mountains, where they constitute a potential threat to the German forces. The guerillas are doubly at a disadvantage. First, there is their traditional political internecine strife; and, secondly, they are opposed by regular units of the German army which also control the military detachments of the Croat Ustasha. In Macedonia units of the regular Bulgarian army are being used against the guerillas; and in Serbia proper General Neditch is in command of the so-called Serbian Security Service and the police, subject to the control of the German military commander.

It seems certain the Germans have no intention of withdrawing from the southern Balkans. Greater Bulgaria is obviously the main buttress of the German political system in the Balkans. "Independent" Croatia, which has been given the Dalmatian coast, comes second in importance, and Serbia under General Neditch third. In Greece the Germans seem to be content to use the differences between rival political and guerilla groups to their own advantage. The idea of a Balkan entente sponsored by Germany appears most unlikely, for the Germans are in fact more interested in exploiting traditional rivalries between the small Balkan countries. Complete pacification of the Balkans, or even an effective military occupation of all parts of the Balkans, is impossible. The main German objective is to secure rail and road communications, to occupy the major strategic positions and to operate a network of aerodromes. The extension of railways and roads has been vigorously carried out, particularly in Bulgaria and Roumania. Work on fortifications, which reached a peak last spring, has been resumed with even greater vigour since the fall of Mussolini. The Balkans are vital for Germany's defence and their policy shows that the Germans intend to maintain their hold.

Shorter Notes

His Royal Highness the Duke of Gloucester will succeed Lord Gowrie as Governor-General of the Commonwealth of Australia. Lord Gowrie's term of office has been further extended for six months from January 22, 1944. This will cover the period before Princess Elizabeth, in whose minority the Duke would have acted as Regent, reaches her eighteenth birthday and could exercise the full functions of a sovereign or, under the new Regency Act, become a Counsellor of State in the event of the King's illness or absence from the United Kingdom.

The Canadian Legation in Washington has been raised to the rank of an embassy—another sign of Canada's Great Power status. The United States Legation in Ottawa will similarly become an embassy.

The following table gives the number of civilian casualties in air-raids since September, 1939:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept., 1939-Aug., 1940.	1,494	1,980	3,474
Sept.-Dec., 1940.....	22,282	28,522	50,804
Total, 1941.....	20,863	21,839	42,702
Total, 1942.....	3,221	4,149	7,370
1943:—			
January-June.....	1,830	2,515	4,345
July.....	167	210	377
August.....	108	164	272
September.....	5	11	16
October.....	118	283	401

Totals to date.... 50,088 59,673 109,761

Of those killed in October, 53 were men, 48 were women and 17 were children under 16.

AMERICAN SURVEY

The South and the World

(From a Correspondent in Virginia)

Richmond, October 18th

THE Southern section of the United States, i.e., that region which constituted the Confederacy in the sixties of the last century, is the most interventionist, and least isolationist, part of America. In the debates leading to the establishment of an international organisation after this war, the South can probably be counted on to give enthusiastic support to anything which promises a close working arrangement between this and other nations, and particularly between the United States and Great Britain.

The South's Anglo-Saxon background is one of the chief reasons for its strong opposition to isolationism. Except in Louisiana, which is predominantly French in its origins, and in all the states touching the Gulf of Mexico, where faint Spanish overtones are discernible, the South is settled by people of English, Scottish and Scottish-Irish blood. It has no large blocs of Germans, Italians or Irish. Thus there is not only the tie of blood between its citizens and those of England and Scotland, but there are at the same time no large groups such as have formed pro-Axis or anti-British nuclei elsewhere. Other reasons enter into the South's general attitude, such as the sympathy which many influential Englishmen showed for it during the Civil War of 1861-65, and the dependence of its cotton and tobacco farmers upon foreign markets, particularly British markets, in normal times. There is also the South's martial tradition (most of its great heroes, such as Washington and Lee, were soldiers).

The Gallup poll, and various other polls taken in this country since the Munich crisis of 1938, have shown the

belt of territory which stretches from Virginia on the northeast to Texas on the southwest to have been the least neutral of all in its attitude, and the most anxious to take steps which might lead to American belligerence. Before Pearl Harbour, the percentage of volunteers from the South to the army and navy was the highest in the Union. For some reason, that leadership was not maintained after the Japs struck, late in 1941, although Southerners have been conspicuous for their fighting qualities on all the battlefronts. The celebrated Virginia Military Institute, alma mater of "Stonewall" Jackson, has supplied an extraordinary number of high ranking officers to both major branches of the service, notably General George C. Marshall, who was graduated from the VMI, and not from the United States Military Academy at West Point.

One of the chief obstacles to the establishment of a decent world after the war is likely to be high tariff sentiment in the United States and elsewhere. Manufacturing and other interests which have had "protection" in the past are apt to be most reluctant to abandon that protection in the future. The South always has been one of the low tariff areas of the United States. The tariff was regarded more than a century ago as "utterly destructive" of the South's interests, and it is so regarded today. This is realised generally by the Southern people, although there are industrialists who feel otherwise. Secretary of State Cordell Hull, who comes from the Southern state of Tennessee, has impressed the citizens of the region with the primary importance of freer international trade, and they have acquired that realisation from other sources, as well. A Gallup poll in 1938 showed the people of the South to

be 92 per cent favourable to the principle underlying Secretary Hull's reciprocal trade agreement programme.

Cotton and Tobacco

Southern manufactures, which are considerable, are less dependent upon foreign markets than Southern agriculture, but processors of the former Confederacy's huge crops of cotton and tobacco are important in the industry of the area. Immediately prior to the present war, the region was exporting from 50 to 60 per cent of its cotton, and 40 per cent of its tobacco. The producers of these staples hope to regain, and to expand, their export markets when peace returns. The tariff has always forced the predominantly agricultural South to buy in a protected domestic market, while selling most of its products in an unprotected foreign market. Thus one of the most important factors of all in building up isolationist sentiment—a desire to retain the tariff—is much weaker in the Southern states than elsewhere.

There are still other reasons, in addition to those mentioned, why the South, which has not favoured some of President Roosevelt's more advanced domestic measures, has been a bulwark of the Administration's foreign policy, not only since war was declared on the Axis, but before. Lend-Lease would have been beaten in Congress had it not enjoyed the overwhelming support of the Southern members, and extension of the draft, when its first year expired in August, 1941, slightly more than four months before Pearl Harbour, also would have failed, but for the South. As it was, the disbanding of the new American Army in that grave crisis was avoided by only one vote in the House of Representatives. The rôle which the Southern members played in saving the day may be seen in the fact that whereas representatives from twelve Southern states cast 102 votes in favour of extending the draft, and only six votes against it, the House delegations from eleven Middle Western states voted 100 to 18 in the negative.

Despite the foregoing, there are one or two factors in the Southern situation which tend to militate against its acceptance of internationalism. One is the region's conservatism and its consequent aversion to Communism. This creates something of a barrier in the way of a close tie-up with Soviet Russia. The other is the traditional Southern devotion to the doctrine of states' rights (the issue that had much to do with bringing on the Civil War),

a doctrine which probably implies a certain reluctance to see the country join a "super-state." But the feeling against Communism does not seem to have affected the attitude of the South as a whole in any important particulars, and the dogma of states' rights is far from having the force that it once had in this section.

In all candour, it must be said, however, that the South does not now, and probably will not, support the very advanced form of internationalism represented by Vice-President Henry Wallace. Mr Wallace, whose views on the domestic front are more left than those of Mr Roosevelt, is also ahead of the President in the foreign sphere. While he has been unjustly criticised and misrepresented, especially by conservatives and reactionaries, he is widely regarded, both in the South and elsewhere, as rather too visionary for the average American, certainly for the average Southerner. Political observers are practically unanimous in saying that Mr Wallace will be a political liability to Mr Roosevelt in the South if he is placed on the ticket with him again next year as vice-presidential nominee.

But if the South is tending away from the views of Mr Wallace, and is moving in a more conservative direction, so is Mr Roosevelt, whose ability to sense popular sentiment is almost unparalleled. This would indicate that the country as a whole is moving rightward. However, such phenomena should not be taken as signifying that the President or the country is preparing to jettison international collaboration after the war. On the contrary, Mr Roosevelt appears to be moving toward the right in order to increase his strength with the country, and particularly with the Senate, which must ratify any treaty by a two-thirds vote.

Certainly the South gives every indication of an intention to support him, when the show-down comes—assuming that he will be in the White House for another term. Should he be defeated, it will support his successor when and if the new President seeks to organise the world for peace. Nearly a quarter of a century ago, the South stood by Woodrow Wilson almost solidly, when that Southern-born statesman sought to carry the United States into the League of Nations. Only five Southern senators voted against the covenant when American adherence was finally defeated in 1920. This would be apt to cast negative votes if a similar issue were presented today.

Puerto Rico Development

(From an American Correspondent)

Washington, October 3rd

LIBERALISED home-rule for Puerto Rico, including a popularly elected Governor, moved a step nearer the goal last week when President Roosevelt sent to Congress and made public a revised Organic Act, into the drafting of which a committee of four Americans and four Puerto Ricans put three weeks of labour last July.

In Washington, thirty members of Congress, polled for comment by the United Press, declared the document a model of progressive statesmanship, a Bill as forward-looking as any ever drafted for the welfare and political future of American territorial areas. They expressed the belief that Puerto Rico is thoroughly competent to exercise democratic processes of government. Sixty Congressmen polled by the Associated Press expressed similar sentiments. While early reports from Puerto Rico described the population as generally jubilant, it is still too early to ascertain the precise degree of enthusiasm in each of the various political parties of the island.

Preliminary estimates, both in Washington and Puerto Rico, indicate that the Bill can be interpreted by each of the respective groups of those who support a "logical political future" of the island, as a clear interim step towards statehood . . . towards a commonwealth . . . towards independence, or towards any intermediate shade of status. Even Senator Millard Tydings, father of the Independence Bill which would give the Filipinos complete freedom on July 4, 1946, and who in April prepared a somewhat similar Independence Bill for Puerto Rico, is surprisingly acquiescent. He assured the press that the present Bill in no way interferes with his independence plans—that it is, in fact, a logical interim arrangement.

His Bill has the backing of a small, orderly, but aggressive group in Puerto Rico which is headed by the owner of several large hotels in San Juan and other lucrative business interests throughout the island; this "independista" declares he will abolish income taxes and set labourers' wages back to the scale prevalent in the "good old days" when he achieves his goal of independence for the Island.

If enacted, the proposed Organic Act will establish a precedent by declaring it to "be the intention of Congress that no further changes in the Organic Act shall be made except with the concurrence of the people of Puerto Rico or their duly elected representatives." The Bill would create a Joint Advisory Council to "study and report to the President and the Congress of the United States on necessary and desirable changes in this Act." This Council would be composed of the Secretary of the Interior, as chairman, the Governor of Puerto Rico (who would be elected by the islanders) and the Commissioner General (who would be appointed by the President to co-ordinate Federal activities in the island), all as ex-officio members; in addition, there would be four persons appointed by the President, and five appointed by the Governor to perform the actual, day-by-day labour. This body is instructed to "study and report on the United States and Puerto Rico, which proposals shall, when and as approved by Congress, be submitted to the people of Puerto Rico for their decision."

If the section of the Bill creating the Joint Advisory Council is adopted by Congress without change, it will, in some measure, forecast the temper of the Washington legislative body with regard to future rehabilitation aid to the island, for it specifically instructs the Council to "study and recom-

mend a comprehensive economic programme to be made operative over a period of years, the purpose of which shall be the economic rehabilitation of the island." The Council would report from time to time, but not less frequently than once every two years, beginning on January 1, 1946.

So tight-lipped were the Puerto Rican and American drafters of the present Bill, and not until President Roosevelt's announcement of its contents last week were any of its features known, with the single exception of the fact that the Governor would be elected by the islanders instead of appointed by the President as heretofore. On this latter point speculation has been rife in Puerto Rico for many months. The Latin blood of Spanish-Americans traditionally effervesces over political issues, and this will be the greatest issue in the history of the island. There is probably not a man in the island who does not covet the distinction of being the first duly elected Governor of Puerto Rico.

"Bread, Land and Liberty"

In power at the present time is the Partido Popular Democrático, whose wild-fire campaign slogan of "Bread, Land and Liberty" in 1940 upset the long-established political apple-cart and bounced them into office over the anguished and hind-sighted groans of their complacently confident opponents. Their campaign appeal was directed at the *jibaros*—the peons—whose political consciousness was limited to the fact that on one day, every year in four, you received a fifty cent piece from your employer, in return for which you dropped into the ballot-box a ballot marked as your employer designated. Travelling through the mountains on horseback, Luis Muñoz Marín, leader of the Populares, prevailed upon the "commonsense" of the *jibaro*. "Bread for the whole year is better than fifty cents for a day," he told them. In an island where bread, as well as land, is at a premium, it was not surprising that the slogan of the Populares had some appeal.

Since their election, the Populares have promulgated an elaboration of a programme of development originally drawn up by a group of islanders at the time the New Deal was beginning operations in Washington. The Federal agency set up to administer the rehabilitation programme at that time was known as the Puerto Rico Reconstruction Administration; and over a period of six years it expended around \$70 million in Federal funds on land resettlement, urban and rural housing, soil conservation, co-operative sugar centrals, health clinics and schools. When Congress discontinued the appropriations in 1941, the PRRA had done a good job. But it had merely scratched the surface. Only a long-range programme could cover the ground.

Attacking a part of the rehabilitation problem directly at its roots, island leaders now are attempting to get some land into the hands of the *jibaros*. The law limiting the corporate holdings of agricultural properties in the island to 500 acres, that was placed by the Congress in Puerto Rico's first Organic Act of 1900, and reaffirmed as a policy of Congress in 1917 by its inclusion in the revised Organic Act, has been totally disregarded by both continental American and Puerto Rican corporations. Until some redistribution of land is accomplished, the earnings of the land, now mainly in the hands of the larger sugar companies, will continue to flow out of the island. To support the programme of land acquisition, its advocates have the opinion of the Supreme Court of the United States which in 1940 upheld the constitutionality of the 500-acre law.

Implementation of the law has moved forward since April, 1941, when the Legislature of Puerto Rico established a Land Authority, "to promote the welfare of the inhabitants of Puerto Rico through the financial stability, social justice and economic freedom of the farmers, labourers and inhabitants in general of the rural districts of Puerto Rico, by providing an improved distribution of agricultural wealth. . . ." Negotiations are now in progress for the purchase by the Puerto Rican Government of the land-holdings of one of the largest and most successful American sugar companies. The company will probably continue to operate the grinding mill, but the land will be parcelled out, as some land in other parts of the island has already been, to small farmers.

Many Caribbean areas to-day are attempting to solve their land problems, each in a different way. Puerto Rico has adopted a system of proportional-profit farms. Under this system, the Land Authority leases lands in parcels of from 100 to 500 acres to farmers, agronomists or other persons with experience in agricultural management who meet certain rigid qualifications. Under a contract with the Authority, which fixes conditions, the lessee cedes parcels of from one to three acres to each of the families of the labourers residing on the farm, without payment. On its small parcel, each family is

expected to produce for subsistence. Labourers residing on any given farm are free to work or not work on that particular farm. But, realising that only large-scale farming operations can be thoroughly successful in this day of mechanised operations, the Land Authority requires that a certain portion of the farm be worked as a whole. For that job the labourers who work on that farm receive daily wages and, on a specified date each year, a part of the net profits in proportion to the days they have worked. The lessee himself receives from 5 to 15 per cent of the net profits.

Yet, even if all of the land were divided among the people, there still would not be enough for subsistence. For the island, 100 miles long and 35 miles wide, already accommodates 2,000,000 inhabitants and has an abnormally high birth rate. It is one of the most densely populated agricultural areas in the world, with about 530 persons to the square mile.

To offset the agricultural restrictions which these conditions impose, Puerto Rico to-day has embarked upon a planned programme of industrial development. Toward this end, the Puerto Rico Development Company was established by Legislative Act of May, 1942, carrying an appropriation of \$500,000. The company may issue up to \$5,000,000 in bonds, and its purpose is the development of industries through its own or private capital, or through a combination of both. The Development Company is now successfully engaged in the operation of a cement plant. It has a bottle factory under construction which is expected to go into production in December, turning out rum containers and other glassware, not only for Puerto Rico, but probably for nearby islands. Products from bamboo, clays, sugar-cane fibres, coconuts, fish, all are in various stages of development, and many more are in blueprint form. High on the list for development is "synthetic beefsteak," or food yeast, to supplement the protein deficiency in the diet of the islanders. Ten young Puerto Rican scientists have been awarded fellowships by the Development Company, after competitive examinations, and are now in the States learning, by working, the technical skills needed in their island. Another group of twelve young technicians has been sent by the company to Louisville, Kentucky, to learn the process for producing food yeast at the Seagram plant.

American Notes

Coal and the Little Steel Formula

Statements on the coal contract between Mr Ickes and the United Mine Workers have been issued both by the public members and the industry members of the War Labour Board. The public members are at pains to insist that the award is within the limits of the "little steel" formula, because the increased earnings will then "all be in payment for increased production of coal." Technically this may be correct, although it is hard to see how payment for travel-time from mine-head to the face, which apparently is included in the award, can be justified on this score. It is, moreover, open to question whether increased production will in fact, balance the increased earnings. Last summer the Board flatly refused to consider portal-to-portal pay on the grounds that it was inflationary. The operators seem likely to secure an increase in the price of coal. From a wider point of view the increased earnings cannot but be inflationary. No increase in coal production will enlarge the supply of civilian goods on which the increased "take-home" pay is to be spent; the only justification for juggling with the terms of the award to make it fit the formula lies in heading off new wage demands. In this the Board has plainly failed. The public members admit that, owing to the complexities of the award, many people have been rightly or wrongly led to believe that the wage stabilisation line has been breached. The wish may have been father to the thought in some cases, for if the line is breached at one point, the case for all controls is correspondingly weakened. But the fact remains that the damage is done. The WLB will have a more sympathetic audience for its bitter, if implied, criticism of the Administration for dealing with the strikers before they returned to work, and for its suggestion that the events of the last weeks may require further legislative action unless labour, and in particular, the Mine Workers, show that they are willing to abide by the no-strike pledge. The industry members were even more vigorous than the public members in urging Congress to put more teeth into the anti-strike laws. The pattern continues to repeat itself. Congress will not be slow to act;

and Mr Lewis will have fastened yet another set of shackles on his fellow labour unions. Meanwhile the open breach between the WLB and the Stabilisation Authorities on the one hand, and the Ickes "appeasement policy" on the other, remains unhealed and unedifying. It is responsible for a revolt on the part of the railroad non-operating unions, which have challenged the Stabilisation Director's authority to veto wage increases and have asked for a Congressional resolution to make their increase effective.

A Drop in the Bucket

The House Ways and Means Committee has completed its major operation in the Treasury tax proposals. What is left is an increase in revenue amounting to \$2 billion, instead of the \$10½ billion requested by the Treasury. The main sources of new revenue are an increase from 90 per cent to 95 per cent in the corporations' excess profits tax, designed to bring in \$616 million more, moderate increases in income-taxes for those already paying them, and increases in excise, transportation, and other similar taxes. The Bill will be taken up by the House on November 22nd, the Senate hearings will start when the measure has passed the House. The only strong disagreement between the two is likely to be over the increase in the excess profits levy, which is opposed in the Senate. If the Treasury could be criticised for not seeking out the sources of increased war-time incomes in the lower income brackets, Congress is even more to blame for hardly seeking out new revenues at all. This is ominously like a sit-down strike. The only subject which stirred up real interest in the committee was an attempt to limit the practice of "re-negotiating" war contracts, by which excessive profits are recaptured for the Treasury—and this seems somewhat out of place in a revenue Bill.

Reverse Lend-Lease

Publicity for Reverse Lend-Lease on the scale secured last week by the President's Message and the British White Paper was sorely needed. A recent Gallup poll showed that two-thirds of those questioned did not believe that Great Britain furnished any aid to the United States under Lend-Lease and that nine out of ten were ignorant of the basic principles of Lend-Lease. Ignorance of this magnitude is not to be dispelled overnight, but in view of the immense amount of space devoted to the subject in small-town papers as well as the great metropolitan dailies, there is no longer any need for those who wish enlightenment to remain ignorant. The great advantage of giving totals which for the first time were susceptible of some comparison was to secure attention which could no longer be gained by mere listing of categories of aid. Certain disadvantages cannot be dissociated with this departure. They were both illustrated in the comments, despite their mainly favourable nature. One was the tendency to concentrate on the figures without giving equal weight to the reservations as to their incompleteness or the accompanying interpretation. "Britain gives billion compared to U.S. 14 billion" was one misleading headline; others concentrated on the ratio of one to five. The other danger is that of concentration on the balance between the United States and Great Britain, without equal attention to British contributions elsewhere. The Senate investigation will no doubt spur the demand for exact accounts. In many quarters there has been a keen appreciation of the undesirability, and the impracticability of dollar measures, and the totting up of a final debt. But it would be dangerous to count too heavily on this, at least as yet, or to imagine that the pleas of blood and toil will completely dispel the belief in the existence of a debt.

Hey Diddle Dilling

The customary decorum of English Speaking Union meetings was rudely shaken last month. A Chicago gathering, at which Mr John Cowles, the newspaper publisher and formerly of the OWI, and Mr Graham Hutton, of the British Information Services and formerly of *The Economist*, were scheduled to speak on Lend-Lease, received rough handling from Mrs Elizabeth Dilling and some of her cohorts. Mrs Dilling, of "Red Network" fame, one of the more notorious small-time pseudo-Fascist leaders, who is out on bail, and naturally anxious to put every moment to good use, invaded the meeting with the purpose of breaking

it up by the judicious use of booing, heckling, and "fixed" questions. With additional police protection, the speeches succeeded in being delivered, and interference never became real disorder, but solid citizens had their faith in Chicago's civic discipline undermined. The *Sun* next day had no hesitation in placing Mrs Dilling and her hard-faced ladies only second to the Axis in the list of America's enemies; and attacked the *Chicago Tribune* as primarily responsible for creating an atmosphere attractive to these gangs. There seems to be no doubt that Chicago is the new wartime headquarters for many of the groups, like the Christian Front, the Silver Shirts, and We, the Mothers, who have found themselves being frozen out elsewhere. Mrs Dilling's "Red Network," published in the early thirties, purported to find in lists of liberals, democrats, and radicals of all descriptions, evidence of a deep-laid Soviet plot to conquer the United States from within. Time passes on; and to-day a more useful study might be made of Chicago's flourishing Black Network, which is anti-British, but is more dangerous for its exploitation of war-time strains and racial tensions.

Gogo and Gopo

The appointment of Mr Bernard Baruch as head of a new unit in the Office of War Mobilisation to deal with war and post-war problems of adjustment was announced this week. It will be his job to develop unified policies for the various war agencies. The first problems will, of course, deal with current adjustments demanded by changes in strategy and conditions on the home front. But Mr Baruch's appointment is being welcomed chiefly on the ground that it is an assurance that the liquidation of the Government stake in industry will be carried out with dispatch and method. This stake is enormous by any standard. Government ownership of war-built plant has exceeded a total of \$15 billion compared with private financing of just over \$4 billion. Government-owned plants are distributed among industries producing aircraft (\$3 billion), ships (\$2 billion), explosives (\$2.9 billion), iron and steel products (\$1.2 billion), non-ferrous metals (\$1.1 billion), chemicals (\$1.3 billion), and a number of others. At the end of the war the Government will own nearly 100 per cent of the country's capacity of synthetic rubber, 93 per cent of magnesium capacity, 50 per cent of aluminium, 50 per cent of machine tools, and 90 per cent of aircraft capacity. Some of these plants are both Government-owned and Government operated—GOGO in Army terminology; others are GOPO. Government productive facilities in some industries and areas are so enormous that they could swamp privately-owned plant; and the anxieties of business as to the method of liquidation is correspondingly acute. In about 50 per cent of the Government-owned but privately-operated plants, the operator has an option to buy the plant at cost less depreciation or less rental income, whichever is greater. If building costs and other factors make purchase desirable, this will simplify Mr Baruch's task. But he will still have to consider the disposal of non-convertible war plants, the convertible plants which are not bought up, the disposal of Government supplies and the liquidation of war contracts in such a fashion as to minimise unemployment. The precedent of the last war is one not to be followed. Although Government investments then totalled only \$500 million, the pressure for speedy liquidation was so great that much plant and equipment was sold for a song, and much was scrapped, a monstrous waste of resources. The Chamber of Commerce recently urged the highest possible realisation from the liquidation, combined with avoidance of disturbance to private enterprise. The reconciliation of the two, if "realisation" is to be taken in its larger sense of real advantage rather than merely purchase price, will be Mr Baruch's main headache.

Shorter Note

Progress is being made in converting war contracts from a cost-plus-fixed fee basis to fixed price and employer incentive types. In 1940 Congress made illegal the old cost-plus-10 per cent contract of the last war, but experience proved that procurement agencies could not secure production with fixed-price contracts. With more production experience, contractors are now willing to return to a fixed-price basis. The advantages lie in keeping costs low and eliminating the possibility of hoarding labour at government expense.

THE WORLD OVERSEAS

Social Credit After Aberhart

(From Our Ottawa Correspondent)

October 4th

WHEN the late Premier, William Aberhart, of Alberta died in May, he left an estate of \$57,000. This would be a tidy sum for any Canadian prairie schoolteacher, such as Mr Aberhart was. Much of the estate, besides real property in Vancouver, was in cash. Most of the cash was in savings accounts in chartered banks. The man whose political career was founded on opposition to "money power" and "high finance" had little use for bonds or stocks. A small proportion of his money was on deposit in the Alberta treasury branches, and it is evident that Mr Aberhart did not regard the treasury branch system, which his Government had established in 1938 as an "interim programme" of Social Credit, with his fullest confidence.

Recently the Alberta Government, in which Ernest C. Manning, protégé of Aberhart in politics and disciple in the prophetic Bible interpretations, has succeeded to the premiership, undertook to reorganise the treasury branch system. No longer does anyone expect the treasury branches to flower into a unique and unorthodox Social Credit banking system in which the citizens of Alberta will obtain the dividends of \$25 a month which Aberhart promised in 1935. Opened originally to provide savings and deposit banking facilities for Albertans who did not trust the regular banks, the treasury branches were used also to provide a bonus on consumption of Alberta-made goods. This bonus, amounting to five per cent, was payable on all funds used to purchase goods made in Alberta. This form of economic provincialism has now been abandoned, as a failure, and deposits will in future bear only two per cent interest, a rate comparable to savings bank interest of 1½ per cent.

The treasury branch system has incurred a deficit of \$1,102,456 since it was established, and this sum may reach \$2,000,000 next year. The system has handled only a negligible portion of the normal commercial and savings business of the people of Alberta. The reorganisation is designed, said Premier Manning, "so the entire overhead costs may be offset by investments and other earnings." In other words, the Alberta "bank" system will make loans on mortgages and other security, in order to earn the costs of operations. In circles where money was once regarded as emanating from the end of a fountain pen, this is a considerable concession to orthodoxy. A surprising feature is that the Social Credit Government's new lending business is conducted at the same or higher rates of interest than that of the established financial institutions, against which much of Aberhart's thunder was long directed. The treasury branches have already made loans to farmers at six per cent, a figure once bitterly denounced by Aberhart and Manning as usury.

As an economic theory, Social Credit is dead in Alberta, as dead as Aberhart. The new status of the treasury branch system shows that all thoughts of unorthodox financial experiment have disappeared. On the other hand, the Manning Government is now seeking to refund the provincial debt. Not for the purpose of borrowing money for provincial purposes, but merely to restore the standing of private investments in Alberta, the Government entertains hopes of securing a refunding that will permit it to reinstate all defaulted maturities and reach a settlement on defaulted interest. Since April, 1936, when the Aberhart Government quarrelled with Ottawa and failed to obtain assistance in meeting a maturity, the accepted policy of Alberta has been to allow all maturities to fall into default despite its capacity to pay. On this score, defaults amount to \$31,300,000 to-day. Since June, 1936, the Social Credit Government has refused to pay more than half the coupon rate of interest on its provincial bonds. On this score, the default in interest amounts to \$22,000,000. As a result, Alberta has been paying an average rate of 2.44 per cent, chiefly because the Social Crediters regarded that rate as high enough. The province has enjoyed heavy yields in taxation, and has had an excellent cash position for several years. To refund, the Govern-

ment offered to pay 3½ per cent and clean up all defaults on that basis. The bondholders have asked for 4 per cent. Whether or not refunding can be arranged on the whole debt, which would include \$120,000,000 in Alberta securities, is not known, but the Alberta Government has set this as one of its major objectives.

A Dying Movement

Politically, the Social Credit movement is dying out. There was a marked decline in the voting strength of the Aberhart movement between 1935, when Social Credit first swept into office, and 1940, when the Government was re-elected with decreased majority. Since then, two substantial opposition groups have made progress in Alberta. The Independents, representing a right wing coalition of Liberals, Conservatives and others, are the formal opposition and have 19 seats in the legislature of 55 members. They offer the kind of government already operating in Manitoba and British Columbia, where coalitions are in office. The other opposition group, the Co-operative Commonwealth Federation party, has only one seat in the legislature, but its claims to progress in attracting voters can hardly be denied. The CCF has recently risen to the position of a major force in Canadian politics, and its origins were laid in Alberta in 1932.

The Alberta Government, like the Federal Government and other provincial governments in Canada, is preparing its postwar plans. This year's budget set aside \$1,000,000 for postwar public works. This fund may be increased greatly before it is used. There is no strange or unique philosophy of finance in this type of postwar planning. When the war ends, there may come a rainy day in which roads must be constructed to provide employment and to promote the economic development of Alberta. The provincial government will have money on hand for these purposes. Unlike the original theories of creating credit by writing entries in a ledger, the postwar funds of Alberta are coming out of tax money. As its people contemplate the future, there is little left in Alberta but the memory of Aberhart's prophetic economics, in which the new age would be ushered in with free dividends, costless credit and permanent prosperity for all.

Roumanian Anxieties

[BY A CORRESPONDENT]

November 9th

A YEAR ago, Roumania was so far removed from the scene of actual fighting in Russia that the Government felt safe enough to turn its activities to the exploitation of reoccupied Bessarabia and the Russian Odessa district, renamed Transnistria and handed over by the Germans to Roumanian administration. At present, Russian troops at Kiev are only

THE BRITISH LINEN BANK

150 miles from the Bessarabian border and 200 miles from the 1940 frontier as the crow flies. From Kherson to Odessa it is 100 miles and to the mouth of the Danube 250 miles. The war has moved nearer to Roumania, and the new colony of Transnistria will probably soon be lost. The present Government must take into account the possibility that the Russian armies may march through Bessarabia into Roumania proper, with its oil resources which are indispensable for Germany.

The critical military and political situation coincides, paradoxically enough, with a considerable recovery in the economic situation because of the good grain harvest. Shortly before Mussolini's fall, the Government made a show of an improvement in political and economic relations with Italy. Since Mussolini's fall, however, there have been reports of peace feelers and of sabotage in war factories. The analogy between the internal situation in Roumania and in Italy is at first sight tempting and lends substance to these reports. There is a dictatorship, and there is a king who could form the centre of opposition—indeed, there have been many stories which pointed to differences between the king and Marshal Antonescu. There are, however, great differences, internally as well as externally. Economically as well as from a military point of view, Roumania is of greater importance to Germany than was Italy, whose loss was primarily one of political prestige. If Roumania were lost by a separate peace move or occupation by Russian troops, Germany would have to use every ounce of strength still left to recover the territory. The loss of Roumania would mean the loss of the Balkan countries and immediate danger to Hungary.

Industrial Production

During the course of the war, Roumania's industry has been adapted step by step to some kind of war economy after the model of Germany's totalitarian economy. The process is still not complete, and the general conditions in this peasant country, with few industrial centres, may prevent a fully functioning war economy from being established. As long as official policy was content with expropriating Jewish businesses, no actual advance in industrial activity could be reported, in spite of steadily growing German influence. Roumania's industry is still dependent on foreign raw materials and machinery, which is particularly marked in the textile and iron and metal industries. During 1942, only 3,000 tons of cotton and 5,000 tons of cotton yarn were imported. The rubber industry, with an annual demand of 3,000 tons of rubber, is trying to build up, in collaboration with the German concern, *Continental Gummiwerke AG-Hanover*, the production of rubber from the koksagys plant. This year, cultivation is reported to have yielded 27 tons, which is less than one per cent of the former demand. Before the war, the steel output was only about 200,000 tons, which means that war production depends on imports from Germany.

Last year, the manganese output reached 35,000 tons, which is below the pre-war figure of roughly 50,000 tons. The output of molybdenum ore was 10,849 tons, of copper ore 69,000 tons, of chromium ore 500 tons, and of iron ore 150,570 tons. The total output of coal amounted to roughly 2½ million tons, of which 88 per cent was brown coal, and imports from Upper Silesia were necessary. Half of the coal output was used by the railways. The generation of electricity increased to 600 million kwh. and was produced mainly by diesel engines. Solid fuel and the considerable resources of natural gas are used for replacing oil in factories and for heating buildings in towns. The control of the iron and steel industry, which began with the allocation of castings, rolled material and iron sheets, has now been extended to all finished articles. The Central Department for the Iron Industry, established in March, 1941, also controls imports and exports. The Industrial Federation stated that 70 to 80 per cent of the entire industrial output is for war purposes, and there is no doubt that the attempt to mechanise agriculture out of Roumania's own production of machinery had to be postponed.

Considerable efforts have been made to maintain the oil output, but new borings have only sufficed to prevent a

serious decline. The Ministry for Economic Affairs has now taken over full control of the entire oil industry for the duration of the war, and in July, nineteen leading oil concerns formed a working committee for increasing oil production. The vague reports on the actual output of oil suggest that the average daily output is at present slightly smaller than in 1942.

The most serious problem of Roumania's war economy is the control of prices. From the simple fixing of maximum prices, which were never effective, a General Commissariat for Price Control has emerged with district and local offices all over the country. Since August, 1939, the wholesale price index has increased by nearly 400 per cent. The movement of retail prices is largely influenced by black market activities, and the general situation can be judged by the fact that textiles and clothing are considered luxuries. One of the main sources of state revenue is the income of the tobacco and salt monopolies. In 1942, the tobacco monopoly yielded 18,700 million lei, against 8,700 million lei in 1941. The consumption of tobacco, however, increased only from 11,667 tons to 12,929 tons. The price of tobacco has been raised several times. Although the price of wheat has been fixed at 260,000 lei per wagon (10 tons), the good harvest created the anomalous situation that peasants were forced to sell wheat below this price. The famous price scissors, that is, the difference between comparatively low agricultural prices and high prices for industrial articles, are open wider than ever before.

The control and organisation of workers in industry is entirely modelled after German institutions. A "Work Book," which makes control easy, has been introduced just as in Germany. The new *Munca si lumina* organisation is the Roumanian counterpart of the German "Strength through Joy." It is said that 718 local groups have already been formed. There have been no strikes so far during 1943 after they had been declared illegal in 1942. Direct German interests, already strong in agriculture and industry, have obviously been extended to cover the control of workers. The German Ambassador, von Killinger, recently decorated a number of workers and industrialists for outstanding work. The vital sections of Roumania's economy are thus in German hands, and it seems that the control of the Roumanian Government by the Germans has been considerably tightened since the fall of Mussolini.

West African Cocoa Problems

[BY A CORRESPONDENT]

November 2nd

THE West African cocoa trade has just entered its fifth war season. The 1943-44 main crop is now being gathered, and it is officially estimated that the crop, though remaining well below the record figures of 1935 and 1936, will be equal to an average pre-war crop, that is, about 225,000 tons in the Gold Coast and slightly under 90,000 tons in Nigeria. These two countries are the world's largest and third largest cocoa producing areas respectively, and in normal times used to supply together between one-half and three-fifths of the world's supplies. As far as can be ascertained from the incomplete data of other cocoa producing regions, British West Africa has retained its relative position as a cocoa producer during the war, although its share in actual world sales may have declined somewhat.

Yet the position of the West African cocoa trade in this war differs very much from its position in 1914-18. In 1909-13, world production of cocoa (according to the League of Nations statistics) amounted on an average to no more than 232,000 metric tons, of which the whole African Continent supplied 81,300 tons, or less than one-third. The great bulk of the remainder used to come from Central and South America. During the last war the foundation was laid for the vast expansion in the African crop, which has since then determined the international cocoa position. At the outbreak of this war, world production of cocoa beans amounted to roughly 700,000 tons, of which British West Africa, French West Africa and the Belgian Congo together supplied over two-thirds. The rise in African production had resulted in a big decline in world cocoa prices. Accra (Gold Coast) cocoa, which had cost about 60s. per 50 kilos before the last war, fell to well below 30s., on the average, in the last years preceding this war. The lower prices greatly helped to expand the market for this valuable food product, and imports into the chief consuming countries

in the last pre-war years remained only slightly below current production. The war has, however, completely dislocated the cocoa markets. It is true that the two leading consuming countries, the United States and Great Britain, have retained access to the producing areas, although the shipping shortage has at times seriously hampered their imports. But the European mainland, which before the war used to absorb over one-third of world shipments, was soon cut off, and the economic and financial position of African cocoa growers was seriously endangered. In the Gold Coast, cocoa used to account for over three-fifths of all pre-war exports, in Nigeria its share was nearly one-fifth, in the Ivory Coast nearly one-half, and in the French Cameroons nearly two-fifths.

The British Government, indeed, took immediate action on the outbreak of war. In the first war season, which began on October 1, 1939, the whole of the British West African cocoa trade was organised under the "West African Cocoa Scheme," which was later extended to the rest of the African output. Under this scheme, the British Government, in co-operation with the local Governments, acquires the entire crop from the natives at fixed prices and sells the maximum possible quantities to the British Ministry of Food, the United States Government and some smaller Allied and neutral buyers. Originally controlled by the Ministry of Food, the scheme was taken over by the Colonial Office in the autumn of 1940. The Colonial Office acts through a special Government agency, formed in November, 1940, as the West African Cocoa Control Board and extended in June, 1942, into the West African Produce Control Board. In its trade transactions the Board has made regular use of "the normal trade channels."

Disappointing Results

The experience of the West African cocoa control since the outbreak of war has not been encouraging, as the curtailment of the market and the shortage of shipping prevented regular sales. In the first war season, the Ministry of Food lost £263,000 on its transactions, although the buying price paid to the natives of the Gold Coast, 9s. per load of 60 lb. (equivalent to less than 25s. per 50 kilos c.i.f. UK ports), was not a high one. In the second war season, owing to a cut of 20 per cent in the buying price paid to the natives

and to large United States purchases, this loss was not only wiped out, but, in addition, a surplus of £1,300,000 was achieved. As a result, the buying price for the third war season was raised to 8s. 6d. per load, but sales were subsequently so disappointing that by the beginning of the 1942-43 season the whole of the previous profit had been lost again. There are no details yet about the financial results in the season ended September 30, 1943, but the fact that buying prices paid by the Board to Gold Coast growers were reduced to 7s. 6d. per load in the 1942-43 season and to 7s. for the current season clearly shows that the Board must have accumulated a substantial debit balance.

There was, of course, never any hope of selling the great bulk of the crop during the war, but the financial losses incurred under the scheme were not only due to the decline in sales but also to serious deterioration in quality and to the destruction of considerable quantities of cocoa in West Africa. In view of the inadequate storage installations and the absence of cocoa processing facilities in the African cocoa regions, some deterioration and destruction were inevitable. But it remains to be seen—if ever a full official account of the West African cocoa scheme is published, as it should be—whether serious attempts were made in 1940 and 1941, when the Board had surplus funds and the possibility of obtaining supplies from the United States, to secure improved stores and processing facilities for the local production of cocoa butter, which would have reduced the losses of cocoa beans to a minimum. Brazil, the world's second largest cocoa producer, has not suffered from problems of surplus comparable with those in West Africa, but it has taken active steps to do this, which are likely to prove a permanent gain to its cocoa trade.

In the meantime, the interest in West African cocoa is beginning to shift to the post-war position. On the one hand, cocoa will play an important part both in relief work in liberated countries and in post-war nutrition generally. On the other, the reorganisation of the West African cocoa trade, proposed by the Royal Commission in 1938, will have to be tackled after the return to normal conditions. The post-war requirements for cocoa will be very large, and, with Brazilian stocks virtually exhausted through large shipments in the past twelve months to the United States, the great bulk of supplies must come from West Africa. It is

Vitamins in chocolate for liberated Europe

The British Government, having examined all the ways in which sufficient vitamins could be provided to the under-nourished children of liberated Europe, have arrived at the conclusion—as Rowntrees did in 1938—that chocolate offers one of the best vehicles for carrying added vitamins. In chocolate, the vitamins retain practically all their potency.

Before the war, Rowntrees pioneered the addition of vitamins to cocoa and chocolate. Their object was to enhance the protective value of these already highly nutritious foods.

Today, when the Allied Governments are faced with the enormous problem of rehabilitating each occupied territory as it is freed, Rowntree's experience of fortifying cocoa and chocolate with vitamins on a large scale is proving of great value. When the war is won, this experience will again be used for the benefit of the British public.

ROWNTREES

Do you expect A COLD this winter?

FOR many people, winter brings a long succession of heavy colds. If you suffer in this way, you will be interested in SEROCALCIN, an immunising course of which gives complete freedom from colds in the majority of cases.

How it is done

SEROCALCIN acts by stimulating the natural defence powers of the body. It enhances the resistive capacity against invading organisms that cause colds and prevents a cold before it happens.

Simple and Safe

The immunising course consists of 60 SEROCALCIN tablets taken at the rate of two daily for thirty consecutive days. In 80 per cent. of cases this course gives complete immunity against colds for a period of 3 to 4 months. There are no

"drugs" in SEROCALCIN—it is perfectly safe both for adults and children.

Proved by Tests

Tests by Doctors in private practice, Hospitals and Factories have established the claims made for SEROCALCIN and confirm its ability to give successful results in 80 per cent. of cases.

Supplies and Prices

Hospitals, Schools, Munition Factories and export trade have first claim on supplies, but most Chemists have adequate stocks. The immunising course of SEROCALCIN (Reg. Trade Mark) costs 8/5½, including tax. Industrial and School Medical Officers, nurses, welfare workers, Labour Officers and interested members of the public are invited to write for a booklet "Immunity from Colds," which will be sent on receipt of 1d. stamp.

For existing colds, too

If you already have a cold, SEROCALCIN will probably clear it up in 48 to 72 hours. The dose for this purpose is three tablets three times daily, and a small treatment pack of 20 Tablets (price 3/4½ inc. tax) is now available.

SEROCALCIN PREVENTS COLDS

Harwoods Laboratories Limited, Rickmansworth Road, Watford, Herts.

CAN YOU THINK and talk "on your feet"? Can you convince a crowded audience, stand up and address a public gathering without notes? If not, learn how **RAPIDISM**, fascinating new course, can train you to become a fluent public speaker. Write now for free Booklet to THE RAPIDISM INSTITUTE, 44, TUITION HOUSE, London, S.W.19.

thus of great importance that, according to official information, the West African cocoa shipping position has lately considerably improved; this may allow the transport of greater quantities of cocoa beans to temperate zones, where the danger of loss through deterioration is far less than in the tropical producing regions. As all cocoa which can now be shipped will almost certainly find a ready market immediately after the war, shipments this season may help to restore the financial balance of the wartime West African cocoa scheme. The permanent reorganisation of the West African cocoa trade, which had become an important issue just before the war, does not appear to have attracted much attention since then. But interest in it is bound to revive, now that the British and local Governments have had practical experience in cocoa trading, and the question of securing direct African representation on any control scheme will be one of the chief issues to be decided.

New Chilean Cabinet

[BY A CORRESPONDENT]

September 20th

THE past few months have seen bitter struggles going on for party domination in Chile, and changes and rumours of changes in the Cabinet have been frequent. Ministers were often at loggerheads with the party chiefs, and a stage was reached when nothing could be arranged without the prior approval of the party in question. This was the more apparent within the Radical Party, which had several severe splits in its ranks on matters of policy and, on each occasion, its representatives in the Cabinet were called upon to resign. Next, the Socialist Party refused to co-operate in the government of the country, and a stage was reached on June 6th, on the eve of President Ríos' departure for the United States, when revolution or dictatorship by the military authorities seemed the only solution.

The President took a strong hand, cancelled his journey at a moment's notice, called on politicians to give up party struggles, and to unite for the nation's good, promptly formed a non-party Cabinet of loyal friends, and placed the Ministries of Defence and Home Affairs in the hands of the chiefs of the Army and Navy respectively. At that time, His Excellency declared it was his main hope that he could soon return to a democratic system of government with the co-operation of the parties which had voted him to the Presidency.

Since June 7th, a strong government on non-party lines has brought the country back to normal; bickerings have to all intents and purposes ceased; and the danger of a dictatorship has disappeared. The President's firm action and admonitions have fallen on fertile ground, and he is to be congratulated on steering his way through difficult waters. His temporary Cabinet resigned recently, as soon as he considered that the way was clear to revert to party lines of Government.

The new Ministry shows an important step away from the Popular Front Government of recent years, and has taken a very decided swing toward the centre. The Radical Party, which has the highest representation in Congress, and to which the President himself belongs, has the largest representation. The Democratic Party was offered a Cabinet post, but refused as it considered that its parliamentary representation warranted at least two Ministers. The swing towards the centre is shown by the inclusion of two members of the Liberal Party, whereas the remaining five portfolios are to be held by non-politicians. The portfolio of Minister of Defence has been given to the chief of the Army, a post he had held in the former Cabinet. The former Ministers of Foreign Affairs, Defence, Labour, and Health retain their portfolios in the new Cabinet.

The following is the new constitution of the Cabinet:—

Minister of:—	
Interior	Don Osvaldo Hiriart, Radical Senator and Lawyer
Foreign Affairs	Don Joaquín Fernández, non-party
Treasury and Finance	Don Arturo Matte, Liberal
Defence	Gen. Don Oscar Escudero, non-party
Economy	Don Fernando Moller, Radical
Education	Don Benjamín Claro, Radical
Agriculture	Don Alfonso Quintana, Radical, who held this post under the late President
Public Works	Don Abraham Alcaino, Radical
Land and Colonization	Don Osvaldo Vial, Liberal
Labour	Don Mariano Bustos, non-party
Justice	Don Oscar Gajardo
Public Health	Don Sotero del Río, non-party

This new Ministry has the confidence of the country, especially now that the Radical Party has settled its internal differences.

The cohesion and discipline formerly shown by the powerful Socialist party has declined rapidly during the past few months, owing to internal differences and fighting for party leadership. Don Marmaduke Grove, for many years the recognised leader of the party, has been ousted and his place taken by Dr Salvador Allende. Grove maintains the nominal leadership, but Allende is the executive leader. Despite these internal troubles, the party as a whole has only suffered temporarily in prestige.

The new Minister of Finance has briefly summarised his ideas and policy. He aims to help and protect all workers, whether manual labourers or otherwise. His main tendency is towards an economy controlled in an intelligent manner in order to benefit the great mass of the public. Owing to inadequate policies in the past, he is of the opinion that direct State intervention is very necessary, at least for a trial period, and asks for time in which to carry out his policy and for criticism to be reserved until the fruits of his labours can be seen.

Letter to the Editor

Marine Insurance

TO THE EDITOR OF THE ECONOMIST.

SIR,—May I offer a belated reply to the article from a correspondent you published some time ago on marine insurance? [August 21st, page 242]. The article was widely criticised as frivolous, one-sided and unfair, and the other side of the picture should be presented to your readers.

The correspondent appeared to criticise the standardisation of war rates and marine surcharges, as contrary to the tradition of the marine market, and emphasised the loss of individual judgment to which underwriters have in the past four years submitted; but he did not explain (as he might have done) the reasons which led to this development, and I venture to summarise them:—

On the outbreak of war Lloyd's brokers lost immediately a large proportion of their male staffs—some of them as high a proportion as 70 per cent, and every month since war started fresh calls have been made on the firms' personnel. The difficulties resulting from this drain of manpower need not be emphasised, and, even under normal market conditions, the obstacles in the way of keeping up an efficient service to the insuring public must have been grave.

But the conditions were far from normal. In the first place, every voyage marine risks had a war risk attached to it, and, unless it was one insurable with the Government, the brokers' normal duty to obtain the right rate was doubled. He must be right on the marine and right also on the war. That was brokers' difficulty number one.

Secondly, it soon became apparent that the marine risk was much greater in war than it had been in peace, and that, unless underwriters were to lose heavily on their underwriting, marine rates would have to go up. Voyages were lengthened. The quality of available tonnage deteriorated. Delays in port increased. Supervision became less and less efficient. The old market rates must go up. Brokers' difficulty number two.

How was the rise to be effected? If times had been normal it would have been left to the traditional bargaining between broker and underwriter, and every broker would have had to see to it that his client got away with the lowest reasonable increase in rates. But with the staffs left to them many brokers could not have discharged this duty, and gross unfairness would have resulted between those firms which had lost a very high proportion of their men and others more fortunately placed which had more of their old staff left to them.

It was this consideration which led underwriters to draw up the scales of war rates and marine surcharges and agree between themselves that the scales should be universally observed. The object was not to create a "planned organism" but to avoid unfairness and a state of chaos which might have been not only disastrous for the marine insurance market but highly embarrassing for merchants all over the world.—Yours, etc.,

October 18, 1943.

A MEMBER OF LLOYD'S.

Germany at War

Finances and Prices

RECENTLY a note of anxiety has crept into Nazi speeches on the financial situation, and it has been admitted that the rate of increase in small savings was perceptibly smaller during the fourth year of the war. Yet the commercial banks report a new accumulation of bank posits as a result of greater financial liquidity. The following table, showing the two most important sets of figures for a general appraisal of the situation, reveals an astonishing position.

	(In 1,000 million Reichsmark)		
	National Debt		Notes in Circulation
	Total	Short-term Debt as % of Total	
End of August	37.43	32.9	10.01
1939	66.30	46.7	13.03
1940	111.22	49.3	16.50
1941	167.02	52.6	21.81
1942	229.86	55.7	29.03

In four years of war the national debt has increased by 500 per cent and the notes in circulation by 300 per cent. The annual rate of debt increase shows a considerable acceleration from Rm.28,870 million in the first year to Rm.62,840 million in the fourth. The really disturbing feature for the Nazi economists is the fact that the percentage of short-term loans has risen from 32.9 per cent in 1939-40 to 55.7 per cent in 1942-43. Every device was used in 1942-43 to increase state revenue in order to keep down short-term borrowing. The most notable instance was the capitalisation of the house-rent tax which produced a sum of roughly Rm.8,000 million. Advance payments to manufacturers were stopped. But the great changes brought about by closing down civilian industry, the oscillations in production of armaments caused by the rigorous methods of Speer's engineers, the transfer of factories and the liberal payment of compensation to bombed-out civilians and manufacturers increased state expenditure by leaps and bounds. It is estimated that, during the financial year 1942-43, Rm.110,000 million were available for spending, which was made up as follows:

	(Rm million)
Revenue	35,000
Contributions to cost of occupation, tributes from Poland and the Protectorate, War contribution of German communes, etc.	21,000
Capitalisation of house-rent tax	8,000
Borrowing	56,000
	110,000

In the previous year the total available was estimated at roughly Rm.90,000 million. These are vague estimates published in German papers which contradict each other.

The figures reveal further anxiety. Any further capitalisation of, say, industrial levies or transfer of the capital of the social insurances to the Treasury will not yield what the house-rent tax did. The stop in advance payments for advance orders has already run its course. The attempt must therefore be made to increase revenue by higher taxation. For more than eighteen months Dr Funk, Minister for Economic Affairs, has forecast that taxes would have to be increased. He is clearly troubled by the fact that borrowing provides at present more than half the total expenditure, in spite of heavy tributes and huge clearing debts piled up in occupied and satellite countries.

There is, however, no possibility of increasing the wages which, together with excessively high social contributions and compulsory contributions to the winter help fund, has reached its limit. Foreign workers and the hundreds of thousands of women who are employed in Germany are paid wages below the tax limit. Any increase would at once narrow the margin available for savings, which has already become small. All current wages do is to provide for rations and leave a tiny margin for entertainments, second-hand goods and savings. During 1942 deposits in savings banks rose by Rm.15,000 million to Rm.50,000 million, which can hardly be repeated during 1943. "Iron savings" are relatively small: about four million savers contribute a monthly average of from Rm.70 to 80 million, that is, less than Rm.1,000 million per annum. The main source of increases in small savings, the closing down of independent artisans and small shopkeepers, dried up at the end of the so-called total mobilisation.

In agriculture and industry, too, taxation has also reached a limit. The situation is thus clear. The percentage of expenditure financed by borrowing, particularly short-term, is steadily growing. At the beginning of the war, or rather, at the beginning of the totalitarian economy, stable wages and prices seemed to be the solution of all economic problems. It is obviously felt now that this stability, although maintained for wages and some section of retail prices, has gone in the industrial sector of the economy.

Contradictions

The problem of the stability of prices and wages in a regimented economy can be illustrated by three figures. During the first four years of the war, three indices increased as follows:

	Percentage increase
Wholesale price index	8.6
Cost-of-living index	9.5
Index of share prices	55.3

The cost-of-living index reflects the prices of rationed commodities. The wholesale price index is more or less fictitious. Only the index of share prices gives any indication how prices in general would have moved if some semblance of market activities had been retained. The relative freedom of the bourses, compared with rigid price control and arbitrary price-fixing in other sectors of the economy, shows how prices in general would probably move if control were less effective. The control of share prices and finally of all security prices was for the Nazi planners the most difficult problem. Step by step controls were imposed on, first, speculation and then any wide fluctuation of prices. Then the registration of shares acquired after the war was decreed, followed by the compulsory exchange of these shares against blocked Treasury bonds. Then came the declaration of a price-stop for shares, and the latest measure has been the fixing of maximum prices for shares, industrial debentures, mortgage bonds and communal loans. Dealings on the basis of higher prices are now heavily punished. The result of this policy, necessary because free dealings would have threatened the complex system of price control over the whole economy, is that the bourses are actually at a standstill; and the quotations which are fixed from time to time show the most curious anomalies. Normal relations between issue prices and quotations, between interest rates and quotations, have gone, and they are now as arbitrary as the prices in industry.

Unfortunately for the Nazi planners, capital markets cannot simply be closed down like commodity markets, where the allocations and distributions of commodities can be organised without any free market movements with a system of war economy. The complex division of labour in modern industry and the capital outlay necessary for new factories or for the preparation of new production programmes are possible only on the basis of credit. Shares and securities are still private property. Private loans for industry are issued, capital is privately accumulated and these circumstances make it necessary to retain the capital market. Nazi ideology and hard facts cannot be reconciled. The simple drastic step of requisitioning openly all private capital is impossible. It has been frequently suggested but always turned down. If carried out, it would remove the last semblance of private initiative among industrialists, who at the moment seem still to believe that they can dispose of their own capital.

If the increase in the national debt is compared with almost stable prices, it is obvious that prices are no longer an indication of the value of industrial output. It can be estimated that production would have increased by half if prices had really been stable, whereas in fact total production is certainly smaller than before the war—if the output of the incorporated provinces is deducted. Prices are arbitrarily fixed, and the Government pays different prices for the same article coming from different factories. There are at least five different kinds of price, distinguished by wartime methods of costing, which are essentially different from costing methods in the peacetime economy of democratic countries. This is true of wages also. The methods are extremely complex and yet, in spite of all this elaborate mathematical ingenuity, the calculations are based on nominal price levels which are a relic from the democratic past in the form of stopped prices and stopped wages. The present actual prices cannot be compared from factory to factory; the lists are secret; and the whole system depends on the controls remaining effective.

THE BUSINESS WORLD

The Durham Coalfield

THE coal industry's fundamental problems are capable of solution only on a national basis, and now that wages and conciliation are handled nationally and the miners have decided to set up a single union, there is a natural tendency to make generalisations about the industry. At the same time, there is so much variation between individual coalfields, that it may be useful to examine some of the present problems in relation to a particular area. Durham, which is the oldest and largest in the country, provides a suitable subject for review.

In 1938 Durham was producing some 31½ million tons with a total labour force of 115,520, representing about one-seventh of both the nation's output and manpower. Although there had been a substantial decline in both output and manpower during the period between the two wars (170,000 men were employed in 1920), there were indications, with the revival in industrial activity during the late 1930's, that Durham was beginning to find its feet again. The war has seen a steady deterioration. Publication of the actual figures is, with needlessly coy reserve, frowned upon by the Ministry, but taking Durham's proposition of the industry's total output and manpower at one-seventh, production in 1942 was between 25 and 30 million tons, and the number employed round about 100,000. In spite of a slight increase in the numbers employed since 1941, output per manshift has continuously fallen. In 1938 it was 22.82 cwt. per manshift; in 1941 it was 20.41 cwt.; in 1942, it had fallen to 19.93 cwt., and in August of this year to 18.71 cwt.; Durham has never reached its weekly target under the Greene scheme, which was perhaps about half a million tons.

Many reasons have been advanced for this disturbing decline in productivity. The most important factor—and this is recognised by the Government, the owners and the miners' union alike—is the shortage of productive workers, while the men in the industry have grown older and more tired under the strain of 4½ years of war. The intake of juveniles has been insufficient to offset the loss of elderly and sick men. This is in part a reflection of the declining birth rate during 1920's, which was particularly marked in mining communities. Taking 1923 as 100, the number of live births in England and Wales had fallen to 88 in 1928, while in such mining areas as Consett (Durham) and Ashington (Northumberland), it had fallen to 82 and 75 respectively. Before the war, Durham had about two thousand boys under 16 in mining; there are probably less than half that number to-day. Even more than in other parts of the country, boys have been reluctant to enter an industry which could offer so little, and they have been discouraged from so doing by parents and school-teachers. There has been a serious

decline in the proportion of actual productive workers: the number of surface workers has remained fairly steady since 1938, but the number of hewers, fillers and other underground workers had probably dropped by nearly a fifth in 1942. Surface workers have been reluctant to go underground, and underground datal boys have in some cases declined to be upgraded to piecework at the face; they could earn almost as much, with less danger, on datal wages under the Greene award.

The county estimates that it needs an extra 5,000 workers to meet its manpower requirements, and it intends to absorb between 4,000 and 5,000 men during the first six months of next year, when the Government's scheme for placing mining on a priority with service in the armed forces will have come into operation. The proposal (described in *The Economist* on November 5th) is to set up two training centres, at Horden and Morrison North pits, which should be able to feed the surrounding pits at the rate of 150 men a week. These trainees will not immediately become productive but their employment should make possible the upgrading of other workers. Both the Durham Coal Owners' Association and the Miners' Association are co-operating fully in the scheme, and no great difficulties are anticipated in its operation, provided the men in the pits agree to the necessary upgrading. The most difficult problem will, perhaps, be that of finding accommodation. From many points of view there are advantages in lodging the men with miners' families, so that they can become quickly acclimatised to the life; on the other hand housing conditions are congested and often very bad. If not enough men can be billeted, the plan is to set up temporary houses and hostels.

The owners' view is that the lack of discipline and the decline in output. They complain that the men arrive late, leave work too soon, are careless in filling dirt with the coal—thus increasing the labour of the surface workers—and do not clear the face properly for the next shifts. Moreover, it is said that the guaranteed working week has removed the incentive to production, and that the Essential Work Order has undermined managerial authority. These criticisms are by no means confined to Durham. There is less ground for charges of excessive absenteeism, since Durham has the lowest rate of avoidable absenteeism in the country. The total rate is 9.5 per cent, but the rate of voluntary absenteeism only 2.5 per cent; for the industry as a whole the absenteeism rates are 4.83 per cent voluntary and 7.26 involuntary. The country has adopted a scheme which should reduce avoidable absenteeism and which has been accepted by all but six of the 80 miners' lodges. The Ministry of Fuel's Regional Investigation Officer, with two assessors representing each side of the pit production committee, can impose a fine on the spot, up to a maximum of £1. If the offender works regularly for six weeks without losing a shift, the money is refunded, forfeited fines being paid over to some such charity as the Aged Mineworkers' Homes Association. The success of the experiment is shown by the fact that the fines have been refunded in half the cases. This procedure is speedier than the old method and the men prefer it to being taken to court; they feel that it is fairer and the possibility of earning a remission provides an incentive to better attendance. Under the old system when a man could be fined up to £10 by the court, he was able to enlist the sympathy of his fellows; now he has only himself to blame. This scheme is on a voluntary basis, but the Minister of Fuel might well consider regularising the position and having the same method adopted throughout the country. A similar procedure might also be applied to cases of indiscipline.

Involuntary absenteeism presents an altogether different problem, and the best way to reduce it is to improve the arrangements for safety and welfare. The accident rate in Durham has risen alarmingly; there were 118 fatal accidents in 1942, as compared with 88 in 1938—as in the last war, the curve has been steadily rising. It is hardly

surprising that the miners feel strongly about the inadequacy of compensation rates, in view of the fact that there are about 1,100 men in receipt of partial compensation, more than half of whom are absolutely unfit for any work in the industry, and the rest only fit for light work on the surface. If more surface workers would go underground, many more compensation cases could be placed in light surface work. As for welfare, Durham is an old coalfield, with little tradition of welfare, though the war has brought about many improvements. There are now 139 collieries in the district with canteens of one sort or another—soon over a hundred will supply full meal service. The canteens, broadly speaking, are well used, though they could be used to a greater extent, to supplement rations. Only about 36 collieries, mostly the larger ones, have pithead baths.

One of the chief problems in the area is how to secure a better spirit of co-operation. Both sides may be to blame for the lack of it, but the fact is that the Durham miners find it hard to forget the long history of unemployment and wage reductions. This atmosphere has made it difficult for the pit committees to function as effectively as they might. As in the rest of the country, some committees are good and some are not so good. Many have made useful contributions on technical points, but under the present organisation of the industry the committees are bound to be limited. Moreover, they are debarred from discussing wages, which are the chief source of friction in the area. The miners claim that the adoption of their programme for control would result in better co-operation at the coal face and better discipline, and would put an end to unconstitutional stoppages, of which Durham has had its share. Between July, 1940, and September 25, 1943, there have been about 50 stoppages. Most of these were of short duration, the majority lasting only about 24 hours, but their cumulative effect on output has been considerable.

The underlying grievance, even if not the immediate cause, of all the stoppages has been wages, and in about four-fifths of the cases they have been due to the pieceworkers' demands for increased piece-rates or amendments to their piecework agreements. Although pieceworkers to their piecework less than 40 per cent of the total personnel, they occupy a key position in the miners' lodges. The whole structure of coalmining wages is inordinately complicated, but the wages in Durham have been among the lowest in Great Britain. The contention is that nearly half the pieceworkers' wages (which include 6s. 8d. a day flat rate and the wartime additions) are not directly related to piecework production, and the pieceworkers feel that they are being balked of their appropriate earnings. This has contributed to the unwillingness, mentioned above, of datal workers to

be upgraded to piecework at the face. A revision of the piecework structure might go far to promote harmony in the coalfield. The actual direction of surface workers underground, which caused so much trouble in other coalfields, has hitherto occasioned comparatively little disturbance in Durham, though the men resent the use of prosecution, and a strike over the imprisonment of a 19-year-old youth has just ended. An interesting suggestion, put forward from the area, is that an industrial psychologist, with practical experience of mining, should be appointed to deal with the younger men in particular and to advise the pit committees on direction. The prospect of a rapid influx of men into the industry makes it desirable that measures of this nature should be tried.

Durham's difficulties are accentuated by the age and structure of its basic industry. Many of the pits are more than a hundred years old, some have only a few more years' lease of life, and a great many, particularly in South-West Durham, have already been worked out and given over to flooding. This factor and the thinness of many of the seams account for the coalfield being one of the least mechanised in the country. In 1938 only 42 per cent of the coal was cut, and 25 per cent conveyed mechanically, as compared with 59 per cent and 54 per cent for the country as a whole. The proportion has slightly increased during the war, and last year 43.71 per cent of the output was cut and 30.6 per cent conveyed mechanically. The introduction of further machinery into suitable mines is now planned. But the Durham coalfield as a whole provides an outstanding example of the need for reorganisation in the interest of technical efficiency. Nearly 200 mines are owned by a great number of different undertakings of varying size and efficiency. Some are fairly large independent companies; there is a group of small concerns which have retained a strong family character; but the dominant influence lies with the large concerns, integrated with other heavy industry. Dorman Long and Company, Pease and Partners, and the Consett Iron and Steel Company between them were responsible in 1938 for an output of 6½ million tons, about a fifth of the county's total output. The Coal Commission, reporting in 1938 under section 12 of the Coal Mines Act on the furtherance of reorganisation, suggested that these three should be left out of any scheme on the assumption that "they would wish to remain as they are." Nothing came of the Commission's attempts to reorganise the industry, and the position has been left very much where it was. If anything, the need for reorganisation has been emphasised by the war; indeed, the future of Durham's coal industry largely depends upon the level of technical and organisational efficiency which can be reached.

Business Notes

A Silver Wedding

The yearly election of Mr Montagu Norman to the Governorship of the Bank of England has become one of the well-established traditions of the City and therefore accepted as a matter of course. The only recent occasion when the event aroused any excitement was on the approach of Mr Norman's seventieth birthday when, by the traditions of the Court of Directors, he should have retired. That tradition was waived for very good and adequate reasons, to be found first in the person of the Governor himself, and secondly in the exceptional circumstances of the war which not only in the Bank of England, have required the older men to continue shouldering burdens which would otherwise have been transferred to younger men now occupied elsewhere. When that precedent had been overcome, interest in the annual elections again waned. The latest announcement that Mr Montagu Norman is again recommended by the Court for election to the Governorship next April is, however, worthy of special notice, for his next year of office will mark the silver jubilee of Mr Norman's wedding to the Old Lady. Heaven forbid any indiscreet inquiries to the dominant partner in this *menage*. In this country, the institution is usually greater than the man. But one can confidently assert that no man has, in this case, had more influence over the institution. The Bank to which Mr Norman was appointed Governor in 1919 has vanished—but for the outside protective wall. Its organisation and the recruitment of its directors and higher officials have been revolutionised. But despite these external changes, the old tradition of the Bank, that of "a privately owned insti-

tution performing an important public service," remains. This feat of modernising the Bank and fitting it for the great tasks of to-day, while yet retaining intact the tradition of two and a half centuries, is the monument which Mr Norman will leave behind him. Next year will certainly be a momentous one for the Bank for, in addition to the Governor's silver jubilee, it will celebrate the 100th anniversary of the Bank Charter Act and the 250th of its foundation.

* * *

Dollar-Sterling Ratio

The White Paper on Mutual Aid gives the first official comment on the prolonged discussions of the true dollar-sterling parity that should be used for converting the war expenditures of the two countries into real terms. The White Paper, pointing out that estimates of lend-lease and reciprocal aid are made independently by the two Governments in terms of actual cost to themselves goes on to suggest that such comparison of money values, unless made with circumspection, will lead to a serious underestimate of the British contribution. . . .

The price-levels in the United States of the labour and materials most in question are substantially higher than ours. Thus, American book costs probably exceed similar British costs by more than 50 per cent. This is not an accurate guide to relative efficiency, after allowing for differences in wage-levels, since costs in the two countries are computed on bases which are widely different in several respects. But they do afford an approximately accurate corrective for the book-costs as entered up for the present purpose.

Deductions made from this official estimate of relative costs in the two countries should also be made with circumspection. One thing which the White Paper does not prove is that the true sterling-dollar parity is somewhere over \$6 to the £, or that it is to this kind of figure that one should look for the correct post-war relation of the two currencies. The basis of costs used for this comparison is too narrow and too artificial to allow of generalised application of this kind. Moreover, it is a basis which is shifting the whole time, and, on the whole is probably moving against sterling as the American war industrial effort gets into its fullest stride. The exchange ratio brought out by comparing the cost of building the first thousand Rolls Royce engines in the United States must have run into hundreds of dollars to the pound. Even if a ratio of \$6=£ were truly applicable to peacetime commerce, there would be a case for keeping the pound undervalued in terms of the dollar in order to adjust the terms of trade between the two countries to the revolution in their respective international debtor-creditor positions. If the obstructions in the way of sales to America are not greatly reduced, the apparent overvaluation of the dollar would have to be considerable for a balance to be achieved in a free market.

Market Rise Resumed

Since the Prime Minister's Mansion House speech there has been rather less talk of a very early end to the war. Possibly this is responsible for the halt in the wave of selling and the recovery which followed it. Industrial equities are by no means the strongest section, but it looks as though, even there, the rise is, so far, more rapid than was the fall. In view of the fact that there has been a material falling off in bargains marked and, it is believed, in actual money value of turnover, the higher prices must arise in large measure from marking up by jobbers. Since they are believed to have good supplies of stock on their books, it might have been expected that they would be ready sellers. If they are not, it can only be because they expect the public to "come in buyers higher up," and there are beginning to be signs that this is happening. The whole move-

ment is, however, so far on a very small scale. The best reason for expecting the recovery now in progress was the sharpness of the previous fall and the ragged nature of the selling. If the present rise continues at the present rate it may, in its turn, give way to a fresh bout of profit taking. There is still a good way to go before the peak of early October is reached. It would be unduly optimistic to expect that to be passed, but a general level not substantially below it may well be established.

Rubber and Rayon

Rumours that a firm in this country had been granted a licence to manufacture synthetic rubber were confirmed on Wednesday last week when Mr Lyttelton, Minister of Production, announced in the House of Commons that he had decided to authorise the use of building labour and materials for a scheme, on condition that this did not affect the production of goods of higher priority. The Government's decision to permit the construction of a plant for the manufacture of synthetic rubber is to be welcomed as an acknowledgment of the growing importance of synthetic rubber and of modern developments in the chemical industry rather than as a measure to alleviate the war-time scarcity of rubber. The decision was taken long ago that Great Britain's war-time needs of synthetic rubber were to be met from the huge plants that have been constructed in the United States, using mainly oil but also grain and coal (calcium carbide) as raw materials; production in the United States is growing and, as Mr Lyttelton pointed out, supplies are now being made available to this country. If it had been the Government's intention to alleviate the wartime shortage of rubber, it would no doubt have provided the necessary facilities some time ago. Actually, the plant is to be financed by British Celanese, Ltd., the well-known rayon manufacturing concern, and the process, of which details have not been published, is apparently one of those which use coal as the raw material. Although Mr Lyttelton pointed out that production will be on a commercial scale rather than experimental, it can hardly be on a large scale until the product has been tested by the market. And since labour and materials are only now being made available for the construction of the plant, that test cannot be made in the near future. In view of the facts that the new plant cannot be ready for production until well into next year and that, in times of peace, natural rubber is not only available in abundance but in super-abundance, it may be asked whether the construction of synthetic manufacturing capacity in Great Britain has any *raison d'être*. The answer is that it is fully justified, and for two reasons. First, synthetic rubber has properties that are denied to natural rubber and serves a number of specialised uses. Secondly, the manufacture of synthetic rubber is a branch of a new line of chemical processes which offer great possibilities and whose deliberate neglect might, in later years, appear in the same light as a refusal to experiment with the petrol engine on road vehicles because there were plenty of horses.

Future of Cotton Industry

In the autumn of last year Mr Hugh Dalton, President of the Board of Trade, requested the various sections of the cotton industry to furnish him with their views on the present position and future problems of the industry. As a result, the Cotton Industry Conference was set up under the auspices of the Manchester Chamber of Commerce, but the trade unions refused to take part in its deliberations, apparently on the ground that it sought a solution within the framework of private enterprise and the existing structure of the industry. Indeed, the United Textile Industry Workers' Association, embracing the trade unions in the industry, prepared its own report, published last week, on "ways and means of improving the economic stability of the cotton textile industry." The report plumps for complete state control by buying out existing owners.

The way to meet foreign competition, satisfy the aspiration of the workers to a better life, and make the industry a national asset is by the socialisation of the industry.

The Association envisages the grouping of the sectional units in the industry under a general board consisting of five departments—production control, technical research, marketing control, marketing research, and labour recruitment and welfare. This board would consist of fourteen members, with a chairman, a man of outstanding success in

the management of a large business enterprise, appointed by the Board of Trade, a representative of the Board of Trade, the heads of the control departments, and representatives of the operatives and of the administrative staffs. The scheme provides for four control committees—for raw cotton, production, marketing, and sewing cotton—and to ensure collaboration on general policy the chairman of the general board would also preside over these committees. Even if a case had been made out for nationalisation, this cumbersome organisation would surely be quite unworkable. But, while the industry is certainly in need of drastic overhaul, the Association's case for nationalisation lacks the conclusive evidence which alone could justify such a step. Not surprisingly, one theme of the report is the urge for security of employment. This somewhat naive passage may possibly be traced to the influence of the World Trade Alliance. The report suggests

an International Control Board to allocate to each country its quota of piece-goods to the various markets and to fix the prices of such goods. In the case of any country exceeding its quota as regards quantity or undercutting in prices, steps should be taken to stop the supply of raw cotton or prevent the export of piece-goods.

It would naturally open up a rosy future if such a Control Board allocated quotas on the basis of existing capacity in each cotton manufacturing country. But is this at all conceivable? The Association also suggests "helping exports by increasing the prices of home-consumed goods." How about the wretched consumer? Fortunately for him, and unfortunately for the Association he has a choice of textiles at his disposal, and a choice that will become more varied after the war. Surely, if Lancashire's cotton operatives wish for prosperity they must think in terms of textiles, rather than of cotton only, and in terms of real costs. Despite some valuable suggestions their approach is outmoded.

Another World Currency Plan

Mr Leon Fraser, president of the First National Bank of New York, has added an interesting contribution to the debate on post-war currency plans. Unlike most American bankers who have taken part in the discussions, Mr Fraser looks rather beyond a mere return to the orthodoxies of the gold standard. He visualises the need for some international organisation to promote collaboration between countries prepared to adhere to a system of stable exchanges, but he believes that such an international bank "should develop out of the facts of present world finance and trade rather than out of an abstract blue-print." The first effective step towards world exchange stability must, in his view, be an agreement between the United States and Great Britain. This brings Mr Fraser to the problem of sterling—one which he ranks as "the world's financial problem No. 1." To solve that problem, created by the large volume of external obligations created by Britain during the war, Mr Fraser suggests, the following help from the United States:

1. A \$5 billion credit to Great Britain, in the form of a call on gold, on the understanding that neither nation would engage in competitive exchange depreciation. (These last three words would require some definition.)
2. Formal cancellation of the British war debt balance from the 1914-18 war.
3. Provision for a moratorium for a five-year period on any post-war lend-lease payments involving British transfers.

The basis behind this dollar-sterling international standard—to which other nations would be invited to adhere—would be gold, with the dollar firmly anchored to the metal and the dollar-sterling rate fixed by the two Governments and protected during the post-armistice transition period by exchange control and American gold. As a further element in his plan, Mr Fraser suggests that the Bank for International Settlements should be reorganised. It is also refreshing to find Mr Fraser suggesting "that the United States must act like a creditor nation, encouraging imports of goods and export of capital."

A New Savings Drive

The Army is to have its special turn in the campaigns of the National Savings Committee, whose national appeals have been based successively on war weapons, warships and

"wings." Next year the drums and speeches will "salute the soldier." The local weeks will follow the familiar pattern. London will provide the spectacular send-off to the whole campaign from March 25th to 31st, and during the next four months every town and village in the country will have staged its savings week. The management and presentation of these campaigns have undoubtedly improved with the passing years. If that improvement is maintained, next year's series of weeks should well repay the effort and expenditure involved. The emphasis should be placed on abstinence from spending and consumption rather than on big target totals, and, as in the case of this year's Wings for Victory weeks, it is to be hoped that the intrusion of big institutional investors will be kept down to a minimum. The Chancellor of the Exchequer, who spoke this week on the four years of the war savings campaign, stressed the need for continuing restraints in personal expenditure not only at present but during the immediate post-war period, because "the repair of war damage and reconstruction of industry must have first charge on the country's resources, and it will take time to provide any appreciable increase in the volume of goods available for private consumption." Sir John Anderson in his speech answered two questions which he thought might be in people's minds as the war drew nearer to an end. They were "Shall I be able to get my money back when I want it?" and "Can I be sure that the money will not lose its value if I leave it in savings instead of spending it now?" To the first he was able to give the obvious answer that "loans to the State will be honoured without exception or qualification." To the second he replied with the Prime Minister's pledge that these savings would be redeemed "in an equal degree of value," amplifying it with the promise that the Government intended to continue the policy of price stabilisation after the war "to the utmost of their ability." The Chancellor made a good thrust when he pointed out that the redemption of this pledge was also a challenge to the savings movement because the economic stability of the nation after the war would rest in a large measure on the continued vigour and success of the movement.

Secret Dossier

Hand in hand with the growth of the organisation of trades and professions into groups there has gone a growth in the habit of compiling dossiers, both of members of the group and of those with whom they are brought into intimate contact in the outside world. Recently there has been considerable heart-searching about how far such information may be made the instrument of oppression, possibly with the best intentions. In particular this question is being raised with reference to the proceedings of the Committee of the Stock Exchange, London. No allegation is made as to any ill-effects of the system, so far. It is only the principle which is questioned. This is a matter about which it is not possible to be dogmatic. It is clearly of great value, and indeed inevitable, that where questions of credit standing are involved, as is the case with banks, the Stock Exchange and other financial institutions, information ought to be available to individual members, and there can be no legitimate objection to the collection being done by the organising body rather than by the member. Probably there are cases outside the financial world where information of a different type is equally desirable. In so far as this information concerns individuals who are not members of the body which collects it, a certain discretion is required in communicating information, which may not always be reliable, to individual members, but no question of principle arises. The position is, however, different where it is either a question of organising the members of the group to boycott an outsider, or of using the information in the dossier to discipline a member of the group. Here the guiding principle should be that applied by the courts, namely, that while evidence of past misdemeanours should not affect the verdict, it should influence the sentence. The trouble is that, while the judge and jury know nothing of the past history of the defendant, some part of the contents of the dossier is likely to be known to those who are called upon to reach a decision in the cases under consideration. That being so, the best that can be done in the case of a member of the group is that there should be full disclosure to the defendant of all the material which is in fact being taken into consideration and that he should be given every opportunity to rebut any evidence advanced. As to the instrument of boycott, it is far from certain how far its use ought to be permitted. It is, however, almost as likely to be practised in the absence of information as when a dossier is available and, unless one postulates a conspiracy in restraint of trade, the presence of information is likely to lead to healthier results than its absence. None the less, both the compilation and use of the dossier calls for a very high sense of responsibility.

Profits Still Mark Time

Company results in the third quarter again give an illusion of slightly expanded profits, marked by a rise in the gross profits index (Table I on page 696) from 103.0 to 106.1 (based on the notional year "1940"). In fact, the whole of the increase, such as it is, is attributable to a substantial improvement in oil company profits, less a further slump in rubber earnings. As Table VI shows, gross profits of oil companies increased by £3,584,000, rubber profits fell by £1,176,000, and the 515 companies as a whole showed an increase of £2,129,000. As a measure of the movement of aggregate home industrial profits, therefore, the latest figures still record "no change." The apparent expansion of over-all profits permits an increase in equity dividends, proportionately to as much as 57 per cent. of total earnings. Analysed by accounting periods (Tables II and III) the so-called expansion of gross profits looks a very mild affair, and the net profits index (Table IV) is with difficulty maintaining a level 6 per cent. lower than the base period (1936) and 25 per cent. below the pre-war level. Possibly the slight improvement in the return to equity shareholders is in part seasonal—third-quarter companies tend to earn and pay higher ordinary dividends than second-quarter companies. Thus, although the average rate of ordinary dividend (Table V) rose from 8.3 per cent. to 11.9 per cent. between the second and third quarters, the corresponding figure for the third quarter of 1942 itself rose from 8.6 to 10.0 per cent. Earnings and profits, in sum, show no evidence of release from the shackles which have bound them for four years.

AEC Bonus

In the company world, the event of the week has been the declaration of a cash bonus of 5 per cent by the Associated Equipment Company, as well as the normal dividend of

7½ per cent, both free of tax. The only other information provided is that the net profit is £227,500 against £141,500 for the year to September 30th, 1942. The shares, which had been steady for a long time at about 65s., improved almost 10s. but now stand at 70s. The balance of profit on trading, after charging factory and other expenses, rose from £111,000 in 1932-33 to some £430,000 in 1936-37. After a minor relapse, they climbed to a new high for 1941-42 of some £795,000. But the net amount available for dividends, which was £217,500 in 1936-37, has averaged only £165,500 for the five years to September 1942. The latest figure shows an increase of some 37.4 per cent over that average. A concern of this nature must have been very fully employed, and it is difficult to see why distributable profits have been so much below the apparent EPT standard. The relevant question is whether this jump to a figure which seems to be in excess of that standard is due to a real increase in earning power or merely to financial or tax adjustments. The accounts offer little guidance. Reserves for depreciation seem moderate, but the fact that the net profit always comes out at a round figure suggests that there may have been substantial adjustments before the gross amount is reached. The fact that the 5 per cent addition to the distribution is described as a bonus is inconclusive—another instance of the great need of definition. In the circumstances, it is regrettable that some explanation of the sudden increase in payment was not forthcoming. If it does arise from a change in the fortunes of the company, it is a pity that the shareholders were not given earlier notice of it. The board are, however, to be congratulated on the complete absence of any leakage of information.

Coal Output

The output of saleable coal in the four weeks ended October 30th increased by 88,600 tons over the previous four-weekly period, and the weekly average of 3,908,000 tons represents the highest output, except for the average in June, during the last seven months, though it was 216,000 tons below the corresponding period of 1942. The figures, given in detail on page 695, reveal an upward trend which is encouraging, as is the steady output from opencast workings, which averages between 120,000 and 130,000 tons a week. It would, however, be foolish to set too much store by these facts. The coal position is grave, and a timely warning against complacency was given by Lord Hyndley, Controller-General of the Ministry of Fuel and Power, at last week's meeting of the British Coal Utilisation Research Association. He pointed out that the national coal requirements would increase with the extension of military operations, and that it was necessary to send the very best coal abroad for operational purposes. A similar warning has been given in a pamphlet on "Coal and the Nation" by Mr Arthur Horner, president of the South Wales Miners' Federation. He estimates that some 210 million tons will be required during the coming year, whereas the present level of production amounts to less than 190 million tons a year. Next week the Mineworkers' Federation is holding a special two-day delegate conference, to consider the Government's reply to their proposals for improving output. No doubt the conference will also discuss ways and means of preventing the unconstitutional stoppages that have been increasing in number and extent. During the past week some 10,000 miners in the Lancashire coalfields have been on strike; the stoppages involving 2,000 men in Durham and 300 men in Nottingham have come to an end. The Executive of the Durham Miners' Association have issued a strongly worded circular roundly condemning strikes.

Coal Distribution Costs

In a memorandum which it has recently compiled for the use of members of area advisory committees under the Retail Coal Prices Order, 1941, the Ministry of Fuel and Power has outlined a more clearly defined programme for the regulation of retail margins than that given in any previous official instructions affecting the cost of the distribution of house coal. It is well known that the retail is the least organised branch of the coal trade. By the House Coal Distribution (Emergency) Scheme many changes have been suggested, including greater integration, co-operation, pooling, and other expedients to raise efficiency. These suggestions, however, have been given only a limited application; there are still many areas in which the methods of distribution differ little from those in operation before the war, except in so far as they have been unavoidably affected

RATIONING MAKES EXTRA VITAMIN SUPPLY ESSENTIAL

The body must have enough vitamins A and D if it is to remain healthy. Before rationing most of us got sufficient of these in our ordinary meals, but wartime diets tend to reduce the vitamin value of our food. A daily dose of Crookes' provides sufficient 'anti-infective' vitamin A to enable you to resist colds and influenza, it provides, too, the correct amount of 'sunshine' vitamin D to keep adults healthy and to allow children to grow up with strong bones and sound teeth.

WHAT KIND OF WORLD?

"The question is being asked to-day everywhere in the world. No expert is needed to tell you the answer.

It must be a world as peaceful and neighbourly as your own town; a world in which decent people can bring up their children decently. It must be a busy world where factories and farms are working and where there are jobs for all.

How can such a world be brought into being? The surest way is to think and talk about it. Full and complete discussions on the porches of this country, and over its fences, in churches, schools, clubs and always at meals—that is how the terms of A JUST AND DURABLE PEACE can be formulated.

In your discussions keep in mind this fact; your terms of peace must be such that the people of other lands can agree with them. There must be provision in your plans for sustained production and for consumption of that production.

Only a world peace that squares with the conscience of men of good will can be just. Only a just peace can endure."

by the increasing scarcity of labour, particularly in haulage. Apparently the Ministry of Fuel and Power intends to force the pace of economy by making it a decisive factor in the consideration of future claims for increased retail margins. Generally speaking, the margins now in force are those of September, 1939, subject to a national increase of 1s. per ton, with additions to meet special circumstances. It is expected that there may be applications for increases in connection with the compilation of the "keys" attached to the schedules of maximum prices since 1941, indicating precisely to consumers the different descriptions of coal which are regarded as covered by each of the scheduled grades. Merchants, however, are informed that it is the general policy of the Government that, so far as possible, increases in distribution costs should be met out of economies effected through rationalisation, and that no further national increases in margins are likely to be authorised by the Ministry, except as a result of a thorough survey of costs and proceeds. These surveys are to be conducted from headquarters, and the area advisory committees have been instructed that, in the consideration of the applications for higher margins, they should have regard to the following, among other factors: (a) increases in the proceeds of sales as well as in costs of distribution; (b) the scheduled prices originally fixed may have been the highest average list prices rather than the average price *actually realised* on sales, or they may have been stabilised at an abnormally low level; (c) the discontinuance of lower summer prices, fewer special discounts, and the practical elimination of "cut" prices; (d) the greater regularity of the house coal trade than before the war, the elimination of competitive advertising, and a falling off in the peacetime standard of service. There are approximately 30,000 retail merchants in the house coal trade, and their margins (covering costs as well as profits) vary widely in different parts of the country. According to the Ministry of Fuel and Power, the delivered charges of merchants are sometimes as low as 7s. or 8s. per ton, and in others "they run as high as 20s. per ton or even more." Since the war there has been an increase of about 30 per cent in the retail price of coal as measured by the Ministry of Labour. For this increase the chief cause has been the higher pithead prices authorised by the Government to cover the cost of wage advances, dearer materials, and other charges. In a representative coalfield these have totalled between 11s. and 12s. per ton. Other additional war-period costs have included a 16½ per cent increase in railway rates, much heavier demurrage and wagon-hire charges, dearer labour (particularly in the haulage of coal from siding to consumers' cellars), petrol and repairs, short weights, bad debts, and so on, as well as the general increase of 1s. per ton in the margin of retailers. The effect of these changes has been to raise the average margin (inclusive of profits) in this particular area from about 11s. to between 13s. and 13s. 6d. per ton, the pithead price from 26s.-27s. to 37s. 6d.-38s. 6d., and the delivered price for Grade "A" coal from 41s.-42s. to 57s. 9d. per ton.

Scottish Arms Factories

Following the report of the Select Committee on National Expenditure, the Ministry of Supply has decided to concentrate the production of four munitions factories in the West of Scotland into two factories. This will "enable the two factories to be run at about their present strength on munition orders." Three of the four factories are managed for the Ministry by a well-known Scottish firm, the fourth being owned privately by the same firm, and the Select Committee, finding that one of the factories in the group was "costing large sums of money for a very small return" and that there was no prospect of increasing its allocation of work under the production programme, recommended that its ordnance side should be closed down. The Ministry of Supply is arranging to place urgent work of a different kind at one of the factories where weapon production is being stopped, and is putting in a new management. At the same time the Ministry of Production has been asked to consider the possibility of finding alternative work for the part of the other factory where weapon production is being stopped—the one which was so severely criticised by the Select Committee—and where the employees are mainly immobile women engaged on unskilled work. The rapid decision to concentrate the group's production is in marked contrast to the original delay in investigating the state of affairs at the factories. At this stage of the war, when the production programme involves constant adjustment between different types of war weapons and the Ministry of Supply's

programme is being cut down, this concentration of production is probably necessary in the interests of economy and efficiency. But it might have been better had a full enquiry been undertaken into the management and organisation of the factory at an earlier stage, and prompter attempts made to bring work to a plant on which so much capital had been expended. The decision has not been well received in Scotland, where it is feared that it will mean further transfers of labour from the area and may worsen the West of Scotland's post-war prospects of employment.

Brazilian Debt Talks

It was announced towards the end of last week that points of difference between the representatives of the British and American holders of Brazilian stocks had been settled and that the way was open for detailed negotiations with the Brazilian Government. The negotiations are being conducted in the British interest by the Council of Foreign Bondholders, which has been in touch with the British and Brazilian Governments as well as with other bondholders' groups. The total amount of loans by this country to the central and state governments of Brazil is large, some £125 million, and the negotiation of a new agreement would, in any circumstances, be a matter of considerable importance. In existing conditions the outcome of the conversations may have very far-reaching results. Before the war Brazil was beginning to develop its secondary industries rapidly and the process has been accelerated rather than retarded by the war, although the special demands of the conflict and the restrictions it has imposed on international trade have altered the direction of development somewhat. Brazil is, in fact, in a fair way towards exercising the predominance in South America for which her size and the variety of her resources fit her. The recent statement of the Minister of Production, and the survey carried out by the local British Chamber of Commerce, both indicate that Brazilian demands for British exports are changing rapidly, but may be maintained. It is also probable that some finance will be required. If so, some of it should be British. In these circumstances there is every reason why the settlement should be such as to help in the establishment of good relations between the two countries. It is also likely to be regarded as a model upon which the smaller South American republics can reasonably base their own policy. There can be no question at present about Brazil's ability to meet the service of her substantial overseas debt, but the present position is abnormal. A full investigation would be necessary to assess the prospects. That may be an argument for deferring a lasting settlement until such time as the outlook is clearer, but it is not one for an offer based on the depressed condition of the country before the industrial revival got under way. A reasonable solution would appear to be to offer a partial repayment, out of sterling balances which cannot at present be used, and to guarantee payment of interest at a reasonable rate, or rates, on the remaining capital. Any settlement should, of course, bear in mind the varying rights and priorities of the different issues. Such a settlement would go far to rehabilitate Brazil's credit, with beneficial results to all concerned.

Larger Clothing Sales

The release of 20 coupons in the new clothing book in September resulted in a large rise in sales of apparel. According to the retail trade report for September, published in *The Board of Trade Journal* for November 6th, sales of apparel, by value, were 37½ per cent above the average for the preceding twelve months, and higher than in any month since December, 1940. The Bank of England's index number of the average value of daily sales (1937 = 100) stood at 132 for this category. The validity of coupons is now the factor which decides the extent of clothing sales—the seasons have little or no influence. In September, 1942, the last month of a coupon period, the index was 102. The steady rise in the amount spent per coupon which had been apparent for some months was checked last September, probably owing to the greater number of coupons current. This may be due in part to larger purchases of utility clothing, and to some extent to the lower pointing of the cheaper utility articles. In household goods sales have been stable, and food sales showed a slight fall. The total index, however, under the influence of apparel sales, rose from 96 in August to 109 in September, four points higher than the

average for the year to August. The table showing the average daily value of retail sales and of stocks compared with the year before appears on page 695.

Wages in Cotton Industry

The steady pressure for higher wage rates continues. The trade unions in the cotton industry have now entered the list of unions which have recently staked claims. They have applied for a flat rate increase of 12s. a week for adult occupations and 6s. a week for juvenile occupations. The latest increase was granted at the beginning of this year when operatives in the spinning and weaving sections secured an advance of 5s. a week; at the same time holidays with pay were increased from one to two weeks a year. Between October, 1938, and January, 1943, the actual earnings of operatives in the cotton trade have shown a bigger increase than earnings in all industries—75.4 per cent against 65.1 per cent—though it must be remembered that the actual earnings in the industry before the war were relatively low. In considering the application for higher wages on November 16th, the Master Spinners' Federation and the Manufacturers' Association decided not to make any counter-offer. Consequently, the spinning operatives' claim will be referred to the National Arbitration Tribunal and the weavers' to their Conciliation Board. A further substantial increase in wage rates would obviously raise costs and, consequently, may involve an advance in the controlled prices for yarn and cloth.

Home Flax

In a recent speech, Earl de la Warr, Director of Home Flax Production, Ministry of Supply, defended the home flax production scheme. He said that the low production, the high costs and the waste . . . belong to a period of teething troubles that we have largely overcome. No doubt steps have been taken to improve the efficiency of growing and processing the flax. It may be that some of the criticisms made by the Select Committee on National Expenditure in their Fifth Report of the 1942-43 Session (reported in *The Economist* of April 10, 1943) no longer apply. Three times as much fibre was produced in 1942 as in 1941 without a corresponding expansion in acreage, and the increase this year might not be, according to Earl de la Warr, "much less sensational." The acreage under flax in Great Britain has steadily increased, from 18,000 acres in 1940 to 40,000 in 1941 and 52,000 in 1942. Next year, it is expected to reach 58,000. In Northern Ireland the acreage has been increased from 20,000 before the war to more than 90,000 at the present time. The Director of Home Production looked to the future of the industry, and he said:

If present progress continues, I am very hopeful that we may be able to establish this as a permanent new industry. Many new industries have of necessity been established as a result of the war and the loss of overseas supplies. Their valuable contribution to the war effort should not, however, be allowed to confuse the issue of their continuance or be closing down after the war. The only criterion is whether their further development is economically sound.

Practical Planning

In an attractive brochure, the Institution of Civil Engineers and the Institution of Municipal and County Engineers, which had jointly organised the recent Practical Planning Exhibition, set out the importance of the part that engineering will have to play in the reconstruction of Great Britain. One of the most interesting chapters shows how a new town should be planned and built. It emphasises the importance of the technical and functional approach to the problem, especially in the provision of adequate and comprehensive public services, such as roads, railways, drainage, and heat and light and power. In the past, or rather in the recent past, the technical approach has probably been insufficiently recognised and often subordinated to financial considerations, especially in industry. But the aim of the technical approach to the problem of industrial reorganisation should be to secure the most efficient utilisation of limited resources in the interests of the community, rather than to hand over the controls to the technician.

Correction

In a Note entitled Fisheries after the War, on page 592 of *The Economist* of October 30th, it was erroneously stated

that an agreement had been concluded between representatives of the British and Norwegian Governments for the resumption and regulation of whaling. All that happened is that the whaler section of the Chamber of Shipping and the Norwegian Shipping and Trade Mission set up a joint committee to take such steps as may seem advisable to secure the earliest possible resumption of British and Norwegian whaling operations on the biggest possible scale consistent with the proper maintenance of the whaling industry.

Tax reserve certificates	—	262,225	340,000

* During the three-year period, £90,000 was appropriated from this reserve for war damage contributions.

† Including dividends received from subsidiaries.

‡ Including £147,000 allocated as a separate item to complete the provision of tax on the profits to date.

(f) Tax free.

The apparent discrepancy between the showing of the profit allocation for 1942-43 and the changes in net assets is, in the main, accounted for by the repayment of £482,500 of debentures on October 1, 1942, and the inclusion among reserves in 1943 for the first time of £239,600 provision for deferred repairs and maintenance, presumably previously counted as a liability. The ordinary stock units of £1 stand at 165s. and yield some £2 9s. 5d. per cent tax free.

COMPANY MEETINGS

THE OTTOMAN BANK

ABNORMAL CONDITIONS CAUSE INCREASE IN DEPOSITS

POSITION IN TURKEY AND THE NEAR EAST

MR A. G. A. JAMIESON'S ADDRESS

The annual general meeting of shareholders of The Ottoman Bank was held, on the 17th instant, at Winchester House, Old Broad Street, London, E.C., Mr A. G. A. Jamieson, the chairman, presiding. Mr W. Stewart McKim, secretary to the London Committee, having read the notice convening the meeting.

The chairman said: Ladies and Gentlemen,—I am informed that the requisite number of shareholders holding the necessary number of shares are present or represented in accordance with the requirements of our Statutes.

The report and accounts have been circulated and I presume that it will be your pleasure that they be taken as read. (Agreed.)

THE LATE SIR HERBERT LAWRENCE

His colleagues on the London Committee record with sorrow the loss of the services of our late chairman, General the Honourable Sir Herbert A. Lawrence. General Lawrence, who joined the Committee of this Bank in 1906, became the chairman of the London Group of the Committee in 1924 and, since then, has always presided at our general meetings. To those of us who have had the privilege of working with him on the Committee of the Bank, his passing is a sad loss. His upright character and sound judgment based on long experience have been of great value to the Bank, the interests of which were very close to his heart. We miss him, but his memory remains as an inspiration and a guide for those who follow him.

I have also with deep regret to record the death, only last month, of Sir Guy Granet, who had been a member of the Committee since 1920.

After the death of Sir Herbert Lawrence my colleagues on the London Committee did me the honour of electing me as their chairman; it is not an easy position, and as time goes on and the European phase of the war reaches its conclusion, it will certainly become no easier.

LIQUIDITY MAINTAINED

The balance-sheet now before you shows once again a considerable increase in its total, which is £42,360,012, as against £36,584,755 on December 31, 1941. Liquidity, you will see, has been more than maintained. You will notice that we have no less than £17,876,000 in cash and money at call and notice, with a further £8,296,000 in bills receivable, and £1,723,000 in British Government securities.

As last year, we have included our French assets at the rate of 176.50, and the figures of our Thessaloniki branch are those of December 31, 1940, since no later details are available.

The profit and loss account, which contains only the profits which can be made effectively available in sterling, shows an available balance for the year of £127,142 18s. 11d. This, added to the amount brought forward, makes a total of £335,178 4s. 3d., which will be carried forward, as in present circumstances the Committee do not recommend the distribution of a dividend.

UPWARD TREND OF DEPOSITS

On the liabilities side of the balance-sheet you will see that our deposits have continued to increase; and this upward trend, which in the period under review amounted to six million pounds, has con-

tinued, and is likely to be maintained so long as abnormal conditions arising out of the war exert their influence. On the assets side, our cash is greater by nearly two million pounds, while our money at call and notice is nearly five million pounds greater than in 1941.

On the other hand, bills receivable are less by one million six hundred thousand pounds. Our investments are five hundred and seventy thousand pounds greater, the whole of this increase being accounted for by our holdings of British Government securities. So long as we continue to hold these abnormal deposits we feel that they can only be employed in the most liquid form.

I do not think there is anything further in the balance-sheet to which I need refer, so I will survey briefly the affairs of the territories in which we are mainly concerned.

RISE OF PRICES IN TURKEY

Although neutral, Turkey has suffered from the war, which has affected her whole economic life. Weather was again unfavourable to the crops, and lack of labour, owing to the large number of producers in the Forces, which have been mobilised since the outbreak of war in Europe, caused a shortage of agricultural products. The Government endeavoured, by trade agreements and other measures, to stabilise exchange rates and prices, but the decreasing volume of goods available and the increase in the note circulation, due largely to greatly increased expenses of the Army, resulted in enhanced prices for the most essential commodities. This tendency increased greatly after July, 1942, in which month the Government returned to the principle of a free market. The index of wholesale prices, which in 1941 stood at two hundred and twenty-two, rose to five hundred and twenty-one in 1942.

Owing to the demand abroad for certain Turkish goods, the exchange position of the country improved during the year, and the returns of the Central Bank of Turkey show an increase in their holding of gold.

Our branches throughout Turkey have taken an active part in the commercial life of the country, but their profits are not included in the figures before you today, as, for the time being, it is impossible to convert them into Sterling.

Our satisfactory relations with the Turkish Government, its Departments, and with the other Banks in the country continued unimpaired.

EGYPT'S PROSPERITY

In Egypt some dislocation and disturbance occurred when, in the summer of 1942, the Axis forces got so near to Alexandria, but the alarm quickly subsided and the Banks met without difficulty all the calls made upon them. The cotton business was well maintained. The Egyptian Government fixed minimum prices at which they would purchase cotton tendered to them, but private sales were encouraged where possible. During the year some four million cantars were exported to the United States and to India, and our Alexandria branch had its share of this business.

To meet the wishes of the Government, the cotton crop in 1942 was reduced to about half that of 1941, in order to increase the output of other crops and reduce imports of foodstuffs. Cereals were good, as was the crop of sugar cane. Imports of commodities fell sharply during the year,

partly owing to the system of import licensing and partly owing to the fact that supplies from America could not be obtained in the almost unlimited quantities which had been available in the past. The cost of living continued to rise, but on the whole there was general prosperity in the country. This was naturally reflected in largely increased bank deposits and reduced demand for advances.

IRAQ AND IRAN

In Iraq political and commercial events were largely governed by the war situation in North Africa, and, until the tide turned at El Alamein, there was a constant feeling of nervousness. The amount of currency in circulation rose from eleven million Iraqi Dinars to nearly twenty-two million, owing chiefly to expenditure by the Allied Forces and the purchase of grain for export at very high prices. Locally produced cereals rose by eight hundred to one thousand per cent above their pre-war prices. The Government set up a Committee to study measures to combat the consequent rise in the cost of living, and some of the recommendations of that Committee have since been adopted.

In Iran disbursements by the Allied Forces resulted in a relaxation of the formerly stringent Exchange Regulations. Sterling became obtainable without difficulty and this permitted the settlement of certain long outstanding debts and contracts. As in Iraq, the note circulation showed a large increase, leading to high cost of living, hoarding and speculation, and crops were not satisfactory.

PALESTINE AND CYPRUS

The economic situation in Palestine continued to develop favourably. Here again money was plentiful owing to military expenditure, and this fact, combined with the shortage of goods, resulted in increases in the cost of living and in the price of land. The note circulation increased from thirteen million Palestine pounds to twenty-four million. The situation of the citrus trade remained unchanged, apart from the development of the production of concentrates. The Banks continued advances to citrus growers, with Government guarantee, and it is to be hoped the recent improvement in the situation may prove of benefit to the growers.

In Cyprus business was on a reduced scale, as, here again, the military expenditure had led to a plenitude of money and lack of demand for financial facilities. Carous and raisins from Cyprus were exported to Egypt, Syria and Palestine, while Iraq and Egypt were buyers of Cyprian wines.

We have no news about our subsidiaries in the Balkans, the *Banque Franco-Serbe*, the *Bank of Roumania* and the *British-French Discount Bank*.

FRENCH MEMBERS OF COMMITTEE

As regards the members of our Committee in Paris, we have no news, and, as you will see from our printed report, we give there the list of their names as it was in 1940 when communication with them ceased. One of their number, Monsieur Philippe Mallet, is due to retire this year under the terms of our Statutes, and we understand that, subject to the confining of the activities of the French members of the Committee to France, there is no objection in this country to his formal re-election.

The vacant place in the Committee left by the death in 1941 of Sir John Hewett has been filled by the election of Mr J. A. Drexel, and Colonel Gore Browne has succeeded General Lawrence.

STAFF'S LOYAL SERVICE

I know that you will wish to convey your thoughts for their safety and early return to the members of our staff in the Forces. To those of the staff who remain to carry on the increasingly difficult work of the Bank, we are grateful for the loyal way they have performed their various tasks. A special tribute is due to our British

managers abroad, who have continued to work in trying climates with no opportunities for home leave.

I now beg to move, Ladies and Gentlemen: "That the report and accounts now read be received and adopted."

Lieut-Colonel Sir Albert Stern, K.B.E., C.M.G., seconded the resolution and it was carried unanimously.

The chairman then moved the re-election of J. A. Drexel and Colonel E. Gore Browne, D.S.O., O.B.E., T.D., A.D.C., as members of the general committee.

This was seconded by Mr A. C. Gladstone, and unanimously approved.

The chairman further moved the re-election of Monsieur Philippe Mallet to the general committee.

The Rt. Hon. the Lord Hillingdon seconded the resolution, and it was passed unanimously.

VOTE OF THANKS

Mr Gordon L. Jacobs: Ladies and gentlemen, the passing of Sir Herbert Lawrence left a big gap and we can congratulate ourselves that Mr Jamieson has

been willing to fill that gap. I am sure it will be your wish that we extend to him a cordial welcome. (Hear, hear.)

Mr J. E. Rosselli seconded the vote of thanks, and it was unanimously accorded.

The chairman: Thank you, Mr Jacobs and Mr Rosselli, both for my colleagues and myself. As I said before, it is not a very easy task either for the members of the committee or for the management and staff, and we are very glad to have your approval and support.

The proceedings then terminated.

ARTHUR LEE AND SONS, LIMITED

A RECORD OF STEADY PROGRESS

DIVIDEND OF 40 PER CENT.

MR PERCY W. LEE'S SURVEY

The fiftieth ordinary general meeting of Arthur Lee and Sons, Limited, was held, on the 18th instant, at the Royal Victoria Station Hotel, Sheffield.

Mr Percy W. Lee, J.P., chairman and managing director, presided.

The Secretary read the notice convening the meeting and Mr A. L. Wing, F.C.A., of Messrs Wing, Richards and Holmes, the auditors, read the report of his firm.

The following is the statement by the chairman circulated with the report and accounts:—

While this is the fiftieth annual general meeting of Arthur Lee and Sons, Limited, it is our first meeting as a public limited company, and for that reason I feel that our new shareholders would like to have a short résumé of the history of the company.

HISTORY OF THE COMPANY

"We were incorporated in 1894, succeeding the business of James Fairbrother and Co., Limited, which was founded about 1860 and purchased by my father, the late Mr Arthur Lee, in 1874; he retired in 1903 when I was made chairman, and my brother the late Mr Arthur S. Lee and I were appointed managing directors. Since that time we have made very steady progress, and with periods of varied success we have, generally speaking, showed gradually increasing profits, and I am pleased to say that while there have been occasional years when for prudence sake we have not paid any Ordinary dividend, we have always earned a profit and maintained our preference dividends."

Our financial policy has always been a conservative one and we have ploughed back into the business a large portion of our profits; this thrifty trading accounts for our present success and our strong financial position to-day. In 1916, owing to the demands for war materials and the impossibility of extending our old works at the Crown, we purchased the land and built the first portion of our Meadow Hall Works. Like all new undertakings, this was faced with numerous difficulties to commence with, but these works have shown steady growth since we started them and I think I am safe in saying that hardly a year has passed without the installation of additional plant.

In 1935 we started a new strip hot rolling mill there, which has been an unqualified success. Of course, it had to go through its teething troubles and the consequence is that the profits which are now being earned from that department are not fully reflected in our standard profits. Since that date we have also made further additions to our plant which should help us materially in the years to come. As all these extensions are in our normal line of business, they should help us to meet the demand that will arise in post-war trading.

It has been our desire since the com-

mencement of this disastrous war to do all in our power to help in its prosecution and towards its early termination. We have worked harmoniously with the Controllers of the steel trade and I am pleased to report that our relationship with them is of the happiest. They appreciate what we have done for them, and in return they have shown us every consideration. As a body we have found them most helpful and we have every reason to be gratified that the control of our product is in such capable and efficient hands.

OUTPUT MATERIALLY INCREASED

Owing to war-time control we cannot maintain our usual discipline and efficiency, but, fortunately, thanks to the bulk of our staff and workpeople having been with us for several years and who still try to maintain their old sense of efficiency and loyalty, we have been able to materially increase our output in spite of the replacement of skilled operatives who have joined the forces by the additional employees who have come into the works, many of whom have had no previous works experience, and some of whom have undoubtedly had a prejudicial effect on production.

We are now employing in the works an increasing percentage of women labour, and while I feel that most of our jobs are not particularly suitable for women owing to the heaviness of the work and the conditions under which they have to work in steel works, they have been of great assistance, and on the whole have quite pulled their weight.

The increase in the number of women workers has, of course, put us to considerable expense, as we have had to provide special facilities for them. However, I can report that we are now well equipped at both works, particularly as regards canteens; we have a fine canteen both at the Crown and at Meadow Hall. The one at Meadow Hall, owing to the more favourable conditions, is, we consider, as good as anything in the district. We have also done all we can to encourage our employees to subscribe to War Savings Certificates, and have given them some considerable financial assistance to this end. I think you will realise that this action of ours has been very much appreciated by them.

POST-WAR PROSPECTS

We are fortunate in that all our productions are still in great demand. While I do not propose to make any prophecies with regard to the post-war prospects, I think you will realise from the remarks I have already made that so far as anyone can say, we can anticipate that time with confidence, although I expect there will be a transition period during which our customers will be readjusting themselves to peace-time manufacture, when there may be a lull in their demands, but fortunately for us our plant will require little or no alterations to meet post-war conditions beyond effecting deferred repairs.

One thing that concerns us, as it must do most manufacturers, is the recovery of our export trade which represented a substantial portion of our pre-war turnover. This was mostly with our Dominions, who, owing to the exigencies of war have either become producers themselves, or have been forced to buy elsewhere, but our close interests and friendly relationship with our biggest customers are such that I trust we may at least recover a portion, and may I say I hope a considerable proportion, of the trade for special qualities which they will require and with which we have supplied them in the past.

You will, I am sure, after consideration of the figures that have been presented to you, agree that we have again improved and strengthened our financial position during the course of the year, and we can look forward to the future with confidence.

Turning to the reports and accounts, which have been circulated, and I assume may be taken as read, you will observe that we have made considerable reserves to cover possible depreciation in stock values. This reserve has been built up to meet any probable contingent liability owing to a reduction in price that may take place.

PROFIT AND ALLOCATIONS

"The trading profit for the year is £268,343 after charging excess profits tax, to which is added interest and dividends on investments, £10,234—£278,577. From this are deducted reserves, depreciation, directors' fees and income-tax of £186,271, leaving a net profit of £92,306, to which is added balance brought forward, £50,427, and surplus on realised investments of £15,000, giving a disposable balance of £157,733. We allot to surplus investment reserve £15,000, and to new plant reserve £35,000 and to dividends already paid."

"A" preference shares 2½%	free of tax	£22,061.
"B" preference shares 5%	less tax	
Ordinary shares 15%	less tax	
and subject to confirmation.		
"A" preference shares 7½%	free of tax, making 10% for the year	
"B" preference shares 5%	less tax, making 10% for the year	£37,051.
Ordinary shares 25%	less tax, making 40% for the year	
and carry-forward £48,621.		

THANKS TO THE STAFF

In conclusion, I would like particularly to express the appreciation of the directors to all the members of our staff who, owing to the number of employees who have left to join the Forces, have carried on under most difficult circumstances, and who have always supported us by their willingness. Whenever they have been called upon to make any special effort they have always risen to the occasion, and have been of the greatest help in the successful carrying on of the business. To mark our appreciation of their loyalty we have started a staff insurance and pension scheme for their benefit, which has been and will be of a great help to them in the future.

The report and accounts were adopted. On the proposition of Mr Mark Barber, seconded by Mr A. R. Habershaw, a vote of thanks was passed to the chairman.

TRINIDAD PETROLEUM DEVELOPMENT COMPANY, LIMITED

EPT POSITION CLARIFIED

MR KENNETH A. E. MOORE'S STATEMENT

The annual general meeting of Trinidad Petroleum Development Company, Limited, was held, on the 12th instant, at the registered office, River Plate House, London, E.C.

Mr Kenneth A. E. Moore, F.C.A., the chairman, presided.

The Secretary (Mr J. Mytton) read the notice convening the meeting and the auditors' report.

The following is the chairman's review circulated with the report and accounts:—

It will be appreciated that the results shown by the accompanying accounts are those arising not from operations dictated by commercial considerations but from the carrying out of official policy in relation to specific production required from time to time, and they should be regarded accordingly.

LARGER AVAILABLE BALANCE

It will be observed that though the profits at £303,974 show a reduction of £94,456, the amount required to be provided for taxation out of them is less by £120,000, so that the net amount available out of the year's operations is £183,974, compared with £158,430 in the previous year. The accounts are of especial interest on this occasion, since the company's position in relation to excess profits tax has now been clarified except for a matter affecting the first two accounting periods, which is the subject of an appeal by the Crown from a decision of the City Commissioners.

In the accounts for the four years to July 31, 1942, provision for EPT and other taxation was made from year to year for the estimated liability computed on a conservative basis. The actual liability as now ascertained following the settlement of the company's standard profits and allowance under Section 13 of the Finance (No. 2) Act, 1940, and Section 31 of the Finance Act, 1941, is substantially less than the aggregate reserves so made, and after making the consequential adjustment for directors' additional remuneration (which is based on profits after deducting EPT), the sum of £150,000 is freed for transfer from taxation reserve.

ADDITION TO RESERVES

The directors feel that the wise course is to use this very welcome alleviation of the company's taxation burden to strengthen the financial position rather than to distribute it by way of dividend. It has, therefore, been added to general reserve account (thereby increased to £250,000), so improving the company's ability to finance further development when more normal conditions return.

After making a substantial payment on account during the year the balance of £387,416 remaining at credit of taxation and contingencies reserve account is, the directors are advised, sufficient to cover all known liability for taxation on profits earned down to July 31, 1943.

TAXATION IN TRINIDAD

Since the accounts for the past year were prepared it has been announced that the Government of Trinidad is extending its taxation legislation so as to render British companies operating in Trinidad liable to excess profits tax there. It is understood that this legislation is to be retrospective to January 1, 1943, that there will be reciprocal arrangements aimed at avoiding double taxation, and that general assurances have been given that British companies

will not thereby be called upon to pay in the aggregate more in taxation than was previously the case.

If this is so it means in plain language that the Trinidad Government has decided to take a larger share of the taxable capacity of British companies operating in Trinidad, at the expense not of the companies but of the British Exchequer. The draft Bill has only reached this country very recently and is having the urgent attention of the Trinidad Oil Companies Taxation Committee and other interested parties.

THE FINAL DIVIDEND

The proposed final dividend, making 15 per cent. for the year, is at the same nominal rate as for the past four years, but as the deduction for income-tax (after giving effect to Dominion income-tax relief) is at the rate of 5s. in the £ only, it is equivalent to a dividend for the full year of 22½ per cent. gross, less income-tax at 10s. in the £, and is therefore somewhat higher than the effective rate in recent years.

The company's standard profits and allowances as now ascertained cover the current rate of dividend with a modest margin for building up reserves for future development, and the large sums already paid or provided for excess profits tax may be regarded to some extent as a stabilising factor during the currency of that tax.

SATISFACTORY OUTLOOK

The news from the field, both geological and general, continues to be satisfactory and we may look to the future with reasonable confidence. Provident and pension funds for the staff and employees in Trinidad have now been in operation a full year.

The board wish to express their appreciation of the loyal and efficient service during the past year of the general manager, Commander the Hon. H. V. Lavington, the staff, both technical and clerical, and the workpeople in Trinidad. There has been no labour stoppage on our fields during the year.

The Chairman, in formally submitting the resolution for the adoption of the report and accounts, said: Since the accounts were published the taxation appeal referred to in my review has been determined in favour of the company.

Mr Richard R. Tweed, F.Inst.Pet., one of the joint managing directors, seconded the resolution, which was carried unanimously.

The retiring director, Mr Kenneth A. E. Moore, F.C.A., was re-elected, and the auditors, Messrs Josolynne, Miles, Page and Co., were reappointed.

A vote of thanks to the chairman, directors and the general manager and the staffs in Trinidad and London concluded the proceedings.

LEACH'S ARGENTINE ESTATES, LIMITED

The thirty-first ordinary general meeting of this company was held, on the 15th instant, in London, Mr H. Roy Leach (the chairman) presiding.

The chairman, in the course of his address, said: The profit on trading at £176,624 is £12,732 less than that of the previous year. The directors now recommend the payment of 3 per cent. on the 6 per cent. preference stock and 6 per cent. on the ordinary stock. In view of the general conditions ruling during the past year, we feel that the results obtained

may be considered as not unsatisfactory.

With regard to the 1942 sugar crop, very adverse climatic conditions prevailed. Improved climatic conditions have been experienced this year. Profits will be reduced during the current year unless legitimate adjustment of the selling price is made at an early date.

The report was unanimously adopted.

ROBINSON AND CLEAVER, LIMITED

LARGER TRADING PROFITS

The annual general meeting of Robinson and Cleaver, Limited, was held, on 18th instant, at the Linen Hall, Regent Street, London, W.

The Hon. John Mulholland, the chairman, presided.

The following is the statement by the chairman circulated with the report and accounts:—

In spite of the increasing difficulties of replacing stocks of consumer goods, especially of the company's principal commodity—linen—the retail branches have been able to maintain a reasonable flow of business; the factories, too, have been working under slightly better conditions than last year.

The trading profits at £88,116 show an increase of £17,260. The taxation account at £44,010 is again the highest figure on the debit side of the profit and loss account. To meet the company's E.P.T. liability, which has now been settled in principle, an adequate amount has been reserved pending a final settlement of the exact amount. There is little change in the other items of the profit and loss account, and a balance of £28,133 is transferred to the appropriation account compared with last year's figure of £16,775.

DIVIDEND OF FIVE PER CENT.

An amount of £14,000 has been transferred to the reserve for contingencies, partly on account of deferred repairs to the company's properties, and partly to build up internal reserves to enable the directors to provide for exceptional expenditure which conditions both during and after the war may occasion. As usual, War Damage Insurance and A.R.P. expenditure have been debited to this account.

An appropriation of £2,500 has been made to the staff benevolent fund, and after the payment of the preference dividend there remains a balance of £70,843, out of which the directors recommend a final dividend of 3 per cent., making with the interim dividend of 2 per cent., 5 per cent. for the year. When these appropriations have been made the carry forward will be £67,093 as against £66,770 brought in.

In the balance-sheet, shops, warehouses and factories show a slight reduction at £812,468. Stocks in trade show an increase of £6,042 at £179,982, but it should be noted that the monetary value of goods is enhanced by increased prices and purchase Tax.

Our thanks are due to the managing buyers and all other members of the staff for the loyal and efficient performance of their duties in face of the many difficulties occasioned by the war.

The report and accounts were unanimously adopted.

MAX STONE, LIMITED

INCREASE IN PROFIT

The eighth annual general meeting of Max Stone, Limited, was held, on the 15th instant, in London.

Mr Sydney Walton (chairman of the company), who presided, said: The profit for the financial year to the end of 1943, is £52,215, compared with £40,000 in the preceding year. Contributions of premiums under the War Damage

1941, were £257 10s. It has been the practice of the company to provide only for the exact liability in regard to taxation. This year a total of £50,000 is provided, sufficient to enable the company's taxation reserve in its balance-sheet to cover not only the liability to June 30, 1943, but also the income-tax for the remaining nine months to April 5, 1944. The total of £50,000 is in excess of the normal by approximately £10,000. The difference is taken from general reserve account. It may be regarded as a transitional arrangement by which the company accepts the recommendations of the Institute of Chartered Accountants as recently published.

After providing for the dividends, less income-tax, for the year to June 30, 1943, on the preference shares at the rate of 6 per cent, and on the ordinary shares at the suggested rate of 10 per cent, their remain undistributed profits of £10,961 out of

which the sum of £5,000 is appropriated to strengthen general reserve. Undistributed profits of £5,961 are carried forward.

In thanking the managing director, his executive colleagues and indeed the whole of the company's staff for devoted service through another year of stress and strain, I do so well knowing how hard it is, increasingly hard, to replace with suitable personnel those experienced managers and assistants who have passed into manifold branches of the war effort. The problem of replacement has engaged the close and thoughtful attention of the board. Despite most careful supervision the human factor does expose the company to the risk of breaches of the multitudinous regulations.

We exercise constant vigilance, but businesses like yours, with shops in many places and numerous transactions in crowded hours, are liable in a peculiar and anxious degree to innocent and un-

intentional errors on the part of inexperienced helpers. The comprehensiveness and complexity of the regulations which beset us demand exceptional study, and your directors decided to seek the guidance of eminent experts and authorities engaged in this field of work. We instructed them, giving them the fullest facilities, to examine and report on such measures and methods as will ensure by all means available to the board that regulations are kept in the letter as in the spirit.

After all, your company enjoys a valuable goodwill built on the practice and reputation of fair dealing. That goodwill is precious to us, and I can assure you that both in the national interest and in the economic well-being of this company no effort is being spared to honour the one and safeguard the other.

The report and accounts were unanimously adopted.

INDUSTRY AND TRADE

Rates of Hire for Tankers.—After a long delay, agreement has been reached between the negotiating committee of the deep-sea tanker section of the Chamber of Shipping and the Ministry of War Transport on the rates of hire for tankers of 6,000 to 14,000 tons deadweight in respect of 1942. Increases on the 1941 rates have been granted to take account of the rise in operating costs, especially wages.

FINANCE AND BANKING

THE MONEY MARKET.—The money market during the past week has never been far from stringency, but at all times has just managed to meet its requirements without applying for special help to the authorities. The tighter conditions are shown in the fall of nearly £10,000,000 in bankers' deposits at the Bank of England. The banks have had to make substantial Treasury deposit receipt payments this week, the £80,000,000 of new money required of them in this form comparing with effective maturities of about £40,000,000. The increase in TDR payments and the rapid return of the Treasury bill tender to £90,000,000 indicates the increased reliance which the authorities wish to place on the former kind of short-term borrowing. By now the banks' TDR holdings must be well ahead of their

THE ECONOMIST PROFIT FIGURES

The defects of company accounts and the complications of income-tax make it impossible to present statistics of profits in a simple, standardised form. The following definitions may assist the reader:—

(a) **Gross and Net Profits.**—Gross profits are profits before payment of standard income-tax (but after such other taxes as E.P.T. and N.D.C.). Net profits are profits after tax. In many cases, figures of gross profits can be calculated only by adding back what appear to be the appropriate amounts of tax to the net figures published.

(b) **Accounting Period and Reporting Period.**—Company reports are published some time after the end of the period in which the profits were earned. The figures can be grouped by the quarter in which they are published (i.e., by the reporting period) or by the quarter in which the company's financial year ends (i.e., by the accounting period).

(c) **Old Basis and New Basis.**—On the old basis the net profit consisted of preference and ordinary dividends as published, whether gross or net, plus actual allocations to free reserves. Total profit was the largest figure of the profit and loss account, excluding capital profits and transfers from reserves. The figure was struck before depreciation if that was disclosed. On the new basis no net profit figure is provided. It can be obtained by deducting from the gross the appropriate rate of tax. The gross profit is the gross total of interest and dividends plus additions to free reserves and other savings, both grossed up at the stated rate of tax.

GOVERNMENT RETURNS

For the week ended Nov. 13, 1943, total ordinary revenue was £43,283,000, against ordinary expenditure of £100,894,000, and issues to sinking funds of £230,000. Thus, including sinking fund allocations of £8,644,860, the deficit accrued since April 1st is £2,002,102,000 against £1,847,330,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £80,788 to £2,916,276, the other operations for the week (no longer shown separately) raised the gross National Debt by £58,629,106 to £18,845 million.

Great Illusions

IN his speech to both Houses of Congress Mr Cordell Hull declared to the applauding Congressmen that by the procedure of co-operation with other nations likewise intent upon security, we can and will remain masters of our own fate.

This occasion, coming very soon after the passage through both Houses of resolutions in support of international collaboration, undoubtedly marks a milestone along the road away from "the policies of detachment and aloofness" which Mr Cordell Hull condemned. But it is easier to see it as a step away from isolationism than as a step towards something else. There is a growing momentum of good will in America behind the idea of international co-operation. There are fewer signs of a growing understanding of what international co-operation must entail.

In Mr Hull's speech, for example, there were many traces of that misleading variant of the collective security principle that brought the League of Nations to disaster—the belief that, since all nations are sovereign and share equally in an international organisation, none of them need bear any special responsibility. If this general system—call it League or Council or Organisation—in which all nations, great and small, stand on a footing of parity, is set up, then, Mr Hull argues,

there will no longer be need for spheres of influence, for alliances, for balance of power or any other of the special arrangements through which, in the unhappy past, the nations strove to safeguard their security.

Here, surely, the American people—and the world—being offered the League of 1919 all over again, with its old idealism, certainly, but all its weakness and faults as well. Equal and sovereign states do not operate in a vacuum. They are big or small. They have a war potential or not. Their economic and social life is twisted in a thousand strands with their neighbours. Aggression is not a chance collision of self-sufficient atoms revolving in the free air of an international security system. It is the cumulative effect of a series of frictions and shocks. To be checked effectively, it has to be checked at the level of causes, not effects. This, by definition, international security system cannot do because it is cognisance of a crisis only when it is past praying for—then—if past experience is anything to go by—only so effectively if "the peace-loving Powers" have very specific and definite arrangements—alliances—short—beforehand. Britain and Czechoslovakia were members of the League in 1938, Russia was a member in 1939. In both cases, pacts or the lack of pacts and the Covenant determined their policy. Mr Cordell I

doctrine does not prevent alliances. It merely secures that only the ill-disposed members of the League are united.

It is true that there is another great fallacy, which is at the opposite pole from Mr Cordell Hull's, and which he may have had in mind in composing his speech. This is the Big Three doctrine, which does, indeed, avoid the error of making the international system a perfect but impotent association of sovereign and equal states. It recognises that under modern industrial conditions only Great Powers can wage war effectively and that, as a result, there can be no genuine system of international security unless it is underwritten by Great Britain, the United States and Soviet Russia. It, therefore, argues that any future international system must grow up round the "nuclear alliance"—to use Mr Lippmann's phrase—of the three Great Powers. The danger in this type of thinking, perfectly sound as far as it goes, is that, like the myth of the universal League, it tends to mistake the real nature of international society. A concert of Great Powers, like a loose association of all the Powers, does not operate in a vacuum. The near-Great Powers and the smaller Powers also have policies, interests and activities which make up the content of international life and which they will not submit to the arbitrary control of an entente of the great. Yet it is these policies and interests that make for war or for peace. Unless the manner of associating the smaller states with the nuclear alliance is worked out far more clearly and unequivocally than has yet been the case, the Great Powers will be able to act only in extreme instances, and then in a way which will make their intervention most undesirable and most feared—by force.

This is a problem that human society has successfully solved on the domestic plane. Within every State, the power to use force is concentrated within a few hands. Most matters, however, are settled not by force but by law and agreement, in both of which all men, strong and weak, are equal. This is the analogy that needs to be followed in the international sphere. The Great Powers alone can wield force; they should recognise their responsibility and be ready, when force is required, to use it in unison. But the overwhelming mass of international relations will, we must hope, be settled without force or the threat of force, and in settling them all nations must be regarded as equal in status. In using their force, the Great Powers should be the executive arm of the international commonwealth.

This is the solution, stated in generalities. But the time has gone past for arguing in generalities and for building anonymous structures. The task now is to concentrate far more on the content of international society and to bring the framework of world order into relation with the kind of problems and disputes and maladjustments that will wreck world order unless it is properly conceived. Both fallacies have their elements of truth which are complementary—the perfect League does point to the sovereign interests of other nations, the nuclear alliance to the unique military power of the Great States. Both lack content. The remedy lies in an

uncompromising resolve on the part of the statesmen of the United Nations to abandon generalities from this day forth. There have been quite enough for the general perspectives and broad horizons to be reasonably clear. It is the hinterland, the rough roads leading to those broad horizons, that now need to be mapped. The principles can be made clear only by being applied. There are all the questions of concrete economic and social co-operation, which, starting from the work already accomplished during the war, can be expanded into a network of intermediate international institutions. The food conference at Hot Springs began the work along these lines. The delegates at Atlantic City have the opportunity of using UNRRA for the same purpose. Such wartime institutions as the Middle East Supply Centre point in the same direction, towards the organising of international life in as many purposive and co-operative organs of association as can be achieved, both regionally and internationally.

The other urgent need is the consideration of the concrete political issues which are likely to trouble the peace before it is fairly established. These are the first test of the nuclear alliance. They will show how the Great Powers mean to use their overwhelming strength, whether in co-operation with their smaller neighbours or in total disregard of their rights or wishes. If the problems are tackled co-operatively, then the nuclear alliance will already be on the way towards establishing a genuine international system in which the power of the great states is used in the only tolerable way—as a purely executive power exercised on behalf of all the states concerned. If the problems are settled unilaterally, then the nuclear alliance will start its career as a menace to the interests of the smaller states. It may then just possibly remain an alliance. It will never be the nucleus of a wider system.

None of this—neither the building of functional economic and social international institutions nor the consideration of concrete political issues—can be accomplished unless the Great Powers get down to the facts. Mr Cordell Hull rather dismissed them. He said

Much less could we anticipate the problems that are bound to arise from day to day and from year to year. There are other problems—for example, the questions relating to boundaries—which must, by their very nature, be left in abeyance until the termination of hostilities.

Unfortunately, this is not so. What is done while hostilities are terminating, in Italy, in the Balkans, in Poland, in Germany, will determine the shape of the peace. The problems—political and economic—of the settlement in Europe cannot be left for vague agreement in an unspecified future. Either the new system of international co-operation can come to agreed solutions or there will be no international co-operation.

The Moscow Conference was happily not the last word. At their meeting, the heads of state will perhaps turn from the general to the concrete and particular. It is the only foundation upon which a functioning system of world order can be built.

Ministries and Ministers

IF the will is there and the chance is taken, the new session of Parliament can begin the most important period in law-making and administration since the great Indian summer of Liberalism before 1914. Do the men and the machinery exist, in Westminster and Whitehall, if the Government does at last produce the necessary measures, to start an era of national refreshment and reform? It is the time for Government and Parliament alike to look over their equipment, to discard old worn-out gear and indent for new.

Waging the war has compelled changes in the methods, agencies and personnel of government. New Ministries

have been set up; new means of Cabinet control and consultation have been developed; new kinds of civil servant have been recruited. The administrative requirements of peace will not be less. It is important to answer three questions, at least in general terms. What reform of Ministries will the peace effort make necessary? What should be the constitution and duties of a Peace Cabinet? Can reconstruction be carried out by the pre-war Civil Service?

A word of warning was said here last week against the delusion that new Ministries automatically secure new solutions to old problems. But this does not mean,

of course, that there will not be a need for a certain sorting out of functions when the war is over, for the disappearance of some departments and the sub-division of others. Some of the wartime Ministries will be as apt for peace as for war; it will obviously be wise to keep the Ministry of Food, for instance, as the instrument of a national nutrition policy. Other Ministries will not be needed, at least in their present form. The home functions of the Ministry of Information, to take a clear example, will cease when the war stops, though some of its overseas work should be continued by other agencies. Most important of all, peacetime tasks will require peacetime Ministries not yet devised. In most cases the nucleus can be provided by existing departments. The Ministry of Supply, for instance, is in fact two Ministries, a Ministry of Army Supplies and a Ministry of Raw Materials; the former should be merged with the Ministry of Aircraft Production and the supply department of the Admiralty in a single Ministry of Defence Supplies; the latter, if the Government's functions in the field of production are to be properly performed, should be merged with the industrial branches of the Board of Trade and, possibly, with some sections of the Ministry of Production (which as a separate department should disappear) in a Ministry of Industry. This would leave the Board of Trade to specialise in international problems.

These are obvious cases of the regrouping necessary for peace work. Another is overdue. The Ministry of Health is not, in fact, a Ministry of Health. It is the old Local Government Board with its title changed (at the end of the last war) and various duties added, simply because town planning, housing and public health were locally administered. Its planning powers have already been transferred to the new Ministry of Town and Country Planning; its housing powers should pass to the Ministry of Works and Building; and the Ministry would then be left divided into two separate sections, the Local Government Department and the Health Department.

In strict logic, no doubt, a case could be made out for constituting each of these disparate sections as a separate Ministry, with the Ministry of Social Security to complete the trio. But it is precisely this sort of dismemberment of functioning organisms, proposed in the name of logical neatness, that raises doubts in the minds of those who have practical experience of administration. In the implementation of a real programme of "food, work and homes" the need for clearly defined Ministries of Food, Industry, Trade, Housing and Health is, of course, unquestionable; reform can hardly go less far. But there are also dangers in the multiplication of departments. Most of the difficulties of modern administration arise out of the time-wasting necessities of "co-ordination"—that is, of keeping all who are concerned in a

matter in touch with each other—and the expenditure of effort varies as the square of the number of units to be co-ordinated. Moreover, there is the question of personnel. It is certain that, say, a new Ministry of Local Government would be junior in both importance and influence to the present entrenched Ministry of Health. It is not entirely because of vested interest that the political and permanent heads of Ministries are disinclined to preside over the liquidation of their departments; there is a real shortage of able and influential men, either to be Ministers or, more important, to be Permanent Secretaries. The multiplication of Ministries means the multiplication of Ministers; the Cabinet threatens to become a rabble.

It is at this point that the first and second questions—what kind of Ministries and what kind of Cabinet?—overlap. The advantages of relatively small, compact departments with distinct and specialised duties, subject to the condition that the Balkanisation of government is not carried so far as to break down administration into tiny powerless parishes under a crowd of little clerks, are as evident as the disadvantages of huge, cumbersome Ministries, which engross all manner of functions. But the country cannot be governed nor the highest policy be made by a Cabinet the size of three football teams. Moreover, departments cannot operate in isolation; their work touches in many places and affects the same people; and they fall into groups dealing with kindred questions, at home and abroad, in industry, trade, defence or social affairs. It is necessary to specialise, but it is impossible to divide and rule.

In wartime this double problem has been solved empirically. First, high policy and administration are kept apart by the device of two Cabinets: the inner War Cabinet of front-rank politicians, some without departmental duties; and the outer Cabinet, members of which enjoy "Cabinet rank" and are responsible for their departments to Parliament, but which as a body never meets. Secondly, policy concerning groups of departments is considered either in Cabinet committees or by specially appointed Ministers.

The Peace Cabinet will have to make use, more deliberately and more comprehensively, of these established expedients: the small inner Cabinet; standing Cabinet committees for questions common to several departments; *ad hoc* Cabinet committees for particular interdepartmental projects; and "group" Ministers, like Lord Woolton, Mr Lyttelton and Mr Churchill, to inspire and stimulate the policies and action of groups of departments. It would be quite wrong, however, to make this framework too set and formal. Whether there should be a "group" Minister of Reconstruction, Production or Defence depends upon whether there is a statesman available to do the job. What should not happen, on any account, is the creation of over-grown

super-Ministries or the blurring of the responsibility of Ministers to Parliament.

The problem of Ministerial responsibility is perhaps hardest of all to solve—on paper. For every administrative act there must be an individual Minister to answer, with the proviso that, in the last resort, the Cabinet as a body is responsible for all policy to the Commons which supports it and can vote it down. The dilemma is this: if departmental Ministers retain their responsibility to Parliament, the War Cabinet member responsible for a "group" can have only a shadowy authority over it; but if departmental Ministers become Under-Secretaries and responsibility is concentrated in the War Cabinet member, everything of importance will have to pass through the bottleneck of his attention. The wartime experiments have not resolved this dilemma. It has come nearest solution in defence matters, where the convention has been generally accepted that it is, say, the Secretary of State for War who must answer for the shortcomings of the Army, but the Minister of Defence for the strategy of the war as a whole. But the system works in this case only because the "group" Minister is also the Prime Minister and a towering personality. It has not worked well in other fields—in production, for example, or in the interrelation of food and agriculture. This is a difficult dilemma to escape from. But to conclude, as some faint hearts do, that because it is difficult, nothing can be done about it would be defeatism. The problem must be solved if British administration is not to bog down. Possibly the solution is to be found on the lines of developing, within the general framework of the collective responsibility of the whole Cabinet, a sort of minor collective responsibility within a number of sub-Cabinets or Standing Committees of the Cabinet. The Economic Committee would be the place where economic policy was thrashed out, with appeals to the full Cabinet being taken only in exceptional cases; and the policy once decided it would be the collective responsibility, vis à vis their colleagues as well as Parliament, of all the economic Ministers.

These are not questions to be answered by written rule. That is not the way of the British Constitution. It is not possible, for instance, by any nicety of definition to draw a plain line between the making of policy and its administration, with Ministerial responsibility appor-

tioned accordingly, as PEP in its latest proposals for improving the machinery of government* seems to suggest. Nevertheless, PEP's point is most important: efficient government is not possible unless both the opportunity and the personnel are provided for working out policy in advance, in the departments, between the departments and at Cabinet level. PEP proposes that the chief administrators in every Ministry should form the Minister's policy-forming committee, with an expert planning group to collect, supply and interpret all the data needed for looking forward, and that there should be the same kind of organisation and staffing between the departments and attached to the Cabinet, as indeed there already is in wartime, to a very large extent. This is of course sensible and sound. It raises the third question—what kind of civil servant?—which *The Economist* has consistently emphasised as perhaps most important of all. In PEP's words

The problem here discussed is not, and should never be regarded as, purely a question of organisation—of formal structures and relationships. Behind the organisation lie the intangibles—the spirit and attitudes, the abilities and equipment, of the men who constitute the organisation.

The recruitment, in peace as in war, of new kinds of civil servants, trained and experienced in industrial, commercial, financial, scientific and educational activities, is not called for because the state intends, or ought to intend, to dominate industry, commerce, finance, science or education; nor because the old-style civil servant, trained and experienced in Whitehall, has failed. It is needed, in the conditions of modern life and government, so that the State may do properly whatever Parliament and the people may require it to do; and, except in individual cases, the present very intelligent and talented permanent civil servants have been brought up too narrowly to discharge expertly and with understanding the many new duties of control and oversight which have already been forced, by events not doctrine, upon the modern state. The right men are even more needed than the right machinery to translate reforms into fact.

* Planning. No. 214. A Civil General Staff. PEP, 16, Queen Anne's Gate, London, S.W.1.

UNRRA

THE Conference that is proceeding at Atlantic City has not been well reported, and it is not easy to form an exact idea of what has been decided. The Soviet delegation at one point proposed the exclusion of the press; and there is a great deal to be said, in a complicated and technical matter like this, for the Hot Springs procedure of permitting no publicity until a full report could be made. The meeting is not, strictly, a Conference; it is the first session of the Council of the United Nations Relief and Rehabilitation Administration, which was set up by formal agreement signed at Washington earlier in the month. The Council is a large body; it has a Standing Committee, in which the United States, the United Kingdom, the USSR and China are represented, and a number of other Committees, of which the most important, the Supplies Committee, is presided over by a Canadian. Mr Herbert H. Lehman, President Roosevelt's successor as Governor of New York, is the executive head of UNRRA.

The first and most important question of procedure to be decided was the means by which UNRRA could procure its supplies. At present the free world's supplies of food, raw materials and manufactured goods are centrally controlled by the Combined Food Board, the Combined Raw Materials Board and the Combined Production and Resources Board, sitting in Washington. The United States and the United Kingdom are members of all three, Canada of the first and third. Some objection was taken to bodies of such restricted mem-

bership being placed in such a commanding position. But the advantages of maintaining centralised control through a period of scarcity are too obvious to require any exposition, and it would clearly be wrong to permit UNRRA—and even more clearly wrong to permit individual countries—to build up stocks, to be held in reserve against an eventuality that may still be distant. As for the restricted membership of the Combined Boards, this was decided upon for severely practical reasons, not in any exclusive spirit. On the same plane of severe practicality, it is obvious that UNRRA will be a success in precise ratio to the extent that it enjoys the good will of the American and British Governments. It appears to have been decided to work through the Combined Boards, and that is certainly the course that common-sense and ease of administration would dictate. The report that UNRRA was to have its own fleet of ships appears to have been a complete *canard*. Anything of the sort would obviously be lunacy. Neither supplies nor transport are going to be so plentiful that any watertight compartments can be permitted. Relief will have to be begun while fighting is continuing, and the claims of both can be adjusted only if the resources are pooled.

A more serious divergence of view appears to have arisen between those countries (e.g., France and Holland) which are well provided with gold and foreign balances and those others (e.g., Greece, Yugoslavia and Poland) which have no external assets. Should the "Haves" be permitted to make their own approaches to the Com-

bined Boards and secure their own supplies, or should they be required to put their claims through UNRRA? The danger in permitting individual action is that it might result in inequitable treatment, supplies being allocated in proportion to means, not needs. On the other hand, few derogations from national sovereignty could be more galling than restrictions on a government's right to do the best it can for its people, and the French and Dutch would be justified in asking whether the supplies of consumers' goods for the American and British peoples are to pass through the UNRRA bottleneck. A satisfactory compromise appears to have been reached. The "Haves" are to be entitled to approach the Combined Boards direct; but UNRRA is to have the right of veto if this results in an inequitable apportionment of supplies.

A further problem involving delicate matters of pride and status was that of the mechanism of distribution to be adopted in each country. In the first phase of military re-occupation, the distribution of relief, like everything else, will necessarily be under military control; the controversy relates to the succeeding phase. Two opposite dangers need to be avoided. On the one hand, it would clearly be wasteful, and unnecessarily wounding to national dignities, for UNRRA to set up its own distributing machinery in countries where there is a legitimate government in full control. On the other hand, in countries where there is reasonable doubt which of several contending factions is, or should be, the legitimate government, to have UNRRA bounty to distribute might put an unfair disadvantage in the hands of one party. The original proposal appears to have leaned too strongly to the legalistic side, and the French and Jugoslavs protested against it. Here, again, a satisfactory compromise has been reached, by which the full formalities of *de jure* recognition will not have to be awaited before a government can secure supplies to distribute. It would, however, probably be too much to hope that there will be no accusations that UNRRA is playing politics with the people's food.

An ingenious device has been adopted for fixing the financial contributions to be made by different countries towards the costs of relief. It has been proposed that each of the "donor" countries should contribute a sum roughly equal to one per cent of its national income. The American contribution would be \$1,500 million, that of the United Kingdom \$320 million and of Canada \$90 million. Australia, New Zealand and South Africa would contribute \$32, \$8 and \$12 million respectively. For poorer countries there is to be some reduction in the scale. Thus, India's \$35 million and the \$495 million to be found by Egypt and the Latin-American countries together represent less than one per cent of these countries' national incomes, while it is apparently expected that Russia and China will make no contribution at all. This is an interesting illustration of the way in which the national income, so recently an obscure academic plaything, is becoming an instrument of statesmanship. It is to be presumed that these sums will, in the main, be spent in the countries providing them. Thus the United Kingdom's £80 million will pay for the supplies coming from this country and the colonies. To have to provide more than a small part of that sum in foreign exchange would be a different matter, which would call for a reconsideration of the formula. The administrative costs of UNRRA are to be shared by a different formula.

These questions of method and procedure are necessary preliminaries and it is useful to have them settled. But they should not be allowed to obscure the fundamental problem of relief, which is that of matching supplies to requirements. On the side of requirements, a great deal of useful work has been done. The Allied Post-War requirements Bureau reported in the summer, giving detailed figures of the requirements for eight European countries under nineteen separate heads. These totals were doubtless realistic when related to the needs of these countries; but that they were less realistic when

related to the possibilities of supply can be sufficiently demonstrated by the fact that they called for total imports at the rate of nearly 47 million tons per annum by sea and 45 million tons by other means. Since then, there is reason to believe that progress has been made in establishing a list of requirements on the bare minimum basis, which is, unfortunately, all that is likely to be possible.

It is, however, a serious question whether even this bare minimum of supplies will be forthcoming. When the whole problem first began to be discussed some two years ago, it was possible to assume that there would be large supplies of many, if not all, of the commodities that would be needed. The first title that Sir Frederick Leith-Ross bore after he left his full-time post at the Ministry of Economic Warfare contained the word "Surpluses," and there has been a certain survival of ideas from this now remote period, if not in the official debates, then certainly in the public discussions of the question of relief. The truth is that there is now very little of anything. With a very few exceptions, there are no large stocks of food or raw materials waiting for ships to lift them. Wool may be a partial exception among the raw materials, though it is of little value without the ability to transform it into cloth. Wheat has hitherto been an exception among the foodstuffs, but it is questionable how much of the stocks will be left when the war ends. Manufactured consumers' goods (clothing in particular) are by now in short supply everywhere, and the prospect of increasing supplies depends more upon the release of labour and capacity from making munitions than upon either raw materials or shipping. Fuel is also in universal short supply.

The largest uncertainty in assessing probable supplies relates to the policies to be pursued in the United States. American supplies are vital, since the United States is the only large country where the average citizen still has a substantial margin of consumption above the bare necessities. The question is whether any part of that margin is likely to be put at the disposal of relief. If it seemed probable that American consumption of food, for example, would be reduced to, and held at, the level of, say, 1938, there would be a substantial supply available for UNRRA. It is a question that only the American people and Government can answer, but the present probability is that the answer will be in the negative. Next year is an election year; the Democratic party is convinced that its setbacks in 1942 and 1943 were due to irritation over rationing and restriction more than to any other single factor; and the Administration is now in full retreat on this front. American good will is plentifully mortgaged for relief; dollars will be forthcoming; but whether food or clothes will be available in substantial quantities is much more doubtful. Indeed, there is some risk lest the pressures of politics will lead the American Government to find supplies for relief at the expense of other countries which, while far from starving, are less plentifully supplied than America itself.

This sheds a particularly humorous light on the contention of the Nazi propaganda that UNRRA is a plot "to flood the liberated countries with American and also with British goods, thus preventing these countries from bringing their own industry and agriculture into alignment with peacetime conditions." The truth is the opposite, and the danger is lest the suffering countries of Europe are being misled into exaggerated expectations of what can be provided. The second R in UNRRA's title stands for Rehabilitation, and it would be the path of wisdom to lay by far the greater weight of emphasis upon this aspect of its work rather than on Relief. It is a hard truth, but a truth none the less, that Relief will have to be restricted to the bare minimum necessary to keep Europe alive, and that the best hope for a quick return to comfort and prosperity lies in the speed with which the normal processes of industry and agriculture can be restored. Self-help must necessarily be the liberated countries' chief resource, and they should look to UNRRA for assistance and counsel in this task rather than for the means of making it unnecessary.

Rehousing Londoners

WHILE planners are working on blue-prints for the betterment of Greater London, and the Government is still debating appropriate legislation "to control and direct the use of the land of Great Britain", the London County Council, whose plan for the redevelopment of the inner London area has aroused much praise and controversy, has taken the first practical step in its own local programme. Compulsory powers are being sought to acquire 910 acres of land at Oxhey, in Hertfordshire. The spur is necessity. Whatever may be thought of the site selected, there can be no question that the LCC has to find sites somewhere outside the County to house its overflowing population decently. On any basis, the replanning of London County will leave a surplus to be housed elsewhere. Equally, although it is a pity that the Council should have to act before the framework of a national plan, or even of a general plan for Greater London, has been completed, longer delay in discharging their rehousing duties is not possible. With the coming of peace, the LCC will be faced with an acute housing shortage, against which they must be armed in advance. The Oxhey proposal may look like an isolated action, unrelated to a general scheme. But criticism on this score needs to be directed less against the LCC than against the delay in formulating national policy for redevelopment.

The reasons for choosing Oxhey are not known. Too much weight need not be given to local objections, which are bound to come wherever a well-placed district receives an influx of what it regards as "poorer development." What is unfortunate is the use, before fuller details are available, of the phrase "satellite town" for the Oxhey project. A satellite town is best and commonly taken to mean a town and not a dormitory suburb; a place to live and work, as well as to sleep; with a distinctive life of its own, largely self-sufficient as regards public and social services, recreations, and employment, though linked with its metropolis in terms of general economy and by reason of accessibility. It may be that the LCC, by providing in advance community centres and other facilities, will avoid the dreariness and lifelessness which have so far characterised most new housing estates on this scale. But the most pertinent question is whether work will be available locally, and how much work?

Probably only an industrial expansion of Watford could provide local employment for the Oxhey estate. A proportion, if not the whole, of the new residents will presumably have to travel to central London daily, in the first instance at least; and the London Passenger Transport Board has no doubt been consulted. This in itself is perhaps ominous, even though it may be inevitable, for the large estates erected by the LCC before the war added much to the overcrowding of London transport, and the metropolitan traffic system is approaching saturation point.

In the absence of fuller information, detailed criticism of the Oxhey proposal is perhaps out of place. It does, however, on the surface, bear a suspicious similarity to the LCC's pre-war rehousing policy, which, perhaps unavoidably, aimed at solving the County's own overcrowding problem, without troubling much where the residents of the new estates should work and how these estates affected the wider problem. This was not the LCC's fault. Then, as now, they were working without the guidance of any coherent national policy. But the effect was to increase the arbitrary sprawl of London and the national problems arising. The question which the LCC's Oxhey action raises anew is the old one. How should decentralisation from the County of London proceed?

Between the two wars decentralisation from London took the form of an uncontrolled overspill into the outer London area. Whether control is exercised this time or

not, there is no doubt that decentralisation will continue. The London Plan anticipates that over half a million people will go from the County in the post-war decades; and in the discussion the only quarrel over this figure has been whether it should not be higher. Industry, too, has moved out from the centre, and in 1937 a peak number of 48 factories left inner for outer London. The London Plan hopes and expects that this trend will also continue or increase after the war.

London is a special and, in some ways, an insoluble problem. Different and more drastic measures will be needed to reorganise it than is the case with other smaller cities. The Barlow Report recognised this when it proposed that a "National Industrial Board" should have executive powers to prohibit factories in the London area, but only advisory functions elsewhere. The economic structure of London is a jigsaw puzzle whose pieces have never been fitted together. Outer London grew up as a dormitory for the inner area, but on top of this has come industrial growth, and finally large numbers of factory workers from all over the country. Industry has often selected the older residential areas, to the annoyance of the latter, while factory workers have often been crowded out by people employed in offices in central London from living near their places of work. Housing, as in the case of the LCC estates, has been as a rule completely unco-ordinated with employment, and sometimes with transport as well. The problem of overcrowding on transport to and from the centre of London is well known, but there is less realisation of the great amount of cross-travelling that is done every day by London's factory workers. Factories in Mid-Kessex now employ about half a million people, against three-quarters of a million employed in the County of London itself, and in addition to the reciprocal flow of workers between the two counties there are innumerable minor movements. If, after the war, there is a further unco-ordinated sprawl of both housing and industry into the outer London, transport difficulties will be increased, not so much in the form of up-and-down travel as in that of cross-travel, for which the facilities available are far from satisfactory. In addition, there is no doubt that the factory worker has a much stronger objection to spending time and money in travelling to work than the office worker.

It is, of course, impossible to wipe out the traffic jam which has been done. The important thing for the future is to ensure that central London shall not continue to be cleared at the expense of outer London by becoming a dumping-ground. A solution which is widely advocated is decentralisation to real "satellite towns." These would be at least 20 miles from the centre of London, and might take the form of either specially constructed towns or the enlargement of existing towns or villages. In either case they would be substantially self-sufficient in the sense defined above. Many responsible planners advocate that the whole decentralisation from central London should be accomplished in this way. This would have the merit of avoiding any increase in the size of Greater London. But how is this to be done? Satellite towns with homes and work cannot be created by a wave of the wand. Industry, left alone, will go where it wills, not where planners want it. Yet, if Greater London is to be a fit place to live and work in, it is of the highest importance that housing and industry should not be allowed to go their several and irresponsible ways, bringing grave problems of transport, work, and public services. Further development must, so far as possible, be designed to reconcile the pieces of the jigsaw, in the phrase once used by Bismarck, to "paper over the cracks."

What is possible? The double decentralisation of population and industry needs to proceed on the basis

of a comprehensive plan covering a wide margin around the area which is usually taken as Greater London. Such a plan is now in preparation under the able hands of Professor Abercrombie. But the plan of itself will be little use without new powers of the type suggested in the Barlow and Uthwatt reports. To some extent housing must wait on industry; and although the reverse arrangement is sometimes possible, as in the provision of a trading estate by the housing authority, this is not often done nor always desirable. For this reason alone a national policy for the location of industry is vital to the future of London. If nothing is done, to quote the London County Plan,

Following an immediate period of dislocation, a continuous and probably increasing outward move of factories to the nearest vacant land or suitable premises outside the County will set in. If not properly controlled, this will, in its turn, induce the development of further residential areas and necessitate the extension of transport facilities, resulting in an ever-increasing sprawl of the Metropolis. This, at all costs, must be prevented.

The urgency of the situation has compelled the LCC to go forward with plans for decentralising its surplus population in the old way. It is more than time that the Government came forward with proposals to do the utmost, by state policy, to guide rehousing.

NOTES OF THE WEEK

Duties Defined

Minimum objectives for the new session of Parliament were laid down in Wednesday's Speech from the Throne. The distinction drawn in the Speech between "a measure embodying proposals for education and 'views and proposals' for other social reforms, if it forecasts a Bill for the first and only White Papers for the others, sets the sights far too low, and should be strongly resisted. If, when the session ends, actual Bills have not been produced on all the matters specifically cited—that is, for the training and employment of disabled persons, for the reconstruction of the national system of education, for the enlargement and unification of social insurance, for the establishment of a comprehensive health service, for the reform of workmen's compensation, and for the redevelopment of "areas which, by reason of enemy action or otherwise, need to be replanned as a whole"—both the Government and Parliament will have failed in their duty. The programme of "food, work and homes," still only a slogan, needs not only these Bills, but good Bills, which really solve problems, many of which are a generation old, and, probably, more Bills.

My Ministers . . . have undertaken a special review of the problems that are likely to arise as hostilities in Europe come to an end . . . and in the months to come will complete their provisional plans for the period of transition through which we must pass before the troubled times of war give place to settled conditions of peace. It will be the primary aim of My Government to ensure that, in this period, food, homes and employment are provided for My people, that good progress is made with the rebuilding of our damaged cities, and that in industry, mining and agriculture a smooth transition is made from war to peace.

The Cabinet has defined its duties, in very much the same general terms its critics have pressed upon it for many months; it remains for Parliament to see that duty is done, and that no excuse of crowded Commons time, administrative delay, or "controversy" is permitted to prevent the minimum objectives, at least, from being reached. The terms of the King's Speech, with Mr Attlee's glosses upon it in the following debate, have already strengthened two doubts. The first is that the Government's approach is still too tentative and too provisional, too much concerned to secure agreement before decisions are made and too little disposed to take the responsibility of stating a policy. The second is that the programme may well turn out to be bits and pieces and not a rounded whole; a heap of bricks is not a building.

Sir Oswald Mosley

It is just two years since Mr Morrison was hotly attacked in the House of Commons for detaining people under Regulation 18B. Since then he has been gradually releasing them, and at the end of September the number of persons still under detention was only 364, against about 1,300 at one time. No one has objected to these releases—in fact, no one has paid any attention to them—and Mr Morrison might be excused for underestimating the public outcry which greeted his announcement last week that Sir Oswald Mosley was to be conditionally released on health grounds—he is suffering from phlebitis. Protest meetings have been held; monster petitions have been drawn up; and deputations have taken place—the

sort of action, in fact, that in English history is usually associated with wrongful imprisonment rather than compassionate release. On hearing the medical opinion—that continued detention might well produce "permanent damage to health and even danger to life"—Mr Morrison, as he told the House of Commons on Tuesday, had only two courses open to him: to keep Sir Oswald in detention and possibly have the responsibility of his death, or to substitute for detention "some system of control approximating to house arrest." In this case, as throughout the administration of 18B, the safety of the state must come first. If, in spite of his health, Sir Oswald Mosley could be a danger to the state if he were released, Mr Morrison would have no option but to continue his detention. If, however, the state of his health is such that it is possible to control him and his activities without detention, then Mr Morrison is not only right in letting him out of detention, he would be wrong in keeping him in. Over and over again it has been emphasised, not least by the very people who are most active in protesting against Mosley's release, that persons detained under 18B have committed no crime and have had no trial or conviction, and that, in Mr Morrison's words,

these extraordinary powers of detention without trial must not be used except in so far as they are essential for national security.

This principle must also be upheld when it is a case of a person with Sir Oswald Mosley's record, and it would have been a grave miscarriage of justice if Mr Morrison had allowed himself to be swayed from this principle by considerations of Mosley's wealth or national unpopularity. The only criticism that can be brought against the Home Secretary is that he did not issue, before the release took place, the explanation he gave this week. The popular outcry is, in fact, somewhat disquieting. It is easy to say any reaction against Fascism is welcome. But in this case the reaction is not a healthy one. It ill becomes the Communists, for instance, who never suffered detention under

Export
and

SKANDINAVISKA BANKEN

18B even when they were obstructing the war effort, to say that Mosley's release is "insulting and disheartening to all who are fighting and working everywhere against Fascism." Moreover, the alacrity with which the Transport and General Workers' Union protested against it, especially in view of the union's close connection with Mr Bevin, has naturally raised suspicions, unjust it is to be hoped, that Labour Party policies rather than disinterested anti-Fascism were involved. A similar construction might well be given to the National Council of Labour's attitude and the T.U.C.'s resolution. More disturbing still are the mass protests and deputations which are non-sectional. These savour strongly of the mass hysteria on which Fascism itself is built. And the slogan—"Let the man die in prison"—has the brutality associated everywhere with the name of Nazi. Least legitimate of all are the views that have appeared in print—in a Liberal newspaper of all places—that the release was wrong because it was unpopular with the British people and, believe it or not, with their Allies. Justice is nothing to do either with popularity or with diplomacy; indeed, it cannot be maintained unless it is prepared to be unpopular both at home and abroad, and if ever the day comes when men, unconvicted of any crime, are put into or let out of gaol on a mob vote, the institutions of civil liberty which are England's greatest contribution to mankind will be at an end. The behaviour of the Home Secretary's critics has been disgraceful.

* * *

Towards Lebanese Independence?

After a week of negotiations, during which Mr Casey and General Catroux conferred together in Cairo and severally studied the Lebanese situation in Beirut, the French National Committee decided to retrieve their original blunder. The President of the Republic was released and reinstated, the Ministers released. At the same time, the French National Committee undertook to restore normal constitutional life and to negotiate with the Lebanese over their country's independent status. At first it seemed that the French would insist on a new agreement. However, the former Prime Minister, Raïd es Solh, and his colleagues, once released, returned to their offices and the Lebanese crowds invaded the Chamber to reinstate the deputies. Under these conditions, the French wisely decided to accept the old Ministry, which is in any case the rightful constitutional Government of Lebanon. Throughout the crisis, the British authorities on the spot, including Sir Edward Spears in Beirut, Mr Casey in Cairo, pressed for the total reversal of the French *coup d'état*, and there is no doubt that without this uncompromising attitude the French National Committee would have allowed the crisis to develop. Unhappily the French have taken great exception to the British attitude, and the comments of the Algiers and Brazzaville radios have been hostile in the extreme. On the other hand, a very annoying tendency to pompous self-righteousness has been apparent in sections of the British press. This psychological worsening of Anglo-French relations is most unfortunate, for it will need all the tact and patience of both sides to work out the more complex and more delicate question of France's future relations with the Lebanese Republic.

* * *

A Protective System

The origin of the recent crisis in Lebanon was, it appears, the refusal of the French to terminate the mandate, unless the Lebanese entered into special treaty relations with France, and the contrary refusal of the Lebanese to negotiate a treaty until France's mandate was officially withdrawn, so that the negotiations could take place between equally sovereign Powers. This complete clash of outlook reflects a deeper one—the desire of the Lebanese to have no special relationships with France, and the determination of the French leaders to preserve a special area of French influence in the Levant. This opposition makes the situation very delicate for the British, for they enjoy with Egypt and Iraq precisely the kind of special relationship for which France is looking; in Palestine they have yet to achieve it. The principal difference is that in the case of both Iraq and Egypt getting rid of the British defence system is not a major issue in politics. In Lebanon, getting rid of the French definitely is. And failure to satisfy the Lebanese demands, to which the British are now committed, would compromise the British task in Palestine.

One solution, which the French would hardly accept, would be a French withdrawal from the Levant to concentrate on North Africa. Another, which may prove practicable, provided that French—and British—statesmanship is equal to the task, would be the creation of a joint British, French and American system of garrisoning in the Middle East which would be the defensive and strategic underpinning of the movement towards Arab union. A concerted military guarantee given by the peace-loving Great Powers might enable France to end the political impasse into which it has fallen and at the same time provide the Arab states with a protective system untainted by imperialism.

State Assets

The Sixteenth Report of the Select Committee on National Expenditure (1942-43 session) explores one of the most interesting byways of war economics—the extent to which the state is acquiring capital assets of permanent value. The Report comments in critical vein on the fact that there is no central collation of information on the subject and no uniformity of practice between the Departments. It is not therefore possible to give more than a few sample facts. But the partial figures that have been collected are large enough to show the dimensions of the subject. They refer to the expenditure of five Departments (the Admiralty and the Ministries of Supply, Aircraft Production, Works and Food) over roughly the first three years of the war. The sums advanced to contractors on contributory schemes for the construction of factories (i.e., where ownership remains with the contractor) amounted to £11,505,000; on non-contributory schemes (where the state is the ultimate owner) the expenditure was £282,082,000; and on factories wholly owned by the state (e.g., Royal Ordnance Factories, agency and shadow factories) the expenditure was £381,500,000. These figures, to repeat, are very partial: they cover only a few Departments and a limited period and are confined to factories. They exclude all movable stores and commodities. Even so, the total is £674 million. According to the Budget White Paper, the total of private net disinvestment in the three years 1940-42 was £395 million. To get a figure expressing what has happened to private capital in these years it would be necessary to add the value of the maintenance and depreciation that has not been carried out. But it may well be that the state's expenditure on acquiring capital assets has actually exceeded the fall in value of privately-owned capital. It does not, of course, follow that the permanent value of these assets will be anything like equal to what they have cost; but they will be far from valueless. It is clearly nearer the truth to say that the war has caused a distortion of the nation's domestic capital resources than to say that it has caused a depletion. Overseas capital assets are, of course, a different matter; there the depletion is all too real.

* * *

Enterprise

When Sir Stafford Cripps spoke to his constituents last week-end on post-war economic policy, he made a gallant bid to lift the argument above the merely doctrinaire and sectional approach which so much mars most present public discussion of the role of the state in national economy. He put the problem in simple logical form. The full productive capacity of the nation, fully used, can provide, as a minimum, a decent standard of living for everybody. A sufficient supply of the goods and services necessary for this standard must be produced and made available; and each family must have, from all sources, sufficient income to buy them.

Controls, as controls, are neither good nor bad. They are good if they are needed to fulfil a purpose; they are bad if they are unnecessary. One of the reasons why the recent interminable wrangling about the goodness or badness of Control (always with a capital C) has darkened both counsel and brows is that the problem is still widely misunderstood. The goal is the utmost and most productive enterprise in the employment of the nation's resources, so that the national wealth, and the share of each in it, may be as big as possible. The function of Government is not to check and oversee everything that goes on—which, however benevolent the motive, would amount to restraining with one hand the enterprise conceded and encouraged with the other, a wasteful, frustrating process. It is rather to free enterprise, untrammelled by all

irrelevant restriction, private as well as public, where private enterprise is appropriate to achieve the ends of society; and where it is not appropriate, that is, in a strictly limited field, to replace it bodily with genuine public enterprise. Control, as such—that is, the negative imposition by one set of persons of prohibitions on the activities of others—should everywhere be reduced to a minimum. The community needs to take its brakes off, not to put new brakes on.

* * *

The Future of Exports

At last week's meeting of the National Union of Manufacturers, serious words about the future of British exports were spoken by both Sir Patrick Hannon and Mr Ralph Assheton, Financial Secretary to the Treasury. The former talked of the "formidable competition" of American manufacturers seeking a leading world position; the latter laid stress on Britain's diminished income from overseas, and the corresponding need to pay for essential imports by increased exporting. Both had good advice to give. Sir Patrick Hannon, asking for "the recognition of mutual obligations" between Britain and the United States, suggested an agreed revision of the American tariff of 1930 and the British Ottawa Agreements. Mr Assheton, referring to the effect of taxation on industrial research and development expressed the wish of the Treasury and Board of Inland Revenue to aid and not to impede efficiency, by which sales abroad stand or fall. Neither speaker made it sufficiently plain that exports, so far from being primarily a means to make employment, have the object of obtaining essential supplies with a smaller use of resources, including labour, than if the supplies were produced at home.

* * *

World Needs

This week, at a Foreign Press Association lunch, Mr Richard Law, Minister of State, had more to say on the subject of exports. Anglo-American commercial competition will be damaging to either or both, if world markets, including their own, are restricted, and world employment and income are kept smaller than may be by impolicy; but if policies of expansion, full employment and freer trade can be made internationally practicable, there will be room and to spare for the productive capacities of both countries in meeting the mutual needs of all nations. The desire of the world to consume is still very far ahead of its power to produce. The problem, nationally as well as internationally, is still to increase the productivity of all kinds of employment—and so, on the one hand, to make supplies more plentiful and more cheap, and, on the other, to make demand more effective.

* * *

Slow Motion in the East

The fighting on the Russian front has brought no decisive advantages to either side in the course of the past week. The German counter-stroke from Zhitomir has grown in intensity; and there can be little doubt now that the German High Command has been aiming at the recapture of Kiev. The position on this sector may become critical for the Russians within the next few days; but so far German successes there have not yet gone beyond the limits of a local and costly advance. To the south of Kiev, the Russians have established a new bridgehead across the Dnieper in front of Cherkassy. This bridgehead, if widened and consolidated in time, might have given the Russians a vantage position for alternative thrusts at the northern flank of the Krivoi Rog salient or at the southern flank of the Kiev salient. The tempo of operation in front of Cherkassy, however, has not apparently been quick enough, so far, for a thrust to be developed soon enough. It does not seem likely that a threat can develop in time to the right flank of the German force which is advancing towards Kiev, and the whole unrelieved brunt of meeting the counter-stroke will probably have to be borne by General Vatutin's troops inside the Kiev salient. To the north of the Pripiet marshes, the encirclement of Gomel has now been almost completed; and the fall of Gomel should now not be delayed for long.

* * *

Debates at Algiers

The Consultative Assembly at Algiers ended its debate on French domestic affairs with a vote of confidence "in the

Government of the French Republic presided over by General de Gaulle." The vote was unanimous, though the Communists expressed reservations about the general conduct of the war. They urged the need for a great French army numbering a million men, instead of 500,000. They also asked the National Committee to organise "national insurrection," a demand which they were not alone in making. But, on the whole, the Assembly has, so far, fully backed the policy pursued by General de Gaulle. The French Socialist leader Jules Moch has said specifically that, during the transition from war to peace, only a Government headed by General de Gaulle will be possible in France. In the Assembly's debate on foreign affairs the hope was expressed that the Allies would recognise the National Committee as the real Government of France—and General de Gaulle claimed outright on Wednesday that the Committee is "the Government of the Third Republic."

* * *

The Ghost of Vichy

At least half a score of versions have been put out to explain the mystery of Marshal Pétain's cancelled broadcasts from Vichy. He is said to have intended to announce either his resignation or his decision to regard himself now as a prisoner of war or, possibly, the cancellation of Laval's appointment as his successor as Chief of State or, finally, his intention to resign his plenary powers in favour of the National Assembly which vested them in the Marshal in June, 1940. This last explanation, if true, would mean in theory the winding up of the National Revolution by its chief and responsible sponsor and a formal return to the Third Republic. Which of the explanations offered is correct it is still impossible to say. But there can be no doubt that the protracted crisis in Vichy has now reached a final stage. The Vichy administration has for some time been in a state of disintegration. Laval's officials are simply not in a position to carry out his orders; and so, in its fourth year, the experiment in strong government ends in impotence to rule. The spirit of resistance has permeated the innermost centres of the administration itself and paralysed its ability to move and to act. The threat of retribution to traitors, constantly repeated from London and Algiers, has acted as a deterrent where patriotic sentiment has been too weak to prevent collaboration. The *maquis* have challenged the police and the *gendarmes*; and the less spectacular, but even more widespread, forms of resistance and sabotage have proved to be beyond control. But the ghost of Vichy will probably continue its illusory existence until Allied landings and French revolt finally exorcise it.

* * *

Second Thoughts on Hereford

The reports of two inquiries which have been published this week show, like the Mosley case, how easily popular emotions can be aroused on an insufficient knowledge of the facts. In the case of the inquiry into the Hereford juvenile court, there was certainly considerable justification, for the strictures pronounced on the magistrates by the Lord Chief Justice and other justices in the Divisional Court might well have been taken as good evidence that all was not well with them. Moreover, popular indignation was roused chiefly by the sentence imposed, rather than by the alleged irregularities of procedure in the conviction. It was with the latter that Lord Justice Goddard's inquiry was concerned. His report (Cmd. 6485; 3d. net) shows that the findings of the Divisional Court were inevitable but were based largely on a clerical error in the magistrate's court. The assistant to the Clerk to the Justices, a young man of 18, had entered the plea of not guilty to all three charges, partly out of some confusion about the amount of malicious damage which was admitted. Lord Justice Goddard found, however, that the boys had pleaded guilty, to all three charges and that the case had proceeded on that footing. When the notice of motion was served on the magistrates in July, six months after the case had been heard, they all declared that the plea on all three charges had been guilty, but, chiefly from a laudable desire not to let down the Court officials, allowed themselves to be overpersuaded in view of the entry in the Court register, which the chairman had signed without noticing the mistake. The mistake was, therefore, persisted in in the magistrates' affidavits placed before the Divisional Court, and, since no notice of motion was served on the prosecutor, there was no affidavit from the police, who would have supported the magistrates in their original conviction about

the pleas. Thus, Lord Justice Goddard found that there was no wrongful conviction, which to the Divisional Court was the most serious matter at stake. With regard to the question of appeal against the birching sentence, Lord Justice Goddard points out that nothing could be worse than for a boy to have a sentence of birching hanging over his head for the fortnight during which an appeal might be lodged. In the Hereford case, the chairman of the magistrates tried to stop the birching as soon as the father's wish to appeal was known, but it was too late. There is no easy solution to this dilemma of carrying out the sentence as soon as possible and yet allowing an appeal—save one, the complete abolition of birching in juvenile courts. In 1938, the Departmental Committee on Corporal Punishment came to the unanimous conclusion that it was not a suitable or effective remedy for young offenders, and justices were reminded of this conclusion in June 1941. Thus it is still permissible to doubt the wisdom of the Hereford magistrates in imposing this particular part of the sentence, though they have been cleared completely of any miscarriage of justice.

* * *

Detention Camps

The second inquiry arose from the manslaughter of Rifleman Clayton at Fort Darland detention barracks. Here there was no question of denying the facts of his death, which very naturally and properly shocked the public profoundly. But from the letters and articles that were published in the press afterwards, it appeared that the public was afraid lest the Fort Darland incident was not isolated and that bad conditions in detention camps were common. The report (Cmd. 6484, 6d. net) of the Committee of Inquiry under Mr Justice Oliver finds, after an investigation extending over five weeks, that at present and for some time past no brutality of the sort indicated is being or has been practised. The Committee visited, without warning, each military prison and detention barracks and the naval detention barracks. They themselves picked at random certain names from among those detained, and the men were then interviewed singly and privately and asked whether they had suffered or seen any ill-treatment or injustice. The Committee also inspected the food; medical accommodation; sleeping, washing and sanitary arrangements; and, in fact, the whole premises. Finally, the men were paraded, and they were told publicly that anyone who wished to complain could do so without victimisation and would be heard in private. The next stage of the Committee's inquiry was in London, where signed statements were asked for from anyone wishing to appear before the Committee, who were later interviewed if their allegations were relevant to the inquiry. It is thus quite clear that the investigation was as thorough and as impartial as it could be, which makes its conclusions the more reassuring. The vast majority of the complaints heard came from recidivists—men who are determined not to serve and would rather spend their lives in prison than do so—neurotics or mental defectives and others who were quite obviously liars.

*

The conclusion of the Committee, it must again be emphasised, does not throw doubt on the Clayton case, and the Committee themselves are less satisfied about conditions at the beginning of the war. Nor are they satisfied that present conditions are perfect. They recommend the establishment of a training school for the Military Provost Staff Corps; a general increase in staff at detention camps, particularly of commissioned officers—abuse, swearing and so on, according to the more reliable reports, were far less common when there were officers about; the provision of sick quarters where they do not now exist; the improvement of night sanitary arrangements; and better diet tins. The great difficulty, as the Committee realised, is to make conditions in detention camps decent but still far less attractive than service conditions. Moreover, the staffing difficulty is acute, as those who are best qualified are generally those who are most wanted as NCO's or officers in the ordinary combatant units. And it is a thankless job to ask anyone to volunteer for. But, even though some of the Committee's recommendations may be difficult to fulfil at this stage, its report is a welcome proof that the conditions disclosed by the Clayton case are not general in spite of the undoubted difficulties in the path of those who run the camps.

Advisory Councils

One of the first and immediate results of the Moscow Conference is a crop of new appointments. Sir William Strang is to serve on the European Advisory Council with the rank of Ambassador. Russia's representative is M. Gusev, the Soviet Ambassador to Britain. The American appointment has not yet been announced. The Italian Advisory Council is to have Mr Harold Macmillan as British High Commissioner, Mr Murphy as American representative and M. Vyshinsky, the Soviet Deputy Commissar for Foreign Affairs, will represent Russia. The French appointment has still to be announced. Mr Macmillan's appointment, which he combines with that of British Resident Minister at Allied Force Headquarters, creates a vacancy in British representation with the French. Mr Duff Cooper has been appointed, with the rank of Ambassador, to work with the French National Committee. His American colleague is Mr Edwin Wilson, his Russian colleague, M. Bogomolov. These appointments are significant, for they seem to point to a difference in emphasis on the status of the two Advisory Councils. Immediately after the Moscow Conference, it was widely believed that the European Council would continue the work begun at Moscow, that in consequence the delegates would be chosen from men of Ministerial rank. For example, there were reports that M. Vyshinsky would come to London. In the event, the representatives on the London Council are at the ambassadorial level, and it is difficult to believe that any really important questions will be settled there. Indeed, Mr Cordell Hull went out of his way in his speech to Congress to say that the Council would in no way supersede normal diplomatic channels. The Italian Council, which, in theory at least, deals with a far narrower, though much more specific, field, has a Soviet Vice-Commissar and a British High Commissioner among its members. It is possible that the playing down of the European Council is designed to allay the suspicion of the European nations that the Big Three intend to settle Europe's future over their heads. The ambassadorial character of the Council will make it easier to co-opt other nations and will probably make them less eager to be co-opted. The fact remains that the chief reason for not deploring the lack of concrete agreement at Moscow—the belief that the Advisory Council would carry on the work—has proved to be unsound. It is to be hoped that, if the general European Council is to have less scope than was at first imagined, other meetings and other Commissions of the Italian type will be quickly substituted to fill the gap.

* * *

The Gilbert Islands

Admiral Nimitz announces that the capture of the Gilbert Islands has been completed, after a short and remarkably successful American combined operation. As there are airfields on the islands and some harbourage for shipping, their recapture very greatly extends the effective range of Allied action in the Pacific. Allied units operating from these bases well out in the Pacific must greatly increase the strain on Japan's naval position, at a time when ships are the enemy's chief bottleneck. Ultimately, the new positions will constitute a threat to the big Japanese base at Truk and to Japanese positions in their mandated areas, the Caroline and Marshall Islands. More immediately, it may be possible to recapture the phosphate island of Nauru. But the most important point is probably the demonstration given by this operation of the Allies' growing naval strength in the Pacific. The sea resources weakens its hold from one end to the other of its precarious area of co-prosperity. Tokyo radio is speaking rather nervously of the "coming battle of the fleets" and Admiral Nimitz believes that there will be "action in the Pacific soon." An incidental result of the successful landing may be to spike the guns of an incipient offensive by the Pacific-Firsters. Representative Maas recently fired the first broadside in a strong attack on "the diversion of American forces" to the war in Europe, embellished with strong criticism of the British and of Lord Louis Mountbatten's appointment. The Gilbert Islands operation proves that, however much is being "diverted" to Europe, Admiral Nimitz still has a comfortable margin in hand.

* * *

Indirect Speech

Time was when *Times* leaders were regarded abroad as statements of the Government's foreign policy. This was

never so, and in any case times, and *The Times*, have changed; last week's *Times* articles on foreign policy, for instance, bore the cachet of Printing House Square's own particular professor, plain for anyone anywhere to see. It is rather in Soviet Russia, freed from the old subterfuges of secret diplomacy, that newspaper articles are brought in to ventilate official policy. With differing degrees of authority, *Pravda*, *Izvestia*, and *War and the Working Classes* can be read to find out what Russian policy is coming to be. On Thursday last week the BBC gave a big part of its important 9 o'clock news to *Izvestia*'s indignant denial of suggestions made by the *New Statesman* and *The Economist* that the Moscow Agreement on Austria might imply, possibly, some kind of approval of some kind of federation in Central Europe. It is, of course, very helpful to have this conspicuous, if somewhat indirect, statement of Soviet views. But is it really the BBC's job, with no news minutes to spare, to assist this roundabout method of explaining official policy? And is it helpful, to either party, for Russian journalists always to sense the worst motives in the speculations of their most disinterested British colleagues?

Shorter Notes

The evacuation of Samos was officially announced on November 23rd. All British, Greek, and some of the Italian troops were successfully taken off, together with a large number of the civilian population. Mr Attlee's statement in Parliament that the Aegean islands were lost "by only a small margin" will hardly satisfy fears that the operations there were badly handled.

*

With Mr Macmillan, Mr Murphy and Mr Vyshinsky on the Italian Council, and Mr Harold Caccia and Air Commodore Lord Stansgate appointed to represent Britain, and Dr Henry Grady and Mr Sam Reber to represent the United States, on the Italian Control Commission, it looks as though Amgot is being drowned in the flood of new officials. It may, however, be somewhat malicious to suggest, as one wit has done, that the present stage is that of *Amgötterdämmerung*, or the Twilight of the Rodds.

AMERICAN SURVEY

War Plants in the Far West

(From a Correspondent in Colorado)

WITH the index of industrial production currently at 200 per cent of the 1935-39 average, and well above the previous peak year of 1929, the average American business man takes pride in the present productive achievement, and has confidence in the potentialities for high levels of employment in the post-war decades. Yet there is evident fear of let-down and economic maladjustment in the months immediately following the Armistice. These "post-war jitters" may be encountered in any part of the country, but they naturally have their most direct impact upon those areas which have experienced a new and almost overnight industrialisation under the spur of war requirements.

On the plains of the Central West, as in Kansas, Oklahoma and Texas, what were hamlets in 1940 are aircraft and munitions centres in 1943; what were cattle ranches have become the sites of modern plants for the wartime production of high octane gas. The search for strategic minerals in the Rocky Mountain states reached into remote places which are now witnessing industrial activity for the first time. To supply the new war facilities of the West has required a mass migration of labour.

Out of a total of some sixteen billions of dollars of Government war contracts for industrial plant facilities to the middle of 1943, approximately one-third went to the states west of the Mississippi. These same states have but 23 per cent of the national population, and have heretofore been regarded as primarily the agricultural and mining area of the nation.

For these Western communities the post-war problem obviously differs from that of the Eastern industrial centres, where the same basic plant and organisation will be reconverted to what was essentially their pre-war production pattern. The Far Western communities, especially those farthest from the coast, have had no such pre-war history of industrialisation to continue where they left off. They must indeed begin from the beginning, to discover a post-war market and to retool for the change from war material to peacetime products. In industries like shipbuilding and aircraft, where there is little prospect of utilising even 20 per cent of present capacity following the war, political pressure is foreseen to continue wartime contracts of doubtful post-war usefulness, pending the emergence of other employment for the labour forces. In any event, it is to be expected that many of the expanded Western communities, dreaming new dreams of industrial greatness, will have a rude awakening when the return to peacetime competitive market conditions places their high-cost, out-of-the-way facilities in the sub-marginal class.

But these communities will not lightly yield their new-found industrial activity to the decisions of a competitive

market. The new plant facilities have been constructed with Government funds. Private steel, mining, shipbuilding and aircraft firms have operated the war plants under leases of the Defence Plant Corporation, an administrative arm of the Reconstruction Finance Corporation. In a few instances, notably that of the \$200 million steel operation near Provo, Utah, the Defence Plant Corporation not only owns but operates the plant, with the US Steel Corporation merely lending its management personnel for employment on the Government's pay-roll. Inasmuch as these Government-owned facilities came into being through Congressional appropriations, the general policy for disposing of them likewise lies within the discretion of Congress.

From the standpoint of the established private corporations in the heavy industries, the publicly-sponsored scheme for keeping the new facilities active after the war presents a potential menace to private industrial investment. It is true that the war contracts give to the firms which are now operating these facilities, as lessees of the Government, the first option for the acquisition of the war plants. But the exercise of these options involves the payment of the cost of construction, after allowance for depreciation and for rentals paid in. Such an outlay would in general be prohibitive, in view of the costs of conversion to peacetime production and competition with more suitably situated opera-

INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

tors. The Government, on the contrary, could operate these plants itself or through local committees, without attempting to meet either interest on the investment or cost of depreciation.

Even to those who do not have a direct interest in the parent corporations of the heavy industries, the forced utilisation of excess plant facilities in these newly-industrialised areas is a matter of deep concern. The time will come when the subsidised facilities have substantially depreciated, and the questions of reinvestment and the prospect of profits likewise have to be faced. It is argued that the day of reckoning, postponed by the initial subsidy, may well prove more disastrous than a timely demobilisation of these facilities and an early conversion of the labour force to more stable lines of peacetime employment.

This line of pessimism, orthodox and logical as it may be, is by no means universally shared, however. The local Western communities, along with their Congressional representatives, are building their fences with economic argument as well as legislative promises. They hold the time to be ripe for a redistribution of the American labour supply from congested Eastern centres to the wide open spaces of the West. To begin with, such a redistribution is favoured as providing a more favourable environment for the workers' families. Expanded hydro-electric facilities are cited, which make available sufficient power to operate new industry in many parts of the Far West. The vast area's resources of coal, shale oil and industrial minerals are still awaiting exploitation. More generally, there is a disposition on the part of the inland communities of the Far West to challenge the traditional handicaps which have been imposed upon the Western states by the business interests of the East. A long-standing bone of contention, for example, has been the structure of railroad freight rates. (To meet water competition, railroad freight rates between the Atlantic and the Pacific Coast has been lower than those between the coastal and inland communities.) An additional handicap has been the use of Eastern basing points for commodity price determination, as in the case of the "Pittsburgh-plus" formula for pricing steel.

A Congressional committee has recently been formed for the decentralisation of industry. Its prime movers are representatives of the Far Western states. Early in October they gave notice to the President and to their Congressional colleagues of their determination to foster a redistribution of the national industrial plant as so to spread it across the more sparsely populated areas of the country.

Apart from the fact that workers and their families will naturally strive to retain their wartime employment or its equivalent, a powerful economic incentive to the dreams of post-war industrialisation of the Western states lies in the prospect of new high levels of consumer demand after the war. Individual deposits in savings banks, together with currency held by individuals, are estimated at \$31 billion; in addition, individuals hold an aggregate of approximately \$19,500 million in war bonds readily convertible to cash. The pent-up demand for durable goods not now available, backed by this tremendous purchasing power, may create a sub-marginal place within the market for plant facilities now regarded as sub-marginal.

Obviously, with the war still to be fought to a finish, there are many unknowns yet to be resolved. The making of decision requires knowledge of the inventory position, military as well as civilian, at the end of the war; of the financial arrangements that can be made through Lend-Lease or other services for the disposal of war surpluses, and possibly for the transfer of plant facilities and machinery to countries that may have urgent need for them.

American Notes

Favourite Sons

The great political question of the next few months obviously is whether Mr Roosevelt will choose—or will be compelled, in order to save his party and his policies—to assume the Democratic nomination. But for the moment this is a relatively barren field for speculation, as it is so greatly to the President's interest to withhold any indication of his intentions, both because it maintains what hold he has over Congress, and because it forces the Republicans to work in the dark. Campaign preliminaries on the Republican side are a different matter. It is common knowledge that a formidable section of the party puts the aim of stopping Mr Willkie only second to that of defeating

the President. No doubt if the Republicans seriously anticipated defeat, this group would flock to Mr Willkie's banner in order to bury him, once for all, under the stigma of a double defeat. But after the recent elections there can be few Republicans who do not hope for a triumphal return to power next November. If Mr Willkie is to be cut out, it must be done in the party convention. Under these conditions, the reported move to sap his strength by encouraging the candidacy of a great number of "favourite sons" in the state primaries is a not unexpected device and one almost certain to be tried. Mr Willkie has made it clear that he believes this is what the opposition to him is attempting, and has warned that it might lead to a disaster for the party. The theory is that, with the state delegations divided into many factions, a deadlock would ensue which could only be resolved by the last moment production of a dark horse. Governor Dewey might come into this otherwise unsuitable classification because of his repeated insistence that he is not available. The real danger to Mr Willkie lies in the candidacy not of Conservatives like Governor Bricker, but of those representatives of Republican Liberalism such as Governor Stassen and Governor Warren, whose supporters would otherwise vote for Mr Willkie. Indeed, with a strong candidate like Mr Dewey at hand, it is hard to believe that the Conservative wing of the party would entrust their fortunes to anyone as colourless as Mr Bricker.

Freedom to be Fascist

Senator Nye, in a speech at Chicago, has roundly upheld the freedom to be Fascist. At a meeting of the Republican Revival Committee he declared that every nation has a right to pick Fascism after the war if it wants it, and called for the resurrection of the America First Movement. In the same address the Senator condemned American commitments abroad, although he granted that the nations might combine temporarily to oppose aggression. This is something of a concession from an isolationist so implacable that, when the bombing of Pearl Harbour was announced, he demanded, "How do I know this isn't a British propaganda trick?" The Republican Revival Committee which Senator Nye was addressing appears to be a creation of Colonel McCormick. So far the McCormick line has been distinguished mainly by what he is agin. He has denounced Mr Willkie and even Governor Dewey as traitors to Americanism; he denounces President Roosevelt and the British as regularly and effortlessly as breathing. The Presidential candidate upon whom the Colonel and his little group of reactionaries have saddled themselves like so many old men of the sea is General MacArthur. Senator Nye's statement provides the first hint of a constructive policy. No doubt it expresses the views of some of the rabidly isolationist and nationalist splinters still operating undercover. But as a way of breathing new life into the Republican party its success is more doubtful, particularly with those who fondly imagined they were fighting the Axis to establish four quite different freedoms.

Inflation Front

The House of Representatives this week passed legislation prohibiting food and agricultural subsidies by a vote of 278 to 118. The Senate is expected to approve the Bill by a similar majority. Despite the fact that the Bill carrying the prohibition is the appropriation for the Commodity Corporation, President Roosevelt has made it clear that he will not allow this to stand in the way of a veto. The final test will come with the attempt to rally a two-thirds majority to override the veto. It has happened before that Congressmen who have been willing and anxious to record their loyalty to their constituents' interests on a preliminary vote have taken a more prudent line when it was a question of overriding the President and assuming responsibility for policy. Press and radio comment has shown a rising tide of hostility to the anti-subsidy bloc, and there have been scathing reports of the huge inflation lobby assembled in Washington; but Congress, no doubt under heavy pressure from its farm constituents, has so far been unimpressed. The main moving force comes from the farm bloc, whose appetite is whetted rather than blunted by solemn warnings of the catastrophic rise in prices that would follow the abolition of subsidies. But the opposition is wider than just the farm bloc. As Raymond

Clapper has pointed out, the fight against subsidies is in reality a fight against price control as a whole; and no doubt it is believed that other controls would follow the Office of Price Administration down the drain. The Office of War Information has published statistics of the purchasing power pressing against the fragile anti-inflation barriers. In the second quarter of 1943 there was an addition of \$2.6 billion to the total of unspent and unemployed money, against an addition of \$1.7 billion in the second quarter of 1942. These figures are found by subtracting spending, taxes and investment for the quarter from total income for the period. The comparative figures are in \$ billions:—

	Second Quarter	
	1942	1943
Total income.....	27.4	34.5
Total personal taxes.....	1.5	3.5
Spending.....	19.8	22.3
Investment.....	4.4	6.1
Total Disposal.....	25.7	31.9
Quarterly Addition to Inflationary Pressure.....	1.7	2.6

They provide an enlightening background to the insistence of Congress that the country cannot carry a heavier tax burden. There are other ominous developments. New demands for wage increases frankly abandon even lip-service to the little steel formula. The Truman Committee has adopted a resolution approving the 8 cent an hour increase for non-operating railway employees which was turned down by the Stabilisation Director. If, as seems likely, the resolution is passed by Congress, it will strike a heavy blow at the already shaken authority of Judge Vinson and the War Labour Board, as well as the whole of the Administration's anti-inflation programme.

The California Japanese

The first real disturbances in connection with the segregation of disloyal Japanese took place at Tule Lake, in Northern California, early in November. A statement by Dr Myer, Director of the War Relocation Authority, suggests that the events themselves were less serious than exaggerated accounts in the American press have led readers to suppose. The Tule Lake camp is only one of several relocation centres, but it was the one chosen for segregating Japanese who for one reason or other, such as refusal to forswear allegiance to Japan, or bad records, were found unsuitable for release or more liberal detention. Apparently there were about 17,000 persons of Japanese birth or ancestry in the camp at the beginning of November. The disturbances appear to have been organised by a small number of those transferred from other centres, and consisted first of refusal to continue harvesting crops on the farm attached to the centre, of the submission of certain demands including the resignation of the Director, and finally of several sporadic attacks on the centre's personnel and property in which two men were injured and a trifling amount of material damage was done. At this point the troops guarding the boundaries of the camp were called in and took full control. Up to now the censorship from authorities have prevented any hint of the story from being cabled abroad, but it is plain from Dr Myer's statement that the newspapers have exaggerated the seriousness of the outbreak, have demanded drastic retaliatory action, and have accused the Relocation Authority of negligence in protecting the centre's staff and property. In consequence Dr Myer took pains to point out that many of the evacuees were innocent of any part in the disturbances; that many are children, and that others are there, not for disloyalty, but for family reasons; and that, finally, distorted accounts have already been used for Japanese propaganda purposes and may be used to justify retaliation against Americans in Japanese hands. Up to the present, the treatment of the Japanese (which was described in the "American Survey" of May 8, 1943), has been remarkably sensible and efficient. It will be unfortunate if at this late date there is a popular stampede away from a policy which has, for war-time, been singularly fair and successful.

Shorter Notes

Figures on the export of food under Lend-Lease have been made public from two sources this week. The Foreign Economic Administration has released figures on individual foods exported in the first nine months of 1943, by million pounds, in per cent of total supply, and reduced to "ounces

per week per US civilian." At the same time, Mr Hendrickson, of the War Food Administration, has announced that in the twelve months ending September 30, 1944, the United States will ship abroad 11 per cent of its estimated food supply, divided 4 per cent to Britain, 3½ per cent to Russia, and 3½ per cent to the other United Nations and the liberated areas. Mr Hendrickson vigorously defended the Lend-Lease exports and the policy of the Army overseas in having on hand or in transit a 270-day supply of food.

Hardships of Total War.—The supply of whisky, domestic and imported, is reaching the vanishing point, at least to the naked, or above-the-counter, eye. OPA investigators trying to check on prices have found no whisky to be priced, and ordinary customers have had to learn the painful technique of extracting under-the-counter stocks from wary dealers. A whisky company which decided to pay its dividend in kind found its securities soaring overnight. A Senate inquiry has been instituted to discover what stocks are available, whether they are being manipulated to increase profits, and to what extent bootlegging is being revived.

Although the War Labour Board has accepted the main outlines of the Ickes-Lewis coal contract, discussions continue about certain details, and there is still some confusion about methods of calculating wages. One concession by the miners which deserves more attention than it has received is the increase of the basic work week from 35 to 40 hours. While this is of slight importance during the war, it involves the abandonment of an important bargaining position for the post-war period. The mines of 43 coal companies have been returned to the operators, because they did not participate in the recent strike action, and therefore suffered no interruptions to "productive efficiency." These constitute, however, only a small proportion of the total. The return of the rest of the mines is contingent, according to Mr Ickes, upon the operators accepting the terms of the contract agreed to between the union and the Government.

NEWS of WHITE HORSE

No. 3

Providing for to-morrow as well as to-day

Suppose that good fortune has brought you a bottle of White Horse, as sometimes it may, even in this fifth year of war.

You pour out a modest measure of this genial spirit into your glass. What is your immediate reaction? First you recognise the delicate and distinctive aroma of the White Horse you have known in times of peace. Then, you raise the glass to your lips and at once your palate confirms your first impressions—that White Horse Whisky was never better than it is today.

This is quite true, and here is the reason. The White Horse Whisky in your glass is a whisky of the past and was growing old when this war was young. Stocks laid down long ago, matured and maturing, provide the White Horse supplies for tomorrow as well as today. Whisky as great as the White Horse you knew in time of peace, whisky which will always be 'fine as a fine liqueur.'

The present system of regulated supply is an essential provision to ensure for you the enjoyment of really good whisky both today, and in the years to come.

MAXIMUM PRICES: Bottles 25/9, Half Bottles 13/6.

THE WORLD OVERSEAS

The Norwegian Health Services

(By a Norwegian Correspondent)

THE health services in Norway, as they existed before the German occupation, have been built up gradually over a period of nearly a hundred years, overcoming many obstacles and obstruction and adapting themselves to the changes in medical knowledge and practice. They are financed out of general taxation and out of a special health tax, which is a premium paid to the Sickness Insurance Organisation. Thus there are two separate administrative systems, the public health administration and the sickness insurance administration, but both are controlled by the state.

Through the public health administration, the state is responsible for all the important factors underlying public health—hygiene and sanitation, and all other matters connected with preventive medicine, and the work of doctors, dentists, nurses, midwives, hospitals and so on. But, in spite of this central control, a considerable amount of local independence is allowed, both for the local health authority and for the individual hospital and doctor. The administrative set up is headed by the Ministry of Social Welfare, which is responsible for the financial, administrative and legislative aspects of the public health services. Then there is a Directorate for Public Health, which has a certain degree of independence of the Ministry, but which is linked to it through the Director-General of Public Health, who is in charge of the medical work of the Ministry.

Responsible to him locally is the local public health officer. Norway is divided into 380 districts, each with a local public health officer who is paid by the state for his public health work. He presides over the local board of health, which is elected by the county council and is the executive organ for carrying out local public health policy. Its tasks are varied. They include the control of tuberculosis and other infectious diseases and the supervision of the social security system for the care of the crippled, the blind, mental defectives and orphans. The board also supervises the conditions under which various foods are produced, stored, sold and distributed, in particular, milk and dairy products, meat, margarine and fish. It is responsible, too, for hygienic conditions in shops, hotels, restaurants, canteens, theatres, schools, churches, camps, log cabins for forestry workers, fishermen's accommodation and so on. Since there are 762 local authorities in Norway (695 rural and 67 urban) and 380 local public health officers, each health district covers an average of two local authorities, with a maximum of five and a minimum of one authority per health district.

Only in the relatively few larger cities are the public health officers employed full time on their public health work. In the rural districts, the salary paid by the state accounts for only part of their income. The rest is earned through private practice—either general or specialist practice—within their own district. In several sparsely populated districts, the public health officer is the only doctor, but there is no

monopoly attached to his private work. Any number of other doctors may settle in his district and practise there if they can make a livelihood.

The public health officers account for only about 15 per cent of the total number of doctors in Norway, but they are clearly the key men in preventive medicine and public health in all their aspects. Moreover, the combination of public health work and private practice, which has been of particular use in the sparsely populated rural districts, has prevented them from turning into office bureaucrats. On the other hand, it must be admitted that it is difficult to give the doctor the training in public health work and general medicine necessary for him to carry on both jobs adequately. Norway has met the problem by the holding of intensive refresher courses in public health, on the one hand, and by a good hospital and specialist service on the other. But it is not claimed that this is as yet a fully satisfactory solution.

How Doctors Are Paid

The medical profession enjoys on the whole a high social status and a good income. If a doctor is a public health officer, he derives his income, as has been said, partly from the state and partly from his private practice. If he is on a hospital staff or does research work, he is paid a fixed salary. But the two groups which comprise the majority of Norwegian doctors—general practitioners and specialists—derive the largest part of their incomes from the sickness insurance system. Unlike the panel system in Great Britain, the doctor is paid according to the amount of work he does. The consultation fee is the basis of his income, but to that is added a fixed tariff for special examinations, say, of the blood or the sputum, and so on. There is no question, therefore, of doctors maintaining two standards of treatment—one for the insured patient and one for the fee-paying patient—for in most cases the payments he receives would be the same. There is an incentive, too, for a doctor to work hard and also to specialise, because the insured have free choice of doctor and there is no limit to the number of patients that a doctor can take from the sickness insurance organisation, and because the fees paid to the specialists are higher than those paid to G.P.s. In most cases, the doctor sends his bill to the sickness insurance organisation, which pays him direct at intervals. In some of the big towns, agreement has not been reached between the doctors' representatives and the sickness insurance on the fees that can be charged in cases where the patient pays the doctor himself. In these circumstances, the patient, if he is insured, sends the receipt to the sickness insurance body, which refunds him most, but not all, of his expenses.

Compulsory sickness insurance was introduced in Norway thirty-two years ago, and, as in most other countries, was resisted to begin with. But there soon sprang from it beneficial consequences which probably even its founders had not foreseen. Not only were the health services made available to people irrespective of their ability to pay, but doctors, hospitals and so on were given a basic income, which enabled doctors to settle in places where they previously could not have made a livelihood—before the war there was roughly one doctor per 1,200 of the population—encouraged the building of new hospitals—there was a hospital bed per 115 of the population—and led to a generally higher standard of treatment. The result is that resistance was gradually overcome and the system was expanded to include larger groups of the population. Voluntary membership was introduced; in 1935 fishermen were included; and in the following year members of the mercantile marine. As a result, by 1940 about two-thirds of the total population in Norway belonged to the sickness insurance system, and, shortly before the war, a bill had been drafted to cover all Nor-

wegian citizens, which would probably have secured a clear majority in the Storting.

What the Patient Gets

An insured person and his family have the right, within certain limits, to treatment at home and in hospital; physiotherapy; tooth extraction and other dental treatment where it is a necessary part of the treatment of disease; disability allowances; and financial help in the case of childbirth or a funeral. Fishermen and others who are their own employers do not get disability allowances. Where the distance from patient to doctor or hospital is long, transport expenses are covered. Some diseases are not covered by the sickness insurance system: for instance, expenses connected with epidemic diseases, tuberculosis and insanity are covered by the state or the local authority, and industrial accidents are covered under workmen's compensation. There is also special legislation regarding the support of the crippled, the blind, the old, and mental defectives. About 80 per cent of the beds in hospitals and other institutions are controlled by the state or the local authority, a doctor is in charge of the administration. In the hospitals there is only one standard of treatment and nursing care, and the comparatively large number of private rooms are allotted according to medical need and not according to ability to pay. There are no non-paying patients. The patient is paid for from the sickness insurance, out of his own pocket, or under the poor law regulations.

The sickness insurance organisations obtain their income through a special sickness premium, which must cover the total expenses every year without any profit. Compulsory members are divided into six income groups and pay in proportion to their income. The member himself pays six-tenths of the total premium, the state two-tenths, and the local authority and the employer one-tenth each. Voluntary members pay seven-tenths themselves, the state two-tenths and the authority one-tenth. The sickness insurance is administered by local bodies, of which there is one in each authority. A board of five is elected by the county council and functions for three years. A salaried manager,

or sometimes a larger staff, is responsible for the day-to-day business. His appointment is proposed by the board, and approved by the central administrative office for the whole insurance system in the Ministry of Social Welfare. Thus, in the Ministry is centralised the ultimate control of the administration of both public health and sickness insurance, but enough has been said to show that there is considerable scope for local and individual initiative. In Norway, it has been possible to combine virtually universal compulsory health insurance with freedom in a patient's choice of doctor and freedom for a doctor to practise where he likes.

The French Maquis

[BY A CORRESPONDENT]

ALL reports from France point to unrest and growing chaos, with which the Vichy Administration has so far been unable to cope. In the fourth year of occupation the resistance movement is rapidly growing, and tends to take on more violent forms. Laval's Government appears paralysed.

The centres of most active resistance are the *maquis*, the name given to the strong-points of the French partisans in the mountains and forests of the Haute Savoie and of other provinces. The *maquillards* are organised in small military detachments, mostly under the command of regular officers, the rank and file consists mainly of young Frenchmen who have managed to evade the German *relève* and Vichy's Labour Service. The number of the *maquillards* is now said to be several hundred thousand. The commanders of these partisan groups are, of course, aware that their forces are not sufficient to undertake large-scale operations against the occupying army. The *maquis* serves essentially as a refuge for hunted French youths. There have been minor operations and sorties, and much sabotage of communications, which in France has perhaps become more important than industrial sabotage.
