## The Prime Minister

THE Prime Minister got his vote of confidence on Thursday of last week, as everyone knew he would. He got it by 425 votes to 23, and though only half the Labour Party was in the majority, not a single Conservative member either voted against the Government or even, as far as can be discovered, voluntarily abstained. If the Prime Minister's purpose was to demonstrate his power and to bring strays to heel, he certainly succeeded. The vote was taken on a narrow issue—even narrower, apparently, than Mr Churchill himself had expected—but it did not prevent a number of members from expressing their indignation at being compelled to eat their words against their will and at being forced to choose between two principles that they had thought compatible—support for the continuance of the Government in office and support for the principle of equal pay for equal work.

This indignation is so natural, and the embarrassment from which it arises so acute, that the Government has been accused by some voices of abusing, or at least of straining, the normal constitutional usages. But this is not distorting constitutional usage,

it was following a constitutional precedent that is not only well established but also an essential part of the British system. What sets off the British system from all other systems of representative democracy is the power at lies in the Prime Minister's hand to challenge the House of Commons, on any issue that he may select, to the electorate. A British Government has the power

to insist that Parliament shall do its bidding, with the sanction that, if not, either the Government or the Parliament, or possibly both, shall cease to exist. It does not follow that a wise Government will regard every disagreement that may arise between it and the House of Commons as an issue so vital as to require this treatment. But it is entirely for the Prime Minister to decide which issues are vital. And it is right that it should be so; for it is this provision of the unwritten constitution, so seldom reproduced elsewhere, which has given Britain its fruitful synthesis of freedom and efficiency. In this country, in the intervals between appeals to the sovereign people, power rests where responsibility also lies, and we are spared the miseries of rule by irresponsible assemblies which have afflicted other democracies. No British Government can escape a rendering of its stewardship to the sovereign people; and so liberty is secured. But so long as it is not repudiated by the people, a British Government is master not only of the administration but also of the legislative process; and so there is an opportunity for consistent and efficient government.

By a curious coincidence, an almost exact parallel with the events of last week can be found in the proceedings of the House of Commons just a hundred years earlier. On March 16, 1844, when a Factory Bill was under discussion, Lord Ashley moved an amendment to limit the labour of women and children to ten hours a day. The amendment was resisted by the Government on the ground

that the women did not want it, and that it was administratively unworkable. On a division, Ashley won by nine votes. But a few weeks later, the Prime Minister, Peel, called upon the House to reverse itself, saying that, if the result were not as he wished, he "would retire with perfect satisfaction into a private station." The House obeyed by 277 votes to 159. "The majority," Ashley wrote, "was one to save the Government, not against the question of ten hours."

The political science of the matter is worth insisting upon, not only for its own interest, but because of its close relevance to the problems of re-establishing democratic government where it has been cast down. The principle upon which Mr Churchill relied last week, the power of the Executive to dissolve the Legislature on any issue that it chooses to take to the people, is the reason, more than any other in the field of rules and usages, why British democracy has worked well while democracy in other countries has worked badly. It is a principle not only to be maintained here but to be recommended for export. It is just as important that democracies should be able to govern with foresight and with authority as that they should be free.

But if the political science of the matter is one thing, the politics of it is another. Mr Churchill acted well within his rights and in accordance with precedent. But did he act wisely? The answer can only be that he did not.

This answer does not rest on the fact that the present circumstances are unusual and that there is virtually no regular Opposition. It is true that, in present circumstances, the House of Commons does not enjoy even its usual limited possibility of voting against the Government. Only a negligible minority wants to unseat the Government, and there is no alternative to take its place. But it is also true that the Government could hardly dissolve Parliament on the eve of the invasion of Europe. Both threats are bluffs, and if either side is the gainer thereby in freedom of action, it is Parliament, as is shown by its rising rebelliousness. Yet the Coalition was formed to make the Government stronger than usual, not weaker, and it would be wholly illogical to deny it, for that very reason, the use of the principle that is the main source of any Government's strength. A coalition has more, not less, right than any other Government to insist on having its way when it deems insistence necessary.

The unwisdom of Mr Churchill's action does not rest on any such complicated reasonings, but simply on its effect on public opinion. His professed purpose was to emphasise national unity; his achievement is to create doubts where there were none before. If the Prime Minister insists that the removal of Mrs Cazalet Keir's amendment is an issue of equal importance with his conduct of the war, his insistence makes it so in constitutional practice; but nothing can make it so in the estimation of public opinion. If the Government had taken the line that the amendment wrecked the Bill, and that the House of Commons must therefore either take it out or lose the Bill, there might have been some grumbling, but no more. The course the Government has actually taken has made it look more than a little ridiculous.

Ever since Mr Churchill returned from his convalescence in Morocco he has exhibited signs of a petulant temper that is most unlike him, usually the most magnanimous of men. While at one moment he exhorts the nation to keep its mind on the main issue, at other moments he goes out of his way to exalt trifles to an importance they do not deserve and would never have received but for his attention. The intervention of an independent candidate at a by-election, the impatience of the public over the delays of planning policy, a Government defeat by one vote on a single clause of a Bill having nothing to do with the war effort—these are hardly worthy of the notice of the captain-general of the nation. To rush at them with a flurry of hard words and over-strong actions is not to convince the doubters or rally the waverers; it is to humiliate what should be his most cherished supporters, to irritate the unconcerned and to sadden his friends. A people like the British, in an emergency like the present, will never hold it against their

leader that he insists on having his own way in the big things that are essential to the life of the nation. It is when he begins to insist on having exactly his own way in the little things which, important in their own sphere, are certainly not vital to the commonwealth, that they start wondering whether he is quite the man he was.

It is not only in the relations between the Government and both Houses of Parliament that there is a deterioration, but also apparently in some of its internal relations. There is much talk of Mr Eden resigning the Foreign Office. The reason given is that he finds the physical burden of combining this office with that of Leader of the House of Commons too great. It may well be believed that the double burden is too heavy, but no politician in his senses would prefer the Leadership of the House to the Foreign Office—least of all Mr Eden, whose heart is in diplomacy—if his choice were wholly free. That his choice is not wholly free and that there is an element of pressure in the matter is made clear by the attacks that are being made upon Mr Eden in some sections of the press. Nor is it very difficult to guess the source of the pressure. It is known that Mr Eden is much disturbed by the recent growth of a phenomenon that is very familiar in British political history and has rarely failed to be noxious—the conduct of diplomacy from No. 10 Downing Street. Mr Eden's loyalty to the Prime Minister and ability to collaborate with him are both unquestioned and of long standing. Some new element has been injected into the relations in recent months—or perhaps it would be more correct to say some old element returning with renewed vigour.

That element is Lord Beaverbrook, who was with the Prime Minister in Morocco and is believed to have been his close adviser since he returned. It is said that in the Cabinet changes that would follow Mr Eden's departure from the Foreign Office, Lord Beaverbrook would cease to be Lord Privy Seal and take some more substantive office. Lord Beaverbrook does not believe in planning; and one of the matters at issue between the Government and both Houses of Parliament is the slowness of the progress that is being made in planning the use of land. Lord Beaverbrook is a believer in "strong" diplomacy and splendid isolation; and there is talk of the departure from the Foreign Office of Mr Eden, who, whatever his other faults may be, is a convinced advocate of negotiated diplomacy as opposed to arbitrary *coups de main*. Lord Beaverbrook is of a peremptory temperament which achieves its results by overwhelming opposition instead of seeking to conciliate it; and the Prime Minister begins to make constitutional mountains out of Parliamentary molehills. Lord Beaverbrook, in his piratical days at the Ministry of Aircraft Production, used to forbid his subordinates to co-operate with anyone; and the re-waxing of his star coincides with a new determination on the Prime Minister's part to exact submission from any of his followers who differ from him.

It is difficult to believe that these things are coincidences. The advice the Prime Minister has been getting is bad advice. If it goes on, it will finish by doing the impossible—that is alienating him from a large section of the country. There has probably never been a Prime Minister who has enjoyed such an enormous fund of credit with the people as Mr Churchill. But he has been drawing on it recently at a very rapid rate. The leadership of the war is not in question; but for every one elect who, two months ago, suspected that the Government was needlessly obstructing reform or who doubted whether Mr Churchill is the man to lead the country in peace as well as in war, there must now be three or four. Until now it has always seemed so probable as to be almost certain that Mr Churchill would win the first post-war General Election, even with the handicap of having the Conservative Party behind him. Now, for the first time, it begins to look doubtful. The day is still very far distant when either Parliament or the people will refuse to do what Mr Churchill wants, if he insists upon it. But in bowing to his will, Parliament can give warning of the electoral wrath to come. Mr Churchill's majority last week was large; but not large enough to drown the warning.

## Russia in the Far East

MANY people, thinking of the Far Eastern scene, take it for granted that, when the German war is over, Russia will be ready to join the Grand Alliance of China, Britain and the United States and bring the Japanese to a speedy defeat. They see in Russia's abstention only a justified concentration on the Western war, and prophesy a speedy abandonment of neutrality when the Russians have recovered their freedom of action. The most recent exchanges between Russia and Japan can be interpreted in this sense. The Soviet Government has scored a remarkable diplomatic victory in compelling the Japanese, 26 years before their lease expires, to abandon their oil and coal concessions in Northern Sakhalin and to withdraw at once, receiving in return only the ludicrously small compensation of 5,000,000 roubles for their property and a promise of an annual delivery of 50,000 tons of oil for five years after the end of the Pacific War. Since the Japanese rely on Sakhalin for almost a quarter of their domestic supply of oil, the complete immediate stoppage of deliveries is a serious loss to their straitened economy. The Russian victories in the West have had their first repercussion in the East. It is not at all to Japan's liking.

Yet can one assume that this is the first step towards Russia's participation in the Far Eastern war? If so, what is to be made of the other evidence of Russia's reviving strength—the news of fighting between Chinese and Outer Mongolian forces on the borders of Sinkiang? The Chinese claim that they were cleaning up a nest of Kazakh brigands in the Altai Mountains, and were attacked by Outer Mongolian troops while doing so. *Tass* states that the Chinese in Sinkiang have been driving Kazakh settlers into Outer Mongolia, and that during these forced expulsions, they crossed the frontier and attacked and bombed Outer Mongolian towns. In these circumstances, *Tass* adds,

the Soviet Government, in virtue of the Treaty of Mutual Assistance between the USSR and the Mongolian People's Republic, concluded on March 12, 1936, will be compelled . . . to safeguard the security of the territory of the Mongolian People's Republic.

As Outer Mongolia has been since 1924 a virtual dependency of Moscow, and Sinkiang, after a decade under Russian influence, is now again controlled from Chungking, trouble on the Sinkiang-Outer Mongolia frontier is trouble between China and Russia. Frontier incidents do, of course, occur. The frontiers are poorly marked, and the frontier peoples are nomads. The important point is that this particular violation has given rise to fighting and to a Russian *démarche* against China. Thus, in reasserting their reviving strength in the Far

East, the Russians are apparently ready to use it as much against Chungking as against Tokyo.

The shape of Russian policy in the Far East in the time of the Czars was easy to define. The Russians expanded their spheres of influence at the expense of China. By 1903 they were in possession of the Chinese Eastern Railway across Manchuria and the tip of Laotung Peninsula, with Port Arthur and Darien, and had also occupied Southern Manchuria (after the Boxer Rebellion), and showed no intention of withdrawing. They were driven from these advanced posts by the victory of Japanese imperialism in the Russo-Japanese War. Up to 1914, it could be said that Russian policy in the Far East, whatever its twists and turns and temporary alignments, was fundamentally hostile to China and Japan and would involve conflict with them both.

The policy of the Soviet Union is harder to define. The policy of expansion in Manchuria was apparently abandoned. There was no protest against the Japanese occupation of Manchuria—on the contrary, the Chinese Eastern Railway was handed over. Yet this period of Russian withdrawal should be interpreted in terms of weakness, rather than of deliberate policy. In the early thirties, a separate Far Eastern Army was built up, and the industrialisation of Siberia accelerated. The Russian-Manchurian frontier was strongly reinforced, and a Treaty of Mutual Assistance with Outer Mongolia was informally concluded as early as 1934—just as the Japanese were penetrating into Inner Mongolia. At about the same time, Russian influence became paramount in Sinkiang. This military and diplomatic reinforcement of Russia's extended land frontier against the Japanese occupying forces was put to the test repeatedly in 1938 and 1939, when the Russians got the best of a sporadic undeclared war on the borders of Manchuria.

Since 1941, neutrality has suited both countries—Russia because it has been involved in the West, Japan because it has been involved with the West. The Pact of Neutrality signed in 1941 has governed Russo-Japanese relations and the two countries have underlined their peaceful intentions by recognising each other's predominant position in Mongolia and Manchuria respectively and by agreeing on the demarcation of the Manchurian frontier. Thus, for the last twenty years, Russia has pursued a policy of tolerance and relative passivity in its relations with Japan—yet first weakness, then preoccupation elsewhere lay behind this policy. If the recent Sakhalin agreement reflects new strength and a new sense of freedom, there is nothing in past policy to suggest that the Soviet Government is prepared to make a permanent policy of tolerating the Japanese encroachments in Manchuria. But

when Japan has been eliminated, what then? Will the Russians return to the traditional Russian policy of expanding influence in Manchuria? And if this were to happen, would the old collision between Russian and Chinese interests recur?

It is not easy to answer with any certainty, for the history of Chinese relations with the Soviet Government is anything but clear. In the first days of the Revolution, Russia abandoned all concessions, privileges and extra-territorial rights. It hoped for social revolution in China, and the Chinese Communists supported the Kuomintang in its struggle for a united democratic Chinese nation. But in 1927, the Kuomintang under Chiang Kai-shek broke with the Communists, and for nearly a decade a sort

of desultory civil war dragged on between them. This was the period of Russia's greatest withdrawal from the Chinese scene. But with the Japanese advance into Manchuria and Inner Mongolia and the increasing threat to North China, Chinese resistance came to be a factor in Russia's own defence policy. The Chinese Communists were encouraged to make their peace with Chiang, and in 1937 the Russians signed a Non-Aggression Pact with China a few days after the outbreak of the Sino-Japanese War. Some supplies were sent to China, but Russia's policy was at no time enthusiastic and China's plight did not once interfere with Russia's need for Japanese neutrality. To-day, if the attitude of the Chinese Communists is any index, the Russians are even less enthusiastic about Chingking.

It may be that Russia is ready, once the European War is over, to join the Allies in the Far East to hasten Japan's defeat and then to negotiate in agreement with

them a peace which gives some hope of putting an end to the anarchy which has reigned in the Far East ever since the old Chinese Empire began its slow process of disintegration. It may be so—but there is nothing in the history of the last twenty years to suggest that it certainly will be so. The evidence points to isolation rather than to co-operation; to the policy of the lone hand and the defence of Russia's purely national interests. It is not difficult to guess what these might be—no immediate entry into the war against Japan, but possibly the giving of the *coup de grâce*; the restoration, in return, of Russia's old spheres of influence in Manchuria to safeguard Vladivostok and the Trans-Siberian Railways; a consolidation of Russian influence in the border lands of China—in Sinkiang and the Mongolias; support for a Government in North China that would be amenable to Russian influence, even if this prevented Chinese unity.

Such an outcome of the Far Eastern struggle would be little short of disastrous. It could not give any permanent security, any more than could a similar policy in the 1900's. Yet Britain and America should see that from the Russian standpoint it is logical and defensible. The Russians have borne the brunt of the fighting in Europe, and it is only natural that they should wish to see their Allies take the edge off the Japanese attack. Their geographical position makes it certain that if they entered the war against Japan at this stage they would again have to bear the heaviest share of the land fighting. And if there are criticisms of their policy for its self-regarding quality, they are surely entitled to ask why they, alone of the Powers, should be asked to pursue an altruistic policy in the Far East. No record in the Far East is very clear. Nor will it resolve the conflict to say that all the Powers should support the Chinese Government, since the happenings in Mongolia suggest the possibility that all the Powers may not finish the war recognising the same Chinese Government.

These are all matters of speculation. They may turn out to be bogeys—or they may not. Even if this proves to be the direction of the Soviets' policy, it does not in the least follow that they will be unwilling to reach an accommodation with the very different desires of the Western Allies. But the one essential preliminary to an accommodation with Russian policy is for the Western Allies to understand its springs and motives. In Europe Anglo-American diplomacy has had to make some embarrassing adjustments—and will doubtless have to make more—because of the baseless assumption that Moscow wants exactly the same things as London and Washington. The same mistake must not be made in the Far East.

## Budget Prospects

THE financial year just ended was a remarkable one for wartime. Though the scale of the war unquestionably increased, the deficit was actually lower than in the preceding year. The Chancellor budgeted for a deficit £45 million higher than in 1942-43, and he has realised one £53 million smaller. The revenue, which provided 50.1 per cent of the expenditure last year, and was estimated to provide 50.5 per cent this year, amounted in the event to 52.5 per cent. That, in such a war, it has been possible to improve on a record already so good is a tribute to the soundness of British public finances.

The figures are also a reflection—for the first time in this war—of accurate budgeting. The fact that the actual result is £99 million better than was expected is fully explained by two items—an excess of £67½ million in the yield of customs and excise and an excess of £53½ million in the omnibus item of Miscellaneous Receipts. The expenditure was only £30 million above the Budget estimate—an error of less than one per cent—and the yield of all the Inland Revenue taxes combined was within one-fifth of one per cent of the Chancellor's estimate last April. Some part of this last result must, however, be put down to coincidence. A "round-figure" estimate of £500 million was assigned to EPT and NDC; but the yield has turned out to be £500,114,000.

This close estimation is not only a refreshing change from the constant and apparently deliberate under-budgeting of the earlier war years; it is also a reflection of the fact that the war, on the financial side at least, has reached a plateau. Expenditure is no longer increasing. This is shown by the following table of the expenditure on Supply Services—much the largest part of the total—in each quarter of the last four years:—

SUPPLY SERVICE EXPENDITURE

|          | (£ million) |         |         |         |
|----------|-------------|---------|---------|---------|
|          | 1940-41     | 1941-42 | 1942-43 | 1943-44 |
| I.....   | 613         | 985     | 1,198   | 1,304   |
| II.....  | 875         | 1,111   | 1,229   | 1,305   |
| III..... | 1,012       | 1,168   | 1,364   | 1,324   |
| IV.....  | 1,137       | 1,238   | 1,505   | 1,474   |

The trend is even more clearly revealed by tabulating the amount by which the expenditure of each quarter exceeded or fell short of the same quarter of the preceding year:—

|          | (£ million) |         |         |  |
|----------|-------------|---------|---------|--|
|          | 1941-42     | 1942-43 | 1943-44 |  |
| I.....   | +372        | +213    | +106    |  |
| II.....  | +236        | +118    | +76     |  |
| III..... | +156        | +196    | +40     |  |
| IV.....  | +101        | +267    | -29     |  |

The definition of expenditure has not been quite uniform throughout the four years. In 1940-41, and to a large extent in 1941-42, supplies obtained from the United States were included in expenditure. When these supplies became available on Lend-Lease terms, they disappeared from the British Budget. And to the extent that some varieties of goods have been removed from the Lend-Lease list, they are now presumably making a reappearance in expenditure. Reciprocal Aid, or Reverse Lend-Lease, must have been a much larger item in 1943-44 than in any previous year; this, of course, figures as part of the British Government's expenditure. Assistance received from Canada has also had a chequered statistical career. In the earlier years of the war, the value of goods received from Canada was debited to expenditure, since a debt was incurred to the Canadian Government in respect of them. This was also the practice on the expen-

crease will be repeated. The Civil Estimates are up by £19 million, and the war expenditure can hardly be expected—especially in view of the Canadian factor—to show anything but an increase, if only because of the gradual increase in wages and other personnel costs. Total ordinary expenditure, which was £5,788 million in the year just ended, will probably not fall far short of £6,000 million in the year just beginning—on the assumption, which is the only prudent one, that another full year of supreme effort should be provided for.

How will the Chancellor provide this sum? His revenue this last year brought in £3,039 million. Some increase is to be expected next year, even without any adjustment in the rates of taxation. A year ago, the Chancellor estimated that this "natural" increase, which is a response of the revenue to the gradually rising money total of the national income, would amount to £289 million. It may be somewhat less this year, but there is no reason why it should be much less. There is, however, the additional factor of "pay-as-you-earn." In the normal course, the income tax collected under Schedule E in the twelve months just beginning would have been based, for the majority of persons, partly on the incomes of 1942-43 and partly on those of 1943-44. Because of the passage of the two "pay-as-you-earn" Acts, the tax collected will in fact be based on the incomes of 1944-45. This means, of course, that the amount collected will be higher than it would otherwise have been, since the total earned in wages and salaries has risen steadily. How much higher is one of the Chancellor's secrets, but it can hardly be less than £50 million. On the probabilities as they are now visible, the Chancellor may be able, without any changes of taxation, to budget for a revenue of over £3,300 million, to set against his expenditure of £6,000 million. This would raise the ratio of revenue to expenditure to 55 per cent, a much higher figure than was attained by this country in the last war or by any other free country in this war.

It might, however, be rash to conclude from this that no increases in taxation are likely. There is no limit to well doing, and though it may be a good rule of thumb to regard a revenue ratio of over 50 per cent as satisfactory, there is nothing sacred about it. The continued buoyancy of the duties on tobacco and alcoholic drinks must be a standing temptation to any Chancellor, and a further increase in these should not be ruled out. But it would seem unlikely that there will be any major change in the Inland Revenue taxes. There is no case for an increase in direct taxation, and even less for a reduction. Nor is it likely that the Commissioners have yet carried their investigations into post-war tax problems sufficiently far to have given rise to any immediate proposals for changing the structure of taxes. There have been some rumours of a change in the basis of motor vehicle taxation. The case for a departure from the horsepower tax is a very strong one, and if the alternative can be found, this year's Budget would clearly be a good time to make the change. But it may be doubted whether there is yet sufficient agreement on the form that the alternative ought to take.

Taken together, the omens are for a Budget of few changes. And that, at this stage of the war, is in itself a sufficiently remarkable phenomenon.

diture side in 1942-43, but an item of £225 million (one billion Canadian dollars) was entered on the revenue side in respect of the gift made by the Canadian Government in that year. In 1943-44, Canadian goods have been available on what amount to Lend-Lease terms, so that both the gift on one side of the account and the corresponding expenditure on the other have disappeared. If allowance is made for these Canadian items, it would appear that the revenue increased in the year just over, not by £218.7 million, as would appear on the face of the figures, but by £443.4 million; the increase in the expenditure was not £165.2 million, but £389.9 million. The plateau of expenditure is thus not quite so flat as would appear at first sight—the gradient is still slightly upwards.

The cost of the National Debt amounted to £54 million more in 1943-44 than in the previous year, and the in-

## NOTES OF THE WEEK

### Warning to Strikers

Mr Bevin has given the strongest possible warning to the strikers whose activities are impeding the industrial effort and threatening to delay decisive military operations. He gave no indication of the action which the Government proposes to take, but, to judge from the tone of his speech and the gravity of the coal situation, it is clear that, unless there is an immediate resumption of work, drastic measures will be introduced against both the present and future strikes. Mr Bevin was almost literally quoting Lear—

I will do such things—  
What they are, yet I know not; but they shall be  
The terrors of the earth.

Mr Bevin is meeting the miners' leaders and the Trades Union Congress, and there will be some plain speaking. The crisis has arisen largely through the inability of union leadership to exercise its authority over the rank and file. As Mr Bevin pointed out, the whole structure of negotiating and arbitration machinery is threatened if either side fails to honour its agreement (the significance of the issues involved is discussed in an article on page 473). The personal position of the Minister of Labour, who has been identified with the industrial arbitration machinery, is also jeopardised, and Mr Bevin's resignation at this critical stage would be disastrous. The strikes themselves are diminishing in intensity. Many of the Yorkshire miners, 90,000 of whom have been on strike for over a week, are now drifting back to work. The coal strikes, together with the continued decline in output from other reasons, has led to the imposition of fuel cuts on industrial users. Not so devastating in its effects, but equally unfortunate, is the strike of Tyneside, Clydeside and Huddersfield engineering and shipyard apprentices over the proposed direction of an apprentice to the mines. Mr Bevin promptly issued call-up papers for the Services, and the strike is now petering out. He denounced the stoppage as the work of "a few irresponsible mischief-makers," who have been widely labelled "Trotskyists"; they have also been active in the Yorkshire minefield. In the present mood of industry, it is all too easy for provocation of this type to develop, and firm action to check it is necessary. There are constitutional ways of settling such disputes. In the meantime, the strike position has caused the Yorkshire miners to ask for a postponement of their decision on the Government's wage plan. This means a further delay in settlement, but it appears that the scheme, even without Yorkshire, is doomed. The executives of South Wales, Northumberland, Scotland, Lancashire and Cheshire have recommended their lodges to vote against it. Rejection would leave the coal crisis further from solution than ever; more outbreaks of strikes and unrest must be expected, and an all-round worsening of the situation, unless something definite can be done now to stop the rot.

### Into Roumania

Roumania is the second enemy country to see land fighting inside its own frontiers. So far Marshal Koniev's army has advanced only a few miles beyond the 1941 frontier. But the advance is bound to gain speed and momentum when the German "pocket" in the Odessa area is reduced and General Malinovsky can join Marshal Koniev in the Balkan pursuit. Immediately after the Russians crossed the Roumanian frontier Mr Molotov stated that the Russians had entered Roumania only because military necessity had forced them to do so. But Russia did not aim at acquiring any part of Roumanian territory or at "changing the existing social order of Roumania." After last week's Russian official utterances, in favour of a postponement of the dynastic crisis in Italy, this is an important declaration of policy. "Law and order" is the guiding principle of Russian policy in Roumania as well as in Italy. But the problem is not as plain as it might appear. No matter what the intentions of Russia might be, a social crisis is likely to develop in Roumania, if only because it has been overdue for so long. Even if the "social order" survives the shock, a political crisis is certain. It is hardly conceivable that the Antonescu regime could survive

defeat. Mr Molotov's statement of Russia's good will has rightly been welcomed in this country, especially as his statement was preceded by consultation with Britain and the United States. But this is not enough. The entry of the Russians into Roumania poses again the question whether Allied policy aims at co-operation in the whole of Europe or at its division into spheres of influence. If exclusive spheres is not the aim, then a Balkan Advisory Council, similar to the Italian Advisory Council, poor though the precedent is, should be set up.

### Spheres of Influence?

Russian foreign policy has so far seemed to lean towards the line of spheres of influence. To say this implies no judgment, one way or the other, on Russian policy; it is merely a reading of the facts as they have appeared. In eastern Europe Russia considers itself to be sole executor, though the other Allies may be consulted. There has been consultation on Finland and Roumania. In both cases, for obvious military reasons, initiative and responsibility have fallen to the Russians. On the Polish issue the Russians have officially rejected all suggestions of Allied mediation, though until recently Marshal Stalin was still exchanging views with Mr Churchill. In the light of this policy recent exchanges over the problem of Italy appear somewhat odd, for the chief charge made against Allied policy in Italy by *Izvestia*, in a recent article, was the allegation that Russia had not been consulted on Italian matters; that is, *Izvestia's* complaint is that the British and the Americans have behaved in Italy as if they regarded that country as their "exclusive sphere." This is certainly an exaggeration, though the Italian Advisory Council has been ineffective, and its influence on the internal position in Italy less than modest. Because of this the Russians decided that they are entitled to maintain direct diplomatic contact (*de facto* but not *de jure*) with Marshal Badoglio's Government. But, more than that, they have also, in effect, laid responsibility for the policy of exclusive spheres of influence at British and American, not Russian, doors. All this reflects the confusion that prevails in Allied policy. It seems very desirable that the position should be clearly defined. If there are to be exclusive spheres of influence, let it be said openly. If no exclusive spheres are to exist, let there be no exclusiveness anywhere—either in Italy nor in eastern Europe.

### Reorganisation at Algiers

With the Second Front just ahead, General de Gaulle has succeeded in consolidating his position, both politically and militarily. The Communists have at last joined the National Committee by an ingenious compromise, in virtue of which General de Gaulle indicated his choice of delegates, and this choice was endorsed by the Communist Party. The inclusion of the Communists has led to some Ministerial changes, of which the most important are the appointment of M. Diethelm as Commissioner for War and of M. Le Troquer as Delegate for the Administration of Liberated Metropolitan Territories. The first act of the reconstituted Committee was to entrust itself with the general direction of the war and to appoint General de Gaulle "Chief of the Armies." The National Committee now represents all the non-collaborating groups in France, and the extent both of its authority and of its contacts with occupied territory entitle it to recognition as a provisional government. The Western Allies will gain little by continuing to postpone this issue, since the entry into the Cabinet of the Communists probably presages more complete Russian recognition, just as the Russian recognition of Badoglio foresaw the Communists' decision to co-operate with the Italian Government. Recognition would also strengthen the hand of the British-American authorities in dealing with the military and political problems raised by the opening of the Second Front. Here General Eisenhower has the right to insist on the fullest collaboration, and can secure it far more easily if he can negotiate with a French

authority whose position is not equivocal. This is the sphere in which decisions are most urgently needed. What, for example, is the effect of General de Gaulle's new position on the authority of General Giraud? How far will M. Le Troquer's appointment affect joint decisions on the post-invasion pattern of French co-operation with the Allied military authorities? The Allies have every reason to be cautious over certain trends—and personalities—in French politics, but they are far more likely to make their opinion felt if the underlying issue of authority is not left in the air.

### The Cost of Schooling

The Education Bill has been passed through its Committee stage in time for Easter. The remaining hurdles were taken by the Commons with ease and speed after last week's spill over equal pay. This is not to say that the last obstacles were unimportant. Indeed, the method of financing reforms in the social services, as between central and local powers and as between public and private agencies, which was the chief issue, covers a much wider field than education, like the question of equal pay, which it comprehends. The claim of the church schools for better treatment was met, apparently, to the satisfaction of all, by the offer of special terms to raise loans at low rates. The suggestion that the proportion of expenditure borne on rates should be cut from about 45 per cent to 30 per cent was rejected, not because the present and prospective distribution of burdens between central and local funds is regarded as satisfactory, but because the whole question, as it affects all local services, is due for review. Three possible courses are open. The first, and probably the least desirable, is to put upon the Exchequer much the largest part of the cost of services which the local authorities continue to administer. The second, and least promising, is to tap new sources of local income. The third, and most practicable, is to maintain the rough 50-50 division of costs between rates and taxes for such services as continue to be administered by the local authorities, but to reduce the total burden on the rates by transferring both the cost and the administration of, say, health, in addition to public assistance, bodily to the national Exchequer.

### Lenin and Ercoli

The shaky throne of the House of Savoy has now been propped up by a new pillar—the Communist Party of Italy. Like Lenin, who in 1917 returned to Russia after many years of exile, the Italian Communist leader, Ercoli, has come back to his country after a very long stay in Russia itself. But unlike Lenin, who preached revolution as soon as he stepped on to Russian soil, Signor Ercoli at once called for reconciliation between the democratic opposition and the Italian Romanovs. His appeal came only a few weeks after the conference of the democratic parties held at Bari demanded the immediate abdication of King Victor Emmanuel. The demand was voiced most loudly by the Communists; and it was echoed with strong conviction by respectable liberals and moderate conservatives. The first reaction to Ercoli's appeal among the parties of the democratic opposition seems to be bewilderment. What was remarkable in this tragicomic incident was the quickness with which Signor Ercoli "readjusted" his views to the attitude taken by *Izvestia* only two days before he gave his speech. The Soviet Government, *Izvestia* stated, favoured a compromise with the throne. Signor Ercoli was left in no doubt over what he therefore ought to favour. True, the Comintern has been dissolved; and this particular instance of Soviet intervention in Italian affairs will be resented by the Italian Left, but not by the Italian Right. Even so, the fact that a strong and influential political party is able so easily to change sides on a matter of principle merely in order to align itself with foreign diplomacy is surely a symptom of political demoralisation. Post-war Europe will need genuine political movements and genuine political leaders, not puppets. On this showing, little political stability can be expected from the fact that in some European countries there will be strong Communist movements—ready to exploit issues of domestic policy for purposes that have nothing necessarily in common with the interests and ideals of their peoples.

### Best Foot Forward

The puzzle about the appointment of Mr Robert Foot, Director-General of the BBC, to be whole-time chairman of the Mining Association, is not why the coalowners have

chosen him, but why he was ready to go. It is most disturbing that high officials of the BBC, with the reputation of competence, always seem to pack up their bags and leave, sooner rather than later. Perhaps on this occasion the division of work between Director-General and Editor-in-Chief, a new arrangement, did not prove suitable, though judgment must be reserved on this until it is known whether Mr Haley, Mr Foot's successor, will also continue to be Editor-in-Chief. The Mining Association's intention of putting its house in order was stated, in principle, last month when its Central Committee announced agreement on proposals to introduce schemes in every coal district for achieving maximum efficiency in each district "as a whole." The appointment of Mr Foot, from outside the industry, is the first earnest that practical steps may soon be taken; but there is a long way to go before it will be really believed by the general public that, this time, the mineowners do intend to fulfil their old, old pledge to reorganise their industry. When the latest wage awards have been straightened out, wages per ton of coal sold will have nearly doubled since 1939; and the inability of the industry to produce the coal required for wartime purposes is a plain warning that, unless productivity can be appreciably increased, it will not be possible, guarantee or no guarantee, to maintain the new wage level without charging artificially high, and industrially disastrous, prices to consumers. Indeed, the imperative need for higher efficiency to make possible both higher wages and higher output at lower prices has been evident for a generation. For a decade the mineowners have been pledged to reorganise the industry. Why have they now promised, of their own accord, to do much more, and brought in Mr Foot, a man of honesty and determination, to do it for them? The answer is probably a double one. First, it will be impossible to reverse the wartime trend in wages without an amount of industrial strife that cannot even be contemplated. Secondly, the alternative of nationalisation, often proposed, has now become very real because of the failure to deliver the goods in wartime. The test of the new mood will come when it is realised inside the industry, as it has been for a long time outside the industry, that it is not possible to carry through the needed grouping of technical resources in each coalfield

RADIO

without carrying through a corresponding pooling of the present widely-spread financial ownerships; and that if financial pooling is done in such a way as to burden the reorganised industry with too heavy prior charges, based on past earnings, the reform will have defeated its own ends, whatever its technical success.

### Thunder on the Right

While the progressive wing of the Mining Association appears to be succeeding in pushing through a positive policy for the coal industry, the progressive wing of the Conservative party has also produced a similar plan; and in this plan compensation to merged concerns will be given in equity shares, not prior charges. Coming almost together these two events are significant. The thunder of Reform is being stolen from the Left in a vital matter. The Tory Reform Committee, in their "National Policy for Coal," make no bones about the need for prompt and drastic reorganisation in order to make possible the required improvements in productive efficiency. They propose that the industry should be compelled, within the first year of the programme, to produce schemes of amalgamation that would reduce the present number of coal undertakings by about four-fifths (from 950 to 200 or so); and they look forward eventually to a further reduction to no more than 40-60 undertakings in all. In the best report that this Committee has so far put out, the case for technical grouping and financial mergers is frankly and factually stated. Between the wars the industry sought a way out of its difficulties in two directions: by contracting its size, through the elimination of the least economic pits; and by increasing its technical efficiency. But both processes went very much too slowly; and the piper was paid, alternately, by the miners and by the consumers. Output per man shift in the years before the war, though higher than it had been, was still only two-thirds of what it was in Germany, Poland and Holland. Only three-fifths of the coal was cut by machinery, compared with four-fifths in the United States and with practically the whole of the output in Germany and Belgium.

The war revealed the nakedness of the land. Before France fell the British coal industry was hard put to it to supply home and Allied needs. Now when France is rising, and the new demands of liberated Europe are ahead, the industry cannot fully serve domestic demand, and its stocks have run out. No plan may do very much in the short run. But a beginning must be made, if only because, with its higher and guaranteed national wage levels—which the Committee blesses—the industry will be disabled when the war ends unless its technique and organisation are overhauled. For nine peacetime years it was organised by statute to restrict output and keep up prices. Now, the Tory reformers suggest, without apparently the Mining Association's disapproval, that it should be instructed by statute how to increase its productivity, by its own efforts, at competitive prices.

### Feeding India

The biggest single charge made against the authorities on account of last year's tragic famine in Bengal, and in other parts of India, was lack of foresight. Missionaries and other social workers, it is said, foresaw, from their knowledge of India, what would happen as early as the previous December. If this is so, it should be known now whether the tragedy will be repeated this year. Mr Casey, Governor of Bengal, has toured his Province in person, and gives good news of his findings. The rice crop, which was poor last year, is excellent. Transport and distribution, which then practically broke down, are under control. There is enough food, the Governor says; the only task is to distribute it, and for this only co-operation and the organisation that now exists are needed. In other words, there will be no excuse if famine comes again. Yet Mr Casey should not be taken too closely at his word. The people of India live on the smallest of margins. Tiny surpluses moved over great distances enable subsistence to be sustained. The slightest shift in consumption, the slightest fall in sales to the market, the slightest hold-up in traffic, the slightest refusal of Provinces or traders to play their part, and the result is starvation for many. If last year's transport difficul-

ties have been overcome for certain, wonders have been done with depleted and inadequate rolling stock. By the liberal use of gold, inflation has been checked and the incentive for food hoarders to hold on for higher prices has been whittled down by this, and by the threat of imports. The situation can probably be summarised thus: famine need not happen this year—at least to no greater extent than in a normal year—but it is not impossible. And the effects upon popular psychology of the still small Japanese advance into India have yet to be measured.

### Battle of Communications

News from the South-East Asia theatre of war in the last week or so has been, on the whole, disquieting. Since the announcement two weeks ago that Japanese troops had crossed the Burma-India frontier the situation seems to have changed slowly for the worse. The death of General Wingate, in charge of the airborne threat to the Japanese communications, deep behind the attackers, is a severe loss. After the long series of defeats in the earlier stages of the war in the Far East, General Wingate inspired a confidence among Allied troops that, with practical training, robbed jungle warfare of its strangeness and uncertainty. Without this new-found confidence the combined operations now being carried out behind the lines of the Japanese would have been impossible. It will be in itself a defeat if the legacy of confident efficiency left by General Wingate is now dissipated. The struggle for control of the communications linking Imphal with the interior of Assam (see *The Economist*, March 25th, page 394) is still in the balance. Official communiqués have, on the whole, been uncommunicative. The Japanese attack, however, appears to be developing from a two-column approach from the south

and east of Imphal into a larger scheme, the number of prongs increasing as the Allied forces go back. Tiddim, the southern terminus of the road leading back to Kohima through Imphal, has had to be evacuated. It appears that the Japanese forces must be attacking in some strength, since reinforcements from Imphal were sent south to cover the getaway. The speech of General Auchinleck, the Commander-in-Chief, to the Indian Legislative Assembly, was not entirely reassuring. The outcome probably depends as much on the rate of progress of the Allied columns advancing southwards from Ledo, and on the exploits of the Wingate Chindits, as on the strength of the defences of Imphal to the west. Of these there has been little recent news—except that, disturbingly, stories have come back of aerodromes being defended by RAF clerks and fitters.

### On Air

It is a portent that all three Great Allies should be in conference at this crisis of the war on the same peacetime topic. Mr Adolph Berle, United States Assistant Secretary

of State, and Dr Edward Warner, of the United States Civil Aeronautics Board, have come to London to discuss post-war aviation with Lord Beaverbrook; while similar talks are going on in Washington between representatives of the Russian and American Governments. In a sense, the discussions are not between like and like. The United States and the Soviet Union are continents; their domestic air routes are trunk lines. This country is a small island; and it is appropriate that these talks should have been preceded by an informal conference of British Commonwealth and Empire countries last October. At that conference unanimous agreement was reached. Though no announcement has been made of the scope of this agreement, it is significant that the Canberra Agreement of last January between Australia and New Zealand proposed, for civil aviation on Empire routes, either international or Commonwealth operation; and insisted that Allied strategic points and bases manned in common during the war should go back entirely to pre-war ownership. It is not likely that Britain, the United States and the Soviet Union will agree now upon joint world flying; it is certain that the internal routes of each will be reserved for its own fliers; but it is reasonable to suppose that they will be able to work out between them a satisfactory accommodation of neutral flying rights in each other's spheres. The test case to be defined will be the status of Commonwealth and Empire routes.

### Tell the Troops

Speaking to the Institute of Journalists on Monday, Mr. Arthur Greenwood, MP, reviewed the Government's demobilisation policy, as stated by Mr. Churchill in his recent broadcast. Probably any scheme for demobilisation, the principles of which are announced while the details of its operation remain a secret, is bound to cause trouble. False hopes at the end of a weary war become convinced feelings of personal right, and disillusionment may, at a later stage, have worse results than mere disappointment. Mr. Greenwood would agree with this. He pointed out that the practical operation of the two principles accepted by the Government was bound to involve some exceptions and some adaptations. Age and length of service could not always get exclusive priority, especially where skilled work was needed in building or in industry—or, alternatively, in the Services.

The demobilisation scheme should be as simple as possible, but it is bound to be complicated in operation. The Government does not propose to issue its scheme at the present time, perhaps with justification. On the other hand, well before the time of demobilisation, all those affected should understand where they stand.

Mr Greenwood appealed to the Government to set clearly before the fighting Services and their families the complexities and pitfalls of the problem, for which there is no one simple solution.

### Argentine Puzzle

Confusion reigns in the administration of Argentina. The belief that high issues of foreign policy or internal reconstruction underlie the kaleidoscopic shifts of government is hard to sustain in face of the very personal character of the events of recent weeks. Foreign policy and internal reconstruction are not really urgent matters for the time being. The country is prosperous and as a result politically indifferent. In the foreign field, the Farrell regime has broken the united pan-American bloc by securing the recognition of Chile, Paraguay and Bolivia; and the extraordinary comments made by General Perlinger, the new Minister of the Interior, on the international situation reflect an almost light-hearted indifference to the future policy of the United States. He said in effect that the war was by no means over, that the Great Allies would probably fight each other before the fighting was done, and that the only sensible course for smaller nations was to keep clear of trouble. Yet even if the larger issues can be dismissed, it does not seem that political stability is any nearer; and although palace intrigues are by their nature obscure, it seems probable that by loosing a wave of militarist nationalism Colonel Peron, President Farrell's *éminence grise*, was creating a Frankenstein's monster and is now involved in a personal struggle for power. To consolidate his own position, he has already dissolved the GOU, the group of xenophobic "young

colonels" who helped him to office. But in General Perlinger, a notorious pro-Axis man, the spirit of the more extreme of the extremists is alive and active. General Perlinger, counted an extremist under the Ramirez regime, but now apparently a "moderate" in contrast to Perlinger, has resigned from his position as Mayor of Buenos Aires—complaining that General Perlinger had tried to reduce the city's administration to a department of the Ministry of the Interior. If General Perlinger takes a similar line over foreign policy—there is still no Foreign Minister and the General's excursions into foreign policy have already been noted—it looks as though a collision between the Minister of the Interior and the President himself were more than likely. The regime can hardly carry on in this state of internal perturbation. Colonel Peron will have either to suppress his ebullient Minister and go the way of "moderation" or capitulate to this week's version of extremism.

### Caribbean Conference

The first conference called by the Anglo-American Caribbean Commission has now completed its final session in Barbados. In its purely advisory capacity, the conference has made several constructive suggestions and recommendations. The next steps obviously lie with the two Governments. On them, too, depends the future of the conference system in the administration of the West Indies, no less than that of the various recommendations. The proposal to the Governments to set up a permanent secretariat—an office and a typewriter have long been the first aspiration of international bodies towards ultimate permanence—is clearly a feeler, put out to gauge its reception in London and Washington, and it is likely to be judged, both in the capitals and in the colonies, not so much on its own merits as on the extent that it is thought to foreshadow a request to move from advisory to administrative functions. As for the suggestions of the seven sub-committees, unanimously adopted by the conference, their proposals were mainly concerned with the economic welfare of the region. The expansion of local food production, side by side with the in-

creased use of protective foods in the home market, made up an important part of the programme for agriculture. Towards these ends, and to assist export production, suggestions are included for Government acquisition of under-developed areas for cultivation by small tenant farmers, and for the post-war establishment of purchasing and marketing commissions operating for the benefit of producers and consumers. On the subject of public works, a major problem is raised in those areas where serious unemployment will be created by the end of the present large-scale military construction for war purposes. The Commission considers that public works in the region should be undertaken by means of special administrative machinery operating a comprehensive Caribbean development scheme. In each colonial area the Government concerned should take powers to zone and plan the use of the land, and, if necessary, to acquire it by compulsion at fair rates of compensation. Industry and trade in the West Indies have also been fully considered. Industry, it is recommended, should be expanded, on new as well as existing lines. The only qualification to this expansionist policy is that no industry should be encouraged or developed that cannot survive without the protection of tariffs, subsidies, or monopoly privileges over more than a limited period. The conference did not explore to what extent this proviso would nullify the main recommendation. In general, these recommendations clearly involve a much wider approach to the economic problems of the Caribbean than has hitherto been taken. Inevitably, they raise the question whether programmes of this nature could be carried out by nearly a dozen different administrations of two nationalities, brought together only in an advisory conference, or whether some beginnings of central administration will not have to be contrived.

### Higher Pension

On the Pensions (Increase) Bill in its Committee stage after Easter, the Commons will discuss a Government amendment to provide higher pensions for certain Civil Servants and retired officers of the armed forces. The amendments tabled by the Chancellor of the Exchequer are based on estimates of the increased cost of living since 1935, when the scales for these pensions were last stabilised. Consequently, the amendments are an adjustment of existing pensions to recent conditions rather than the inauguration of a new scheme or scale of benefit. Pensions of £200 a year and less will be increased by 10 per cent, those of between £200 and £400 by 7½ per cent, and those of between £400 and £600 by 5 per cent. Various adjustments to the very lowest income-groups among pensioners are also proposed, and the upper income-limit may also be raised, according to individual circumstances. These increases, which are certainly not prodigal in their generosity, will, if accepted by the House, be applied to Civil Servants, teachers, police, firemen, local government officers, and some smaller categories of public servants. The proposals were foreshadowed by a statement by the Chancellor of the Exchequer on December 3rd of last year, during the debate on the pensions of retired state servants. An amendment to the Address was then discussed, but was withdrawn on a Government assurance that legislation would be brought forward

to provide increases for the lower ranges of pensions in order so far as may be practicable to mitigate really severe hardship. The emphasis was then put by Sir John Anderson on the adjustment of pensions only in cases of grave hardship. And most of the real distress in the wartime years has been among pensioners unable to work. Pending the comprehensive social security scheme and the general revision of pensions that the Government's Beveridge room boys are presumably busy working out, this conditional assurance was clearly necessary to avoid any misinterpretation of the Government's present intentions. These proposals will be welcomed by the public as well as the pensioners, as a stop-gap, so far as they redress real grievances. But they touch only a proportion of pensioners, and nothing is more needed in the field of social reform than a general settlement of the pensions problem—which is bound to be costly, because the nation, as its average age increases, will become more and more a nation of pensioners.

### A Plan for Wales

The Welsh Reconstruction Advisory Council is a Government-appointed body. Set up in June, 1942, it was

instructed to proceed "in conformity with the general examination of reconstruction problems" by the Government. The slow pace of Government progress has from the start cramped the Council's style; it has also been hampered by reticence on the part of South Wales' major industries. But in spite of these limitations, the Council's first interim report contains many useful suggestions. The report has a familiar ring. Wales has been surveyed and resurveyed time and again in the past ten years, and the problems of a formerly depressed area in the transition from war to peace are now widely recognised. What is needed—and the Council stresses this point—is an indication that the Government is prepared to weigh the problems in a national balance. The assumptions are made that economic policy will be directed to the maintenance of employment; that there will be a measure of control over industry and labour, including the location of industry, and that a central planning authority, as recommended by the Barlow Commission, will be set up. The temporary nature of the present employment boom is stressed, and the warning given that the continued demand for the products of mining and heavy industry in the immediate post-war period may lead to a feeling of complacency and delay much-needed changes in organisation and method. Rationalisation and modernisation are especially urgent in the tinplate industry, though it may mean less employment for the industry's workers. For the coal industry, the Council urges the planned development of the coalfield as a whole, with the opening of new pits, drainage and increased mechanisation, and the development of an integrated fuel policy. Though its view that there will be an expansion of coal exports at the end of the war is probably correct, this may conflict with the proposals for conservation and utilisation of coal resources, and in particular the development of electricity and electro-metallurgical industries. The prohibitive price of electricity is described as one of the main deterrents to new enterprise, and schemes for cheap generation from coal are proposed, but the Council does not feel that the Severn barrage offers any immediate solution. As well as cheap electricity, the provision of modern factory buildings, improved communications—in particular across the Severn—adequate housing, better amenities, and facilities for technical education, must be given priority if new enterprise is to be attracted, and the area is to acquire the industrial balance it has always lacked. The Council deals also with agriculture, education, the tourist trade, and youth services. This is very much an interim report, but it serves a very useful purpose in bringing the problems before the public and suggesting lines on which they can be tackled.

### Shorter Note

The Prime Minister has given the following account of casualties (excluding deaths from natural causes) to all ranks of the British Empire Forces during the first four years of war:—

|                      | Killed* | Missing | Wounded | Prisoners of War | Total   |
|----------------------|---------|---------|---------|------------------|---------|
| United Kingdom†      | 120,958 | 29,469  | 93,622  | 143,947          | 387,996 |
| Canada               | 9,209   | 2,745   | 3,583   | 4,360            | 19,997  |
| Australia            | 12,298  | 11,887  | 29,393  | 20,760           | 74,338  |
| New Zealand          | 5,622   | 884     | 11,315  | 7,896            | 25,717  |
| South Africa         | 3,107   | 279     | 6,475   | 13,966           | 23,825  |
| India‡               | 5,912   | 17,810  | 13,230  | 72,848           | 109,800 |
| Colonies             | 1,635   | 15,130  | 1,903   | 7,218            | 25,786  |
| Total British Empire | 158,741 | 78,204  | 159,219 | 270,995          | 667,159 |

\* Including died of wounds or injuries.  
† Including overseas personnel serving in these forces, in particular from Newfoundland and Southern Rhodesia.  
‡ Including casualties to the Hong-Kong and Singapore Royal Artillery.  
§ Including 58,221 officers and other ranks missing but presumed to be prisoners of war.

Mr. Churchill also gave the following figures of casualties to merchant seamen in British ships during the four years:

|                                                     |        |
|-----------------------------------------------------|--------|
| Deaths (including deaths presumed in missing ships) | 26,317 |
| Internees                                           | 3,997  |

Total ..... 30,314

Civilian casualties in the United Kingdom during the first four years of war (excluding casualties at sea) were:—  
Killed, 49,730; injured and detained in hospital, 59,371.  
Total, 109,101.

## AMERICAN SURVEY

### Bulwark of the Farm Bloc

(From a Correspondent in Iowa)

Des Moines.

THE youngest and strongest of the three general farm organisations in the United States is the American Farm Bureau Federation, with nearly 700,000 farm families as paid-up members of one or another of the 43 State organisations or the one in the territory of Puerto Rico, and with an influence on Congress far beyond its numbers.

The Congressional Farm Bloc was organised in the Farm Bureau's Washington offices in 1921, scarcely a year after the National Federation had been formed by the State Federations, which in turn had been built upon the County Farm Bureaux. These Bureaux had grown up rapidly in the period 1911-1920 to help support and extend the bringing of education to farmers by means of demonstrations in the field—a work first undertaken as a project of the Federal Department of Agriculture in 1904.

The strength of the Farm Bloc then and since has been founded on political co-operation on matters touching agriculture between Republican legislators from the North and West and Democratic legislators from the South. The Bloc no longer has the definite personnel and cohesion that it had in the early 1920's, and the farmers' percentage of the population has continued to decline—but even so, two million organised farmers still swing more weight with Congress than 10 million organised city workers.

Lately, labour and liberal opinion in the cities (along with one of the national farm organisations, the Farmers Union) has been profoundly disturbed by the direction in which this weight has been swung. The farm-labour consensus which made the New Deal victories of 1932 and 1936 possible has been dissolving before their eyes, and American Farm Bureau support, once a pillar of the Roosevelt Administration, has been brusquely pulled out from under the Farm Security Administration, the President's ideas on agricultural price ceilings, and the subsidies to hold down the cost of food to consumers. Most of the other agricultural organisations have shared the Farm Bureau's attitude.

Critics of the Farm Bureau have built up a case compounded of assorted truths and misconceptions. In their view, the Farm Bureau does not speak for the farmers, but for a small minority of wealthy, businessmen-farmers, who have no objection to subsidies in themselves (such as the AAA payments for limiting production) but object violently to subsidies for consumers or for poor farmers (such as the Farm Security loans).

These critics make much of the fact that the first county Farm Bureau was started by the Binghamton Chamber of Commerce in New York State, with financial help from the Lackawanna Railroad, and they draw from this and similar transactions the conclusion that the whole Farm Bureau idea was concocted to lure the farmers away from their "natural ally," labour, into an organisation that the business-minded could control. The critics also point to the anomaly of a private pressure group being built around a public educational service as the Farm Bureau is built around the County "Extension Services," in a number of States by law, and in others by custom. Thus the "County Agent," "Farm Adviser," or "Extension Director" (as he is variously known) is supported in part by Federal, State, and County tax money and in part by the County Farm Bureau, under arrangements which often leave the Farm Bureau directors with more authority over him than any of his public official superiors, though the Federal share of the cost of the Extension Services has been increasing for a long time and the Farm Bureau's relative share decreasing.

The tie-up, critics claim, has tended to make the Extension Service primarily interested in the type of farmer who leads or belongs to the Farm Bureau, especially in States where the flexible part of the County Agent's salary is the Farm Bureau contribution. But that strikes a Farm Bureau member as a welcome bit of local self-government in a world rapidly becoming bureaucratised. As "proof" that

the whole organisation was "sold out to the capitalists" from the start, more extreme opponents cite an innocent remark by an early Farm Bureau leader about the Bureau "preventing unrest" among farmers, and a scandal of the 1930's when a paid official misused his position by taking money from various large corporations to advocate their point of view in Farm Bureau literature. Many farmers are indeed capitalists, risking considerable property as well as labour on their managing and forecasting abilities—but that does not mean that they like to have a corrupt employee sell them some other capitalist's bill of goods under false pretences.

But with the possible exception of the South, where caste and class lines are sharper, the class struggle analysis of the Farm Bureau has little relevance. Roughly half its membership is in the Corn Belt, which is the stronghold of commercial farming on family-sized farms. A Corn Belt tenant farmer (unlike a Southern sharecropper) owns considerable livestock and farm machinery. Hired farm labour outside the operator's family is found only on the larger farms and then is frequently an intermediate stage on the way toward tenancy or wage work in the cities rather than a permanent class status. In the Corn Belt, the Farm Bureau is the big farm organisation: Farmers Union strength is mainly in the wheat areas to the west, and National Grange strength mainly in the North-east. In the Corn Belt, all sorts of farmers belong to the Farm Bureau, even farm labourers if they wish. Over 50 per cent of the Farm Bureau members in Illinois are tenants rather than owners—a higher

# RACE . . .

## for post-war business

The post-war business will move "on ball bearings." Drawers and filing cabinets will open and close at a touch. Desks, cupboards and shelving will be fire-resisting, clean, and practically everlasting. STEEL supplies the answer to all problems of post-war office and factory furniture and equipment, and even now the designers and craftsmen of the great Sankey-Sheldon organisation are at work. New designs with unexpected refinements and devices will be available in the Sankey-Sheldon post-war range of steel furniture and equipment.

**SANKEY-SHELDON**

percentage than holds among farmers in the State as a whole.

The typical Farm Bureau set-up, where County annual meetings elect delegates to State conventions, and State conventions elect delegates to National conventions, does tend to favour leaders over rank and file, and farmers with the leisure that comes of hired help over those who must do chores personally every day or else impose on a neighbour. But to many a Corn Belt farmer, this does not mean undemocratic exaltation of the more prosperous farmer; it means getting the best management brains to carry out a policy common to all.

Farm Bureau policies take form in discussion among farm members in individual townships. County Farm Bureaux reconcile divergent views and pass them on to the State convention, which considers and passes them on to the National convention—and if State organisations do not like the National decision, occasionally they stick to their own policy anyhow.

Thus the fight against the Farm Security Administration was mainly the South's battle. The Federation President, Ed O'Neal, is an Alabamian. The Federation gave its support to a policy of drastic reorganisation of the FSA, but the Ohio and Vermont State Farm Bureaux disavowed even that, and the Iowa Bureau remained friendly to the FSA locally (in Dallas County, Iowa, the vast majority of FSA "clients" belong to the Farm Bureau), while taking the Southern Farm Bureau's word for it that all was not well with FSA as administered in the South.

In the fight against consumer food subsidies, a Farm Bureau questionnaire showed 93 per cent of Iowa Farm Bureau members opposed to this type of subsidy, and 87 per cent of all farmers in a number of sample townships. A private sampling poll of the Gallup type showed a smaller weighted sample of all Iowa farmers split 47 per cent against, and 40 per cent for consumer food subsidies. The 1943 National convention found all the State Farm Bureaux opposed to them.

But the Farm Bureau is by no means the outright inflationist that the price ceiling and subsidy fights suggest. To Farm Bureau members, consumer subsidies are inflationary, and of a type to leave farmers in a particularly bad relative position when they are removed. To them, farm prices are as essential a tool of production policy as are wage scales and industrial prices, and they resented deeply the prolonged failure to put ceilings on wages and the continuing failure to tax away the inflationary gap.

The Farm Bureau has long had its notions of fiscal morality, and they are neither those of the New Deal nor those of the market place. Back in 1932, the Farm Bureau opposed the National Grange's farm relief plan because it contained a subsidy. Then and in 1933-35 it championed plans which collected the farm relief money from the food industry that was benefited. The government cheques of the 1930's, while welcome, always made thrifty farmers uneasy: they knew they could not last. With returning farm prosperity, they want to get back on a commercial basis. If they cannot make money on straight market prices now, they reason, when can they ever?

The fact that the Farm Bureau's perennial national president, Ed O'Neal, is (now) an anti-New Deal Southern Democrat and big cotton planter, and its perennial vice president, Earl C. Smith, is a conservative Illinois Republican and big farm operator, is proof to some critics of reactionary tendencies, but the definition of "reactionary" is a chameleon, and many of the State Farm Bureau chieftains are not reactionary by any reasonable standard.

Mr O'Neal was re-elected for another two-year term this past December, possibly for the last time—he is 68—and Mr Smith does not wish to succeed him. If the lightning should strike Alan Kline, the new Iowa Farm Bureau president (recently in England for a visit), the overtones would be somewhat different at the national headquarters.

And in these same recent years when the gulf has been widening between the American Farm Bureau Federation and labour and the New Deal, the Federation has been moving closer to liberal international trade policies and international political co-operation. "We favour," resolved the Farm Bureau's Directors in October and the National convention in December,

the United States of America assuming its rightful share of the responsibility for co-operation with other nations in:

- Holding aggressor nations in check after the end of the war.
- Maintaining world trade policies that will give opportunity to all nations to obtain the materials necessary to maintain a sound peacetime economy, and
- Providing the opportunity for political and economic

freedom for all people—to the end that a just and lasting peace may be maintained among the nations of the world.

This from an organisation whose foreign policy long consisted in advocating subsidised dumping of farm surpluses abroad to "make the tariff effective for farmers"!

## American Notes

### The Right to Vote

Both Congress and the Supreme Court have taken action affecting the right of American citizens to vote. President Roosevelt has decided, with reluctance, to allow the complicated compromise on the soldier vote to become law without his signature, despite his doubts whether the measure would, in fact, assure Service men and women the same opportunity to vote as if they had been at home. A few days later the Supreme Court overruled one of its own earlier decisions, and ruled that negroes may not be excluded from voting in party primaries on account of their race. In principle, at least, the Court appears to have been more tender of the rights of citizens than Congress. The soldier vote Bill provides, briefly, that in order to take part in the November elections a soldier stationed overseas must request a ballot from his home state. Only if he applies before September 1st, and does not receive a ballot by October 1st, may he use the ballot provided by the Federal Government, which will list only candidates for Federal offices. In addition, the Governor of the voter's state must have certified by July 15th that the use of such Federal ballot is permitted. In his Message, Mr Roosevelt argued that these conditions largely nullified the provision establishing a Federal ballot, and urged Congress at least to delete the required state certification, pointing out that as Congress had not hesitated to affect state law in order to protect Servicemen's property rights it might do as much for their political rights. Beyond this, the degree to which the present law will extend the right to vote depends on the action of the states. Many have not as yet taken any action to legalise Federal ballots, and it is believed that in the end a majority of the states may not count them. In his Message Mr Roosevelt appealed to the states to take the steps necessary to make the Bill as effective an instrument for overseas voting as possible.

To appreciate the importance of the Supreme Court decision on negro participation in party primaries it is necessary to remember that in the South, where the bulk of the negroes live and where, in effect, there is only one party, the Democratic, any effective choice between candidates must be made at the primaries rather than in the final elections. Justice Reed, who wrote the majority decision (the vote was 8-1), overruled an earlier decision that the Democratic party is a private organisation with the right to govern its own membership, and said the Court was agreed that primaries are a part of Federal elections, therefore subject to Federal control, and that under the terms of the Sixteenth Amendment the right to vote cannot be abridged by any state on account of race. To lay down a principle in Washington does not immediately affect practice in Alabama or Louisiana. The poll tax still exists in some southern states, and public opinion—to put a polite name on it—may still discourage all but the hardier negroes. But in the long run the Court's action to extend the right to vote may be more important than the cumbersome measure Congress has evolved to complicate the participation of Service men and women in the November elections.

### Willkie in Wisconsin

This week's primaries in Wisconsin are widely regarded as the acid test of Mr Willkie's chances for the Republican nomination. That he himself believes them to be vital, if not crucial, is shown by the time and energy he has devoted to his campaign. From all accounts he has made a good impression, despite the lethargy of local party leaders and the graveyard silence of his opponents, which might have intimidated another candidate into a similar wait-and-see policy. Governor Dewey, General MacArthur and Lieutenant-Commander Stassen have all been entered in the primaries by their supporters, but of the three only Lieutenant-Commander Stassen has gone so far as to say he will accept the nomination if it is offered. In his speeches Mr Willkie has continued to urge the Republican party to

take a stand for international co-operation to maintain a just and permanent peace and for the protection of human values at home, instead of reverting to nationalism and economic Toryism, or, what seems even more likely, avoiding any clear-cut position at all. The advantages and disadvantages of this line appear fairly evenly balanced in Wisconsin. The tradition of the La Follette family and their Progressive movement stands, of course, for isolation, although it is not clear how strong the La Follette influence still is. On the other hand, the La Follettes were notably liberal on domestic issues, and Mr Willkie's progressive Republicanism might be expected to find a more responsive electorate in Wisconsin than in some other Republican strongholds. The results of another election held last week may also score in Mr Willkie's favour. This was in Oklahoma, where a by-election for the Federal House was held (not a party primary for the nominating convention, which is the present business in Wisconsin). In this election, the Democratic candidate not only repelled the attack of a diehard Republican but actually increased the Democratic majority. The moral of this result, which Mr Willkie was quick to draw, was that "you can't beat something with nothing," that the magic of "the trend boys" is no substitute for a policy and a candidate. It certainly is too soon to speak of stemming the Republican tide. Oklahoma is normally Democratic, and an increase of approximately 3,000 in the Democratic majority over the bare 300 of 1942 is no decisive omen, particularly as it probably was due in some part to the superior vote-catching qualities of the present Democratic candidate. But undoubtedly it has shaken the reputed belief of some Republicans that they can win with any candidate so long as he can read and write. If Mr Willkie makes a good showing in Wisconsin, it will provide a further salutary jolt to the Old Guard when the party gathers to select a candidate and frame a platform in Chicago this June. If he does not do well, his chances of getting the nomination, already less than they were, will fall still farther.

### Conscripting the Barrel

Although the manpower problem itself has grown increasingly pressing, there are no signs of the President's proposal for a National Service Act emerging from its Congressional pigeon-hole. As a result, the Army has taken a hand, with a proposal by the Under-Secretary of War that the 3,500,000 men graded 4-F, that is, physically or emotionally unfit for active service, should be enlisted as reservists and directed to war-work, with the provision that if they refuse they should be called up and placed in labour units. In its most drastic form, this might involve forcing men to work for private employers at Army rates, and it is difficult to believe that the pressure groups opposed to the authoritarianism of a National Service Act would find such a solution any more agreeable. Mr Patterson spoke of an "actual danger" on the manpower front, and it is reported that in some categories war production is falling off because of labour shortages. Nevertheless, it is difficult to speak of a real manpower shortage with a reserve of over three million men, many of them in non-essential work, and many more millions of women. The present stringency is compounded of the Army's decision to call up more of the men under 26 who have so far been exempted for occupational reasons; of the drift of both men and women from essential work into jobs which hold more promise of peacetime permanence; of excessive deferments; and of the failure to evolve any effective machinery for directing labour. In a sense it is the penalty of plenty, for were the situation worse, there is no doubt that a civilian solution of the problem of directing men and women would be found. In default of this, there may be a half-hearted resurrection of the old "work or fight" doctrine, although in the case of older men and the unfit it would appear to be even less suitable and more unpopular than it was when directed at younger men. But that there will be wholesale conscription into mobile labour battalions at this stage of the war appears most unlikely.

## THE WORLD OVERSEAS

### Latin American Trade Unionism—I

THE nations of Latin America will take an important part in the forthcoming meeting of the International Labour Office, as well as in the deliberations of the World Trade Union Congress which is scheduled for early this summer.

Economically, the nations of Latin America are "backward." Although there has been a wide movement towards self-sufficiency and industrialisation during the last decade and a half, most of the Latin countries of the New World are still agricultural and to a large extent have one-crop economies. In addition, most of the countries south of the Rio Grande have had but little experience with political democracy as Britain and America understand it. Finally, in many of them the question has been complicated by involved racial problems.

Although the countries involved represent many stages of economic, social and political development certain common features stand out. Labour organisation in Latin America has tended to concentrate in certain kinds of industry. In almost every country the strongest organisations have been in transportation. In Mexico, Argentina, Chile, Brazil, unionism first saw the light of day on the railroads and in the ports. The Argentine railroad unions, "Union Ferroviaria" and "La Fraternidad," have, since the advent of labour organisation, been the core of the trade union movement in that country, and have been the rallying point for other unions. In Chile, the port workers' and sailors' unions have played a somewhat analogous rôle, while in Mexico the railroad workers have always been at the centre of the labour movement. This tendency is even more marked in nations which are industrially more backward, such as Costa Rica.

Mining has been another centre of organisation. Mexico and Chile are, perhaps, the best examples. In the latter, the copper and nitrate miners of the north have been organ-

ised, sometimes haphazardly, sometimes tightly, for nearly fifty years. On the other hand, the Mexican petroleum workers have been among the most militant trade unionists of that country since the beginning of the Revolution, and their part in the nationalisation of Mexico's oil industry was decisive. More recently, the strike of the Bolivian tin miners has gained international attention.

The textile industry, in those countries in which such an industry has existed, has been a favourite field of union activity. In Peru, the textile workers have been the core of unionism, while in Brazil they have also been in the forefront.

It is natural that these industries should have been the main centres of Latin American labour organisation, since transport, mining and the textile industry have been the principal industrial elements in an otherwise agricultural community. What is perhaps not so easy to understand at first has been the apparent difficulty of organising the

The Bank undertakes general banking business and with its numerous branches offers special facilities in Canada, Newfoundland and the United States.

workers in the agricultural industries, which are still the corner-stone of the economic life of these nations. For example, in Argentina and Chile, as well as in Peru, there has been practically no attempt to organise the peasants, who are held in semi-serfdom. Mexico is the great exception, but then there has been a major social revolution in Mexico during the last thirty years.

Such organisation of agricultural workers as has occurred has been along characteristic lines. The organised workers have been those employed in the great commercialised crops, dominated by foreign capital. Sporadic organisations among the United Fruit Company employees in Colombia and various Central American countries, as well as among Cuban sugar workers, are typical.

The fact that organisation has occurred in foreign-owned agricultural enterprises rather than in domestic ones, points to another very characteristic feature of labour organisation in Latin America. Almost without exception they have been nationalistic. This nationalism, until the advent of the Good Neighbour Policy on the one hand and the Third Reich on the other, expressed itself in constant attacks—economic and political—upon foreign capital and foreign “imperialism.” During the twenties and early thirties “imperialismo yanqui” was the favourite whipping horse for labour spokesmen. In more recent years, Latin American labour has felt that the Nazi menace to them, both as organised workers and as members of “mongrel races,” was urgent enough for them to drop their old antagonism to the Americans and the British, and to line up behind the struggle against the Axis. Aided by the change in the US official attitude, as demonstrated in the Good Neighbour Policy, Latin American labour has become the strongest supporter of the United Nations.

This nationalistic feature of the trade unions, especially in older days, was probably a prime factor in their success. It is, on the face of it, strange that there should be organised labour movements of one quarter million and one million members respectively in such relatively backward nations as Argentina and Mexico. Organised labour's nationalism helps to explain this phenomenon. A strike against a foreign-dominated company could usually gain widespread popular support where a similar move against

native industry might be completely quashed. Or, more generally, agitation against “foreign imperialism” might gain support from among nationalist-minded middle-class people to whom labour organisation might otherwise be anathema. The general strike in the port of Buenos Aires at the end of the last war—which was aimed primarily at British and American interests—springs to mind in this connection. Walk-outs in Chile, Mexico and among the banana workers of Costa Rica also support this theory.

This factor of labour nationalism is perhaps only a phase of a broader aspect—the intensely political nature of Latin American trade unionism. It is impossible to recall a single Latin American instance of what US labour would call pure and simple unionism. Trade unions are almost without exception tied up with some political group—in or out of the Government as the case may be. Before 1914 the anarcho-syndicalists held the predominant position in Latin American organised labour, and such centres of union strength as existed—Argentina, Chile and Brazil—were largely dominated by anarchists. At the same time a counter influence was exerted by the Socialists, who in most instances had rival union organisations.

The period between 1914 and the present has seen three political developments in the trade union field. First there has been the utter collapse of anarcho-syndicalist influence to an extent that, although unions of this tendency do exist, they are of little importance.

The second feature has been the growth of what, for lack of a better name, can be called “Marxist” influence—both Socialist and Communist. The Socialists came to dominate the Argentine movement—the stablest trade union movement in the region. Communists and Socialists shared the leadership in Chile and Cuba. The more or less Socialist Aprista Movement in Peru was the dominating influence there, though the Communists were of some importance. In Costa Rica, the Communists have had the field almost to themselves, while in Colombia they were the strongest element. Thus, to a large degree, the fortunes of the unions have depended on the rise or fall of these political groups.

But another political factor has also evolved in this period—Government intervention in labour organisation. This intervention reached its apogee in revolutionary Mexico, where for a time each succeeding regime had its own pet labour organisation which prospered for a while, but later, with the advent of a new administration, gave way to a new group.

In recent years other governments have experimented in sponsoring the organisation of labour. The Vargas regime in Brazil has a highly organised system of almost compulsory unionism under government sponsorship. Even in Peru, which has had one of the most reactionary regimes in South America, the Government has experimented with government-aided unions to counteract those sponsored by Aprista, the perennial opposition. Other examples of governments sympathetic to labour unionism are the recent Leftist administrations in Chile and the Batista regime in Cuba.

All of these features—concentration in particular industries, a nationalistic outlook, an intense political nature—are characteristics of labour organisations in “backward” countries everywhere, whether in Latin America or in China or in West Africa. The movement has been strongest in those countries which are most advanced industrially. Thus Argentina, Chile, Cuba and Mexico are the outstanding centres of labour organisation. And, even if the Brazilian Government were not patronising—while at the same time controlling—its organisation in that country, it is likely that Brazilian unions would be prospering. The history of the movements in these countries will be sketched in another article.

## Mineral Poverty in Eire

[FROM OUR DUBLIN CORRESPONDENT]

THE reduction of all sorts of imports caused by the war has led to much investigation of possible home-produced substitutes. The principal limiting factor on the production of substitutes is the narrow range of available raw materials. Mineral deposits have been worked in Ireland for hundreds of years and the mineral resources of the country have been carefully studied in the course of the last century. There is a certain amount of popular belief in the existence of vast

quantities of untapped mineral deposits, the development of which was impeded by political causes in the unhappy past. A useful service to realistic thinking on Irish economic problems has been discharged by the publication by the Stationery Office of a “Short Review of Irish Mineral Resources,” prepared by Mr D. W. Bishopp, of the Geological Survey of Ireland. This survey, which shows the value of Irish mineral resources against the background of demand, market price and cost of production, will do much to remove popular misconceptions on the subject.

Ireland is very poorly endowed with coal. Only four rather small coalfields are at present being worked. The fields in County Kilkenny yield anthracite coals which are inclined to be sulphurous. The more accessible seams have been exhausted, and the seams now being worked are narrow and, in some cases, much disturbed by folding and faulting. The total production of anthracite is about 100,000 tons yearly. The Arigna field in County Leitrim provides coal of a higher volatile content which can be used for raising steam. The seams are narrow and the best seams have been worked out. Annual production amounts to about 60,000 tons. The Munster coalfield is large, but its working presents many difficult problems. It could not be worked except at very high cost. This cost, though prohibitive in peacetime, might be worth incurring in times like the present if output could be rapidly expanded. This, however, is impossible. The conclusion is inescapable that Eire must continue to import coal in large quantities unless some substitute fuel can be found to take its place. The experience of the war years does not suggest that turf can replace coal except within narrow limits.

There is evidence that, in the past, many metallic ores were mined in Ireland, but no such ores were being mined at the outbreak of the war. In the middle of the nineteenth century copper, lead, zinc, iron and pyrites as a source of sulphur were mined. The working out of the most profitable parts of the deposits and the reduction in the price of metals caused by the discovery of new sources of supply brought these activities to an end. A small and purely temporary revival took place under the stimulus of the high prices during the last war. Copper is widely distributed over the country, but the deposits are too scattered and poor for commercial development. Lead, zinc and silver are also widely distributed in small quantities, but it is extremely doubtful whether it would be profitable to reopen the old mines in view of the present price of these metals and of current cost of production. Abundant iron ore is to be found at Lough Allen, but the phosphorus content is high, and its concentration in the parent shales is low. Exploitation would consequently be very costly. No other deposits of iron ore capable of commercial development are known.

A large number of non-metallic minerals are to be found. Many of these are being successfully exploited by private enterprise. Slates, clays, structural materials, road metal, brick-clay and gravel are widely distributed. Fireclay is found in the coalfields. Ornamental marble is being worked in small quantities. The abundant supplies of limestone are used for building, for agricultural liming, and as a raw material in the successful new cement industry. The small deposit of rock-phosphate in County Clare has proved very useful since the reduction in the import of phosphate fertilisers during the war, but it is quite inadequate to supply the total demand. Extensive gypsum deposits of good quality are to be found in County Cavan. Other non-metallic minerals which are commercially exploited are barytes, sulphur ore, glass-sand and ochre.

### Future Developments

The general conclusion to be derived from the survey is that there is no great future for mineral development in Eire. A rapid expansion of the output of coal would be impossible except at a completely prohibitive cost. The field for expansion in the case of copper, lead, zinc and silver is extremely limited. The non-metallic minerals are abundant and should continue to be profitably worked for some time. There is no possibility of any further mineral deposits being discovered by a study of the surface, as the geological survey of Eire has been unusually thorough. The realisation that Eire is badly endowed with minerals should direct attention to the necessity of exploiting as efficiently and intelligently as possible the great natural fertility of the soil. A soil survey on the same lines as the Survey of Mineral Resources is long overdue. Such a survey should form the basis of post-war agricultural policy.

## NOTHING LIKE LEATHER

CHEMICALLY this is not true. Leather is a protein and so are wool, silk, hair, nail and horn! The manufacture of leather is a highly-skilled and complex craft which has developed slowly but surely through centuries of trial and error. The hides must go through many treatments before being tanned. Tanning converts the soft skin into durable leather, but it is not the end. The leather must be brought to the required degree of pliability and finally dyed or finished to obtain the wide range of effects, say, between an army boot and a bright bedroom slipper, a fancy handbag and a Sam Browne belt. All these many and varied processes have been developed by the leather industry, but gradually, as the chemistry of leather has become better known, the chemist has been increasingly brought in, replacing the old agents for leather treatment, lime, animal excreta, eggs, offal and crude fats, with standard alkalis and sulphides, pancreatic enzymes, disinfectants, purified and analysed fats, the chrome tanning process and so on. Most of all, the chemist is helping the leather manufacturer to understand the principles of his processes, to speed them up and standardise them. The excellence of British leather is universally recognised, and British chemists are among the first in the field of leather research. Professor H. R. Procter, known affectionately as “the father of leather chemistry” led a pioneer school at Leeds University from 1890-1913 and the work he initiated has been pursued and developed all over the world. Leather remains the best material for footwear and all the white races walk in leather—in normal times! So the old saying that there is nothing like leather is still true.

## More NEWS of WHITE HORSE

### When distillation ceased

You can make bricks without straw, but you cannot make Scotch Whisky without barley. Since the war began the fruits of each golden harvest have been called up for National Service. No more whisky is being made: distillation has ceased.

Yet in this fifth year of war you can still, with good fortune, obtain White Horse. This is because stocks have always been laid down many years ahead of the time when they will be released for your pleasure. White Horse was growing old when this war was young. It is therefore in your own interest that supplies should be very carefully regulated so that in the years to come you may still be able to enjoy White Horse, fine as a fine liqueur.

MAXIMUM PRICES: Bottles 25/9; Half-bottles 13/6  
as fixed by The Scotch Whisky Association.

## Russia at War

### Plan for Farming

ON March 15th the Council of People's Commissars issued the agricultural programme for 1944. The plan fixes this year's acreage at 7½ million hectares more than the area sown in 1943. (The total proposed acreage is not given.) The programme does not cover the Ukrainian areas to the west of the Dnieper, Byelorussia or the provinces of Leningrad and Kalinin recently freed. Thus the proposed increase in acreage covers roughly the provinces of Smolensk, Orel and Kursk, the eastern Ukraine, the Donetz and the Rostov province, and possibly some parts of the northern Caucasus. The total sown area of these regions, (not including the northern Caucasus) used to be about 25 million hectares; the provinces of Orel and Kursk alone accounted for 6,000,000 hectares. If, after the liberation of these lands, the year's increase in the sown area of the whole of the USSR is not to be more than 7½ million hectares, then the conclusion must be drawn that only perhaps a third of the normal acreage in the freed areas will come under the plough this year. At least two-thirds will for the present remain uncultivated.

Farming in the rest of Russia is labouring under the cumulative effects of wartime dislocation, as well as of the special adversities of the past year. True, the Government's survey of 1943 pays a brief tribute to the farmers who have "coped successfully with the work"; but it goes on to describe the actual conditions in the following words:

The unsatisfactory work in 1943 in the machine and tractor stations led to non-fulfilment of the plan of tractor-work, a lowering of the level of mechanisation, delay in field work, and non-fulfilment of the plans for ploughing and crop-cultivation.

The survey confirms reports about last summer's severe drought in the south of Russia, on the Volga and in the steppes of Kazakhstan. But it rightly points to the "lowering of the level of mechanisation" as the more important, because more permanent, difficulty. The technical basis of Soviet farming has been shattered by the mobilisation of motor equipment for war purposes. In a country where about 75 per cent of the ploughing and about 50 per cent of the sowing used to be performed by mechanical means the switch over to more primitive methods of work could not fail to cause a serious fall in productivity. The survey speaks of a sharp decline in the yield of cereals and industrial plants.

The war has made heavy inroads, not only into the mechanised equipment, but also into the cattle population of the countryside. The decree of March 15th orders a stop to the mobilisation of draught animals. Nor even the Governments of the various Republics have now the right to call up horses.

There is also the shortage of manpower. In the course of 1943 male labour in farming still continued to be replaced by female labour on a mass scale. Even so, the reserves have proved to be inadequate, and the quality of labour has suffered badly. There has been shallow ploughing and sowing. Infection of the land with weeds has become a plague on most collective farms. In the dry and important agricultural areas around the Caspian Sea, which depend so much on careful irrigation, the networks of canals and water reservoirs have fallen into neglect, because the hydro-technicians had been directed to other work or called up. Elsewhere irrigated areas have changed into marshes. For the first time since the beginning of the war, the Government now issues a warning about the sharp decline in the yield of cotton, the staple crops in the dry Central Asiatic Republics and in the south of Kazakhstan.

The sad tale of the losses of Soviet agriculture could be carried on almost indefinitely. It is told officially with a high degree of frankness. The remedies suggested are not all new. There is the insistence on repair of tractors, on

the production of spare parts and on a rational use of machines and animals. There is, further, the emphasis on incentive wages for the tractor drivers and for other technical staffs. There are the admonitions to the leaders of the collective farms to take care of the stocks of seeds, as well as other highly technical instructions to the farmers; and attached to them are strict timetables for the sowing campaign. All these detailed orders are planned and fixed at the centre, from where they are issued and broadcast to the peasants of "one-sixth of the world."

Besides those routine orders, which were evidently not too effective last year, there are also some new measures that indicate changes in agricultural policy.

In recent years a big effort has been made in the eastern territories to change over from spring to winter grain. Scientific laboratories were said to have produced special sorts of frost-proof grain which could be grown in Siberia. It was hoped that the higher yield of winter wheat compared with spring wheat would partly help to offset the loss of the Ukrainian winter grain. This policy is now, at least partly, reversed. The collective farms in the east have now been ordered to restore the cultivation of spring grain within one or two years.

Another wartime experiment carried out on a very large scale, mainly in Turkestan, was the reduction in the cultivation of cotton in favour of rice-growing. The experiment was clearly necessitated by dire scarcity of foodstuffs. The result has not been up to expectations; the mixture of cotton and rice on plantations has also very badly affected cotton harvests.

This policy, too, has now been reversed. The growing of rice is to be drastically reduced; and an energetic effort is to be made to bring the output of cotton up to pre-war standard. Self-sufficiency in cotton has for many years been an important plank in the Russian agricultural programme.

Another new feature in this year's plan is the campaign for sugar-beet. At least four-fifths of the Soviet Union's sugar-beet used to be grown in the now liberated areas of the Ukraine. Since 1941 the Soviet population has been starved of sugar. The recent regulations aim at the reconstruction of the sugar economy and at securing for the state absolute control over all available beetroot supplies. Beetroot fields may therefore be cultivated only within the radius of 20-25 kilometres from the state's reception depots.

Most of these measures are, no doubt, expedient; and they will be carried out with drive and energy. But they are hardly more than palliatives. In the short run, no remedies can possibly be found for the losses in manpower, machines and cattle; and even in the long run administrative measures are no substitute for a broader programme of agricultural reconstruction. The need for such a programme is likely to become more and more pressing on economic as well as on social and political grounds.

#### Kolkhoz and Moujik

Collective farming needs for its existence the tractor, the lorry and the harvester. Without technical equipment the Kolkhoz is merely nominal. Manual work and the draught animal form the technical conditions of small-scale individual farming. The war has inevitably weakened the coherence of collective farming. Within the framework of the Kolkhoz the cultivation of small and privately owned plots of land has now developed with new momentum. Technical retrogression makes it for the time being impossible for the Government to stem the expansion of the "private sector" within collective farming.

The decree of March 15th, significantly, says nothing of this crucial problem. The immediate future of collective farming depends, however, on the speed with which the Government will be able after the war to replenish stocks of agricultural machinery and cattle. This it may do either, quickly, by importing tractors, lorries and cattle from abroad or, slowly, by rebuilding from Russia's own resources the technical backbone of the collective system. If this second course is taken, Russian agriculture is almost certain to find itself in considerable difficulties during the years immediately after the war before its technique is restored. Stagnation is, in addition, likely to be accompanied by a partial renewal of "individualist" tendencies in the countryside. The *kolkhoznik* has not yet completely ceased to be the *moujik*.

## THE BUSINESS WORLD

### Arbitration and Industrial Unrest

THE industrial front is more unsettled to-day than at any time since the war began, and the coal industry is, as always, the main seat of the trouble. Many factors, some physical and some psychological, have contributed to the present industrial unrest. War weariness, boredom, apathy, the feeling that the war is won, the desire to safeguard post-war standards, and a general sense of frustration in the industrial field, akin to the frustration caused by the suspension of political activities—the cumulative effect of these factors is not inconsiderable. And the mood of restlessness has been played upon and accentuated by irresponsible elements.

To explain is not to excuse. Apart from the detrimental effects on war production and industrial morale generally, one of the major difficulties in the present situation is the inability of the union leaders to control their rank and file. This weakness of authority constitutes a threat to the whole structure of negotiating and arbitration machinery; the grave consequences of a breakdown of this machinery were described by Mr Bevin in a speech on Tuesday. When the coal industry's National Tribunal was set up in July of last year, the settlement of disputes on a national rather than a district level was hailed as a great advance. Yet rarely has an industrial award given rise to so much disturbance as the Porter Tribunal's decision on mining wages. Both sides were pledged to accept the award, whether they liked it or not. But rather than leave the negotiations to their union machinery, for further reference if necessary to arbitration, the miners expressed their dissatisfaction by the time-honoured but, in wartime, unconstitutional, method of withdrawing their labour.

Is an arbitration award only to be regarded as binding if its terms are favourable? To judge from recent events this would seem to be the prevalent attitude. If this is so, it is a poor prospect for industrial peace. But it would be wrong to judge the success or failure of wartime arbitration machinery solely from these events. Apart from the Porter award and the National Arbitration Tribunal's award on engineering wages, which was the ostensible (though not the fundamental) cause of the Barrow strike last October, the awards of arbitration tribunals have been received without stoppage of work.

British tradition and practice are opposed to the idea of compulsory arbitration, and there is in peacetime a wide range of machinery for conciliation and the voluntary submission of disputes to arbitration. But in wartime, the voluntary principle has had to be abandoned in favour of compulsory arbitration.

The record in this war has so far compared favourably with that of the last war. From August 1914 to August 1918, 15,542,000 working days were lost through stoppages—nearly half the disputes occurred in 1917-18. In four years of the present war, up to August 1943, only 4,761,000 working days were lost. Professor A. L. Bowley, whose figures these are, estimates that, taken over the whole of industry, the time lost by strikes works out at an average of less than half a day per worker employed. The improved record in this war has been primarily due to the co-operation of the trade unions in production, but it is probably true to say that arbitration has been a contributory factor in maintaining industrial peace.

It is interesting to compare the experiences of arbitration in this war and the last war. Strikes and lock-outs were first made illegal in 1915, and a system of compulsory arbitration established under the Munitions of War Act. The Tribunal was limited to workers actually engaged on munitions production, and excluded mining and transport workers. Between the passing of the Munitions Act in 1915 and the end of the war, 8,000 awards were issued, and in the majority of cases they were accepted without cessation of work. Humbert Wolfe, in his "Labour Supply and Regulation" (Carnegie Endowment Series) comments:

The machine of compulsory arbitration, combined with a reasonable use of the munitions tribunal did . . . go a long way to keep the industrial position steady in respect of purely industrial matters.

The same expedients have been adopted in this war. The Minister of Labour's Joint Consultative Committee declared:

In this period of national emergency it is imperative that there should be no stoppage of work owing to trade disputes.

On its recommendation the National Arbitration Tribunal was set up in July, 1940, under the Conditions of Employment and National Arbitration Order. The Order provides that disputes which cannot be settled by normal negotiating machinery should be referred to arbitration and that in industries where there is no provision for arbitration the disputing parties may either set up their own machinery or else refer to the National Arbitration Tribunal.

The National Tribunal, appointed by the Minister of Labour, is composed of three independent members, one of whom is the chairman, and one representative each of employers and workers selected by rota from representative panels. No panel member may serve on the Tribunal if the claim concerns an industry in which he is interested. Since July, 1940, the Tribunal has heard over 500 cases, of which all but a few have been submitted by the workers. It has dealt with claims affecting practically every industry, even those which have their own machinery, and has considered disputes ranging in importance from claims concerning a small individual employer to claims of nationwide importance, such as those of the engineers and shipbuilders. It is difficult to make any precise analysis of the Tribunal's work, because many of its findings have separate parts, and even where a claim is rejected, the finding may contain a recommendation which affects the whole industry. A recent attempt at analysis showed that by January, 1944.

out of 488 cases heard, 110 awards were in favour of the claim, 164 claims were partly won, and 209 rejected, while no award was made in three cases. But this calculation does not enable any precise conclusions to be drawn.

Arbitration is, very properly, usually regarded as a last resort, though there has been a tendency to refer to the Tribunal trivial disputes which should be settled by negotiation. In 1942, 52.7 per cent of the stoppages were settled by direct negotiating machinery, 36.1 per cent by the workers returning to work on the employers' terms, 8 per cent by conciliation and only 1.8 per cent by arbitration. In 1940, the proportion settled by arbitration was even lower—only 1.2 per cent. But the fact that machinery exists and is, on the whole, regarded as fair, has undoubtedly been an advantage for the workers.

Many criticisms have been made about the arbitration machinery, and certain proposals for improving its operation have been put forward. It has been said that Tribunals are composed of outsiders, with insufficient knowledge of industry and industrial relations. It is true that anyone with a knowledge of mining could have foretold that trouble would result from a disturbance of the relation between day and piece workers' wages, but Lord Porter, to do him justice, recognised this danger when he urged the need for a fundamental overhaul of the industry's wage structure. Most of the recent wage claims have been based on the relative level of wages in other industries, and each increase granted has the effect of stimulating fresh claims. It may be hard for a Tribunal in this "catch-as-catch-can" process to assess the relative importance of industries, and it is not really its function to do so. On balance, the advantages of having an impartial and independent Tribunal outweigh the possible disadvantage of lack of expert knowledge. It is, however, essential that a Tribunal should have access to expert advice and that the parties should have faith both in its capacity and in its impartiality.

It has also been said that the Tribunal's findings are couched in obscure legal language which the workers cannot understand, and that it is too slow and cumbersome in operation. The charge of obscurity arose out of the engineering award, but the difficulties over this award were due to the complexity of engineering wages rather than to the phrasing of the award. In fact, the National Arbitration Tribunal has never taken more than three weeks to announce its decision after a claim has been submitted to it. Delays occur at an earlier stage, and there is no doubt that local delays, especially in the engineering industry, have exacerbated grievances and led to stoppages over disputes which could, and should, have been settled by negotiation. The Amalgamated Engineering Union is now considering methods of speeding up local machinery for settlement, and recently the Trades Union Congress suggested the establishment of regional tribunals, to consider local grievances and thus save the main Tribunal's time.

Criticisms of this nature are very minor in substance compared with the more fundamental issues raised by arbitration. One such issue is the question of trade union recognition. It obviously facilitates the Tribunal's work if

it can deal with the recognised representative organisations of either side, and difficulties have sometimes arisen when a union is not recognised by the employer as a negotiating body. There is already a considerable demand among unions for legal recognition and protection such as is provided for American unions under the Wagner Labour Relations Act, and this is likely to be one of the trade unions' major postwar demands.

A more immediate issue is the question of how an award can be enforced, and what sanctions should be adopted against those who fail to comply. Mr Bevin has often appealed to strikers to respect trade union authority. But trade union authority cannot be enforced at a pistol point. Individual workers can be prosecuted—up to the end of August 1943, 14,000 men and 3,000 women had been prosecuted for various offences, mainly in connection with the Essential Work Order and direction to work. It is impossible to prosecute, imprison or fine a hundred thousand miners, and it is equally impossible to pick out and punish the ringleaders. The knowledge of "safety in numbers," as well as their instinctive sense of solidarity, has been responsible for the spread of many strikes; moreover the strike is still looked upon as the workers' "only weapon," and when the same leaders who taught them how to use it, now tell them not to strike, many of the rank and file are confused.

The right to strike has, in theory, been given up by labour in wartime, under the pressing consideration of national unity to win the war. It might be argued that, since full employment depends upon the cooperation of labour, the strike should be outlawed in peacetime as well, and the machinery of compulsory arbitration retained. Many trade union leaders are probably thinking along these lines when they speak about continued "control over labour." The coal owners and the miners' representatives recently agreed to pledge themselves to maintain industrial peace in the coal industry for a period of 4½ years, though the whole scheme is in danger of foundering in the districts.

But, however logical and theoretically desirable, compulsory arbitration would certainly not be practical politics. The review of the National Arbitration Tribunal's work suggests that it has, on balance, been moderately successful in its objects, but it would be unrealistic to think about its prolongation into peacetime. Compulsory arbitration was abandoned after the last war, and voluntary machinery set up under the Industrial Courts Act of 1919. This was one of the recommendations of the Whitley Committee, which foresaw, optimistically and wrongly, an era of industrial peace and co-operation. If the experience after the last war is to be avoided, it will be necessary to build up and strengthen the voluntary negotiating and conciliation machinery for individual industries, some form of national tribunal could be retained as a last resort, though, even so, it would probably have to be shorn of its compulsory powers. The collective bargain is the foundation of British industrial relations and the best means of determining labour's terms of employment, but it is in essence voluntary and flexible.

## Business Notes

### The Franc Rate

The problem of the franc rate falls into two distinct parts: that of the period of the liberating military operations and that of the more permanent alignment of the franc with other world currencies. The two are not entirely separate. As was argued in *The Economist* of February 5th, the rate immediately applied is likely to acquire the rigidity of established fact, and in fixing it the wider considerations which must go to discussion of the longer-term problem should not be overlooked. Nevertheless, it can be said that the exchange problem in the phase of liberation falls into a category of its own. It should be treated as part of the problem of supply and of competition for consumer goods and services in the liberated areas. From this point of view it will evidently be desirable to place the value of the franc at as high a level as possible, for by so doing the purchasing power of the armies of occupation for the depleted supplies of the liberated areas will be reduced. But the solution of this problem cannot be left to the rate of exchange alone. Even if a rate of 200 francs to the £ be fixed—and a more

favourable rate for the franc can hardly be contemplated—the franc expenditure of the Allied forces should be drastically limited by some such device as blocking part of their pay. Moreover, the liberating armies should, as far as is compatible with the problem of transporting munitions and other stores of the first priority, be followed by supplies of foodstuffs and consumer goods. The muddle, to give it no worse name, which has occurred in Southern Italy cannot all be laid at the doors of the exchange rate of 400 lire to the £. The competition of officers' messes for local foods would probably have lost little of its keenness if the rate of exchange had been 300 lire to the £. The delay in issuing specific instructions to the Allied forces against denuding the country of its foodstuffs and in getting in supplies for the troops are faults of administration for which the choice of an exchange rate provides no convincing scapegoat.

The fixing of an exchange rate between metropolitan francs and other Allied currencies will fortunately not fall

to the local Allied commanders. Their troops will take with them not sterling and dollar military notes, but franc currency issued under the authority of the Committee of National Liberation. It is mainly for the Committee and its experts to decide the rate at which this currency will be made available against sterling and dollars. That decision has not yet been made and is still the subject of keenest debate in French circles. Those favouring a high exchange value for the franc base their contention mainly on the relative modesty of the rise in French wages. The minimum wage in France is roughly 60 francs a day. Even at 200 francs to the £ this is a very low figure. There are other experts who have worked out a parity of 280 francs to the £ as having some semblance to economic realities. At the other extreme are calculations which would give the franc a parity of 500 to 600 francs to the £, based on relative changes in circulation and prices and confirmed by the respective quotation for franc and sterling notes in the free Swiss market. That is a debate which had best be left to the French. But to which Frenchmen? Will the United States accept the rate fixed by the Committee of National Liberation, or will General Eisenhower be free to make his terms with some other authority in metropolitan France? A clear-cut decision on this political aspect of the problem would go some way towards a satisfactory solution.

### New Building Methods

There is, perhaps, no single industry that is more in need of adopting new methods and processes than the building industry. After the war, the pressing housing shortage will call for the utmost speed in construction and the improvement in the general standard of housing for an effort to reduce the real cost of new houses. Neither of these aims can be achieved by the traditional practices of the building industry. The possibilities of building houses more speedily and more economically are at present under investigation by an inter-departmental committee under the chairmanship of Mr George M. Burt, appointed in September, 1942, by the Minister of Health, the Secretary of State for Scotland and the Minister of Works. In its first report,† issued on March 31st, the committee has published the results of a survey of methods, other than the traditional, used during the inter-war years. Later studies will deal with the so-called prefabrication of houses and with other new methods of construction. Since the experience gained in new methods of construction during the inter-war period was small, and was mainly confined to alternative systems of walling—the great majority of the 4,500,000 houses erected in Great Britain between 1919 and 1939 were built by traditional methods—the committee has recommended a programme of research and development. This is now being carried out by the Ministry of Works and the Department of Scientific and Industrial Research. In the view of the committee, research may reveal advantages in a greater measure of standardisation of the parts of a house. Hence,

investigation should be directed not only to the development of forms of construction and of the use of new materials, but also to that degree of organisation in the workshop and on the site which will be essential if the full benefits offered by standardisation are to be obtained.

At the outset of its deliberations the committee reached the conclusion that the building industry, in its depleted stage, would be unable fully to meet the demands likely to be made upon it, and that methods of construction alternative to the traditional ones would be required. Its conclusion has no doubt influenced the Government's decision to supplement the construction of permanent dwellings by the erection of up to half a million factory-made houses, as a means of relieving the shortage as speedily as possible after the war. The Government's decision is undoubtedly sound and its initiative in calling for an investigation into building methods is to be commended. But in view of the controversy that the decision has aroused, it is a pity that the committee has not yet been able to issue its findings on prefabrication and on other new methods of building.

### The Challenge Accepted

In contrast to the opposition expressed by Mr Coppock, secretary to the National Union of Building Trades Opera-

† "Post-War Building Studies, No. 1. House Construction." 152 pages. H.M. Stationery Office. 2s. net.

tives, Sir Malcolm Stewart, chairman of the London Brick Company, Ltd., accepts the challenge of the factory-made house in the spirit of progress. At the annual meeting of the company, when he had to inform shareholders of the unfavourable impact of the war upon its profits, he said:

It is no good decrying prefabricated structures; it is up to us to produce progressively something better and get it accepted as such by the householder. . . . Let us recognise that a situation has arisen which calls for the building of prefabricated houses in an emergency and prepare to meet any threatened competition by reducing the cost to the utmost and improving the design and amenities of the traditional brick house. Thus we can give the public the homes I believe they really want and at a price they can afford to pay.

In Sir Malcolm Stewart's view, it is not so much the walls and the roof of a house that cause delay and heavy expense, but the fittings. Hence he advocated the fullest possible use of prefabrication for fittings; these could be greatly reduced in cost by mass-production and assembly on panels at the factory, ready for delivery to and erection on site. Further, the houses to be built—they must be built in adequate numbers to justify the mass-production of fittings—should be carefully designed and dimensioned to receive the prefabricated fittings. Sir Malcolm Stewart's faith in the survival of the brick, based on the scope for reductions in the cost of the traditional house, is also a measure of past neglect, due to convention and inertia. His faith may be justified; but, as he himself readily concedes, it must be justified in the fire of competition, not merely with the temporary prefabricated houses to be constructed by the Government, but also with alternative walling materials. Competition is likely to be keen, and the investor in building materials, like the prospective tenant or owner of a house, might miss opportunities in sticking to the brick, by overlooking the attractions of the industries engaged in the production of materials, such as cement, plaster board, timber and, possibly, metal and asbestos sheets, as well as of fittings, such as heating installations, refrigerators, kitchens, bathrooms and the rest.

### Lamport and Holt Valuation

The announcement by the board of Lamport and Holt Line that they had refused an offer of 22s. 6d. for the stock units of 6s. 8d. has caused quite a flutter in the market for shipping shares. Shortly before the news became known the units had stood at 15s., which was about the highest for a considerable term of years. The net liquid assets, mostly in cash, at the end of last year were equivalent to about 18s. 7½d. a unit. If the written-down value of the fleet and the Government Tonnage Replacement account were taken in at par and the contingency reserve counted as being freely at the disposal of the directors, the figure would be raised to about 25s. 6d. It seemed evident that the directors were not stretching their discretion unduly in withholding from the proprietors the right to decide for themselves whether the offer should be accepted or no, although, as a matter of principle, the question should plainly be submitted to them. Since then it has been disclosed that the offer was made by United Molasses, and it is stated in all sorts of quarters, apparently on the best authority, that a reasonable "going concern" valuation of the 6s. 8d. units, including Conference rights and all other intangibles, is 40s. a unit. Granted that United Molasses would probably not be much interested in Conference rights and goodwill, the gap between 25s. 6d. and 40s., or some £1,942,000, calls for explanation. So far as tangible assets are concerned, the only ones which appear to be capable of under-valuation are fleet £267,548, investments £334,930—stated to be worth more—and debtors less reserve of £565,080. The average dividend of the past decade has been 4.1 per cent, and the average disclosed earnings 8.05 per cent, but the corresponding figures for the four years 1935-38 were 2.25 per cent and 3.5 per cent. As to the future, the chairman, Sir Philip Haldin, has not been noticeably less insistent than his conferees on the need for increased allowances if the industry is to be in a position to compete after the war. If the 40s. valuation has in fact any official basis, the proprietors ought to be informed of it and an explanation given to them of where the additional value resides. If it is in tangible assets, it is a very different matter from being a mere valuation of prospects in an uncertain future. The shareholders have a right to know much more precisely than within the limits of, say, £3 million and £5½ million what net tangible assets they own. It is likely to influence their opinion about the efficiency of the management.

### Cornish Mining Claims

The memorandum of the Cornish Tin Mining Advisory Committee on metalliferous mining in the Duchy is little better than a plea for the maintenance in being of the four principal mines, Geevor, South Crofty, East Pool and Castle-an-Dinas, at any price. It is maintained that the cost will be small—and in view of the size of the industry this is probably true—but this is not a sufficient justification for establishing a precedent which will be seized upon by larger applicants for favours. The Committee produces arguments which resemble the special pleading of agricultural interests and of the Cotton Report: the industry cannot function, owing to the fluctuations of metal prices—this really means that the average price obtainable under competitive conditions is too low; there is no alternative employment for Cornish miners; the "wealth" represented by the unmined tin will be lost to the country and the export business of the mining plant manufacturers may be lost. But the country cannot afford to base its policy on a maintenance of the *status quo* if that means an unjustifiable cost to the community.

In addition to these arguments, the Committee does advance two points which may have substantial importance: the need to maintain the Cornish mines as a training ground and research centre for the British mining engineer, and the need for a radical revision of the taxation of wasting assets. The former point might warrant a small subsidy. But there are limits to the number of industries which the nation can afford to subsidise, and agriculture has already staked large claims. The revision of the taxation of wasting assets is a matter of some urgency—as is that of all industrial taxation. The present tax policy is given as the main cause for the decline in British mining, and, if this is so, the Committee would have done well to concentrate their attention on stating the case for revision. They seek exemption from tax for the first three years of development, a substantial allowance for pre-production expenditure and a percentage depletion allowance, presumably for the life of the mine. These seem large claims, for it must not be supposed that Britain would be justified in making concessions which may be necessary in the Dominions or in other countries where the same alternative means of employing the factors of production do not exist. If a reasonable revision of taxation reduced the deficit, after meeting capital charges, to a point at which it could be covered by a subsidy from the educational authority, it might be worth while to maintain the Cornish industry. If not, other means must be sought of providing employment for displaced miners which will be less burdensome to the community.

### Hitting the Bull's Eye

London's Salute the Soldier target of £165 million was duly passed—by a margin of £447,623. This magnificent balance between planning and achievement is too exact to avoid all suspicion of having been managed. Applications for Government issues received on Monday of this week were allowed to swell the total and it may be presumed that in the final stages certain strategic reserves were brought up and used. For the sake of verisimilitude a final result of £447,623 under the target would have been preferable to the one actually announced. Up to the end the technical task of neutralising the exceptional flow of funds caused by these heavy subscriptions to Government tap loans was successfully performed. In that process of balancing the volume of bank cash, the pre-encashment of Treasury Deposit Receipts by the banks played a considerable part. The debt return for March shows that during the month £102 million of TDR's were encashed prior to maturity, and the bulk of these encashments must have taken place in the final week of the month. The debt return also indicates how the subscriptions made during London's week were distributed among the various Government loans. The totals for the month, which must be largely dominated by the figures for the final week, show that 2½ per cent National War Bonds brought in £118,645,000, 3 per cent Savings Bonds £51,875,000 and National Savings Certificates a net figure of £16,350,000.

### Tax Certificates

It seems doubtful whether Sir John Anderson's decision to extend the period of effective surrender of tax reserve certificates from two to five years is much more

than the removal of an anomaly. It appears that hitherto the mere fact that certificates were surrendered in payment of tax falling due more than two years after the date of issue of the certificate meant that the holder lost the whole of the interest on the certificate and not merely the excess over two years. The certificates are only to earn interest for a maximum of two years and are only to rank for that period as capital employed in the business for purposes of EPT. Since the whole attraction of the certificates lies in the tax-free interest and the protection from EPT exactions, it would appear that the extension of what may be called the "tenderable life" to five years will offer no active inducement to taxpayers to take up a largely increased amount of the certificates. Since, however, companies which are already paying EPT will not be allowed to better their position by holding assets in any other form, it is, perhaps, not improbable that they will continue to regard a purchase as a convenient form of interest-free loan to the Government. However, they will, presumably, not buy up to the limit, since they will still hope for the disappearance of EPT at 100 per cent before the expiry of five years from now. None the less the Exchequer may be able to obtain a further proportion of future taxation some time in advance by this expedient. The net expansion in the amount outstanding during the two years to December 31, 1943, was some £630 million, which is a clear indication of the popularity of the certificates with companies and the surtax payers.

### Licensing of Agents

Thanks to excellent co-operation between the Board of Trade and the Stock Exchange Committee, it will be possible to dispense with a large proportion of the agents' licences required under the Prevention of Fraud (Investments) Act. The Committee has, in recent years, thoroughly "vetted" all applications for inclusion on its General Register of agents for sharing commission. Further, all applications come up for renewal yearly. The Stock Exchange is, therefore, prepared to give some sort of guarantee of the status of these agents, and the Board of Trade has decided that, subject to a further undertaking to be given in writing to the Committee, those on the General Register need take no action under the Act. The undertaking required is threefold: (1) that the business of dealing in securities is concerned only with transactions with members of bodies recognised under the Act, with a number of specified institutions, with an exempted dealer or the holder of a licence under the Act or with the manager or trustee of an authorised unit trust, or, as a principal, effecting transactions with those engaged in stock exchange business; (2) that the applicants do not hold themselves out as dealers in securities; and (3) that they are not concerned in the distribution of circulars relating to securities. A large proportion of those on the General Register will be able to give this undertaking. So far as these are concerned, a great deal of work will be saved and what remains will be done by the Stock Exchange. For the rest, a licence, or membership of a recognised body, will be required. This will, in practice, probably mean membership of the Association of Stock and Share Dealers. That institution had adopted the practice of halving its entrance fees to those on the Stock Exchange General Register, but it is understood that they have agreed to suspend this concession, which would seem undesirable, for the time being. Although the Bye-Laws of ASSD appear in general very well conceived, it seems probable that a number of minor points, mainly arising from the possibility of the control of members by other members, will call for discussion with the Stock Exchange Committee.

### Coal Dust Suppression

It is good to learn, from reports of a conference recently held in Cardiff, that satisfactory progress is being made with measures for dust suppression in the South Wales coalfield. Under a recent order, colliery undertakings can be instructed by the Ministry of Fuel to introduce into their seams methods of water infusion which reduce the coal-dust content. This method is still largely in the experimental stage. There is so far little evidence by which to judge its efficacy, and perhaps too little scientific and controlled assessment of the results of varying degrees of water infusion into the seams. But it marks an important

## EVERY LINK

In any manufacturing unit one weak link in the chain can cause drastic reduction in the efficiency of the whole. It is only by seeing clearly at every stage of the work that weaknesses can quickly be found and cured, and it is only by providing suitable and sufficient lighting that everyone can see clearly.

The fact that there already is lighting in a works makes it very easy to assume its adequacy through long familiarity, but if it is anything short of the minimum requirements for the class of work in hand it will have a continual effect on production. Inadequate lighting can cause the waste of expensive machinery, scarce materials and heavy wage bills.

The investment of good lighting in a works yields returns in the better utilisation of all other equipment and in the better working of operatives. Its absence can be the weak link in the whole chain of manufacture which can cause all kinds of worries for the management.

There is no substitute for good lighting, and its planning is a skilled matter for illuminating engineers. Benjamin have been specialists in this field for over a third of a century, and their engineers are at your service.

"WHAT! Another of  
those 'Zoning'  
advertisements?"

TO be in the fashion, we ought to say "Some of you can't get our splendid chocolate now. We are sorry for you! All this zoning, you know."

And we say phooey.

If we were still making our pre-war chocolates — Black Magic, Chocolate Crisp, Aero Milk Chocolate, Dairy Box, Smarties — there would be something in it.

But we're not.

We're making good chocolate, but so are other people. If you can't get Rowntree's, you can still get your ration of good chocolate.

"Good" was not quite our idea of what chocolate should be when we had a free choice of ingredients and all the skilled workers we needed. "Good" would not have satisfied us then. Nor would it have satisfied you.

Perhaps it doesn't now.

But there's nothing to be done about it till the war is won.

Then, when we are again free to set our own standard, we are going to set it higher even than before; for we're still learning. If then you couldn't get the things we shall be making, you might well think yourself hard done by. But for the present, we won't say we're sorry for you.

To be absolutely honest, we're more sorry for ourselves.

**ROWNTREES**

advance, not only from the point of view of miners' health, but as a means of conserving the industry's man-power. Many thousands of miners are hoping for release, as sufferers from pneumoconiosis (the broad term covering diseases contracted by inhalation of coal-dust), and out of 1,152 cases heard by the Silicosis Medical Board between July 1, 1943, and February 1, 1944, 693 certificates had been granted; over half were men in anthracite mines where the risks are greatest. In this matter, prevention and re-habilitation are complementary. It is useless to cure men, merely in order to send them back to the same disease-producing occupation; and it is useless to send men into the pits if they have potential lung trouble. The medical examination of new entrants (now compulsory) should include radiography, and all miners should undergo periodic X-ray examinations. The problem of re-employment is a national one—to discover industries, locally, which can provide suitable work for miners no longer fit to mine. "Light work" has always been the bane of Workmen's Compensation in an area where employment is mainly in heavy industry. As a first step, the Ministry of Labour might well draw up a list of jobs which can be performed by semi-fit miners, and collect information about ex-miners, sufferers from pneumoconiosis, now in other industries; their present state of health compared with when they left the mines; and the type of occupation which is suitable at the various stages of the disease. This information could form the basis for a planned scheme of the re-allocation of ex-miners to other occupations. Unless preventive measures advance more rapidly than the spread of the disease, the problem will take on increasing dimensions in the future.

#### South Africa and Free Gold

The South African authorities have recently become vocally aware of the problem of free gold markets. Their ruminations on the subject have been invariably interesting, not always coherent and certainly not consistent. Mr Hofmeyr, the Minister of Finance, speaking of South Africa's participation in the international currency schemes now under discussion, stressed that the Union's attitude would be guided by two considerations affecting its own interests. The first was the extent to which any White-Keynes compromise scheme (Mr Hofmeyr said that South Africa had not yet heard of one) would safeguard the position of gold. The second was the extent to which such a scheme would help in the restoration of international trade. Mr Stallard, South African Minister of Mines, speaking in the Senate on the same day as Mr Hofmeyr made his speech to the House of Assembly, was definitely antagonistic to the currency schemes, because

if bancor or unitas or any other arbitrary paper money is established after the war, we in South Africa will not sell our gold for any fixed quantity of this paper money.

What Mr Stallard wants is a free gold market, because

where there is a free market the price is very much greater than the fixed price.

If Mr Stallard had studied the Keynes and White plans he could hardly have dismissed them as "paper money" schemes providing some alternative to gold. But for some such plan, the prospect for gold in the future monetary set-up would be extremely dim. Mr Stallard might also ask himself what the free price of gold would be if the United States did not underpin the market by its readiness to buy at the fixed price of \$35 per ounce. He should also beware of converting the current rupee price for gold at the official rupee exchange rate. In so far as the abnormal rupee price is a reflection of inflation, it may involve a lower exchange value for the rupee after the war, and conversion into sterling and dollars might not in those circumstances give such a glittering answer.

It is evident, however, that South Africa insists on sharing some of the profits of the exceptional rise in the gold price in India and the Middle East. General Smuts declared this week that negotiations to this end had been opened with the British Government. His announcement contained some amusing contradictions. He spoke of the "black market" in gold, and of the concern which the authorities entertained about the abnormal prices quoted for the metal in India and elsewhere. He pledged support to "fighting" this black market, but also said that South Africa must share the profits being made in it—and must achieve both ends without selling directly to it. At present the South African Reserve Bank has first pick of the Union's current produc-

tion of gold, and the balance is automatically sold to the British Government at the official price of 168s. per ounce. It is this South African gold which the British authorities are using to make their sales in India at prices which have admittedly risen to the equivalent of over £16 per ounce. South Africa now wants to re-negotiate this war-time contract for the disposal of its gold, and to share in the special profits being made by these sales. It may be pertinent to recall that the proceeds of these gold sales go to cover Allied expenditure in the war against Japan, and thus avert a danger of which the Union was very much aware in the difficult days of 1942. The proceeds of these sales of gold are used to buy materials in India, the prices of which have risen even more sharply than the price of gold. The British Government can, therefore, hardly be accused of profiteering on its gold operations. It is difficult to know what to make of the South African pronouncements; the Kaffir market has reacted by a general marking-up of prices.

#### Bombay Bullion Prices

There has been a sharp reaction in the prices for silver and gold on the free Indian markets. In the second part of last week the Indian Reserve Bank ceased to sell gold at a rigidly held price, but declared itself prepared to sell 100,000 tolas, or 35,000 ounces, a day, and asked for bids for this metal. In this way the Reserve Bank's selling price became automatically adjusted to the market price. The market price, after touching a record of Rs. 80 12 annas on Wednesday of last week, began to decline on Thursday, when the change in the Reserve Bank's selling policy came into operation. By the close of the week the quotation had come back to Rs. 72 13 annas under the combined influence of a further reassuring statement on the military situation in Manipur State by General Auchinleck and of a stern warning addressed to bullion speculators by Mr C. E. Jones, the Finance Secretary. Mr Jones limited his remarks to safe generalities, saying that the Government of India would take "drastic measures to deal with the situation." In the prevailing circumstances, with many speculators able to take substantial profits on gold bought previously, these two statements had their effect. It should not be supposed, however, that mere threats of this kind can have any lasting influence on the situation. Given the continuance of monetary inflation in India and the inevitable limitation of the supplies of bullion used as anti-inflationary solvents, the underlying trend of bullion prices is likely to continue upward. By this week that trend had begun to reassert itself again. Silver prices have closely followed those of gold. From a high of Rs. 139 per 100 tolas the quotation fell to Rs. 132 at the end of the week, but has been rallying again this week. There has as yet been no report of official sales of silver, though it is widely reported in India that the Government, in addition to purchasing 16 million ounces from the National Bank of Iran has also made arrangements for importing silver from the United States.

#### Wheat Supplies

Since wheat will have to play a crucial part after the war in the relief of poverty-stricken and food-denuded areas, the size of the supplies likely to be available is of major importance. The latest survey of the wheat position, published by the Food Research Institute of Stanford University, California, shows that stocks at the end of the 1942-43 season in the four chief exporting countries—the United States, Canada, Australia and Argentina—were the highest on record; they were 1,694 million bushels, against 634 millions at the end of the 1938-39 season. But the survey also shows that the consumption of wheat in these countries has risen substantially in the current season, mainly as a result of its use for feeding and industrial purposes. In the United States, especially, domestic consumption in the first half of the current season about equalled the quantity normally used during a full year. In view of this rise in consumption, the Food Research Institute expects stocks in the four exporting countries to be substantially lower at the end of the current season than they were in the summer of 1943; nevertheless, at the estimated total of 1,160 million bushels, they would still be nearly double the stocks at the end of the last pre-war season. With average crops this year the four countries should therefore have available substantial quantities for export and relief. Russia's crop, apparently, was a short one last year and needs to be supplemented by

imports. Continental Europe, on the other hand, had the best wheat and rye crops of the war; it compensated, to some extent, for the reduction in the supply of other foods. This year's crops, both in Russia and Europe, cannot be estimated, but it is a safe guess that those, as well as other countries, will require heavy imports and that the surplus likely to be available in exporting countries will be badly needed.

#### Tungsten and Antimony

The Chinese Ministry of Information has published a survey of China's trade, which in one of its passages refers to tungsten and antimony. Before the war China was the world's largest source of supply of these two metals, which are of great importance in war and peace, the one as a steel alloying element—mainly for high speed steel—and the other as a hardener of non-ferrous metals, especially of lead. At times during the inter-war period China's contribution to the world's supplies of the two metals exceeded four-fifths; its more normal contribution was nearly one-half of the tungsten and slightly over one-half of the antimony. But as a result of China's export difficulties since 1937 and the almost complete stoppage of exports since the closing of the Burma Road in 1942, the production of the two metals has been appreciably increased in other countries. In tungsten, expansion appears to have been most marked in the United States, Bolivia, Argentina and certain other areas, including the Iberian Peninsula; in antimony, production has risen substantially in North and South America, chiefly in Mexico and Bolivia. The antimony supplies of the United Nations from extra-Chinese sources have, in fact, proved large enough to meet essential requirements throughout the critical stages of the war; as long ago as March, 1943, the United States War Production Board was able to relax restrictions on civilian consumption. In tungsten a similar stage has now been reached and, according to an official announcement, the WPB will reduce its purchases from both home and foreign sources from April 30th next, the one through the suspension of premium price payments and the other through the discontinuation of some of the special inducements to production and the scaling down of orders. Some, but by no means all, of the much increased war-time tungsten and antimony output of producing areas outside China has undoubtedly been secured at costs which, in normal times, would be uneconomic. China's position on the world markets for the two metals may therefore be considerably weaker than it has been in the past. This, no doubt, accounts for the suggestion by Dr C. Y. Wang, a leading Chinese authority on the two metals, quoted in the survey of China's trade, that "international agreements on output quotas be concluded, so that China may have a reasonable share in the world antimony and tungsten market." But the discovery and development of new and rich deposits outside China should be a permanent gain insofar as increased supplies at reasonable prices will encourage the consumption of the two useful raw materials after the war.

#### Films in Industry

As a result of its extensive and successful use of films by the Services and the supply departments as a means of instruction and propaganda, British industry has come to realise their value for education, for staff training in industrial research, and for propaganda at home and abroad. Wartime experience has shown that knowledge can be imparted speedily by a well-made film and that, for example, it can be used to take the public "on a tour" of a factory, giving, in 15 or 20 minutes, as vivid an impression of the processes of manufacture as a personal visit to the factory, which, in any case, is needs confined to a few. Moreover, such films can be shown in any office, showroom or canteen by the portable sound projectors now in use. The modern salesman who goes abroad will in future be able to take with him a few reels of film revealing—by picture, sound and suitable commentary in the language of the country concerned—much better than he can explain the firm he represents and the goods he wishes to sell. Nor is the cost of such films prohibitive; they can be made from £1,500 for a simple, straightforward single-reel film. It is reported that one large concern engaged in the production of instructional films is receiving so many orders—amounting almost to a scramble—for commercial films to be made after the war

(Continued on page 488)

## INDUSTRY MUST FACE THE FACTS ABOUT COAL

# The shortage is now **CRITICAL**

What is the root cause of this crisis, the greatest emergency that industry has had to face since Dunkirk? Simply that the war now nears its climax. The Services are calling for more and more transport, and the war effort for more and more coal.

There is no easy way out of this difficulty. The needs of the Services, for coal and transport, must be met, and both those needs cannot but grow with every passing day.

### WHAT YOU HAVE TO DO—NOW!

- ◆ Face the facts as we did after Dunkirk. Then the peril was plain to see. Now it is still concealed.
- ◆ Call on your workers for the effort necessary to keep up your present output *with the greatest possible cut in your use of every sort of fuel.* Gas, electricity, steam—they all come back to coal.
- ◆ Make it plain that the choice now facing you—and every other industrial or commercial management—is to

## Use less COAL or GO WITHOUT

- ◆ Finally, see to it—yes, for yourself!—that no coal wagon spends a moment longer in your place than it must.

COMPANY, LIMITED

## SATISFACTORY RESULTS

## REMARKABLE GROWTH DUE TO PRIVATE ENTERPRISE

## SIR GEORGE L. BARSTOW'S REVIEW

The ninety-fifth annual general meeting of the Prudential Assurance Company, Limited, was held, on the 30th ultimo, at 142, Holborn Bars, London, E.C.1, Sir George L. Barstow, K.C.B. (chairman of the company), presiding.

The Chairman said:

## ORDINARY BRANCH

In the ordinary branch the premiums were £15,861,761, an increase of £888,936 as compared with the preceding year. The net new sums assured, including group life and overseas business, exceeded £27,250,000. While the home new business shows a small decrease, the overseas new business at £10,750,000 shows an increase of over £2,000,000.

Of our annual premium income in the ordinary branch, over 10 per cent. arises from group business and over 15 per cent. from overseas business.

The surplus, including £280,885 brought forward from last year, is £2,584,133. The allocation of this amount is set out in the directors' report.

The directors have declared a bonus in respect of participating policies which become claims by death or maturity of endowment during 1944 at the rate of £1 per cent. for each December 31st on which such policies were in force subsequent to December 31, 1939.

## INDUSTRIAL BRANCH

In the industrial branch the premiums were £27,737,864 as compared with £26,275,143 for the previous year. The death claims were £8,453,549 and the claims by maturity of endowment were £8,019,639. The volume of cash surrenders has remained at the low level of the previous year, and it is hoped that the economic conditions prevailing in post-war years will be such as to ensure the present low rate of both lapse and surrenders being reduced still further.

The expenses of management for 1943, which include the cost of service at the homes of the people both as regards the collection of premiums and the payment of claims, amounted to 24.91 per cent. of the premiums, a decrease of .86 per cent.

Since the initiation of the profit-sharing scheme a sum of over £60 million has been allotted for provision of bonuses to the industrial branch policyholders. The claims paid in this branch last year included over £2,900,000 by way of bonus representing, on the average, an addition of more than 20 per cent. to the amount that would otherwise have been payable in respect of these claims.

The surplus in the industrial branch, including £340,940 brought forward from the previous year, is £4,960,485. The allocation of this sum is set out in the directors' report.

The directors have declared a bonus in respect of claims arising by death or maturity of endowment during 1944 at the rate of 16s. per £100 sum assured under participating policies issued by the Prudential for each December 31st on which the policy was in force subsequent to December 31, 1939, provided that at least one year's premiums have been paid when the claim arises.

## GENERAL BRANCH

In the general branch the premiums received were £2,879,726, an increase of £158,591.

An increased volume of fire and accident insurance was transacted by our branches and agencies overseas, and this section of our business has again been profitable.

It is perhaps not generally realised that underwriting profits derived from this source and interest earnings on the corresponding overseas assets together constitute part of this country's invisible exports. Although our own share in the total is not yet large, reliable estimates have placed the sum produced by British insurance as a whole at a figure comparable with the value of visible exports of any of the major industries. Moreover, in contrast to the export trade in general, it has contributed on an increasing scale to the national resources throughout the war. The desirability from the national point of view of maintaining, and if possible expanding, the invisible exports of insurance after the war is manifest.

The surplus in the general branch, including £185,971 brought forward from last year, is £315,186. Details of the disposal of this surplus are given in the directors' report.

## PRIVATE ENTERPRISE

This brief survey of the company's operations during 1943 reveals continued progress of which we have every reason to be proud. We have become so accustomed to remarkable figures that it is salutary to recall that our organisation began in a small way. Careful management and the initiative of private enterprise have been the factors mainly responsible for its growth.

Throughout all the fluctuations of national fortune, slump and boom, peace and war, the British insurance companies render substantial assistance in stabilising the national economy. This factor is exemplified in the replacement of losses incurred by individuals, the safeguarding of commerce, the steady employment figures within the industry and the regular flow of funds available for investment.

A product of private enterprise, insurance in this country operates within a framework of public control, exercised by the Board of Trade and, in the case of industrial assurance, also by the Industrial Assurance Commissioner responsible to the Treasury. Its operations are governed by Acts of Parliament, the guiding principle of which is a very considerable measure of freedom of action for the offices combined with the obligation that detailed statements concerning their affairs be periodically rendered to the Government. Normally these returns are published year by year and are available to the public. With this measure of control, which leaves room for healthy growth, we have no quarrel. We may ask ourselves, however, what purpose further control would have beyond mere restriction.

## SOCIAL INSURANCE

At our last annual meeting I referred to the Government's provisional decisions in regard to those changes in social insurance which directly affect our business. A White Paper dealing with the proposed comprehensive health service for the nation has recently been issued, and a further White Paper is expected very shortly dealing with other aspects of an extended social insurance scheme.

During last year the industrial life offices issued a booklet with the object of rectifying the many misunderstandings which exist and the mis-statements made on the

subject of industrial assurance. This booklet, while not an exhaustive study, deals, in a moderate compass and in non-technical language, with the more important aspects of the business and should be of assistance to anyone desiring to form a sound judgment on this subject.

## INVESTMENTS

As you will have observed from the report, our total assets now exceed £400 million, having increased during 1943 by nearly £16,000,000.

As might be inferred from references to our investment position in recent years, the channels available for the employment of our ever-growing funds continue to be limited almost completely to subscriptions to British Government issues, with the result that our holding of these securities now surpasses £173 million and represents more than 42 per cent. of our total assets. Included in this amount is the sum of £109 million, which up to the end of 1943 this company had subscribed to War Loans issued in this country since the outbreak of war. It has been our practice to support the various Savings Weeks which have been organised throughout the country, and we have made arrangements to continue this practice during 1944 in support of the "Salute the Soldier Campaign." We have also subscribed more than £3,200,000 to War Loans issued elsewhere within the Empire.

I must again draw your attention, however, to the adverse effect on the average rate of interest on the company's funds resulting from this growth in our holding of such low yielding investments. This effect is accentuated by the tendency, also previously mentioned and still continuing, for borrowers who are in a position to do so to convert high-yielding stocks to a lower rate of interest.

Whether the present level of capital values, attributable to the highly controlled financial economy which the war has made necessary, can continue after the war depends on factors which it is difficult to foresee. It may well be that when some of the restrictions at present in force are relaxed, a reaction to lower prices on the part of fixed interest bearing securities may follow. But as a large part of our investments consists of securities redeemable at definite future dates, variations in the intermediate market values are of little real significance, provided that the securities are intrinsically sound and do not have to be sold before maturity.

## FINE WORK OF THE STAFF

The record of the company's progress in 1943, which it has been my privilege to bring to your notice this afternoon, is the result of a very fine year's work on the part of all grades of the staff.

The claims of National Service are such that less than one-third of the pre-war staff now remains to carry on the company's business. I may add that at the present time no member of the home staff is employed solely in obtaining new business, although in pre-war years a considerable number were so engaged.

It says much for the inherent soundness of our organisation, for the energy and resourcefulness of the remaining members of the permanent staff, to whom I have just referred, and for the keenness and application of the large body of men and women who have assumed the duties of those temporarily absent from our ranks, that the prompt and efficient service which the public expect of us has been maintained.

Shareholders will have an opportunity on a subsequent resolution to express their appreciation of the services of the management and staff, but I cannot refrain, as I am speaking, from paying my own tribute to their invaluable work, both at home and overseas.

The report and accounts were unanimously adopted, and the formal business having been transacted, a vote of thanks to the chairman, directors and staff terminated the proceedings.

THE ECONOMIST

481

## THE BANK OF SCOTLAND

## STRONG LIQUID POSITION MAINTAINED

## POST-WAR RECONSTRUCTION AND REHABILITATION

## LORD ELPHINSTONE'S SPEECH

The annual general meeting of the proprietors of the Bank of Scotland was held within the Head Office, Edinburgh, on the 4th instant. The Rt. Honourable Lord Elphinstone, K.T. (governor of the bank), presided.

In submitting the directors' report the Chairman said: My Lord, Ladies and Gentlemen,—I assume that as usual we may hold as read the report by the court of directors of the affairs of the bank as at February 29th last, a copy of which you have all no doubt received.

At the outset I would like to refer to the honour of knighthood recently conferred by His Majesty the King upon our colleague Sir John Craig. This further recognition of Sir John's outstanding position in industry has given the utmost satisfaction to the members of the board, and I am sure the stockholders would wish to be associated with us in extending to him most cordial congratulations.

## THE BANK'S BALANCE SHEET

Compared with a year ago, our deposits show a moderate increase of £1,400,000 against an expansion of over £10 million during the previous year. As I explained a year ago, we had at that time the benefit of substantial credit balances on certain public accounts which are now with another bank in ordinary rotation. The average annual increase over the two years is therefore approximately £6,000,000.

In keeping with the general trend there has been a further large increase in our note circulation to a figure bordering on £9,000,000. Expanding wages bills and the increased requirements of Services personnel no doubt are the main reasons for this, but we would like to see the surplus notes in the hands of the public returned promptly to the banks and made available, as deposits, for Government loans in support of the war effort. It is particularly to be hoped that this may be done during the "Salute the Soldier" Campaign for War Savings.

## LIQUID ASSETS

It is very necessary that a strong liquid position should be maintained, and throughout the year, as always, we have observed orthodox principles with a substantial margin to spare. Assets in cash, bank balances, cheques in transit, money at call and short notice and bills discounted (including £350,000 of Treasury bills) amount to nearly £20 million, which is equivalent to fully 26 per cent. of our total liabilities to the public. Adding thereto our holding of £8,500,000 of Treasury deposit receipts and our investment portfolio of over £40 million, we have liquid resources of £69 million, equal to 90 per cent. of our public liabilities. Most of the wartime increase in our resources has been placed at the disposal of the Government in one form or another.

## ADVANCES

Our advances show a further decline of £589,000 at £7,840,000. This in no wise indicates unwillingness on our part to accommodate suitable borrowers. Actually our advances to customers in Scotland are considerably higher than they were a year ago, but this has been more than offset by the repayment of certain large loans in London. Accommodation is being given liberally, mainly for the production of war supplies and other essential purposes, but for ordinary trading the requirements of our customers are of course much below

normal. All known bad and doubtful debts have been fully provided for.

BANK'S PREMISES AND CHARITABLE  
PROPERTY

The figure at which the properties of the bank stand in our books is regarded as much under their actual value. Our properties have been maintained in good condition, and we have made suitable provision against the cost of post-war renovations and improvements.

## RESULTS FOR THE YEAR

|                                                     |          |
|-----------------------------------------------------|----------|
| The nett profits show an increase of £10,695 at ... | £248,819 |
| Add the balance carried forward from last year ...  | 157,342  |
|                                                     | £406,161 |

This has been dealt with as follows:

|                                                        |         |
|--------------------------------------------------------|---------|
| Applied to reserve for contingencies                   | £85,000 |
| Transferred to trustees for officers' pension fund ... | 30,000  |
| Dividend at 11 per cent. per annum, less tax...        | 132,000 |
|                                                        | 247,000 |

Leaving to be carried forward £159,161

## THE OUTLOOK

During recent months much has been said and written by leading authorities regarding post-war problems and plans for their solution, and with these exhaustive reviews before us it would not serve any useful purpose for me to attempt to traverse the ground again in detail. So far as the bank is concerned the figures I have given indicate, I think, very clearly that we are favourably placed to play our part in post-war reconstruction and rehabilitation, and I would like to emphasise, quite definitely, that we are anxious and willing to do so. Our roots as a bank go down deep into the history of Scotland—next year we shall reach our 250th anniversary—and to us the prosperity and development of Scotland are naturally matters of intimate concern and abiding interest. We fully recognise that the future of our country depends upon the state of world trade no less than upon the energy and enterprise of her business leaders and the diligence and industry of her people. We appreciate the good work which bodies such as the Scottish Council on Industry are doing in directing attention to the opportunities which the post-war years hold for the development of Scottish crafts and industries. Meantime we must concentrate our energies and employ all our resources in the immediate and imperative task which still lies before us, namely, the winning of the war.

## THE STAFF

Like all other businesses, we have had further calls upon us for the release of men and women for national service. The maintenance of an efficient banking service in these circumstances is fraught with difficulties, but we are pleased to say that our remaining staff, permanent and temporary, are responding admirably to the task. To them and to the executive, managers and agents, we offer this expression of appreciation and thanks. We

record with deep regret the death on active service of a further seven members of our staff, and to their bereaved relatives and friends we extend sincere sympathy. To all our staff, both men and women, who are on National Service, and especially to those who have the misfortune to be prisoners of war, we send greetings and sincere wishes for a speedy and a safe return.

## THE RESOLUTION

I now have pleasure in moving that the report and balance-sheet as submitted be adopted, and that a dividend for the past half-year at the rate of 12 per cent. per annum, less income-tax, be now declared, payable on 15th current, making with the dividend paid in October last 11 per cent. for the year, less income-tax, the same as for the previous year.

The motion was agreed to. The Lord Elphinstone, K.T., and the Lord Henry Scott were unanimously re-elected governor and deputy-governor respectively for the current year.

Sir Michael Nairn, Bart., D.L., and Sir John Craig, C.B.E., D.L., were re-elected ordinary directors.

Mr H. L. Usher, C.A., and Mr R. Arthur Morrison, C.A., were reappointed to conduct the audit of the bank's books for the current year, and a vote of thanks to the chairman terminated the meeting.

JOSEPH NATHAN AND  
COMPANY, LIMITED

## PENICILLIN PRODUCTION

The forty-fourth annual general meeting of Joseph Nathan and Company, Limited, was held on the 30th ultimo, in London.

Mr Alec Nathan (the chairman) presided.

The following is an extract from the chairman's statement circulated with the report and accounts:

The profit and loss account shows little change on last year; this must always be the case whilst E.P.T. is 100 per cent. and we are earning our standard profits. The net profit is £84,298 which, when added to the £27,650 brought forward from last year and after deducting the preference and preferred ordinary dividends, leaves £40,948 available for distribution—the sum of £20,000 having been allocated to general reserve, which now amounts to approximately two and a half times the ordinary capital. The directors have decided to recommend that the dividend on the ordinary stock shall be paid free of tax.

## DEMAND EXCEEDS SUPPLY

The Glaxo Laboratories have had a satisfactory year. More and more of the company's activities have been diverted to work of direct national urgency and importance through the increasing demands of Departments of State and of the Services for the production of non-proprietary food and pharmaceutical preparations. The public demand for the baby foods and the medical and pharmaceutical products of the company has far exceeded our capacity to supply under present conditions. The policy of "research and manufacture, all directed to the production and sale of products of undoubted utility," as mentioned in the chairman's speech in 1941, has been and is still being carried out.

The company can justly claim considerable satisfaction for the part they have played with the other members of the Therapeutic Research Corporation in the development and production of penicillin. Stockholders should not accept as correct statements made by unauthorized people, particularly in regard to a monopoly in its manufacture and production. Exactly the opposite prevails; there is complete exchange of resources, information and

## LONDON BRICK COMPANY, LIMITED

### EFFECTS OF ADVERSE CONDITIONS

### PREFABRICATED AND TRADITIONAL HOUSING

#### SIR MALCOLM STEWART'S REVIEW

The forty-fourth annual ordinary general meeting of the London Brick Company, Limited, was held, on the 30th ultimo, in London.

Sir P. Malcolm Stewart, Bt., O.B.E., Hon. LL.D., D.L., J.P. (chairman of the company), in the course of his speech, said:

The profit on trading is down by £27,963 after taking credit for the dividend from Clock House Brick Company, Limited, earned over the past two years. Nothing has been placed to general reserve, as against £25,000 in the previous year. Again, no provision has been made for depreciation.

The board recommend the payment of a dividend on the ordinary stock of 10 per cent.

#### PREFABRICATION PROBLEMS

Prefabrication has received much publicity. The Minister of Works, Lord Portal, has accepted this method of construction to meet an emergency in a transitional period. There has been some concern among those interested in the supply of materials for the construction of traditional housing lest the prefabricated house should displace the standard type of house we are accustomed to, or, at any rate, reduce the demand for such houses.

If the problem is looked at in the right light it should be realised that the Government's decision to embark on prefabricated housing is not inspired by any question of choice of type, but is due to the determination to provide as quickly as possible accommodation of a temporary character for those young people returning from the war and others dispossessed of their homes by blitz. In a word, the effort is to provide homes ready for occupation at the earliest moment and on the largest scale practicable. If the matter is thus envisaged it is clear that all concerned should place first this national need in an emergency.

You are doubtless forming the question in your mind, how will the priority and prestige given to prefabricated building under the aegis of the Government affect the manufacturers of building materials, particularly our company, as the largest brick makers in the world. The degree of detriment to the manufacturer of building materials will, in my opinion, depend considerably on the reaction of the professional services, the building operatives, the manufacturers of materials and particularly the numerous small building contractors.

#### A NEW COMPETITOR

We have to face a new competitor entering the field offering speed of assembly and possibly lower first costs, but whose production, however designed to please the eye and conveniently fitted up, will lack certain fundamental requirements and amenities. The prefabricated house gets a wonderful start while the traditional house gets away later from scratch. How can it win the race? By confirming to owners or tenants that brick houses are more comfortable and pleasant to live in. It is no good decrying prefabricated structures, it is up to us to produce progressively something better and get it accepted as such by the householder. I am not afraid of the issue; there are several helpful factors in our favour apart from the pleasing results which can be produced by building in brick when an experienced architect is employed.

The public like a brick house; it gives a sense of permanent security and of solidity not to be obtained from any temporary structure. Bricks have established themselves for domestic construction and have

stood the test of thousands of years. They will survive competition so long as they are best fitted to the purpose to which they are put.

The most pressing need is to reduce the cost of the traditional house. This must be accomplished to the maximum degree to make possible the granting by Government of reasonable subsidies, the finding of sound finance and the establishing of fair purchase price or rent. The most effective method of reducing the cost is to tackle first the heaviest items. Everyone who has had experience of house building on a modest scale will know that while the walls can be run up and the roof placed quickly there is an interminable delay in fitting up and decorating before occupation can be enjoyed. A variety of tradesmen have to fiddle about with fittings which never fit, and much time is wasted and costs increased. This is the common experience. I do not say this applies to those large-scale contractors who have practised standardisation.

#### NEED FOR CONTINUOUS PRODUCTION

Now, to overcome these difficulties it will be essential to apply prefabrication in respect of fittings to the greatest extent possible. Fittings can be much reduced in cost if mass produced and assembled on panels at the factory ready for delivery to and erection on site. But those who manufacture them must be assured in advance of bulk orders to permit of full and continuous production, always essential to low costs. Further, an adequate number of houses must be contracted for at a time by local or other authorities or parties. Lastly, and this is a prerequisite, the batches of houses to be built must be strictly dimensioned in respect of every part designed to receive the prefabricated fittings. Here lies opportunity for reducing the cost and building-time of traditional housing and of retaining all the comforts to which we are accustomed.

#### THE PUBLIC DEMAND

The employment of prefabrication as indicated need not prevent the use of variety of style or treatment of facade. We have it on the authority of the Prime Minister, himself a practised bricklayer and for a time a member of the Bricklayers' Trade Union, that the prefabricated houses to be built will be owned by the Government and that a limited life is allotted to them. They may be regarded today as temporary buildings, but I predict the time test of their survival will depend on the degree of satisfaction they give to their occupants and the opportunity of changing to something better. In this country we are, generally speaking, lamentably slow in providing for obsolescence. Let us recognise that a situation has arisen which calls for the building of prefabricated houses in an emergency and prepare to meet any threatened competition by reducing the cost to the utmost and improving the design and amenities of the traditional brick house. Thus can we give the public the homes I believe they really want and at a price they can afford to pay.

Further, let us not forget the Government over some ten years propose building three to four million houses as part of their permanent programme, and the trade unions are increasing the number of operatives to meet this demand which will require bricks in great quantities. We are already seriously at work on schemes of expansion to provide for the anticipated increased demand.

The report and accounts were unanimously adopted.

## UNITED GLASS BOTTLE MANUFACTURERS, LIMITED

### RESULTS OF PROGRESSIVE POLICY

#### SIR WALROND SINCLAIR'S REVIEW

The thirty-first ordinary general meeting of the United Glass Bottle Manufacturers, Limited, was held at the registered offices, 8, Leicester Street, W.C., on the 30th ultimo, Sir Walrond Sinclair, K.B.E. (the chairman), presiding.

The chairman said:—Ladies and gentlemen,

As indicated in the directors' report, the form of the accounts has been modified to bring them more into line with modern practice and in accordance with the recent recommendations of the Institute of Chartered Accountants. While certain of the main items are not directly comparable with those relating to the previous year, our substantial liquid resources are now shown more clearly, as are the reserves and current liabilities. I feel confident that the alteration will meet with your approval.

Trading profits of the six subsidiary companies which formed the original amalgamation in 1913 and operated thereafter under finance agreements, amounted to £348,474, after providing for depreciation, excess profits tax and other reserves. This shows little variation from the previous year. Interest and dividends at £61,692 received from our investments yielded about £4,000 more than in the preceding year.

#### DISTRIBUTION OF 12 PER CENT.

The net profit for the year, after charging debenture interest, income tax and sundry other items set out in the profit and loss account, amounted to £203,276 compared with £194,752 for 1942. You will observe that this year we have introduced an appropriation account, to which has been carried the net profit, together with the credit balance of £65,152 brought forward from the previous year, thus giving us an available surplus of £268,428 compared with £260,674 a year ago.

The dividend on the preference capital absorbed £45,051, and a dividend of 3½ per cent. was paid on the ordinary capital in September last, which took £19,548. The directors now recommend that £21,890 be transferred to debenture redemption reserve, £78,019 to general reserve, a final dividend of 6 per cent. together with a cash bonus of 2½ per cent. (making a total distribution on the ordinary capital of 12 per cent., less tax, for the year), which will absorb £47,473, and carry forward to the current year the credit balance of £56,447.

#### BALANCE SHEET STRENGTH

Turning to the balance sheet, you will observe that current assets have now been grouped, as have current liabilities and provisions. This illustrates very clearly the net liquid position. Current assets are shown to exceed current liabilities, including provision for the dividends set out in the report, by £986,000. The principal changes are noteworthy increases in the holding of Government securities, which appear at £224,983, in addition to £300,000 represented by tax reserve certificates. I might add that since the closing of the accounts a further investment of £100,000 has been effected in British Government securities. Cash and debtors are also higher, but stocks, stores, etc., show a reduction.

The substantial investment of £1,158,792, representing the cost of shares in subsidiary companies other than those referred to earlier in my address, contributed during the year under review the very satisfactory return of slightly over 4½ per cent., after allowing for excess profits tax and income tax.

Having regard to its intangible nature, our directors have decided, after very full consideration, that the item patent rights,

trade marks and goodwill, valued in the balance sheet a year ago at £178,019, should be written off entirely, and, as you will see, this has been done by a transfer of an equal amount from general reserve. I am sure shareholders will approve this decision, which further strengthens the balance sheet position. Despite the elimination of this nominal item, the total assets increased during the year from £4,707,012 to £4,840,217.

#### SUBSTANTIAL RESERVES

Turning to the liabilities' side of the accounts, you will observe that after deducting the amount of £178,019 to write off these patent rights, etc., and including the £78,019 transferred to general reserve out of the past year's profits, the reserves and undistributed profits remain at the substantial figure of £702,648.

The only item amongst current liabilities and provisions that appears to call for particular comment is that of trade creditors, which shows an increase of £170,825 over the previous year's figures. As I explained last year, owing to the regulations applicable to the use of timber, customers are called upon to make a cash deposit, which is in due course returnable, in respect of each case invoiced to them, and it is this practice which is mainly responsible for the increase in creditors. It is also to some extent reflected on the other side of the accounts in the amount of cash we hold, to which I have previously referred.

I think it can be justly claimed that the accounts now submitted are indicative of a progressive policy, particularly in regard to the earnings shown for the past year and the position disclosed by the balance sheet.

#### LARGER TURNOVER

The year under review brought no relief from the very considerable difficulties under which our business has been conducted, but notwithstanding these difficulties our volume turnover during 1943 was higher than in the preceding year, although, due to increased costs with no compensating increase of selling prices, the profit ratio was lower. Important economies have, however, been effected during the year and these have, to some considerable extent, offset the higher costs.

When hostilities cease and full disclosure can be made of the achievements in this industry during the period of the war, the record of this company will afford reason to be proud of your association with this enterprise. Meantime, we have the knowledge that we are contributing our quota to the national effort.

#### TRIBUTE TO OFFICIALS AND STAFF

As a corollary, this reflects the ability and energy of our joint managing directors, Mr. T. C. Moorshead and Mr. H. J. Judd, who, as stated in the directors' report, were appointed to their office last May, to Mr. S. S. Kenyon our worthy secretary co-opted to the board in November, the efficiency of the whole of the executive under them, and the loyalty and hard work of the staff and all our employees who have contributed to these results, and to whom my colleagues and I tender our very sincere thanks.

Finally, I would add that so far this year the volume turnover is being maintained, with costs showing a tendency to rise. Nevertheless, with due regard to war-time uncertainties and providing the general position does not deteriorate, we have reason to hope that we shall be able to submit another satisfactory account a year hence.

## SCOTTISH POWER COMPANY, LIMITED

### HYDRO ELECTRIC DEVELOPMENT

#### MR. WILLIAM SHEARER'S STATEMENT

The thirty-fourth ordinary general meeting of the Scottish Power Company, Limited, was held, on the 31st ultimo, in Edinburgh.

The Chairman, Mr. William Shearer, being indisposed, Mr. Ian C. A. Murray, vice-chairman, presided and read the speech prepared by Mr. Shearer, of which the following is a summary:—

You will recollect that last year I referred at length to the report of the Cooper Committee and to the introduction in Parliament of the Hydro-Electric Development (Scotland) Bill. The Bill became an Act on August 5, 1943, and the North of Scotland Hydro-Electric Board has since been established. The powers of the Central Electricity Board have been transferred under the Act to the new board, and it may be assumed that at no far distant date our hydro-electric stations will become selected stations.

#### SUPPLIES TO THE HIGHLANDS

I am glad to think that the benefits, actual and potential, of electricity supply to the Highlands of Scotland are being recognised in those quarters where previously the efforts of private enterprise to provide such supply were treated with disfavour. It is not without interest to reflect that when we were seeking powers for the development of hydro-electric resources, we suffered intense opposition, not only locally, but in Parliament on the ground that the intention behind our proposals was to utilise the Highlands as "the Power House of the South"—notwithstanding the fact that we had made adequate provision for all local requirements. An essential feature of the operations of the new board is the export of a substantial proportion of their output to the South.

Since I addressed you last year the question of the post-war position of the electricity supply industry has attracted increasing importance and publicity. We do not accept nationalisation nor so-called public ownership (either through the medium of regional boards or local authorities) as a solution, as we are convinced that private enterprise and the business management that accompanies it provide a highly efficient method of handling this important public service, particularly in areas outside the large centres of population.

The Report of the McGowan Committee contains logical and reasoned proposals which would establish the conditions necessary to speed up the efficient and economical development of supplies of electricity in the post-war period.

#### PROGRESS OF THE COMPANY

Let me now summarise very briefly the substantial progress we in this company have achieved:

We have secured a substantial reduction in the number of undertakings by the substitution of larger and more economic units and the elimination of duplicate powers where they exist in the same area.

We have established uniformity of forms of tariffs and have gone a long way towards complete uniformity of charges throughout our territories, which occupy over 40 per cent. of the total area of Scotland.

Except in isolated cases we have standardised voltages and systems of supply.

Diversity of load is a most important feature in the development of areas which to a substantial extent are rural in character. We have certainly not been unmindful of this aspect and have offered attractive rates for industrial development and concluded bulk supply contracts with local authority and company undertakers outside our group and immediately adjacent to our territories.

The report was adopted.

research in the production of penicillin among the five companies comprising the Therapeutic Research Corporation, I.C. (Pharmaceuticals), Limited, Kemball, Bishop and Co., and American producers. Stockholders—and the medical profession particularly—should note that the entire production for the present is reserved for the Forces.

The produce businesses, Geo. Bowles Nicholls & Company, Limited, Stewart, Limited, and Trengrouse & Nathan, Limited, have had a satisfactory year; each has had an increase of turnover and profit.

#### WORKS COUNCILS

During the year joint workers' and management committees, works councils, and efficiency bonus schemes have been instituted and are working in many of your businesses. They have given promise of yielding satisfactory results in the form of increased understanding by the workers of the problems of management and of their taking a more active and practical interest to increase efficiency and economy. With more experience, confidence and trust which will result with time, I am confident that materially beneficial results will be obtained by all parties—stockholders, labour and management.

The company owe thanks to the members of the staff both at home and abroad for their continued and persistent loyalty and self-sacrifice—particularly to the part-time workers at the Glaxo Laboratories and to members of the office staff of that company who, after office hours, have worked in the factory as packers. Without that splendid assistance the delivery of essential foodstuffs and medicines to the public and official bodies would have been considerably less. I am glad to have this opportunity of acknowledging, not only our thanks, but the debt of gratitude the public owe to these workers.

So long as this spirit of sacrifice, loyalty and determination for public good prevails, and provided the policy of the business is directed as ably in the future as it has been in the past, stockholders should, and I hope will, feel that the destiny of the company is in safe and prudent hands, which is the best surety for its satisfactory future progress.

The report and accounts were adopted.

## JAMES W. COOK AND COMPANY, LIMITED

The forty-seventh annual general meeting of James W. Cook and Company, Limited, was held, on 3rd instant, in London.

Mr W. J. Clarke (chairman and managing director) said that the result was better than the previous year. This had been assisted by the recovery of expenditure on damage repairs to property caused by enemy action, and was further due to the revival of work in the Port of London and to the strenuous efforts they were making to serve the various Ministries in every branch.

Their lighterage trade had been busy, and they sadly missed the use of the barges which had been taken from them by different Ministries for various good reasons. Their ships had continued on requisition for the whole year under review, and they had been entrusted with the management of other tankers, in common with others, by the Ministry of War Transport. Matters under discussion with regard to rates of hire and other points were still not concluded.

He would be failing in his duty if he did not say that he could give no promise for the future because of the violent fluctuations that occurred in traffic movements made in the national interest. All they could do was to keep alert and hold themselves ready to fulfil every demand made upon them.

The report was adopted, and a final dividend of 7½ per cent. and a bonus of 2½ per cent., making a total distribution of 12½ per cent. for the year, was declared.

## HADFIELDS LIMITED

## ALTERED CONDITIONS AFFECT OUTPUT

## MR P. B. BROWN ON THE OUTLOOK

The fifty-sixth ordinary general meeting of Hadfields, Limited, was held, on the 4th instant, at Sheffield.

Mr P. B. Brown, M.Inst.C.E., J.P. (chairman and managing director), presided and in the course of his speech said:

You will, no doubt, have observed from the report that your directors have elected Lord Dudley Gordon to the board of the company. In Lord Dudley Gordon we have one who is greatly esteemed by all coming into contact with him in business, scientific and Government circles. He has held with distinction important offices of president of the Federation of British Industries, president of the British Engineering Association, and vice-president of the Institution of Mechanical Engineers. Many changes have taken place in the nature of the work your company has been engaged upon since we last met. A considerable number of contracts have been curtailed or suspended. It is, however, satisfactory to have the assurance that these changes in programme are mainly due to the fact that ample stocks of many classes of munitions have already been accumulated. The altered conditions have, of course, had the effect of reducing our volume of output as compared with last year.

Some of the new classes of work upon which we are engaged call for the highest skill and technique. For instance, we are now producing large numbers of light and intricate alloy steel castings to be used in the construction of aircraft. These castings are subjected to the most stringent examination and testing before acceptance, and are proving to be more efficient and less costly than the parts that have hitherto been made as forgings. If those engineers who still retain doubts as to the reliability of steel castings could see what we are doing I am sure they would be enlightened.

I should like to congratulate our founders and metallurgists on their excellent work. It should be noted that much of this and other intricate work is now being done by women and semi-skilled men—all trained in our own works. You will, of course, realise that this training has called for a great deal of patience and perseverance on the part of our foremen and managers, and they well deserve our compliments and thanks.

## FINANCIAL POSITION

The financial position of your company at the end of 1943 is portrayed in the balance-sheet and profit and loss account. You will see that certain modifications have been made in the form of the balance-sheet. We have taken out certain provisions formerly included under the heading of "current liabilities" and placed them among the "reserves" accounts to which they properly belong. The provisions made towards works development and reorganisation being reserves created to meet future expenditure are, therefore, not strictly speaking current liabilities. As regards the pension schemes provisions, these represent the balance of the reserves created at the time of the initiation of the pension schemes, and as the current contributions are being charged against revenue, such reserves will not be required unless some exceptional circumstances arise during the next three years. A further change is the inclusion this year among the current liabilities of the provision for the payment of the final dividend recommended by the directors on the ordinary stock. These are the only alterations made in the form of the balance-sheet, and I hope they will have your approval.

Referring now to the figures, the fixed assets have decreased during the year by £76,158 represented by the difference between the charge for depreciation, plus

the obsolescence on plant, etc., scrapped, and the capital additions during the year. The current assets show a decrease of £525,607 compared with 1942, but, on the other hand, the current liabilities have been reduced by £635,268, resulting in an actual improvement in the excess of current assets over current liabilities during the year of £109,661. The total excess now amounts to £1,883,788, as against £1,774,127 in 1942. The net profit for the year is £9,585 less than that of 1942, which can be regarded as satisfactory, considering the production changes that have taken place during the year.

## CONSERVATION OF RESOURCES

I feel sure you will all agree that in order to be in a position to face with confidence the uncertainties and difficulties of the post-war years, the policy of building up and conserving the resources of the company is a wise one.

Day by day additional burdens are being placed on the shoulders of employers with their already depleted staffs. The much discussed "pay-as-you-earn" system for the deduction of tax from wages, which is now coming into operation, involves a considerable amount of extra work and some capital expenditure, but it is agreed by most of us that this is worth while if it removes the cause for annoyance and grievance under which our workers have been labouring for many months.

It may be remembered that in my address to you last year I drew attention to certain vital matters on which we were hoping to receive definite pronouncements by the Government. They referred to the manner in which it is thought the Treasury should make allowances from taxation on account of losses on stocks, deferred repairs, and the losses which must accompany the change-over from war to peace-time production. No decision has so far been announced, but it is hoped that the Chancellor of the Exchequer, in his forthcoming Budget, will take the opportunity of making equitable provisions to meet those contingencies, so that undertakings such as ours may be in a position to make their plans for the future with greater confidence.

## RECOVERY OF OVERSEA TRADE

Now that the war is approaching its climax many and various schemes of world reconstruction are being promulgated. The vital problem of how this country can recover and increase its pre-war overseas trade is one which will call for the collaboration of all classes of the community, traders, industrialists, bankers, merchants, indeed workers of every kind. The large number of trade union leaders who are in a position to influence the minds of millions of our workers we trust will rise to the occasion.

It is sincerely to be hoped that in the international agreements and in such Government controls as it may be found necessary to maintain, ample scope will be provided for the encouragement of private enterprise. It must not be forgotten that we are indebted to our inventors, pioneers, manufacturers, and merchants for the leading position this country has held in industrial matters for over a century.

## TRIBUTE TO MANAGEMENT AND STAFF

Before closing I wish to thank the members of our local board, managers, foremen, office staff, and workpeople for the invaluable help they have rendered and which has enabled us to present to you what I hope will be considered a satisfactory report of the year's working.

The report was adopted and a final dividend at the rate of 15 per cent., less tax, making 22½ per cent. for the year, was approved.

## ASSOCIATED ELECTRICAL INDUSTRIES, LIMITED

## RECORD RESULTS

The forty-fourth annual general meeting of Associated Electrical Industries, Limited, was held, on the 31st ultimo, in London.

Sir Felix J. C. Pole (the chairman) presided, and, in the course of his speech, said: I feel sure the proprietors will have noted with pleasure the strength of the balance-sheet, and particularly of the consolidated balance-sheet, now before you. The profit for the year was £695,266, that is after making full provision at current rates for all taxation payable in respect of the profits earned up to December 31, 1943. This compares with £686,527 for the previous year, an increase of £8,739. Your directors recommend a dividend on the ordinary stock of 10 per cent. per annum, less tax. If this recommendation is approved we should have paid a 10 per cent. dividend for eight consecutive years.

## STRONG FINANCIAL POSITION

A consolidated balance-sheet shows the position of the associated group of companies as a single unit, and I would again direct your attention to the strength of the group as demonstrated by the reserves and profit and loss accounts, which items have increased by £348,710 to £4,776,464, a total which represents 97 per cent. of our ordinary capital.

Circumstances still prevent me from giving any details of the company's activities, but I may tell you that we have again had a record year from the point of view of physical output and value of sales invoiced. All departments and sections of the organisation have made a major contribution to the demands of the war, and the research and engineering departments especially have been responsible for the discovery and improvement of specialised devices of great national—indeed international—value. The planning of manufacturing programmes to secure manufacturing efficiency and the various commercial and accounting problems have necessarily imposed a great strain upon the departments responsible for those sections of our business.

On former occasions I have told you that your company has always been most progressive in dealing with its employees. For the last 26 years we have had works, staff, and suggestions committees. The effect of this has been that, in spite of the great strain which the war has imposed on all our employees, another year has passed harmoniously without labour disputes arising. On our side we have maintained welfare, benevolent, and thrift organisations, and have done all we can to merit our wish to be regarded as good employers.

Since the outbreak of war 3,689 employees of the Metropolitan-Vickers Company have joined the Services. The loss of so many skilled and experienced manual and staff personnel, and their replacement by others, has been a difficult task.

## IMPORTANCE OF EXPORTS

On this occasion I do not propose to refer to post-war problems, beyond saying that they are receiving most careful attention. I should, however, like to make special reference to export business, which has been seriously curtailed by the war. In that connection I would like to endorse Lord Wardington's speech at the annual meeting of Lloyds Bank, when he said: "Of all the tasks before us none is more important than the re-establishment of our export trade. Without it we can neither eat nor work." We maintain a large and efficient organisation overseas, and when the time comes, as we hope it soon will come, we shall be ready to play our part in meeting the requirements of our valued customers outside this country.

The report was unanimously adopted.

## HALIFAX BUILDING SOCIETY

The ninety-first annual general meeting of this society was held, on the 3rd instant, in Halifax, Brig.-Gen. Sir Edward N. Whitley, K.C.B., C.M.G., D.S.O., D.L. (president of the society), presiding.

The Chairman, in the course of his speech, said: The total assets now amount to £129,229,049, which is the highest figure ever reached. Our reserve funds stand at the same figure as last year, £5,750,000, but the amount carried forward is increased by £105,853 to £631,751, bringing the total reserves and undivided profit to £6,381,751.

The balance carried down to the appropriation account this year is £2,418,597, as compared with £2,416,878 last year. Out of this sum we have paid or credited £1,919,360 in interest to the holders of shares; we have allocated £300,000 to war damage contribution indemnities; and we ask for your confirmation to-day of the proposed payment of a bonus of 5s. per £100 to monthly subscription investors and to holders of paid-up shares, Class 1, free of income tax to the members.

## PROVISION FOR LIABILITIES UNDER WAR DAMAGE ACTS

In respect of the society's liabilities under the War Damage Acts, it seems to your directors prudent to provide out of the profits of this year for the whole of the remaining balance, and we believe that the sum of £300,000 will enable us to discharge our present liability and we trust we shall not need to make any provision of this kind in future. Under the War Damage Acts compensation will be paid in the case of a totally demolished house by a "value payment" based on the value of the house at March, 1939, but if the house is capable of restoration and should be restored, a "cost of works payment" will be made. The Acts provide that in the case of "value payments" interest will be paid at the rate of 2½ per cent. per annum, while in the case of a "cost of works payment" no interest will be paid.

We have decided that, until further notice, we will accept the Government rate of 2½ per cent. on the mortgage in place of the rate stated in the mortgage deed in cases in which the member's property is totally destroyed and is not restored, from the date of the destruction till the "value payment" is received or, in the case of a house qualifying for a "cost of works payment" and rendered uninhabitable for more than six months, for so long as it is uninhabitable. We have had many letters from our borrowing members expressing their great appreciation of this concession.

## REDUCTION IN INTEREST RATE ON LOANS

One other important decision which the directors have recently made has been to reduce to 4½ per cent. the rate of interest to be charged on loans on residential property.

I regret that there is no decision yet with regard to the part that is to be played by private enterprise in post-war housing. I realise that it is necessary for some local authorities to build houses, but the private builder has had a very difficult time during the war, and with his knowledge and experience should have every encouragement and a full share of the priorities for labour and materials.

Turning to the future, it is impossible to say whether the war in Europe will end during the current year or not, but this is certain: that our society is in an extremely strong liquid position. Our organisation is in good working order in spite of the large numbers of our staff who have joined the Forces or who have been called up for work of national importance. We can, therefore, look with confidence to any call which will be made upon us, whether in connection with financing of the building of houses for letting or for owner occupation, and nothing would please us better than that that service should be required at a very early date.

## THE BRITISH ALUMINIUM COMPANY, LIMITED

## SATISFACTORY RESULTS

## MR R. W. COOPER'S STATEMENT

At the annual meeting of this company, held on March 31st, the chairman, Mr R. W. Cooper, moved the adoption of the report and accounts. The following are the main features of his statement:

The total profit for the year 1943 amounts to £1,068,937, compared to £1,051,119 for 1942, being an increase of £17,818.

## THE DIVIDEND

In order to save space and some repetition, we have embodied the profit and loss account in the directors' report, and have shown therein the appropriations, including the final dividend on the ordinary stock of 7 per cent., which we recommend, making with the interim already paid 10 per cent. for the year. We have also on this occasion shown the dividends on the preference and ordinary stocks, less tax, the latter having been added to the provision for income-tax. The balance of profit to be carried forward has been increased by £22,687 to £274,684.

Some modification in the grouping of the items on the liabilities side of the balance-sheet has been given effect to, and we provide for the second half-year's dividend on the preference stock and the recommended final dividend on the ordinary stock, both of which are in fact not payable until April 1st of this year.

Debtenture stock outstanding is reduced by sinking fund to £3,312,318.

## BALANCE SHEET ITEMS

As you will observe from the balance-sheet, we have grouped the reserves and undivided profits. We have allocated the same total of £200,000, as in the previous year, to the reserve and depreciation reserve accounts, but this year we have increased the proportion to the latter on account of the heavy duty to which our plant and machinery is subjected under existing conditions. The division is £125,000 to the reserve account, raising it to £3,325,000, and £75,000 to the depreciation reserve account, bringing it up to £1,675,000. The debtenture stock redemption account now stands at £187,682, and with the balance at the credit of profit and loss account these four items amount to £5,462,366.

The creditors, including taxation and other reserves, at £3,848,528 show an increase of £203,816. We have provided in advance for income-tax on the year's profits, and have added tax on the dividends previously shown gross and now shown net, as I have mentioned.

The total investment in subsidiary companies now stands at £6,387,976, and in allied companies at £1,514,453.

Government and other securities have been decreased by £90,000 to £331,011, but on the other hand our holding of tax reserve certificates has increased by £100,000 to £500,000.

Stocks have increased by £399,363 to £1,209,095 and debtors by £29,735 to £1,483,135, whilst cash has decreased by £238,443 to £1,194,818.

## FURTHER EXPANSION

All the works of the company have operated to full capacity and further extensions became productive during the year. The programme of expansion in the national interest has not yet been completed and work of considerable magnitude is still proceeding.

The statement concluded with an appreciation of the efforts of the staff to maintain maximum output.

## VICKERS LIMITED

## MR A. A. JAMIESON'S STATEMENT

The seventy-seventh annual general meeting of Vickers, Limited, was held, on the 4th instant, at Vickers House, Broadway, Westminster, and Mr A. A. Jamieson (chairman of the company) presided.

In his statement, which was again circulated to the stockholders with the report and accounts, the chairman said:

Colonel J. B. Neilson asked to be relieved of his position as deputy-chairman at the end of 1943 owing to the urgent call upon his time arising from his acceptance of the office of managing director of Baldwins, Limited. I am glad to say that he is remaining on your board, and he will continue to act as chairman of the Metropolitan-Cammell Carriage and Wagon Company. Sir Charles Craven has been elected deputy-chairman of Vickers, and will continue to act as chairman of Vickers-Armstrongs and of English Steel Corporation.

There is one item in the balance-sheet of Vickers-Armstrongs which calls for special explanation. Certain foreign assets of that company were realised during the year, with the result that the remaining foreign holdings now stand at a nominal figure. With this exception, the balance-sheet figures are of a normal wartime character, but they reflect practically maximum use of our productive capacity. There has been some change in the nature of the output, with the result that employment has actually decreased in some works, but the total numbers employed have been more than maintained. The percentage of women employed throughout the group is 36 and the highest percentage in any works is 55.

The Minister of Reconstruction has expressed the desire that industrial concerns should turn their thoughts towards the problem of post-war employment for their employees. This company is faced by a difficult problem which will call for the closest collaboration between the management and our employees, particularly in the change-over period. The problem is difficult because of the highly specialised knowledge and experience of many of our people; but surely, after the tragic experiences resulting from unilateral disarmament, there can be no repetition of this policy, and it will be essential that the strength and technical efficiency of a group such as yours, with its great value to the country in times of emergency, should be maintained. I believe that orders will continue to be placed with us by the Defence Departments; but, nevertheless, commercial shipbuilding, engineering, steel and civil aviation must absorb a considerable portion of our available capacity. This time we have the experience of 1919 to guide us, and in certain products, particularly those of a heavy nature, we had, before the war, established a very sound position and become recognised as leading producers. When peace returns we should, therefore, be better equipped to deal with the problems of change-over than we were in 1919. Certain of our post-war plans have been made, and others are under active consideration; but until victory is achieved our primary concern must be to do everything in our power to assist in achieving that victory at the earliest possible date.

We have entered upon another strenuous year, and I would remind stockholders that many of our employees have now been working long hours with little rest or holiday for seven or eight years. Like others who have passed through strenuous times, and have made a notable contribution first to national survival and then towards victory, our employees appreciate recognition of their services, and this, I know, is given in full measure both by stockholders and by those who are in a position to judge.

The report and accounts were unanimously adopted and the final dividend of 6 per cent. approved.

# RECORDS and STATISTICS

## GOVERNMENT RETURNS

For the 13 days ended Mar. 31, 1944, total ordinary revenue was £128,000,000, against ordinary expenditure of £210,719,000, and issues to sinking funds of £484,942. Thus, including sinking fund allocations of £15,446,087, the deficit accrued since April 1st is £2,765,319,000 against £2,817,688,000 for the corresponding period a year ago.

## ORDINARY AND SELF-BALANCING REVENUE AND EXPENDITURE

| Revenue                           | Estimate 1943-44 | Receipts into the Exchequer (£ thousands) |                          |                             |                             |

A change has been made in the method of showing an excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £287,012 to £2,492,934, the other operations for the period (no longer shown separately) raised the gross National Debt by £80,631,263 to £19,590 millions after allowing for £15 million for sinking funds.

(Continued from page 479)

that it will have to introduce a system of priority. Inquiries come from many different industries, such as textiles, steel, plastics, electricity, agricultural implements, aircraft, motor cars, pottery and flower nurseries. The sudden realisation of the possibilities of the film is a welcome reflection of the willingness of industry to adopt new methods, of the more progressive outlook that is essential if Britain is to remain in the vanguard of industrial nations. It will also give a useful fillip to the film industry.

### Shorter Notes

During the four weeks ended March 18, 1944, the average weekly output of coal was 3,637,800 tons, against 3,769,000 tons in the preceding four weeks and 4,013,700 tons in the corresponding period of 1943. Transport and other difficulties contributed to the loss of output, but last month the weekly loss of tonnage due to stoppages was 188,000 tons, or more than twice the loss for this cause in the previous period. The only district to qualify for the output bonus was Leicestershire. South Wales' percentage of standard tonnage was only 64.0 per cent. Production from opencast working averaged 108,300 tons a week. As a result of the fall in production the Ministry of Fuel and Power has had to impose further cuts on industrial users, amounting to 10 per cent for electricity and 25 per cent for gas.

A flat rate increase of 4s. a week to all adult male workers has been awarded by the National Arbitration Tribunals in

the case of the shipbuilding and engineering unions' claim for a substantial advance in wages.

The following table summarises the Exchequer returns for the financial year, and shows the respective shares of revenue and borrowing in meeting expenditure. It will be noted that the difference, amounting to nearly £2,773 million, between ordinary revenue on the one hand, and total expenditure (including sinking funds and debt repayments) on the other, was met as to £836 million by borrowing from the money market (i.e., by additions to the floating debt), compared with £785 million in 1942-43; £363 million by small savings (3 per cent defence bonds and national savings certificates), compared with £318 million; £1,559 million by other borrowing, compared with £1,705 million; and £15 million by miscellaneous receipts.

SUBSCRIBED CAPITAL ... £4,000,000

PAID-UP CAPITAL ... £2,000,000

RESERVE FUND ... £2,200,000

The Bank conducts every description of Eastern Banking business. Trusteeships and Executorships also undertaken.

## THE CUNARD STEAM SHIP COMPANY, LIMITED

NOTICE IS HEREBY GIVEN that the TRANSFER BOOKS for ORDINARY STOCK and PREFERENCE STOCKS will be closed from the 12th April until the 25th April, 1944, both days inclusive.

By Order of the Board.

H. J. FLEWITT, Secretary.

Offices: Cunard Building, Liverpool.  
5th April, 1944.

## The Governor

THERE is a large element of personal misfortune in Mr. Montagu Norman's decision to withdraw his name from the election to the Governorship of the Bank of England that is to take place next week. Had Mr. Norman been re-elected, as was the intention until the last few days, he would not only have served his own twenty-fifth year as Governor, but he would have been in office on the 250th anniversary of the Bank's foundation and the 100th anniversary of the Bank Charter Act. That the longest and most influential Governorship in the Bank's history—from its internal point of view incomparably the greatest Governorship it has ever known—should be brought to an end by illness on the verge of such a coincidence of anniversaries as this is lamentable. The decision was Mr. Norman's own, on the advice of his doctors. There is no question that his colleagues would have been happy to re-elect him for another year. But the Governor (as for these last few days he may still be called) has often shown that he is no sentimentalist, and his departure will grieve the Company of the Bank of England more than it will disappoint himself.

There can hardly be any public figure of our times on whose career it is more difficult to express a single opinion. Mr. Norman is an unusual and many-sided character, and the judgment to be expressed will vary with

the angle of view. Foremost of all, he is a great personality. He has the secret, very rare in this or any other age, of combining a presence that imposes his authority on all around him with the utmost personal simplicity. He has what is usually called an old-world courtesy, and an entirely new-world impishness. No head of a great institution is more democratic in his habits or more autocratic in his policies. He has been the leading banker of his age, yet when in these last few days he was described as a poetic figure, those who know him felt that it was the *mot juste*.

It is, however, as a banker, not as a poet, that he must be judged. His quarter century of office has built up the Bank to a position it has never occupied before. The parallel with the physical reconstruction of its building is hackneyed but exact—the outer shell remains, but inside all is different. The Bank used to be an almost republican institution—a Venetian oligarchy of the best City families, with a Doge who was never left in office long enough to be more than a presiding official. Sovereignty then lay with the Court, and particularly with its Committee of Treasury—and that means that it was shared among the great merchant banking houses. After a quarter century of Mr. Norman's Governorship, all that is changed. The Bank is now a monarchy—or

perhaps a plebiscitary dictatorship would be the closer analogy, and Lord Catto would be the first to agree with the remark that the Bank now faces the familiar dilemma of what to do when the dictator departs. To an extent that previous generations would not have believed possible, Mr Norman has made himself the autocrat of the City. The perspective is too short to permit of a final opinion on the advantages or defects of this. It is equally difficult to say whether Mr Norman's pre-eminence has been due to a falling-off in the flow of outstanding talent to the great houses of the City or, as some would allege, to an impatience of rivalry which has tended to exile the more promising figures. But if one thing is reasonably clear, it is that the current judgments of his regime are strangely reversed. Mr Norman has never been popular with the Left (perhaps because articulateness is not among his virtues), while he is something of a hero to the Right. Yet the extent of central control that he has established over the financial mechanism of the country should have endeared him to those who believe in the conscious management of economic affairs; and those who hold to the doctrine that the business-man should be allowed to pursue his business, subject only to his own assessment of the risks, ought to see in Mr Norman one of the chief agents of the enemy. Whatever the final verdict is on this aspect of the Governor's regime, it is unlikely to be that which is fashionable to-day. Indeed, the future may say that he was the man who nationalised the City. There is, however, one ultimate test to which any banker's reputation can be submitted—has he retained the confidence of his customers? No other country in the world has passed through the storms and stresses of this last quarter-century without even a ripple of disturbance to the confidence of the public in the solvency and soundness of the banking system. The magnitude of this achievement is less apparent to us who have lived in financial security than to those who have suffered from distrust and disturbance. But the credit for it is very great, and the largest share should properly go to the presiding personality.

For all previous Governors of the Bank of England, this would be an end of the matter, for the preservation of financial soundness was the end of their duties. Mr Norman has had much wider functions thrust upon him; he has had to play the part of an economic statesman both in international finance and in industrial policy at home. His international policies have been much criticised, and it would be impossible to deny that there have been many mistakes. The two largest were the precipitate return not only to the full gold standard but to the old gold parity of the pound sterling, and the great assistance that was given to the rehabilitation of Germany. But the intentions, in both cases, were of the best, and there was not very much opposition to either policy until after it had been proved to be in error. And if the gold standard is to be held as a reproach against Mr Norman, he ought in fairness to be given full credit for the completeness of his conversion when once the mistake was proved. To-day the fundamental issues that underlay the gold standard controversy are once again under discussion, and the Bank of England is foremost among those whose voices are lifted in warning against premature commitments to rigid systems.

The case is similar with Mr Norman's German policy. It is easy to criticise now, in the light of events. But when the policy was initiated, it was not only universally acclaimed, it was also the right policy. The only tenable line of criticism is not that Mr Norman started on the road of rebuilding the financial structure of Europe, but that he did not withdraw from it, and reverse his policy, with sufficient promptness after Hitler's arrival on the scene. It is a valid criticism—but, in one form or another, it hits every section of opinion in the land. The Governor's international policies have unquestionably been unlucky, but before the judgment is passed that they were more than unlucky, it would be as well to wait and see whether the same problems are handled with any more success after this war.

It is in the field of domestic industrial policy that the

severest condemnation of Mr Norman's regime can be expressed. Here it was not a question of a generally approved policy striking a reef that was hidden when the course was set, but of a deliberate point of view being enforced in the face of repeated warnings. The Bank of England's great influence, overt and covert, has consistently been thrown on the side of the so-called, and misnamed, "self-government of industry." Under Bank leadership, one industry after another has been encouraged to organise itself in a tight association, to fix its prices, to protect its high-cost members, to scrap its "redundant" plant. The Bank of England has been one of the chief buttresses of the New Feudalism which has, of late years, usurped the place of economic policy. If the verdict of the future on Mr Norman's international policies is more favourable than the present day would pass, it is likely that economic historians in the future will say that his industrial policy did far more harm than his contemporaries realised. The all too general belief of the British industrialist that his profits should be protected by restriction rather than that they should be earned by efficiency and enterprise would never have taken so firm a hold if it had not seemed to be encouraged from on high.

For twenty years, the methods by which the next Governor of the Bank of England should be nominated have been eagerly canvassed. Yet nothing has been made known of the way in which Lord Catto's name was chosen. There are some unusual features in the appointment: Lord Catto is not at present a member of the Court, and has never been a member of its innermost circle, the Committee of Treasury. These facts, together with the circumstance that for the past four years he has been serving as adviser to the Chancellor of the Exchequer, might seem to suggest a Government nomination. But it would be very rash to leap to that conclusion, for there is certainly no one among the elder statesmen of the City who would be more acceptable to the Court than Lord Catto. The question of the succession has been fully discussed in recent years, and it has always been understood that Lord Catto was the candidate favoured by the Committee of Treasury and approved by their colleagues on the Court. It is probable that, on this occasion, the initiative came from the Bank, though with foreknowledge that the nomination would be acceptable to the Treasury. The question of who does the choosing when the Court and the Treasury have no joint candidate is thus as unresolved as ever.

It is no light thing to follow Mr Norman, and a certain sympathy will be mixed with the congratulations to Lord Catto. But, in the circumstances in which the vacancy occurred, it is an excellent choice. Lord Catto is enough of a banker to inspire confidence in the City, but enough of a merchant and industrialist to inspire confidence elsewhere, and he has had enough experience in the Treasury to understand the delicate nature of the relationships between Threadneedle Street and Whitehall.

It is no disrespect to the new Governor to say that his tenure of office is likely to be short. Lord Catto is 65, and his great service will be to keep the Bank in safe and strong hands while the guiding lines of its policy and position in the post-war world are being laid down. It is perhaps an advantage that the problem of filling the Governorship of the Bank should thus be kept not far from the forefront of public attention. After the war, a new start will have to be made in international finance, and an even newer start in domestic finance, for there it is not a question of merely doing more successfully what was unsuccessful before, but of working out a whole new set of principles and techniques for the rôle that finance will have to play now that the Age of Finance is dead. What is required is not a financial technician but an economic statesman—and, moreover, an economic statesman who has a clear view of the road he wants to travel. He must, almost necessarily, be a young man, or at least not wedded to orthodoxies which may be of little relevance to the problems of the next few decades. There are very few posts in the country to the filling of which so much careful thought should be given.

## Freedom for France

WITHIN a few weeks, British and American troops will be landing in France to play their part in the country's liberation. They will be launched on an enterprise that will affect profoundly the future of the French people and of their relations with Great Britain and the United States. It is not necessary to underline the importance of the decisions and policies which are to guide their intervention, and it would be reassuring to know that Frenchmen between themselves and the Allies between each other had reached agreement on the course their collaboration is to take. Unhappily the evidence is all the other way. The divisions between General de Gaulle and General Giraud have flared up again at this eleventh hour; and it is difficult to believe that much progress has been made in determining the Allies' joint policy, since it remained in doubt until barely a week ago whether the Americans would negotiate with the French Committee of National Liberation at all.

The time is desperately short, yet the right decisions must be reached. The invasion of Italy has shown that an invasion followed by protracted land fighting must worsen a country's economic position. All France is short of food, and in some areas, even on Vichy's showing, the shortage is near to real famine. Invasion, fighting, the dislocation of transport will for a time make all this worse. The Allies cannot avoid it. But the example of Italy has also shown that there are a number of things they can avoid.

Reports of the fixing of the French exchange rate at 300 francs to the pound have been officially scouted. Even the 200 rate in North Africa caused difficulty enough. If on top of an inflated rate, American and British soldiers were to enter France in possession of spare money and to engage, as they did in Italy, in spite of all efforts to the contrary, in a local competition to corner supplies and send prices rocketing up, then the arrival of the liberating army would be the signal not only for unavoidable evils but for a gross and perfectly avoidable attack on the living standards of France, which in all conscience are pitiful enough. It is imperative that the liberating troops should not appear to the French as worse despoilers than the Germans. In concerting their economic plans, the Allies should agree on a reasonable exchange rate, on a very reduced rate of pay to soldiers—more deferred credits could be introduced—on strict rationing and price control in each zone as it is liberated, and, as soon as shipping and transport are available, on an immediate despatch to France of goods to meet some of the people's basic civilian needs.

In the political sphere, there is little to be learnt from Italy, because there is no parallel between the two coun-

tries. Italy is enemy territory; any government there—democratic or dictatorial—must be under the authority of the occupying Powers until the final peace is arranged. But France is an Ally. There can be no political control by the occupying forces apart from immediate authority in the actual fighting zones. To suggest any other course than the transfer of full civil authority to Frenchmen would be fiercely resented by the French people who, after four years of slavery and forced co-operation, probably feel more strongly on the matter of sovereignty than any other European nation. Nor have the British and the American governments any other aim than to restore full sovereignty to the people of France. The civil administration behind the fighting lines can only be the responsibility of the French.

The difficulty lies in the fact that while the National Committee is the only possible claimant of authority possessing the support of most Frenchmen and sufficiently organised to give it the technical competence for the task, the British and the Americans feel some hesitation in accepting the claims of the Committee and some apprehension about the results. Some of these hesitations can be dismissed as unfounded and unworthy. There is nothing to gain and everything to lose—politically as well as militarily—by any toying with the idea of an understanding with Vichy or another deal on the Darlan model. Ever since President Roosevelt suggested that the Commander-in-Chief should use his discretion in deciding with which civilian authority he would deal after the invasion, rumours of a "deal" have been abroad. Mr Cordell Hull has fortunately put a stop to them by giving *de facto* recognition to the National Committee's claim to control the civil administration.

Not all the hesitations about the National Committee come from the supporters of Vichy or the anti-democrats. An entirely different and very serious difficulty springs from some of the actions of the Algiers Administration itself. Many sincere friends of France, who look on the restoration of full sovereignty to the French people as a solemn trust, wonder whether in giving unequivocal support to the claims of the National Committee they are not helping to forge new chains for the unhappy French. Many people fear the personal ambitions of General de Gaulle and they are the opposite of reassured when Frenchmen interpret their fears as an insult to France. This is the very atmosphere of the leadership *mystique*. Recent events have not done much to lessen these apprehensions. Political censorship has grown stricter in Algiers and political control has been extended to the French news agencies. The newspaper *Combat*, mouthpiece of the most enthusiastic personal

supporters of General de Gaulle, has published an ominous attack on what it is pleased to call "dissidents"—Frenchmen who, although opposed to Vichy from the first hour, have never given personal allegiance to the General, among them such distinguished Frenchmen as the editors and staff of *France*, of *France Libre*, and of the *Agence Indépendante Française* (now in abeyance since its members would not accept the political control of Algiers), and many of the regular French broadcasters at the BBC. Of these men, *Combat* makes the astonishing statement that they are worse traitors than "repentant Vichyites." Can this mean anything but that fidelity to General de Gaulle is to be the hallmark of patriotism, not fidelity to France?

These disturbing events might be dismissed as irresponsible ebullience in the "lunatic fringe" at Algiers. It is much more difficult to interpret the actions of General de Gaulle himself. There may have been a good military reason for abolishing the post of Commander-in-Chief at this point. The French army will not fight as a single whole, and different generals will lead their units in different sectors under the overriding authority of General Eisenhower. But this military reason does not explain why General de Gaulle chose this moment to have himself made "Chief of the Armies," to put in one of his warmest personal supporters as civilian Minister for War, and to carry through the move without consulting either General Giraud or the Assembly. He has achieved a concentration of military and civil power which good French Republicans have always looked on as politically dangerous, and he has done so regardless of the fact that he used the desirability of separating military and civil power as his excuse for excluding General Giraud from the National Committee last November. In these circumstances it is not surprising that many people interpret his move as an attempt to exploit the Second Front emergency in order to secure a supreme concentration of power in his own person.

If these fears are justified, does it follow that the British and American Governments are right in withholding full recognition of the Algiers Committee? Is the best course to adopt the line proposed by Mr Cordell Hull—a *de facto* recognition of the National Committee's authority with the proviso that it must be exercised under the control or supervision of the Commander-in-Chief? On the face of it, it may seem that this is the best compromise. Yet it is really an impossible one. Any intervention by the British and Americans in the conduct of civilian affairs in France after the invasion will be used not to moderate but to justify any personal ambition to power which General de Gaulle may have. Nothing could better justify a concentration of power, a state of siege, a continued emergency, than the charge

that France's allies were trying to limit the sovereignty of the French people. Thus, by an apparent paradox, the surest way for the British and American Governments to control what they fear may be General de Gaulle's dangerous ambitions is to give the Committee full recognition as a provisional government and to hand over to it the civil administration of France without reservations save that the Assembly be consulted in all matters of policy. Responsibility will then be squarely fixed. There can be no resorting to criticism of Allied interference to cover doubtful political manoeuvres. The record of the Committee will have to speak for itself without a shadow cast by extraneous authority. French public opinion will know with whom it has to deal, and the future of French democracy will lie in the only place where it can lie—in the hands of the French people themselves.

The British and American Governments can impose conditions in the military zones. They can choose, up to a point, the French officers who will work with them. They can also in any zone dissociate themselves from actions—for example, the banning of political activity, the indiscriminate rounding up of suspects, political censorship—which the French civil authorities may introduce. But direct intervention will have the worst, not the best, results. In this matter confidence must be placed in the people of France. For four years they have lived under the worst conditions of political servitude. When liberation comes, can it be imagined that they will willingly exchange one servitude for another? Democracy in France must ultimately depend on the desire of the French to have a democratic society. It is hard to believe that the flame of freedom is spent. The danger is that the Allies, in trying to shield it, may blow it out.

Yet they need not be reduced to a completely passive rôle. Through broadcasting, through literature and the Press, through personal contacts, through the choice of representatives they send to France, they can help the French to realise democracy by making them see that democracy is what the world expects of France. A great people cannot be guided or coerced into a new way of life; but they can be challenged into it. Once the British and the Americans have recognised unequivocally the authority of the National Committee and can no longer be accused of wishing to foist their own authority on to France, they will be free to be much more candid in their comment and criticism of the French authorities and much more ready to underline any deviation from the way of freedom. At the moment the Americans and the British have the worst of both worlds. They do not recognise the Algiers administration and they dare not criticise it. The right course now, on the eve of invasion, is full recognition, full co-operation and the most candid and critical appraisal of the results.

## Article Seven

THE so-called Master Agreement between the British and American Governments, regulating the conditions on which Lend-Lease assistance was provided, was signed on February 23rd, 1942. Its famous Article Seven reads (with some simplification of purely formal language) as follows:—

In the final determination of the benefits to be provided to the United States of America by the Government of the United Kingdom in return for aid furnished under the Lend-Lease Act, the terms and conditions thereof shall be such as not to burden commerce between the two countries, but to promote mutually advantageous economic relations between them and the betterment of world-wide economic relations. To that end, they shall include provision for agreed action by the United States of America and the United Kingdom, open to participation by all other countries of like mind, directed to the expansion, by appropriate international and domestic measures, of production, employment and the exchange and consumption of goods, which are the material foundations of the liberty and welfare of all peoples; to the elimination of all forms of discriminatory treatment in

international commerce and to the reduction of tariffs and other trade barriers; and, in general, to the attainment of all the economic objectives set forth in the Atlantic Charter.

At an early convenient date conversations shall be begun between the two Governments with a view to determining, in the light of governing economic conditions, the best means of attaining the above-stated objectives by their own agreed action and of seeking the agreed action of other like-minded Governments.

It is no secret that negotiations have been going on about the implementation of Article Seven for some time past. The Chancellor of the Exchequer told the House of Commons as recently as last month that no decisions had been taken, or would be taken, until the House had had an opportunity of debating the subject. But it is reasonable to suppose that conclusions are beginning to emerge, and that the agreement is taking shape. What is more, it is possible from the reports that are available and the rumours that are afloat, to piece together a picture of what is contemplated which may

not be correct in detail but is probably accurate in outline.

On the currency side, it would seem that the compromise achieved follows the main structure of the original American plan much more closely than that of the British. The proposal of an international bank creating international credit and issuing it on overdraft to countries with deficits in their balances of payments has been rejected. Instead, there is to be an international stabilisation fund subscribed to by the participating countries. The amount of this fund will probably be in the region of \$8 to \$10 billion; but it should be remembered that the effectiveness of the fund will be limited by its holdings of the currencies that actually prove to be in short supply. If it is dollars that turn out to be needed, then the fund's holdings of dollars (plus its holdings of gold) will determine the amount of assistance it can give to deficit countries. Though the main principle of the American proposal has been accepted, it will probably be found that some of its rigidities have been modified—for example, to permit the depreciation of member currencies by not more than 10 per cent of their value in gold at the inception of the fund. The whole scheme is designed to come into force, not immediately, but after a delay of some three years from the cessation of hostilities.

### Trade Prospects

On the trade side, the precise tenor of the proposals is more difficult to predict. There have been two main American contentions: that interferences with trade other than reasonable protective tariffs—that is, in particular, quota regulations, bulk purchases and the like—should be forsworn; and that all forms of commercial policy, whether tariffs or quotas, should be non-discriminating—that is, that all countries should be treated exactly alike. Of these two contentions, it is the second that is the stronger, and it will probably be found that the agreement, while setting limits to the permissible use of quotas, bulk purchases and the like, does not ban them completely, but that it is very strongly opposed to any form of discriminatory treatment—that is, treating American goods in any way worse than the goods of any other country. In American eyes, the Dominions are separate countries, and it will probably be found that the agreement severely limits imperial preferences. There will be provisions for securing that import quotas do not confer, by a back door, the preferences that are banished from the tariff list. Bulk purchasing also, to the extent that it is tolerated, must be non-discriminating in its effect—that is, the same terms must be offered to all suppliers. And it will probably be made clear that the most mortal of all commercial sins is for a country to use its bulk purchases as a means of securing favoured treatment for its goods in the selling country. In short, and to be blunt, Great Britain will be expected to abstain from any use of its importing power to expand its exports.

It will be surprising if the agreement, when it emerges from the long period of gestation, does not also incorporate a number of American concessions. Thus some reductions in the American tariff would seem to be in order—though it remains to be seen whether any reductions will be offered on the important items and whether the reductions are to be made without "reciprocal" reductions on the other side. And the American case against discrimination would clearly not apply, and would have to be suspended, if the United States failed to bring its balance of payments into reasonable equilibrium. If the supply of dollars is below the world's demand, they must perforce be rationed, and the rationing can hardly fail to discriminate against purchases from America. It would be wrong to suppose that there will be no concessions of this nature in the agreement. But in general it is not unfair to say that the British Government is contemplating the acceptance of about three-quarters of the American thesis both on currency and on commercial policy, and that the acceptance will be made without conditions as to the circumstances of its coming into

force, save only for a specified short period of transition.

Any such agreement, if entered into, will be a far-reaching commitment and clearly deserves the most careful weighing of the arguments, which are many and complex. It is unlikely that such an agreement between the United Kingdom and the United States would be very welcome to the Dominions, except perhaps to Canada, whose position is admittedly difficult and delicate. But, with all that is at stake, Dominion doubts should not by themselves be decisive if an agreement on these lines meets with the approval of opinion in the two metropolitan countries. Opinion in this country will not be unanimously favourable. The National Farmers Union will not be pleased by any limitations on the right to impose quotas; nor the Federation of British Industries by any restriction of the tariff-making power. Those who conceive of export policy in terms of high-pressure horse-trading or market-protecting cartels will not like any prohibition of bilateral bargains. The Socialists love bulk purchasing for its own sake, and the Empire Free Traders of the Beaverbrook Press will be outraged by any interference with the sacred cow of imperial preference, or indeed by anything that smacks of internationalism or of "Cobdenite shibboleths." With this grand confederacy of vested interests there will, of course, be not an atom of sympathy among those whose eyes are fixed on the good of the common purpose. Indeed, if this were all that were to be said about the matter, one would rejoice that the New World had once more been brought in to redress the balance of the Old and that the powerful reinforcement of American policy had intervened in the struggle against the whole restrictionist crew and all their works.

But this does not exhaust the matter. In recent discussion of the place that international trade should occupy in the economic system, the old clear-cut distinction between those who would "liberate" and those who would "restrict" is coming to be seen as too simple. There are two possible ways in which the problems of international trade can be approached. One school of thought assumes that the possible volume of international trade—the demand in all countries for goods produced in other countries—is determined by an act of God. It therefore concentrates its attention upon making sure that the actual volume of trade comes as close as possible to reaching the potential maximum, and that all the competing suppliers have an equally fair chance. To this school of thought, the ultimate aim is to abolish "restrictions" and discriminations; such abolition is all that mankind can do to increase the flow of trade.

The second school of thought, which has been growing up in recent years, refuses to accept the doctrine that the economic environment cannot be controlled. Within each country, the aspiration after Full Employment is, in essence, a determination to see that the National

Income is raised to, or close to, the potential maximum and stabilised there. The corresponding international policy is to expand what can be called International Income and, so far as possible, prevent it suffering from sudden relapses of the 1929-32 variety. According to the more old-fashioned views, a country was to be judged not by its success in maintaining the volume of its foreign trade but by the resolution with which it adhered to low and non-discriminatory tariffs even at the bottom of a severe depression in its foreign trade—the depression being, of course, a visitation for which it was not responsible. Virtue was measured by the degree of resolution in adversity, not by success in avoiding it. By this reckoning an America which, in 1934, bought only \$1,655 million from abroad, but was reducing its tariffs, was doing more good than an America which, in 1929, bought as much as \$4,399 million but was in the course of enacting a higher tariff. The newer school of thought holds that the volume of trade—that is, the amount of mutual employment provided—is by far the most important criterion of policy.

### Trade and Employment

Unfortunately, the practical measures of policy that a Government will take if it is pursuing one aim will not necessarily advance the other. There are, indeed, circumstances in which the two coincide, and that is when there is reasonably full employment in all the chief trading countries. Then, all that is necessary to attain the potential maximum of international trade is to remove all the obstructions. Then, the insistence upon exactly equal terms for all traders runs no risk of preventing any trade-creating bargains. Unfortunately, these circumstances are rare, and when they are not present it is all too likely that the pursuit of one aim will obstruct the other. For example, rigid insistence on non-discrimination rules out any attempt to build up specific mutual exchanges. If Country A and Country B are able to make an exchange of, say, antimony against bauxite, the principle of non-discrimination would prevent them from doing so unless A is also prepared to buy bauxite from C, and B to buy antimony from C, on the same terms as they offer each other, irrespective of whether C is prepared to buy anything at all from either of them. In these circumstances the bargain cannot be struck and the trade cannot be done.

In conditions of trade depression, it is possible for the mere removal of restrictions on trade to have the paradoxical effect of reducing the volume of trade. For the removal of restrictions will not affect imports and exports equally. There may be a large increase in imports and a huge deficit in the balance of payments. This, in itself, will create unemployment. And since, under this system, the only way by which a country can adjust itself to a heavy deficit is by reducing its internal costs, there may be a still further induced reduction in the National Income. It is, after all, not so complete a paradox that the absence of restraints reduces the volume of trade. The brakes of a motor-car can be used to prevent it from moving; but it is also true that a car that is equipped with brakes can be driven not only faster, but at a less variable speed, than one that is brakeless.

There is, then, an unavoidable dilemma between the two possible objects of a policy for international trade—the object of removing controls, and the object of maximising the volume of trade passing—except when reasonably full employment prevails in the countries chiefly concerned. If that condition does not prevail, a choice must be made. Nor does Article Seven give much guidance on the choice. For it enjoins on the signatories the pursuit both of "the expansion . . . of production, employment, and the exchange and consumption of goods" and also of "the elimination of all forms of discriminatory treatment in international commerce and the reduction of tariffs and other trade barriers." It would be as wrong to ignore the first sentence as to disregard the second.

The criticism that can be made of the undertakings

into which the British Government are about to enter should now be clear. If full employment is to prevail both in the United States and in Great Britain, then the criticism should be that the British representatives have not gone far enough in accepting the full milk of the "liberationist" doctrine. In those circumstances there will be no need for any vestiges of preference or quota restrictions or of bulk purchasing. But if full employment is not to prevail, they have gone far too far and have seriously hampered the use of the weapons that would be necessary to defend the British National Income against a world-wide depression. It would be far better to accept 100 per cent of the American thesis, subject to the circumstances in which the agreement was to be applied, than to accept 75 per cent unconditionally.

It is impossible to feel very happy about the prospects of full employment in the United States. He would be a rash man who would prophesy with absolute assurance that it will be attained in Great Britain. But America is at a threefold disadvantage as compared with Britain. First, the American problem is far greater: the output of the American economy is now more than 50 per cent higher than in any peacetime year, which means that the total of civilian demand will have to be increased by roughly half and then kept at this figure if there is not to be mass unemployment. Secondly, there is a substantial theoretical and practical agreement in this country on the methods to be pursued in maintaining the volume of effective demand; in America, all is still controversy. And, thirdly, there is an accepted administrative machine in this country to carry the policy out; in America, the machinery, in so far as it exists at all, is the object of violent political attack. No Englishman should be so very foolish as to look forward with any pleasure to the possibility of a post-war depression in the United States. But no Englishman can banish that possibility from his mind, nor should any British Government fail to take such precautions against the eventuality as it can.

### A Plea for Delay

The plea that is made here is thus a double one. On the one hand, as a long-term proposition, let there be an even more far-reaching agreement upon the principles of untrammelled and non-discriminating movement of commerce and finance—and of human beings too. But let the application of these principles be deferred until it can be seen whether the conditions are going to be created in which they would do more good than harm. In the intervening period, let the British Government retain its freedom of action to join with any other country in concerting a policy for the maintenance of trade and income. There are good prospects of building up a substantial grouping of countries pledged to this object and assisting each other in its attainment. Not only the countries of the sterling area but also many of the European countries will look to Britain to give a lead; it will be a tragedy if the lead cannot be given. It goes almost without saying that access to this group should be open to any country that shares the objects and is prepared to meet the conditions. It would be aimed at no country; on the contrary, it would benefit the whole world. It is surely far better to apply the principles of liberated trade in a limited area where the conditions of successful working can be created than to compromise them all once again (this time, perhaps fatally) by insisting on imposing them in a wider arena where the stage has not been set.

This plea for delay can be made in all sincerity from the British side. For it arises not out of any opposition to the principles that have, in recent years, met with such support in Washington, but out of solicitude for them. It comes not from any rejection of Article Seven, but from a desire to see the whole Article implemented. Once before, after the last war, the mistake was made of rebuilding a complex and rigid structure before the foundations had stopped heaving from the earthquake. Some of the voices that cried out most loudly against that mistake are now, by an ironic chance, most in favour of making it again. They were right the first time.

## NOTES OF THE WEEK

### Odessa to the Carpathians

The centre of gravity on the Russian front has shifted to the Roumanian sector. While General Malinovsky's armies have taken Odessa and are now swinging southwards into the coastal regions of Bessarabia; Marshal Konyev's forces have approached Jassy and crossed the Sereth, forty miles to the west of Jassy. The right wing of Marshal Konyev's forces will soon skirt the eastern slopes of the mountain range along which they may drive southwards towards Galatz. To the east of the Pruth, General Malinovsky's forces will move in the same direction. On the Galician side of the Carpathians the Russians reached the former Czechoslovak frontier to the south of Kolomea, and the Czechoslovak flag was hoisted again in the Carpathians five years after Hitler's march into Prague. A call to arms was issued to the Ruthenians on the other side of the mountains, and the Czechoslovak Government announced that a delegation would go to the freed territories in order to restore Czechoslovak administration. All this seems to indicate that Marshal Zhukov really intends to force the Carpathian passes and to strike at Hungary. Should he succeed in this, then the German forces in Roumania will find their defence lines in the Carpathians and Alps turned from behind, and they will consequently be compelled to retreat across the Hungarian plain towards Austria. The risks of such a daring stroke have since been emphasised by the successful German counter-stroke at Buczacz and Skala. Not only did the Germans succeed in rescuing the remnants of their divisions encircled at Skala, but they also created a threat to Marshal Zhukov's left wing near the Czechoslovak frontier. The next days will show how Marshal Zhukov will dispose of that threat.

\* \* \*

### Replies to Molotov

Mr Molotov's statement of Russian intentions towards Roumania has not yet met with any open response in Roumania itself—though it has almost certainly allayed anxieties there, and stimulated the wish for peace. In an interview with a Roumanian press agency, Ribbentrop has, understandably enough, tried to restore the Bolshevik bogey, so skillfully knocked down by Mr Molotov. He spoke of the Bessarabian gate to Europe and promised that Bucharest would be defended as stoutly as Berlin. But other German commentators have been preparing the public for a further German withdrawal to the Carpathians and the Transylvanian Alps. The most striking—and positive—response to the Molotov statement has come from Mr Gafencu, who was Foreign Minister in Calinescu's Government and later in Roumania's ambassador in Moscow until June, 1941. In a statement published by the *Journal de Genève* Mr Gafencu declared:

The Roumanians feel themselves to be brothers of all the oppressed, of Belgium and Norway, as of Greece and of Serbia. Words like these of Molotov can allay certain natural apprehensions and make Roumanians entertain the possibility of a reconciliation which is both desirable and necessary. Mr Gafencu is now in Switzerland; but he is not a political refugee. His relations with the Antonescu Government, as well as with the Roumanian Peasant Party, of which he once was a member, seem still to be friendly. Thus his statement throws some light on the reports that a peace mission, including Antonescu himself, has left for Moscow.

\* \* \*

### Mr Eden and Mr Stettinius

It seems that, after all, the reports of Mr Eden leaving the Foreign Office represented not pressure from without but his own desire to desert foreign politics for home affairs. Why he should choose this moment for such a move is difficult to understand. For four years he has been in charge of the conduct of British foreign policy. For part of this time, it is true, military events have jostled out normal diplomatic exchanges. Now, however, with victory in sight, the emphasis is returning to diplomacy. The

importance of foreign affairs will grow. The responsibilities of the Foreign Secretary, and with it his influence and prestige will grow to the same degree. Mr Eden's desire for withdrawal does not fit in very well with the great political future forecast for him. However, he has decided to stay and risk the grandeur and servitude of the Foreign Office. He will conduct the negotiations with Mr Stettinius. The present Anglo-American talks will cover specific issues—policy towards France and towards the neutrals—and the wider questions of post-war world order. Final agreement cannot be reached without consulting Russia and the other European neutrals, and it is to be hoped that at this early stage Mr Eden and Mr Stettinius will make use of the joint machinery set up at Teheran. There will be more chance of full agreement if the Russians are brought in early in the negotiations and all suggestion is avoided of an Anglo-American *fait accompli*.

\* \* \*

### Reorganisation in Italy

Many weeks of negotiation—between Britain, America and Russia, between the Italian king and the political parties and between the parties themselves—have ended in what may be taken to be a truce, an interim agreement in which all are prepared for the time being to acquiesce. When Rome is occupied by the Allies, the King will withdraw from public affairs and the Crown Prince Umberto, as Lieutenant of the Realm, will take over all his duties. At the same time, presumably, Marshal Badoglio's Government will be strengthened by the inclusion of representatives of all the Italian parties. As a provisional arrangement, this distribution of political power seems the one most calculated to give Italy a reasonably steady transition from war to peace. This being so, the question may be asked: why postpone the advantages of greater political stability until the retaking of Rome? The decision to postpone all these major changes must inevitably put political pressure on Allied strategy in Italy. The decision to take or not to take Rome should be decided on military grounds alone, and the strategic planning should not be bedevilled by political hopes or disappointments. The political reorganisation ought to take place at once and the taking of Rome be left to the Allied commanders.

\* \* \*

### Miners' Decision

The special delegate conference of miners, which met in London on Wednesday and Thursday, has given the leaders a vote of confidence and a mandate to enter into a final settlement of the Government's wage plan. This plan had been in serious danger of being lost. Although the Executive of the Mineworkers' Federation recommended the acceptance, most of the districts voted against it, mainly on the basis of local objections, and the position until this week was one of deadlock. The miners' decision means that the plan will now go through roughly as it stands, but that the Executive will have a free hand to negotiate on certain points. There was nearly a last-minute hitch over the position of skilled workmen, who did not benefit from the Portal Award. (This term is distinct from "skilled craftsmen" who are to receive 1s. a shift increase: it includes such men as rippers, roadmen, machine-minders and certain types of enginemen). Mr Bevin gave an assurance that the Government would meet the cost of the adjustment—which has been estimated at about £1½ million. He emphasised, properly, that the cost must ultimately come from increased output, and not fall on the public. It would be rash to prophesy that there will be peace throughout the coal industry, but this week's meeting has certainly cleared the air and the prospects of peace are at least better than they have been for a long time—the Yorkshire miners have all resumed work. The next stage, on the miners' side, will be the setting up of a national union in place of the loose district federation. For the industry as a whole, the need has become more pressing than ever to bring about the reorganisation, without which high output cannot be secured, nor a high level of wages maintained.

## Looking Ahead

A glance at the number and scope of industrial disputes after the last war proves the critical importance of putting labour relations on a sound economic footing when this war is over. Then, as in this war, a comprehensive system of industrial arbitration and conciliation had been introduced during the war with a view to preventing stoppages in wartime and making them needless in peacetime. The following table shows how disastrously hopes were belied.

INDUSTRIAL DISPUTES 1913-1922.

| Year | Number of Disputes Beginning in the Year | Total Number of Work-people involved | Aggregate Duration in Working Days of all Disputes in Progress during the Year |
|------|------------------------------------------|--------------------------------------|--------------------------------------------------------------------------------|
|      |                                          | (000's omitted)                      | (000's omitted)                                                                |
| 1913 | 1,459                                    | 654                                  | 9,800                                                                          |
| 1914 | 972                                      | 447                                  | 9,880                                                                          |
| 1915 | 572                                      | 448                                  | 2,950                                                                          |
| 1916 | 532                                      | 276                                  | 2,450                                                                          |
| 1917 | 730                                      | 872                                  | 5,650                                                                          |
| 1918 | 1,165                                    | 1,116                                | 5,880                                                                          |
| 1919 | 1,352                                    | 2,591                                | 34,970                                                                         |
| 1920 | 2,607                                    | 1,932                                | 26,570                                                                         |
| 1921 | 763                                      | 1,801                                | 85,870                                                                         |
| 1922 | 576                                      | 552                                  | 19,850                                                                         |

Thus, the number of days lost by disputes in 1919 was six times those lost in the worst full war year, 1918; and the number of days lost in 1921 was fourteen times more than in 1918. (In this war from August, 1939, to August, 1943—four years—only 4,761,000 working days were lost by stoppages.) Thus, after 1918, the apparatus of arbitration was completely helpless in the post-war situation. Two factors were mainly responsible. One, the relief from wartime discipline, will be present again this time. Whether the other, and more fundamental, will be present, depends upon the wisdom of economic policy; it depends upon whether post-war industry will be capable of supporting the wage structure which it will take over from the wartime period. Only if, on the financial side, both deflation and inflation can be avoided, and if, on the industrial side, industry can be made efficient by a deliberate programme of re-equipment and reconstruction, can the same grievous aftermath of labour troubles be avoided. At this moment, therefore, it is not simply a question of stopping strikes by appeals and threats—essential though this is. It is a question also of planning at once to provide the industrial and economic conditions in which industry can be efficient and prosper, in which employment can be maintained, arbitration and conciliation can work, and industrial peace can be preserved. There could be no better starting point for such a positive policy than the coal industry, which, with transport, was the centre of post-war trouble twenty-five years ago.

## Civil Aviation

The talks between the American and British Governments on international civil aviation led to a communiqué announcing a sufficient basis of agreement for further consultations, and to a press conference in which both sides claimed to have made concessions—but to little hard news about the subject-matter of agreement or disagreement. These talks were preceded by the Commonwealth conference of last October, and are to be followed by similar conversations with the USSR and other interested powers. This is a slow and unspectacular method, but there is a wealth of experience to demonstrate the wisdom of working out a fair measure of agreement before summoning a public conference. From what has been said and from what can be guessed, it would seem likely that both the British and the American Governments would be ready to recommend to other countries that they should adopt the Right of Innocent Passage for civil aircraft, with the additional right of making "technical stops"—that is, that civil aircraft should be allowed to fly over every country and to land for the purpose of taking on fuel, etc., but not of receiving or discharging payload. This principle, if agreed upon, would automatically solve the difficulty of the bases that have been constructed by American efforts under other flags than the American. It is also probable that there is agreement on the desirability of preventing "wrecking" subsidies, while acknowledging the necessity of subsidies for some routes. The "conference" system, which has worked well in connection with shipping rates, might be applied in the air. On the other hand, there are still points of disagreement. One is on the extent of the functions, if any, that might be given to an international authority.

Neither Government wants such an authority to operate either aircraft or airfields, but the British Government is apparently willing to see it go much further in the creation of standards for safety regulations, pilots' qualifications, navigational aids, etc., than the American. The largest point of difference is probably over the allocation of traffic. The British thesis is that the number of flights along a route should be regulated and divided among the participating nations, either equally or on some other basis of allocation. The American thesis is that, once a route is opened, it should be operated under competitive conditions. These attitudes correspond, of course, to deep-seated national interests. The Americans, with a large domestic industry protected from foreign competition, are naturally interested in the maximum freedom for international lines. The British, less concerned with the relatively small volume of domestic business, are naturally unwilling to abandon the advantage that their wide dispersal of potential bases gives them. Other countries—Russia in particular—also have their own interests to protect, and an Anglo-American agreement, even if it were complete, would be a long way from a world-wide agreement. But at least the area of common interest is slowly growing, and the means of reconciling divergent interests are beginning to emerge.

## Russia and Finland

Negotiations between Finland and Russia have now entered the stage at which not only armistice terms, but also the conditions of a peace settlement are being discussed. This in itself is encouraging, because it shows that both sides mean business. The Russians are reported to have modified their original terms for an armistice. They no longer demand the internment of the German forces in Finland, but their "isolation." The demand that the Finnish army should withdraw to the 1941 frontier has also been changed insofar as the withdrawal is to be effected gradually over a period of four months up to the end of July. The reports about the proposed peace terms contain several new features. The Russians seem to have made it clear that no complete disarmament will be demanded from Finland. After a gradual demobilisation Finland would retain an army of normal peacetime size. Bargaining is still going on about the boundary terms. The Russians now agree to give up the claim to Hangoe island, which was leased to Russia in 1940 in exchange for the Petsamo area. They have, however, not agreed to return Viipuri to Finland. The territorial dispute is clearly one of the chief reasons why no agreement seems likely to be reached. Another even more important reason is the Russian demand for reparations, said to amount to £150 million, to be paid in kind over a period of five years, at the rate of £30 million a year. The extent to which such annual payments would burden Finland's economy is shown by the fact that they are equivalent to about three-quarters of the total value of Finnish exports before the war. Even if the payment were extended over ten years instead of five, the burden would still be great enough to make the Finnish Government hesitate. This is the first instance of the difficulties involved in the problem of reparations after this war. Significantly, Swedish public opinion, which has urged the Finns to accept the Russian terms, is nevertheless highly critical about the demand for reparations. Professor Cassel has published an appeal to the Russians asking them to withdraw this demand. The Finnish Parliament has met again to consider the new terms and, at the time of going to press, the chances of acceptance do not seem bright.

## No Polish Paasikivi?

The Polish Government has announced that the Polish military organisations in some parts of eastern Poland have established contact with the Soviet forces and that, in these places, Poles and Russians are now cooperating in the fight against the Germans. Reports available suggest that so far this has been confined to local action in Volhynia. As long as no general agreement exists, covering the whole of the fighting in Poland, the importance of local agreements can be exaggerated. Still less is known about the political relations between Poles and Russians in Poland. At first there seems to have been serious friction, which caused the Polish Government to despatch an official complaint to the British and American Governments. But more recent reports suggest a decided improvement. The Russians are said to have recognised the right of the Polish military underground in

Volhynia to communicate with the Polish Government in London and to receive orders from them. The implications of such a decision may be far-reaching. If true, it may mean the resumption of contact between the Russian and the Polish Governments through indirect channels. Yet what is most needed is the restoration of direct diplomatic relations between the two Governments; and the obstacles to this still seem as great as ever. The Russians have made no move to make possible a rapprochement. Allied mediation has proved unavailing. Russia seems to favour bilateral negotiations, and there might be something to be gained from a direct Polish approach to the Soviet government. So far, Polish diplomacy has been awaiting events. Yet a "Polish Paasikivi" in Moscow might be able at this point to obtain better terms for Poland than any offered so far.

## Schools and Schooling

It has not gone without notice that the Education Bill has passed through its Committee stage in the House of Commons without anything having yet been decided about three of the crucial educational questions of the post-war period. Who is to teach in the new Butler schools? What is to be taught? What is to be done, if anything, about the public schools—in themselves excellent educationally, but socially a reserved road of entry into high posts? These gaps, with the unresolved problem of finance that overhangs the extension of all locally administered services, were noted when the White Paper, on which the Bill is based, first came out. Probably the Bill itself, which is largely a measure for the reform of administration, could not have been expected to answer these questions. But answered they must be. The Norwood Report on curricula and examinations has been in the Government's hands for several months. The McNair Report on the training of teachers, which has taken a long time to produce, is expected in May. Whether any action on the public schools is contemplated, apart from general discussion of the role of boarding schools in the state system, is still very uncertain. Thus far, therefore, there is the framework of a new structure of schools without any educational or social content—and without adequate financial foundations. Well-earned congratulations to Mr Butler on the smooth progress of his notable Bill should not prevent the necessary pressure from being exerted from all sides to secure its translation into terms of actual schooling. First, there is the need to insist upon a prompt and sure timetable for the application of the Bill's key proposals—the raising of the school-leaving age to fifteen and then, as rapidly as possible, to sixteen; the reorganisation of all schooling after the elementary stage; and the fullest development of adolescent and adult education. Secondly, there is an essential need for decisions on the kind of teaching that is to be done at all these stages, and on the kind of examinations required to serve as guidelines. Thirdly, and most urgently, there is the need for sufficient teachers to do the work.

## Post-war Teachers

The report of the McNair Committee on the training of teachers will not deal with the immediate short-term problem of finding teachers, as soon as the war is over. This is to be tackled, empirically, by the establishment of short-term training courses to enlist ex-Service men and women and to bring in suitable recruits from other occupations. For this purpose "shock teams" of instructors are being organised locally to provide short courses when the men and women become available for training. But the need for a radical revision and broadening of teachers' training will be in no way diminished when the immediate gap has been filled by these emergency means and by the return of ex-teachers from their war service. The long-term training of teachers is equally a matter of urgency. The McNair Committee is faced with the task of providing both a quantitative and a qualitative solution. The system of training they propose must attract many more recruits, of more varied age and experience, than was the case before the war; and it must turn out better teachers, with a much wider and more assured view of their function. For some years, as the school-leaving age is progressively increased, as the reorganisation of post-elementary education is at last carried through and the proposed programme of continuous education from the cradle to manhood is begun, teachers will be needed at an annual rate about as big as the total annual output of universities and colleges before the war.

They will need to be much less stereotyped in their qualifications and background, and much more eager to be teachers. It is believed that the McNair Committee, without precisely solving among themselves the difficult problem of the right relations in the hierarchy between universities and training colleges, will make a number of proposals calculated to make the best of both university and training college methods in the training of many more teachers drawn from many more sources. It is only to be hoped that no considerations of "face" or "status" have been allowed to prevent the Committee from stating quite plainly the conspicuous defects in the recruitment and equipment of teachers that existed before the war—with honourable exceptions—in both the education departments of universities and in training colleges.

## Responsibility for Industrial Progress

It is important and timely that so many people now see that the future of Britain depends, not upon political or economic legerdemain, but upon the productivity of its industries. It is no less important, however, that attention and effort should be directed to the places where they are most likely to produce results in terms of efficiently produced goods and services. For the moment there is, in some quarters, an almost pathetic belief in the magic of financial assistance from public funds. That the Government should make a larger and more constructive contribution to the development of scientific and industrial research and technical training is undoubted; but the battle will be lost or won in factories and board rooms. If the objective of industry itself, above all other considerations, is the production of the cheapest possible articles of the required kind, in terms both of the price and of the resources used to make it, and in the largest saleable quantity, it will be well on the way to the confidence it seeks. Whatever the Government can do to help—and this is a lot—should be done.

## The State's Part

Government assistance in the raising of industrial efficiency can be of three kinds. The first, and most direct, is the encouragement by fiscal means of enterprise, inventiveness and re-equipment. The second is embodied in a motion which will be discussed in the Commons next Wednesday asking for a bolder and more generous policy of assistance to research. The third is by technical education. In anticipation of next week's debate, the Lord President of the Council, Mr Attlee, has put out a White Paper (Cmd. 6514), describing the present arrangements; the Development Commission set up in 1909; the various Committees of the Privy Council, with attached councils and departments, for scientific and industrial, medical and agricultural research; and the several research and development sections of Ministries, much extended during the war. Since 1940 the work of these bodies has been co-ordinated,

in addition to the ordinary inter-departmental arrangements, by the Scientific Advisory Committee of the War Cabinet. The White Paper will not satisfy the critics who point to the much greater sums spent on research by other countries. The widespread opinion—expressed in a letter to *The Times* this week from a number of industrialists and labour leaders on the subject of technical education—is that this is “a backward country.” Britain’s long start in industrial development created bad habits of trial-and-error and rule-of-thumb which still block, in industry itself as much as in the minds of Ministers, a full appreciation of the fruitful marriage that is possible between theory and practice. Not the least important test of the educational reforms that are now projected is the extent to which they will produce willing men and women capable of serving industry scientifically. After the elementary stage, general education in the future, if the experts’ views are accepted, is to be biased, rather than split, in one of three ways. It will not be the object of these schools to train engineers or scientists any more than to train clerks, teachers or lawyers. But it will be their object to produce boys and girls capable of becoming, on contact with special training and actual practice, one or another of these. It is technical education proper that will train the engineers and industrial scientists; and there can be no doubt that there is need for a greatly increased provision of buildings, equipment and instructors—much greater provision than is envisaged in the vague and perfunctory financial references of the new Education Bill, where technical and adult education are lumped together. But, again, it should be remembered by the managers of industry that success in technical education depends at least as much upon them as it does upon the education authorities. They must be ready to release their young recruits for long periods of technical instruction; they must be ready to blend the practical experience gained in their workshops with the teaching given outside; and they must be ready to give due recognition, in terms of opportunity and status, to the young people who have gone through this mill.

### Defending Assam

The profit and loss account in the fighting in North Burma shows a heavy debit this week on the Allied side. The Japanese have side-tracked Imphal and have advanced to Kohima within striking distance of Dimapur. If they reach the town, they will cut the railway communications between Northern Assam and the coast and undermine the supply position of all the Allied forces operating between

Sumprabum and Myitkyina. Here progress, though slow, has been steady. The British forces have advanced halfway from Sumprabum and are within 36 miles of Myitkyina. General Stilwell is about the same distance from Mogaung, but obviously a successful Japanese stroke against the sup-

plies and communications of both forces would leave them in dangerous isolation. Meanwhile, neither the Japanese nor the Allies have very long in which to reach a decision. The monsoons are on the way, and it would be turning a new page in military history if either side campaigned through the rain-sodden and malaria-ridden months ahead.

### Front Line Province

On April 1st Mr Casey, Governor of Bengal, said in a broadcast from Calcutta that “we are going to succeed in averting a recurrence of the famine in 1944.” On April 6th, in the House of Commons, Mr Amery added an important rider. After listing the difficulties, such as the loss of Burmese rice, dependence upon the tiny surpluses of small cultivators, the steadily increasing population and this year’s poor miller and wheat crop—the crucial rice crop is very good—the Secretary of State for India expressed his confidence in the measures taken by the Government of India to ration food in urban areas, to distribute food surpluses, to purchase grains and control their price, and, within the limits set by military needs, to ship in imports. But Mr Amery gave a warning: “The procurement of rice surpluses . . . is still influenced by lack of confidence, due to last year’s experience.” The Japanese advance into Manipur is not the invasion of India that some American critics have alleged. But it is a most disquieting sortie, at a time when the boot should be on the other foot; and, unless the confused position can be quickly cleared up, it cannot help but lessen Indian trust in the outlook for this year’s food. The reprinting of a number of remarkable articles from the Indian paper, *The Statesman*, which appeared between March and October last year, comes at a very apt moment. These articles, soberly written though they are, give a picture of what was rightly called “An Imperial scandal.”

by which the whole administrative structure relating to this country, whether India Office, in Parliament or on India’s or Bengal’s own soil, is collectively besmirched.

The picture of pauperism, disease, extortionate landlords, streets strewn with corpses and garbage, persistent muddle and chronic ignorance of the facts among officials, is more horrifying than anything that was made known at the time. The constant theme of *The Statesman*’s leader-writer was the demand that the facts should be found out, and not only made the basis of policy, but also published in both India and Britain. If it is true that this year all possible steps have been taken to prevent the return of this tragedy, there is even less excuse than there was then for the withholding of any particle of information from the British Parliament, press and public, upon whom so heavy a responsibility still rests. Missionaries on the spot send reports of a grave and lingering aftermath of sickness and near-starvation. The best proof that the right remedies are now being applied in this front line Province would be the freest possible publication in this country, not only of official figures of destitution, disease and deaths, as well as of food supplies, in both Calcutta and Bengal, but also of articles like these in full from India’s own press. Concealment will invite the worst suspicions, whether justified or not.

### Agenda for the I.L.O.

The twenty-sixth meeting of the International Labour Conference, which opens in Philadelphia on April 20th, will be one of the biggest international gatherings held since the war, and the most representative. The feature of the I.L.O. is its tripartite character as a body representing governments, employers and workers; it is the only instrument through which organised labour can contribute directly to the making of international economic decisions at the highest level. Out of the fifty-five states which belonged to the I.L.O. at the beginning of the war, forty are expected to be represented at the conference. The attitude of the Soviet Union, which has been invited to send a representative, is enigmatic. If Russia, bound to play a leading role in international reconstruction, does not participate, it will greatly weaken the effectiveness of the I.L.O., which must clearly play an important part in the transition from war to peace. As Mr Eden has said, the I.L.O. is an obvious instrument for giving effect to Clause Four of the Atlantic Charter, which stated as a goal the all-round improvement of living and working conditions. It is important that the I.L.O. should put these, its proper tasks, first, and not try to spread its net too wide; and the first item on the agenda—“the future policy,

programme and status of the International Labour Organisation,” and its relation to other international agencies, including UNRRA—may be the most important. A declaration which it is proposed the Conference should adopt, reaffirms the principles of social justice, and raising the standards of living which were laid down in the original constitution. But there is a new emphasis on the need to maintain full employment.

### The International View

The Philadelphia resolutions of the I.L.O. will be discussed and decided by neutrals and belligerents alike. To that extent, international problems will be looked at internationally; and the United States Government has suggested that the United Nations should receive the conference’s proposals on post-war policy. This, as the *Manchester Guardian* has pointed out, may be of importance for the future of Europe. When it was roughed out at Atlantic City, the attitude of UNRRA towards the people, as distinct from the rulers, of defeated Germany and Italy was left unclear, but suggested some policy of deliberate discrimination. The I.L.O., on the other hand, if the conference accepts the proposals before it, takes for granted that it is neither the desire nor in the interests of the Allies

that defeat should involve for the workers of the Axis countries and their families a depression of standards of social protection below the minimum level necessary to safeguard standards in other countries.

Unfortunate experience in liberated Southern Italy has proved how essential the economic conditions of both freedom and health will be for the wretched masses of all the European countries, foe as well as friend. So long as Goebbels can say, without denial, that the Allies intend, after victory, to starve and bleed the people they are now of necessity blockading and bombing, he can still rally his dupes behind their lost cause.

### Absent Workers

It has been said that miners, subjected as their industry is to a sort of “statistical searchlight,” are low in public repute as orderly workmen, because their deeds, and misdeeds, are made so widely known. Undoubtedly one of the reasons why so much is heard about absenteeism in the mines is that every detail of time-keeping is recorded. The Industrial Health Research Board of the Medical Research Council has thrown at least a glimmer of the same light on the absenteeism of industrial workers in general. In a pamphlet called “Absence from Work and Prevention of Fatigue” the Board investigates the causes of absenteeism in sixty different factories, varying in size from small concerns to firms employing 25,000 workers. In peacetime, absenteeism due to all causes is not more than about 5 per cent a year of the possible hours of work—an average of about one day or a day and a half’s absence per person per month. In wartime, the rate is considerably higher; it amounts, on the basis of this inquiry, to 6 to 8 per cent for men and 10 to 15 per cent for women. Married women may lose up to three times as much working time as single women. The causes of absenteeism among women are now well known. Conditions such as transport difficulties, the care of children, housework, shopping and husbands’ leave largely account for the “voluntary” absenteeism of the married ones. Inside the factories, overlong hours, unsatisfactory working conditions, wage problems and idle time tend to produce bad time-keeping. Though the physical reason of ill-health is responsible for at least half the time lost, the psychological factors of boredom, apathy and monotony of work are also important; and it is significant that absenteeism is least in factories where there are good management-labour relations. The causes and effects of industrial fatigue are familiar, and it is unfortunate that so little seems to have been learned from the lessons of the last war. The Board’s recommendations for reducing fatigue are common sense: hours should not exceed 60 for men and 55 for women, and should be less in the case of heavy manual workers and women with domestic duties, there should be adequate rest pauses, week-end breaks, longer rest for tired workers and some extension of part-time work. One of the most effective ways of relieving boredom is to make the workers understand the relation of their job, however trivial it may seem to them, to the war effort, and to secure their co-operation in production.

### Common Wealth in Danger

In its appeal, though confusedly, the Common Wealth party goes back to the Commonwealth, to the levellers and egalitarians who attacked property in the debates of Cromwell’s army. In twentieth-century practice, however, the party must have money—a lot of money—to carry on; and its founder, Sir Richard Acland, has given most of his away, in accordance with his views on common wealth. So far, he and Mr Good have provided most of the funds needed to keep the party going. Now, Sir Richard has told the party conference that from next year the continuation of the movement will depend upon its members’ own contributions. Without the send-off given by him and by Mr Good, Common Wealth could never have built up its triumvirate of MPs or achieved its considerable success in terms of votes cast at by-elections. At no distant date the party will soon lose a credit as important as that given by its founders—namely, the ability to cash in on the political truce, with other Left parties absent. It may find itself with few political friends. Common Wealth stands for Left-wing solidarity, embraces the principles of Socialism, and proposes to support Socialist and Radical Liberal candidates at future elections. But so far its overtures have been rebuffed rather than welcomed. Common Wealth’s own supporters—as distinct from the much greater number of voters who use it as a stick with which to beat the Conservative party—are to be found among middle-class elements, who have definitely Socialist leanings, but to whom orthodox Labour has failed to appeal. They now have their chance to show by their contributions how strong their allegiance really is. It is a test through which the working-class supporters of the Labour party came triumphantly in the early days. It will show how much real fire there is behind the considerable smoke that Common Wealth has made.

### The City President

The solemnity with which Goebbels has been appointed *Stadt-Präsident*—City President—of Berlin suggests that some important political issue is at stake or at least that something entirely new has happened. In reality, the move merely confirms Goebbels in the exercise of many responsibilities which he had already assumed. As chief of the “Inter-Ministerial Committee” for the relief of war damage he was responsible for relief work in Berlin. Berlin is not only a city, it is also a Gau, and Goebbels has been its Gauleiter for a decade or more. As Gauleiter he is Reich Defence Commissioner for Berlin and a member of Goering’s Ministerial Council for Defence. This means that he directs all civil defence measures in Berlin. The reason why it has now become necessary to hand over to him the functions of *Oberbürgermeister* as well is that, under repeated bombing, the administrative structure of Berlin has been blasted away and the overlapping of relief measures and ordinary civilian activity has become so great that the only solution is to concentrate both relief work and what is left of normal administration in one man. Goebbels could not be given the title of *Oberbürgermeister* because his position in the Nazi hierarchy is already too exalted. The new style of City President had to be created to signify the fusing of relief work and ordinary administration. It is a measure of the devastation and chaos in Berlin. It is also in keeping with Hitler’s queer dream world, full of hints and phantasies and intuitions. In 1926, Goebbels first “conquered” Berlin for the Nazis against the bourgeois politicians and the organised workers. Today his job is to repeat the “miracle” against a far more formidable foe.

### Willkie's Wake

THE party bosses held a wake for Mr Willkie after his crushing defeat in the Wisconsin primaries. Mr Willkie himself contributed a handsome wreath to his own obsequies by withdrawing his name altogether from the race for the nomination. But, as in the Irish story, the corpse may prove the liveliest member of the party, Mr Willkie's failure to win a single delegate surprised even his worst enemies. There is no doubt that in part this was due to the fact that Mr Willkie's strength is with the independent voters rather than with the active party members who constituted a main part of Wisconsin's light vote. His attacks on his own party could hardly have commended him to them, and no doubt contributed to their reported inability to distinguish between his policies and those of the Administration. On the other hand, there is plenty of evidence that Mr Willkie's platform on foreign affairs, however admirable, failed to excite noticeable enthusiasm among his audiences.

But it is most unlikely that Mr Willkie will sink into obscurity. He has already promised that he will go on fighting in the Republican Party for the policies in which he believes and which have given leadership and inspiration to countless men and women. It may be that his greatest rôle is yet to come—as the conscience of the Republican Party. On the choice of both nominee and party platform he may exercise a veto power on behalf of that very considerable section of the American public whom he has converted to a belief in full participation in world affairs. William Jennings Bryan went down to his third defeat in 1908, but his power in the party was so great that he was able to effect the nomination of Woodrow Wilson, instead of Champ Clark, the professional politician's favourite, as Democratic candidate in 1912. Mr Willkie may not have quite the authority of a second Bryan, but he will give the party leaders some uneasy moments between now and Election Day, and if the man chosen by the Republicans at Chicago in June uses weasel words on post-war collaboration, Mr Willkie can be counted upon not to spare him. Whether his influence would not have been greater had he remained in the ring is debatable. The impulsiveness which prompted his withdrawal, and which is the other side of Mr Willkie's political courage, may not have been altogether wise. But this final blow to his ambitions need not necessarily be incompatible with victory for his ideas.

Since the Wisconsin primaries Governor Dewey is confidently assumed to be the inevitable candidate. Without lifting a visible finger he won over half the vote and collected more delegates than all the other contenders put together. This surprising strength may not be altogether substantial. Up to now, the aspirants and their supporters have been so busy stopping Mr Willkie that they have had no time for each other. With Mr Willkie out of the way, it would not be surprising if more thought were given to the problem of checking Governor Dewey. It is traditional, and understandable, that the man who gets out in front too early solidifies opposition. This was Mr Willkie's misfortune.

At this moment the other characters in the cast are extremely shadowy—General MacArthur, Lieutenant-Commander Stassen, Governor Bricker, Governor Warren and, most problematical of all, Senator Taft. With the exception of Governor Bricker, who has made some fugitive appearances, all are silent, although the Stassen interventionism is well known. It is to be hoped that the pressure of events will soon force at least Governor Dewey to speak out. There is something terrifying in this central core of silence in the most vocal and expressive country in the world. If Governor Dewey decides before the Convention that he is, after all, available: the party chieftains may be content to

say ditto, but it is more likely that some rival will emulate Senator Taft at Mackinac and say, "It's a fool idea."

Whether Mr Willkie will choose to support Governor Dewey depends on the alternatives. Lieutenant-Commander Stassen's ideas are far closer to those for which Mr Willkie has campaigned so ardently. His prospects have hitherto seemed somewhat remote, but he has done well in the Nebraska primary, an organisation is being built up for him in the East and, with the Willkie influence behind him, he might be a serious contender. On the other hand, should Governor Bricker, that sane, solid, safe and eminently traditional Republican figure, show signs of success, it is not impossible that Governor Dewey might inherit the Willkie contingent. In the meantime, the Democrats may cherish the dubious consolation that, with Mr Willkie out of the running, President Roosevelt remains the unchallenged symbol of progressive internationalism. But if Wisconsin has a lesson for the Democratic party it is that a realistic political touch is needed as well.

### American Notes

#### Mr Hull and His Critics

Mr Hull's dearest aim is said to be the creation of a body of agreement on foreign policy which would lift the question of the peace and American participation in its maintenance out of the realm of domestic politics, thus assuring a continuity of foreign policy new in American affairs but now recognised as essential. Already the Secretary of State has taken the historic and unprecedented step of requesting the appointment of representatives by Congress to concert with him plans for an organisation to maintain the peace. His broadcast on Sunday night was another great landmark in this campaign. Not all the omens are favourable. The handling of foreign policy, until recently considered one of the Administration's major assets, has suffered a sad decline in public opinion. The critics are to be found not only among the Republican stalwarts, who cling to the idea of "sovereignty" as embodying all that is needed, but even more among the liberals, not forgetting progressive Republicans like Mr Willkie and the group of young Republicans newly elected to Congress. There have been widely echoed charges that the United States has no foreign policy. The "burial of the Atlantic Charter" has been celebrated and mourned in print; the deterioration of Allied relations has been accepted in many quarters as established fact; and the blame is put either on the President and State Department for the lack of a clear and realistic policy, or, by another group, on Russian expansionism and British abetting. There has been widespread disillusion over specific issues. Mr Hull in his broadcast was therefore at pains to insist that the United States had a policy—"comprehensive, stable, and known of all men"; that the Charter, far from being abandoned, provided an expression of fundamental objectives, though it could not give detailed solutions; that harmonious action among the Big Four would be the very life-blood of the peace; and that the United States attached the greatest importance to the creation of popular and progressive as well as stable governments in liberated Europe. Mr Hull was particularly happy in his assurances on the future of France and the responsibility of the French National Committee to exercise leadership in establishing law and order as soon as liberation could be achieved. His confident augury of a tougher policy toward the recalcitrant neutrals will, if borne out, go far to satisfy the critics of continuing "appeasement" of France, Spain and other neutrals. He was also, surely, on solid ground in arguing

that the immediate production of complete blue-prints for the post-war world was impracticable, that definitive solutions require the slow process of discussion with America's allies abroad and her citizens at home.

#### Foreign Policy

It was, no doubt, Mr Hull's devotion to democratic procedure, as well as his skill as a negotiator, that prevented him from dealing in more than broad strokes with the future of American foreign policy. Yet there was a new and encouraging emphasis on the importance of the Big Four, and the need of agreed action among them. For further elaboration Mr Hull evidently means to await the result of his discussions with Congress. There are manifest advantages in attempting to chart a bi-partisan course, particularly in an election year, when the possibility of stirring up controversy over issues of foreign policy is never remote. Only a long-standing tradition of keeping foreign policy out of domestic politics—which is lacking in the United States—could prevent a certain amount of fishing for votes this year on foreign issues. The unrest among the Polish and Irish minorities, who occupy strategic positions in the American political scene, offers an almost irresistible temptation to the opposition. As yet there are only sporadic and individual raids; the Republicans have no single coherent alternative to offer. The generalities of the Mackinac Conference noticeably failed to gloss over the divisions within the party, which includes progressive interventionists like Senator Ball and Mr Willkie, as well as the extreme nationalists of America First, and a great body of middle-of-the-road opinion. If a forthright and inspiring agreement on the main bases of policy can be concerted between Congress and the State Department without undue delay, not only will the dangers of controversy be avoided, but future Senate acceptance will be assured. It may prove, however, that to arrive at such an agreement beforehand will require more than a little dilution, if not of Mr Hull's principles, at least of their application; and this is hardly likely to be either a speedy or an inspiring process. Already there is a spreading cynicism about the good faith of Britain and Russia; there are demands that the United States should get tougher, and use its post-war economic strength to enforce its own view of affairs upon its Allies. Should Mr Hull fail to secure concrete agreements with Congress, which commend themselves wholeheartedly to the American people, no reference to broad principles or noble ideals will head off this nationalistic view of American participation or rescue foreign policy from entanglement in domestic politics next autumn.

#### Holding the Line

The cost of living has not risen during the past year and the basic wage structure has remained unchanged, according to a report from the Office of Economic Stabilisation made public last week by Mr Roosevelt. The report admitted that there had been increases in some items, notably clothing, but insisted that these had been fully offset by decreases elsewhere, particularly in foods, and contrasted the present stability with the 3 to 4 per cent monthly rise in the overall cost of living which prevailed before the "hold-the-line" order of last April. Mr Chester Bowles, head of the OPA, testifying before the Senate, displayed a similar satisfaction with controls which have allowed only a 38 per cent increase in wholesale prices, compared with a rise of 103 per cent in the same period of the last war. A comparison of the cost of living shows a 65 per cent increase in the last war with 26 per cent this time. Both Mr Bowles and Mr Vinson, Director of Economic Stabilisation, have made an excellent impression. The likelihood that Congress will extend the life of OPA, virtually unchanged, is attributed very largely to Mr Bowles's persuasive powers, although the failure of OPA's enemies to agree has played its part. Mr Bowles, formerly of the advertising firm of Benton and Bowles, displayed his professional talents to perfection in his testimony. He won all hearts by admitting OPA's past faults; and members of the Committee were so struck with the forcefulness and clarity of his exposition that at its end they all filed up to shake his hand. This is a far cry from Mr Leon Henderson's stormy experiences with Congress. Labour alone appears unconvinced by assurances that it is better off than ever before, although surprise is said to have been felt in

other quarters. The CIO's demands for increased wages in the steel industry to match the cost of living are still under consideration. Among the apologists for price control a significantly strong emphasis is put on the argument that stabilisation has shown tangible, "indeed bankable," benefits to all groups. Without more draining off of purchasing power by taxes and savings, the very success of price control may be digging its own grave.

### Shorter Notes

The Supreme Court's decision on negro voting in the Texas primaries has aroused protests, partly because it is feared as an encroachment on states' rights, and partly on purely racial grounds. Southern Congressmen and other political figures have already promised that some other means will be found to bar negroes from state primaries. Thus, in the past, when the "grandfather clause," which made it a condition of voting that one's grandfather has voted, and thus disfranchised all negroes, was found illegal, substitutes were found in literacy tests, the poll tax, and similar measures.

The Bureau of the Census estimates put the population of the Continental United States, exclusive of the Armed Forces abroad, at 134.6 million on July 1, 1942, against 133.9 million in 1941 and 132.8 million in 1940. The most interesting revelation is that in 1942, for the first time in American history, females outnumbered males, by 644,196. The excess of males has shown a steady decline. The scarcity value of American women thus joins the Redskin and the frontier as a vanished phenomenon of history in the American legend. But if this is the end of another happy hunting ground, like the habits of mind established by the existence of the frontier, the comparative freedom and privileges with which it endowed American women are in no danger.

## Latin American Trade Unionism—II

LAST week's article described the features common to the organisation of labour in Latin America as a whole. In Argentina, the labour and socialist movement dates back to the middle of the nineteenth century, when, as in the United States, European exiles introduced socialist ideas and trade union organisation. The Buenos Aires typographical union—the oldest in the country—dates from the 1850's. But it was not until the first years of this century that a real labour movement got under way. Under anarcho-syndicalist domination, Argentine unions led a stormy existence until the First World War. A general strike in Buenos Aires of many months' duration marked the immediate post-war period. These struggles resulted in a weakening of the movement, which was seriously split during the early twenties. But by 1928 most of the Argentine unions were reunited in the Confederación General del Trabajo, under Socialist leadership. In the last decade and a half, the unions, as well as other liberal groups in Argentina, have been busy fighting successive dictatorships, and struggling for a full restoration of democracy. Recently there has been a split in the CGT, which was used to full advantage by the semi-Fascist government now in power. Trade unionists in Argentina are thought to number between 200,000 and 250,000.

Chilean unions were also launched by exiled European Utopian Socialists in the last century. But trade unions were not of any importance outside the mining and port areas until after the First World War. These organisations were mainly anarcho-syndicalist, the American IWW

having an important affiliate there. The end of the First World War was marked in Chile, as in Argentina, by extensive port strikes, the result of which was to destroy the IWW. At the same time, most other unions joined the new Red Trade Union, Internationale, while Chilean Socialists joined the Comintern. Both movements prospered until the advent of the Ibanez dictatorship in 1925. The independent unions were then suppressed, and a government-sponsored TUC, based on the mutual benefit societies, was paramount. With the overthrow of Ibanez, there developed a period of political chaos, accompanied by serious labour unrest. With the return to political stability and democratic government during the thirties, the remnants of the free trade unions were finally consolidated into the Confederación de Trabajadores Chilenos, and Socialist and Communist parties gained much support. With the advent of the Popular Front government in 1938, and its liberal successors, the unions gained great strength until at the present time most workers in industry, transport and mining who can be organised are organised.

### Growth in Mexico

The history of the Mexican trade unions is perhaps better known than that of any other Latin American country. There was little organisation until the overthrow of the Diaz dictatorship, and what did exist was inspired by anarchists. During the first years of the revolution, which started in 1910, these anarcho-syndicalist unions came out from underground. But a more important element was a group of vaguely socialist unions, which had the patronage of the Obregon-Calles revolutionary faction. This group crystallised into the Confederación Regional Obrera Mexicana in 1919. All throughout the 1920's, so long as the Obregon-Calles group was in control, the CROM was the dominant labour organisation, and it wielded great power. It was one of the main factors in the Government's support against the Church and against rival militarist-politicians. Its leader, Morones, was Secretary of Labour in successive Cabinets.

Just before the retirement of Calles in 1928, Morones broke with the President and a period of swift decline for the CROM followed. The organisation split into a number of factions, and each succeeding administration had its own pet faction to which it lent support. Morones, meanwhile, went to Europe. Although there was no strong federation at this time, individual unions continued to exist, and, with the advent of the Cardenas regime and its extensive reform programme in 1934, a number of these were brought together to form the Confederación de Trabajadores Mexicanos, under the leadership of Vincente Lombardo Toledano. The CTM was one of President Cardenas' prime supports in his vast programme of land reform and the nationalisation of industry, and it grew to an immense size, claiming a million members. When the Avila Camacho regime took office in 1940, it first looked as if the new President would again back the CROM against the CTM. However, with the retirement of Lombardo Toledano from the leadership of the latter, the Government apparently withdrew the threat of backing its rival. At the present time, although there has been a considerable revival of CROM influence, the CTM remains the leading Mexican labour federation. Relations between the two are better than they were under Cardenas.

From time to time both the CROM and the CTM have been friendly to the Communists. The Communist Party has had a strong minority in both federations. But the first loyalty of the dominant Mexican labour group has always been to the Government of the day.

As in most of the other Latin American countries, the pre-1914 labour movement in Brazil was largely in the hands of the anarcho-syndicalists. They remained an important element during the twenties, although Communist and Socialist unions were also important. All Brazilian unions

## THREE NUNS SAVES MONEY —because of its SLOW-BURNING CUT

There are two special reasons why 'Three Nuns' Empire Blend Tobacco saves the smoker money. It is scientifically cut to burn slowly, each ounce lasts longer, you smoke fewer ounces a week. It is made from fine leaf which is favoured by the lower duty on Empire Tobacco. To enjoy the fullest pleasure of smoking at a moderate cost, take to 'Three Nuns' Empire Blend.

out the 1920's, and their growth was seriously impeded. The Vargas Revolution of 1930 was thus greeted with approval by the unionists, and for some time there was considerable trade union activity. But the radical leadership of these unions was not to the liking of the Vargas regime, and, furthermore, the participation of the unions in anti-government agitation and revolutionary activity during 1934-35 made them very unpopular with Vargas, with the result that most independent unions were destroyed. From about 1937, however, the regime began to patronise and build up unions sympathetic to itself. Soon afterwards, a 'labour code' of—on paper—very advanced labour legislation was drawn up, granting these unions considerable power. Government-controlled and sponsored unions are, therefore, widespread in Brazil at the present time.

Other nations might be mentioned. Cuba has a strong trade union movement, dating back to Cuban branches of Spanish unions, which were founded when the island was still a Spanish colony. These unions are particularly powerful among maritime workers, tobacco workers, and, in recent years, sugar workers, and are led by Communists, with a strong Socialist minority. In Peru, trade unions were widely organised and controlled by the agrarian socialist Indian Aprista Movement. Recently, the Government has sponsored a number of unions. In Costa Rica, the movement—once very strong in the banana regions—is controlled by Communists, while in Colombia the Communists are the most important element, but are opposed by a Liberal-Socialist group. Since the death of Gomez, 'tyrant of the Andes,' in 1935, there has been limited trade union activity in Venezuela. Uruguay has a fair-sized trade union movement, mainly centred in Montevideo, and leaning towards the Communists politically.

There have been a number of moves to unite the trade unions of the New World. The American Federation of Labour and the Mexican CROM launched the Pan-American Federation of Labour soon after the first World War. This organisation never achieved much support outside these two countries, as it was looked upon as a 'tool of Yankee imperialism' during the 1920's. Contemporary with the Pan-American Federation of Labour was the Confederación Sindical Latino Americano, organised by the Red Trade Union International. This had few important affiliates outside Chile, and, for a very short while, Mexico. But in the late thirties the Confederación de los Trabajadores de América Latina was launched. It was organised by the Mexican, Lombardo Toledano, and, although it was very sympathetic to the Communists, it nevertheless had in its ranks most of the independent Latin American trade union centres—including Argentina's strongly non-Communist CGT. The American CIO maintains fraternal relations with the CTAL and was active in its organisation. But, with the exception of very occasional conferences, the CTAL activity is largely confined to Lombardo Toledano's high-falutin, wordy proclamations.

The organisation of labour in Latin America is really only getting under way. It is not unlikely that, with the increasing industrialisation of these nations, and the achievement of more advanced political democracy, the trade unions of Latin America will take their place as an important factor in world trade unionism.

## East African Sisal

It has been reported from Nairobi that the British Ministry of Supply has agreed to increase its buying price for East African sisal, as from January 1st last. The new prices will average £27 12s. per ton, an increase of £5 7s. The previous price had been in force since the beginning of 1943, when the buying price for the lower grade was raised by almost half, and that for the top grade by about one-fifth.

The latest increase in sisal prices coincided with the statement by the Governor of Tanganyika that steps have been taken to increase sisal output in East Africa by a fifth in the near future; and the Governments of Britain and the United States are to supply sisal planters with machinery and replacements. These events are important both for Allied supplies of a vital raw material and for East Africa's own economic development.

Sisal hemp is urgently required for the production of tows (including marine tows), ropes, binder twine, and mats, for which the war has created a record demand. The Philippines used to export about 175,000 tons of manila hemp a year, and the Dutch East Indies about 90,000 tons of

sisal. With the loss of these supplies, Allied reserves of hard-hemp fibres have become very short.

In 1942 a number of emergency projects were set on foot, especially in North and Central America, but they have failed to close the gap. A good deal, therefore, depends upon the procuring of maximum supplies from East Africa, which is the chief sisal-growing area under Allied control.

### An Old Industry

The East African sisal plantations date back over fifty years, to 1893, when Dr. Hirndorf, the German pioneer, imported a thousand plants from Florida into Tanganyika, then called German East Africa. The plants flourished. In 1906 and 1907, Kenya, then British East Africa, imported a number of plants from Tanganyika and laid the foundation for its own sisal industry. Now sisal is the backbone of Tanganyika's economy. Before the war it supplied two-fifths of the territory's total exports. In Kenya sisal production is the second largest industry, accounting before the war for between a tenth and a fifth of total exports.

Sisal production requires considerable capital outlay, and is not suited for this reason to local development by native resources. The sisal fibre is produced from the thick fleshy leaves of the plant, and its weight amounts to less than one-twentieth of the weight of the leaves. The yield of fibre per acre at each cutting seldom exceeds one ton, and often is not more than half a ton. Thus, unusually extensive plantations are needed to raise a sizeable crop.

Very large supplies of leaves have to be collected and carried, usually by light railways, to fibre extracting plants. There they have to be crushed, dried and brushed; and all these processes require machinery, as well as labour.

Early in this war the outlook for the East African sisal industry seemed bleak. Production had been doubled in the ten years before the war, and had reached 130,000 tons a year, of which 100,000 tons came from Tanganyika. But roughly half East Africa's sisal exports before the war went to Germany and other continental European countries. The imposition of the Allied blockade at once caused serious difficulties; the British Ministry of Supply limited its purchases in East Africa to 100,000 tons a year, and required the industry to restrict its output correspondingly.

## "WHAT! Another of those 'Zoning' advertisements?"

TO be in the fashion, we ought to say "Some of you can't get our splendid chocolate now. We are sorry for you! All this zoning, you know."

And we say phooey.

If we were still making our pre-war chocolates — Black Magic, Chocolate Crisp, Aero Milk Chocolate, Dairy Box, Smarties — there would be something in it.

But we're not.

We're making good chocolate, but so are other people. If you can't get Rowntree's, you can still get your ration of good chocolate.

"Good" was not quite our idea of what chocolate should be when we had a free choice of ingredients and all the skilled workers we needed. "Good" would not have satisfied us then. Nor would it have satisfied you.

Perhaps it doesn't now.

But there's nothing to be done about it till the war is won.

Then, when we are again free to set our own standard, we are going to set it higher even than before; for we're still learning. If then you couldn't get the things we shall be making, you might well think yourself hard done by. But for the present, we won't say we're sorry for you.

To be absolutely honest, we're more sorry for ourselves.

ROWNTREES

The situation changed abruptly when the hard-hemp supplies of the Philippines and the Dutch East Indies were lost. East African planters were then asked to do all they could to increase output. The British Ministry of Supply increased its purchases to 115,000 tons a year, and the American Government agreed to buy any quantity that the East African plantations could produce in excess of this total.

Recent production figures have not been published. But reports from individual plantations suggest that output now probably exceeds the highest pre-war figure. Shortages of labour and machinery, however, have seriously limited the rate of production. The Governments of Tanganyika and Kenya have used their wartime power to conscript native labour for private industry engaged in vital production. But the need to maintain food production sets a definite limit to the diversion of labour to the sisal plantations. Most needed is an increased supply of machinery which would permit a much greater economy in the use of labour.

The financial position of the East African sisal industry has considerably improved. Both output and prices are higher than before the war. Already last year some plantations had either paid off arrears of preference dividends or increased ordinary dividends. It is reported that the new Ministry of Supply contract has been arranged to last until two years after the end of the war with Japan—with the Ministry reserving the right to end it, on six months' notice, two years after the end of the war with Germany. The immediate future of the industry seems well assured.

In the longer term there may well be difficulties, for which substantial financial reserves may be required. It is certain that post-war world supplies of sisal and other hard-hemp fibres will be well above the pre-war figure. On the other hand, it is probable that wartime experience has opened the way to new developments in sisal consumption, so that the increased world supply of fibres need not necessarily result in very large surpluses. For the moment the long-term future of the East African sisal industry cannot be judged. But it would not be over-optimistic to say that it is at least likely that the industry has entered a phase of prosperity which may prove to be something more than just a temporary wartime boom.

## Slovakian Anniversary

FIVE years ago, on March 14, 1939, Slovakia was declared independent. Dr Tiso became the State President, and in a formal treaty Germany guaranteed the inviolability of the frontiers of the new State. In the first military campaign of this war, in the attack on Poland, the newly formed Slovakian army took part in the fighting. Slovakian territory had been used for the concentration of part of the German army. German and Slovakian armies stormed the Jablonka pass, opening the road to Cracow and Lwow. In recognition of these services Germany rewarded Slovakia with small parts of disputed Polish territory with a population of 25,000.

At present Slovakia, like Hungary, has become the immediate rear of the German armies. From Stanislawa to the eastern tip of Slovakia the distance is some 60 miles. Three of the six main passes of the Carpathian mountains are on Slovak territory. The remaining three eastern passes, formerly on Czechoslovakian territory, are now Hungarian.

Nazi Germany always paraded Slovakia as a show piece of independence within a German-dominated continent. In 1940 Slovakia formally joined the Tripartite Pact, and in 1941 the Anti-Comintern Pact. Throughout the war against Russia Slovakian troops have been fighting side by side with German troops.

The complex national and ethnographic problems of this part of Central Europe were illustrated when Slovak refugees living in Britain denounced Dr Benes's authority to speak for the Slovaks, when the Russian-Czechoslovak Treaty was concluded in December last year. Slovak refugees believe that Slovakia is capable of complete independence.

Germany's interest in an independent Slovakia was first of all a strategic interest. The further east the fighting moved in Europe the stronger was the appearance of Slovakian independence. During the first years of the war Slovakia seemed to experience a considerable economic development. Railways and roads were built; hydro-electric power stations constructed; and the old-established mining

industry revived. The following table shows that, relative to the size of the country, with a population of roughly 2.8 millions, mineral resources are not unimportant. It shows also that actual production appears to have been limited. Output of the most important minerals was as follows.

|                                       | In 1,000 Metric Tons |      |      |      |
|---------------------------------------|----------------------|------|------|------|
|                                       | 1937                 | 1940 | 1941 | 1942 |
| Brown coal . . . . .                  | 730                  | 805  | 816  | 813  |
| Iron ore . . . . .                    | 760                  | 862  | 978  | 950  |
| Pyrites . . . . .                     | 18                   | 14   | 11   | 11   |
| Manganese ore . . . . .               | 63                   | 60   | 82   | 107  |
| Copper ore . . . . .                  | —                    | 114  | 122  | 119  |
| Antimony ore . . . . .                | 9                    | 12   | 19   | 34   |
| Oil . . . . .                         | 13                   | 24   | 27   | 31   |
| Natural gas (in 1,000 cbm.) . . . . . | 118                  | 118  | 127  | 121  |

The first point revealed by the table is that there is a considerable range of resources. Yet the most important is that expansion remained moderate, apart from the production of manganese ore and antimony ore. No doubt the Germans did not spare mining machinery and expert advice. It seems, however, that there were conflicting interests. Lack of labour in the German war industry induced the Germans to take a total of 120,000 Slovakian workers to Germany, almost 4½ per cent of the total population. The Slovakian army used up another section of the male population, and the substantial groups of *Volksdeutsche* have also been fully mobilised. From an original Jewish population numbering 135,000 in 1939 not more than 88,000 are reported to be still in Slovakia.

This drain on manpower resources must have influenced industrial production, and for some time there have been complaints of lack of workers, especially in industry. The construction of hydro-electric power stations, the attempt to build up an industry for the manufacture of artificial fibres and the construction of strategic railways and roads, all need large numbers of workers. It can be said that, on the whole, industrial activity has remained steady during the war with a tendency to decline during 1943.

The timber resources of the country and some of its minerals are invaluable for Germany's war industry, particularly after the loss of southern Italy and the Ukraine. German interest in the industrialisation of Slovakia was sufficiently strong to provide the material for the construction of a blast furnace, which began operation in February, 1943. No doubt this industrialisation has lately been fitted into the general eastward move of German industries under the pressure of the air war.

The mountainous character of the country limits agricultural production, and a considerable effort was needed to maintain production, which also suffered from several bad harvests. At present there seems to be a temporary glut of pigs, which are slaughtered in great numbers because of the shortage of feeding stuffs. Root crops, particularly potatoes and sugar beet, experienced a bad harvest in 1943.

### Glut of Notes

In contrast the country has had a considerable financial expansion. Notes in circulation have increased as follows:

|                       | In Million Kroner |
|-----------------------|-------------------|
| End of 1939 . . . . . | 1,392             |
| " 1940 . . . . .      | 1,657             |
| " 1941 . . . . .      | 2,023             |
| " 1942 . . . . .      | 2,742             |
| " 1943 . . . . .      | 3,532             |

Year by year there has been a larger annual increase, although economic activity has not risen. The national debt increased during the same time to Kr 5,270 million at the end of 1943. The banks have been asked to sell investments in securities until their cash basis reaches at least 8 per cent. The increase in the cash ratio of the banks demanded by the Government is part of a scheme to skim-off surplus purchasing power held by the public. The public has apparently been hoarding banknotes—which is also suggested by a relatively small increase in savings deposits.

Slovakia's foreign trade is mainly conducted with Germany. On an average Germany has taken 85 per cent of the exports and supplied 75 per cent of imports. A considerable clearing debt has accumulated and there are difficulties in financing it. Slovakia's trade with neutral countries, such as Sweden and Switzerland, is hampered by price differences, and an attempt has been made to compensate the differences by setting up a price-equalisation fund between Slovakia and Sweden. Compared with 1939-40 the value of

imports and exports in 1942 had increased by roughly 50 per cent, and during the first 6 months of 1943 a further advance was reported. There is no doubt, however, that the volume of foreign trade remained stable with a tendency to decrease.

## Letter to the Editor

### Irish Neutrality

TO THE EDITOR OF THE ECONOMIST.

SIR,—Surely the closing passages of your article on Irish neutrality (*The Economist*, March 18th, p. 357) fall below your usual standard of well-informed, detailed commentary. I appreciate the fact that the earlier part of the article passes a judgment on the recent past of Anglo-American policy towards Ireland in a manner which shows no inconsiderable understanding of the problem. I agree with you, moreover, about the beneficial effect on Irish sentiment of the British attitude towards Ireland during the present war.

But just as the commendable refusal of this country to violate its pledged word by seizing the Irish ports confers no title deeds for perpetuating the glaring abuses inherent in partition, so is it impossible to feel that the sound common-sense of your opening furnishes a justification for the surprising burst of hysteria with which you conclude. "Maso-chistic raptures of deliberate isolation"; "peculiarly narrow, bigoted and tyrannical form of Roman Catholicism"; "Home Rule means Rome Rule"; "Irish masses reduced to a state bordering on illiteracy." These are strong phrases on the lips of the Editor of *The Economist* about a neighbouring State whose attitude to Britain throughout the war has been consistently friendly and helpful to the full limit of benevolent neutrality.

You must, one would suppose, have made prolonged inquiries before launching such charges against Ireland, but it is impossible to believe that you have, in fact, done so. I know many Irish Protestants whose testimony would refute

your allegations, and none who would support you in so far as such general charges can ever be proved or disproved even by first-hand evidence. It must suffice to recall one tribute, the words of which I have verified since reading your article, Dr. Thomas Harvey, Protestant Bishop of Cashel, speaking in July, 1938, said:

I would like to pay the warmest tribute to our Government for the more than generous way they have treated us and met us in our desire to keep our schools open. No British Government treated us with a like consideration—in fact, had we remained under the British Government we should have lost many of the schools we now have. I gladly bear testimony to the facilities afforded to our clergy by giving religious instruction to those of our children who attend schools under the management of the Church of Rome.

Myself brought up an Irish Protestant, and working in England, but in recent times living and enjoying to the full the remarkable range of liberties accorded here, I had eighteen years from the establishment of the Free State in 1922 in which to form an opinion of the extent to which the Catholicism of the new Ireland conceded full freedom to the Protestant minority, from whom I sprang before being received into the Catholic Church in 1940.—Yours, etc.,

Oxford.

FRANK PAKENHAM.

# THE BUSINESS WORLD

## The Discount Market

AN interesting and important phase in the evolution of the London discount market has just come to a close. It is the phase of consolidation which began, under official prompting and encouragement, in the late 1920's. The last war and the post-war decade, with their high money rates and generous margins between discount and short loan rates, brought magnificent profits to the discount market and attracted to it many new entrants, all of whom brought capital, most of them the best of social credentials, but not all of them the solid knowledge of the bill business on which the greatness of the London market had been built. By the late 1920's the authorities in the City had decided that the personnel of the market had become somewhat excessive and that the number of firms in it could well do with some compression, especially if in the process the average of capital resources held by each individual unit could be increased. The risks inherent in the business of the market had begun to increase. The tendency to hold a larger proportion of bonds had begun to manifest itself, and the immense volume of bank bills arising largely from "clean" or non-documentary acceptance credits granted to Continental banks, held a threat which was not to materialise until the early 1930's, but which even in the late 1920's must have been vaguely present in the minds of the authorities. "Fewer and bigger" was therefore the *mot d'ordre* given to the market. It was heeded.

First came the phase of amalgamations, absorptions and retirements from the market, which reduced the membership from twenty-four (exclusive of running brokers) in 1925 to eleven. Then came the attraction of additional capital by firms that had been left outside the concentration movement and whose capital resources still remained below the £500,000 figure which had been indicated by the Bank of England as the desirable minimum. With the recent increase in Jessel Toynbee and Company's capital, all firms other than Messrs Seccombe Marshall and Campion, the Bank of England's agents, have lifted their capital structure above this basic figure. Seccombe's exclusion from the rule in no way spoils the argument. The firm is in a special

category. Its main business is to act as agents to the authorities, but in order to perform that business efficiently it must "keep the touch of the market" and therefore runs a small book. It is in the market without being of the market. There is no doubt that if it wished to raise its capital to the £500,000 minimum, applying to other members of the market, it would not have the slightest difficulty in obtaining the necessary resources.

Six firms of running brokers are at present recognised by the Bank. They are essentially intermediaries, brokers in the most strict sense, who do not assume ownership of the bills in which they deal. Before the war, they also acted as money brokers, but the present rigidity of money rates has brought their money business to an end and the profit margins on discount business are now so small that the scope for their operations in bill business has narrowed considerably. If they can still transact such business it is because of the anonymity which they bring to the transaction. A bank desiring to sell bills in preparation for its make-up would normally choose to do so through a running broker. Of late, however, these brokers have run small bill positions and have, for this purpose, been able to borrow money from the banks for which they transact other business.

Except in one instance, the additional capital which has been attracted to the discount market since the beginning of the war has taken the form of preference capital. The single exception to this rule was provided by the participation of United Dominions Trust in the increase of the equity of Ryder and Company which then changed its name to Ryders Discount Company. Even in this case special arrangements were made by which the control of the firm was to be left unaffected for a considerable time by the infusion of fresh equity capital. In all other cases the new capital has been made available in the form of preference shares. It has been provided by a variety of institutional investors ranging from insurance companies to investment trusts and merchant bankers. The ability of the discount market to attract such capital is hardly surprising. The remuneration of the new capital is

adequately covered by current profits, the specially protected position of the market, enhances the investment merits of its shares, while the preference capital in question has been placed on exceptionally attractive terms: a first batch at 5 per cent and the last operation at 4½ per cent. This twofold process of amalgamation and consolidation is illustrated in the appended table. The 24 firms which existed in 1925 had an aggregate capital and reserve of £10,520,000 or £438,000 per firm. At present the latest published figures give an aggregate of capital resources of £14,442,000, or £1,444,000 per firm. In both cases this excludes certain unpublished figures.

What of the future? Is the trend to be towards still greater concentration or towards further strengthening of the capital structure of individual firms in the market? The reduction in the number of firms in the market has probably gone far enough. The personal relation between the banks and the bill brokers which has been so important an element in the successful functioning of the London money market might well be endangered if the latter were reduced to a half-dozen or so public companies. The private firms have still a part to play. The point is whether the efficient playing of that part may not call for further increases in capital—whether the time may not come when the Bank of England will regard the figure of £1,000,000 as the desirable minimum of capital resources commanded by each firm.

The answer to that question must depend on the type of role which the market will be called upon to play in the future credit structure of this country. It may recapture part at least of its lost commercial bill business. The international bill on London may return. But in view of the probable position of sterling after the war—if for no other reason—it would be wise not to place excessive hopes on any such development. There will certainly be no return to the non-documentary acceptance credit which came into such bad odour after the crisis of 1931, but which provided the market with the bulk of its bank paper during the two inter-war decades. Nor is there much hope for the revival of the domestic acceptance. The forces that have virtually killed the domestic trade bill will be reinforced after the war by the underlying trend towards declining bank advances, and by the keen competition of the banks for the kind of short-term finance which would normally be effected through an acceptance credit.

Whatever doubts there may be on the prospects for commercial discount business after the war, there can be none regarding the market's still growing stake in the market for short to medium term gilt-edged securities. The deficit is being financed cheaply, but on a comparatively short-term basis. Of the tap loans issued by the Government since the beginning of the war, National War Bonds account for some £2,500 million, by far the greatest single item. The various series of these bonds, with their 8 to 10 year currency when first issued, will provide the market with an abundant supply of eligible short-term paper for years to come. Indeed, the existence of these large slices of national debt steadily maturing year by year demands a specialised market to hold it and deal in it. To some extent the discount market has already become an extension of the gilt-edged market in the Stock Exchange. It will hold that position even more after the war. The efficient fulfilment of that task may well require a fresh infusion of capital into the market.

The market should also be able to count on the survival of the Treasury bill, which now provides it with the vast bulk of its discount business, though with a very small part of its total profits. There have been impious, not to say impish, suggestions that after this war the Treasury Deposit Receipt might be found not merely to have come to stay, but to supplant the Treasury bill completely. The Treasury bill can be defended on its own merits and not out of any tenderness for the discount market. As the two instruments of Government short-term borrowing now stand, there can be no doubt that the bill is by far the preferable instrument for those whose views on the subject must carry greatest weight, namely, the banks which hold them. Without negotiability, the TDR will never supplant the bill. If the TDR becomes negotiable, it will immediately become a superb instrument for the discount market.

Whatever the discount market deals in, it is on the liabilities and not on the assets side of its balance-sheets that its main function is indicated. It provides the short-loan market which is important to any highly organised banking structure and essential to one so diversified as in Great Britain. The discount market, by tapping every source of surplus cash in the London market, whether it be from the big deposit banks or the many overseas banks operating in London, or the merchant banks, or insurance companies and large com-

mercial enterprises, achieves an astonishing economy of cash in the credit system. The disappearance of the discount market would demand some alternative such as an inter-bank market for surplus balances. Such a market functions in certain foreign centres, but nowhere does it approach the elasticity and efficiency of the London short-loan market. There might be serious objections to one large bank borrowing direct from another, but these objections entirely disappear when that process is effected through the intermediary and anonymity of the discount market.

The discount market, moreover, provides an admirable instrument for the control operations of the Bank of England. It is the focus at which shortages or surpluses of credit immediately and automatically make themselves felt. The market is, therefore, not merely an essential barometer of the credit pressure over the whole banking system, but it is an ideal point at which to apply remedial measures. Open market operations in the discount market will react rapidly at the various points in the credit structure where stresses are to be found. The alternative to this form of open market operation would be a multiplicity of remedial measures each aimed at one of the many points requiring attention. On the score of convenience of the central credit authority alone, the discount market deserves to survive.

One phase of the recent attraction of capital to the market deserves a word of warning. The remuneration of additional capital bearing interest at 5 per cent in a market where profit margins are reckoned in sixteenths or even thirty-seconds of 1 per cent depends on the high gearing which that capital commands. For a given amount of capital resources a discount house can command loans from the clearing banks totalling many times that figure. Of late years the volume of borrowing created on a given capital basis has increased considerably, owing mainly to the growth within the short-loan fund of abnormal sterling balances held on overseas account. The clearing banks to-day provide rather less than half the total short-loan fund of the market, whereas in normal times the proportion might have risen to three-quarters. The sterling represented by this abnormal growth of the short loan will not be destroyed when the overseas banks, which now hold it, utilise those funds to pay for British exports or when this short-term debt is

### To MEMBERS of the Scottish Widows' Fund

In the past 128 years members have invested nearly £99,000,000 in premiums.

During the same period over £105,000,000 was paid to members or their families and the Society still holds £36,000,000 out of which to pay the claims of existing members as they arise.

Increase your stake in this strong old mutual Society. In most cases new with-profit policies cover CIVILIAN WAR RISKS WITHOUT EXTRA CHARGE.

Write to your agent or to the Secretary,

**SCOTTISH WIDOWS' FUND**

9, St. Andrew Square, Edinburgh, 2

funded. In either case, these funds will tend to come into the possession of the clearing banks. But it is more than questionable whether, as a result of these operations, the clearing banks will feel disposed to employ much more than they employ to-day in the short-loan market. In other words, part of the resources with which the market is operating to-day is probably impermanent. If the discount houses are

to be given the task of making a market for Government bonds in addition to transacting such commercial discount business as may return to London, there is perhaps added reason to expect a further strengthening of the capital of individual units, though such additional capital cannot be expected indefinitely to enjoy the same generous bearing as exists to-day.

## Business Notes

### "The Bankers' Magazine"

As one centenarian to another, *The Economist* extends its greetings to *The Bankers' Magazine*, which has just celebrated the hundredth anniversary of its foundation with the publication of a special edition. *The Bankers' Magazine* epitomises in its own mode some of the most typical characteristics of British banking. It has remained throughout its life under the same ownership, that of the Waterlow family; it has kept its name unchanged; the appearance and general arrangement of the centenary number are almost identical with those of the first issue; it has had a remarkably small number of editors owing mainly to the fact that the present editor, Mr Arthur W. Kiddy, has held that position for 49 years. This magnificent resistance to change has endeared *The Bankers' Magazine* to the banking community in this country, and in a commendable message, the chairman of the committee of London Clearing Bankers, Mr Colin F. Campbell, suggests that *The Bankers' Magazine* "is now so fully established and well known that there is little likelihood of a change in the future." As might be expected from the interests by which *The Bankers' Magazine* is owned, the printing technique that goes to produce it is outstanding. The most remarkable feature of the centenary number is the collection of portraits of famous bankers which adorns it and is a masterpiece of the printers' art. Long may *The Bankers' Magazine* live to uphold its staunch defence of robust individualism and to prove that in a fast changing world there are certain things that never change.

### Monetary Isolationism

Certain passages from the report of the Chairman of the Chase National Bank for the year 1943 merit reproduction in *extenso* as a very typical presentation of the case against the international currency plans which is being so persistently argued in American banking quarters.

"The stability of the American currency remains as the one firm foundation on which the economic life of the post-war world can be rebuilt. This is a point, I believe, which has been least considered in the long and often puzzling discussions of the two plans for exchange stabilisation that have been put forward from Britain and from our own Treasury. These two plans are ingenious and, at first glance, persuasive. But they are both open to the basic objection that they provide new and elaborate mechanisms, which, to be effective, will require further mechanisms and controls, each designed to patch up the other. And what is still more serious from the American point of view, each sets up an international authority nominally charged with the duty of advising on national economic policies, and of assessing penalties if the advice so given is not followed.

"Neither plan is final. In the course of discussion both are understood to have been modified, though to what extent and in what manner have not been announced. Yet the opinion remains that the remedy for post-war economic distress does not consist in cumbersome machinery and the use of

methods hitherto untried, which, if they fail, will leave us in worse condition than before.

"If American credit is necessary, let us provide it of our own volition through the national and international channels already tested and familiar to us. If American funds are required to relieve suffering abroad, let us provide them freely, as we always have. If a sound currency is essential as a guide for all the currencies in the world, it is in our power to provide it through the sound administration of American national finance. If we adopt these three aims, we shall at least know where we are, and our destiny will remain in our own hands."

The argument ignores the abnormal situation which will face the world after the end of the war. In dealing with the disruption of international balances of payments, the "national and international channels already tested and familiar to us" are unlikely to do better than they did before the war when faced with far less difficult situations.

### Unit Trust Accounts

For the third year the managers of the Municipal and General group of Unit Trusts have published their accounts. It may be recalled that the profits of the managers are disclosed in absolute figures, but that the earnings from the various functions performed are given as percentages. The information is provided for each trust and for the whole group. This year there is added a simplified summary of the accounts and a statement for each trust of the profit earned under each head per £1,000 of turnover. Short of giving absolute figures throughout—which is considered undesirable because it would give away the size of the individual funds—the managers appear to have done their best to make intelligible a very complicated matter. In this they are playing a lone hand, for no other group has so far produced accounts in any detail. But the others will be forced to do so once the "Share-Pushing" Act becomes law in July, and the other groups are now considering what they should produce. Plainly, the Board of Trade should intimate that there should be uniformity of practice, uniformity of definition and the maximum of information. Apart from figures of actual earnings of the managers, which were £12,074 gross and £3,335 net in 1943, against £9,314 gross and £276 net in 1942, M and G give percentage profits under five sub-heads. Profits on new issues—the most lucrative item in normal times—are non-existent owing to the Treasury ban. Earnings from running the trusts and all the necessary clerical work amounted to 0.097 per cent gross of the average monthly valuation of the trusts. This is paid by all unit holders. On the purchase and re-sale of sub-units, the managers made 2.837 per cent gross on the proceeds of sub-units resold. This charge has somehow to be split between buyer and seller. There was a profit of 0.621 per cent from rounding off prices to a convenient quotable figure, but nobody pays both this and the previous charge.

These three percentages are all paid by the sub-unit holder. But there are two further possible sources of profit—or loss. These are on the holding by the managers of sub-units and of the underlying shares. No underlying shares were held, but on holding sub-units there was a gross profit of 0.536 per cent. Losses were made on some trusts and profits on others. The turnover of sub-units doubled on the year and that mainly accounts for the rise in profit, but the improvement in percentage earnings on holding sub-units from 0.466 to 0.536 arose from the fact that they were held for longer, for the rise in their average value was substantially less during 1943 than in 1942. Obviously this profit arises from a jobbing business which tends to keep the price of the underlying securities up, if the managers hold sub-units, and down, if they go short of them. This business produced a gross profit of only £1,077 on the year, but it is open to question whether an unlimited jobbing business should be considered part of the functions of the managers.

The M and G managers are to be congratulated upon taking the lead in publishing informative accounts. The only profit which seems at all large is that on the margin between buying and selling prices. This is reasonable at present in view of the small turnover, but it ought to be possible to reduce it as business becomes more brisk.

### Canadian Pacific Costs

The full accounts for 1943 of the Canadian Pacific Railway tell the familiar wartime story of a very high business turnover—in which all space and facilities are utilised to their utmost capacity—offset by shortage and inexperience of labour and lack of new equipment. Gross railway earnings are up by over \$40 million to the new record peak of \$297 million odd, but all except \$1,000,000 of this increase is swallowed up by higher costs. The experience of British railways is repeated, for, despite the stoppage of all reduced fares, the closing of holiday hotels, and the reduction of travelling amenities, the volume of passenger traffic has been the highest known, and earnings from it have soared by 30.1 per cent. Freight earnings, which provide in any case the bulk of the revenue, show a substantial but comparatively modest increase of 11.3 per cent. Grain movements from the prairie provinces to Eastern Canada and the USA have been heavier, and it may be partly due to the greater availability of lake transport that at the end of the year there were 60 million bushels less awaiting transportation than at the close of 1942. On the expenses side, there were special costs due to exceptionally bad weather, and to the increase in the cost of living bonus to employees; but the main increase was in maintenance and transportation costs. The application of employees to the National War Labour Board for a rise in the rates of pay to US levels has still to be decided; but it is stated that as things are, higher transportation costs in wages and supplies have been wholly offset by the increased earnings per train mile. Under income from sources other than the railway, the most interesting item is the increase of over \$2,000,000 in net cash receipts from land, due to the restored prosperity of Western farmers. The directors have stated that the dividend for 1944, if any, is dependent upon conditions. But it seems likely that the snowball effect of the war will continue, in expanding turnover, to increase revenue rather faster than expenditure. This fact, taken with the growing surplus carried forward annually, should surely mean that the shareholder will be lucky if his dividend is not at least maintained during the war.

### De Beers Assets

The full accounts of De Beers Consolidated for 1943, promptly received this year, show that the estimate of an increase in net profit from £2,755,744 to £3,500,000, given in December, was a slight overstatement, the actual figure being £3,440,231. This is before the provision of £739,900 to bring up the reserve against diamond investments to the increased value of holdings, the company having taken over an additional 740,000 shares in the Diamond Trading Company during the year. After taking account of this transfer, free reserves and carry forward show a fall on the year of £325,267, but the really relevant question for the shareholders is the true value of the diamond interests, and on this point the balance-sheet valuation of £6,238,837 is, probably, very little help. The other point of interest, emerging from that statement, is a fall in net liquid assets, excluding inter-company items, from £841,123 to £404,277. This is still above the level at the end of 1941, but it seems a modest sum for so large an enterprise. The absence of a consolidated balance-sheet renders all comparisons of little value. The comparatively modest rise in net profit contrasts sharply with an increase in receipts from the diamond account to £4,558,178, compared with £2,614,904 in 1942 and £1,767,967 in the previous year. According to the report, 1943 brought record sales, and the outlook for the current year is described as favourable. The latest stimulus to the demand for the shares of the company is the news that a new concern, De Beers Industrial Corporation, is to take over from the parent company its holding of £1,000,000 in African Explosives and Industries, valued in the accounts at par, in exchange for £4,000,000 ordinary capital. The Industrial Corporation will have, in the first instance, £1,100,000 in cash derived from the issue of a million 5½ per cent cumulative preference shares of £1 at 22s., with which to finance industrial development in the Union. While there is no immediate intention of parting with any of the interest in the new concern, De Beers Consolidated will

possess in its equity holding an asset which should be readily marketable once its earning power is proved.

### Oil Politics

The future of oil is to be discussed in Washington next week between official representatives of the countries controlling the world's principal oil resources, including Russia. It is reported that the aims of the discussions will be, among others, to ensure a fair distribution of oil to all nations, and the efficient and economical development of the world's resources without unnecessary restrictions. Like the discussions about the future of civil aviation, the forthcoming conferences on oil, to be held under the auspices of the governments concerned, are a welcome indication of the recognition of the need for international agreement on international problems. In spite of frequent scares, there is no likelihood of an early shortage of oil. They are invariably based on proved reserves which bear little relationship to actual reserves. Moreover, there is still great scope—as there is in coal—for improvements in the efficiency of utilising oil, of making each barrel go further. But the fact that no shortage is in prospect does not mean that an international agreement on oil is superfluous. On the contrary, it is vital, not merely to ensure equal access to supplies—which should mean equal access at reasonable prices—but also to prevent a scramble for the control of oil resources and their exploitation without reference to the countries in which they are treated. The oil conferences, in fact, will be a test of the ability of five main oil-controlling countries—America, Great Britain, Russia, Holland and Mexico—to agree among themselves, and to agree on a policy that fulfils the aims of the Atlantic Charter.

### Kaffirs and Gold Prices

There has been a renewal of the boomlet in Kaffirs, this time affecting the established as well as the developing mines, on two suggestions about the possibility of an increase in the price of gold. The first of these, dealt with on page 478 of *The Economist* of last week, concerns the possibility of South Africa and the mines receiving a share in the

premium obtainable in India. The second is the suggestion that the price paid by the Union Government should be the full equivalent of the US price of \$35 per ounce at the existing rate of exchange. On the former point, it is sufficient to remember that the profit on sales in India is a rupee profit, and that the premium is due to an invasion scare and to inflationary finance, for which it is hoped to find remedies. On the second point the suggested price of 173s. 6d., or 5s. 6d. more than that now ruling, makes no allowance for costs of handling, insurance, freight and interest. To make a present of the whole of these to the mines, or even to the mines now on the point of closing down, would be a definite subsidy. The Union Government might decide that it was worth while to pay this to keep some gold producers in being, but there is so far no sign that they would. No doubt, however, part of the 5s. 6d. margin is profit to the Government, and that part might be conceded if it were necessary to prevent a working loss. How far the Government would be prepared to allow any concession, let alone a subsidy, to result in actual profits to the shareholders is another matter. The question is largely one of domestic politics. It is true that the local industry is passing more and more into the ownership of local residents, but it is still the case that the farming interests have to be convinced of the need to keep the mines in being. It is a long step further to convince them that all shareholders must receive some return.

### More Treasury Bills

The weekly issue of Treasury bills by tender is being raised from £90 million to £100 million this week. The move appears to have about it a more permanent character than the similar increase which occurred last October. That increase, which was to last four weeks only, was primarily intended to place more Treasury bill maturities in the hands of the banks early in the new year when revenue payments normally cause a considerable drain on bank cash. The effect of this increase in the issue of tender Treasury bills on the banks' portfolios wore off very quickly, and it has recently become evident that the banks have again been suffering from bill starvation. By last February the London clearing banks' holding of bills amounted to less than 3 per cent of their total assets. On the outbreak of the war the ratio was over 11 per cent. To a large extent the place of bills has been usurped by Treasury deposit receipts, but this new type of asset does not provide an altogether satisfactory alternative to the bill in the banks' structure of assets. The depletion in the volume of bills going to the banks is not due to an absolute reduction in the issue of Treasury bills by tender. Apart from seasonal fluctuations, the weekly issue has been maintained at £90 million since April, 1943. The competition for these bills from quarters other than the clearing banks has been increasing steadily over the past year. Most of that "outside" demand comes from overseas central banks and issuing authorities whose sterling resources are constantly growing as a result of wartime disturbances in the UK's balance of payments. Some of these special demands are satisfied by the issue of tap Treasury bills, but a considerable proportion figures in the weekly applications for bills issued by tender. If £100 million is to be a new norm for the weekly offering of tender Treasury bills, the total outstanding will ultimately settle down at £1,300 million. If

only half of the increase could be canalised to the clearing banks, it would raise the ratio of bills to total assets to nearly 5 per cent. A small part of the additional supply of bills is likely to remain in the discount market, where recent increases of capital are likely to lead to corresponding increases in bill and bond holdings. It would, however, be quite wrong to attribute the decision to issue new bills by tender to any desire on the part of the authorities to accommodate the discount market in this respect.

### Training for Industry

The Government is introducing a scheme for the training of men and women on their demobilisation from war service, which may have an important bearing on post-war resettlement of workers and on the supply of skilled labour for industry. The Parliamentary Secretary to the Minister of Labour announced the broad provisions of the new scheme in the House of Commons last week. Training courses will be available to men and women released from the Armed Forces, the merchant navy, civil defence services and other types of war service, whose training or careers have been interrupted by the war and who are in need of special training. Training for industry will be given in the Government training centres, and the usual arrangements for allowances will be made. Agricultural training will be provided by the Department of Agriculture. If the facilities are inadequate, priority will be given to men and women released from the armed forces, or from the merchant navy. The scheme will be co-ordinated with the educational and vocational training now being given in the Services. The details will be worked out by the various industries, but it seems likely that in most cases the schemes will follow the lines of the training scheme already announced for the building industry. In the absence of any details, it is impossible to comment on the Government's proposals, but the scheme will certainly meet a long-felt need, and will be welcomed not only by men and women in the forces, but by the representatives of industry in general.

### The Blind in Industry

The day is well past when blind workers were confined, at the best, to such secondary occupations as basket-making. Statistical investigations have revealed that the blind are now being employed over the whole range of industry—in engineering, soap, tobacco and munition factories. It is claimed in a recent pamphlet by Dr Fenelon, general secretary to the Institution of Production Engineers, that blind people are no more liable to accidents at the bench or the machine than other workers. If this is so, it should be taken as a tribute to the special care and guidance that is given to adapting the blind to their job. Unfortunately, other classes of disabled workers are less well looked after. They tend to be let loose on new jobs without the same regard being paid to their particular limitations and aptitudes. The strides forward that are being made, in other fields as well as industry, towards equipping blind persons to lead an almost normal life, are both remarkable and heartening, and they point the way to what can and should be done for all disabled persons.

### The Statistical Black-out

The statistical black-out was strongly criticised by Lord Barnby in the House of Lords on April 5th. The lack of adequate statistics, in his view, is hampering industrialists in formulating their plans. He contrasted the wealth of statistics still published in the United States with the paucity of the information available for this country. He effectively illustrated the harm that can be done by the withholding of statistics by reference to the coal-mining industry. If mining statistics had not been suppressed, "the seriousness of the situation which faces us to-day might have been modified by anticipatory action." He might have added that the resumption of the publication of coal production figures when the crisis came to a head was an admission of the harm caused by their previous suppression. Lord Templemore, speaking for the Government, listed the usual security arguments in favour of the statistical black-out; he enumerated the statistics that are still being published, such as those relating to the earnings of workers in industry and the returns about retail sales, and he drew attention to the new statistics about the national income and expenditure—a welcome innovation—published each year. He also drew attention to the facilities provided by the Government

(ABRIDGED REPORT)

# CANADIAN PACIFIC RAILWAY COMPANY

(Incorporated in Canada with Limited Liability)

## Sixty-Third Annual Report of the Directors of Canadian Pacific Railway Company Year ended December 31, 1943

### To the Shareholders:—

The financial results of operations showed a moderate improvement over 1942, which, however, was not in proportion to the increase in traffic handled. As a result of governmental regulations rates, both passenger and freight, were maintained at the 1941 level. On the other hand operating costs, both labour and material, and taxes advanced substantially.

The volume of traffic handled in 1943 surpassed what might have been thought possible a year ago. Freight, passenger, mail and express traffic all reached levels never before attained.

In meeting the enormous wartime demands for transportation your Company's organization and facilities were subjected to rigorous tests. Heavy snowfalls and sleet in the first quarter of the year created operating difficulties; the shortage of labour curtailed the maintenance programme; the amount of new equipment procurable fell short of requirements; and wartime restrictions limited the provision of additions and alterations to facilities. The continuance of heavy enlistments in the armed services of members of the staff created problems not only of replacement, but also of training and supervision. In spite of all obstacles, however, your Company succeeded in meeting the demands made upon it.

NOTE.—Particulars of securities held for account of the Company and of contingent liabilities of the Company are set out in the accompanying schedules.

TO THE SHAREHOLDERS, CANADIAN PACIFIC RAILWAY COMPANY.

We have examined the Books and Records of the Canadian Pacific Railway Company for the year ending December 31, 1943, and having compared the Balance Sheet and related schedules therewith, we certify that in our opinion it is properly drawn up so as to show the true financial position of the Company at that date, and that the Income and Profit and Loss Account correctly set forth the result of the year's operations.

The records of the securities owned by the Company at December 31, 1943, have been verified by an examination of those securities in the custody of its Treasurer and by certificates received from such depositaries as are holding securities for safe custody for the Company.

Montreal, March 10, 1944.

## Important Notice to our Sherry Customers

FINDLATER'S FINO, well-known to Sherry drinkers all over the World, will in future be known as

FINDLATER'S DRY FLY SHERRY

The reason: Findlater's Fino cannot be registered and protected from imitations under that name. FINDLATER'S DRY FLY is registered, ensuring protection for our customers throughout the World.

FINDLATER, MACKIE TODD & CO. LTD.  
Vine Merchants to H.M. the King 55 Wigmore Street, W.1

whereby persons who require particular statistics can apply to the Government for special release. But he refused a reconsideration of Government policy. "on the very eve of the Second Front." Admittedly, the considerations that must guide policy are not identical in Great Britain and America; the one is an operational base and the other a dispersed arsenal. Nevertheless, there is a case for the revision of policy, for the substitution of a "dim-out" for the present black-out.

### Coupon Capital

Correspondence arising out of two notes on Retailers' Coupon Capital, which appeared in *The Economist* of March 11th, suggests very strongly that the loss of coupons due to carelessness or misfeasance of the retailer's staff is so large an element in the problem as to call for special consideration. It remains the case that it is very difficult to give unrestricted allowances for such losses. Insofar as the public obtained, through the leakage, more goods than they were intended to, the ensuing issue of clothing coupons to the public would have to be cut. Total sales would have to be maintained, at the pre-determined level, and to that extent replacement of coupon losses would not alter total sales. But it would change their distribution between retailers, and it is on this ground that some of them may have a real grievance. It is tempting, but wholly wrong, to argue from money to coupons, and to say that because a retailer has to meet the money cost of losses, thefts and mistakes he should also meet the coupon cost. While the retailer is allowed a money "mark-up" to cover these (and other) costs, he is hardly allowed any coupon mark-up, nor can he gain on any coupon swings what he loses on his coupon roundabouts. If coupons are lost or stolen, or locked up in unsaleable merchandise, he has no escape from a progressive reduction of his scale of business. Presumably, this will mean in the end a shortage of goods to satisfy legitimate demands, and then some solution will have to be found. Meanwhile, however, it is extremely difficult to think of a formula which will not, in fact, encourage leakages or a means of replacing losses which will not cause an outcry from those who have been more fortunate or more efficient in preventing them. As so often happens in the case of central control, it may well prove that the least harmful solution, when one is necessary, is a modest all-round relaxation, in this case a percentage grant of coupon credit to all clothing retailers without discrimination, irrespective of any injustice involved. A further point emerges which concerns even more specifically Board of Trade policy is the matter of sales. If it is the intention of the Board to enforce the sale of goods which are unpopular by withholding more desirable alternatives, no compensation for the locking up of coupon capital in unpopular stock is necessary. If, however, concessions are made to public taste, as in the instance of austerity suits, the position is different. To the extent that this renders the prospect of selling the less popular alternative goods negligible, some grant of additional coupons should be permitted. It appears, however, that the importance of this factor, except in those cases where allowance has been made, is so small as to be covered in large measure by the 2 per cent allowance.

### Ships' Tonnage

Merchant ships are measured by a number of different "tonnages." Deadweight tons denote the *cargo weight* which can be carried; displacement is the *weight* of the ship, light or loaded; gross and net registered and under-deck tonnages are related *volume* measurements—100 cubic feet equals one ton—on which all harbour, canal and other dues are paid, and which are also used for registration and statistical purposes. The very complicated rules under which the latter tonnages are determined have often been criticised and have never been completely standardised internationally. The British shipbuilding industry is now recommending their revision. At the recent annual meeting of the Ship-

building Conference the following resolution was adopted unanimously:

That the tonnage measurement laws for ships are out of date and in urgent need of drastic revision in order to remove impediments to desirable developments in new ships, and that the matter of revision be pressed upon the British Government for urgent discussion with the United States and other maritime nations as a necessary prerequisite to post-war shipbuilding progress.

This is a sequel to strong criticism of the present system by the new vice-president of the Conference, Mr A. M. Stephen, in a presidential address last October before one of the technical institutions. Mr Stephen described the tonnage laws as "a disgrace to the shipping community of the world and an insult to their intelligence," and proposed a very simple alternative system based on the ship's main dimensions. The present rules are too complicated to describe. They involve the actual measurement of the cubic content of the permanently covered-in spaces in a ship as defined; the net tonnage, on which dues are normally levied, is supposed to represent the capacity of the spaces which earn money.

The burden of the criticism of the system is that it has a considerable influence on ship design, owing to the efforts of designers to obtain the lowest possible figure for dues assessment. Many anomalies have thus arisen. A special class of cargo ship—known as the shelter-deck ship—has been evolved which owes its existence not to any technical merits but solely to the fact that it allows a favourable interpretation of the rules for tonnage measurement. For example, the rules have prevented the full realisation of the economic advantages to be gained by compact machinery of the most modern type. While the more glaring anomalies which undoubtedly exist can be overcome by limited revision of the rules, ideally the design of a ship should not be influenced by the way it is measured for dues or other purposes. This should not occur if a dimensions formula such as that suggested by Mr Stephen were adopted. His suggestion involves the abolition of the principle that dues should be related to a ship's earning space or its ability to pay, and the adoption of the more logical alternative that they should be governed by the cost of the services rendered, i.e., by the canal or harbour authority. True, revision of the tonnage rules can only come through international agreement. But it is desirable that the subject should be thoroughly explored before post-war ship replacement programmes are begun, even though it may be an exaggeration to describe the revision of the rules as a "necessary prerequisite to post-war shipbuilding progress."

### Unemployment Insurance

The report of the Unemployment Insurance Statutory Committee, which was published last month, makes strange reading in comparison to the earlier reports of the same body. In 1934, when the Committee was set up under the Unemployment Act, there was a debt of over £105 million. The Committee is now able to report the very satisfactory net balance in the Fund of £224.7 million. The total expenditure on unemployment benefit in 1943 was negligible compared with the early years of the war, as the accompanying table shows. At the same time, it may seem peculiar that as much as £2½ million should be spent on unemployment benefit at a time when the nation's manpower is so fully mobilised. The reason is that the 1943 programme changes and transfers of workers from one occupation or one area to another inevitably involve some workers in intermittent spells of unemployment, and as further changes in production develop the total of unemployment at any one moment may further increase.

| EXPENDITURE ON UNEMPLOYMENT BENEFIT 1938 TO 1943 (£'000) |         |              |        |
|----------------------------------------------------------|---------|--------------|--------|
|                                                          | General | Agricultural | Total  |
| 1938 .....                                               | 51,662  | 742          | 52,404 |
| 1939 .....                                               | 40,690  | 831          | 41,521 |
| 1940 .....                                               | 25,894  | 635          | 26,529 |
| 1941 .....                                               | 8,874   | 294          | 9,168  |
| 1942 .....                                               | 3,708   | 166          | 3,874  |
| 1943 .....                                               | 2,709   | 86           | 2,795  |

Last year, contributions from employers and employed amounted to £49 million; those from the Exchequer to £24.5 million; together with income from investments and miscellaneous receipts, total receipts amounted to £77.8 million. There was a decline of £2½ million in contributions from employers and employed, compared with 1942, due

(Continued on page 515)

### COMPANY MEETINGS

## REFUGE ASSURANCE COMPANY, LIMITED

ASSETS £85,200,000

INCOME £14,700,000

CLAIMS PAID IN YEAR £8,000,000

At the Eightieth Annual Ordinary General Meeting the chairman of the company, Mr J. Wilcock Holgate, in the course of his remarks, said:—

During the year our staff suffered a further net decrease of 451, and the total number released for the armed forces or other forms of whole-time national service is 3,198. Despite the difficulties caused by the absence of so many of our trained employees, by dint of constant re-organisation and the employment of temporary staff, many of whom are women, we are able to carry on our operations, and although we have not any staff concerned solely with the procurement of new business, the new premiums in each branch represented 85 per cent. of the 1942 figures.

### DEVELOPMENT OF ENDOWMENT ASSURANCES

The company's ordinary branch new business has long been predominantly of the endowment assurance type, and in the industrial branch also there has been a growing tendency to favour this type of assurance. Industrial assurance has progressed far beyond its original conception as a means of providing against funeral expenses only; so much so that the premiums collected under the company's industrial branch policies embodying the endowment principle now amount to over £3,000,000 annually.

There remains, however, a considerable demand for whole life assurance, the more so as it is only in the industrial branch that policies may be taken out for funeral expenses within certain permitted relationships; and whether or not any social security scheme put forward in the future embodies a death grant, this will not meet the need for provision against expenses in connection with deaths such as mourning, travelling, loss of wages, and the like. The point was appreciated by the members of the Cohen Committee in 1933, who stated that in their opinion there was a real demand for policies of this type, and who embodied a recommendation to this effect in their report.

### QUESTION OF SOCIAL SECURITY

The question of social security has been long before the public, but in accordance with our excellent national custom the Government has come to no hasty decisions on the matter. Very careful consideration is being given to the various proposals, and I feel that much may be learned from the experience of industrial assurance organisations. We are, of course, in cordial sympathy with the underlying aims of social security, since not only do our policies provide payments on death and make provision against old age, but we administer sickness and other benefits under the present and long-established National Insurance Scheme. The business provides also, by means of its agents, the benefit of frequent and regular calls which experience has shown suits the needs of the public, and for which it would prefer to pay rather than to spend time in travelling to some office to pay premiums, make enquiries or receive benefits. The necessity of such a home service has been clearly proved, not only in the past by the failure of the Post Office scheme for life assurance—which did not provide the service—but also at present by the large amount of voluntary service enlisted to promote and sustain the War Savings Campaign by

regular collection of contributions at the homes and workplaces of the bulk of the people.

### VALUE OF INDUSTRIAL ASSURANCE

As conducted to-day industrial assurance has first to seek out and then to satisfy its policyholders, and it is administered with a flexibility which enables it to meet a variety of needs, with wide discretionary powers to deal expeditiously with special cases. Industrial assurance organisations could not have been developed as they have done if the public had not desired and appreciated their services. Your own company has now been operating for eighty years, and the figures before you afford evidence of an initiative and a vitality which augurs well for our future progress.

A steady improvement as regards economy of administration has been a feature of the operations of the company for many years. In the last ten years the expense ratio in the industrial branch has been reduced by over one-sixth, and this has been accompanied by very considerable allocations of profit to policyholders, amounting to some £3,300,000 since 1933. We have always very present in our minds the importance of conducting the business of the company with the minimum of expense consistent with satisfactory service to our policyholders and proper remuneration to our staff.

### COMPANY'S LARGE HEALTH INSURANCE BUSINESS

On behalf of the National Amalgamated Approved Society, the company administers the national health insurance of a membership of 871,000 and during the year made payments of benefit amounting to £1,123,669. The services of our agents in times of sickness are very convenient to the insured people, and are obviously much appreciated by them; they are, of course, rendered possible only by the close association of industrial assurance with national health insurance. It is gratifying to remember that after 20 years' experience of national health insurance, of which he was the founder, Mr. David Lloyd George, M.P., congratulated industrial assurance Approved Societies on the maintained zeal and efficiency with which they played their part in a great social service.

### BONUSES

Since the outbreak of war, as a result of war conditions, over £750,000 has been paid in death claims on the lives of H.M. Forces and of civilians. The total premium income increased by £371,008 to £12,016,095. The total claims were £8,042,688, including £5,058,697 by maturity. The total assets were £85,215,797, an increase of £3,774,759 during the year. Valuations in both branches were made by the net premium method, using 2½ per cent. interest for all assurances and 3 per cent. for annuities. Of the Ordinary Branch surplus £204,244 is allocated to policyholders to provide bonuses on participating policies which become claims by death or survivorship within the twelve months commencing March 20, 1944, at the rate of £1 per cent. on the sum assured in respect of each full year's premium due and paid in 1939, 1940, 1941, 1942 and 1943 respectively. Until further notice an interim bonus at

the same rate will be allowed on policies becoming claims by death or survivorship. The amount carried forward is £3,025,420.

Of the industrial branch surplus £150,000 is transferred to the investments reserve fund, and £481,586 allocated to policyholders to increase temporarily, and in some cases permanently, the amounts payable under certain policies.

### INVESTMENTS

Our holding of British Government Securities is £44,996,100, having increased during the year by £5,623,623, and represents 52.8 per cent. of the total assets. Since the outbreak of hostilities the company has taken up, and still holds, various war loans amounting to £17,110,800, which is included in the above figure. 92.78 per cent. of the company's investments are now in Great Britain, and a further 5.16 per cent. in India, the Dominions and Colonies. The aggregate values of our Stock Exchange securities appreciated during the year and exceed considerably the values at which they appear in the balance sheets, the investment reserve funds totalling £5,250,000, being intact.

### RATES OF INTEREST

In the industrial branch the gross yield has fallen from £4 6s. 6d. per cent. to £4 4s. 5d. per cent., and the net yield from £4 0s. 7d. per cent. to £3 18s. 4d. per cent. In the ordinary branch the gross yield is £4 7s. 11d. per cent. against £4 9s. 0d. per cent. in 1942, and the corresponding net yield £3 5s. 5d. per cent. compared with £3 6s. 6d. per cent.

The chairman concluded his remarks with a tribute to the services of the staff and a hope that before long the conditions under which all are now working will be replaced by happier circumstances following the successful termination of the war.

The report and accounts were adopted and, the formal business having been transacted, a vote of thanks to the chairman terminated the proceedings.

## S. SMITH AND SONS (MOTOR ACCESSORIES) LIMITED

### CHANGE OF NAME APPROVED

An extraordinary general meeting of S. Smith and Sons (Motor Accessories), Limited, was held on the 12th instant at Cricklewood to consider a resolution sanctioning the change in the name of the company to S. Smith and Sons (England), Limited.

Mr Walter Henderson-Cleland, M.C. (chairman of the company) said: For some time past your directors have been concerned that the name of S. Smith and Sons (Motor Accessories), Limited, was not adequate for a company whose activities have developed into much wider scope than the motor accessory business. The field of the company's activities is, as you know, divided into four spheres: The motor accessory group, the clock group, the aircraft instrument group, and the industrial instrument group. The change of name will not now entail any alteration in the parent company's financial structure and the same board of directors will function as at present.

A new company—Smith's Motor Accessories—will be formed in order to maintain the goodwill of S. Smith and Sons (Motor Accessories), Limited, which is known even more familiarly as "Smith's Motor Accessories."

Smith's English Clocks is already in existence. A new company entitled Smith's Aircraft Instruments will now be formed to deal with all aircraft instruments side of the business. A further new company, to be named Smith's Industrial Instruments, Limited, will look after all matters concerning our industrial instruments section.

A separate board will be formed for each of these four group subsidiary companies, and will work, of course, under the direction of the parent board.

The resolution was carried unanimously.

### ROYAL BANK OF CANADA

#### DIVIDEND No. 227

NOTICE IS HEREBY GIVEN that a DIVIDEND of 1½ per cent., being at the rate of 6 per cent. per annum, upon the paid-up Capital Stock of the Bank has been DECLARED for the three months ending 31st May, 1944, and will be PAYABLE at the Bank and its branches on and after 1st June, 1944, to shareholders of record 28th April, 1944.

By Order of the Board.

E. B. MCINERNEY, London Manager.

6 Lothbury, London, E.C. 2.  
13th April, 1944.

## SELFRIDGE (HOLDINGS) LIMITED

### POSITION OF CONSIDERABLE STRENGTH

#### MR H. A. HOLMES' STATEMENT

The annual general meeting of Selfridge (Holdings), Limited, will be held at 400 Oxford Street, London, W., on the 21st instant.

The following is an extract from the statement of the chairman (Mr H. A. Holmes) which will take the place of the usual address made at the meeting:—

The trading profit of Selfridges, Limited, as shown in the attached accounts, after making provision for depreciation of leaseholds, fixtures and plant, and £25,000 for deferred repairs is £426,611, against £441,324 a year ago. Debenture stocks absorb £54,337 for interest and £33,600 for sinking funds under the terms of the trust deeds, leaving a net profit for the year of £338,674, which is a reduction of £14,837 on the previous year, a not unsatisfactory showing under the conditions which prevailed and one which has exceeded the board's expectations.

#### VOLUME OF SALES

The volume of sales and the percentage of gross profit earned both show declines, but these, to some extent, have been counterbalanced by a further small reduction in the percentage of selling expenses. Costs of sales, however, must now be regarded as being at the irreducible minimum—in point of fact they are considerably below the level of efficiency, because of serious depletion of staff and other causes beyond our control.

Provision for estimated income-tax and N.D.C. to January 31, 1944, is £230,000, against £180,000, and the amount transferred to reserve for future income-tax is £40,000, against £100,000. I referred a year ago to the heavy incidence of taxation on a new company, but I think now that it can be said that the reserves are sufficient to meet all such obligations, and it is anticipated that future appropriations under this heading will be limited to the tax applicable to the earnings of each year. £10,000 has again been transferred to staff benevolent fund, and from the balance of profit remaining a dividend of 12½ per cent., less tax for the year, amounting to £62,500, has been declared and will be paid to Selfridge (Holdings), Limited. The unappropriated balance carried forward is £22,155, as against £25,981 brought in.

#### REDUCED WARTIME STOCKS

The balance-sheet shows a large reduction under the heading of stock in trade, which has fallen from £747,810 to £496,441. Stockholders will naturally wonder whether this is occasioned by the shortage of supplies, and, to some extent, it would be true to say that it is, but the major cause has been the planned policy of reducing the stocks of wartime productions, which will be improved upon when we emerge from the period of hostilities to the days when better-quality goods become available. It would, however, only be right to give the warning that for the remainder of the war period we cannot hope to replace many lines of durable merchandise which are rapidly becoming exhausted.

The other important change, on the assets side, is the large increase in cash at bank, which has risen from £563,899 to £933,788. This sum, together with tax reserve certificates and other investments, leaves us with a comfortable figure of over £1,000,000 in hand.

The accounts of Selfridge (Holdings), Limited, show a net income for the year of £63,040, against £49,754, owing to the larger amount credited under rents receivable, which have benefited by the inclusion of adjustments in respect of earlier years. With the balance brought in from the previous year, the amount available is £94,171. Of this sum £24,816 has been appropriated

for redemption of the "A" secured income redemption stock, £7,445 for the redemption of the "B" secured income redemption stock, £12,167 for reduction of mortgages, etc., leaving a balance of £49,743, which the directors recommend should be carried forward to next account.

#### A POLICY OF "AUSTERITY"

The balance-sheets, read together, show a position of considerable strength in the form of substantial cash balances and reserves, which fully justifies the financial policy approved by the shareholders three years ago. The prudent course followed might, in fact, in these days, be appro-

priately referred to as a policy of "austerity," which will undoubtedly prove to be of enormous benefit in the conduct of post-war business, when very large sums of money will be required for restocking our shelves, the rehabilitation of our indoor appointments, and the expansion of trade which can reasonably be anticipated, and my feeling is that a business such as ours cannot have too much cash available to take full advantage of such opportunities.

Present conditions of trade indicate that we must expect some further decline in profits during the remainder of the war period, but as this will be temporary, our minds are much occupied in laying our plans for post-war expansion of business.

## THE ALLIANCE TRUST COMPANY, LIMITED

### SATISFACTORY RESULTS

#### MR JAMES PRAIN'S STATEMENT

The annual general meeting of the Alliance Trust Company, Limited, will be held, on the 21st instant, in the company's office, Meadow House, 64 Reform Street, Dundee.

The following is the statement by the chairman (Mr James Prain) circulated with the report and accounts for the year ended January 31, 1944.

#### TRIBUTE TO THE LATE MR DAVID PIRIE

Before giving you my review of the position, I must refer to the loss we have sustained in the death last September of Mr David Pirie. For twenty-four years he gave to the company in unstinted measure and with a high sense of responsibility the benefits of his wide experience and sound judgment. In this long tenure of office and by constant attention to the company's affairs, he acquired an intimate knowledge of our manifold interests, which, along with his natural business acumen, gave to his opinions that quality which commands respect. His loss is a very real one and to his colleagues a matter of great personal regret.

#### INCREASED GROSS REVENUE

The accounts for the past year disclose a gross revenue from investments of £667,832, an improvement of £26,273 over the figure for the previous year. A considerable part of the increase is absorbed by taxation, but the final result shows that we are able to recommend once again a dividend of 25 per cent. on the ordinary stock, which requires £137,812, leaving a substantial surplus for the year of £67,770, of which £60,000 is transferred to general contingent fund and £7,770 is added to the amount to be carried forward.

This is a satisfactory result, and it is of interest to note that the figure for gross revenue is the best we have submitted during the war years and equals the amount collected in 1939, when we had not yet felt the effect of the requisitioning of our comparatively high-yielding dollar securities, nor the loss of revenue from areas under enemy occupation.

#### MORTGAGE BUSINESS

In the mortgage business we have experienced on the whole more favourable conditions, which are reflected in larger collections of principal and interest. The improvement has been most marked in Canada, where the farmers are still receiving the benefit of the bumper crops of 1941 and 1942, which they have been slow to market, and also the 1943 crop, which, although of average size, is of a value above the average. In the United States the demand for land which might have been expected to result from higher prices for agricultural products, and the fears of inflation, has not materialised to any great extent. The control of prices and the difficulty of obtaining suitable farm labour are, I believe, in the main, deterrents. Nevertheless, the process of liquidation of the

mortgage business proceeds steadily, and it is now but a small part of the company's business. It has well repaid the care which has been expended on its management, and I would take this opportunity to pay tribute to the efficient and loyal service we receive from our agents in Canada and the United States.

#### STRONG POSITION

The general level of Stock Exchange values at January 31st last, although somewhat below the highest point reached in 1943, showed a further advance on that of January a year ago. Without question, therefore, there is a considerable appreciation over the book values. As I have remarked on a previous occasion, the high prices now quoted in these wartime markets do not have the same significance for us as in peacetime, when they would suggest some grounds for the expectation of improving returns. All we can say is that the balance-sheet shows a position of considerable strength and we face the uncertainties of the future with substantial reserves.

In surveying the immediate prospect it is evident that under our wartime economy the industries of this country are now stabilised to a great extent by the steady flow of Government orders, while the operation of the Excess Profits Tax tends to even out fluctuations in profits. With the continuation of these conditions in the current year I would expect our revenue collections to show but little change.

#### STATE CONTROL AND PRIVATE ENTERPRISE

In providing finance for the development and expansion of all forms of legitimate commercial activity, the investment trusts, along with other financial institutions, have played their part in taking the initial risk either by subscribing to or guaranteeing the subscription to new issues of capital. If I understand it rightly, there is now a school of thought which advocates that these functions should be performed by a Government Department or be subject to some form of State control. This to my mind is a dangerous doctrine and one for which I can find no justification. Under peace conditions all our nation's old skill and resource will be required to meet the problems which specially face this country, and these qualities will only be brought out satisfactorily under a system of private enterprise. If that system is to work it must be untrammelled or the driving force will go out of it. I would remind those who in State control see a cure for all our economic ills that this country depends probably more than any other on the bold initiative of its industrial leaders. The fact that State control is exercised elsewhere does not mean that it would suit our requirements. Countries with ample agricultural resources and comparatively small export trade can afford to make economical experiments of a revolutionary nature without incurring the risk of starvation, but we here depend for our bread and butter

on being able to maintain our position in the markets of the world—and not a State-controlled world, but a world of all sorts, and a competitive one at that. We should take thought, therefore, before we tamper with a system which, with all its faults, has so far kept us in the van of progress and I firmly believe will continue to do so.

## BRITISH INSULATED CABLES, LIMITED

### SIR ALEXANDER ROGER ON POST-WAR TASKS

The forty-eighth ordinary general meeting of British Insulated Cables, Limited, will be held in Liverpool on the 20th instant.

The following is an extract from the statement by the chairman, Sir Alexander Roger, K.C.I.E., circulated with the report and accounts:—

Turnover has been almost as high as that of 1942, but there have been important changes in its composition; and this, coupled with higher costs, has resulted in a reduced rate of profit and a decrease in the total trading profit. The decrease, however, has been mitigated by the use of part of the E.P.T. cushion available from previous years, leaving the profit as stated in the accounts £18,778 lower at £1,130,253. The heavy burden of income tax is strikingly revealed in the provision of £566,482 necessary for estimated liability on 1943 profits.

#### PROBLEMS OF COMING CHANGE-OVER

We are still in the throes of war, but the signs and portents encourage us to take the view that we are in sight of a victorious conclusion of the European war, while definite progress is being made in dealing effectively with the Japanese menace. It would be well, however, if the public, which is so deeply interested in industry, were able to give some thought to the immensity of the task which will have to be undertaken in due course by both Government and people in changing over from war to peace and also to some of the problems which will require to be overcome.

When peace comes the vast war production will gradually cease and the gap must be filled by the production of civilian needs if we are to reach full employment successfully. We are going to meet numberless difficulties in achieving this, but there are encouraging features which we can and will convert for the common good, and our international traditions and experience will be of great aid in such directions.

It is probably easier to convert from peace to war than from war to peace, and it must be remembered that it has taken years for industry to achieve the present great volume of war output. Conversely, it will take years before we are completely turned over to peace-time occupations.

#### ECONOMIC COLLABORATION OF ALLIES

There is also real ground for hope that economic collaboration will come about on

(Continued from page 512)

mainly to the calling up for the Services and the introduction of part-time uninsured workers in industry. The Unemployment Insurance Committee does not speculate, or offer any suggestions, about the future use of the Fund—since this is not its function. The Exchequer may well be glad to have it in hand against any dislocation that may arise in the transition from war to peace or the development of any temporary post-war slump.

#### Fewer British Films

In answer to a question in the House of Commons on April 4th, Mr Dalton, President of the Board of Trade, pointed out that the number of British long films (that is, feature films) registered during the year ended March, 1944,

a mutually satisfactory basis between the United States, Britain, Russia and China, and if that not too easy task is surmounted many other nations will follow their example. One of the few benefits which have already arisen from this war is the better understanding and the satisfactory growth of mutual respect among the United Nations.

It is true that competition for world markets will be keen, but much has been done in this country to modernise plant and machinery during the war, and the finest machine tools have been installed, not only in big plants, but in thousands of small plants, leading to much improved methods in factory production generally.

As I see it industry must work and strive ever harder to produce everything that is asked of it for the war in Europe and in the Pacific until the last shot is fired. Secondly it should collaborate and plan effectively so that it may carry out successfully the change-over from war to peace and so rebuild employment and prosperity.

Government will then be free and undisturbed for the gigantic task of directing the prosecution of the war followed by the almost equally onerous task of planning a world peace that will endure.

## AUTOMATIC TELEPHONE AND ELECTRIC COMPANY, LIMITED

### RECORD OUTPUT

The twenty-fourth ordinary general meeting of this company will be held, on the 20th instant, in Liverpool.

The following is an extract from the statement by the chairman (Sir Alexander Roger, K.C.I.E.) circulated with the accounts:—Factory output was the highest in our history. Profit on trading, dividends on investments, etc., at £280,952, after providing for taxation and adjustment of provision for contingencies, compares with £261,888. Net profit is £212,312, compared with £191,005. After deduction of income-tax on 1943 profits of £127,478 and dividends already paid of £17,324, your directors recommend: transfer of £20,000 to war contingencies reserve; final dividend of 7 per cent. on the ordinary stock (making 10 per cent. for the year), plus a cash bonus of 2½ per cent., both subject to tax; dividend of 10 per cent. on the deferred stock and shares, plus a cash bonus of 2½ per cent., both subject to tax. The carry forward, £130,348, compares with £138,669 brought in.

In these days, when private enterprise is under fire, the experience of this company might be of value. In 1911 we purchased for a large sum from America the manufacturing rights, patents and technique of a pioneer system of automatic telephony known as the "Strowger." We modernised our old factories and built new ones. We improved the amenities for our employees. We spent large sums annually on research, development, education, the accumulation of technique, improved processes, exploitation and its attendant risks, better machinery, and steadily reduced the cost of our

products and our selling prices. I am convinced that our progress, designed to secure prosperity and stable employment, could not have been achieved under public ownership.

## JOHN BARKER AND COMPANY, LIMITED

### JUBILEE YEAR

The fifty-first ordinary general meeting of John Barker and Company, Limited, was held, on the 12th instant, at 99/121 Kensington High Street, London, W.

Mr Trevor A. Bowen, D.L., J.P. (chairman and one of the joint managing directors), said that they celebrated this year the jubilee of the company, and, as they looked at its present position, he thought they could heartily congratulate themselves on the remarkable growth of the business. Fifty years ago it had been a matter of practically only local interest; to-day it was an institution national in its character, universal in its service, in itself a street of shops, an amazing progress in the span of an ordinary lifetime.

Trade conditions had been exceedingly difficult during the past year, particularly as regarded shortage of staff, while in connection with the issue of Orders and trader regulations they had almost reached a position now which imposed a breaking strain upon business efforts. Having regard to those facts, he thought it would be agreed that the resulting net profit of £329,068 for the year under review was satisfactory.

The report and accounts were adopted and the proposed dividend of 10 per cent., less tax, was approved.

## WESLEYAN AND GENERAL ASSURANCE SOCIETY

### MANY GOOD FEATURES

The one hundred and third annual general meeting of the Wesleyan and General Assurance Society was held, on the 4th instant, at Birmingham.

Mr Arthur L. Hunt, F.S.S., F.C.I.I. (chairman and managing director), said that there were many good features in the one hundred and third annual report and statement of accounts before them. In the ordinary department 7,057 policies had been issued during the year assuring £1,275,270, and in the industrial department 96,510 policies assuring £2,602,375. There was a substantial increase in the number of policies on the books, there being now 107,222 policies in the ordinary department and 2,155,797 policies in the industrial department. The premium income of the ordinary department had increased by £43,521 in the year to £861,673, and that of the industrial department by £65,336 to £1,637,899.

The assets listed in the balance-sheet now amounted to £19,771,016, having increased by £869,083 in the year.

A satisfactory volume of business continued to be transacted in the fire and general departments.

The report was adopted.

was 70, compared with 103 during the year ended March, 1939. The reduction in output, as is well known, is not due to any sinister attempts by American producers to dominate the British cinema, but to the shortage of manpower and studio space, most of which has been requisitioned by the Government. After the war these limiting factors on British production will disappear. But the existence of adequate physical capacity, and even of financial resources, will not in itself lead to a flourishing film industry in this country. This again is by now well known. The real problem of the industry is to produce, not so much more films as a greater number of films of a quality that the public is anxious to see. There is no short cut to the fulfilment of this aim. It can only be fulfilled gradually by the creation of first-class teams of producers, directors and script writers. It is an uphill job.

## FINANCE AND BANKING

**THE MONEY MARKET.**—Credit has been available in abundance during the week. The bank cash position has been eased by a net increase of about £3,500,000 in securities held by the Bank of England and a decrease of about £2,000,000 in Public Deposits. Of these combined stimuli to the volume of bank cash £4,320,000 has been neutralised by a further expansion in the note circulation. This has left £1,352,000 to be added to bankers' deposits which, at £168,184,000 are at a level in keeping with the comfortable conditions experienced in the money market this week. The latest increase in the note circulation carries the expansion for the past three weeks to £30,000,000 or more than twice the increase in the corresponding Easter weeks of 1943. The past week's expansion has reduced the reserve of unissued notes to £26,694,000.

**MONEY RATES, LONDON.**—The following rates remained unchanged between Mar. 31st and April 13th: Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½%; 6 months, 1½%; Treasury Bills: 2 months, 1-1½%; 3 months, 1-1½%; Day-to-day money, 1-1½%. Short Loans, 1-1½%. Bank deposit rates, ½%. Discount deposits at call, ½%; at notice, 1%.

**Exchange Rates.**—The following rates fixed by the Bank of England remain unchanged between Mar. 31st and April 13th. (Figures in brackets are par exchange). United States, 3 (4-88) 4-02½-03½; mail transfers 4-02½-03½. Canada, 1 (4-88) 4-43-47; mail transfers 4-43-47½. Switzerland, Francs (25-28) 17-30-40. French Empire, Francs 1971-2001. Syria, p. 8-81-85. Sweden, Krona (18-169) T.T. 16-85-95. Dutch West Indies, Florin (12-11) 7-58-6. Portugal, Escudos (110) 99-80-100-20; mail transfers 99-80-100-30. Panama, 64-02-04; mail transfers 4-02-04½. Brazil, 83-64½ cr. (buying); mail transfers 83-56½. Uruguay, 7-6597 p. (buying).

**Fixed Rates for Payment at Bank of England for Clearing Offices.** Spain Pesetas 44-00. Turkey, Piastres 520. Italy, 71-25 lire.

**Marked Rates.**—The following rates remained unchanged between Mar. 31st and April 13th. Egypt, Piastres (97½) 97½-1. India, Rupee (18d. per rupee) 17½-18½. Siam, Baht (100) 17-18½. China, National 33-3½. Iran, Rl. 128-130.

**Special Accounts** are in force for Chile, Peru, Bolivia and Paraguay, for which no rate of exchange is quoted in London. Rate for payment into Argentine special account: 16-15 pesos.

## GOVERNMENT RETURNS

For the 8 days ended April 8, 1944, total ordinary revenue was £51,508,000, against ordinary expenditure of £12,100,000, and against sinking fund allocations of £72,965. Thus, including sinking fund allocations the deficit accrued since April 1st is £60,665,000 against £120,484,000 for the corresponding period a year ago.

A change has been made in the method of showing excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £64,898 to £3,357,832, the other operations for the period (no longer shown separately) raised the gross National Debt by £2,559,994 to £19,653 millions after allowing for £15 million for sinking funds in 1943-44.

## Can We Afford It?

IT is always rash to rule out the possibility of surprises on Budget Day. But the prospects are that when Sir John Anderson opens his first Budget on Tuesday he will produce few novelties so far as the revenue and expenditure of the present year are concerned. It may be, however, that he will give the House of Commons and the public their first glimpse of post-war plans and possibilities. Clearly, there is a double need for financial reconstruction plans: first, because the fiscal and budgetary system needs some reconsideration; and secondly because finance is a part of every other plan. The nature and weight of post-war taxation are, in themselves, a fascinating subject which deserves careful exploration. But it is subject to the overriding question of how large the operations of the Government are going to be. When the tide of abnormal war expenditures had ebbed after the last war it was found that the level of expenditure had permanently risen from less than two, to something more like eight, hundred millions a year, or expressed—as it is more accurate to do—in terms of the national income, the increase was from around 7 per cent to around 17 per cent. What is to be the experience this time? There is no lack of projects for spending public money. How many of them can we afford?

The objection that the money cannot be found for

projected expenditure, or that the finding of it would involve inflation or the even more nameless disasters associated with departure from "sound finance" seems very old-fashioned to-day. Indeed, a war generation which has witnessed the raising of £3,000 million in taxes, and the spending of twice as much, almost all of it on destruction, is understandably impatient of arguments that suggest any impossibility in spending much smaller sums on much worthier objects. The only argument that such a generation will respect is the physical one: if the men and materials are available to do the job, it can be done, otherwise not.

But this new mood of revolt from purely financial limitations shows signs of going much too far in the opposite direction. For one thing, even in a strictly physical argument, the conditions of war cannot be translated bodily into the conditions of peace. Such enormous sums can be spent by the Government in wartime only because the public is content to consume only about half of what it produces and, moreover, to do so in a straitjacket of controls. The distribution of the national resources will be very different in peacetime, and the Government share will be much smaller than it is to-day. The really relevant question is whether the British people, when they have returned to the ways of peace, will be willing

## THE CHARTERED BANK OF INDIA AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

CAPITAL (PAID UP) - £3,000,000

RESERVE FUND - £3,000,000

Branches and Agencies throughout INDIA and the EAST AFFILIATED BANK IN INDIA

THE ALLAHABAD BANK LTD., with 15 Branches &amp; Sub-Agencies

The Bank offers a complete Banking Service and provides exceptional facilities for financing every description of trade with the East.

Deposits for Fixed Periods or repayable at call or at short notice are received at rates which may be ascertained on application. The Bank also undertakes Trusteeships and Executorships.

## ASHANTI GOLDFIELDS CORPORATION, LIMITED

NOTICE IS HEREBY GIVEN that a Final Dividend (No. of 35 per cent, less Income Tax at 10s. in the £, has this been RECOMMENDED on the issued Capital of the Corporation in respect of the year ended 30th September, 1943, and will be payable on and after the 12th May, 1944, to all Members on Registers on the 12th April, 1944.

In the event of Dominion Income Tax Relief being due Members as the result of the imposition of Income Tax by Gold Coast Government, the gross rate of this dividend will be varied so as to leave the net dividend unaltered.

THE TRANSFER BOOKS WILL BE CLOSED from the 20th April, 1944, both dates inclusive, for the preparation of Dividend Lists.

By Order of the Board.

H. E. ASHBY, Manager and Secretary  
 Temporary Registered Address: St. Hilda's, Bushey, Hert  
 12th April, 1944.

## BIBIANI (1927), LIMITED

NOTICE IS HEREBY GIVEN that a Final Dividend (No. of 17½ per cent, less Income Tax at 9s. in the £, has this been RECOMMENDED on the Capital of the Company in respect of the year ended 30th September, 1943, and will be payable on and after the 12th May, 1944, to all Members on the Registers on the 12th April, 1944.

In the event of any further Dominion Income Tax Relief being due to members as the result of the imposition of Income Tax by the Gold Coast Government, the gross rate of this dividend will be varied so as to leave the net dividend unaltered.

THE TRANSFER BOOKS WILL BE CLOSED from the 20th April, 1944, both dates inclusive, for the preparation of Dividend Lists.

By Order of the Board.

H. E. ASHBY, Secretary  
 Temporary Registered Address: St. Hilda's, Bushey, Hert  
 12th April, 1944.

## THE CUNARD STEAMSHIP COMPANY LIMITED

NOTICE IS HEREBY GIVEN that the Sixty-seventh Ordinary General Meeting of THE CUNARD STEAMSHIP COMPANY LIMITED, will be held at CUNARD BUILDING, in the City of LIVERPOOL, on Wednesday, the 26th April, 1944, at 10 o'clock a.m.

1. To receive and consider the Statement of Accounts Balance Sheet to the 31st December, 1943, with the Report of the Directors and Auditors.

2. To sanction the declaration of final dividend for the year 1943.

3. To elect Directors and Auditors in place of those retiring, but who being eligible offer themselves for re-election.

By Order of the Board.

H. J. FLEWITT, Secretary  
 Offices: Cunard Building, Liverpool.  
 13th April, 1944.

to let the Government dispose of a larger fraction of their annual output of goods and services than it did before; and if so, how much larger.

This is the economic argument. But before it is pursued, the observation must be made that purely financial factors cannot be quite so cavalierly swept aside. Even if the reconstruction enthusiast can convince himself that material resources and manpower are available for his project, the Chancellor of the Exchequer has still to find the money. The money, in most cases, can—or at least should—be raised only by taxation. The idea of a double budget, for income and capital items, is now very widely accepted, and it would be reasonable that the capital budget should not have to be strictly balanced every year. But the normal, continuing expenditure of the state belongs in the income budget and should ordinarily be met out of revenue. There are limits to the raising of taxes. There are political limits—it is questionable whether the public, in peacetime, would tolerate a 10s. income tax, with such reduced allowances, or duties on beer and tobacco of anything like the present height, or a purchase tax of the present dimensions. There are also economic limits—every tax reduces in some degree the incentive to economic activity, and it may be that the growth of the National Income, on which even the most severely non-financial argument is predicated, would be hindered if the level of taxation were too high. Such very productive wartime taxes as the EPT should, for this reason, be wholly removed when the war is over. The finding of the money is thus not quite so negligible a factor as is often implied.

#### Transfer Payments

This is what lends importance to the so-called "transfer payments" which, because they impose no burden on the output of real resources, are customarily ignored in the National Income calculations. It is true that if a sum of money is raised and paid out as interest on the National Debt, no materials and no manpower (except that of the clerks in the Debt Office) have been used up. This is true; but the money still has to be raised. Similarly with Social Security schemes, the effect is to transfer command over real resources from one set of individuals—the well-to-do, the employed and the healthy—to another set of individuals—the poor, the unemployed and the ill, rather than to use up any resources. Nevertheless, the raising of the large sums involved sets a problem for the Chancellor of the Exchequer—for, of course, even if the employers' and the employees' contributions are not brought into the Budget they are nevertheless taxes. It is probable that, after the war, the annual cost of the National Debt will be at least £250 million more than it was before the war. The additional cost of Social Security, according to the Beveridge plan, will be a slightly larger sum. The total of £500-600 million is not a charge on the National Income; it is not even a net charge on the Budget; but it does use up taxable capacity which would otherwise be available for other purposes. Nevertheless, though these financial difficulties cannot be ignored, they are less fundamental considerations than those that concern the absorption of real resources. In the last pre-war year, the Gross National Income of the United Kingdom was £5,587 million\*, divided among the main constituents as follows:—

|                                                                              | (£ millions) |
|------------------------------------------------------------------------------|--------------|
| Government (incl. Government expenditure on capital).....                    | 845          |
| Public—Consumption.....                                                      | 4,035        |
| Maintenance, replacement and increase of capital, domestic and overseas..... | 707          |
|                                                                              | 5,587        |

How much larger will the total be, at the same value of money, after the war—not immediately after the

\* Footnote for statisticians: This is Net National Income at market price plus a conventional figure of £475 million for expenditure on depreciation. It has been assumed that there was no Government expenditure on capital overseas.

armistice, but after the demobilisation is complete? The estimates cover a wide range, from those who predict a fall to those who foresee an increase of 25 per cent or even more. Reasons have been given in *The Economist* for expecting some increase†, and it would be reasonable to conclude from the experience of last time that the increase might be about one-tenth or one-eighth. The increase may turn out to be greater than this—there is some reason for hoping so; but this is, more than most, a matter where unhatched chickens should not be counted, and an increase in the available resources of from £560 to £700 million would seem to be quite as much as can prudently be assumed. Even this reposes on assumptions about unemployment and overseas trade which are reasonable but by no means certain.

Who are the claimants on this sum? Much as public opinion is supporting schemes for what can be called Government-sponsored consumption—such things as education, hospitals, houses—it is most unlikely that any reduction in voluntary consumption—that expenditure over which individuals have full control—will be popular. Quite on the contrary; not only will there be arrears of consumption expenditure to be made good, lasting over many years, but the whole apparatus of incentives to consumption will be once again in full swing. Economists can argue that, in the national interest, the level of consumption ought to be kept below its 1938 level; politicians know that it will not be. Indeed, especially if there is less unemployment than there was in 1938, the likelihood is that voluntary consumption will be higher. As a matter of probability, not of desirability, some part of the £560-700 million should be allocated for this. (Increases due to the rise in prices are, of course, excluded from this calculation.)

The allocation for capital—the third of the items in the above table—will also probably be higher. There can be no question that it ought to be higher. The replacement of wartime capital wastage and the overtaking of arrears of maintenance and replacement will last for many years, and in addition there is a growing realisation that the nation's rate of accumulation of capital in the inter-war years was too low. If the technical efficiency of British industry, on which the growth of the standard of living depends, is to keep pace with other countries, more resources will have to be sunk, year by year, in the upkeep and increase of plant. For these reasons, an increase in the capital item should be budgeted for.

How much does this leave available as a fund that can prudently be regarded as available for additional Government command over real resources of manpower and materials? It is difficult to say; but the figure can hardly be more than £350 to £400 million a year at 1938 prices (the postwar figure depending on the level at which the value of money settles down). This is not a large sum. Expanded and more heavily equipped defence forces will be the first charge on it and the increase in defence expenditure can hardly require less than half the suggested total. The "ultimate" increase in the cost of education is estimated at £102 million, but at a price-level higher than that of 1938. There is a similar projected increase in expenditure on health services of nearly £80 million, though some part of this should be reckoned as "transfer payments." The cost of housing and town planning has yet to be specified, but is not likely to be small.

#### Call a Halt

It is difficult to resist the conclusion that the available fund is already mortgaged and that the time has come, not on grounds of "sound finance" but of material prudence, to call a halt. It may be, to repeat, that the estimated increase in the National Income which underlies this calculation will turn out to be unduly pessimistic. If so, so much the better; the feast when the chickens hatch can be all the larger—and, indeed, it will be legitimate to prepare a larger feast as soon as it becomes apparent that a larger brood is going to hatch. But any more optimistic estimate rests on theory and on assump-

† "Shall We Be Poorer?", *The Economist*, December 18, 1943.

tions; it outruns anything that can be deduced from ascertained experience; and it involves the belief that the as yet untried techniques of economic management are going to be as successful as their advocates (of whom *The Economist* is one) hope they will be. On the other hand, the dangers of over-optimism are very real. If the Government is committed to an expansion in its own expenditure on goods and services larger than the increase in the National Income actually turns out to be, then either the consumption of the public or else the provision for the maintenance, replacement and increase of the community's capital equipment will necessarily suffer. If the British public, after five years of unprecedented exertion, is prepared to impose a further self-denying ordinance on itself—and prepared not merely to do so in theory, but to suffer the practical inconveniences of doing so in practice—then well and good. But not even the most convinced believer in the nobility of a democratic electorate would advance this as a reasonable probability. The likelihood is that if the Government sector of the national income is too rapidly expanded, it will be the provision for capital that will suffer. There could hardly be anything more calamitous. The lesson can be clearly drawn either from the East or from the West, either from

the communism of Russia or from the capitalism of America, that the rate of increase of a country's productivity, its strength in war and its wealth in peace, rest on a regular and adequate provision for capital. This is not a matter of theories of ownership; Socialist and Capitalist can be at one in realising that to expand the immediate level of consumption—voluntary and state-organised together—at the cost of its future increase would be the most improvident of all policies.

The throwing of cold water on enthusiasms is never a pleasant task. But a little of it is needed now. This is—it should hardly be necessary to say—no argument against proceeding as rapidly as possible with those items of reconstruction that are already firmly on the agenda; it is an argument for pausing to inquire whether projects for spending public money have not now gone just about as far as they should. One of the great slogans of the present age is that, if a plan is physically feasible, mere shortage of money should not stop it. The slogan is a true one—or an almost entirely true one. But in the enthusiasm over its discovery, another equally true principle is being neglected—that if the physical resources are not adequate to do everything at once, no financial contrivance can make them so.

## Pressure on the Neutrals

IT is a mistake to think of Mr Hull's warning to the neutrals and the British and American Notes of protest as a new departure. They are part of a consistent policy of economic pressure which began with the war and has grown more and more intensive ever since. In the first year, the principle underlying Britain's war trade agreements with the neutrals was to persuade them to limit their trade with the Axis to its pre-war volume. This principle was later abandoned, and for at least two years now the aim of all negotiations with the neutrals has been to persuade them to reduce their trade with Axis countries to the smallest possible amount and, where persuasion failed, to use direct pressure. This sometimes takes the form of cutting off vital outside supplies. Another effective method is the black-listing of individual firms. The stoppage of all oil supplies to Spain this spring followed earlier and less publicised precedents.

While a general reduction of trade with Germany was sought, particular emphasis was laid at different times on different articles of export. Last year, for example, precision instruments and vital manufactured parts such as Swedish ball-bearings or Swiss fuses were high on the priority list of the British Ministry of Economic Warfare and the former Board of Economic Warfare in America

(now absorbed into the Foreign Economic Administration). In the last nine months or so, the emphasis has been extended to metals and particularly to the ferro-alloys. The German war effort is growing exceedingly short of special steels. This fact has been confirmed by recent examinations of German weapons. Twice last year, the chief source of molybdenum at Knaben in Norway was bombed, with the result that over a year's production has been very seriously curtailed. The loss of Nikopol has deprived the Germans of their chief supplies of manganese. Tito's guerrillas have made the delivery of chrome ore from the Balkans very precarious. The Germans have become more and more dependent upon the deliveries of chrome from Turkey and of wolfram from Spain and Portugal. Tungsten, which is derived from wolfram and for which there is no satisfactory substitute, is essential for tool tips in armament production and for the shot-cores for tank and anti-tank guns. So highly do the Germans prize it and so short are their supplies that they have even equipped submarines as blockade runners to bring in minute amounts from the Far East. Their only substantial source of supply is the Iberian Peninsula.

This year both Sweden and Switzerland are making substantial reductions in their exports to the Axis. During

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

For particulars apply to:—

Incorporated  
A.D. 1720

**ROYAL EXCHANGE Assurance**

Head Office at the Royal Exchange, London

the last few days, the Swedes have themselves published the fact that their reductions, notably in iron ore and ball and roller bearings, are the result of a new War Trade Agreement negotiated last year in London with the British and American Governments. The other neutrals, Spain, Portugal and Turkey, have in the past limited their trade with Axis countries and there were a number of reasons why, last year, no new pressure was brought to bear on them. In Portugal, the needs of strategy seem to have taken precedence over economic warfare. The chief concern of the British Government was to secure the use of the Azores base. In Spain, political questions such as the presence of the Blue Division in Russia were under discussion and there was the British need to get certain supplies from Spain to set against the need to reduce Spanish exports to Germany. Turkey was still thought to be a potential belligerent. These seem to have been the main reasons why no greater economic pressure was exerted on Turkey and the Iberian states. It should be remembered, too, that in many ways they are less dependent upon outside supplies than either Sweden or Switzerland.

The new value set on metals by the Ministry of Economic Warfare would in any case have led to new attempts to limit Germany's supplies during 1944. The stoppage of oil supplies to Spain in February was the first sign of a new approach. But while the aim of the new initiative in no way differs from the Allies' consistent policy, the manner and method are new. Supplies have been cut off from neutrals before, but without publicity. Great pressure has been put on their governments, but it has not made headlines in the daily press. In 1944, the methods have been revolutionised. The stoppage of supplies to Spain was fully advertised. Mr Cordell Hull's recent warning and the Notes despatched to the neutral governments are front page news. The aim of all this is unexceptionable. The neutrals are assisting the enemy,

Turkey in particular has actually increased its shipments of chrome. The only question is: can the method of full publicity give as good and as quick results as the old less sensational methods? If not, is it wise to repeat the Irish experiment and risk an open rebuff?

It is difficult at this point to assess the wisdom of the new approach. It has the major disadvantage of raising in each case the question of "national honour." No government likes to look as though it were yielding to pressure, and the attitude of the De Valera Government may very well be repeated. The Swedes plead the special difficulty of having very recently concluded a new trade agreement with Germany in which all the ceilings set in their previous agreement with the Allies were observed; and in Spain there is the very real danger that if agreement is not reached, large quantities of wolfram which are stored near the frontier may be despatched to Germany *en bloc* in the next few weeks. It may now be that the prospect of an Allied victory is so certain, that a much publicised heavy hand will have effect. But this has not been the case in the past. In making concessions to German pressure, smaller states have always had the fear that military intervention might follow. It is a tribute to the Allies that the neutrals have no such fear in their dealings with them, but this fact very seriously limits the effectiveness of a policy of open pressure and threat. If the earlier policy of unpublicised pressure had had no effect, there might be some point in this new method of frontal attack. As it is, the Allies may well increase the smaller states' fear that, after the war, they will find their policies managed and controlled by their great neighbours. Their co-operation will be needed if any of the post-war schemes of reconstruction are to be successful. Yet to use the big stick now may well drive them to an uncooperative attitude when the time for peace making comes.

## The Site of Government

IN one sense the distinction that is commonly made between central and local government is unreal, or at any rate incomplete. In practice, almost all administration is local in the sense that it affects particular persons in particular places. If the seat of government is in Westminster and Whitehall, the site of government is in Birmingham, Bootle and Broadstairs.

This is true whether administration on the spot is done by national or local officials. The difference between centralised systems of government, such as prevailed mainly on the Continent before the war, and our own less centralised form is not that, while in the one case major decisions are made at the centre, in the other case they are not. In few cases are more of the major decisions of administrative policy made more centrally than in this country. The difference lies in the fact that an unusually high proportion of administrative activity is carried on by locally appointed officials responsible in their day-to-day duties to locally elected bodies, who carry out duties placed on them or permitted by central statutes, and under the supervision of central departments.

There is thus a large, though lessening, penumbra of freedom which allows each local authority to reflect and respond to the wishes—or the apathy—of local communities. Politically the major task, as the scope of public administration, central and local, extends, is to preserve this margin of local decision; and the sanction of local responsibility is the proviso that public services which are locally administered should be largely locally financed.

Lest it should be thought that this recital of familiar constitutional facts belongs too much to the field of political theory and too little to that of political practice, it should be said at once that there is no more important single item in the drafting of a programme for postwar

reconstruction than this question of the division of tasks and costs between central and local bodies. In peacetime the local administration of public services by national officials, and wholly out of national funds, was chiefly confined to the Post Office, the Ministry of Labour, the Inland Revenue and, for a very few years before the war, the Assistance Board. Other local services, including the key activities of education, public health, police and much road construction, were locally administered. That is to say, they were performed by the local officers of local councils and in large part financed out of local rates.

It is therefore not possible to say simply that, to avoid wartime controversy, the reconstruction of local government must be put off until the reconstruction of the public services has been completed. It is essential to ask from the outset whether it is possible to maintain popular local control of local administration and at the same time to ensure efficient performance and adequate financing. This is not to suggest that there can or should be any radical refashioning of the present administrative system. In theory it might perhaps be desirable to start again: to sweep away the structure of districts, boroughs and counties which has grown up piecemeal during the past century out of the older administrative units of earlier history; and to put in their place new local authorities devised and mapped so as to ensure that each local service would be operated in the most appropriate area for technical efficiency. Many proposals have been made for a new three-storey structure of administration. This would interpose a new layer of regional authorities between the Whitehall departments and the local authorities. The regional authorities would work in areas similar to those covered by the present civil defence regions, which have been employed for administrative

purposes during the war by a number of wartime Ministries. To each kind of administrative agency, central, regional and local, would be attached its own source of revenue, so that administrative responsibility would still be matched by financial responsibility at each level.

It is probable that the evolution of local government is already moving in this direction. Both the Education Bill and the Health White Paper give signs of it. The main administrative principle of the former is that, so far as possible, all stages of education in each area should be operated by a single authority, usually a county or county borough, in order to secure uniform and continuous standards of administration and policy. In the latter case, joint regional authorities are to be created or the administration of services, such as hospitals and specialist treatment, which can only be made fully effective if they can draw on the resources of areas larger than those of most existing local authorities. In the case of town and country planning, the necessity for regional uniformity and co-operation has long been recognised.

But it remains necessary, in practice, to build upon and adapt the existing system, which has deep roots in history and tradition, rather than to make revolutionary changes according to preconceived and theoretical principles. We cannot say with Pope or the totalitarians that "What e'er is best administered is best." If British democracy is again to flourish, nothing is more important to keep or revive than representative and responsible local government in the areas which, despite large and often artificial changes, still stand, however weakly, for a sense of communal pride and for communal liberties. The historic counties of England have been as chopped and changed as the ancient diocesan sees, but tradition still breaks through, and its image is local election and local responsibility.

The question then is: Can the existing local authorities do the job and pay their way? And it must be answered before, not after, the reconstruction programme is finally drawn up. Already it is very clear (as was pointed out in two articles in *The Economist* on September 25th and October 2nd last year) that, with the present distribution of administrative and financial burdens between central and local authorities, it will be impossible to carry out even the extensions of locally administered educational and health services that have already been proposed. The rough and ready estimates attached to the Health White Paper propose an increase of something like a fifth in the rate charge for public health. The added charges proposed in the Education Bill are even larger and would, by themselves, involve an increase in the rates, on the average of all local authorities, of nearly 3s. in the £. Administratively, it is possible to proceed towards a solution step by step—as by the institution of single county administration in education and joint regional authorities for public health or planning. Financially, there is no such empirical remedy.

Is it possible, while preserving the present system, either to increase the financial resources of local authorities or to decrease their financial commitments? Before the war the average rate poundage throughout the country was between 13s. and 15s. in the £, and varied in county boroughs between 27s. 6d. in the £ in Merthyr Tydfil and 7s. 10d. in Bournemouth. It would be possible, and certainly desirable, to equalise rates by levying them at a uniform rate in all localities and then distributing the proceeds from a national pool according to need. This would get rid of the worst discrepancies. But some authorities would still have considerably more rateable capacity to draw upon than others; and the addition of the extra charges already contemplated, whether equalised or not, would probably raise the general level of rates above 20s. in the £.

Several ways of increasing local revenue without raising the rate burden to such onerous levels have been suggested. One is to go back on the derating of industrial and agricultural properties which was dictated by the interwar depression. Another is the introduction of a local or regional income tax—which would simply cut into or add to the central income tax. No way suggested

seems likely to do more than soften the asperity of the problem. Almost certainly it will be necessary to follow the alternative road—that is, to reduce the total of expenditure falling upon local funds.

The danger of doing this is that the principle of local responsibility may be weakened. The present rough division is half of the expenditure from taxes and half from rates. There are people who see the solution in an alteration of this proportion. During the committee stage of the Education Bill it was proposed that the Government instead of meeting 55 per cent of the cost should meet 70 per cent. But it is hardly consistent for the local authorities who see in the Education Bill a considerable and ominous increase in the mandatory powers of the Board of Education, to ask at the same time for a reduction of the local share of financial responsibility. For this would almost certainly carry with it a reduction also of the local share of administrative responsibility. The local authorities are being very short-sighted, in their own interest, in asking for larger grants from the Exchequer. Thereby their freedom of action would undoubtedly be curtailed rather than enhanced.

Thus it appears, from a process of elimination, that the only practicable solution is to reduce local commitments by reducing the number of locally-administered and locally-financed services. The local authorities could then continue to be, if not masters, at least partners in their own house, though the house would be appreciably smaller. Already public assistance is passing to the central administration. A deal of highway expenditure has already gone that way. On financial grounds a case could be made for the transfer of police powers and costs; but on political grounds the institution of a completely centralised system of police would be undesirable. A better subject for transfer might be housing. But even these transfers would still leave local authorities in serious doubt about their capacity to finance the locally-administered services that would remain. Because of the importance of local initiative and diversity in schooling, to transfer education, the most costly item, would be the poorest of policy. There can be little question that a sufficiently large saving in rate expenditure could only be made by transforming public health, the highest single charge on local funds after education, into a national service.

To those who say that the transfer of health services would be a serious lessening of local responsibility in a vital sphere, the answer can only be that, without some such drastic step, the local authorities will be financially incapable of maintaining their present degree of democratically controlled responsibility in any sphere. Better a complete surrender in one sphere than an almost complete surrender in all. The local authorities would in fact gain much more than they would lose; in the services left to them they would still have the chance, which they are now in considerable danger of losing, of successfully combining efficiency, popular control and financial solvency.

### THE MISSING TECHNICIAN

IN INDUSTRIAL PRODUCTION

JOHN GLOAG

A practical study of the operation of design research work in industrial production which emphasises that unless British goods lead in matters of design they will lose markets at home and overseas. "An eminently practical treatise."—*Advertisers' Weekly*.

"The reader's normal expectation of fascinating reading when Mr. Gloag has anything to tell him will be fully realised."—*Hardware Trade Journal*.

## China's Seventh Year

THE Japanese penetrations into Manipur and the transfer of Admiral Mountbatten's headquarters from New Delhi to Ceylon have been accompanied by scores of criticisms and commentaries covering every aspect of Allied policy in the Far East. From them has emerged the fact that many observers in America believe the British and Americans to hold completely different views about China and, as a result, to be advancing different strategies for a Far Eastern victory. This view would have it that the British have no respect for China either as a political or a military power and think of the Far Eastern war in naval terms with the "liberation of the British Empire"—Singapore and Hongkong—as the first objective, while the Americans believe in China as a Great Power, count on its military assistance and therefore put the highest priority on the reopening of the Burma Road. A contrast is being built up between a British "amphibious" strategy and American belief in the direct approach by land.

The absurdity of this supposed division of view is obvious enough. The chief exponent of the "amphibious approach" to Japan, via the Philippines and landings in South China, is not Admiral Mountbatten in Ceylon but

Admiral Nimitz in Hawaii. And on the other hand, there are more British and Indian troops fighting in Burma than American and Chinese. In the political sphere, Britain certainly did not lag behind the United States at Moscow or Cairo in recognising the status and prestige of Free China. Finally, it is from the United States that the most factual statements about Chungking's internal difficulties have come. Yet even though the supposed division between British and American opinion is fanciful, the question on which it turns—the political and military contribution that China can make to the Far Eastern war—is vitally important, and any discrepancies which may exist in the British and American approach must be ironed out now.

It is undoubtedly true that Free China faces formidable internal difficulties. The financial machinery of the Chungking Government is breaking down under the triple pressure of a bad tax system, the lack of consumer goods and the unreliability of the civil service. Little attempt is made to evolve and impose a genuine budgetary policy. Income tax stands at only four per cent and even so does not touch the cost of living bonuses, which now make up nine-tenths of the income of the salaried classes. There is a provincial *octroi* but very little of the proceeds seems to reach Chungking. To finance its expenditure the Government has resorted to the printing press. The flood

of bank notes grows as the trickle of consumer goods decreases. The presence of foreigners increases the stringency. American officials and troops are paid on imported dollar notes. These are sold openly on the black market. Experts estimate that the cost of living index in Chungking in 1943, taking 1939 as 100, was 12,000. The pace of inflation is increasing and one must ask whether under these conditions the currency system will not collapse altogether.

The total failure of the Government's financial machinery would of course cripple the war effort. It would be a factor making for the political disintegration of China. But its likelihood and its effects cannot be judged by Western standards. Currency is much less important to the working of China's economy than to a more highly developed and industrialised system. About 80 per cent of the people live on the land. The Government's most effective tax is a tax in kind. Rice is requisitioned from the peasants and used to supply the hordes of men under arms. So long as there is no large-scale fighting, this system, though it leads to some discontent among the peasantry, keeps the army alive.

Against the growing economic insecurity at Chungking must be set the very great growth in political prestige which Marshal Chiang Kai-shek has earned by his diplomatic successes in recent months. The acceptance of China as one of the Big Four, China's signature of the Moscow Declaration, Marshal Chiang's meeting with Mr Churchill and Mr Roosevelt at Cairo—all these events have buttressed the authority of Chungking and helped it very considerably in rallying the dispirited and the wavering through long months of economic stringency and military stalemate. Nevertheless the internal political difficulties of the regime are probably more serious and immediate than any danger of economic collapse. There are besides Chungking two other competing centres of political authority, the so-called National Government of Wang Ching-wei at Nanking and the Communist headquarters at Yen-an in Shensi. Nanking has nominal authority in the areas effectively occupied by the Japanese. In South China, in spite of some trouble from local war lords, unoccupied territory is for Chungking. In the North a more complex situation has arisen. In Shensi the Eighteenth Chinese Army Group—formerly the Eighth—is the core of Communist control. Its headquarters at Yen-an are virtually a government with a writ running as far north as Hopei and Jehol and eastwards and southwards into occupied territory in North China. Remnants of the officially dissolved Communist New Fourth Army are still active near the lower Yangtse. Thus in between the areas of Japanese occupation, which coincide with the cities and the main lines of communication, the Communists are coming to exercise considerable influence. They organise effective guerilla warfare. They have set up village councils. Notorious quislings have been shot. And "mass mobilisation and political education" are reinforcing the hold of Communism on the peasantry.

The task of the Communist leaders is made easier by the collapse of the traditional Chinese social structure under the pressure of Japanese occupation. In South China, the old basis of society still holds. The petty rural gentry with their two or three tenants, their sons officers in the army and their cousins officials in the administration, are the dominant class and are nationally the social basis of the Kuomintang and of the Chungking Government. Their tenants are share croppers and this system of payment in kind often turns the landowner into a merchant and banker as well. There are few big estates, but in some provinces the pressure on the tenants is overwhelming. In the North, this structure has been ground away between the requisitioning Japanese armies and the requisitioning Communist guerillas. In its place, Communist political influence has some chance of lasting success.

This situation has been watched with growing anxiety

from Chungking. According to the 1937 agreements which the Communists concluded with Marshal Chiang they recognised his authority and agreed to an effective party truce. They have not kept it, and last autumn there was even fighting between the Chinese Army and the Communists. Some of the best Chinese troops are posted at Sian under the command of General Hu Tsung-nan, not only to guard the back door to Chungking, but also to blockade the Communists inside their province of Shensi. Many military leaders argue that time is playing into the hands of the Communists, that they are steadily building up a state within a state, and that unless they are dislodged now, the withdrawal of Japan from North China will be the preface not to reuniting China under its central Government but to the permanent division of China between rival Governments. Marshal Chiang Kai-shek wisely preaches moderation. Last September he admitted the difficulties of the situation at a meeting of the Kuomintang's Central Executive Committee but argued against civil war and said that political not military means must be used to solve a primarily political problem. Yet uneasiness is growing. Influential people at Chungking are disturbed by the formula applied by Mr Churchill to Yugoslavia—that arms and help will go to any resisting group, whether or not it accepts the authority of a government officially recognised by the Allies. Does this mean that the arms and goods which can alone make the Free Chinese armies effective will in the event be divided between Chungking and the Chinese Communists? The authority of Marshal Chiang's Government rests so much on the degree of international recognition it has received that any change of front on the part of the Allies would have violent repercussions at Chungking.

Wang Ching-wei and the Nanking Government are also factors in the problem. At present their influence is very small. Now that the certainty of Japanese defeat grows, the nominally puppet Chinese of Nanking behave in a less and less puppet-like fashion. The Japanese are trying to woo them—the latest treaty with Wang Ching-wei provides for the complete withdrawal of all Japanese troops from China after the war—but are finding that

the ways of obstruction open to Chinese officials far exceed the sands of the sea. The Japanese have in fact nothing to offer. Occupied China is even shorter of food than Free China, and the dearth of consumer goods is almost as great. There is inflation, black marketing, requisitioning, and even though the Tokyo High Command has decreed a policy of co-operation and good will, the local army commanders have made savage nonsense of it. So long as the Chungking regime can, with Allied economic and political backing, combat the fissiparous and disintegrating tendencies inherent in the present situation, the Nanking Government is little more than a cipher. But if Chungking were led by any major change in Allied policy to believe itself betrayed and abandoned, then the temptation to come to some understanding with Nanking might be very strong.

The political equilibrium of China is therefore very nicely poised and if the Western Allies approach the period of liberation with no more carefully prepared policy than in Africa and Italy—if, that is, they take far-reaching political decisions on the basis of temporary military expediency—the results may be disastrous. For the period of the war the Allies need a strong Chinese government dedicated to the alliance of the United Nations—in other words, they need to support Chungking. After the war they also need a strong central government in China—but with the proviso that it should be dedicated to peace with its neighbours and to democratic advancement and economic development at home. Whether the policy that is right for the war is also the policy that is right for after the war is, at the moment, very difficult to say. But at least there is no inevitable contradiction. If all the Great Allies could act in concert they could, by that fact alone, have a great influence on China's development. Unhappily, the anomalous position of Russia in the Far East—neutral as against Japan and with a certain natural sympathy with the Chinese Communists—makes such a policy impracticable to-day. But it is in this direction that British and American diplomacy should work, and the first step is to secure not only that London and Washington speak with one voice, but that the voice is clear.

## NOTES OF THE WEEK

### Mr Bevin Acts

The new Defence Regulation to restrain persons responsible for strikes or lock-outs is, in essence, a measure to reinforce the authority of trade unions over their members. It is for this reason a minor not a major measure. There already exist two wartime provisions against strikes. One, the Conditions of Employment and National Arbitration Order of 1940, prohibits strikes or lock-outs "in connection with any trade dispute." The other, Defence Regulation 1A of 1939, forbids acts "calculated to prevent or interfere with the carrying on of their work by persons engaged in the performance of essential services." The new Defence Regulation, 1AA, is formally designed to complete the picture by extending the penalties of the law to stoppages which, like the shipyard apprentices' strike, are not properly trade disputes, and to persons who are not bound by trade union agreements to abandon the strike weapon for the duration of the war. In fact, it is directed against the so-called Trotskyite agitators whose rôle in recent strikes, though noticeable as a lesser factor, has been much exaggerated. The glaring fact that emerges from the record of the wartime years is that, while trade union officials themselves have faithfully observed the self-denying ordinance in the matter of strikes, strikes have taken place with increasing frequency—though by no means on the scale of the last war—without the existing Order and Regulation being used to prevent them. Now it has apparently been decided that, though it is impossible to use the Order of 1940 or the Regulation of 1939 against tens of thousands of strikers, it may be possible to use the new Regulation of 1944 against the handful of agitators upon whom the main blame for trade union indiscipline is being, most tendentially, placed. The few, who are no doubt guilty, are to suffer for the misdeeds of the many—and for the failure of the leaders of the many to rein in their fol-

lowers. This interpretation is amply proved by the actual terms of the new Regulation. From its provisions are excepted any person "having ceased work or refused to continue to work or to accept employment," and "any act done at a meeting of members of a trade union." What is done or said in the closed shop, though formally unlawful, is not to come under the new penalties, while what is done or said in the public house, the open street and, presumably, the press, may be penalised.

To criticise the new Regulation in this sense is not to carp about lost peacetime liberties, or to voice press alarms. Fundamental issues are involved. The first is that a few rabble-rousers are being used as the scapegoats for events which go much deeper into the present attitude and grievances of the industrial masses. The second is that a weapon is being forged which may prove a boomerang against the trade unionists who have forged it. The third, and most important, is that the symptoms as distinct from the causes of strike action are being dealt with. The question is not whether a handful of revolutionary pamphleteers are to be permitted to carry on their dirty work. It is what can be done to prevent 100,000 miners or 10,000 engineers from going on strike. Even the mandate given to the Mineworkers' Federation to conclude a wage agreement is not in itself a solution. During the military emergency, when the Second Front is opened, no workers are likely to go on strike. The emergency in itself no doubt justifies the most drastic penal measures against fomenters; but political wisdom will surely see much further than this. It is not without significance that the measures and procedure which were sufficient in 1940 have apparently proved insufficient in 1944, the fifth year of the war, and they will be insufficient in 1945 when the German war ends and the tension breaks.

### Diplomatic Embargo

The Germans are going through a war of nerves exactly comparable to the uneasiness and strain they inflicted on their western neighbours in 1940. To-day it is Allied movements, preparations, troop concentrations that send a storm of rumours over the wires, and it is the Germans who announce that their nerves are steady and their defence measures complete. Some of their military commentators admit that the Allies have a good chance of making "deep penetrations," warn their readers to expect a terrifying increase in aerial warfare, and predict that parachute troops will be landed far into the interior to cut communications and disrupt transport. No single Allied action has so heightened the tension as the decision announced on April 18th to suspend for a time all secret diplomatic communications between Governments and their representatives in Britain, and to place a temporary embargo on all permits to diplomats to leave this country. This order does not cover the Russian and American Governments or the fighting Dominions. It is an entirely unprecedented step. In the past the Axis countries have made it, in fact, difficult for free and secret diplomatic exchanges to be maintained, but they at no stage introduced a complete formal embargo. To do so is to stretch total war to practically the last remaining sector of civilian life. The many Allied and other governments affected are anxious to see an Allied victory, and a temporary infringement of their diplomatic rights is not a heavy price to pay. Yet it is as well that the entirely abnormal and unprecedented character of the steps should be underlined. It is a grave restriction of a clearly established right, and to-day there are few areas in international life in which the smaller nations can feel themselves to be in absolutely unequivocal possession of such rights. The embargo will undoubtedly be raised on the very day that the need for it has passed. Meanwhile no opportunity should be lost to underline its exceptional and temporary character.

### National Union in Italy

Marshal Badoglio's Government has resigned, and the King has charged him with the task of forming a new administration which will take into account "the wishes expressed by all parties." The Italian parties have been asked to submit candidates for office, and there is little doubt that a Government of National Union is likely to be the result of these negotiations. This is a result warmly to be applauded by the Allies. The European peoples' only chance to pass from war to peace without frightful internal upheavals lies in the existence in each liberated country of a Government which can transcend deep social and economic cleavage. The experience of working together, after the many years in which no party has worked at all except in opposition, may have a sobering and decisive effect. All groups in Italy are presumably committed to the post-war consultation of popular opinion in the shape of free elections. But one may ask on what basis the peoples will be able to choose if they have had no opportunity of seeing the political parties in action. In pre-war France, the unwillingness of Left wing parties to assume responsibility was a permanent weakness. It was not until 1936 that the Socialists were ready to enter a Left wing coalition, and in 1939 the Communists were still petulantly guarding a sterile political virginity. Now in the crisis of war, armistice and peace, it seems, judging by France as well as Italy, that the parties of the Left are ready to exchange total ideological purity for a measure of practical experience. There is a chance that the possibilities of parliamentary life in Europe will be strengthened as a result. But it would be more reassuring if in Italy and in France the initiative towards co-operation had come from the Italian parties themselves. In fact, the impetus has been given by an outside agency, the Soviet Government, and it is the Italian Communists' readiness to follow the Russian lead that has brought all the political parties into line. Russian influence is based on two very strong foundations—the tremendous prestige Russia has gained by its victories; and the existence in most European countries of a docile Communist party. That the lead should have to come from the Communists is a measure of Italy's democratic weakness. In Algiers the Communists are joining, not creating, a Government of National Union. But in any country where Fascist methods of government have prevailed in the last decade, a similar political anaemia must be expected among the political parties, and Russian and Communist influence will inevitably be strong.

### Governments in Eastern Europe

There are obvious similarities between the political crisis in Italy and the problems raised by the situation of the various exiled Allied governments of Eastern Europe. For all the Eastern Allies, a government of National Union would be the best insurance of a just and reasonable transfer from war to peace. If post-war elections can be organised by an administration representing all parties, the chance of their expressing the popular will is obviously greater. Yet the possibilities of reaching an understanding on the Italian model are at present remote, and the chief factor in each case is the same. National Union could be secured in Greece, Yugoslavia and even in Poland, if the Soviet Government would follow the diplomacy it adopted in Italy. The record of the Yugoslav King in fighting the Germans is better than that of the King of Italy, the record of Greece and above all, of Poland is incomparably better. There are thus no political obstacles. What could be done in the case of Italy, the ex-enemy, can surely be done for the three Eastern Allies. At present the outlook is not bright. King Peter of Yugoslavia is negotiating in London for the creation of a new administration. The resignation of Mr. Purich is expected daily and would have been handed in weeks ago, if a satisfactory alternative to his administration could have been found. In the case of Greece, new possibilities have been opened by the resignation of M. Tsouderos and the appointment of M. Sophocles Venizelos as Prime Minister and, for the time being, Lord High Everything Else. If representatives of EAM's newly founded Provisional Political Committee under Colonel Bakardjis will join a new Cairo Government—it is Russia's role to persuade them—and the Cairo Government will accept representation from these genuine forces of internal resistance—it is the job of Britain and America to persuade the King—then a "Unity Government" is within sight. Not all the members of the Provisional Committee are Communist; but as in the case of Italy, the Communists, backed by the immense power and prestige of Russia, have the initiative in political moves. There remains the case of Poland. Here, too, a government of National Union can be secured if Russia is willing to play as generous and shrewd a rôle as it has done in Italy and has sought to do in Finland. The Polish Government in London is, for all the boasting of the Union of Polish Patriots, a truer representative of Polish opinion than any "government" that might be established at this late stage of the struggle. It might be possible, on the analogy of Italy and France, to include Communist representation in a reconstituted government—the Union of Polish Patriots is a possible substitute for the non-existent Polish Communist Party. But an essential preliminary is Soviet recognition of the Mikolajczyk Government. It should not be a more painful diplomatic operation than recognising Badoglio.

### Dominion Relations

This week's debate in Parliament on relations between the members of the British Commonwealth is the prelude to the London Conference of Dominion Prime Ministers which will be held shortly. In the debate, as at the conference, the Government's wish is to hear the views of others rather than to state its own policy. Lord Cranborne has emphasised that it is not for Britain to "impose" any programme or formula for closer association upon the independent Dominions; and it is plainly as a judicial arbiter rather than a leader that the Government regards its rôle in Commonwealth affairs. The views of Australia and New Zealand have already been embodied in the Canberra Agreement of last January, which arranged for continuous collaboration between the two Dominions on military, economic, territorial and commercial matters in their common region. Mr. Curtin's proposals for closer Commonwealth co-operation, like the long-settled views of General Smuts, who speaks for South Africa, are now well known. To-day, as in 1917, while he is opposed to suggestions for any formal federal framework for the Commonwealth, General Smuts asks for the utmost consultation in the concerting of a common policy for diplomacy and defence. Hitherto the chief divergence in Commonwealth views has seemed to be between these Dominions and Canada. Canada looks first to its American connection and to the prejudices of its own French population; and Lord Halifax's speech at Toronto, suggesting no more than a search for common policies in peacetime as in wartime, was severely criticised on the

ground that it represented Imperialism rather than Internationalism.

### Mr Bracken Speaks Out

Strong though the domestic political reasons are why all Canadian political parties have felt constrained to oppose projects for drawing the ties of Commonwealth too tight, it has always been obvious that a considerable number of Canadians could not fail to see the advantages of a Commonwealth policy and its real compatibility with schemes for wider international collaboration. It is significant that this view has now been stated forcibly by Mr John Bracken, leader of the Progressive Conservative Party, which is a rising force in Canadian politics. Mr Bracken accuses the critics of Lord Halifax of having failed "to emerge from Colonial habits," and of being "afraid to take responsibility as a full-grown nation and a partner in this freely associated Commonwealth." He accuses them of being still the victims of "the folly of isolationism." The danger that Commonwealth arrangements might become exclusive and sectarian is, of course, always to be reckoned with; and Canadian hesitations may be for this reason salutary. Nevertheless, it remains a fact that, so far from being hostile to international collaboration, Commonwealth collaboration in defence, economics and foreign policy is a necessary part and prelude of it. The British Empire, as General Smuts said twenty-seven years ago, is "the only successful example of international organisation that has yet been devised"; and, if the heresy of an Imperial ring fence can be avoided, the Commonwealth has a great and indispensable contribution to make to the world organisation of world peace.

### War Effort of the Dominions

The latest issue of the *Bulletin of International News* issued by the Royal Institute of International Affairs contains the fifth of an interesting series of articles on "Economic War Efforts" in which a contributor is attempting to reduce to comparable terms the available data on the magnitude of the war efforts being made by all the belligerents. The present instalment deals with the Dominions, where the data, in the majority of cases, are very scanty. To arrive at useful conclusions involves a process that can better be called quantitative guessing than estimation, but the figures given are probably of about the right order of magnitude. An exception may, however, be appropriate in the case of Canada, where the contributor to the *Bulletin* finds an increase of 80 or 90 per cent in the real national income between 1938 and 1943. This may be due to defects in the statistics. It is known that there have been considerable revisions in recent years in the Canadian national income statistics, and it is widely held that the pre-war total (which gave Canada a *per capita* income far below that of the United States, even in depression) was too low. There is a certain resemblance in the course of events in each of the four Dominions, though there are differences in degree. In each there has been a considerable expansion in the real national income, which has been devoted entirely to the war effort. In Canada and South Africa the total of private investment on consumption and investment has remained about stationary in real terms. In Australia and New Zealand it has fallen, but it is probable that this decline has affected investment more than consumption. In all four Dominions the conclusion is reached that consumption is not substantially below the pre-war level. Figures for national incomes and war expenditure (exclusive of receipts under lend-lease or from the United Kingdom) in 1943, all converted into sterling at what the author of the articles believes to be appropriate rates of exchange, are as follows:

|                   | National Income. | War Expenditure. |
|-------------------|------------------|------------------|
|                   | (£ million)      | (£ million)      |
| Canada .....      | 2,000            | 790              |
| Australia .....   | 1,100            | 430              |
| New Zealand ....  | 240              | 75               |
| South Africa .... | 620              | 90               |
| Total .....       | 3,960            | 1,385            |

The war expenditure of India would raise the total to £1,500 million, which does not include goods and services made available to the United Kingdom on loan. No figures are given for the Colonial Empire; but even without that, the article concludes:

It is clear that the Empire as a whole (including the Mother Country) is in the same class, as a producer of goods and services for war purposes, with the Soviet Union or the Old Reich (to which perhaps two-thirds of the economic war-output arrived at for Greater Germany may be attributed), and that it has achieved something like half the gigantic output of the United States.

### Water for All

The White Paper on a National Water Policy (Cmd. 6515) will not rank among the most impressive of the Government's reconstruction sketches. Most of the right things are said about the present inadequate use and distribution of water; but little specific provision is proposed to remedy it. The position is that this country is given by nature more than fifteen times the water it needs, but that nevertheless many districts, especially in rural areas, are either continuously under-provided or periodically overtaken by drought. The need for a central planning authority, a central plan and the central enforcement of a national policy have been recognised for more than a generation. So, too, has the need for proper knowledge of the water available. It is upon this second need that the White Paper mainly concentrates in its recommendations. The Inland Water Survey must be "pressed on with vigour." Surveys of the "bulk needs of large areas" must "continue to be carried on" by Regional Advisory Water Committees. The Ministry of Health, whose duty it is to promote the provision of adequate water supplies and to conserve water resources, must carry out surveys of the efficiency of water services. The Ministries of Agriculture and Fisheries and of Town and Country Planning must pool their information. The Ministry of Health must collect facts from users of water and sinkers of wells. When these duties are embodied in a Bill, the fact-finding service will be adequate. Whether policy, that is, results in terms of the sufficiency and continuity of water supplies, will be adequate is another matter. It can be said without malice that, in the final analysis, the recommendations of the White Paper add nothing at all that is definite to general policy. Good will no doubt be done. The amalgamation of water undertakings is to be "encouraged." The giving of bulk supplies by one undertaker to another is even to be enforced—"if necessary." But, broadly, the situation will remain as it has been, with a multiplicity of water undertakings and an extreme variation of water resources between district and district, with only this difference—that whatever administrative action can do within the present framework will be done with much more force than it has been hitherto—and with the important change that really substantial sums of money will be made available by an early Bill to extend piped water supplies and sewerage in rural areas. The expenditure contemplated amounts to £15 million for England and Wales and £6,375,000 for Scotland. It is not necessary to accept the root-and-branch proposal of a national grid system, to suggest more position action might have been envisaged, without controversial or radical innovation, to secure that no reasonable demand for water on tap, and guaranteed, should be refused.

### Economic Disarmament

Lord Vansittart's motion in the House of Lords for the economic disarmament of German industry had the plausibility of technical thoroughness. The motion called for a committee of scientists to prepare a practical scheme aiming at the permanent prevention of the manufacture of explosives in Germany after the war. Particular attention was to be paid to the German chemical industry and the nitrates and hydrogenation plants. Unfortunately, the argument that military disarmament, to be thorough, must be extended to war industry as well as the instruments of war, ignores the obvious retort that there can be no logical limitation to such a principle in its practical application. Almost all components of peacetime production can at will be utilised in a war economy, and similarly there are relatively few industries essential to war production that are not equally essential to a developed industrial system under conditions of peace. The logical conclusion can only be either that the economic disarmament of Germany to be effective must be complete, and that every German industry of possible use in war must be "eliminated" or controlled on a super New Order pattern; or, that economic disarmament need only be extended to the production of the major end-products of modern warfare, without which no conceivable development of German chemical production could possibly threaten the peace of Europe. The difficulty of the first alternative, its disastrous repercussions on the whole of European and world trade, are only too obvious. This high price for security—so high that it would certainly not be exacted—is unnecessary if there is any other method which is both practicable and equally effective in its guarantee of peace. The alternative, as Lord Perth suggested in the debate, would be a complete ban on the German production of aircraft, battleships, submarines, tanks and the other major offensive weapons of aggression. Such a ban is the only common-sense solution that would not hinder economic development in Germany as elsewhere. If that could be enforced, nothing further would be needed. It could not be enforced, neither could more drastic prohibitions. In any case, such measures as Lord Vansittart proposes can only be seriously considered by a people willing to ignore the real challenge of peace. The final problem is not, as the Government reply made by the Paymaster-General suggested, one of curbing the German war potential, but of making it ineffective, firstly through the prohibition of offensive armament production, and, secondly, through the institution of an adequate system of international security.

### Pensions Bill

A number of amendments to the Pensions (Increase) Bill were accepted by the Commons during the Committee stage of the Bill this week. Clauses 1 and 2, dealing with the general provisions for increasing the pensions for public servants and with some special provisions, were considered on Tuesday. A number of amendments proposed in the name of the Chancellor of the Exchequer were accepted without much discussion. By these amendments the benefit system which, under the original Bill, was applicable only to children under 16, was extended to other possible dependants, and the upper income limits for pensioners, with and without dependants, entitled to benefit from the increased rates, were revised upwards to £300 and £225 respectively. With regard to the rates of increase proposed under the Bill, the Government also proposed an improvement for the various income-groups of pensioners. The original rates (see *The Economist*, April 8th, p. 466) were amended to include all pensions under £400 in the 10 per cent increase and to alter the higher groups proportionately up to a maximum pension of £645. At this point in the Committee stage, the House, while welcoming the Government's improvements, began to show a certain dissatisfaction with the inadequacies of this stop-gap measure. It was felt by some Members, for instance, that the Bill contained certain injustices, both to pensioners of the public service in general, and to certain special categories, such as the pensioners of the Indian and Colonial Civil Services, the Port of London Authority and the London Passenger Transport Board, who were not to benefit by the Bill, and pensioners already receiving disability pensions, which operated unfavourably on the amount of their ordinary pension. The most strongly voiced general criticism was that when the Government had brought down pensions with the cost of living, between 1922 and 1934, it had been done both promptly and precisely. When the cost of living

began to rise in 1935, however, and continued to rise from 150 to 200 in the last nine years, pensions had been allowed to remain at the trough point. This criticism, which the present Bill only goes a small way to meet, reflected the whole difficulty facing the House. The Treasury was inevitably accused of offering "a contemptuous, mean and ungenerous hotch-potch," but, until a general revision of all pensions schemes in the framework of social security can be worked out, any measure attempting temporarily to provide only for cases of severe hardship can hardly be anything more.

### Australian Censorship

It is not possible to give any final judgment on the events which led up to the recent suppression of certain issues of six Australian daily papers and one weekly, because little account of the offending articles has been cabled to this country. Censored passages included attacks on the Minister of Information, Mr Caldwell, and comments on labour troubles. It is clear, however, what the quarrel, which has been brewing for some time, is about. The Australian press has accepted readily any censorship of news or information that might endanger national security or aid the enemy. But, like the British press, it has been steadily opposed to any censorship of views or criticisms. In this country the distinction has, for the most part, been very carefully drawn by officials and Ministers; but there appears to have been some tendency in the high tension of Australian politics for the censors to confuse news and views, with the result that political criticism has come under its ban. Almost certainly this is the issue which is now being reviewed by the Australian High Court and will be considered, when the law has had its say, by the Australian Cabinet. The position is anomalous. Mr Curtin's Government has probably the strongest support ever possessed by an Australian administration; and the move of Mr Hughes, Australia's elder statesman of the last war, to join the War Advisory Council is only one instance of the way in which the tide is still flowing in its favour. The Prime Minister himself has defined the censorship as applying "only to information of use to the enemy"; and the Government has written specific safeguards for the freedom of the press into the constitutional proposals that are to be submitted to a referendum of the Australian electorate. The explanation seems to be that, while Mr Curtin's majority is large, the minority in Opposition is correspondingly virulent and outspoken, which is not congenial in the heat of the moment to certain Ministers. The chief allegation made by the Opposition is that the doctrines and methods of the Labour Government are autocratic; and it seems certain that any disposition to take wartime powers too far, in needless infringement of democratic liberties, can only play into the hands of the few embattled critics.

### Attitude to India

That it is necessary to continue the suspension of parliamentary government in the five provinces of British India, where Congress Ministries withdrew early in the war, cannot be doubted. Government on the lines laid down in the Act of 1935 is impossible if the Indian parties will not participate; and, on the ground of fair and efficient rule, there is no reason to suppose that the emergency regimes set up by the Governors of these provinces have done harm in the abnormal wartime situation. Certainly they contrast not unfavourably with the record of wartime Bengal, where, except for a brief period, parliamentary government has gone on. Whether Mr Amery was wise or tactful in attaching to his speech on Wednesday the familiar charges against the leaders of the Congress Party, who are now in prison and cannot answer, is much more doubtful. Whatever the justification for Mr Amery's remarks—and it is considerable—such a speech shows that British as well as Indian leaders are still looking backwards instead of forwards. The objects of policy in India at the present moment are three: first, to defend the country; second, to feed and supply the country; third, to free the country for self-government. Taken together, these aims can constitute a policy in themselves if by-gones can be allowed to be by-gones. They will be the topics of the forthcoming day's debate on India in the Commons, and spokesmen on both sides would do well to look for whatever signs there may be of new leaders and new attitudes among

the Indians rather than at the misdeeds of old ones. It is perfectly true that the many events of the war years in India have shaken faith in the ability of Indians to govern themselves properly. But, despite the mishandled but most fair Cripps offer, they have shaken faith in British rule no less, and the confused circumstances which now surround the conduct of the present military operations on India's eastern frontier have not improved the matter.

### God and Caesar

Political disunity is ten times as deep, and social cleavages are twenty times as bitter, when differences in political outlook and social status are backed by religious divergence. On the whole, religious issues have not played a prominent part in this war, for no belligerent can claim to be completely identified with any one religion or one branch of religion, and in so far as religious propaganda has been made, it has been on the general basis of the obvious anti-Nazi appeal of justice and brotherhood. Religious broadcasts have been made from London to members of the major religious communities in Europe. It is perhaps more surprising to know that frequent and fervent religious broadcasts have been made from Moscow. Just as the appeal to social revolution has to a large measure been abandoned, so, too, all trace of militant atheism and "godless" propaganda has been dropped in Russia's approach to what is still to a large extent a Christian Europe. The known attitude of the Russian Government puts these religious broadcasts into their proper perspective. They do not represent a change of heart on the part of the Kremlin, but a realistic calculation of the strength of the religious forces ranged against Hitler. This realism has now been carried a step further. After *Isvestia's* sharp attack on the "pro-fascist" policy of the Vatican, the Orthodox Church has joined the controversy on the theological plane. In a recent number of the *Church Bulletin*, the Patriarch Sergei attacked the ecclesiastical claims of the Pope. Thus it seems that the religious line, which has been devoted during the war with complete interdenominational impartiality to creating unity among Germany's enemies, may be used after the war in a strongly partisan spirit, to foster disunity in Eastern Europe. The Orthodox-Catholic split in Poland and the Balkans was a cause of religious and civil unrest before the last war, and, unabatedly, between the wars. It might be hoped—and perhaps it still can be hoped—that the efforts of Governments will be directed to allaying these disputes, not to reviving them. The line between Caesar and God has always been difficult to draw, but nothing is more disastrous than to use God so serve Caesar.

### Colonel Knox Testifies

It is announced that the projected talks on oil have started in Washington. The position in America is still obscure, for a considerable body of opinion opposes the Ickes pipeline scheme, chiefly on the grounds that it "brings government into business." It was presumably to meet this point that Colonel Knox recently gave some extraordinary testimony to the Naval Appropriations Subcommittee of Congress. Colonel Knox believes in the pipeline scheme, as does Mr Ickes, for a reason which most people in Britain will applaud—that it will commit the United States to active military co-operation in keeping world peace. But the reasons he put forward to Congress followed a very different line.

There were prospective oil reserves in Saudi Arabia, and the British were, I believe, offered them first. They thought there was no oil there, and said they were not interested. At that point American companies got interested. . . . They went in and made some explorations and discovered a huge pool of oil, currently estimated at 20,000,000,000 barrels. It is one of the largest pools known. They made some prepayments to the Arabian Government in anticipation of royalties running up to several millions of dollars. The Arabian Government at the same time was calling on the British for help, and they advanced considerable sums of money. Eventually the American companies became a little alarmed over the situation. They were private interests wholly, with no support from their own Government, in possible competition with the British Government and with the British companies having all the support and prestige that the British Government could bring. They came to us in a state of concern, and urged the American Government to protect these American-owned deposits.

This, of course, suggests to the American people the tradi-

tional picture of a grasping Britain out to make a sucker of Uncle Sam. This may be an effective way of gaining support for the pipe line plan, but it can hardly foster good relations with America's ally. It is, of course, a usual procedure in American politics, but the cumulative effect is to make the British resentful, distrustful, and, finally, angry.

### Concessions in Saudi Arabia

Colonel Knox's account of the situation in Saudi Arabia is very wide of the facts. British and American companies negotiated for the Saudi Arabian oil in the ordinary commercial manner. The British companies failed to reach an agreement, and the fact that the British Government owns shares in the Anglo-Iranian oil company did not affect the bargaining. It may well be that, faced with the large American oil companies, King Ibn Saud hopes to bring in some British interests as a counter-weight. American pressure has been increasing recently. In the course of the war, General Royce has twice visited Saudi Arabia, and Mr S. K. Twitchell, director of the American gold company in Saudi Arabia, undertook in 1942 a survey of the prospects for agriculture and irrigation. It was not very difficult to draw the inference that new concessions—for minerals and mining as well as oil—might be sought by American companies. The Arabian King would probably prefer his concessionaires to be drawn from more than one Great Power. So far, he has apparently been completely unsuccessful in raising a flicker of interest in either private or official circles in this country. The myth of grasping British imperialism has to be set against the truth of public and private unenterprise. It is true that the British Government pays certain subsidies to King Ibn Saud in compensation for the pilgrim traffic and other small items—but it has been paying them for twenty years, and they certainly do not bear the relation to Britain's commercial activities insinuated by Colonel Knox. It must be asked what advantage is gained either for the United States or for the oil project by giving an exceedingly distorted picture of British policy in the Middle East.

### Ford and the Unions

The agreement for the recognition of trade unions in their British factories by the Ford Motor Company, which was signed on Monday, brings to a conclusion negotiations which have been going on for several months between Lord Perry, chairman of the company, and Sir Walter Citrine. More than that, it closes a long chapter in the history of industrial relations. Non-unionism at Fords has been a set principle and a constant thorn in the flesh of the TUC. For many years, efforts to secure recognition have been made by unions both here and in the United States. In America

they resulted in the recognition of the United Automobile Workers' Union (affiliated to the Congress of Industrial Organisations) three years ago. It should be emphasised that the British agreement was not sought and executed because of any dissatisfaction with working conditions at Fords, which, it is claimed in a joint statement, are actually better than in many British factories, and provide advantages which the trade unions have been trying to secure throughout industry. Holidays with pay are provided; a 40-hour five-day week is worked in peacetime, and there are many welfare arrangements. But these standards have been given of grace, not of right; and it is hoped that the agreement will ensure mutual co-operation in maintaining them. Mr Henry Ford's philosophy of life, described in his autobiographies, has always been that the best results are secured from contented workers, though he has always been a bitter enemy of trade unionism. The actual number of trade union members at Fords' British factories is small, though now it will probably increase. The agreement does not affect the existing arrangement whereby workers, whether members of unions or not, can take their grievances to the personnel manager or the management. There will be no suspicion of a closed shop.

### Back to Shops

It is right and proper that, as Colonel Llewellyn, Minister of Food, announced on Tuesday, keepers of food shops driven out of business by calling-up or war circumstances should have a prior and guaranteed right to start up again. (The details are given in a Note on page 551.) They will wish to resume their trade during a period when the control of retailing caused by shortage and rationing will probably still be in force. Thus, it will be easy to give them preferential licence to trade. On the other hand, one loud warning must be sounded. This must not be made the thin end of a restrictive wedge. There is no case in peacetime conditions, with ample food supplies, for the licensing of food traders. Free trade in food is imperative, and any restriction of entry would be contrary to the interests of consumers. Most careful guard must be taken against the institution of a lasting restriction of entry under the guise of consideration for ex-Service and other traders.

### The Opticians Protest

Opticians do not profess to treat diseased eyes; but they do claim to be able to detect ocular disease and to refer such cases to medical advice. Some doubts were expressed on these points, in a Note in *The Economist* on March 25th. The Joint Council of Qualified Opticians have replied to these doubts. Opticians, they point out, have their own examining bodies; and to become a qualified optician it is necessary to undergo clinical training, and to pass an examination, conducted by ophthalmic surgeons, which covers a wide range of physiology and pathology. It is therefore claimed that the optician has sufficient medical knowledge to sift the cases coming to him; and that the oculist's function should be to provide a complementary service, dealing with diseased eyes, while the optician's concern is with healthy eyes. That the optician should undergo a wide training, held under medical auspices, is much to the good. Unfortunately, however, there is no agreement about the number of eye cases which should have medical treatment. An analysis of the records of the medical-sponsored National Eye Service revealed that, in 35 per cent of cases, eye trouble was associated with some bodily defect. This result is probably overweighted as a sample of total eye cases; but against it, probably only about 3 per cent of the cases examined by opticians are passed on by them for medical treatment. The fact is that the distinction drawn by opticians between diseased eyes and healthy ones which need adjustment is an oversimplification. A great number of eye defects—some would even say all eye defects—can clearly benefit from medical opinion. For the patient to be seen first by an optician is to run some risk of inadequate diagnosis, since the passing of an examination, at some stage in one's life, can hardly be compared as a qualification with the continuous and professional contact with methods of eye treatment which the oculist should possess. This point was made by the

Royal Commission on National Health Insurance, which said,

It was admitted, even by medical witnesses who appeared before us to support the case of opticians, that, other things being equal, it would be preferable, for the purpose of testing eyesight, to have recourse to a properly qualified eye specialist rather than to the most highly qualified optician.

Whatever the proportion of cases that are distinctively pathological, the only sure guarantee that medical factors will not be overlooked is examination by medical experts.

### What Sort of Protection?

There is no reason whatever to belittle the achievements of opticians. What may be objected to is that the state should strengthen an arrangement which already falls short of the desirable by extending to the optician "the complete protection of his professional title," which is what he asks for. Messrs Carr Saunders and Wilson, in their book "The Professions," rightly laid down the principle that

it is most undesirable that, where a vital service is in question, the State should confer its hall mark except upon persons whose qualifications to perform services are uncontestable.

These authors, who can hardly be accused of medical bias, concluded that there should be a register of ophthalmic practitioners, but that no spectacle-maker should be eligible for admission to it. Without going as far as this, it might be possible to utilise the sight-testing experience of opticians at clinical centres, which would be under the general charge of an oculist. That there should be greater co-operation between optician and oculist is incontestable. But that the state should support a system under which the majority of eye cases never receive even a preliminary medical examination is difficult to admit. Certainly, opticians have a case for protection against the pretensions of those who have no qualifications at all in spectacle-making. As things are, any person is able to set up a shop and call himself an optician—a state of affairs which is not permitted in most of the Dominions and Colonies. This claim could be met, however, by a scheme of registration for spectacle-makers. Opticians should not be denied the state's protection—only this protection should be limited to those functions which can be fully substantiated as being within their province. Finally, the opticians have at least a strong negative case for State registration. The majority report of the Departmental Committee which examined the opticians' case in 1927, remarked that

we desire to emphasise that one of the principal reasons on which we base this opinion (i.e., against a State register) is our view that it is possible and probable that the medical profession will be able to provide insured persons . . . with the services of oculists at an early date.

Despite the institution of the National Eye Service, the expectations of this Committee are very far from having been fulfilled. As long as the ideal is so far from being realised, it is hard to resist the claim of those who have, not unskillfully, filled the gaps, to have their *de facto* position recognised.

### Shorter Note

The following table gives the number of civilian casualties in air-raids since September, 1939:—

|                          | Killed | Injured and<br>Detained in<br>Hospital | Total<br>Serious<br>Casualties |
|--------------------------|--------|----------------------------------------|--------------------------------|
| Sept., 1939-Aug., 1940.  | 1,494  | 1,960                                  | 3,474                          |
| Sept.-Dec., 1940.        | 22,282 | 28,522                                 | 50,804                         |
| Total, 1941.             | 20,863 | 21,839                                 | 42,702                         |
| Total, 1942.             | 3,221  | 4,149                                  | 7,370                          |
| Total, 1943.             | 2,357  | 3,462                                  | 5,819                          |
| October . . . . .        | 118    | 263                                    | 401                            |
| November . . . . .       | 119    | 238                                    | 357                            |
| December . . . . .       | 10     | 41                                     | 51                             |
| 1944—                    |        |                                        |                                |
| January . . . . .        | 107    | 270                                    | 377                            |
| February . . . . .       | 961    | 1,712                                  | 2,673                          |
| March . . . . .          | 279    | 633                                    | 912                            |
| Totals to date . . . . . | 51,564 | 62,567                                 | 114,131                        |

Those killed during last month's air-raids included 125 men, 116 women, and 38 children.

## AMERICAN SURVEY

### The Automobile Industry

(From a Correspondent in Chicago)

SINCE Pearl Harbour, when passenger car production was halted and the Government began rationing cars to essential users, the automobile industry has been functioning exclusively for the war effort. Engineers converted the great assembly lines of Detroit to the work of turning out tanks, airplane parts, and a thousand other items of war material. Meanwhile thousands of gasoline stations along the open roads of the country ceased business operations. Vacations by motor car became a memory. The retail tyre business all but disappeared. And that special American institution, which over a generation had become very close to a religious rite, the annual showing of new automobile models, vanished with the rest.

A few statistics tell most of the story. Since Pearl Harbour the reserve of new passenger automobiles has shrunk from 2,000,000 to 50,000, and most of this remainder will have been released to eligible buyers by July 1. Ward M. Canaday, chairman of Willys-Overland Motors, which developed the "Jeep" in co-operation with US Army Engineers, says that America's present stock of 24,000,000 passenger cars in use is being sent to the scrap heap at the appalling rate of nearly 10 each minute, or 13,000 a day. The backlog of new trucks has been depleted by 200,000 since truck rationing began in March, 1942, and the War Production Board will permit only 80,000 to be turned out this year for civilian use. Even motorcycles are affected, with domestic output limited to 2,130 cycles this year, and these only for police use, or other absolutely essential business.

The automobile industry, as Americans used to know it, has vanished, but it is still about the biggest thing in the national nostalgia for pre-war pleasures and freedoms. "America's biggest industry" it used to be called, and with its ramifications of sales branches and instalment financing, this claim was not too great. It has been an industry based on fishwife salesmanship, David Harum horse trading and mushroom capitalisation. The stock market operations of William C. Durant are perhaps the best illustration of the influence of gasoline smoke on the character of a rugged individual. Once head of General Motors, his name attracted more stockholders than any other company in the nation, with the exception of American Telephone and Telegraph. Then he lost control, as drivers will do on a sharp turn. All that can be said now is that the many millions of dollars involved in his operations look small by comparison with the national budget to-day, and he willingly ruined himself in order to protect his own stockholders.

General Motors to-day, no longer with Durant at its head, remains as a going concern. The company is doing well, as its recent dividend increase suggests. The financial streets of the United States quickly put their own interpretation on the news of the larger dividend. It was said that the General Motors management had decided that the expense of reconversion and adjustment to routine peacetime manufacture would be accomplished without too much strain on the company's finances. It was known for certain that the corporation over the past three years had allocated \$75 million from earnings as a reserve against the costs of going back into the production of civilian goods.

The rumour will not die that the automobile industry will be permitted to manufacture passenger cars next year, even though the War Production Board and the Army have repeatedly refused permission. The pressures being brought to bear for the re-establishment of a civilian motor car industry are incalculable. The reason is that automobiles are to Americans nearly as important as houses.

The automobile industry is gone for the time being, but not the automobile business. The great companies are holding their sales organisations however they may—by advertising services, repairs, etc., waiting for the green traffic light to be switched on. The classified advertisements in the newspapers are full of used car notices. The market is high.

The automobile market used to be centred in Detroit.

Now the hub is Omaha, Nebraska. Prosperity has come to the regions of the great plains, farm produce being a weapon of war. Farmers with ready cash are buying the automobiles that are still available—somebody else's cars. This demand is not a demonstration of useless indulgence in wartime. Human beings, from farm to farm in the great plains, are as widely scattered as Sir James Jeans describes the distribution of physical matter to be in the universe. America used to be able to get along with the horse and wagon, but under the pressure of present-day conditions, the motor car is an essential supplement to the railroad, even under the national speed limitation of 35 miles an hour. In addition to the demand for used cars from the farming areas, there is the demand from war plant workers, who have no means of transportation to their jobs except by motor car. Many of the new factories have been built in extremely inconvenient localities. There are not enough buses, or railroads, to get the people there.

Meanwhile, automobiles are wearing out, and tyres are wearing out, which amounts very nearly to the same thing. Mr Bradley Dewey, the Rubber Director, put a brush stroke or two into the picture of vehicle scarcity when he reported that tyre production in 1944 will probably fall 6,000,000 to 12,000,000 short of the 30,000,000 originally estimated to be the necessary minimum for this year. Cautious management, and the junking of ageing cars now on the road, he suggested, would be the only solution to the tyre problem, since the armed forces are "chewing up" rubber so fast that the output of civilian passenger car tyres must be limited to 1,000,000 a month.

That America is in the grip of inflation can be observed nowhere better than in the used-car market. Automobiles that sold, new, for \$1,000 in 1941 are being sold to dealers, after two years of depreciation, for a price of from \$1,200 to \$1,400, the dealer in turn disposing of them for a \$200 markup. Old cars—very old ones—are coming out of hiding and rolling over streets and highways. One sees a surprising number of model "A" Fords, and now and again even model "Ts." And names of machines whose companies long ago died or went into a different line of manufacture—Maxwells, Auburns, Reos—are mingled with the newest that remain after years of business competition.

Among city dwellers in the pre-war years, many more Americans bought automobiles than homes. It was a national habit. More than that, practically all of them bought their cars on time payment. Unwise as this may have seemed at the time, those who went into debt in order to buy the last new cars manufactured before the United States entered the war took about the best hedge that could be taken against inflation, and now that they are being called up for military service by the thousands, their ace in the hole is the family automobile, which will provide a stake for the wife and children when father puts on his uniform.

The Office of Price Administration has said, time and again, that it would put a "ceiling" price on used cars. The best authorities say the maximum ceiling prices are being based on the prices that appeared in the industry's official "guidebook" in January, 1944. This would slash hundreds of dollars from the current actual selling prices of used cars and would certainly work a great hardship on many people whose main property is an automobile. In an automobile-minded country like the United States the political implications of such a move are worth consideration. On the one hand, people who need automobiles will compete for them. On the other, people who have them to sell expect a price such as their neighbours have been receiving. If they think they have been unfairly dealt with, their reactions will be, at the very least, interesting.

Meanwhile the automobile spokesmen continue to predict. Studebaker says the new cars, after the war, will be cheaper. Chrysler says they will be more expensive. General Motors say, obliquely, that there will be a 50 per cent increase in autos used.

## American Notes

### The Passing of MacArthur

General MacArthur, like Governor Dewey, has announced that he is not seeking the Republican nomination for President. Coyness is becoming a political disease to which possible candidates appear strangely subject. The General's statement was induced by the publication of his correspondence with Representative Miller, of Nebraska, which has caused considerable embarrassment and perturbation in the Republican ranks. General MacArthur insists that his replies to Mr Miller were merely "amiable acknowledgments," but it was surely an excess of amiability which led him to apply the adjectives "scholarly" and "sobering" to Representative Miller's characterisation of the New Deal as a monarchy destined, if perpetuated, to threaten the rights of the common people. The General went further, and commented:

Indeed, we must not inadvertently slip into the same condition internally which we fight externally,

which appears to imply approval of Mr Miller's charges. General MacArthur has for long been the focus and figure-head of the Pacific First agitation which the "Chicago set," headed by Colonel McCormick, has stimulated to vilify the President and all his works. It would be gratifying to record that this was General MacArthur's misfortune, were it not for the encouragement he has supplied by hints of dissatisfaction with strategy as laid down in Washington. Thus in his last letter to Mr Miller he says:

The point is to bring before them the real facts. Out here we are doing what we can with what we have. I will be glad, however, when more substantial forces are placed at my disposal.

In the Illinois primaries last week, where he enjoyed the influential backing of the *Chicago Tribune*, General MacArthur won a smashing victory. It is being said now, however, that his implied criticism of his Commander-in-Chief puts him outside the pale. Certainly no other well-ordered country could afford to tolerate such political indiscretion in a commander in the field. General MacArthur's renunciation did not, it is being noted, include any unwillingness to be drafted; there was no hint of Sherman's fierce, "If nominated, I will not run; if elected, I will not serve." But traditionally American generals become President after, not before, they have won their battles, and the threat of the man on horseback riding into the White House is probably remote; particularly so in view of the surprising strength Governor Dewey is showing in the Middle West. The big surprise of the Nebraska primaries was the 15,000 strong write-in vote for Mr Dewey. If General MacArthur captures a significant number of delegates to the convention, and there is any hint of a deadlock—which now seems unlikely—his supporters might bring off a deal with the successful candidate. But even a Republican President might be forgiven for having doubts about the prudence of promoting so articulate and amiable a general.

### The Silent Service

The fate of the Republican aspirants for the Presidency is becoming like the nursery rhyme of the Ten Little Nigger Boys. First Governor Bricker blights a promising candidacy by making a few shy, but damping, personal appearances outside Ohio. Then Mr Willkie goes to Wisconsin and talks himself out of the nomination. Now General MacArthur writes himself out of it by indiscreet letters to Representative Miller. Who goes next? ask the would-be champions, glancing uneasily at one another. So far, Mr Dewey has neither spoken nor written about his Presidential aspirations, and he has glued himself to his desk at Albany. Lt.-Commander Stassen is protected by the silence of the Service and the vast wastes of the Pacific. The jinx or hoodoo that has overtaken Mr Willkie and General MacArthur will confirm the lesser hopefuls in the wisdom of saying, writing, hearing and doing nothing. It is an extraordinary situation that within two months of the Republican Convention all the horses left in the race are pretending to admire the landscape and ostentatiously keeping their eyes off the fatal track. It would be unfair to say that the Republicans are like Shelley's "party in a parlour, all silent and all damned," but for a great political party that recently was exultant at the prospect of sweeping victory, this abdication of leadership is at least a little odd.

Somebody must break the awful silence soon. The Republicans can hardly adopt a candidate in June of whom the best that can be said is that, like Ol' Man River, "he don't say nuthin', but must know somethin'."

### Mr. Hull's Programme

Mr Hull's broadcast defence of the methods and policies pursued by the State Department has met with restrained enthusiasm. Even his severest critics concede that the speech was a substantial advance upon earlier pronouncements. In particular, the outline of a world organisation based firmly upon a four-power agreement, his interpretation of the function of the Atlantic Charter as a statement of objectives, not solutions, and his efforts to secure bi-partisan support, have received approval. Meanwhile the thought of the State Department has been carried one step further in a speech by Mr Breckinridge Long, one of its assistant Secretaries of State. In sketching conclusions to which the Department has been led, Mr Long put a significant emphasis on the part to be played by the major nations in creating an international security organisation, in maintaining adequate forces to repel aggression, and in accepting responsibility for keeping the peace in special areas. As the *Herald-Tribune* points out:

The plan eschews any idea of world government or an international police force; it rests on a frank acceptance of national sovereignties as they exist. It properly begins by seeking to organise the three or four major centres of force which will exist when the enemy has been defeated. This represents about the maximum of what is to-day practicably and humanly possible.

Senator Connally, Chairman of the Senate Foreign Relations Committee, went even further in suggesting specifically that Britain and Russia be delegated to check German aggression, and saw the American sphere as stretching from Africa westward to Asia, and including both North and South America. This realistic approach is not universally approved, as is shown by Senator Ball's attack upon spheres of influence and power politics; but it is evidently the essence of the plan which Secretary Hull is to discuss with the three Republican and three Democratic Senators who are being appointed to meet with him. By this prior consultation and wooing of the Senate it is hoped to avoid a subsequent rejection of the plan for an international organisation. It is also reliably reported that the Administration has hopes of submitting the plan for ratification as an agreement, rather than a treaty, thus requiring only a majority of both Houses rather than a two-thirds vote of the Senate. Here the going is more delicate, for any open move to undermine the authority of the Senate would be likely to arouse the most violent resentment.

### Butter on their Boots

In the last war Russians were reliably reported to be in England, complete with snow on their boots. There are some Americans in this war also afflicted by Russian visions, but in the current account it is butter on their boots, good American Lend-Lease butter. The renewal of the Lend-Lease Act always seems to stimulate the higher flights of the imagination. This time Mr Crowley has had solemnly to deny that the Russians greased their boots with butter; that British officials in Washington charged up whisky parties to Lend-Lease; that Australian women received nylon hosiery; that Britain made whisky of Lend-Lease alcohol (sic!) for shipment back to the United States; that Russia traded US planes for rubber to the Japanese; and that the British substituted their own for American labels on Lend-Lease goods to obtain credit abroad. The diaper cloth for North Africa which has been relentlessly pursuing the Lend-Lease Administration emerges as the only rumour based on fact, but it was paid for in full by the French. With the regularity and inevitability of the return of spring, Representative Rogers has renewed her attacks upon the intentions governing the administration of the Act. The current Rogers amendment is based upon the fear that Britain may use Lend-Lease goods to get a head start in the race for markets after the war; and it provides that Congressional approval be required for the disposition of all undistributed Lend-Lease stocks after the war. The attempt to restrict the power of the President to make any final settlement of the Lend-Lease account is endemic in Congress. It will not be decided at this session.

## THE WORLD OVERSEAS

### Authoritarian Gains at Algiers

WITH the melancholy words "Men may go, France remains," General Giraud has left the stage. In his duel with General de Gaulle, which had lasted for more than a year, he has been strikingly, and it appears finally, defeated. The significance of this event is probably greater than it may seem at first sight, because the controversy has been much more than a wrangle between two rival generals. The consequences of General Giraud's dismissal will affect the whole outlook of the French army as well as the relations between the army and the politicians.

The post and title of Commander in Chief have been abolished. The reason given is that the French armies are not to fight under a single French command in the liberation of their country. This was as clear a year ago as it is now; and yet General de Gaulle himself has chosen this moment to assume the title of Head of the French armies. He has simply changed the name of the supreme post in the army in order to take it over.

The change of commander will entail an overhaul in the officers' corps of the French army which is now in the process of reconstruction. General Giraud was above all the flagbearer of the old officers' corps of the Third Republic. The outlook and tradition of that corps were, on the whole, conservative and Right wing. But they were also in a sense non-political. The French General Staff used, indeed, to be a potent factor in domestic and foreign politics; and its wishes, its activities, and at times its intrigues, counted for much behind the scenes of French political life. But the old military leaders, at least in recent decades, never aspired to assume direct, let alone sole, responsibility for political decisions or to substitute themselves for the civilian Government and Parliament. This happened only in 1940, when the Third Republic was crumbling, and Pétain hoisted the flag of the *Révolution Nationale* on its ruins.

The good name and traditions of the officers' corps were dragged down into the mud of Vichy; and General Giraud's brief career at Algiers was in essence an attempt to restore them. No French officer could have been better suited for this task. General Giraud, whatever his political and personal shortcomings, represented the officers' corps at its best—its courage, its loyalty, and its devotion to France. His name was not besmirched by the events of 1940. Indeed, it was surrounded by a legend which seemed for a while capable of matching the newly born *mystique* of General de Gaulle. His failure and dismissal mark the last mournful chapter in the history of the French officers' corps as it existed under the Third Republic. The events of 1940 went too deep, and were too destructive of old values to permit the prestige of the corps to be built up again. General Giraud's dismissal comes, significantly, only a very short time after the Consultative Assembly at Algiers declared the Constitution of the Third Republic null and void. In the person of General de Gaulle the Fourth Republic is cutting its links with the past.

### A New Military Leadership

This is not to say that the new officers' corps of the Fourth Republic can be created from entirely new elements. It will have to absorb and assimilate old ones. Indeed, the process of absorption has already started. General Bethouard, the new Chief of Staff, can be described as a Giraudist. But old elements of the army—*les giraudistes sans Giraud*—have apparently to be remoulded in the melting-pot of Gaullism. The new military leadership is full of contempt for the civilian politicians of the Third Republic. It has come into existence at a time when the air is still full of authoritarian bacilli. It is true that, in staking out its claim to political leadership, it has to reckon with the violent reaction of Frenchmen against the authoritarian experience under Marshal Pétain. This results in the ambiguity of Algerian politics. The new authoritarianism—so its critics believe—is working its way by zigzags and subtle political manoeuvres. On November 9th last year General de Gaulle became sole

President of the French Committee of National Liberation; and the reason given for the dismissal of General Giraud as co-President of the Committee was the need to separate military from civilian power. Yet General de Gaulle has now concentrated in his hands more military and civilian power than any Frenchman has ever wielded since the downfall of Napoleon III.

This General de Gaulle has done on the basis of the law of July 11, 1938, which gave plenary powers to M. Daladier, then Prime Minister. To declare the whole constitution of the Third Republic to be null and void, and at the same time to pick out and use one particular statute of the Third Republic seems an obvious contradiction. The new military leadership does insist upon its popular origin and backing. In this it differs strikingly from the officers' corps of the Third Republic, and bears a close resemblance to its Bonapartist predecessor. In fact, the only historical analogy to the controversy between General de Gaulle and General Giraud is the tussle between President Louis Bonaparte and the Orleanist General Changarnier in 1851. Like Louis Bonaparte, General de Gaulle defeats his traditionalist opponents by the appeal to popular will, popular sentiments, and popular prejudice. Louis Bonaparte—Emperor by the grace of the People—established his Empire on the basis of universal suffrage, which he had introduced against the opposition of his traditionalist adversaries. General de Gaulle has extended universal suffrage to the women of France against the opposition of those Frenchmen who would prefer to stick to the constitution and laws of the Third Republic.

### The Communists' Role

This claim to popular origin and support has now been immensely strengthened by the adhesion of the Communist Party to the National Committee of Liberation. After long negotiations, two of its leaders have become members of the Committee. M. François Billoux, leader of the North African Communists, takes over the Commissariat of Air, and M. Fernand Grenier, deputy for St. Denis, becomes Minister of State. The most important Communist leaders, who have remained outside the Committee, M. Marty and M. Bonté, have declared that the two new Commissioners have entered the Committee on behalf of the party, which is now committed to support General de Gaulle's Provisional Government.

This decision of the Communist Party marks a radical departure from all the traditions of French Communism, traditions that went back to Guesdes' fight against Millerand's participation in the Coalition Government of Waldeck-Rousseau. Even in the years of the Popular Front the anti-Millerandist tradition was still strong enough to prevent French Communists from accepting seats in the Governments of MM. Blum and Daladier. Their abstention was one of the sources of the weakness of the Popular Front, since it enabled the Communist party to vote for the Popular Front in the Chamber, and to oppose it in the factories. It is certainly a striking if somewhat paradoxical political victory for General de Gaulle that he has succeeded where M. Blum failed.

Political trends at Algiers have thus had two apparently contradictory results. They have strengthened the representative character of the National Committee of Liberation, because the Communist Party is a powerful factor in the Resistance in France itself. But they have at the same time weakened the principle of representative Government, since within the broadened framework of the Committee all power has now been vested in General de Gaulle.

The attitude of the Communists will be of crucial importance, but it is not yet clear what it is going to be. The ordinance under which General de Gaulle has become Head of the French armies, and assumed plenary power on the basis of the law of 1938, was announced a few days after the entry of the Communists into the National Com-

mittee. The decision to dismiss General Giraud was passed by the Committee—unanimously, according to the official communiqué. From this one might have inferred that the Communist members voted for it. Later on, however, the Communist leaders at Algiers declared that MM. Grenier and Billoux had voted for the dismissal of General Giraud from the post of Commander in Chief only because they had believed that he would accept the post of Inspector General which was offered to him. In addition, the Communist members of the Consultative Assembly lodged a protest against the plan for the provisional administration of liberated France adopted by the Committee of National Liberation. They have accused General de Gaulle of the intention to set up a "French Amgot" brought to France from abroad, and demanded safeguards for the establishment of democratic self-government by Frenchmen in France.

In the contest between authoritarian and democratic tendencies at Algiers the authoritarian tendency has recently gained new ground. It would be unwise to rely on the defence of democratic principles by the Communists. Unfortunately, the representatives of the genuinely democratic parties at Algiers have not spoken their minds openly. Such reservations against dictatorial practice as they have made have, as a rule, been wrapped up in so many tributes to the Gaullist mystique that they could hardly enlighten French public opinion about the real character of the controversies. The all powerful mystique has put all sorts of dampers on political thought and speech in France's temporary capital, until it has muffled them almost completely. It seems less and less likely that French democracy can be rescued and invigorated in the political climate of North Africa. Will it, at least, regain its strength when it reaches its native—and liberated—soil?

## Military Projects in North Canada

[FROM OUR OTTAWA CORRESPONDENT]

THE general principles governing the post-war disposal of military projects undertaken by the United States Government in the Canadian North have been agreed upon for some time now. No permanent proprietary right in any expenditure made by the United States during the war in Canada will survive for more than one year after the end of the war. This is a reciprocal principle.

On airfields, roads, buildings, oil development, airplane landing strips, and other projects on Canadian territory, the United States has expended about \$300 million. Not one foot of land has passed into American ownership as a result. By far the greater portion of this expenditure has gone into the Alaska Highway and the Canol project, the latter being a development of the oil field at Norman Wells, on the Mackenzie River, with pipeline to Whitehorse and a refinery of 3,000-barrel daily capacity.

The general formula for the post-war disposition of defence projects, installations and facilities, where no specific provisions have been made, was contained in an exchange of Notes in January, 1943. The formula provides:

1. Within one year after the end of the war, all immovable defence installations built by the United States in Canada will become Canadian property.

2. Within one year after the end of the war, all movable defence installations paid for by the United States may be removed by the United States Government, or offered to Canada for sale at a price fixed by independent valuation.

3. If both Governments agree, movable installations may be offered for sale in the open market, within one year after the end of the war.

4. If no sale can be made, the Canada-United States Permanent Joint Board on defence shall be determined what will be done with the installations.

The key organisation in all military arrangements between Canada and the United States is the permanent Joint Defence Board. Its purpose is to consider all measures for the joint defence of Canada and the United States. Its field, of course, is not confined to the Northwest, but to all theatres in which Canadian and American defence problems coincide. It is through the Board that American interests in joint defence are safeguarded and, conversely, Canadian interests. It is the Board that will determine measures to maintain defence installations after the war. In this way, it is more useful even than outright ownership of the defence installations by the United States. It is the reason why Canada has

never been involved in recurrent criticisms arising in US political circles of possible loss of American rights in military expenditures by the United States in various parts of the world. As a choice between a thorough military alliance—which has been in force between Canada and the United States since August, 1940—and rights of proprietorship in foreign lands, it is obvious that the relationship of alliance contained in the permanent Joint Defence Board serves the interests of both countries with least friction.

### Alaskan Air Route

In the recent purchase by Canada of American installations on the Northwest Staging Route, a vital air trunk line through Canada to Alaska, an example of the working arrangement can be found. Canada spent \$25 million on this chain of airports before a single US plane had flown over it, before even the United States entered the war. This skyway will probably become one of the important arteries of world aviation in the future. As originally constructed, it possessed landing strips of 3,000 feet in length and other facilities. During 1942 and 1943, enlargement became necessary and both Canadian and American expenditures were made. This year, when Mr Howe announced that the Canadian Government would pay for all American additions and improvements to the skyway, he gave the final joint cost, now to be borne entirely by Canada, as \$59,500,000. In the purchase, Canada in effect exercised an option that already existed.

This purchase will not shut out any American or other user of the Asia-bound air route in the future. Use of Canadian air facilities by international services is a matter of future agreement. Mr Howe said:

In arranging for the post-war use of the Northwest Staging Route, the Government of Canada will pursue a liberal policy of co-operation with other nations. We hope that the right to use the route will become part of a general scheme of international co-operation in air transport matters, which will provide greater freedom of movement of aircraft and of air traffic, within a suitable international framework.

One incidental feature is worth noting. Canada was able to pay cash to the United States simply because this country possessed ample supplies of US dollars. This, in turn, was the result of an elementary economic relationship, in that wartime trade between Canada and the United States has risen to phenomenal levels, on a free trade basis as far as war materials are concerned. The United States buys heavily in Canada for essential war materials, and Canada does the same in the United States. This is the basic reason why Canada has not required lend-lease assistance from the United States, and why it is in the position of being able to pay in US funds for materials and services such as the United States provided in expanding the skyway to Alaska and Asia.

## Letter to the Editor

### Pay and Allowances

TO THE EDITOR OF THE ECONOMIST

SIR,—In your Note on "Equal Pay" I was surprised to find no mention of family allowances or more effective income-tax rebates for children. Surely they are an essential corollary to any extension of equal pay, and should, if anything, precede rather than follow it.

Present practice has obviously many anomalies and imperfections when the needs and responsibilities of individuals are compared. It does, however, in some degree take account of the existence of dependent children, though everyone realises some men have no children, and some women have to provide for other persons. Without fiscal adjustment, Equal Pay is going to make no improvement on this present somewhat hit-and-miss method of providing for dependants. On the contrary, it will mean for the man with children a definitely lower standard of living than that enjoyed by women of equal occupational status.

The teaching profession is one of the social groups with a very low birth-rate, a long way under unity. It would be regrettable if, by Equal Pay, those with children were put at a still greater disadvantage compared with the childless. Is it not, therefore, desirable, on grounds of both equity and the future of our population, that Equal Pay should also mean more effective adjustment of taxation in favour of the parent?—Yours, etc.,

Birmingham.

L. J. CADBURY.

# G.E.C.

*in war — as in peace —*  
at the service of the Empire

Civil air transport is everywhere destined to leap ahead as soon as the war ends. For the present, however, plans must be held up because so many of the firms who would make the equipment for the factory, or the aircraft, or the aerodrome, are fully engaged on war production. This is the case with the G.E.C., the largest British electrical manufacturing organization in the Empire.

Working in close collaboration with Government experts, the G.E.C. research and manufacturing organizations have made developments of the utmost scientific importance. When war priority ceases, however, the technical advances made by the Company in all applications of electricity, including the important one of electronics, will be available to all in every part of the world for the carrying out of complete electrification schemes of any magnitude.

### Electrification Schemes

G.E.C. Electrification Schemes have been applied to all industries, including: Aircraft Factories; Chemical Works; Collieries; Food Factories; Gold Mines; Iron, Steel and Copper Works; Locomotive and Railway Carriage and Wagon Works; Motor Car Works; Oil Refineries; Ships and Shipyards; Textile Mills, etc., etc.

*G.E.C. — always in the  
forefront of electrical progress*

### MESSENGER OF THE FREE PEOPLES

Britain is now the European nerve centre of the Allied Nations. The governments of Occupied Europe are in Britain and the Empire. The military headquarters of the forces of the new world are 'over here.' From Britain radiate the messages that control this mighty effort. Approximately two million words pass through the central telegraph station of Cable and Wireless every day. The heavy strain which has been thrown upon Cable and Wireless resources is being met and overcome by the skill and loyalty of the staff. No difficulties to be met in the future can prove insuperable to men who do not know the word 'defeat.'

WHAT TIME IS IT 'OVER THERE'?

## Conserving the FOOD VALUE of our Milk

MILK Chocolate is a convenient medium for carrying, storing and conserving milk, but there is much more to it than that. . . Fresh dairy milk consists of two elements — water, which averages 87½%, and 'milk solids' (fats, protein and milk sugar), which contain calcium, phosphorus and Vitamin D and which constitute the whole food value of the milk. As the chart shows, Cadburys Milk Chocolate retains all the milk solids of all the milk used, and only the water is eliminated.

Cadbury means Quality

## Is your drinking water above suspicion?

IF there is any doubt about the matter, STILL MALVERN WATER, the purest natural spring water known, can still be supplied without restriction of area throughout Great Britain.

STILL MALVERN WATER is singularly free from mineral salts which may be harmful, and its medicinal value lies in its essential purity.

Order from your Wine Merchant,  
Chemist or Grocer.

## NEWS of WHITE HORSE

No. 3

### Providing for to-morrow as well as to-day

Suppose that good fortune has brought you a bottle of White Horse, as sometimes it may, even in this fifth year of war.

You pour out a modest measure of this genial spirit into your glass. What is your immediate reaction? First you recognise the delicate and distinctive aroma of the White Horse you have known in times of peace. Then, you raise the glass to your lips and at once your palate confirms your first impressions — that White Horse Whisky was never better than it is today.

This is quite true, and here is the reason. The White Horse Whisky in your glass is a whisky of the past and was growing old when this war was young. Stocks laid down long ago, matured and maturing, provide the White Horse supplies for tomorrow as well as today. Whisky as great as the White Horse you knew in time of peace, whisky which will always be 'fine as a fine liqueur.'

The present system of regulated supply is an essential provision to ensure for you the enjoyment of really good whisky both today, and in the years to come.

MAXIMUM PRICES: Bottles, 25/9d. Half-bottles 13/6d.  
as fixed by The Scotch Whisky Association.

## American Banks and War Finance

(From Our New York Correspondent)

SINCE October, 1942, the methods of war finance have been marked by an aggressive public sales campaign for Government obligations, just as American participation in the war itself has been said officially to have changed at that time from "defensive" to "aggressive deployment." The First War Loan drive got under way in November, 1942; the Fourth War Loan has just ended and plans for the Fifth, expected for early summer, are being made. Subscriptions to all four War Loans, shown below, exceeded the quotas established by the Treasury:

|                               | Commercial<br>Banks<br>(000,000) | Purchasers<br>other than<br>Commercial<br>Banks<br>(000,000) |
|-------------------------------|----------------------------------|--------------------------------------------------------------|
| First Drive—December, 1942... | 5,087                            | 7,860                                                        |
| Second Drive—April, 1943....  | 5,079                            | 13,476                                                       |
| Third Drive—Sept., 1943.....  | None                             | 18,943                                                       |
| Fourth Drive—Jan.-Feb., 1944  | *None                            | 16,730                                                       |
|                               | \$10,166                         | \$57,009                                                     |

\* Banks were permitted to buy small amounts in relation to savings deposits held; figure is not yet available and probably is not included in the drive total as announced.

During the period from October 31, 1942, to February 29, 1944, the public debt rose by about \$90 billion to reach a total of about \$186 billion. The total raised in the four drives, plus special issues sold to Government trust funds and agencies, the E, F and G issues sold outside the drives (in considerable part by pay-roll deduction) and the Treasury bills bought by the Federal Reserve Banks, make a total virtually equalling the increase in the public debt. Direct offerings to commercial banks for new money apart from the drives have been relatively small—except for Treasury bills, which have not usually remained in the banks' possession but have been promptly resold to the Federal Reserve. Hence the appearance has been created that, thanks to highly successful War Loan drives, the Treasury has had to rely relatively little on the commercial banks and that its policy has been markedly uninflationary.

The fact is, however, that commercial bank holdings of Federal Government securities rose by \$25,200 million between the end of October, 1942, and the end of December, 1943, and that the holdings of the weekly reporting member banks (the larger banks of the country) rose another \$2,646 million by February 23, 1944 (which suggests something like \$5,000 million for all banks). In addition, from the end of October, 1942, to late February, 1944, loans of the weekly reporting member banks for purchasing and carrying securities (presumably mostly federal issues) rose by about \$2,000 million. For the 16-month period, then, commercial bank financing of the federal deficit exceeded \$30 billion, or more than a third of the rise in the debt; something more than another \$10 billion was taken by federal agencies and trust funds and the Federal Reserve.

These facts—the appearance of relatively small participation by the banks and the actuality of large participation—explain the somewhat obscured process of war finance in the country. There is original sale or primary distribution of the greater part of the debt to non-bank buyers; thereafter a considerable part of the debt proceeds in one way and another to more "secure" lodgement in the banks—or, what is the equivalent, issues sold to non-bank holders before the present period are sold to the banks and replaced by issues purchased in the drives.

This "leakage," or secondary distribution to the banks, plus the smaller direct sales to them by the Treasury, has dominated the activities of the banks during this period. The process of acquisition of public debt by the banks has, of course, increased the amount of cash in the hands of those other than commercial banks; indeed, the sale of securities to the banks in such large amounts can be inter-

preted as a demand for cash by those other than commercial banks. Partly they have wanted this cash in the form of bank deposits and partly they have wanted currency: roughly they have taken \$6½ billion in currency and \$27 billion in deposits. The total of currency outside of banks is now nearly \$20 billion, and total deposits, excluding inter-bank and US Government deposits, are nearly \$110 billion.

This task of taking a substantial part of the debt and providing the general public with these large increases in cash has put a great strain upon the banks' reserves. Ordinarily, when a deposit is created by purchase of a Government security the banks' required reserve is increased by the required fraction—averaging in the neighbourhood of 16 per cent. When the deposit is taken in currency, the banks' reserve declines dollar for dollar.

At the end of October, 1942, the member banks of the Federal Reserve System had total reserves of \$12,735 million, of which only \$2,644 million were in excess of requirements. This excess, however, was quite inadequate.

The banks were assisted in two ways. The Federal Reserve Banks expanded the cash basis of the banking system; they increased their credit outstanding by \$7,281 million, almost entirely by the purchase of Treasury bills, which were sold by the Treasury to the banks and then resold by the banks to the Federal Reserve. Secondly, in the spring of 1943 the banking statute was amended so that the banks no longer needed to carry reserves against US Government War Loan deposits: this freed about \$1,000 million of reserves at that time, and the amount of relief obviously varies with the total of War Loan deposits. With this aid the banks were able to meet the demands upon them (which also included a decline in the monetary gold stock of about \$1,000 million and some shifting of Treasury and other funds into the Federal Reserve Banks) and to come out, toward the end of the Fourth War Loan drive, with \$13,200 million of reserves, of which \$2,100 million were in excess of requirements. As the large War Loan deposits in banks at the end of the Fourth War Loan are spent by the Treasury and become private deposits requiring reserves, a decline in these excess reserves will occur unless offset by some other development.

The ultimate and major burden of war finance clearly fell upon the Federal Reserve Banks, which had to provide the greater part of the funds needed by the commercial banks. Preponderantly they did it by purchasing Treasury bills; in addition, they bought certificates of indebtedness.

But in thus relieving the member bank reserve position the Reserve Banks obviously greatly extended their own position. At the end of October, 1942, the reserve ratio of the Reserve Banks was 81.5 per cent., i.e., they had reserves—almost wholly gold certificates from the Treasury—equal to 81.5 per cent. of their combined deposit and note liabilities. By the end of February, 1944, the ratio had fallen to close to 60 per cent. The statute provides that they must keep a reserve of 40 per cent against note liabilities and 35 per cent against deposit liabilities.

The entire war finance operation, with its great magnitude and tremendous impact upon the banking and Federal Reserve System, has been carried out smoothly thus far. Interest rates have remained low and stable, and the Treasury has received its new money for less than 2 per cent. The authorities have used relatively little of their monetary armoury: reduction of member bank reserve requirements; greater monetisation of silver; conversion of the Stabilisation Fund; and other measures.

It may be, of course, that this smoothness and apparent ease of operation are being attained at the cost of future difficulties. The size of the deficit, the enormous rise in the money supply, the ever more towering size of the public debt, the large proportion of the debt which is redeemable on demand or will shortly mature—all these cast a shadow on the future which only the unperceptive fail to see.

## Business Notes

### The Motor Industry's Chance

The British motor industry will have the opportunity after the war of becoming one of the world's great suppliers of private cars, of enjoying a period of expansion and prosperity such as it has never enjoyed before. The opportunity will arise from the heavy replacement demand, from the prospective growth in the number of potential car owners throughout the world, and from the fact that the United States and Canada are the only two major countries, besides Great Britain, that are likely to resume production fairly quickly and on a large scale. The size of the replacement demand alone will be enormous. In Great Britain, the greater part of the pre-war stock of cars, numbering some two million, is likely to be worn out; only a small proportion of the eight million cars in use before the war outside North America and Great Britain will still be serviceable; North America, whose stock of cars was nearly thirty million in 1941, will also be faced with a heavy replacement demand. Even the United States, with its capacity for organising large-scale production—in 1941 it produced 3½ million cars—would require several years to meet its own and the rest of the world's replacement demand, let alone the demand arising from the growth in the number of potential car owners. The British motor industry will therefore enjoy not merely a large home market, but it will also have the opportunity of participating in the world market to an extent never achieved before, and of developing an export trade substantially bigger than in 1938, when the total value of private cars and chassis shipped abroad was only £7½ million. But unless the industry takes swift advantage of the opportunity it will pass; and it may never recur.

### Conditions of Success

The conditions of success are not merely the quick resumption of production as soon as possible after the end of the war in Europe, but—and this is even more important—the ability of the industry to design the cars people want, and to produce them at competitive prices. As a preliminary measure, a revision of the present system of taxation is vital. Irrespective of the justification or otherwise of the pre-war ratio between the cost of the roads and the receipts from taxation on road vehicles, the present horse-power tax—next to the tax on petrol, the chief source of revenue—has two serious defects. First, the horse-power tax, which is based on the diameter of the bore of the engine, has driven manufacturers into building freak engines of small bore and long stroke, which are more costly and less efficient than engines of the same cubic capacity but with a wide bore and a short stroke. By basing taxation on the cubic capacity of the cylinder instead of on the diameter of its bore, this particular defect of the horse-power tax could be removed. This, incidentally, is the reform advocated in recent statements by Sir Miles Thomas, vice-chairman of the Nuffield organisation, and chairman of the public relations committee of the Society of Motor Manufacturers and Traders. But any horse-power tax has a second defect in that it concentrates demand on the small car—nearly two-thirds of the new cars registered in this country before the war were cars of ten horse-power or less—and weighs more lightly on the expensive car than on the cheap car. Concentration of demand on the small car, together with the tariff, has rendered the home market virtually immune from American competition; but it has also denied British exporters the opportunity of selling large numbers of cars in foreign markets. It may be, of course, that the industry sees its future in the specialised market for small cars and for *de luxe* cars, a view that could only be based on the assumption that it would never be able to compete with the American-type car. But such a view, if it were held, could only be born

of timidity and pessimism. If the industry is to seize its opportunity after the war, such a self-imposed limitation of scope is hardly the most suitable method of approach.

A really bold solution would be to abolish the horse-power tax. But a heavy petrol tax would not be a good substitute; it also penalises the big cheap car—that is, the easily exportable car. The most radical solution, therefore, would be to abolish both the horse-power tax and part of the petrol duty, and to substitute for them a licence duty based on the original cost of the car, designed, if necessary, to yield the same revenue. Such a tax would not merely enable manufacturers to produce big cheap cars, and therefore to compete in foreign markets, but it would also remove the anomaly whereby the British owner of a cheap car has to pay a proportionately much higher tax than that on an expensive car of equal horse-power. Moreover, such a redistribution of taxation, while reducing the cost of motoring to people of limited means, need not seriously affect the demand for *de-luxe* cars. It would be necessary to draw up a schedule specifying the rate of tax for every type of chassis, past and present (the tax might decline with age), but that would not be a very formidable proposition. A revision of the present system of taxation is urgent in order to enable manufacturers to lay their plans for the future, and the forthcoming Budget might provide an occasion for an announcement of the Government's policy. It would free the industry from the obstacles in the way of its large-scale participation in the fulfilment of export demands. But it would merely be a preliminary to a concerted drive to produce cars of competitive design and price. This is the task of the motor industry.

### Dual Control Abandoned

At Thursday's annual meeting of the proprietors of the Stock Exchange, London, it was announced that a scheme had been evolved for putting into effect a form of unified control. Since the institution of the present company, the Stock Exchange has been controlled by the Trustees and Managers, in the interests of the proprietors, and by the Committee for General Purposes in the interests of the members. Proprietors and members are the same people, but the holder of a considerable number of shares may be little interested in trading and *vice versa*. The system of dual control, which has been the subject of discussion, both inside the Exchange and elsewhere for many years, has had many disadvantages. There has been no officer common to the two controlling bodies, and co-ordination has been extremely difficult. The Managers wished, by and large, to maximise dividends, or at least distributable profit. The Committee wanted to provide additional services for the members and thus for the public. There was literally no means of joint discussion to settle such questions on their merits. This system is now to be ended. After discussions lasting more than two years, a Consultative Committee of the Trustees and Managers and of the Committee for General Purposes has agreed on a scheme, whose details are not yet available, which will transfer control to a single body which will administer the Stock Exchange in the joint interest of members and proprietors, while preserving the financial powers and rights of the latter. Thus, what has for many years been felt to be a cumbersome, if not a crippling, piece of rather antiquated machinery is to be revised, and there is little doubt that the reason for hastening the change is that post-war problems are likely to raise many questions with which the old organisation could not have dealt with sufficient rapidity. It is felt in some market quarters that the change will open the way for reforms of the first importance which have long been advocated, but have so far made little progress.

### ICI Results

The net profit figure for 1943 of Imperial Chemical Industries, arrived at after deducting taxation, and after repeating the allocation of £2,500,000 for depreciation, is

£6,685,345, or some £185,000 higher than last year. Almost the whole of this increase is taken up by a rise of £174,000 in the appropriation considered necessary for war contingency reserve, which receives £774,210, against £601,595. The remaining profit is distributed in the same manner as last year. The ordinary dividend is maintained at 8 per cent, and after repeating the allocation of £100,000 to war personnel reserve, carry forward is again strengthened by approximately £100,000. On the evidence of these preliminary figures, at least, it is hard to judge whether or not any improvement has taken place in the company's fortunes. If the allocation for war contingencies is considered a reserve, "earned for ordinary" works out appreciably higher at 11.9, against 11.2 per cent; on the other hand, if this item is knocked off first, "earned for ordinary" comes to 8.8 per cent for both years. It is arguable that provision for some war risks is as much a current charge on earnings as is depreciation. The difficulty is to know whether or not ICI has over-provided under this head—a question which can hardly be answered until after the war. Previous appropriations out of current income for war contingencies have amounted to £1,000,000 in 1939, £339,000 odd in 1940, and £300,000 odd in 1941. Out of the 1942 provision of £601,595, some £350,000 was required for current premiums paid by ICI and its full subsidiaries under the War Damage Act. The war contingencies reserve was very considerably strengthened in 1940 by the transference of £1,500,000 profits on the realisation of investments and by transfers from the free reserves of subsidiaries, and at the end of 1942 it stood at £2,750,000. The maintenance of the dividend at 8 per cent was expected in the market, and the £1 shares, now standing at 38s. 3d. ex dividend, offer a yield of £2 4s. 3d. per cent free of tax.

### The Banks' Investments

The clearing bank statements for March have contradicted every expectation by showing a decline in investments. The total of this item has fallen by £4,781,000 over the month, whereas it was expected to reveal part of the

banks' considerable aggregate contribution to the large amount subscribed to Government securities during London's Salute the Soldier week. It should, however, be noted that four of the eleven clearing banks made up their March returns before the week in question opened, and that most of the others did so very early in that week. It may be assumed that the large clearing banks' direct contributions to the £166,629,273 raised during the Salute the Soldier week came from strategic reserves brought up towards the end of the week, and it is only in the April statements that the full impact of these subscriptions will be seen. The same holds true of the heavy pre-encashments of Treasury Deposit Receipts which took place in connection with these subscriptions towards the end of March. They hardly affect the March returns, which show TDR's £67 million higher than in February. One of the most interesting movements in the March returns is the increase of £19,506,000 in loans and advances. An increase in this item normally occurs in the last month of the financial year, and indicates the extent to which temporary bank finance is used to meet tax payments. Last month's movement is rather larger than usual, but it may be assumed that tax loans still account for a considerable part of it, since there are now special incentives for financing tax payments—even anticipating them—by raising bank loans.

### Still More Treasury Bills

Last week's rise in the weekly issue of Treasury bills by tender from £90 million to £100 million was only one step in the expansion of this part of the floating debt. This week the amount on offer has been further raised to £110 million. This is also in the nature of a permanent as opposed to a seasonal increase. It does not necessarily mean that £110 million is the new norm at which the weekly tender for Treasury bills will settle down, but if this is so, it is because the expansion is not yet at an end. The need for some increase in the bill tender is again emphasised by the March clearing bank returns, which show bills discounted at the exceptionally low figure of £113,144,000, a reduction of over

## UNION CORPORATION, LIMITED

(Incorporated in the Union of South Africa.)

### ABRIDGED REPORT OF THE DIRECTORS FOR 1943.

The Accounts are drawn up in Union of South Africa currency, United Kingdom currency being taken at par. The profit is £710,299 0s. 0d. plus £121,663 13s. 3d. brought forward, making a total of £831,962 13s. 3d. The Directors placed £100,000 0s. 0d. to the credit of Exploration Reserve Account. A final dividend of 5s. 6d. U.K. currency per share was declared absorbing at par £423,500 0s. 0d., making, with the interim dividend of 2s. 6d. per share, a total distribution of 8s. 0d., or £616,000 0s. 0d. for the year, and leaving £115,962 13s. 3d. to be carried forward. Holdings of Shares, Debentures and other securities have been taken into the Accounts at cost or under, but in no case above the market price of December 31st last, or, where no market price exists, above the Directors' valuation. At present market prices, these holdings show a very substantial surplus over the amount at which they stand in the Balance Sheet. The Directors, as on other occasions, have thought it expedient to provide for contingencies by reducing the book cost of certain holdings both below cost and below market price.

### GOLD INTERESTS.

A summary of the operating results for the past year of the five gold mining companies operating in the Witwatersrand in which the Corporation is largely concerned is given below and is based on the market price for gold at 168s. per oz. fine:—

| Year ended December 31st, 1943      | East Geduld Mines | Geduld Proprietary Mines | The Grootvlei Proprietary Mines | Marievale Consolidated Mines | Van Dyk Consolidated Mines |
|-------------------------------------|-------------------|--------------------------|---------------------------------|------------------------------|----------------------------|
| Tons milled .....                   | 1,872,000         | 1,323,000                | 1,900,000                       | 582,000                      | 1,177,000                  |
| Yield per ton .....                 | 49s. 6d.          | 39s. 10d.                | 43s. 0d.                        | 45s. 0d.                     | 39s. 0d.                   |
| Working costs per ton .....         | 15s. 5d.          | 19s. 7d.                 | 18s. 3d.                        | 28s. 5d.                     | 26s. 9d.                   |
| Working Profit per ton .....        | 34s. 1d.          | 20s. 3d.                 | 24s. 9d.                        | 16s. 7d.                     | 12s. 3d.                   |
| Total Working Profit .....          | £3,190,000        | £1,337,000               | £2,353,000                      | £483,000                     | £720,000                   |
| Dividends (totals and per share)... | £999,000 (11/0)   | £876,514 (12/0)          | £822,165 (5/9)                  | £225,000 (1/0)               | £378,125 (1/4)             |

The Working Profit figures include the amounts due to the Union Government for taxation and under Government lease agreements, but exclude revenue from sources other than gold mining operations. Thus, East Geduld Mines 1943 dividend income on its shareholding in The Grootvlei Proprietary Mines was £38,600, and Geduld Proprietary Mines 1943 dividend income on its shareholdings in East Geduld Mines and The Grootvlei Proprietary Mines amounted to £389,700.

ORANGE FREE STATE.—Three farms north of Sand River, totalling 2,326 morgen, have been purchased jointly with Selection Trust Limited.

WESTERN HOLDINGS.—Owing to war conditions no further developments have taken place on this Company's areas in Orange Free State. WITBOK.—The joint borehole reached a depth of 5,588 feet at the end of the year.

### OTHER INTERESTS.

BAY HALL TRUST.—The dividend for 1943 was 7 per cent., against 6½ per cent. BRITISH ENKA.—Further progress was made and profits were well maintained. CONSOLIDATED AFRICAN SELECTION TRUST.—This Company paid 1s. per Ordinary Stock unit, against 7½d. free of tax in each case, under its contracts up to May 31st, 1943, and in consequence it was decided to stop mining operations. RHODESIA.—Mafudira and Roan Antelope earned satisfactory surpluses, but in view of the need to conserve liquid resources, neither company paid a dividend and for the like reason Rhodesian Selection Trust passed its dividend. SAN FRANCISCO MINES OF MEXICO.—The net profit for the year to September 30th, 1943, after charging taxation, amounted to £236,561, against £139,630. A dividend of 3s. per share was paid, against 2s. 6d. SELECTION TRUST.—For the year ended March 31st, 1943, this Company paid a dividend of 10½d. per Ordinary Stock unit, against 9d. SOUTH AFRICAN PULP AND PAPER INDUSTRIES.—In 1943 the Company earned a net profit of £193,061, against £86,532. A dividend of 9d. per share has been declared, against 6d. ULTRAMAR COMPANY.—In order to provide funds for the Venezuelan operating companies, 300,554 shares were subscribed by shareholders at 42s. 6d. per share in May last. Field operations in Venezuela resulted in further satisfactory oil strikes and the determination of promising oil structures. COPIES OF THE FULL REPORT AND ACCOUNTS CAN BE OBTAINED ON APPLICATION AT THE LONDON OFFICE, PRINCES HOUSE, 95, GRESHAM STREET, E.C.2.

ESTABLISHED 1824  
**SCOTTISH UNION AND NATIONAL**  
**INSURANCE COMPANY**  
 ASSETS EXCEED £18,500,000  
 FIRE LIFE ACCIDENT MARINE  
 Edinburgh: 35, St. Andrew Square.  
 London: Northgate House, 29/30, Moorgate, E.C.2  
 and 45, Pall Mall, S.W.1.

£10 million from the already low figure for February, and except for a single month, namely, February, 1942, the lowest total in the history of the clearing bank statements. The March figure shows discounts to represent only 2.66 per cent of the total assets, a figure which is a low record. It would be desirable for the banks to have that figure raised to about 5 per cent. Since the outside, and especially the sterling area, demand for Treasury bills continues to expand, the only way in which the banks' requirements can be satisfied is by increasing the amount of bills on offer. The discount market syndicate's aggregate applications for Treasury bills are already adjusted to the increases in the amount on offer. Though the additional bills to be made available to the banks will reach them through the discount market, the increase in the turnover will not bring much grist to Lombard Street's mill. At the current price of application for Treasury bills the profit on reselling £1 million of bills to the banks is about £44. Even if the market obtained half the additional £20 million of bills put up for tender each week, the resultant increase in its gross revenue would be diminutive.

### South African Gold Contract

Mr Hofmeyr, the South African Minister of Finance, has this week effectively answered all the queries which have recently been raised in South Africa about the open market price for its gold and the policy which the Union should follow in the sale of its gold output. Mr Hofmeyr asserted that it was to the interest of South Africa to have a fixed price for gold and not to follow the dangerous will of the wisp of a fluctuating free market price. Answering the demands that South Africa be allowed to sell its gold in India, he asked who would provide the shipping, who would insure the shipments, what would South Africa do with its rupees, what would happen to the rupee exchange and to the rupee price of gold if the Union's output were put on the Indian market. These questions were sufficient to demolish the opposition case. Mr Hofmeyr then gave official explanations of the gold contract between the South African Government and the British authorities. The South African Reserve Bank takes such gold as the Union requires for its own needs and the Bank of England is given the option to purchase the balance at the official price of 168s. per fine ounce. This gold is paid for delivered at Cape Town or Durban and the British Treasury, for whom the Bank of England acts, bears the expense of shipping the gold to London or New York or, more latterly, Bombay. If South Africa had had to ship and insure the gold to the United States it would have received a net price below the figure of 168s. per fine ounce. The gold realisation charge of 3s. 2d. per ounce debited to the mines has, during the war, been placed to a special fund, for no realisation expenses had been incurred by the South African Government since the contract with the British Treasury came into operation. This fund has grown to more than £10 million and provides a useful reserve from which the gold industry can be assisted in offsetting the cost of the higher wages recently granted to native workers.

A few months ago, added Mr Hofmeyr, the British Government had advised the Union of its intention to sell gold in India. Mr Hofmeyr pointed out that the Government in India was maintaining the rupee rate despite inflation, that the British Government, therefore, had to pay much more for its requirements in India and that, by selling gold at the open market price, it could, to some extent, offset the effect of these inflated commodity prices and at the same time combat inflation by offering Indians gold for hoarding. The Union had pointed out to the British Government that it had to pay rupee value for certain purchases in India and that, to that extent, the Union was importing Indian inflation. A case was, therefore, pleaded for allowing the Union some of the benefit of the higher gold price in India. An agreement has been reached whereby the British Government is giving the Union facilities for sharing in the sales of gold on the Indian market to the extent justified by the Union's imports from India.

### The Montreal Scheme

What looks like the last chapter in the story of the Montreal default, negotiations and final settlement has just opened with the circulation of the full terms to stock-

holders. The offer carries the recommendation of the London Committee and appears to be in every way a reasonable one. While full particulars have not even yet been circulated, it appears that the total debt of the City of Montreal was approximately Can\$206 million, excluding certain items which were not involved in the scheme. Of these the only one which concerns British holders is £1,406,000 of 3 per cent perpetual stock. Excluding these items, some 28 per cent of the total debt was held in this country, but whereas maturities of all sorts extended from 1940 to 1971, sterling maturities were grouped between 1948 and 1954 with two exceptions. These were the small 3½ per cent Montreal issue which fell due in 1942 and an issue of £2,149,000 4½ per cent stock maturing in 1969. Of these the former is to be repaid at par plus full accrued interest in June next. After a visit of Montreal officials to London, a very substantial measure of agreement was reached on most points, but the whole scheme threatened to come to grief because of the suggested treatment of this loan. A turning point was reached with the suggestion for new finance to cover all matured loans, short-term liabilities and, it seems, some Can\$15 million of Treasury bills. A total of just under Can\$56 million is to be raised to cover these replacements and maturities up to the turn of the current year. This is designed to be repaid in yearly instalments over the period 1944-53. Debt maturing after June next will have its maturity deferred for periods which, in the case of most sterling issues, are from 12 to 16 years. But the new maturities are arranged so that the amount rises steadily from Can\$5,573,000 in 1954, the first full year, to Can\$9,951,000 in 1974 with a final, slightly smaller, payment in the following year. Owing to the rise in annual payments the later maturities are extended for short periods only and the sterling 4½ per cent stock, mentioned above, will be repaid in 1973-74. (This has the additional distinction of being the only large issue to carry the option of payment in Canadian dollars, although the two small series of St. Louis 4½ per cent bonds, extended to 1961, carry options for both Canadian and US currency.) As previously stated, the rate of interest on all stocks after present contractual maturity dates is, for sterling loans, 3½ per cent, but on earlier maturities the extension of date is less and on these and the new short-term borrowing the rates vary, according to length, from 2½ per cent to 3½ per cent. According to the statement of the London Committee, there are a number of provisions designed to ensure sound finance, including an independent audit, to be published annually, while all future loans will require the sanction of the Quebec Municipal Commission.

### Control of Industrial Location

The need for a measure of control over the location of new factories after the war is now widely accepted. But less thought has hitherto been given to the detailed application of a policy of controlled location, that is to the actual technique of control. By way of an example of the kind of technique that might be adopted, Professor P. Sargent Florence, in a Paper read before the Royal Statistical Society on April 18th, has attempted to sort out the various considerations that might guide the selection of industries suitable for dispersion into rural areas. He listed three principles of selection. The first is that in selecting industries for agricultural areas, account should be taken of the facts that agriculture usually employs a disproportionate number of men and of older workers, offers less employment in winter than during the rest of the year, and, if pre-war trends continue, may require progressively fewer workers. The second principle is that the movement of industries to rural areas should assist in the solution of unemployment, urban congestion, and other social problems. Although agricultural areas are not likely to be faced with acute problems of unemployment after the war, they should, in the view of Professor Sargent Florence, bear their share in the dispersion of industry from congested areas if the recommendations of the Barlow Commission are to be implemented. But factories which are to be dispersed should not be so large as to involve too much new house-building, or too long a journey to and from work for scattered workers. The third principle of selection is one of "practical feasibility not of social desirability"—that the industries to be diverted to rural areas should not operate at costs that are high compared with those of their competitors, or compared with the demand prices of their customers. Next,

guided by these principles, Professor Sargent Florence elaborated a statistical technique of selection, by measuring, on the basis of the data available, the relative advantages and disadvantages of moving factories in individual industries into rural areas. His attempt revealed the paucity of information at present available to translate the principles of selection into practice. And, as he fully recognises, his statistical measurements suffer from the defect of being based on the past. It would be necessary to supplement them with expert knowledge of technical developments which are likely to influence the prospective size, technique and organisation of particular industries. If Professor Sargent Florence's Paper has demonstrated one thing, it is the practical difficulties in the way of controlled location and the need for further investigation into its implications.

### Electric Power in Scotland

Judging by the statement of the chairman, Mr William Shearer, the Scottish Power Company feels aggrieved, to some extent justifiably, that the development of water power in the Highlands should now be treated as a public boon, to be backed with public money, whereas previously its own efforts at expansion were thwarted and criticised as the exploitation of a depressed area by outside interests. To date, the generation of almost all hydro-electricity in the Highlands has been done by the Grampian Company, a subsidiary of Scottish Power. For the future, however, all development has been entrusted to the new North of Scotland Hydro-Electric Board, under whose direction the Grampian's generating stations will be administered as selected stations. This arrangement does no more than bring the North of Scotland into line with the arrangements for generation already prevailing in the rest of Great Britain. The Grampian Company will continue to supply its existing area, covering as much as 13,000 square miles, and arrangements have been made for it to obtain bulk supplies from the Board with which to satisfy additional demands. There has been criticism in the past of the policy of turning the Highlands into the "power-house of

the South." But, in point of fact, the more electricity that can be exported southwards to the grid at a competitive rate, the cheaper can be the rates and the wider the area served in the Highlands. The Grampian Company is under contract to supply to the Central Electricity Board, for consumption in the industrial middle of Scotland, an annual total of 106 million units, which compares with a distribution in 1940 of 63 million units to its Highland customers. The policy of the Hydro-Electric Board, in this respect, is likely to follow that of the Grampian. The only condition of such a policy must be that local needs are given full priority, as is guaranteed by the Board and as has been done by the Grampian. There can be little doubt about the value of hydro-electric development to the depopulated Highlands; and if it is all to the good that this should now be undertaken by public enterprise, it is also true that the Scottish Power group did their best to finance this development, at what was considered by the Cooper Committee to be a very reasonable rate.

Turning to the general interests of the Scottish Power group, Mr Shearer claimed that a number of the recommendations of the McGowan Committee, directed to a greater integration of supply units and standardisation of charges, have now been implemented. He complains of a delay in ratifying the relinquishment that some local authorities have made of their distribution powers in favour of the group. Where, as in the case of the Grampian Company, the private company is very much larger and more experienced than the local authority, there is at least a *prima facie* case for supposing that such transferences of the authorities' optional powers are helping to accomplish the aims set by the McGowan Committee. Disillusioned perhaps by the lack of appreciation accorded to his group's efforts in the Highlands, Mr Shearer is strongly on the offensive to protect the activities of private enterprise. He calls upon his confrères in the electric supply industry to unite in a crusade against the "attempts insidiously being made and politically inspired" to force bureaucratic control upon the whole industry.

## BENEFACTORS OF MANKIND

JOHN HOPKINSON (1849-1898)

The practical mind is sometimes the most truly imaginative. It applies mathematics, most exact of all the sciences, to the most intangible in speculation. Thence spring the inventions which from time to time alter or modify the course of universal events.

# Practicality

A MAN of great mental power, bold experimenter and practical engineer, he did not neglect the commercial problems of the enterprises in which he engaged, and initiated a new system for charging cost of electricity supply. Electricity was his master passion, and his life was devoted to harnessing it to the service of man-

kind. Great were his achievements. He was a pioneer in the invention of the three-wire system of distribution, and the series paralleled method of working motors. He invented a system of flashing codes for lighthouses. He evolved the characteristic curve which laid the foundation of the accurate design of dynamos.

A secret of the success of BRUSH Electrical products is their practicality for use in all industries.

## Uninformative Circulars

An instance of the paucity of information upon which shareholders are expected to act is the recent circular of Savory and Moore. The company guarantees £125,000 6½ per cent preference of Pharmaceutical Products and has outstanding some £262,000 of 5 per cent first mortgage debentures. After these rank two small issues of cumulative preference capital and then £160,000 of 6 per cent non-cumulative redeemable preference. It is proposed to replace, apparently in the immediate future, the guaranteed preference and debentures by 5½ per cent first redeemable preference capital and, at some later date not stated, to pay off the 6 per cent redeemable preference and issue in its place an equal amount of the new 5½ preference. This means increasing the amount placed in front of the old cumulative preference shares of the company for no apparent reason. Further, the maximum of the new preference is fixed very high, namely at £440,000. No explanation is given of how the change in capital is to be effected or to whom the new capital is to be offered. The explanatory circular states little more than the conviction of the board that the change will operate to the advantage of the old preference and ordinary capital of the company. It is sought to sustain this argument by the statement that the company will be relieved from the need to provide heavy sinking fund payments. This may be convenient, but it must not be forgotten that such items are capital payments which eventually improve the position of all classes of shareholder. The shareholders are given only ten days' notice of the meeting and that period includes two week-ends. The proxy form was not sent to the press, but it appears to have provided facilities only to support the board's scheme. The information provided is inadequate for a reasoned decision and the time allowed far too short to permit of any organised opposition. Information may be given at the meeting, but it is improbable that more than a fraction of the few shareholders who are able to attend will be able to digest the full implications of a somewhat complex scheme in the time available. The remainder are invited to buy a pig in a poke.

## Milk Distribution

Mr W. A. Nell, the chairman of the Express Dairy Company, in his speech to its annual general meeting on April 13th, raised the question whether there should be a return after the war to free competition in milk retailing. The pre-war position was that any number of milk roundsmen could serve the same street, which gave rise to criticisms of wastefulness and unnecessarily high costs of retail distribution. Justification for that method of distribution was claimed on grounds of the different services provided. During the war a policy of rationalisation has been adopted throughout the country, and apart from the Co-operative Society (which is not affected by rationalisation) it is now rare for two dairymen to deliver in the same district. On the whole, the consumer does not suffer in wartime from this quasi-monopoly of the dairymen. The quality of the milk scarcely differs from one to another retailer, and no one can provide a better service than another. In peacetime the housewife prefers to choose her own retailer, because freedom of choice gives her the service she prefers, but she may in future prefer cheaper milk to better service; these are the alternatives. There is no doubt that rationalisation has reduced the absolute cost of distribution. According to Mr Nell, the six-monthly investigations into distributors' costs, which are made by the Ministry of Food, show that the present costs per gallon are substantially the same as before the war, despite an increase in material and labour costs of almost one-third. Whatever plan is operated after the war, the consumer will be prepared to accept it provided milk is cheaper, and provided there are improvements on the wartime service. Considering the cost of delivering milk to the consumer's door, it should be possible to sell milk cheaper at the depot or dairy to consumers who would be prepared to collect it themselves. If this can best be achieved by the allocating of districts to each retailer, so much the better, if the danger that there will be no incentive to reduce costs can be avoided.

## A New Yield Index

Despite the dangers of the abuse of statistics, the need for suitable measuring rods for a vast variety of purposes is now widely recognised. The latest addition

to the equipment of the investor is a new index of equity yields compiled by *The Financial News*. This is based on the already well-known index of industrial equity prices which is a geometric mean of the middle closing prices of 30 market leaders. The new index cannot be more nearly accurate than the price index, but that has shown over any extended period a very close correspondence with the much more detailed figures of *The Actuaries' Investment Index*. This index produces an arithmetic mean for its yields based on a geometric mean of prices. *The Financial News* preserves the geometric method for its yields and that creates a new difficulty and a new source of possible error. With 30 stocks in question it is possible that one or more will be paying no dividend, and this has

FINANCIAL NEWS CORRECTED INDEX OF INDUSTRIAL YIELDS

|                | 1939 | 1940 | 1941 | 1942 | 1943 | 1944 |

| December.....  | 5.88 | 5.99 | 4.92 | 4.43 | 4.02 | .... |

happened in the 5½ years covered by the new index. Several approximate adjustments are possible. That chosen is to work out the geometric average of the yields on the shares carrying dividends and to correct this by the difference between the arithmetic average of these shares and the figure obtained by dividing the total dividends paid by the total of the 30 shares in the index. The new index is calculated daily and appears on page 551 with other stock market indices. Monthly average figures are given above for dates since January, 1939. The index is consistently lower than that of the Actuaries, mainly because a geometric average is always lower than an arithmetic one, but partly because market leaders tend to yield less than well-known securities.

(The Records and Statistics section this week includes details of the rise in raw cotton prices, page 551; of the facilities to be provided for ex-Service men formerly engaged in food retailing to re-enter the trade, page 551; and of the experience last year of the Co-operative Wholesale Society, page 552.)

\* On assumption only 1 year's preference dividends had to be paid.  
† For 1941, Income tax is included with administrative expenses.  
‡ In 1941, 2 years' arrears of dividend on the 5% Preference stock was met, but none on the 6%. In 1942, payments on both issues of Preference stock were brought up to date, requiring 9½ years' payment on the 5% and 11½ years on the 6%.  
§ Including shares in subsidiary companies at cost, less reserve, valued at £13,925,226. The Cunard Steam Ship is, of course, primarily a holding company.

The ordinary stock units of £1, quoted at 218. 9d. ex dividend, yield £5 10s. 4d. per cent.

## HOW TO MAKE IMMEDIATE SAVINGS in the use of Gas and Electricity in Industry

Economy in the use of fuel in all factories is now a matter of first consideration. Managements are seeking every opportunity to reduce fuel consumption. The following suggestions will be helpful.

## FACTORY GAS

Any of the following will show an immediate saving of Gas:

- Plan the work so that furnaces and such-like are run only when fully loaded; avoid lighting them for odd jobs; don't put more into use than are absolutely essential;
- Insist that every single burner must be turned off when not actually needed for work;
- Furnace doors should not be left open a moment too long — be adamant on this point;
- Moving parts which work freely stand a better chance of being handled properly; see that all controls can be adjusted easily;
- Mark the air shutters on natural draught furnaces and the control valves on furnaces using high pressure air so that the plant can be worked at the most economical settings;
- Insist that lids of liquor tanks and salt baths are kept on as much as possible.

## FACTORY ELECTRICITY

Any of the following will show an immediate saving of Electricity:

- Be ruthless in cutting out idle running;
- Plan the work so that plant operated is fully loaded;
- Check the lagging of ovens, tanks and other plant; repair at once broken or faulty lagging;
- Make a spot check for electric furnace doors left open; give strict instructions that they are not to be open a second longer than is necessary;
- If you have bigish transformers, see that they are never left on to supply negligible load;
- See that every electric appliance is switched off when not actually in use (read the riot act to all offenders).

Factory managements will find many more practical suggestions for quick savings in their Fuel Efficiency Bulletins. Look them up straight away. You need Bulletins Nos. 5 and 14 for gas savings, and No. 13 for electricity savings.

**MOST IMPORTANT**—make every effort to strengthen your Fuel Watching System. Keyed up it will make possible astonishing savings of gas and electricity. Study afresh your Fuel Efficiency Bulletin No. 7.

ISSUED BY THE MINISTRY OF FUEL AND POWER

## AND WHEN THE WAR IS WON?

Non Co-operation, or . . .

'Combined Operations'?

We have discovered beyond all doubt that economic interdependence between nations—the spirit of sharing—is as vital a factor in winning the war as combined operations in the Field. It will be no less vital when the war is won. And why? Because a lasting peace depends not only on justice and good will but upon world-wide prosperity . . . and prosperity can only be secured by sustained industrial co-operation between all the nations of the world.

It is the responsibility of the United Nations to maintain the vital machinery of industrial co-operation which they have already set in motion. It is the responsibility of every citizen to insist upon really practical plans for the use of this machinery . . . plans which will permit of unhampered progress towards the prosperity not merely of the individual but of the entire world.

★ ★ ★

This Statement is issued in support of the principle of continued industrial collaboration between the United Nations after the war. Announcements by the International Nickel Company of Canada, having the same purpose, have appeared in Canada and the U.S.A.

## COMPANY MEETINGS

## THE STANDARD LIFE ASSURANCE COMPANY

## BONUS DECLARATION

## LARGE SUPPORT FOR GOVERNMENT LOANS

## MR. JAMES C. CAMPBELL'S ADDRESS

The one hundred and eighteenth annual general meeting of the Standard Life Assurance Company was held, on the 18th instant, in Edinburgh. Mr J. C. Campbell was in the chair.

The manager and actuary having read the auditor's report, the chairman said:—

Before dealing with the accounts and with the results of the quinquennial valuation, I must refer to the loss which the company has sustained as a result of the sudden death of Mr E. M. Beilby. Mr Beilby became a director in 1917, and filled with distinction the offices of chairman of the board from 1929 to 1932 and of vice-chairman from 1924 to 1929 and again from 1939 until the date of his death. Mr Beilby's presence is greatly missed by those of us who served with him and who were accustomed to the benefit of his wise and far-seeing judgment.

After referring to the directors and staff, the chairman continued:—

I wish now to refer briefly to the report and accounts for the year; I am sure you will feel satisfied with the results which they show. Once again, and that with practically no outdoor staff in this country and a greatly depleted staff overseas, the new business for the year shows an increase. The total of new life assurances at £3,542,239, after deducting sums reassured and including group life assurances, shows an increase on the previous year of £541,207. As in recent years, we have written a substantial amount of deferred annuity and pension scheme business and we received £319,574 for the purchase of annuities. I attribute the continued good flow of business to the work of our agents, who, although deprived of the assistance of our pre-war outdoor staff, are still sending business regularly to the company; I can assure them that their co-operation and loyalty are highly appreciated.

## FAVOURABLE INTEREST RATE—REDUCED EXPENSE RATIO

From the revenue account of the life assurance and annuity fund you will notice a reduction in the amount of claims paid—both under claims by death and by maturity—and a satisfactory reduction in the sums paid out in respect of policies surrendered. These, combined with an increase in our premium income, which now stands at nearly £2,800,000, have contributed to increase the fund during the year by over £2,000,000. It is satisfactory to be able to record that our expense ratio has now been reduced to 9.8 per cent.—evidence of economical management under war conditions. Our net rate of interest of £4 os. 11d. per cent. shows a reduction of 1s. per cent. as compared with last year, and you may feel that this net rate makes an extremely good showing in the present circumstances.

## WAR LOAN INVESTMENTS

In the balance-sheet our assets now total £39,197,000; the fact that our holding of British Government securities, which at November 15th last stood at £13,817,000, increased during the year by £2,194,000 shows that, as requested by the Government, we are energetically continuing our policy of subscribing to new War Loans, although, of course, the low rates of interest obtainable thereon cannot but adversely affect the rate of interest earned on our funds. We follow this policy cheerfully, however, fully aware that it is in the best interests of the country as a whole

that the Government makes its request, and it will no doubt be of interest to members to know that since the commencement of the war our holding in British Government securities has increased by £9,938,000, and of this total £8,949,000 has been subscribed to new War Loans. In addition, our Canadian branch has invested substantially in the new War Loans issued by the Canadian Government.

## QUINQUENNIAL INVESTIGATION

Five years have now elapsed since we published the results of an actuarial investigation into the affairs of the company,—five years filled with trouble and danger. As required by statute, we have accordingly completed a full and thorough investigation into the affairs of the company, both as regards the assets and the prospective liabilities. The results indicate that the company has emerged from this trying period much larger as regards its undertakings and with undiminished strength; our liabilities have grown in amount, but so have our resources, and I believe we may face the future—uncertain and difficult as it will be—knowing that we have made every reasonable provision and taken every precaution which the present circumstances suggest to us as being in the interests of our members.

The directors have made a detailed scrutiny of the assets of the company, and you will see from the certificate attached to the balance-sheet that they are of opinion that the actual value is in excess of the published figure. Last year I was able to state that there was a substantial margin in value over the published total of assets, and on this occasion I shall content myself with stating that this margin has increased.

## STRONG ACTUARIAL RESERVES

As regards the prospective liabilities, a complete actuarial investigation has been carried out by the manager and actuary on a basis similar to that employed on the last occasion. The rate of interest assumed both for assurances and annuities is 2½ per cent., and the latest tables of mortality available have been employed. This has in the past been acknowledged to be a basis of great strength, but in these days of low-interest rates and high taxation it will be a satisfaction to you to know that certain additional actuarial reserves have been set aside which would be sufficient—and more than sufficient—to enable the actuary at the present time to reduce his valuation rate of interest as regards assurances to 2 per cent., whilst taking credit in his calculations for the 2½ per cent. select net premiums only—a position greatly stronger than an ordinary 2 per cent. net premium valuation would provide. The directors do not feel that the present is an opportune time to change the basis of the actuarial valuation; it is sufficient to be aware that, without in any sense encroaching upon the margin of assets to which I have referred, the basis could now be altered to one of even greater stringency and to await the appropriate time when more settled conditions will enable us to be more precise in our estimates of the future.

## DECLARATION OF BONUS

You will be aware from the report that we have declared a reversionary bonus at the rate of 30s. per cent. per annum—that

is, £7 10s. per cent. for a policy entitled to participate during the whole of a quinquennium, calculated upon the sum assured and bonuses attaching at November 15, 1943, and applicable to all policies in full force on that date in the reversionary bonus class, with corresponding bonuses in other classes. Also and in notice of alteration, intermediate bonus have been declared at the same rates in respect of premiums due and paid since November 15, 1943, under policies becoming claims by death or maturity. We do not propose to issue individual bonus notices on this occasion. Our members will realise that this is due to shortage of staff and a desire to economise in the use of paper.

## BOARD'S SOUND BONUS POLICY

In 1939, the directors abandoned temporarily, I hope—as a measure of prudence, the declaration of an annual compound bonus, and as a consequence the bonuses now declared are compounded on a quinquennial, not upon an annual basis. When more normal times return and after a sufficient period has passed to give us experience of the new conditions—for no doubt in many important respects they will be new—the question of a return to annual declarations and annual compounding will receive the consideration of the board.

The members will not conclude from the fact of this declaration of bonus that the directors have made the mistake of taking an over-optimistic view of the future; we have received too many warnings from those in high places to fall into this particular error. Our attitude is that taking a sober view of what lies ahead and considering the financial resources at our disposal, a failure to make a distribution of surplus to existing members on this occasion could not be justified. We have not forgotten that great trials lie ahead of the nation, and that these may well affect life assurance and other financial institutions adversely; but we have made such provision for the event as to the best of our judgment, the declaration of an annual bonus is just and safe.

## COMPANY'S LONG RECORD OF SERVICE

For a long time now—over 118 years—the Standard has served its members in good times and bad; we can look back upon the past with satisfaction and some pride, for the enterprise of the founders of the company and their early successors introduced the benefits of life assurance in many parts of the world, and the Standard's name is known in many countries as a synonym of sound life assurance practice. Our activity in recent years in the comparatively new direction of life assurance and pension schemes for industrial workers may, I hope, be taken as indicating that we have not forsaken the pioneering tradition of our predecessors.

## CONFIDENCE IN THE FUTURE

I have confidence in the future of our company and in its capacity to render valuable service under changing conditions. I believe that there is, and will continue to be, a necessity for the beneficent enterprise of institutions such as ours; that under post-war conditions there will be a wide field open for our activities and ample opportunities to encourage the virtues of thrift and prudence, as it is our business to do. The demands of the war have restricted our activities, but we are doing what we can now to be ready when the war is over to renew that full service which it was previously our pleasure to give. It will be our aim to provide in the most convenient and economical forms the means to exercise the sense of individual responsibility and the desire to protect dependants which are, and will, I trust, remain characteristics of the communities which we serve.

I now move the formal adoption of the report, revenue accounts and balance-sheet submitted.

Mr A. Ballantyne seconded this motion and the report was unanimously adopted.

## NATIONAL BANK OF EGYPT

## EGYPT'S IMPROVED FINANCES

## ALY SHAMSY PASHA'S REVIEW

The forty-fourth ordinary general meeting of the shareholders of the National Bank of Egypt was held at the head office of the bank in Cairo on the 29th ultimo.

Aly Shamsy Pasha (president), was in the chair.

## BALANCE-SHEET, DECEMBER 31ST, 1943

## PRESIDENT'S ADDRESS

The President, in the course of his speech, said:—

As a result of Allied successes in the Mediterranean area, hopes were entertained that our imports would increase, but the paramount difficulty of shipping and the shortage of consumer goods in overseas manufacturing countries made their realisation impossible. The value of imports during the year was lower than in 1942, mainly due to decreased arrivals of textiles, coal and tea. On the other hand, the reopening of the short sea route through the Mediterranean led to an increase in the export trade, the bulk consisting of raw cotton. Egypt's visible adverse balance of trade has thus been notably diminished, although the general balance of payments continues overwhelmingly in her favour, due to the unceasing flow of funds disbursed locally by the Allied Forces.

## THE COTTON CROP

The 1942-43 cotton crop, amounting to some 4½ million cantars, or just over half the previous crop, reached record levels in quality and yield. Only 6 per cent. was tendered to the Government Buying Commission as market quotations steadfastly maintained an upward trend, and later in increase of 20 per cent. in the official purchasing price for the 1943-44 crop was announced. The latter, which on account

of poorer yields is expected to fall short of the 1942-43 crop in size is, however, composed predominantly of the finer varieties.

Stock Exchange quotations rose steadily during the first four months of the year, and, with the exception of another period of uncertainty at the time of the Italian surrender, closed the year at a record level.

Further signs of the times are provided by the returns of the Cairo and Alexandria clearing houses, which show that 756,000 cheques totalling £2.66 million were cleared in 1943, against 690,000 cheques amounting to £1.19 million in 1939. The bank note issue rose from £7.79.2 million at the end of 1942 to £10.1.4 million on December 31st last. Our statistics show that the proportion of the higher denomination notes in the total issue has, since 1938, more than doubled. This may be attributed in some measure to the convenience of large notes for the purposes of hoarding as well as of illicit trading.

## TRANSFORMATION OF STERLING DEPT.

I mentioned in my address to you last year, as evidence of the prevailing superfluity of funds, that the Treasury had, in 1942, been able to borrow, through its fortnightly tender of three-months bills, at an average rate of 1.12 per cent.; that rate fell during 1943 to around 0.64 per cent., and what had meanwhile become the weekly tender for £500,000 Treasury bills was being consistently oversubscribed. At the same time the prices of Egypt's internationally quoted Preference and Unified bonds were rising steadily.

In circumstances such as these the Government judged it opportune, at the end of September, to effect the transformation of Egypt's sterling debt into an internal obligation, subject to various periods of redemption. Public response to the conversion offer fully justified expectations, and applications amounted to £42 million in Egypt, £4½ million in London, and half a million in other foreign centres, notably Geneva. Of the unconverted portion of the debt, amounting to some £39 million, £21½ million has already been repaid, while reimbursement of most of the remainder must perforce be deferred until conditions in Europe so permit.

## INCREASED BALANCE-SHEET FIGURES

The balance-sheet which we present to you today reflects the easy monetary conditions which have prevailed throughout the year. The figures have reached a new high level and bear striking testimony to the important rôle which the bank plays in the financial life of the country. Current, deposit and other accounts also show a very marked increase, while bankers' balances are again considerably higher. I should like to take this opportunity of thanking our banker friends for their valued co-operation during the past year.

The profit and loss account for the year shows that earnings have improved by £113,718 to £1,222,267, while expenses are higher by £115,839. The latter increase is due to heavier taxation payments, both in this country and in London, on our increased revenue and also to the grant of additional allowances to the staff to meet the rise in the cost of living. We therefore propose to maintain the distribution to shareholders at the same rate as last year and to add to the carry-forward the sum of £1,117,773.

In conclusion, I can but express our appreciation of the way in which the staff have responded to the many new calls made upon them.

## BIRMINGHAM SMALL ARMS COMPANY, LIMITED

## VALUE OF PRIV ENTERPRISE

The adjourned ordinary general meeting of this Company was held, on the 18th instant, in Birmingham.

Sir Bernard D. F. Docker, K.B.E., the chairman, said that the profit on trading and income from investments was £744,219, compared with £719,758 in the previous year. It was proposed to pay a dividend of 7½ per cent. on the ordinary stock. It was still impossible to comment to any great extent on the group's varied activities, but on the cycle and motor-cycle side they had been able to maintain contact with the majority of overseas agents. The Daimler armoured car and scout-car had enhanced the reputation of the Daimler Company. The tool group of companies continued to play a conspicuous part. Output of all types of special steels, tungsten carbide, forges, crankshafts, castings, magnets, files and certain special tools had reached a new high level.

The keynote for the present and the future was the importance of technical control and the continuity of active research, and throughout the whole of their organisation he regarded research as of paramount importance. In spite of great accomplishments by men whose energy and initiative and under whose guidance great enterprises had been built up, there was being fostered in some quarters an agitation against free enterprise whether individual or collective. However well intentioned proposals for bureaucratic control might be, they had considerable elements of danger for all classes of persons. Efforts had been made to confuse the minds of the public with statements and innuendos that private enterprise was nothing more than what was commonly referred to as big interests, whereas in fact they were often economical combinations of small interests.

The report was adopted.

## MITCHELL COTTS AND COMPANY, LIMITED

## DIVIDEND AGAIN 15 PER CENT

The ordinary general meeting of Mitchell Cotts and Company, Limited, was held, on the 14th instant, in London, Mr Alexander Hamilton, the chairman, presiding.

The following is an extract from the chairman's statement circulated with the report and accounts: The trading profit for the year is higher at £182,475, compared with £180,053. The net profit also shows an increase, being £101,225, compared with £98,803. The total ordinary dividend for the year is 15 per cent., less tax, the same as previously. The directors have transferred £40,000 to general reserve and £5,000 to staff provident fund, after which the amount carried forward to next year will show an increase of £7,624 over the amount brought forward from the previous year and will amount to £59,979.

The parent company and its numerous subsidiaries have made such provisions for their various taxation liabilities, both in this country and overseas, as, according to the best information and advice available, should be sufficient to meet the sums due in the accounts under review. It has been found possible to issue a consolidated balance-sheet which sets out the financial position of the group. The margin between the net assets of our subsidiary companies and the cost of their shares to the parent company is satisfactory, the capital and surpluses of the group now totalling £1,278,240. Of the total assets of over £3,000,000 shown by the consolidated balance-sheet about 70 per cent. are in Africa.

With regard to the current year, existing conditions make any forecast difficult, but results achieved so far encourage me to believe that the net profits for the year to June 30, 1944, should be much the same as those now before you.

The report was adopted.

## E.N.V. ENGINEERING COMPANY, LIMITED

### LARGE VOLUME OF WORK

#### MR C. G. TWALLIN AND POST-WAR PROBLEMS

The annual general meeting of E.N.V. Engineering Company, Limited, was held, on the 14th instant, at Winchester House, Old Broad Street, London, E.C.

Mr C. G. Twallin (chairman of the company), who presided, said: The figures we are now considering represent a large volume of work. We are pleased to be able to make our contribution towards the national effort. While the individual items in the accounts vary considerably, the result in net profit is slightly less at £81,469, against £85,661 in the previous year. Our cash balance is up, also our investment figure, which latter includes tax reserve certificates. Stock and work in progress at £155,429 is up by £9,022.

Machinery and plant, etc. Expenditure by way of additions has been small during the year under review. The plant has, of course, been well maintained in our customary manner, and adequate depreciation has been provided. Land and buildings. Here, again, the expenditure on additions has not been large, ample provision being made for depreciation. On the liabilities side, creditors are down, reserve account standing at £175,000.

#### ALLOCATION OF PROFITS

We therefore submit for your approval the following allocation: Balance brought forward from the 1942 year £33,070, add profit for 1943 as shown on accompanying profit and loss account £81,469, a total of £114,539, less redeemable preference share dividend from January 1st to September 30, 1943, and interim dividend of 7½ per cent. on the ordinary shares for 1943 £93,914, which the directors recommend to be allocated as follows: Proportion of dividend at the rate of 5 per cent. per annum on the redeemable preference shares for the period from October 1st to December 31, 1943. The redeemable preference share dividend for six months was paid on April 1, 1944; in payment of a final dividend of 10 per cent. on the ordinary shares for the year ended December 31, 1943, and a bonus of 8½ per cent. on the ordinary shares; in transferring to reserve account £10,000, leaving a balance to be carried forward to the next year's accounts of £36,414.

#### PROBLEMS OF PEACE

The last time I had the privilege of addressing you I pointed out that, while our main energies were devoted to the war effort, we constantly had in front of us the resumption of peacetime industry.

Without a doubt the war has brought its problems, but we must not lose sight of the fact that the problems of the peace will be as great, if not greater. The important part the Allied Nations will have to play in the reconstruction of the world is one in which this country will have to take a leading part. We are fully conscious of our responsibility as directors of devising means whereby we shall be able to absorb into industry the men who are fighting, and find employment for those who have kept the home fires burning; in fact, the Ministry of Reconstruction has issued a general request that industrial concerns shall give this matter serious consideration. While it is dangerous to prophesy, we do feel the two fields of industry in which we are mainly interested, namely, automobiles and aircraft, have great possibilities. We are of opinion our conservative policy on the question of finance will stand us in good stead. Our liquid resources are such that we feel we can face periods of development which will of necessity occur.

#### PLEA FOR RELAXATION OF CONTROL

We appreciate the efforts the authorities are making in endeavouring to bridge the gap which will arise as between war- and

peacetime production; to ensure success this must be co-operative. We are fighting a war for freedom, and while recognising the necessity of bureaucratic control in wartime, some relaxation of control will be essential at the conclusion of hostilities. Our experience in this connection has been such as to confirm the idea that nationalisation of industry is a retrograde step.

In the strenuous times through which we have been passing, where long hours have been worked with only short periods for rest, our thanks are specially due to my co-directors, staff, foremen, charge hands and employees, all of whom have helped in achieving the results we now place before you.

The report and accounts were adopted.

## THE MIDLAND EMPLOYERS' MUTUAL ASSURANCE, LIMITED

### CHAIRMAN'S REVIEW

#### REMARKABLE FIGURES

#### STILL LOWER RATIO FOR MANAGEMENT EXPENSES

Lieut.-Colonel J. Beaumont Neilson, C.M.G., D.S.O., C.A., the chairman, presiding at the forty-fifth annual general meeting at the head offices in Birmingham on the 18th instant, stated as follows when commenting on the results for the year 1943:—

#### RECORD PREMIUM INCOME

You will see from the revenue account that the premium income, less reinsurance, for the year 1943 amounted to £3,306,715, an increase of £642,442. This is yet another record in the company's history, and is due to increased employment, higher wages and a further increase in the number of policyholders. It is interesting to note that, notwithstanding the fact we can no longer employ members of the staff on the procurement of new business, I am able to report this increase in the number of assured, the majority of whom have been recommended to place their business in the hands of the "Midland Employers" by old policyholders who appreciate the specialist service rendered to them.

#### ONLY 6.9 PER CENT EXPENSES RATIO

The expenses of management at £228,692 show the very low ratio of 6.9 per cent. Although the company continues to make allowances to members of the staff on active service, and has found it necessary to employ a large number over military age to enable a large and complex business to be conducted in the same efficient manner as in the past, the expense ratio is 6.9 per cent. below that for the previous year. Commission at £160,849, i.e., 4.9 per cent., is substantially the same as the previous year.

#### INSURANCE FUND INCREASED BY OVER £1,000,000

Cash expenditure in connection with claims amounted to £1,671,483. The insurance fund at the end of the year amounted to £4,645,701, which compares with £3,414,595 a year ago. Of this amount, £1,488,022 is reserved in respect of unexpired risks, as against £1,198,923 in the previous account, while you will see that the claims reserve at £3,157,679 is £942,000 in excess of the figure for 1942.

During the year under review the number of accidents reported was substantially the same as in 1942, the large number being due no doubt to the direction into industry of those previously engaged in sedentary or household duties. Further, the strain and fatigue of four years of war is reflected in the figures.

#### ASSETS ADVANCED BY NEARLY £11 MILLIONS

The assets of the company as at December, 1943, show that investments have increased by £729,924, cash by £222,184 and debtors £269,333. The assets now total £5,302,062, as compared with £4,080,621 a year ago.

The war savings scheme, referred to in my previous reviews, continues to run satisfactorily, and during the year the com-

pany supported the "Wings for Victory" weeks throughout the country.

Since I last addressed you the Workmen's Compensation Act, 1943, and the Workmen's Compensation (Temporary Increases) Act, 1943, have become law. The former statute extended Section 47 of the 1925 Act to any form of pneumoconiosis, and also affected the compensation payable in cases of partial disablement. The Temporary Increases Act provided for the payment of substantially higher rates of compensation not only in respect of accidents occurring on and after November 29, 1943, but also to all employees injured since January 1, 1924, and who were in receipt of compensation or may become entitled to compensation when the Act came into operation. It is estimated as the result of legislation passed since the outbreak of war the cost of workmen's compensation will be increased by no less than 75 per cent. We have extended our policies to cover the provisions of the new Acts in respect of claims arising thereunder from accidents occurring during the currency of such policies, but it has been necessary to make additional reserves to meet the increased liabilities imposed on employers, and assumed by us on their behalf.

Workmen's compensation is to be the subject of a White Paper shortly to be issued by the Government revealing their proposals. Whatever amendments or alterations are proposed, your company will be in a position to deal with them.

#### ACCIDENT PREVENTION SERVICE WELCOMED

In an effort to reduce the number of industrial accidents, with the consequent loss of man-power established during the year, department was Y's department are available to all policyholders free of charge. The results so far achieved by this department are encouraging.

As I have mentioned in previous occasions, the company has set staff to the call-up of members of the male Forces. Nearly 75 per cent. of our staff is now engaged in addition to branches of the Services, in the female staff has been released for service in auxiliary units and for other national service.

During the past year the staff has been called upon to deal not only with increased premium income and a number of accidents, but also with legislation affecting our business. Nevertheless, they have responded magnificently thereby enabling us to maintain a high standard of service to our employees alike.

I am sure you would like to see the general manager and to the appreciation of the very excellent work he and they have done on behalf of the company.

The accounts and balance-sheet have been adopted unanimously, a vote of thanks to the chairman brought to a close.

## CUNARD STEAM SHIP COMPANY, LIMITED

### SIR PERCY BATES' STATEMENT

The sixty-seventh annual meeting of stockholders of the Cunard Steam Ship Company, Limited, is to be held at Liverpool on the 26th instant.

Along with the report and accounts Sir Percy E. Bates, Bart., G.B.E., the chairman, has issued the following statement:—

In writing a statement on the year's accounts, I am subject to the same paper restriction as in previous years. I am also precluded by war conditions from making any alterations in the accounting system of the group, but I have tried, on the face of the figures themselves, to set out the fact that we are practically a holding company and to make the figures self-explanatory so far as war circumstances permit. The holding company (Cunard Steam Ship Company, Limited) only employs a very small fraction of the staff of the group, and it would perhaps be more appropriate for the operating companies, who do the bulk of the work and bear the greater proportion of the risks, to refer to their services: but I would like the Cunard stockholders to understand that the directors have the highest admiration for the loyalty, courage and steadfastness with which all, afloat and ashore, have served.

The stockholders will see in the report that the alteration in the company's memorandum of association, to cover air services, has now been made and approved by Court Order. The whole of the group now is equipped with a background of legality to move in the lighter element, should it so decide.

#### PROFIT AND LOSS ACCOUNT

In the profit and loss account for the first time we have shown as a separate item income tax, to indicate to stockholders how much of their income is returned to the National Exchequer. The item, a balance figure, is slightly higher than in 1942 because that year included the tax deducted from the final instalment of interest paid on the 5 per cent. mortgage debenture stock redeemed in February, 1942. Debenture stock trustees' fees are lower, owing to the reduction offered by Martins Bank consequent on the repayment of the bulk of the 5 per cent. mortgage debenture stock. Depreciation of ships, etc., has followed its normal course. Interest on loans from subsidiary companies is slightly higher, not because we have borrowed more money from them, but through the comparison of a full year with a partial year.

I would like to be able to say now that we shall not need the £100,000 provided in the profit and loss account for E.P.T., but the situation only enables me to say that I believe we have not under-provided. The bog over the tax situation which exercises such a paralytic effect on all forecasts is still thick: visibility is at a minimum. On the credit side of the account there has been a re-adjustment of dividends, resulting in a small decrease in the balance of profit for the year—£312,127 6s. 8d., compared with £343,723 for the year before. In the balance-sheet on the credit side, changes in subsidiary companies, £13,925,000, is unchanged. In my opinion it is a perfectly safe figure. Ships, cost, less depreciation, show the effect of latter. Shares in other companies, at £114,000, are also unchanged and return 4.66 per cent. on our investment. The remaining two figures require no explanation. On the debit side there now remains only £3,250 of the old 5 per cent. mortgage debenture stock; the Government venture of £1,000,000 and the mortgage of the Cunard building are unchanged.

The deposit by the superannuation fund has again been reduced by £50,000. We could quite easily accelerate what has been a policy of the board for many years, to pay off this item entirely and

have the monies of the pension fund all invested outside the company. To do so would accelerate also the impact of modern interest rates on the fortunes of the fund. The company pays 5 per cent. on this deposit, a correct rate when the plan first began, but now including an element of support in the face of the steady reduction in the rate of interest obtainable on Government securities which has been such a successful accompaniment of the country's war finance. This very success will create problems for every pension fund in the United Kingdom, and my colleagues have agreed with me in the policy of providing a cushion for its effects pending some Governmental recognition of the remoter effects and obligations of their financial economies.

Creditors and open voyage accounts, etc., show a small increase and include £100,000 provided for E.P.T. in the profit and loss account. The small balance due to subsidiary companies is a temporary affair of current business. Loans due to subsidiary companies remain unchanged. To make provision for contingencies, we have decided to transfer £100,000 to reserves, bringing that item up to £660,000 and leaving a balance on profit and loss account of £295,812 4s. 11d.

#### DIVIDEND

We are proposing a final dividend for the year 1943 at the rate of 3½ per cent., absorbing nett £97,479 11s. 5d. If this is approved by the general meeting the carry-forward to 1944 will be £198,332 13s. 6d. It will be seen that there are three transactions of approximately £100,000. From the profit and loss account of 1943 we will be providing one sum of £100,000 in case of E.P.T.; a second £100,000 to add to our reserves; and something just short of £100,000 (£97,479 11s. 5d.) in the final dividend. This distribution I think gives the stockholders a correct picture of the situation of our group.

It is most important that you should understand that our "subsidiary" companies, to use a legal phrase, are termed domestically "associates." We have, if we choose to exert it, absolute control of all of them, but we do not want the dead response of one cog wheel driven round by another. We want life, and life means volition, thought, enterprise, all on the scale and on the level of the "subsidiary" company. As we want life we must also expect variations from any set model, the continuing influence of "subsidiary" views, desires, ambitions, in fact all the attributes of local life impinging on any theoretical outlook of the "parent." Our plan has this great advantage, we do not have to inspire our "subsidiaries"; they have their own sources of inspiration and resources; rather do we work to harmonise their aspirations and try to see that they lie within rather than without the ability of the parent company, the Cunard, to provide any ultimate financial backing which might be needed.

Since the outbreak of war, Cunard White Star has not been able to build either a passenger ship or a cargo liner which would be of any post-war use in their lines of trade, either west or east.

#### NEED FOR SPECIALISED SHIPS

Whatever the course of the war, at the end of it there is bound to be a surplus of the ordinary type of cargo ships and a very considerable shortage of specialised ships such as our cargo liners, refrigerated liners and passenger liners. I think the time has arrived when the building yards should be opened to specialised ships, capable of serving their owners' needs when the guns stop shooting. These remarks apply to the whole of our group. We shall need specialised ships in all our trades, and to-day we cannot build any of them even for delivery in 1946.

## THE CLERICAL, MEDICAL AND GENERAL LIFE ASSURANCE SOCIETY

### SUCCESSFUL RESULTS OF THE YEAR

#### SIR FRANCIS E. J. SMITH'S STATEMENT

At the annual meeting of the Clerical, Medical and General Life Assurance Society, held at Hamilton House, Victoria Embankment, London, E.C., on April 19th, the following address was submitted by the chairman, Sir Francis E. J. Smith:—

A year ago I described the results of 1942 as satisfactory, judged by war-time standards, and as showing indications of improving tendencies, in harmony with the general trend of our national fortunes. To-day, I am glad to be able to record that, during 1943, this upward trend has been continued. Our accounts show increases in new business, interest yields and funds, with decreases in death claims, surrenders and expenses.

#### NEW BUSINESS AND CLAIMS BY DEATHS

The net new life assurances of the year, at £1,320,794, represented an increase of £210,230 and a war-time record.

The total sum paid by the Society, during 1943, in respect of surrendered life policies was less than £25,000, the lowest figure, relatively to the total assurances in force, experienced within living memory.

The claims paid, during 1943, although lighter in total than in the previous year, involved the Society in a slight mortality loss, after allowing for the inclusion of war deaths.

#### INVESTMENT CHANGES

During 1943 our holdings of British Government and Government-guaranteed securities have risen by £500,000 to nearly £3,500,000, and now represent 50 per cent. of our Stock Exchange investments and 21 per cent. of the total funds.

Our average earned rate of gross interest has shown a rise of 1s. 4d. to £4 6s. 7d. per cent., and our net rate has risen by 5d. to £3 3s. 11d. per cent.

A valuation of the Stock Exchange securities at the end of the year disclosed a satisfactory appreciation in capital values, for which no credit has been taken in our accounts. This further improvement has increased the substantial margin by which market prices exceed book values.

#### INTERMEDIATE BONUSES

It will be recalled that, as at the end of 1940, the Society declared a bonus in respect of the three years 1936-38, but postponed any distribution in respect of the two years 1939 and 1940. It was then hoped that events might permit a further bonus distribution to be made, under peacetime conditions, at the end of 1943, in respect of the profit-sharing rights accruing during the five-year period 1939-1943 inclusive. Unfortunately, this hope has not been realised and, in view of present events and conditions, no general distribution of profits is now contemplated until the end of 1945, our normal quinquennial valuation date.

Since January 1, 1941, the outset of the current valuation period, intermediate bonuses have been paid upon participating policies which have terminated by death, maturity or surrender, in respect of each annual premium due and paid on or after January 1, 1939, and the directors are pleased to announce that the present rate of surplus earnings justifies the continuance of intermediate bonuses upon the scales allotted during the past three years. These scales are necessarily subject to revision at any time.

The report and accounts were unanimously adopted.

## THE SCOTTISH WIDOWS' FUND AND LIFE ASSURANCE SOCIETY

### INTAKE OF NEW BUSINESS MAINTAINED

#### MR CARLYLE GIFFORD'S SPEECH

The 130th stated annual meeting of the Scottish Widows' Fund and Life Assurance Society was held on the 18th instant in the society's head office, Edinburgh, Mr T. J. Carlyle Gifford, W.S. (chairman of the ordinary court of directors), presiding.

In moving the adoption of the report and accounts the chairman said:

I shall say no more about the society's experience in 1943 than that mortality continued to be favourable despite the war, and that our intake of new business accomplished with but a skeleton outside staff was maintained at over £2,000,000.

#### WAR FACTORS DURING QUINQUENNIAL

I turn now to the quinquennium which ended on December 31, 1943. Apart from the first eight months of 1939, that was a period of war. It is a natural assumption that war must be gravely injurious to the interests of a life assurance society. Casualties in battle and in modern times among the civilian population will be expected considerably to increase the mortality. Direct taxation will eat up a larger slice of the annual income, and a decline in the value of the investments would be anticipated. Actual experience up to the end of 1943 has been somewhat different. Casualties in battle on Western fronts have mercifully been on a smaller scale than in 1914-18. Notwithstanding war deaths, the total claims for the past five years have been only 90 per cent. of the amount expected by the table of mortality used for the society's valuation. That is about the percentage in peace time so that the mortality experience has been light, but the proportion of deaths at young ages has naturally been much higher. Excluding deaths arising directly from war operations, the claims were only 82 per cent. of those expected.

Direct taxation has risen for insurance societies by 2s. in the £, and thus has reduced the margin of income out of which surplus for bonuses is built up. The fear of a fall in investment values has not been realised. By 1939 the Treasury had come to realise that with a strict control over transfers of money abroad, it had the power as the only substantial borrower to fix the rate of interest on new loans, not with a view to attracting subscriptions—which were bound to come—but solely to hold the balance equitably between those who saved and lent and the general taxpayer now and in time to come. The result was twofold—adverse to this society in its earning capacity but beneficial in maintaining and even improving the value of its assets, and the favourable margin between their market and their book value, which is to-day very large.

These are war factors which have operated during the quinquennium. Their effect has been far from disastrous, but they inevitably made the results less favourable to policyholders than in the pre-war quinquennium.

#### LOWER RATE OF INTEREST

In estimating our liabilities on this occasion we have reduced the net rate of interest assumed to be earned from 2½ to 2½ per cent. per annum. I do not wish to lay too much stress upon that. Five years ago, though we used the rate of 2½ per cent., the chairman pointed out that special additions had been made to reserves which made them as substantial as they would have been had a net 2½ per cent. rate been assumed. Nevertheless, the use of the lower rate on this occasion with certain adjustments results in an estimation of our liabilities at a figure £300,000 greater than would have been the case had we pro-

ceeded on the same footing as at December 31, 1938. The position of the society is correspondingly strengthened and members of the society can be assured that the estimate of liabilities has never been arrived at on a more stringent basis.

Our figures show an available surplus for the quinquennium, leaving out the sum brought forward from 1938, sufficient to have paid a compound reversionary bonus on all policies of about 32s. per cent. per annum. But the war is not finished, and we have thought it prudent to restrict the bonus to 30s. That figure, in our judgment, holds the balance fairly between participation by policyholders in profits actually earned and provision for the maintenance in the future with all its uncertainties, of the accustomed strength of the society.

#### SUBSTANTIAL RESERVES

We have made a substantial provision

## THE NATIONAL BANK OF INDIA, LIMITED

### RECORD BALANCE-SHEET TOTAL

### LIQUID POSITION MAINTAINED

#### MR R. LANGFORD JAMES'S STATEMENT

The ordinary general meeting of the shareholders of the National Bank of India, Limited, will be held, on the 2nd proximo, at 24 Bishopsgate, London, E.C.

The following is the statement of the chairman (Mr R. Langford James) circulated with the report and accounts:—

Since we met last the directors extended to Sir Robert Reid an invitation to join the board. Sir Robert has recently retired from the Indian Civil Service after a distinguished career—latterly as Governor of Assam—and our satisfaction in receiving his acceptance was enhanced by the fact that his father, Mr David Reid, was a valued director of the bank from 1878 to 1909.

#### EFFECTS OF WAR EXPENDITURE

The total of the balance-sheet constitutes a record for the bank at £61,867,357. This is an increase of £7,500,000 over the figure for the previous year, and is accounted for by a similar increase under the heading of current and fixed deposit accounts, which continue to reflect the large volume of war expenditure in the areas in which the bank operates.

Cash on hand and with our bankers and money at call show an increase of nearly £4,000,000. The ratio of this item to the amount of our liabilities to the public is greater than is normally considered necessary, but under present conditions it is desirable to maintain a very liquid position. Indian and Ceylon Government securities are higher by £2,413,000, while our holding of British Government securities has increased by £1,140,000. Discounts and loans receivable are £490,000 higher.

We are now in the fifth year of the war, and the way in which banks and business concerns in general, both in this country and in the Dominions, have adapted themselves to wartime conditions is alike remarkable and laudable. Problems of one description or another present themselves almost daily, of course, but they always seem to find a solution. Later a material contraction in the time taken in transit by the overseas mails has facilitated working.

#### CONTRASTS IN INDIA

For India 1943 was a year of conflicting experiences: practically universal financial prosperity on the one hand and a distressing shortage of foodstuffs in certain parts of the country on the other. This shortage made itself felt in particular in Bengal and in the Southern Indian States of Travancore and Cochin. In Bengal actual famine

against these uncertainties by carrying forward into the current quinquennium £420,000, against £167,000 brought in. We have also left our reserve fund of £500,000 undisturbed, so that the new quinquennium starts with substantial reserves against untoward events in addition to the very large margin between the market values and book values of our securities.

We have fixed the rate of intermediate bonus with which to start the new quinquennium at 28s. compound and reversionary—a modest reduction on the bonus declared for the past five years. Naturally, however, we shall review that rate from time to time and shall deal with it as emerging circumstances may demand.

In conclusion, the account of which I have given you cannot fail to be encouraging to those who contemplate taking out a with-profits policy with this society. The past record speaks eloquently and the basis on which the future is founded is one of very great strength.

conditions prevailed, resulting in a lamentable loss of life, not only from starvation, but from the effects of disease on debilitated people. Fortunately, Nature vouchsafed to Bengal a bountiful rice crop last winter, and this should at least make the food position of that great province reasonably safe for the time being.

In my address to the shareholders six years ago I drew attention to a statement made at that time by the late Sir James Taylor, then Governor of the Reserve Bank, to the shareholders of that institution. Sir James pointed out that the area under cultivation in India was not keeping pace with the growth of population: as he put it, "the pressure of population on cultivated land" was a matter for concern. How correct he was in his views last year's famine conditions appear to indicate. I have seen it stated recently in a responsible publication that, against an increase of 27 per cent. in population in the last 20 years the area under food crops had increased by only 1 per cent. Whether or not the latter figure is correct I do not know, but its meticulous accuracy is not a matter of great moment. What, however, does emerge as a question of the first importance to India is the urgency of growing sufficient food for the adequate nourishment of a population increasing at a phenomenal rate.

#### A 15 YEAR PLAN

The recent publication by a group of eminent business men in India of a fifteen-year plan for the economic development of that country after the war has attracted considerable attention. The industrial pendulum started to swing in India some years ago. Under normal conditions its rate was appreciable, and this has been accelerated greatly by the war. Whether it will be desirable to force the pace further by elaborate planning is perhaps a matter open to difference of opinion, but I presume there will at least be agreement on the desirability of agricultural development until the food requirements of the country are placed on a permanently safe basis. The institution of new industries and the erection of costly factories—however desirable in themselves—would not be of much avail without a healthy and well-nourished supply of labour to work them.

Of the other centres in which our interests lie—Ceylon, East Africa and elsewhere—there is nothing of special interest to report. To them also the war has brought prosperity.

#### MR NORMAN'S RETIREMENT

An event of much interest to the banking world is the impending change in the governorship of the Bank of England. Mr Norman's unrivalled experience, his wise counsel and kindly help were always available to us, and in acknowledging—as we do with gratitude—our indebtedness to him we wish him many peaceful years in which to enjoy a rest from his strenuous labours. His successor, Lord Catto—himself a director for some years of the Mercantile Bank of India—has an intimate knowledge of Indian affairs through his connection with the firm of Andrew Yule and Company, Calcutta. It is a matter of much satisfaction to us to know that, in losing officially one good friend, we have in his successor one well qualified to appreciate the problems which may confront Indian banking in the future.

#### TRIBUTE TO STAFF

Last year I mentioned that the increase of ill-health among members of the overseas staff was a cause for anxiety, and naturally a further year of wartime working has not improved matters in that respect. There are, however, indications that short periods of furlough may be possible before long, which must be welcome news to many, though, for the time being, an extra strain will be thrown on those of our depleted staff remaining in the East to carry on. In extending to the staff, both overseas and at head office, our warm thanks for their work on behalf of the bank, I assure them again that the directors realise a full measure of the difficult working conditions of these present times.

## TELEGRAPH CONSTRUCTION AND MAINTENANCE COMPANY, LIMITED

### IMPROVED RESULTS

The annual general meeting of this company was held, on the 18th instant, in London, Mr Colin F. Campbell (chairman of the company) presiding.

The following is an extract from the statement by the chairman, which had been circulated with the report and accounts, and was taken as read: The balance of the trading account shows an amount of £375,114, which compares with £320,709 last year. This increase in these days means, of course, further taxation, and to meet this liability a sum of £323,642 has been put aside, leaving a balance of £51,488 on profit and loss account. From this balance the directors have decided to transfer a sum of £30,000 to reserve for contingencies, which leaves a balance of £21,488 8s. 2d., to which must be added the sum of £43,540 12s. 1d. carried forward from the previous year's account. An interim dividend of 5 per cent. was paid in July last, and the board now recommend a final dividend of 5 per cent., making a total of 10 per cent. for the year, the same as for 1942.

The works have again been occupied during the year well beyond their normal capacity, and the output is steadily increasing, which throws an ever greater strain on personnel and plant. In consequence, the maintenance of plant requires constant and close attention, and engineers have been allotted for this purpose.

Shareholders will see that a new associated company, Transformer Steels, Limited, is shown for the first time in the balance-sheet, and the board consider that it should have an important future after the cessation of hostilities.

The report and accounts were adopted.

## HALL TELEPHONE ACCESSORIES (1928), LIMITED

The sixteenth ordinary general meeting of this company was held, on the 20th instant, in London. Major the Hon. Oscar M. Guest, M.P. (chairman and managing director) presided.

The following is an extract from the chairman's statement published with the report: Once again a greater turnover than ever before has been attained; and it is noteworthy that an increase of about £256,000 in gross trading profit has been achieved, with a rise of only £8,000 in operating expenses.

The company's factories are fully engaged on essential work, and at present I have no reason to anticipate that this will change in the near future.

This year provision has been made for war contingencies by segregating the sum of £20,000 for that purpose. £20,000 has also been placed to general reserve, but, as a similar sum has been applied from reserve in reduction of the item patent rights and goodwill, the total of the general reserve remains at £130,000.

The report was adopted.

## INDUSTRY AND TRADE

**Raw Cotton Prices Raised.**—The Ministry of Supply raised Cotton Control selling prices of raw cotton by 4½d. per lb., from April 17th. The price of American middling is now 12.75d. per lb. In April, 1941, the purchase and sale of raw cotton were taken over by the Ministry of Supply. Selling prices were fixed on the basis of the closing prices on the Liverpool market at the end of March, but subsequently the selling prices to spinners were reduced by 1½d. per lb. In view of the increases in the general purchase cost of cotton it has become necessary to raise the Control's selling prices. The selling prices of utility cotton cloths will, however, be maintained unchanged by means of a system of rebates to merchant converters on their utility cloths. The increase in cotton selling prices necessitates certain changes in the regulations controlling prices of cotton yarn and grey cloth. The price of controlled American-type yarn has since April 17th been arrived at by adding the prescribed margins to 12.75d. per lb. instead of 7.80d. per lb. as before. The increase of 4.95d. covers the increase in the selling prices of raw cotton plus allowance for additional waste loss. For controlled Egyptian-type yarn, provision is made for adjusting the prices of cotton purchased before April 17, 1944. Two new Orders made by the Minister of Supply came into force on April 17th. One changes the method of allowing for profit by combining the allowance for profit with the allowance for weaving expenses; the former provisions for a separate allowance have accordingly been revoked. At the same time adjustments were made in the allowances for profit in the light of recent investigations into the trading outcome. The other Order adjusts the table of profit allowances for sheetings so that the increases in costs which arise from the new raw cotton prices will not entail increases in profit. Contracts made before April 17, 1944, are not affected by the changes made under the new Direction and Orders. The effect of the increase in the prices of raw cotton is to bring them closer to United States prices.

**Ex-Service Men and Food Shops.**—The Minister of Food announced on April 18th the arrangements, which are already

in force, whereby ex-service men can return to their occupations as food traders. The condition that a food trader must be needed in the district before a licence can be granted is waived in the case of ex-service men provided they had a business of a similar kind to the one they propose to set up in the same area. This special facility will not be granted where an ex-service man sold his business. The rule that traders must have at least 25 registrations will not apply for the first three months an ex-service worker is in business, and for the first four weeks consumers will be permitted to transfer their registrations to such a trader without question. An initial credit of 3,000 food points will be made. These provisions apply to shops selling food by retail, and catering establishments, including hotels. They do not apply to milk distributors.

**Wholesale Co-operation.**—For the year ended January 8th the turnover of the Co-operative Wholesale Society reached a record of £166,834,649, being an increase of £9,439,311, or 5½ per cent. This included supplies from the federation's own productive works, totalling £49,968,923, an increase of £2,562,666, or 5½ per cent above 1942. The directors pay tribute to the improvement in Government control of supplies for consumers, but they are not satisfied with the working of the points rationing scheme for foodstuffs, and would prefer that "points" goods should be linked with rationed commodities so that consumers should be able to satisfy their needs at one shop. They are considering the problems of post-war development and will shortly convene conferences of retail societies to outline proposals for the future expansion of productive works and fuller recognition of the international position. The year 1943 marked a relative stability of trading conditions in the food departments. The sales of grocery and provisions for 1943 were £125,881,619, an increase of 7½ per cent; the agricultural department was responsible for an increase of 10½ per cent, rising to £3,255,358. But there were decreases in the coal, drapery, men's wear, boots and shoes, and furnishing sections ranging from 1 to 20 per cent. Sales to the Ministry of Food were more than double those of 1942, rising to £5,525,332; but the turnover of the exports and contracts department receded 10 per cent to £3,960,031. The CWS now owns and farms 19,032 acres, from which it made £160,902 profit. The largest productive output was from the flour mills, with a total of £10,778,927, followed by the creameries, £8,024,457; preserve works, £4,889,986; tobacco, £3,459,226; soap, £2,240,472; margarine, £1,703,368; cabinet and bedding, £1,532,637; men's clothing, £1,416,818, and boots and shoes £1,367,481. In the banking department the deposits and withdrawals were £1,075,236,123, an increase of £71,915,018. There are now 857 co-operative societies and 1,062 trade unions banking with the CWS. After meeting all expenses, depreciation, interest on capital and provision for taxation, the society made a profit of £4,845,869, and is giving its society members a dividend on purchases of 5d. in the £, plus a special bonus of 2½d. in the £. Some £243,848 is to be added to the reserve fund, which stood at £4,611,615 on January 8, 1944. The CWS Health Insurance Section has raised its membership to 671,024, and the fifth valuation of its funds reveals a surplus of £467,000. The sales of the seven distributive societies absorbed by the CWS Retail Co-operative Society for 1943 were £1,147,457 and the membership rose from 15,152 to 38,207. Ten other societies in Wales and the West of England linked with this society towards the end of the year, so that there are now 17 branches in trading operations.

## FINANCE AND BANKING

**THE MONEY MARKET.**—Rather mixed conditions have been experienced in the money market this week. Credit began in abundant supply on Monday, the position being helped by the mid-April dividend disbursements. By Tuesday the effect of heavy calling by one bank, which was making up on that day, was sufficient to call for special assistance through official purchases of bills. By Wednesday the position had been completely reversed and redundant credit was actually being mopped up by small official sales of bills. The turnover of money has been considerable, being helped by heavy floating debt borrowing. Not only did the market have to take up £10,000,000 more Treasury bills than were maturing (next week's excess will be £20,000,000) but the T.D.R. call of £100,000,000 was about £45,000,000 in excess of the effective maturities. The Bank return reflects the easier credit conditions experienced in the latter part of the week by an expansion of £9,198,000 in bankers' deposits. The main counterpart to this movement is a rise of £8,180,000 in other securities. A fall of £2,180,000 in Government securities is approximately offset by a contraction of £2,792,000 in the note circulation—a very modest movement after the considerable expansion of the preceding four weeks.

**MONEY RATES, LONDON.**—The following rates remained unchanged between April 14th and April 20th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½%; 6 months, 1½%. Treasury Bills: 2 months, 1½%; 3 months, 1½%. Day-to-day money, 1½%. Short Loans, 1½%. Bank deposit rates, 1%. Discount deposit at call, 1%; at notice, 1%.

**Exchange Rates.**—The following rates fixed by the Bank of England remained unchanged between April 14th and April 20th. (Figures in brackets are par of exchange.)

United States. \$ (4-86) 4-02½-03½; mail transfers 4-02½-03½. Canada. \$ (4-86) 4-43-47; mail transfers 4-43-47. Switzerland. Francs (25-28) 17-30-40. French Empire. Francs 197½-200½. Syria. p. 8-81-85. Sweden. Krona (18-169) T.T. 16-85-95. Dutch West Indies. Florin (12-11) 7-58-62. Portugal. Escudos (110) 99-80-100-20; mail transfers 99-80-100-30. Panama. P. 83-56-64; mail transfers 4-02-04. Brazil. 83-64½ cr. (buying); mail transfers 83-56-64. Uruguay. 7-6597 p. (buying).

**Fixed Rates for Payment at Bank of England for Clearing Offices.** Spain. Pesetas 44-00. Turkey. Plasteres 520. Italy. 71-25 lire.

**Market Rates.**—The following rates remained unchanged between April 14th and April 20th.

Egypt. Plasteres (97½) 97½-1. India. Rupee (184. per rupee) 17½-18½. C. de la India. Francs 176½-1. China. National \$ 3-3½. Iran. R. 128-130.

**Special Accounts** are in force for Chile, Peru, Bolivia and Paraguay, for which no rate of exchange is quoted in London. Rate for payment into Argentine special account: 16-12 pesos.

**Forward Rates.**—Forward rates for one month have remained unchanged as follows: United States. 1 cent pm-par. Canada. 1 cent pm-par. Switzerland 3 cents pm-par. Sweden 3 ore pm-par.

A change has been made in the method of showing excess of Post Office Expenditure over Post Office revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of as shown, as up to July 24 inclusive, as a deduction in ordinary revenue.

After decreasing Exchequer balances by £5,381 to £2,752,451, the other operations of the week (no longer shown separately) set the gross National Debt by £1,041,079 to £19,727 million after owing for £15 million for sinking funds 1943-44.

## Warnings and Promises

SIR JOHN ANDERSON'S speech on Tuesday can be taken as the classical example of the new-style Budget. A few sentences at the beginning about the results of the past year and an even shorter passage at the end comparing the prospective revenue and expenditure of the coming year—the whole occupying less than three pages of Hansard—were all that were devoted to what used to be the substance of the whole Budget. This procedure nowadays seems natural, so complete has been the acceptance of the revolution in the nature of the Treasury's stewardship that Sir Kingsley Wood and his advisers accomplished in the past three years. Henceforward the Budget speech is not an occasion for forensic accountancy but, as Sir John Anderson said, "an occasion when the financial and economic health of the country as a whole can be reviewed."

It was to this wider review that the greater part of the Chancellor's speech was directed, and his remarks very largely consisted of two warnings and a set of promises. The first warning was of immediate application; it was that the policy of stabilising the cost of living by means of subsidies could not be continued indefinitely in the face of rising wage rates. The chief purpose of the stabilisation policy when it was started three years ago was to avoid the necessity for a general rise in labour costs. Some degree of inflation is inseparable from a war of these dimen-

sions, especially in a country that is as dependent on imports as Great Britain. But the greater danger is lest this unavoidable primary degree of inflation should be converted into a cumulative process of rising prices and costs. If the cost of living is pegged, wage rates can be pegged and costs of production can be held down. But if, in spite of the stabilisation of the prices of necessities, the level of wage rates is not kept down, the policy of subsidies becomes both more expensive and less effective. This is what has been happening. When the policy was started, the cost of living index stood at 28 per cent, and the index of wage rates was 21 to 22 per cent, above the pre-war level. To-day, the cost of living is still at 29 per cent, but wage rates stand at 40 per cent, above pre-war. The cost of subsidies has increased from £70 million in 1940 to £190 million in 1943 and to still more this year.

The Chancellor's proposal is far from extreme. He is not intending to abandon the policy, or even to reduce the expenditure on subsidies, but simply to raise the range of stabilisation from 25-30 per cent to 30-35 per cent above the pre-war level. This, as he said, will only offset one quarter of the increase in wage rates that has occurred since the policy was started. Moreover, no immediate increase towards the new upper limit is in prospect.

It is very difficult to quarrel with this decision. But unfortunately, in the present temper of the labour market,

it may merely stimulate demands for higher wages, and thus provide a very clear illustration of the very dangers of the vicious spiral against which the policy was intended to guard. True, there is very little justification for further increases in wage rates. Real wage rates—the purchasing power of the standard rate—are higher than they were before the war, and real earnings considerably higher. Since the consumable wealth available to the whole community is much smaller, this can only mean that one section has gained at the expense of the others. From figures given in the White Paper, it can be shown that while the real value of property income (rents, interest and profits) in 1943 was 8 per cent less than in 1938, and of salaries 12 per cent less, the real value of wages was 19 per cent higher—all these before allowance for taxation, which has naturally fallen more heavily on property and salaries than on wages, and, in spite of the large migration into the Forces. But economic justification is rarely the deciding issue in wage negotiations. The wage-earners ought to take Sir John Anderson's revision of the stabilisation policy as a warning of the dangers they will face by persisting in wage demands. Unfortunately, they are more likely to use it as an argument for increasing the pressure.

The Chancellor's second warning was directed to the international position of the country after the war. He had little to say that was new; but the sobering facts of Britain's new position can hardly be repeated too often or with too great authority. Britain after the war will hardly be a creditor on balance; there will be no contribution to the national income from overseas investments; and it will require skilful management to avoid "a drastic curtailment in our volume of imports, such as might threaten our standard of life and gravely prejudice our prospects of active employment." The Chancellor made it plain that "the Government cannot make an export policy" and that its contribution was limited to creating "conditions in which export trade can flourish" by commercial policy, by "an appropriate internal policy in managing and disposing of physical resources, material and labour" and by financial policy. This is disappointingly negative—it appears to imply the abandonment of the attempt to evolve an export policy as such. But it is certainly true that not even the most positive export policy could succeed without the enterprise and energy of industry and labour.

The Chancellor's promises related to the replacement of capital assets, the taxation of patents and provision for scientific research. All of them, that is to say, had a direct bearing on the productivity of British industry, which is a compound of equipment, methods and "that mysterious catalyst, the know-how." This preoccupation with pro-

### THE NATIONAL FINANCES

Next week's issue of *The Economist* will include a special section containing a statistical summary of the public finances of the United Kingdom, a complete reprint of the tables contained in the Budget White Paper, with a commentary on the figures. For this reason, the usual statistical summary of the Budget is omitted from the present issue. The salient points of the Budget speech are summarised in an article on page 563.

ductivity is a most welcome sign of the times and evidence of a shift in economic thinking which, it is to be hoped, will be very fruitful in the years to come. The Chancellor's proposed amendments of the law are detailed and complicated and a full judgment of their effect will have to await the event. But it is already clear that they go a long way and that they may largely meet the case that has been so frequently stated for a more liberal attitude of the taxing authorities towards the expenditure of industry on scientific research and on the prompt replacement of obsolescent plant. This is, unquestionably, the most urgent part of the case for a relaxation of the burden of taxation on industry. But it is not the whole of the case, and the Chancellor may well be pressed to go further.

He specifically rejected the proposal that "there should be a reduction of income tax in respect of any industrial profits that are not distributed but are placed to reserve for the future development and extension of the business" on the ground that this would be "giving relief for the act of saving." This is a point of considerable substance; but the Chancellor's alternative is only a partial remedy. There are many more ways of ploughing back funds in the development of business than the erection of buildings and the purchase of plant. To single out these for relief is a long step in the right direction, but it is another sign of the tendency of Government policy in recent years to favour manufacturing industry at the expense of all other forms of creating wealth. That the main argument for complete review of the burden of taxation on business activity still stands can be shown by asking two questions. Can British business permanently stand taxation on its undistributed profits at the rate of 10s., or even of 7s. 6d. in the £, without prejudice to its rapid development? And is it possible to believe that the standard rate of tax that is appropriate to personal incomes also happens, by coincidence, to be the appropriate rate for profits ploughed back into business? These are wider issues than those with which the Chancellor dealt this week; but they will have to be faced before long.

## Many Mansions

IN a world of nation states, it is very difficult to improve on the League of Nations as the international instrument of organised peace. The fact that it did not work last time is a poor reason for abandoning its principles. As the Prime Minister says, if the League had been properly backed, it would have succeeded, and it is encouraging to find that, although statesmen to-day do not all use the terminology of the old League, the international organisation they propose—with its general assembly of all peace-loving powers, its executive council, its international law court and its measures of collective security—differs only in name from the League of Nations. The important thing now is to ensure that the major failures of the old League are not repeated. In the main, these were defects not of structure but of policy. In the political sphere, the chief faults were the League's lack of universality and its inability to pin responsibility for executive action on the state members capable of exercising effective military and economic power. The second obviously followed from the first.

When one thinks of the power wielded by the United

States and Russia and of the part they have played in this war, it is almost incredible to remember that the old League started out on its career without either of them and that Russia became a member only later and then for only a very few years. It is true that the military and economic strength of both countries was less when the League was formed than it became in the course of the following twenty years. The abstention of both or either would have far more immediate and disastrous results now. Happily there can be good hopes that both will play their part in an international organisation. The Soviet Union's pre-war isolation condemned it to bear the brunt of Hitler's attack. The advantages of collective security have been forcibly underlined and both at Moscow and Teheran Marshal Stalin gave his support to a post-war attempt to organise the peace. The position in the United States is complicated by such factors as public opinion and party policy, but Mr Cordell Hull's decision to concert the conditions of peace with Congress is a happier augury than the entirely one-party delegation President Wilson brought to the last Peace Conference.

If universality can be secured, the problem of responsibility will be clearer. It has become a commonplace that under modern industrial conditions only the great industrial Powers can exercise effective force. They are bound, whatever the theoretical arguments for equality of states, to occupy a special position. An attempt to recognise this fact was made in the structure of the old League in which the Great Powers—Britain, France, Italy, Japan and later Germany and Russia—had permanent seats on the League Council. Yet the reason why they enjoyed a special position was never made clear. The addition to the Council of representatives of the smaller nations, though perfectly justified for the purpose of concerting policy, blurred the issue of responsibility when it came to taking action, once the policy had been agreed. The Great Powers, by virtue of their overwhelming strength, must enjoy a special position as the only possible wielders of force, if force should be needed in execution of policies decided on by the World Council or International Organisation or whatever the new League comes to be called. As Mr. Breckinridge Long put it in his recent speech on American foreign policy

Each of the major nations, and any other nations to be agreed upon, should accept responsibility for maintaining adequate forces, and for using such forces on the basis of arrangements made in connection with the international organisation to prevent or suppress all disturbances of the peace.

The League's two-layer structure of Council and Assembly may need developing into a three-layer structure. There should be an Assembly in which all states meet on equal terms and where the main principles of international action can be decided. There should be a Council, elected from the Assembly with a few permanent members, acting as the executive committee of the Assembly and handling all matters of policy unless and until they reach the point of requiring the use of force. But when they do reach that point (as only a tiny fraction of international transactions ever threaten to do) there is everything to be gained and nothing to be lost by making the responsibility plainly rest on those, and on those alone, who can carry it. If the decision to go to war is to be made, or is to appear to be made, by a Council on which the Great Powers are in a minority, then all the absurdities into which the doctrine of collective security was distorted will reappear and the peoples of the Great Powers will be able to delude themselves into the belief that collective security absolves them from effort or initiative. A structure which leaves the Great Powers in a special category as the wielders of force is not destructive of the League of Nations; it is the only means by which the League can be made to work.

The designation of the Great Powers as the executors of the League is not the international police of which the idealists dream nor the complete equality of status which Utopia demands. But it is better than anarchy and nowhere is the perfect so effective an enemy of the good

as in international relations. President Wilson's attempts were not defeated on a straight anti-League ticket. Liberals and Idealists reinforced the isolationists with the cry "Yes, we want a League—but not this League. We want international co-operation—but not on this model." There are already signs in the New World—in the United States and Canada—of a tendency to attack any modest achievement in international co-operation on the grounds that it is neither international nor co-operative enough. Here universalism and isolationism meet.

Some differentiation between great Powers and small Powers is inevitable. Should it be the only differentiation? For example, should all local or regional arrangements for security give way to the all-embracing system of world security? In the near future, the Prime Ministers of the Dominions are to meet in London to discuss a wide range of imperial problems. Mr. Curtin brings with him from Australia a proposal to tighten the machinery of imperial consultation and his Government has already concluded a regional agreement on Pacific security with New Zealand. In last week's debate, the House of Commons made it very clear that this country would welcome any form of closer association to which the Dominions might agree. Would such arrangements interfere with the organisation of world peace? When Lord Halifax made some very mild suggestions on this subject in Toronto last January he was subjected to an astonishing flood of criticism. He was accused of returning to balance of power politics, of advocating spheres of influence and generally of expounding a new and sinister version of British imperialism. Critics in the United States have followed the same line. General Smuts' rather naïve comparison of the strength of the three "colossi" is recalled and the British are accused of trying to refurbish the old imperial connexion to redress the balance of their new weakened world position. Now Mr. Malcolm MacDonald has joined the dispute with an attack on those who seek to

measure the respective strengths of Britain, America and Russia . . . and devise means of striking a balance between them so that peace would be maintained because no one of them will be strong enough to force its will upon another.

The strength of the Canadian reaction is due to the country's intimate connexion with the United States. If Canada's links with the other Dominions were drawn closer, many Canadians feel that its relations with the United States might be endangered. This fear is rationalised into support for a universal peace organisation and opposition to special Commonwealth arrangements. Criticism in the United States springs from the old deep-rooted distrust of the British Empire and the belief that "Commonwealth collaboration," imperialism and power politics are three terms for the same thing. Thus both in Canada and the United States an influential body of opinion is tending to proclaim, as a first principle of international action, the doctrine that any special or

## SAVING IS EASY . .

Only when it has become a habit. Systematic saving by way of Life Assurance enables you to plan a secure financial future

EQUITY & LAW LIFE ASSURANCE SOCIETY  
LINCOLN'S INN FIELDS

Temporarily removed to  
163/4, STRAND, LONDON, W.C.2

regional or local arrangements for peace are necessarily sabotage of the prospects of a universal world order.

Here again the best is helping to drive out the good. A universal system of equally co-operative and well-meaning nations might indeed be the ideal. In the mean time, does any North American critic suggest that the Monroe Doctrine has been a menace to world peace? Does any politician in the United States seriously question the desirability of Pan American solidarity or the value of a hemisphere defence policy? The United States and Canadian Defence Board, the United States bases in Newfoundland and the Caribbean and the special arrangements for bases in Brazil and Uruguay are generally felt to reinforce peace. Why? Because the aim of these special arrangements is in every case the preservation of world order and the method of making the arrangements is that of free agreement between sovereign states.

The record of the British Commonwealth is far more remarkable even than the achievements of Pan American solidarity. The aim of the British nations is peace, peace with each other and peace with the world. Their method of collaboration is equal sovereignty and complete freedom of choice. Burke's warning of 200 years ago—

deny them this participation of freedom and you break that sole bond which originally made and must still preserve the unity of the empire

has been heeded. The bond is, as Mr Churchill put it in last week's debate in the House of Commons, their "union in freedom." Without compulsion of any kind they have twice fought the battle of Europe, coming from the ends of the earth to do so. To suggest that any strengthening of this one supremely effective instrument of collective security would be a disservice to the cause of international order is not only bad internationalism; it is the plainest lunacy.

## The Joint Currency Scheme

IT is just a year since the experts of the American and British Treasuries published their proposals for post-war currency arrangements. The New White Paper issued at the week-end shows that the intervening time has been well employed. It has been possible to devise a jointly agreed "Statement of Principles for an International Monetary Fund." The Governments remain uncommitted until an international conference can be held, but the new scheme carries the agreement of experts from other United and Associated Nations as well as that of Lord Keynes and Mr Harry White. To have secured so wide a measure of agreement is a very considerable achievement.

The central framework of the joint scheme follows the original American proposals more closely than the British. The idea of an international institution "creating" international credit and lending it on overdraft to deficit countries proved to be too novel to win general acceptance. The alternative has been accepted of constituting a fund by initial subscription from the member countries, which would then be able to obtain from it supplies of such currencies as they needed. Since the Fund will operate entirely in terms of existing currencies, no new unit will be required; both "bancor" and "unitas" therefore disappear. The Fund is to amount to about \$8 billion for the United and Associated Nations and about \$10 billion for the whole world. The draft does not specify the method by which each member country's quota is to be determined; but it has been stated in Washington that the American quota would be about \$2½ to \$2¾ billion. The original subscriptions are to be paid in the member's own currency or in gold, the gold portion amounting to 25 per cent of the quota or 10 per cent of the country's holdings of gold or gold-convertible exchange, whichever is smaller.

Members will be entitled to buy from the Fund, in exchange for their own currency, any other currency that they need for settling current transactions, but a stop can be put on these transactions if the Fund's holdings of the

Not only should the Commonwealth method be preserved. It would be a gain, not a loss to the cause of freedom, if the area of its operation were extended. Australia, New Zealand, Canada are fully as sovereign as the Scandinavian States, or the democracies of Western Europe. They have not found it derogatory to their safety or sovereignty to join with the United Kingdom for certain common purposes, of which the most important is defence. None of the present proposals envisages any restriction of their freedom of action or of their sovereignty of decision, but simply an increase of the opportunities for common action. The states of Western Europe would find equally that the method of free association elaborated in the Commonwealth would give them greater security and undiminished independence. The far-reaching effects of such an association, not only along the Atlantic coast but in the colonial empires in Africa and the Far East, need not be underlined. The area of organised freedom would have increased a hundredfold. To suggest that this is a menace to world peace is to accuse Britain, the Dominions and any other states associated with them of aggressive intentions. To say that this is imperialism is to imply that Britain has used coercion to maintain the Commonwealth and is now preparing to coerce its European neighbours—whereas if one thing in this world is visible beyond all others it is the peacefulness of Britain's intentions and its total unwillingness to coerce any nation, even so weak and defenceless a nation as its Irish neighbour. As Mr Churchill put it

"In My Father's house there [Sic] are many mansions." So in this far greater world structure, which we shall surely raise out of the ruins of desolating war, there will be room for all generous, free associations of a special character, so long as they are not disloyal to the world cause nor seek to bar the forward march of mankind.

currency offered amount to 200 per cent of the quota, or if they have increased by more than 25 per cent in a year. In other words, if a country's quota were, say, \$1 billion, of which it had paid \$250 million in gold, it could get accommodation from the Fund to the amount of \$1,250 million in all, or of \$250 million in any one year. It is made clear that the Fund is not to be used to meet large or sustained outflows of capital.

But if the main structure of the American scheme has thus been adopted, it is clear that great care has been taken to meet the criticisms of that scheme that were made in this and other countries. For example, the original American scheme envisaged the possibility of a large fund operating in the exchanges on the initiative of its managers. In the new proposals it is made plain that the Fund is to take no action save that of meeting requests for accommodation from its members. Perhaps the deepest British suspicions attached to the prominent part played by gold in the original American scheme. This has been considerably diluted. No country is asked to subscribe in gold more than one-tenth of its gold holdings; the apparatus of fees and penalties payable in gold has disappeared completely. It is true that several clauses permit transactions in gold—for example, a country may, if it chooses, redeem for gold the Fund's holdings of its currency; but there is no compulsion to do so. It would be foolish to drive anti-gold fanaticism to the length of denying that there are any useful purposes to be served by an international precious substance, universally acceptable. But every care has been taken to protect the scheme from any suspicion, justified or fanciful, of domination by gold.

Another of the original criticisms that has been largely met is the charge that the American scheme was likely to be restrictionist in its effect. The greater part of a country's initial subscription is to be in its own currency, and since the Fund's holdings will presumably be returned to the member's central bank to lie on deposit, or else to be

used in the local money market, there need be no abstraction of funds. Both the original schemes contained provisions for enforcing conditions upon a country that was exceeding its borrowing limits, and these conditions could hardly have avoided being restrictionist in effect, the more so since the original schemes ruled out—the American completely and the British very largely—the one adjustment that may sometimes be expansionary in effect—namely, an adjustment of exchange rates. These corrective provisions have disappeared from the new scheme. If a country is reaching the limit, the Fund may make a report "setting forth its views," but there is no obligation on the country to accept these views, and it may withdraw from the Fund at any time, liquidating its obligations "within a reasonable time."

Indeed, by implication, the new proposals seem to suggest that changes of exchange rate, instead of being, as originally, the one prohibited method of adjustment, shall be the normal means. A member may change the value of its currency by 10 per cent on its own initiative and by a further 10 per cent with the permission of the Fund, which has to decide within two days. The Fund, moreover, is instructed to approve a requested change "if it is essential to correct a fundamental disequilibrium" and it may not reject a requested change necessary to restore equilibrium "because of domestic, social or political policies of the country applying for a change." In addition, it is to take into account the extreme uncertainties that will prevail when the post-war parities of exchange are first determined. It is not too much to say that these provisions, especially in the absence of any reference to other methods of adjustment, give the new scheme, in contrast to the original proposals, a definite bias in favour of moderate changes in exchange rates. This is a great improvement. Nobody, of course, likes exchange alterations, which are most inconvenient for the trader. But they are, on balance, much the least disturbing of all means of effecting a readjustment when a fundamental disequilibrium has arisen.

Another point on which opinion in Great Britain has been insistent is that the whole burden of correcting disequilibria should not fall on the deficit country. When the balances of payments of the nations get out of adjustment, the fault may lie with the country that is buying too little, and therefore running a surplus, rather than with the country that is buying too much and therefore running a deficit. Indeed, it can be argued that it is the deficit country that is better performing its duty to the comity of nations. Both the original schemes attempted to tackle this problem, but neither went beyond suggesting that a surplus country should be requested to mend its ways. The new proposals meet the issue very squarely. The relevant clauses are worth quoting in their entirety:—

### VI. Apportionment of Scarce Currencies.

1. When it becomes evident to the Fund that the demand for a member country's currency may soon exhaust the Fund's holdings of that currency, the Fund shall so inform member countries and propose an equitable method of apportioning the scarce currency. When a currency is thus declared scarce, the Fund shall issue a report embodying the causes of the scarcity and containing recommendations designed to bring it to an end.

2. A decision by the Fund to apportion a scarce currency shall operate as an authorisation to a member country, after consultation with the Fund, temporarily to restrict the freedom of exchange operations in the affected currency and, in determining the manner of restricting the demand and rationing the limited supply amongst its nationals, the member country shall have complete jurisdiction.

This is a most important set of provisions. For the sake of realism, "the scarce currency" should be interpreted as meaning "dollars," since there is no other currency in the world where the risk of scarcity is so great. No one in his senses would look forward with any pleasure to the necessity of rationing dollars, but it is most important to have it firmly established, firstly, that such rationing will not be an unfriendly act but a necessary measure, and secondly, that trade between other countries—for example between Great Britain and Brazil—need not be limited because difficulties have arisen in

making payments to the United States. This is a great victory for realism and common sense.

Finally, British opinion has been anxious to secure that international currency arrangements do not work prejudice to the efficient functioning of the sterling area, which seems, to British minds, no more incompatible with a good international system than the British Commonwealth of Nations is with an effective system of world order. On this point, the text of the new proposals is somewhat ambiguous, as countries are to undertake not "to engage in any discriminatory currency arrangements or multiple currency practices" without the approval of the Fund, and they are, during the transitional period, "to withdraw as soon as possible by progressive stages any restrictions which impede multilateral clearing on current account." Some of the words used in these phrases require definition, but the explanatory memorandum of the British experts says that

the drafting of this clause, as the experts on both (sic) sides understand it, allows, during the transition period [three years from the inception of the Fund], the maintenance and adaptation by the members of the sterling area of the arrangements now in force between them. Nor is the scheme intended, when the obligation of free convertibility has been accepted, to interfere with the traditional ties and other arrangements between the members of the sterling area and London.

All these modifications of the original schemes, taken together, constitute a very considerable improvement. The joint proposals are better, in several respects, than either the Keynes plan or the White plan. The passing of a comprehensive judgment upon them, however, depends upon the criteria by which they are to be tested. If these proposals, or any others that could be made in the currency sphere, are to be regarded as standing by themselves, then the judgment must be that they can only make a limited contribution to the restoration of a healthy international trade. The absence of satisfactory means of payment may impede the flow of trade; their presence does not ensure it. But if they are regarded as a technical matter, which it is of great advantage to get satisfactorily resolved as a preliminary to an advance upon the fundamental issue of restoring trade between nations, then it can be said that the task has been well and skilfully accomplished. As the proposals now stand, the only criticism of any significance to which they are subject is that the Fund is very small—\$8 billion is not a large sum in relation to world commerce, the more so when it is remembered that it is the Fund's holdings of the scarce currencies that will set the limits to its operations. But this defect can perhaps be corrected if it becomes necessary.

One of the disadvantages of the procedure followed a year ago in publishing two alternative schemes on the same day was to concentrate attention on the technical differences between them and to divert the public discussion from the much more fundamental question whether, and if so in what circumstances, any plan of the kind could be expected to work. The appearance of these joint proposals may, it is hoped, permit a return to this more important topic. Currency arrangements are a preliminary to trade policy, but no more than a preliminary. Now that the *hors d'œuvre* is arranged, the main course should be brought on.

Financial arrangements can have three kinds of effect on the underlying trade. They may operate to restrict the volume of trade; transactions that would otherwise be accomplished are prevented by the lack of means of payment. Alternatively, they may encourage trade; the offer of financial assistance may bring to birth transactions that were not otherwise likely to happen. Or thirdly, finance can be neutral, always standing ready to effectuate transactions that are otherwise arranged, but never taking the initiative. In relation to the trade of the world, the present proposals are neutral—so long as no currency is declared to be scarce. This is an advantage gained, since it lifts the threat of currency chaos, which would unquestionably be restrictive. But neutrality in itself is not enough, and the task now is to pass over to the search for positive means for increasing the volume of international trade.

## Plymouth and Planning

TOO often it is suggested that the demand for Government decisions on planning the use of land comes mainly from impractical theorists. In fact, it comes almost entirely from the people responsible for the rebuilding of bombed towns. The reconstruction Bill which Hull put before Parliament the other day was a case in point; and the handsome but sensible plan for Plymouth, prepared by the City Engineer, Mr J. Paton Watson, in consultation, almost inevitably, with Professor Patrick Abercrombie—whose wideflung work is rapidly making him the architect of a national plan—is another. Every plan for reconstructing the towns that have suffered badly from enemy raiding will prove that it is not possible to do the job properly unless local authorities are given the necessary powers and unless the Government itself possesses the necessary policy.

Local problems will of course differ from town to town. Each, by history, geography and livelihood, is a special case. Plymouth is a naval town, almost ringed round by water. As this report says "its highly emphatic and marked topography has imposed definite limits of growth," and "its prosperity is based on a few and readily classified occupations"; ship building and marine engineering, building and public works, and distribution, each engages about a fifth of its workers. Unlike many other bombed towns it was not depressed before the war; nor is it likely to be afterwards, when national defence will be more than ever a first concern. Yet Plymouth, too, with its Hoe, its Stuart Citadel and its Elizabethan town, its naval dockyard, its barracks, its world-famous Sound and its shopping centre, which serves a great stretch of agricultural and holiday-making countryside, was as clogged, congested, overcrowded and "blighted" before the war as most less fortunate cities. "With regard to over-crowding [records the report of its planners] Plymouth compares unfavourably with two other ports, Southampton and Liverpool, and with the East End of London." There are something like 150 acres of obvious slums to be cleared; and 200 acres of buildings have been destroyed or very seriously damaged.

Before the war, the City of Plymouth did not possess, in the Planning Acts, sufficient powers to put its houses in order. Like other local authorities, it could only proceed, ineffectively, plot by plot and street by street, courting claims for large compensation without the hope of collecting any appreciable betterment. Congestion of living, working and travelling piled up at the centre; even the Royal Naval dockyard became dangerously cramped; while on the fringes the city was sprawling outwards, undirected, over fruitful soil and beautiful scenery. So it is now that the experts say "it is most essential for the corporation to see clearly the most ex-

peditious and equitable way of getting its devastated centre rebuilt." So it is that they look beyond the City's own boundaries for ways of preventing the urban exodus from destroying rural richness. So it is that they contend, quite rightly, that these things cannot be done until the Government produces a planning policy.

Plymouth, the first municipal corporation to be created by Act of Parliament, five hundred years ago, is now three towns in one—Plymouth itself; seventeenth and eighteenth century Plymouth Yard and Dock, now Devonport; and Stonehouse, site of the century-old Victualling Yard and the Royal Marine Barracks. The triple city covers 10,000 acres, bounded by the Plym, the Sound and the Tamar, with a peacetime population of 220,000, cut down by bombing and war movements to 145,000. A postwar population of 180,000 is suggested in the plan. The density of population is just over 70 persons per residential acre, but in two wards the figure is over 200 and in many more it is between 100 and 200. The plan proposes three residential zones. In the first there will be a maximum of 100 persons per acre, half in houses, half in low flats, with sufficient open spaces and gardens. In the second the maximum will be 50 persons per acre, all in houses, and in the third 25 persons per acre in houses with large gardens. The plan for Plymouth, like the plan for London County, is in the Abercrombie mode. One "precinct" will reveal and protect Old Plymouth. Another will enclose the Civic and Shopping Centre rebuilt from bombed ruins. Open spaces and wedges of green will recreate old communities in the heart of the town and round off new ones in the suburbs. The term of the plan is twenty-five years, but the rebuilding is to be done in half that time. The vision is of "a series of smaller community units, built up into a single magistral city."

The large inner area of bombed and slum property has been marked out for special treatment as a "reconstruction area" under the Bill by which the Government has again promised to give larger powers of land purchase at pegged prices to local authorities. The way has been largely cleared by the bombs. To achieve the plan, if the pre-war population comes back, it will be necessary to rehouse 63,000 persons, of whom 23,000 will find room in the replanned city. Thus the problem resolves itself into the task of "decanting" 40,000 persons into decent living conditions outside, without spoiling the surrounding moors and sea coast, and without wasting good farm land. The local authorities, in the 135 square miles which make up "the immediate area of influence of the City of Plymouth"—Saltash, Torpoint, Plympton and Plymstock, Yelverton, Roborough, Millbrook, Kingsand-Cawsand and the rest—have neither the powers, the money nor the inclination to take charge of the spill-over from Plymouth and to protect the countryside, among the loveliest in England. Who is to determine policy, to take action and to foot the bill?

There is no question here of compulsory decentralisation. Given good communications and decent "neighbourhood groups" to live in, the "surplus" will willingly move. They need not go far—only over the water. They need have no long daily journeys. The size of Plymouth and its dependent environs is about right; this is no London in embryo. But the problem is nevertheless there. Who is to settle the emigrants, and how? How is compensation to be paid, and by whom? As the industries, warehouses and markets of Plymouth are sorted out, where are they to be put? If industrial trading estates are to be projected, as they are in the plan, shall they be within the city boundaries or in nearby satellites? The City of Plymouth has answers to these questions, as this plan and report show. So no doubt have all the other towns and cities who must build again perforce because of war damage and slumdom. But none of their wants and needs can be given effect until the Government speaks its mind on planning.

## The Budget Speech

APPROPRIATELY at this, the final stage of the war, the Chancellor of the Exchequer devoted much the greater part of his Budget Speech, on April 25th, to the financial aspect of economic reconstruction. He first of all painted the economic position of Britain at the end of the war as he sees it.

### The External Position

At the end of the war, he said, "we shall have ceased to be a large-scale creditor country."

To finance our purchases in the United States before Lend-Lease, and to meet these external costs (of military operations and supplies), we have already parted with overseas assets to the extent of £1,000 million, and we have incurred undischarged liabilities amounting to £2,000 million. We are not yet at the end of this tale. We have parted with all this, not to neutrals, but nearly all of it, some 90 per cent, to our Allies and Associates, most of whom will emerge from this war with their overseas financial position greatly strengthened as a result, just as ours is greatly weakened. . . . If we are to avoid a drastic curtailment in our volume of imports, such as might threaten our standard of life, and gravely prejudice our prospect of active employment, it will be indispensable for us to increase our exports. That will be a matter of life and death to us, for it is impossible for any country to live indefinitely beyond its international income.

But Sir John Anderson did not paint a gloomy picture of the future. There will be a price to pay. The burden will be large, but the productivity of Great Britain is also large. The burden can be carried "if we make an effort," though it will not be a light effort. It will be "a challenge to the vigour, the initiative and the adaptability of our industry." The Government cannot make an export trade; this is a matter for manufacturers, merchants and workers. But, he went on to say,

What the Government can do is to try and make conditions in which export trade can flourish, both by its foreign policy of co-operation in the international field, by an appropriate internal policy in managing and disposing of physical resources, material and labour, and by its financial policy. . . . We must prepare such measures as we can devise to give industrial enterprise a fair chance to meet the challenge which the future holds for all of us. Industry is entitled to know where it stands.

### Taxation on Industry

The Chancellor then went on to give a broad outline of the Government's post-war policy of industrial taxation, the "most important part" of what he had to say. Industry had advanced two main propositions. To the first, which would involve a reduction in income-tax on any profits put to reserve for the development and extension of the business, he could not accede; in his view relief for the act of saving is not the appropriate approach to the problem of assisting industry in keeping in step with the latest and most economical methods and processes of production. He saw the solution on the lines of the second proposition, namely, that taxable profits should be real profits in the sense that those profits should be struck "only after making all proper deductions and allowances such as might be made on a commercial basis for the amortisation of money expended on assets which are used up in the making of profits."

The following are, in brief, the proposals made by the Chancellor for translating this principle into practice.

First, the present system of wear and tear plus obsolescence allowances for plant and machinery (these were described in *The Economist* on January 2, 1943) is to be maintained. Broadly, by the present system industrialists are granted annual relief (wear and tear allowances) from income-tax, on an amount representing a percentage, not of the original cost of the plant and machinery, but of the amount to which it has been written down; when replacement takes place, they may claim exemption from income-tax (obsolescence allowances) in respect of the difference between the sum total of the depreciation allowances granted and the original cost of the machinery, provided an amount at least equal to this difference has in fact been spent on replacement. But in addition to these allowances, Sir John Anderson proposes a special initial tax-free allowance of 20 per cent of the cost of new equipment. Further, industrial buildings—hitherto these were not eligible for wear and tear allowances except under the special scheme relating to munition factories

built since 1937—are to be included in the scheme. He proposes that the cost of buildings should be written off on the basis of a life of 50 years by an annual depreciation allowance of 2 per cent of the cost, with an initial allowance of 10 per cent of actual expenditure. The new depreciation allowance, though not the initial allowance, will be applied to existing factories as well as new ones. This system—it is further discussed on page 575—should assist industrialists in accumulating the capital necessary for replacing plant and equipment, not merely when it is beyond repair, but where more economical tools have been invented. There are special provisions designed to assist agriculture and extractive industries.

Secondly, there is to be a change in the taxation levied on royalties derived from patents. Where a patent is acquired on the basis of the payment of a royalty, the royalty is income subject to deduction of tax, and the trader paying the royalty enjoys the full allowance in respect of the cost of the patent. But where the royalty is acquired by payment of a lump sum, the lump sum is not treated as the income of the recipient, nor is any allowance made under the existing law to the trader in respect of the lump sum, though that expenditure is used up in earning profits over the life of the patent. During past examinations of this problem, the two questions of charging the lump sum to income-tax in the recipient's hands, and writing off the expenditure in the buyers' accounts, have been linked together. This link is to be maintained by the proposed reform; it will provide for the writing off, during the life of the patent, of any lump sum paid by a trader in acquiring a patent, while making the sum payable for the patent rank as income in the hands of the seller; but there is to be suitable provision enabling the seller to spread that income over a number of years to avoid any hardship that might arise if it were taxed as the income of the year in which it is paid.

### Scientific Research

Thirdly, the partial relief given in respect of research expenditure is to be extended. Hitherto the Inland Revenue has allowed as a deduction from taxable income all annual payments made by a trading concern to a central research body approved by the Department of Scientific and Industrial Research, though this allowance did not extend to a particular payment earmarked for a specific research project. Insofar as a trader's own research is concerned, the practice has been to exempt from tax expenditure of a revenue character, but not capital expenditure. But the capital expenditure required in modern research is often substantial—in the construction of pilot plants, for example. Hence, the Chancellor proposed

that any research expenditure of a capital character, which means normally expenditure on laboratory buildings, plant and machinery, should be allowed over a period of five years, or over the life of the assets if shorter, as a deduction from profits for income-tax purposes. In addition, all current research expenditure, such as salaries, wages, cost of materials, repairs and so forth, will be allowed as and when incurred by the trader.

The Chancellor hoped that the Committee of Ways and Means would agree that

in this comprehensive attempt to relieve from taxation altogether funds devoted by industry to the support of fundamental research, to the translation of laboratory research to production, and to the full-scale development of the product, the Board of Inland Revenue have tackled the problem with a sense of realities born out of their close interest in the effects of taxation upon industrial recovery and the buoyancy of the revenue.

### Chemical and Motor Industry

The Chancellor expressed himself as anxious that Great Britain should play a large part in the development of the new chemical industry based on oil. It should be possible, in his view, without unduly sacrificing revenue, to make sure that the tariff offers no obstacle to the chemical industry in obtaining the necessary raw materials from oil. He was not able to make any specific proposals, but informed the Committee that an inquiry would be set on foot to provide the necessary data on the inter-relationship of raw materials derived from oil and coal, for example, on which such proposals can be based.

## The BRITISH MUTUAL BANKING COMPANY LIMITED

Founded 1857

By reason of its organization, this old established Bank is able to provide prompt and individual service for all classes of sound business, and customers in all parts of the country express their appreciation of the facilities provided.

LUDGATE CIRCUS, LONDON, E.C.4

About motor taxation the Chancellor has reached the conclusion that the balance of argument is against a redistribution of total taxation between the licence duty and fuel taxes. The question therefore arises whether there should be a change in the way in which the vehicle tax is levied. About the horse-power tax on private cars, he said that that tax may have helped to lead to the development of a rather special type of engine, but that, for this reason, it has also been a "valuable form of protection against imported cars." He did not say, however, that the horse-power tax, in its present form, has acted as an obstacle in the way of exports. He added that

if it is the considered view of the motor manufacturers that a change from the present horse-power tax to some other basis, yielding about the same revenue, is desirable, that a change would be an advantage—for instance, a change to cubic capacity, and possibly a change of taxation with a different graduation or wider steps than under the present system—I would be ready to listen sympathetically to representations.

#### Excess Profits Tax

In order to remove any doubts about the refund of one-fifth of the Excess Profits Tax, subject to income-tax, the Chancellor said

It is quite clear that all trading concerns that have to face post-war expenditure on rehabilitation and reconstruction or, indeed, that have to face capital expenditure of any kind whatever, can look forward with absolute certainty to having their post-war Excess Profits Tax credits available for the financing of such expenditure.

He pointed out, incidentally, that, allowing for income-tax, those post-war credits are accumulating at the rate of £40 million to £50 million a year. He drew attention to the value of this refund as a means of financing expenditure after

the war, but he did not refer to the unequal incidence of the refund due to the fact that by no means all firms have been able to exceed their pre-war profits, and that some have exceeded it more than others. As an immediate measure, the Chancellor proposed that all EPT standards, except profit standards, should be increased by £1,000 from April 1st. The cost of this concession, which will benefit 30,000 small businesses, is estimated at £12,500,000 in a full year.

#### Price Subsidies

Lastly, the Chancellor offered a stern warning against the tendency of wage rates and costs to run ahead of the official cost-of-living index. Since 1941, when the cost-of-living index was stabilised, wage rates have risen by about 15 per cent, quite apart from the growth of earnings due to overtime, the extension of piece-rates, and other special factors. Hence, the cost-of-living index could only be maintained on an even keel by a progressive increase in subsidies, from £70 million in 1940 to £190 million in 1943. Without these subsidies, the Chancellor said, the cost-of-living index, instead of being 28 per cent above the pre-war level, would probably have reached about 45 per cent above it in 1943, and might reach 50 per cent above it during this financial year. In the event, the Chancellor felt that the present ceiling of the cost-of-living index, at 25 to 30 per cent above the pre-war level, could no longer be regarded as sacrosanct, and that a ceiling of 30 to 35 per cent should be substituted for it. About the future he said:

It is the firm intention of the Government, as has been announced on other occasions, to maintain the policy (of stabilisation), so long as they have the vital co-operation of all sections of the people, and to continue it on the same conditions during the transitional period when we are turning back once more from war to peace.

## NOTES OF THE WEEK

#### Imperial Preference

The two-day debate on Commonwealth relations in the House of Commons last week elicited from the Prime Minister one of his most felicitous and statesmanlike speeches and from the House generally an impressive witness to the strength of the invisible bonds that knit the British nations together. The debate was opened by a speech by Mr Shinwell, which was perhaps less remarkable for its substance than for the fact that he delivered it—but was still remarkable enough in the fervour of its imperial attachment to stir some protest in his own party. There can be no doubt of the desire of the people of the United Kingdom, as voiced by their representatives, to lose no opportunity of increasing the cohesion of the Commonwealth—not as a policy directed against any other nation, or against any universal association of the nations, but as the one sure fundament in an unsure world. The imminence of the Premiers' Conference, and the divergent views that have been expressed by the Prime Ministers of Canada and Australia, prevented any very far-reaching discussion in the debate of the political side of Commonwealth relations. The effect was to give the subject of imperial preference an importance greater than it really deserves. The Prime Minister not only underlined the reservation he had inserted in the Atlantic Charter to protect the system of imperial preference, but also revealed that before accepting the Lend-Lease Agreement, with its famous Article Seven, he had secured from President Roosevelt a declaration that the United Kingdom was no more committed to its abolition than "the American Government was committed to the abolition of their high protective tariff." It was clear from the debate that the Parliamentary resistance to the one act of abolition would be fully as strong as the Congressional resistance to the other. This forthright statement has aroused some irritation in the United States. But it should also serve to clear the air. As a matter of fact, and not of desirability, there is no chance that the British Parliament would consent to the abolition of the system of imperial preference save possibly as part of a very large reconstruction of international trade involving concessions by other countries far larger than any that are yet in prospect. There is no reason to suppose that the feeling in the Dominions is any less strong. These are facts that cannot be ignored. But when it comes to the question whether they are welcome or unwelcome facts, it is per-

missible to regret that so much of the symbolism of something as desirable as Commonwealth unity has come to be concentrated in a system of preferential duties which is of questionable virtue in any form and of downright harm in its Ottawa manifestation.

#### Service Pay and Allowances

The improvements in Service allowances announced by the Government on Wednesday are in some respects more generous than had been expected. Though there will be criticisms on many points, and there are many anomalies in the White Paper, the general reception is likely to be favourable. The Government has refused any general increase in service pay. This was only to be expected, but it will create a good deal of resentment among single soldiers and the women's forces. Instead, the non-tradesman private will be able to earn more rapid increments up to the maximum pay of the rank, which will be 5s. a day for the specially proficient soldier. The White Paper (Cmd. 6521) admits that "a substantial improvement should be made in the position of those men with families in the lower range of pay, who find it most difficult to supplement the State contribution to the family upkeep." The new scale of dependants' allowances should go a long way to correct the shocking inadequacy of the present rates. A wife will now get 35s. a week instead of 25s., and there will be a flat rate for children of 12s. 6d. instead of the present descending scale from 9s. 6d. The introduction of a flat rate establishes an important principle from the point of view of operating a scheme of family allowances. But why should it be less expensive for the widow of a serving man than for his wife? War pensions are to be increased, but the widow will get 2s. 6d. a week less than the wife, and her children 1s. 6d. less than the wife's. The indication that war service grants are to be more strictly administered and the existing grants reviewed, in consequence of the general increase in allowances, is ominous. There is need for more and not less latitude in the provision of grants to meet exceptional hardship cases, medical expenses and the like. The new standard of maintenance, 22s. a week for an adult instead of the previous 18s., is an improvement, but is still too low, especially if the cost of living is being allowed to rise. The total cost of the increases will be about £50 million in the

first year, the largest items being the increase in wives' allowances (£20 million) and children's allowances (£18 million). Now that the Government has decided, under public pressure, to grant these improvements in servicemen's allowances, it is time that the scheme for the post-war social security of civilian families should become available.

#### Neutral Trade

Negotiations with the neutrals are making headway. True, Sweden has refused to alter its existing trade agreement with Germany and no concessions have yet been reported from Portugal; but an agreement with Spain over the export of wolfram is almost ready, and would have been concluded some time ago if the Spanish offer to reduce this year's exports to a third of their earlier exports had proved acceptable to both the British and American Governments. It is from Turkey that the greatest reaction has come. The Turkish Government has banned all exports of chrome to Germany. This is not only due to the Allies' stiffer attitude towards the neutrals. Ever since the military negotiations with Britain broke down in February, and the British Military Mission left Ankara, the Turks have been feeling uneasy. War supplies from the Allies ceased. Turkey lost caste as a friend of the United Nations. Public opinion was disturbed. Meanwhile, the German debacle in the Ukraine and the Russian advance to the Carpathians reduced the risk of German reprisals—a risk which had weighed heavily on the Turks during the Allies' disastrous withdrawal from the Aegean islands. Turkey's aim has, after all, not changed. It is to maintain its friendship with Britain and to see an Allied victory, and even to contribute to it, always provided that such a step would not involve Turkey in war. To ban all chrome exports to Germany demonstrates the country's somewhat damaged solidarity with the Allies. At the same time, given the present Allied pressure on Germany in South-East Europe, it involves no risk of war. This is also the reason why the Turks are ready to reopen military conversations with the British Mission which has returned to Ankara.

#### Air News

With the same regularity as Easter itself, but much more often, the approaching doom of the German air force is officially announced, either by the British or American bombing commands, fresh from some new and shattering triumph. Each time up to now, and with equal regularity, a postscript has later been added, suggesting that the annihilation of the German fighter force may not be so near as some may have been led to suppose. The effect on ordinary readers of these official statements, faithfully supported as they are in every chop and change by the semi-official articles of air correspondents, is more than a little bewildering. There has been nothing like it since England repeatedly changed its religious allegiance with every shift of dynastic politics in the reigns of Henry VIII, Edward VI, Mary and Elizabeth. The question is asked, not unnaturally, whether it is really necessary for Old Moore to put on Air Force uniform. The fact is that the whole problem of expounding and reporting the astonishing achievements of the Allied Air Forces has beaten both the official news services and the newspapers. The figures of aircraft used and bombs dropped have ceased, because of their repetition and immensity, to mean anything. The practice of recording them like motor racing records or batting averages has nothing like the appeal that it had when we were on the receiving end, four years ago, dependent for our salvation upon the bags of a few gallant hunters. Moreover, some people, bombarded with these four-figure totals, even refuse to forget that the target which is so well and truly hit contains human beings, often Allies, as well as military objectives. If the pundits are not capable of bringing to the discussion of air strategy and tactics the colder reason and expert knowledge that a few military commentators, trained in a long and scholarly tradition, do bring to the discussion of ground actions, probably the best solution would be to print the air communiqués with the minimum of comment. There is a dignity in these matters that has its worth.

Certainly dignity is not aided by the apparently perpetual changes of mind about the impact of this bombardment upon the enemy's air strength. In fact, of course,

Allied air policy is in no way so vacillating as the periodic prophecies and contradictions would seem to suggest. The programme goes on night and day, week in and week out, remorselessly wearing the enemy down. What emerges in the statements, official and inspired, is the internal party politics of the Allied Air Forces, divided as they are between the Bombers with a capital B and the Rest. One side gets its oar in by pointing out that, in spite of enormous damage, German fighter production is still buoyant. Then, feeling slighted, the others, British or American, take a hand, and tell the world that the Luftwaffe, whatever some air-men may say, is indeed on the way to destruction. The whole affair would be disquieting as well as unedifying were it not for the fact that the general public, stunned by figures, has long since ceased to read more than the headlines about this, the most damaging assault ever made by one belligerent upon another.

#### Politicians and the Press

It is unquestionable that the Australian Government has acted unwisely and undemocratically in allowing the wartime censorship to be applied to press criticisms of Ministerial policy and to frank comment on Ministerial failures in labour matters. On the other hand, it must be admitted that there is an explanation for this, if not an excuse. Press responsibility is in question as well as the responsibility of Ministers. The Labour Government of Australia, despite its large majority in the country, has been consistently subjected to the most virulent attack from newspapers which represent a small but powerful minority of opinion. Certain newspaper proprietors have tried to consolidate something like a monopoly over the dissemination of news. The story of their relations both to the Australian news agencies and to the national broadcasting system do not suggest, that this is a case where the "freedom of the press" can necessarily be regarded as being on the side of the angels. Indeed, it is doubtful whether, with the exception of a few newspapers of tradition, the term "free press" is really applicable in this case. It is rather the vehicle of the special views of a particular section of the community. In this, of course,

### WILLS' THREE CASTLES CIGARETTES

20 for 2's

Issued by The Imperial Tobacco Co. (of Great Britain and Ireland), Ltd.

T.T.1115

Australia is in no sense remarkable—though, as so often in Australian politics, which always seem to be bare, sunlit, uncompromising and even primitive, the facts may be more starkly apparent. In any country, it is this kind of development that must cause any believer in the essential virtues of free discussion and criticism in a free press to ask where the mechanics and methods of modern newspaper publication may be taking us.

### Censorship in India

The Australian newspaper proprietor, Sir Keith Murdoch, who is on his way to London, has passed judgment on the Indian censorship. In his criticism he says, probably rightly, that the Indian Command's unfortunate suppression of cables about Allied difficulties on the Burmese front, which recently caused a number of well-known and reliable war correspondents to protest, was due to the established policy of keeping hard facts from the people of India. The cause is at least as much political as it is military. Perhaps something like a case could be made out by the authorities for walking warily in the spreading of news that might further shake the confidence of the Indian population—were it not for the fact that the rumours which run from bazaar to bazaar, as they do from club to club in other countries, invariably make bad news very much worse. And the distortion of facts has been much aided in this case by Japanese propaganda. The events of last year, when every effort was made for a considerable time to conceal the full truth about the Bengal famine from both Indian and British knowledge, should have shown what a boomerang secrecy can be; and in the matter of the Burma fighting, where the Allied position is not so unfavourable now as some distant observers have suggested, the chief effect of undue censorship has been to give fuel for political criticism in the United States and elsewhere.

### Hope for Italy

The new Italian Cabinet brings together representatives of all the political parties under the leadership of Marshal Badoglio, who is also Minister of Foreign Affairs. The "grand old men"—Cioce and Sforza—are Ministers without Portfolio. So, too, is the Communist leader, Togliatti. The Service Ministries are unchanged; Agriculture and Economic Affairs go to the Left Wing parties, Finance to a non-party banker, and the crucial Ministry of the Interior to a Christian Democrat. Provided the parties are serious in their intention to make the coalition effective, the portents are good for continuity and stability in the military field, reform and action in economics, experience in finance and tolerance in the internal administration. But the possibility that the Socialists and Communists are not wholeheartedly committed to the new Government is suggested by the liberal Action Party's accusation that the Left Wing parties have not nominated their best-known leaders, and are attempting, in the manner of pre-war France, to evade responsibility by evading office. The first aim of the new Government will be to increase Italy's contribution to the war effort, to counter the economic crisis, and to cleanse local administration which, in the interval between Amgot's relinquishing power to the Badoglio administration and the setting-up of the new Government, has relapsed dangerously into Fascism. The deepest issue facing the new Cabinet is not, however, the immediate steps to be taken to speed on the war. It is the question whether a Government so chosen and so organised can restore to Italy the long-lost habit of responsible and sober self-government. These men are now to put Italy's political maturity to the test. If they cannot work together, if they cannot inspire confidence in the electorate and prepare the people to pass over by pacific methods from war to peace, the only alternative is a return to government based on force. It has yet to be proved that the tremendous problems of social and economic reconstruction in Europe can be handled by democratic and constitutional means. The new Italian Government is the first test.

### Polish Courts Martial

Delegates from the Polish Underground have reached London and are discussing with the Polish Government the crucial question of co-operation with Russia. Contacts have been made in Poland, and there were some faint hopes of an understanding. Unhappily, the Polish army has again

showed itself the worst enemy of the Polish people. At this peculiarly delicate moment, two things are essential if any hopes of reconciliation are to be realised. The Russians must not be offered a new opportunity for violent recriminations against the Polish Government, and British public opinion must not be alienated from the cause of the Poles in exile. Yet this very week the Polish army has staged two sets of courts martial—one for Ukrainian deserters and one for Jewish deserters. The Ukrainian court martial has already made angry headlines in the Soviet press, and the Jewish case has caused a highly critical stir in Parliament and in the British press. The Jews deserted because they were the victims of violent anti-semitism at the hands of their fellow Poles. They believed that they would be allowed, as were a previous group of deserters, to join the British Army. The Polish military authorities are within their legal rights in punishing desertion, but in doing so they have brought down on the heads of the Polish Government all the criticism of fascism, anti-semitism and reaction, which are most damaging to its cause at this moment. They have convinced the British public that the autonomy which the British Government has granted to the Polish army is being abused to cover anti-semitism, hooliganism and brutality. No worse service could have been done to Poland.

### The Mining Agreement

It is probably quite true that the coal-owners signed the wage agreement last week with a bad grace; they have never disguised their objections to the stabilisation of wages for a period of four years; they know better than most people that the mining industry, as at present owned, financed, equipped and organised, will find it hard to pay its way in competitive conditions. But it hardly befits Mr Will Lawther to make this a *casus belli* with the Mining Association, when most of his own followers by their votes in the districts had at an earlier stage rejected the Government's proposals and the Miners' Executive had to seek an overriding national mandate to sign. Nor does the week-end's incident make a very propitious opening for the projected period of peace in the coal industry. The incident itself can be dismissed as a petty piece of face-saving on Mr Lawther's part. But if the miners are seriously pressing for nationalisation, they must surely find better arguments against the owners than that they will not be photographed by the side of the miners' leaders. Mr Lawther would have been wiser to have taken the chance of making history, instead of scandal, by being one of the first of the miners' leaders to speak frankly, and without any doctrinaire prepossessions, about the industry's overriding technical need to produce much more coal per man and per shift. But it is doubtful whether most miners' leaders have any great wish that the present private ownership should be made efficient. Mr Arthur Horner, South Wales leader, showed more realism in his Presidential speech on Wednesday. His condemnation of the strikers was not new, nor his criticism of the Government's blunders over the Porter award "anomalies"; but there was a welcome lack of recrimination and an emphasis on the need for the co-operation of miners, Government and public, both during and after the war, to rehabilitate the coal industry.

The wage agreement, as Major Lloyd George said in the House of Commons last week, is a landmark in the history of the mining industry, and the Minister of Fuel is to be congratulated on having achieved it. The proposals, which were described in detail in an article in *The Economist* of March 18th, have been accepted as they stand. The only addition is the last-minute concession to skilled workmen, not included in the Porter award or the original Government scheme. About 116,000 workers will benefit, and a global sum of £1½ million will be allocated in the different districts. The Government hopes that the cost of this concession will be met from increased output, and not entail any extra burden on the consumer. The agreement is not the "fundamental overhaul" of the mining wage structure advocated by Lord Porter, but it should ensure stability—a factor of great importance to the miners who suffered so grievously from years of insecurity—and should provide a greater incentive to output. Moreover, both sides are pledged, however grudgingly, to "maintain output, efficiency and regularity of attendance, and the speedy determination of disputes." The atmosphere in the coalfields is better than for some time,

unless, of course, Mr Lawther's outburst is representative of a deeper feeling. At the moment there are no strikes. In the three years after the last war, 97½ million working days were lost in mining disputes, compared with 4½ million in four years of the war. The new agreement is intended to be surety against a repetition of this experience.

### Strikers and the Law

The strikes of three thousand London bus workers and five hundred Manchester gas workers, which came to an end at the beginning of the week, had much in common. Both were unofficial and condemned by the Transport and General Workers' (Mr. Bevin's) Union. Both affected essential public services in a large city, and in both cases troops were called in to maintain the services, which created singularly little resentment. Both strikes were built up to very large proportions by the national press, but in neither case was there any enthusiasm among the strikers. Both fizzled out after a few days. Fundamentally, they were symptomatic of a general tiredness and war strain, which was particularly acute in the case of the bus workers. The summer schedule was the last straw, and the strike may have been due as much to a desire to take a holiday as to anything else. Defence Regulation 1A (a), the Cabinet's answer to illegal strikes, made no difference to either stoppage. There were no identifiable Trotskyists lurking in the background, fomenting and inciting the strikers, though there were conversations at the depots and in the streets in which non-strikers deliberated whether they should join the strikers—thus rendering themselves, presumably, punishable under the new regulation. Although official labour is supporting the Minister of Labour in the anti-strike measure—whose chief purpose, after all, is to prevent the authority of trade union leaders from being usurped by irresponsible outsiders—there are signs of disquietude among the rank and file of the movement. Regulation 1A (a) is as far-reaching in its possible application as it is narrow in its conception of what causes strikes; and, since

it is very largely irrelevant to any strike that is likely to happen, the threat it presents to ordinary democratic practices is not balanced by any gain to the war effort.

### Food Consumption Levels

The effective results of a wartime experiment in international food planning have been published this week by the Ministry of Food, on behalf of the Combined Food Board of Britain, Canada, and the United States. In principle, food supplies have been treated since 1942 as a common pool. The practical application of "to each according to his need," however, has naturally been severely limited by transport difficulties, especially where it necessitated an Atlantic crossing, to get food to Britain. Nevertheless, the nutrition of the people of this country, as of Canada and the United States, is shown to be reasonably adequate provided that there is no serious waste or maldistribution. The survey of comparative food consumption has not been limited to a study of bare nutrition levels in terms of calories and vitamins, but has gone in detail into changes in the types of food consumed in each country. The substitution of one type of food, usually less palatable, for another in short supply is a fact only too distressingly obvious to everyone, especially in this country, and explains the substantial increases in consumption of potatoes, cereals, and vegetables in place of meat, which are illustrated in the charts reproduced below. Naturally, the nature of the substitutions in each country, like the nature of the diet as a whole, is bound to vary between the three countries according to the differing conditions of home production and climate, and this should be remembered when the charts are studied. What is equally important is that consumption is estimated at the retail distribution level, and does not therefore take account of waste between the shop and the stomach. The estimates of consumption per head, therefore, err if anything on the side of over-estimation. Moreover, the *per capita* estimates are average figures, and cannot state the differences in consumption at different income levels in the three countries. The survey shows that total

CHART 1.  
COMMODITY SUPPLIES MOVING INTO CIVILIAN CONSUMPTION IN 1943  
Consumption per head in Canada and United Kingdom shown as percentages of United States.

CHART 2.  
COMMODITY SUPPLIES PER HEAD MOVING INTO CIVILIAN CONSUMPTION  
Percentage change 1943 compared with pre-war.

Reproduced by permission of the Controller HMSO

food supplies in the United Kingdom are about 10 per cent below the other countries, measured in calories per head, and considerably farther below in most of the foods that consumers prefer—notably meats, poultry, eggs, butter, sugar and fruit. But it also reveals the voluntary sacrifices that have been made by the American and Canadian communities in order to maintain the working efficiency of people in Great Britain. The complete cut in supplies of tinned salmon to Canadian civilians during 1942 and 1943

ESTIMATED SUPPLIES MOVING INTO CIVILIAN CONSUMPTION

NOTES.—(1) The figures in the above table are national averages and should not be taken to represent the actual supply received by each individual consumer. (2) Including Victory Garden Production.

is only one example among many. The final value of this survey lies in the working out of a reliable method of comparing food consumption levels in different countries. In particular, the post-war problems of food supplies, particularly to Europe, foreseen by the Hot Springs Conference will undoubtedly call for similar survey work in the future. The experience gained by the Combined Food Board in the past will be of great value.

### The Finnish Disaster

The Russians have officially announced the breakdown of the Russo-Finnish peace talks. The Finns described the final terms as in part "technically impossible" and in general too heavy. Except perhaps for the matter of reparations, it is hard to see what easier terms they could have expected from a powerful and victorious enemy. The Russians asked for the 1940 frontiers and for Petsamo, but were prepared to withdraw their demand for Hangö. Otherwise all their demands were concerned with the methods of getting Finland out of the war, a step which, in asking for peace terms at all, the Finnish Government must have envisaged. Some hesitations at Helsinki would have been natural. Fear of Russia has not grown less, and the Russian demand for the demobilisation of the Finnish army to peacetime strength, though perfectly justified, must have underlined Finland's defencelessness in the event of an armistice. Again, it is very far from easy to turn out an occupying German army—as the Italians discovered—and Russia's offer of help would bring Soviet forces into Finland. But what is the alternative? In rejecting the opportunity of getting out of the war the Finnish Government have thrown away its people's greatest safeguard, the sympathy of the Western democracies. They face a Russo-German conflict on their soil, followed by a Russian occupation. Forced labour may now take the place of reparations and even independence may be at stake. What can lie behind this colossal folly? It can only be the assumption that Germany will not be defeated and that in some way there will be not victory but stalemate. It is also possible that an echo of the whispering campaign which has so bedevilled Polish politics—that the Anglo-Saxon Powers must ultimately break with Russia—has reached receptive ears in Helsinki. One may ask whether a dramatic step, such as the breaking off of United States relations with Finland,

might not at this eleventh hour stir public opinion to realise what the Government has done and give the peace party one more chance of action.

### Progress in the Far East

The Japanese advance towards the Assam-Bengal Railway has been held, the garrison at Kohima relieved after a three-week siege, and the road to Dimapur almost cleared. It does not look as though another serious Japanese threat can develop before the rains, but the advance into Assam has disrupted the Allied attack in North Burma. Major-General Lentaigne has been appointed to command the airborne divisions and reinforcements have reached the units operating in the rear of the Japanese; but it would need a strong new drive to effect a junction between the airborne columns and the British and Chinese forces advancing on Myitkyina—and the Japanese diversion into Assam may have drawn off the reinforcements. The first attack from Admiral Mountbatten's new headquarters in Ceylon was significantly directed against the naval base at Sabang in Sumatra. This is the first really heavy blow against the Japanese island conquests from the west. It matches the new attacks on the other most easterly end of the island chain. American and Dutch forces under General MacArthur have made a series of landings on the northern coast of New Guinea to the west of the Japanese 18th Army, which has been holding the Wewak-Madang coast line. These surprise attacks have so far met with little resistance, and the total defeat or dispersal of local enemy forces will probably be only a matter of time. The 18th Army is now threatened by sea, air and land. The fall of Madang to the Australians pens the Japanese in between two advancing Allied forces. The capture of Hollandia gives the Allies a new base from which to continue the pounding of Japanese bases and lines of communication. The outer cordon is being drawn steadily more close, and Japan's freedom of action is shrinking with each withdrawal.

### Divided Greece

A few weeks ago, groups of Greek soldiers and sailors in Cairo staged a "sit down strike" to express impatience over the delay in broadening the basis of the Greek Government. The number of soldiers affected was small, and they were constrained without much difficulty to return to duty. The mutiny in the Greek Navy was more serious, for the men refused to carry out convoy work and mine-sweeping duties, and, in three ships, held out for three weeks until they were boarded by Greek officers and men, and, after some fighting forced to surrender. The Greek Government had no alternative but to quell these disorders, which were a definite embarrassment to the Allied Command. Barely a third of the Greek crews were affected, and the mutiny—for, whatever its grounds, mutiny it was—could not be permitted to spread. On the other hand, it would equally be folly to dismiss the grounds which led the soldiers and sailors into insubordination. They used the most effective method at their disposal to demand a speedy broadening of the basis of the Greek Government. Their protest brought about the resignation of Mr Tsouderos, the interim administration of M. Venizelos, and now the formation of a new government by M. Papandriou who recently escaped from Greece and is said to be devoted to the cause of national unity. Now the question is whether representatives of the resistance movements inside Greece will consent to serve in an all-party government on the Italian model, and it is too early to say whether M. Papandriou is an acceptable leader. Thanks to the efforts of British and American officers in Greece, an armistice concluded in February put an end to most of the fighting between the three main resistance groups in Greece. The largest group, the EAM, with its new Political Committee of National Liberation, is said to be ready to send representatives to Cairo. The difficulty is the instability of the local situation. No Greek group has the continuity or cohesion of Tito's guerilla movement. Even the largest, EAM, is on a far smaller scale. Yet the danger remains that unless an all-party government can be secured, a situation resembling the Yugoslav deadlock may gradually develop, to the detriment both of the Greek contribution to the Allied war effort and of collaboration and goodwill between the Allies themselves.

### Labour's Foreign Policy

The Report by the National Executive of the Labour Party on its policy for the international post-war settlement does not cover much new ground. There is little with which a Conservative Government might not agree. The Report holds that co-operation between Britain, the United States and Russia can be the effective nucleus of a world organisation; it welcomes Mr Curtin's proposal that the co-operative machinery of the British Commonwealth should be strengthened; it says unexceptionable things about post-war economic organisation, and suggests a number of useful international economic institutions. "Expansion not restriction must henceforth be our watchword, and the aim of all our economic planning." There are some points, however, which do not simply register general agreement, and about some of these it is difficult to feel very happy; for example, that reparations should be made by forced labour is accepted as a perfectly normal and just procedure. No one doubts that the Germans should make good as far as possible the awful destruction for which they are responsible. But does the Labour Party, whose first concern should be to raise the status of work, and to ensure the dignity and rights of the labourer, suppose that a perpetuation of forced labour into the post-war period can have anything but disastrous political results? Again, the transfer of large national minorities is treated light-heartedly. Finally, it is astonishing to find thrown in almost as an afterthought a commitment of the Labour Party to a full Zionist policy.

The Arabs have many wide territories of their own; they must not claim to exclude the Jews from this small area of Palestine, less than the size of Wales. Indeed, we should re-examine also the impossibility of extending the present Palestinian boundaries, by agreement with Egypt, Syria, or Transjordan.

When the Labour Party comes to discuss this document at Whitsun, it should beware of the dynamite which the National Executive has embedded in the tail of its Report. A solution of the Palestinian problem, which not only gives to Jews a majority in Palestine, but suggests first that the Arabs should move out, and then that Palestine should be expanded to include other Arab territories as well, would confront Great Britain with war in the Middle East.

### Middle East Inflation

A conference on monetary policy, attended by representatives of twelve countries of the Near and Middle East, has been held in Cairo this week. It was opened by Lord Moyne, Minister of State in the Middle East, whose speech to the delegates was almost wholly concerned with the problems of inflation. He explained that this problem had arisen from the arrival of Allied forces for the defence of the Middle East, and from the subsequent development of this area as a base for operations. The Allies have been involved in heavy local expenditure—often, said Lord Moyne, exceeding the expenditure of the Government itself—and, owing to shortage of shipping and consumer goods, this expenditure could not be immediately offset by imports into the countries concerned. The main problem for these countries is to absorb the purchasing power created by the expenditure of foreign governments. As Lord Moyne pointed out,

If you can solve your problem, you will reap a rich harvest. Your countries are acquiring wealth. As far as it has not been controlled during the war, that wealth has acted as a boomerang, and has disorganised your price and wage levels. Unless this is checked, it will affect your competitive power in the markets of the post-war world. The problem is not one for this country or that. It is one for the Middle East as a whole.

The difficulty arises from the fact that no government accepts the responsibility of countering by taxation or loans, expenditure incurred in its own territory by some external authority. In the Middle East, where no highly developed fiscal system exists, that difficulty is considerably intensified. The symptoms of inflation have, moreover, been increased by the absence of any administrative machine able to operate a rationing system, and by the natives' habit of hoarding and speculation. Palliatives have been applied in the shape of sales of precious metals in the countries concerned, and, in India, by the offer of Government premium bonds. These measures do no more than touch the fringes of the problem. The only complete, though not immediately practicable, solution must lie in the import of consumer and capital goods in the countries concerned, for their inflations are as much a problem of scarce goods as of unscarce money.

### Clothing the Naked

A rise in the purchasing power of the natives in the colonies and dependencies, besides being highly desirable in itself, should offer new markets for British exports. Among the needs of South African natives, clothing ranks high, especially for those working in the mines and those living in towns; but it is unlikely to receive attention until elementary food requirements have been more fully satisfied. A recent article in *International Textiles* points out how large a potential market for clothing exists in South Africa. It concludes that, as far as the native is concerned,

The money needed for improving his present ill-balanced diet by adding vital protective foods is comparatively small. Once he has learned to deal adequately with this problem . . . he will undoubtedly spend a large proportion of his remaining income on clothing himself warmly and reasonably, and without proper clothing no diet will sustain him.

This may be so. But the present poverty among South African natives, and among Bantus in particular, should not be under-estimated. The very low standard of living prevailing among native workers was brought out in a recent investigation by the National Health Service Commission of the Union of South Africa. The first need must be for officially-sponsored welfare and nutrition schemes. It must be some time before the native can become even a moderately large consumer of manufactured goods, although among such goods clothing will certainly enjoy a high priority. As far as the hopes of British textile exporters are concerned, there is also the probability of strong competition from other countries to be taken into account. Before the war, the export of cotton tissues from Japan was enjoying great success throughout the British Empire, in Africa as well as in Asia. Japan may now be put out of business, but there are other textile importers; and the gap left by Japan's defeat must be filled. Clothing the naked is more a duty than an ideal, and if the British are to play the proper part in fulfilling this duty, it is necessary both to make every effort to improve the natives' general standard of living and to produce clothes that can be sold to him at low cost.

is in the Shipyards  
ensuring faultless construction

Defecting unseen flaws in steel construction work, revealing vibration stresses, and in many other critical ways, 'Kodak' Film helps war time shipbuilding. The variable pitch principle of Rotol aircraft propellers has now been adapted to marine use, with the aid of vibration analyses recorded on 'Kodak' Film. Such vital work must come first—that's why you can't always get film.

## AMERICAN SURVEY

### A Bridge to Congress

The appointment of a Senate Committee to work with the State Department on the principles of the peace marks a new advance in Mr Hull's patient efforts to build a bridge between Congress and the Administration. The American Constitution, which gives the Senate power of veto over treaties, also provides that the President, in conducting foreign relations, shall act with "the advice and consent of the Senate." In the past it has often happened that, because the advice was not sought, the consent was withheld. As Wilson found with Lodge, Hull knows no fury like a Senator scorned. The patent sincerity of Mr Hull's desire (he is himself a former Senator) to employ to the full the neglected possibilities of the provision about advice gives the creation of this new Committee its importance. It formalises the method he has been pursuing of gradually bringing Senators and Representatives into ever-closer consultation in the making of policy. Although the Democrats are still strong in the Senate, the Committee has not a partisan majority. It is composed of 4 Democrats, 3 Republicans, and one Progressive, Mr La Follette. Most of its members have pledged themselves in the past to international collaboration, though Mr Vandenberg and Mr Gillette are hardly to be described as liberals in foreign relations, and Mr La Follette even opposed the Connally-Fullbright resolution. But while Mr Hull may not be able to carry the Committee with him as rapidly as he would like, its composition is less important than the principle it establishes. Its existence obviously points to the creation of a new technique in American government, and a movement towards the Parliamentary method of being assured in advance of a majority that can be relied on. If in 1918 the Wilson Administration had associated Senators Johnson, Lodge, and Borah with its conduct of foreign relations, the Senate's rejection of the League Covenant might have been avoided. Mr Hull's attempts to prevent a similar breakdown this time may make his name live in history as a great constitutional innovator or rejuvenator. Senator Connally made it clear last week that any attempt to substitute a majority vote of both Houses for the power of the Senate to ratify treaties by two-thirds vote would be fought by every means at his disposal. With that avenue probably closed, it is more than ever important that an enduring and effective partnership be established between the State Department and the Senate if a possibly disastrous breach between the Executive and the Legislature is to be bridged. Without adequate support in the Senate the most inspired peace may fail to assure American participation.

### Too Little and Too Late

The day after Colonel Knox, Mr Stimson, and Admiral Land, the heads of the Navy, Army, and Maritime Commission, issued a statement terming the passage of a "War Work Service Act" for industrial conscription a step of great urgency, the House Military Affairs Committee announced that not only would it not propose legislation to draft the 4-Fs into essential war work, but that it had voted against submitting any legislation affecting the manpower position. Instead it suggested that the present law, if properly utilised, was adequate to deal with the situation. It is true that there is general agreement that over the nation as a whole the demand and supply of manpower are roughly in balance. What is less satisfactory in the present picture is the decline of 1.5 millions in the civilian labour force over the past year; specific labour shortages in 67 areas which impede essential war production; and the continuance, despite the stabilisation plans of the War Manpower Commission, of an astonishing rate of labour turnover, which requires, on the average during a year, the hiring of 72 new hands to maintain a working force of 100 men and women. In part, this is the natural consequence of the failure to create a single, effective policy and administration for the direction of manpower; but the situation also appears to have become worse as a result of the belief that the war is nearly as good as

won. The present alarm felt by the Services is due to the fact that from this rather shaky structure they will be compelled, during 1944, to withdraw 1.4 million of the younger men, many of them from vital war work, for Service replacements and the expansion of the Navy. They feel real doubt whether the present system can find the workers to maintain the flow of munitions and essential services, and propose an Act, which, while depending in the first instance on volunteers, would make possible direction of labour where this was found necessary. The statement urges, rather optimistically, that once the obligation to service was imposed, the volunteers would come forward, and that, in any case, only a small proportion of the nation's employables would be affected. Presumably this is a sop to Congress and the trade unions. But if a National Service Act is really essential at this date, what is needed is not a sop, but high explosive. There have been so many contradictory statements on the manpower position—Mr McNutt himself has said in the same week that it was "relatively good" and that "we have long since scraped the bottom of the manpower barrel"—and the Administration has dilly-dallied so long, that the fault will not be entirely that of Congress if this last cry of wolf goes unheeded. It has been the contention of the Truman Committee that by the time such an Act could be put into effective operation the need would be over. The matter has been left so long that there is some substance in this line of thought; and it will not be abandoned without new arguments from the battlefronts.

### Great Expectations

The House this week renewed President Roosevelt's authority to make Lend Lease contracts for another year by a vote of 334 to 21. All the Nays were Republicans, and mainly from the Middle West, but these diehards constitute only a tiny fragment of the Republican strength in the House. Only one amendment, that of Representative Wadsworth, was attached to the Bill when it was sent to the Senate, and this provides merely that any settlements should be in accordance with "long established constitutional processes" without specifying precisely what restrictions the Constitution imposes. The Schiffer amendment, subjecting any new agreements to Congressional approval, and the Rogers amendment, placing Congress in control of post-war Lend-Lease surpluses abroad, were defeated. The submission of these proposals has been hailed in some quarters as welcome proof that Congress is turning its mind to the post-war aspects of Lend-Lease. However, it is difficult to see in these three specific cases much more than a jealous attempt to safeguard the Congressional claim to be consulted. As the *Baltimore Sun* pointed out, the disposal of Lend-Lease surpluses is properly part of the much more general problem of all war surpluses and might usefully be considered from this angle. The *Journal of Commerce* this week suggests that surpluses abroad might be distributed as a part of the American contribution to UNRRA, with provisions against their re-export to established American markets. It seems likely that popular expectations of some concrete return for American contributions under Lend-Lease will be revived by the suggestion of the House subcommittee which has been touring American bases in the Caribbean and South Atlantic that the United States should take steps to convert the 99 years' leases from Britain into permanent possession—a suggestion on which Mr Churchill has since expressed himself emphatically, in the negative. Despite reports that the State Department considers possession unimportant, compared with equal access for American air-lines, Governor Bricker has been quick to incorporate this suggestion in his platform. This is a notion understandably popular in Congress. The American investment in these bases has been heavy; and it would be good politics to show a tangible return on Lend-Lease and confound the whispers that once more Uncle Sam had been taken to the cleaners without the Government showing sufficient energy to defend American interests. It is indeed, only

another short step to the thought that some of Britain's West Indies possessions would make an acceptable *quid pro quo*; and there is no very wide appreciation of the fact that Bermuda, or any other British possession, might, with all due respect for the American flag, feel as strong a distaste for being made a burnt offering to Anglo-American understanding as, say, Maine or Texas.

### Bricker Takes the Plunge

Governor Bricker, of Ohio, who makes no bones about his Presidential aspirations, is said to have adopted the slogan of "Whole hog or nothing." It is to be President Bricker or plain Mr Bricker, with no compromise candidacy as Vice-President on Governor Dewey's ticket. With equal dash, Governor Bricker has broken through the Republican conspiracy of silence on questions of foreign policy. After a vigorous attack on the Administration for having allowed the country to enter the war "shamefully unprepared"—proof that Mr Bricker has the conveniently brief memory of the true politician—he demanded a "consistent and competent" foreign policy, without the indecision and weakness he finds in the present Administration. His policy would include the maintenance of military order by the four Great Powers, acting as independent sovereign states, and without a world police force, until the peace had been settled; exploration of a basis for "post-war co-operative organisation of sovereign nations without any world super-government"; and inauguration of studies by the Big Four of currencies, credits, tariffs, air rights, markets, and international trade, with the eventual objective of a return to the world gold standard. Read carefully, the substance of the proposals is less startling than, as Dr Johnson said of the woman preacher, the fact that they were made at all. Governor Bricker clings to the word sovereignty with the passion of a drowning man for a life-belt; and he has carefully provided so many fire exits that his platform looks more like a colander than a policy. Nevertheless, the ice has been broken. If Governor Bricker survives his plunge, Mr Dewey may be tempted to emerge from his prudent and abstracted seclusion. Governor Bricker's modest proposals should not, however, be disregarded. As the man himself may well be the ideal of those Republicans who rallied behind Harding and the cry of normalcy, his evasive commitments may represent the plank the Old Guard favours.

### Service Integration

Admiral King's monumental "progress report" on the Navy's part in the war combines with a sketch of the technical and industrial problems of the expansion of the Service, an unequalled account of the Pacific War, which is well worth reading by itself. The description of combat operations includes hitherto undisclosed facts concerning the North African landings, and the heavy damage sustained by the US Fleet in the early defensive stages of the war against Japan. In view, however, of proposals now before Congress for a merger of the Services, particular interest attaches to Admiral King's emphasis on teamwork between the Army and Navy, and, within the Navy, between the air and sea arms. Admiral King is justifiably proud of the integration of the Services which was worked out after the disaster at Pearl Harbour underlined its importance. It appears, however, that both Army and Navy favour further consolidation of the two branches, to be effected after the war. In his testimony, Mr Stimson told the House Committee that under the present system disagreements have to be resolved at unnecessarily high levels—sometimes being taken even to the President—"a necessarily slow and inadequate process." Experience during the war has shown, Mr Stimson said, that voluntary co-operation can never be as effective as concentrated authority at the level of staff planning, supervision, and control. Another witness for the Army, Lieutenant-General McNarney, suggested that there might be a single department for the Armed Forces, with under-secretaries for the army, the navy, and the air. Such an arrangement by itself would not necessarily guarantee smooth co-operation; and, indeed, the creation of a separate Under-Secretary for Air suggests a departure from the integration of the Air Forces with the Army and Navy which has characterised the American Forces. The vitalising element would have to be provided by actual experience of the necessity of co-operation. Admiral King's report makes it clear how well this

lesson has been learned since the days of the rumour that in Hawaii the Army and Navy were hardly on speaking terms.

### Shorter Notes

Nearly 5,000,000 people have taken part in a vast internal migration since April, 1940. Two trends are visible, one towards metropolitan centres and war production areas, and the other from the north-east Atlantic States to the West Coast. Over a period in which New York State lost over a million inhabitants, California showed an almost precisely similar increase.

A vigorous press campaign on the complications of the new pay-as-you-earn tax schedules, combined with only too audible moans from the nation's 50 million taxpayers, has brought the promise of speedy relief from Congress. The House Ways and Means Committee this week approved legislation to revise the present withholding tax in order that the full liability for those earning up to \$5,000 a year in wages and salaries will be deducted at source. This will relieve 30 million taxpayers from computing their own returns and provide easier computation for the remainder.

The Secretary of the Treasury has announced that last year's census of American property holdings abroad totals more than \$13,300 million. Investments in Canada are the largest in any single country. American assets in six enemy countries total \$1,757 million, more than three times known Axis investments in the United States, and there is an additional \$2,000 million invested in countries now under enemy occupation. Assets in United Nations' territory, not under enemy occupation, are estimated at \$8,000 million. Mr Morgenthau said the returns are already being used for several wartime purposes, and that they will be available for the peace table and post-war negotiations.

## Hungarian Transformation Scene

THE dramatic incorporation of Hungary in the German defence system, which reached its climax at the end of March, has probably been completed in the purely military sense. Politically, Hungary is still in transition from a semi-parliamentary state to an openly totalitarian régime on the German model.

Before the fall of Mussolini, Hungary enjoyed some power of manoeuvre by virtue of her geographic and political position between Italy and Germany. Although the Government altered several times after the beginning of the war, the leading party, called the Government Party, remained in power. The fall of Mussolini and later the advance of the Russian armies to the Carpathians, the gates of Hungary, put an end to an extraordinary internal situation. After the fall of Mussolini there had been renewed activity by the political parties, on the Right by the Imredy Party and the Hungarian National-Socialists and on the Left by the Social-Democrats, the Trade Unions and the Smallholders' Party, the representatives of the peasant population. The Kallay Government, unable to strengthen its position by the complete suppression or assimilation of the Right or the Left, moved haltingly towards a policy of national concentration without any real success. The Social Democrats and Trade Unions were reported to have more than doubled their membership during 1943-44. Yet no clear statement of foreign policy came forward from the leaders of the party.

WHEN will you  
get Black Magic  
again?

[WE GIVE YOU ONE GUESS]

All the nice things that used to be in Black Magic  
Chocolates — are they dead?

No.

They exist.

But they might as well be dead, for all the use  
they are.

The Mauritius sugar that gave the tang to the  
Black Magic caramel — it's in Mauritius.

The Valencia almonds that went into the Black  
Magic truffle-and-nougat and montelimar —  
they're in Valencia.

Brazil is no longer where the nuts come from.  
It's where the nuts stay.

Venezuela no longer sends us its peculiar fruity  
cocoa beans. It sends us petrol.

We didn't use petrol in Black Magic.

All the nice things are in all the nice places—  
except Britain.

They'll come again. When they do, so will  
Black Magic.

You can call that a threat or a promise, as you  
please.

ROWNTREES

### Calling the Tune

It seems that the Premier, Mr Kallay, tried to pursue a policy of non-belligerency without realising that it was quite illusory, since Hungary had become indispensable as the rear of the German armies on the southern Russian front. German defence necessities and the rift in Hungary between peasants and workers, on the one hand, and the bureaucracy and big landholders, on the other, dictated the direction of Hungarian politics.

Retreating towards Hungary, the Germans decided to end all pretence. The result in Hungary was a change in government, partly enforced and partly voluntary, which bears all the marks of the first step in a transformation of the entire régime. It is still not possible to discover the truth behind the sensational rumours which accompanied the fall of the Kallay Government. The notion that the changes were simply dictated by Hitler can be dismissed. It would be nearer the truth to say that the changes were effected by active collaboration between German and Hungarian National-Socialists.

There is no doubt that the political monopoly of the MEP or Government Party has been broken. The new Government includes members of the Imredy Party as well as the Government Party. The new Prime Minister, Mr Sztojay, has been made a member of the Government Party and, according to traditional practice, its president. The most significant appointment, however, is that of Mr Backy to be Secretary of State in the Ministry of the Interior. Mr Backy is the deputy leader of the Hungarian National-Socialist Party, whose leader is Count Palfy.

A Government composed of members of the Government Party has thus been replaced by a Coalition Cabinet in which rival parties of varying degrees of totalitarianism predominate. Subsequently, there has been a strong drift away from the discredited Arrow-Cross group and from the Government Party to the Imredy and the National-Socialist Parties. It is, however, not clear at the moment whether the Right wing parties will finally merge into one totalitarian party. Negotiations for closer collaboration are said to be going on.

This is only one aspect of the transformation. The other is reminiscent of events in Germany eleven years ago. Almost the first action of the new Government was to proscribe the Social Democrats, the Trade Unions and the Smallholders' Party. Their leaders were arrested. The Social-Democrats, for example, were charged with high treason, and accused of having been in correspondence before the war with Mr Basil Davidson, a British correspondent in Budapest. Government Commissars took over the property of the trade unions. At the same time, the "National-Socialist Labour Centre" was officially recognised as representative of the workers. The Social Democratic and Liberal press has been banned, and the whole press is undergoing a process of *Gleichschaltung*.

### The Jewish Scapegoat

But the main aim of the new Government is to get a greater war effort from the Hungarian people. The Kallay Government was unable or unwilling to tackle the wartime agricultural problems. It was unable to prevent black markets and could not cope with the difficulties caused by the rapid industrialisation promoted by German war necessities. For the moment the new Government is following the line of least resistance. That is to say, anti-Jewish measures have been intensified. Jews, who number about 800,000, or 5½ per cent of the total population, are forced to wear a yellow David-Star. In many towns a curfew for Jews has been introduced. Measures promised by former Governments are now being carried out with great speed—the introduction of a fresh levy on Jewish capital

the distribution of Jewish landed property among peasants, and a speed-up in the closing down of Jewish retail shops, particularly in the textile trade. Other persons will be given the shops owned formerly by the Jews. At the same time, a big propaganda campaign has begun promising the solution of the agricultural problem, and some redistribution of land will probably be declared, at least formally. All this is done in conjunction with an anti-Bolshevik campaign, in which the peasants are threatened with compulsory collectivisation if the Russians should occupy Hungary.

The new Government describes itself as "a Government of action." So far most of the action has been in the direction of more intensive mobilisation for the war. Several classes have been called up for registration. The conscription of women for labour service is foreshadowed, and compulsory labour service is no longer confined to Jews. New civil defence regulations have been put into operation. A scheme for decentralising industries geographically is being prepared, together with more comprehensive industrial planning, and the compulsory delivery of agricultural products has been tightened. The military occupation by German troops is made to appear as voluntary collaboration. The Germans are all the time watchful observers, prepared at any moment to hasten the inevitable march towards a complete one-party and totalitarian system.

## The Turkish Path

THE problem of Turkish trade with Germany, especially in chrome for steel making, has lately been much in the news. Less has been said about the general economic situation in Turkey, which as a country has been for a considerable time in a near-war condition.

With over a million men under arms and military expenditure amounting last year to more than seven-tenths of total Government expenditure, Turkey is not reaping benefits from neutrality or non-belligerency. A country where four-fifths of the peasantry still work with primitive wooden ploughs, and where the numbers engaged in industry, despite recent industrial developments, are still comparatively small, is bound to suffer severely from the prolonged absence of the best and youngest workers on military service. Moreover, it has not been possible to replace mobilised labour by farm machinery. Before the war, farming was assisted considerably by the import of agricultural implements from abroad. This has been very much slowed down because of the wartime demand for machinery in other countries; and the Turkish Government recently announced a plan to set up a factory to make 50,000 iron ploughs annually.

The difficulties of production are only one of Turkey's troubles. Transport and distribution provide serious problems. Even in cases where the total annual supply is sufficient, local shortages frequently occur. Before the war much of the goods traffic of Turkey was conducted by sea. Now sea transport is only possible during daylight hours and within the Turkish zone of sovereignty. On land, there is a shortage of engines for the railways and of petrol for motor transport. Moreover, a very large proportion of the transport available is reserved for military purposes.

### Price Inflation

One of the most serious effects of the shortage of goods is the effect on prices. According to the recent statement of a Government Commission on Prices none of the official price-regulating measures has so far proved successful. Since the outbreak of the European war the average price level has risen by about five hundred per cent. In 1939 the note circulation was 230 million Turkish pounds. At the end of 1942 it was 767 million Turkish pounds. Early this year it was 806 million Turkish pounds.

There was a brief stop in the rise of the note circulation in the first half of last year; it fell by about 50 million Turkish pounds. This temporary check was the consequence of the so-called "tax on wealth." This tax, according to an official statement, was

a revolutionary step taken to protect the Turkish economy from collapse and, at the same time, to meet the most urgent financial needs.

Scores of thousands of business men, mainly in Istanbul, were suddenly asked to pay a large proportion of their wealth within a short space of time. The justification

was that many of them had made profits out of the war. It was estimated that the yield of this tax would be 380 million Turkish pounds. Up to the end of June last year, long after the official date for payment, only 255 million Turkish pounds had been paid—despite the fact that "defaulters" were threatened with deportation to forced labour camps in the interior of Anatolia.

Quite recently it has been stated that the Turkish Government still intends to collect most of the outstanding sums due for this tax, apparently as a further measure to stabilise the currency. It should be noted that three-quarters of those assessed for this tax, and probably a larger proportion of the "defaulters" condemned to forced labour, happened to be either Jews, Armenians or Greeks. There would seem to be a notable element of discrimination, since members of these national or religious minorities are now more or less completely barred from influential positions in the economic life of Turkey.

The failure of the state to control the currency is in odd contrast to the fact that modern Turkish industry is almost completely run by the Government. The hold of the state has in fact been strengthened during the war, especially by the campaign to get in the "tax on wealth." Many businesses which formerly belonged to private traders have been taken over by the Government or by its nominees.

### Failure to Ration

The state, however, has so far refused to introduce a comprehensive rationing system. Bread ration cards have been instituted, entitling ordinary consumers to 300 grammes daily and heavy workers to 600 grammes; and the Government Commission on Prices has suggested an increase in this ration as a way of combating the sale of unrationed bread at unofficial prices. In Istanbul, coffee has now been rationed also, and set amounts of sugar, rice and vegetable oil have to be sold at lower prices to wage and salary earners.

But the absence of any general rationing scheme is still a conspicuous lack. It is explained, or excused, by the special features of the country. The great differences in habits of consumption between the various regions and classes of the population, together with illiteracy which is still widespread, may indeed make it difficult to work a rationing system in Turkey. But the price paid for the absence of rationing is a very large uncontrolled market which imperils both the stability of the currency and the standard of living of the people.

Another factor which makes control of the markets even more difficult is the fact that many of those engaged in economic administration are unreliable. It is significant that the Government Commission on Prices found it necessary to make special recommendations for the "fight against corruption" and for a purge of the Civil Service. The number of civil servants has been reduced and the pay of the lower ranks is to be improved. But, in general, despite its often proclaimed intention to fight against profiteering with all its power, the Government is content to rely upon the penal code rather than upon the right economic policy.

## DOES A MAN WHO EATS THE RIGHT FOOD NEED VITAMINS?

IT'S a catch question: "Does a man who eats the right food need vitamins?" The answer, of course, is: No. Or, rather: Yes, he does need vitamins—but he gets them.

The governing word in the question is "right."

But eating the right food presupposes an ideal world of plenty, where the right food is available and where education and economics encourage the proper feeding of all sections of the population.

Consider the position in Britain today, after five years of war. The *per capita* intake of vitamins in the diet is almost certainly higher now than before the war. The Government have taken measures to fortify all margarine with Vitamins

In a recent report in "The Practitioner," on the Medical Aspects of Axis Prison Camps, it was stated: "Before being taken prisoner most of the British and South African troops had been receiving a routine dose of ascorbic acid (Vitamin C) in tablet form while campaigning in the desert. This, coupled with the fact that on one or two rare occasions we were able to obtain for the men a few fresh tomatoes and onions (at extortionate prices), apparently served as sufficient protection against the development of any clinical scurvy in the camp during the first five months after capture."

A and D, so that it has a vitamin content equal to summer butter. Children under five, and pregnant women, are given an allocation of Vitamin C in orange juice and Vitamins A and D in cod liver oil.

The Government have also seen that our fighting men suffered no ill effects when in the Western Desert they were short of fresh vegetables and fruits. They received synthesized Vitamin C tablets. Red Cross parcels sent to our prisoners of war in German hands contain jam that has been fortified by Vitamin C. Already the children of Malta have had chocolate fortified with Vitamins A, B, C and D.

These facts show clearly how Government circles have not only recognized the importance of additional vitamins, but have already made a very wise use of this knowledge.

It is interesting to remember that as recently as six years ago the mass production of vitamins, necessary to apply this knowledge, would not have been possible. But today, at the Roche plants in Britain, synthesized vitamins are made by the ton.

### NOW ECONOMICALLY AVAILABLE

It is this mass production of vitamins that has made them available on an economic scale. The first gramme of Vitamin B<sub>1</sub> is reputed to have cost £50,000. Today, thanks to the enterprise of Roche, the cost is negligible.

It is certain that synthesized vitamins have played a very important role in keeping Britain at war in good health. The ideal world where the *right* food will be available to all may take some time to evolve, but no one in Britain, or in the countries of Europe awaiting liberation, need fear any shortage of these protective factors.

# THE BUSINESS WORLD

## Business Notes

### Budget Reactions

The immediate reactions of the market to the Budget speech were limited to a slightly better tone in most sections. It caused an appreciable acceleration of the very modest rise in industrial equities which had carried the index of *The Financial News* from 103.0 to 105.6 in some eight weeks; the index now stands at 106.1, the highest since October 5th. But the changes suggested by Sir John Anderson merit more interest than is reflected in prices. The valuable depreciation provisions, discussed below, will have important effects on industries such as shipping and shipbuilding, owing to heavy wartime losses of fixed assets by the former, and on many of the newer industries where the rate of plant obsolescence is very rapid. The very definite announcement about the certainty that the EPT refund will be available for any capital expenditure should remove the many doubts which remain as to the value of this contribution to post-war finance. The special concessions for research are also valuable, but in the rather longer term, since they are more likely to encourage expenditure than to increase profits in the short run. The one section of the market specifically affected by the new taxation—breweries—shows only modest price changes. This is reasonable, provided that no credit has been taken in existing prices for the lower cost of barley. On the supposition that the additional tax is borne by the brewers, it can, apparently, be met out of this reduction in costs which would otherwise, presumably, have gone to swell EPT payments in those cases where the company's earnings exceed the standard. The present slight movement in industrial prices in general is not surprising, but as soon as conditions are more favourable to an active investment policy, it is probable that the provisions of the Budget will work in favour of higher prices.

### Taxation of Profits

Much the most important ingredients in Sir John Anderson's first Budget were his proposals for a new and more realistic definition of business profits as a basis of postwar taxation policy. More specifically, he laid down as a principle of future fiscal policy that the real profit of a business is that part of its revenue that is left over after meeting not only all current costs but, in particular, after deducting an amount equivalent to the value of the assets used up in the making of profits. "Tax," he said, "should be charged on true profits reasonably measured, but not more." This is mere commonsense, for the levying of tax at the present high rate of 50 per cent on an amount which exceeds the true profits of a business is bound, in the end, to defeat its own object in that it acts as an obstacle to the replacement of industrial equipment and, in the long run, diminishes the profit-earning power of British industry.

### Past Practice

Past practice, unfortunately, did not fully conform to this elementary principle, largely because in their search for revenue Governments were not too particular about the wider implication of the tapping of specific sources. In theory, the present system of wear and tear *plus* obsolescence allowances conforms to the principle of taxing true profits. Industrialists are granted annual tax-free allowances for the wear and tear of equipment, and at the time of replacement they can claim a tax-free obsolescence allowance in respect of the difference between the sum total of the wear-and-tear allowances already granted and the original cost of the equipment less its scrap value,

provided they have spent on new equipment an amount at least equal to the difference. In practice, however, the present system has fallen short of the principle of taxing only true profits. The annual wear-and-tear allowances are too small in that they do not—in many industries—correspond to the actual rate of depreciation in the value of the assets. In the iron and steel industry, for example, the annual wear-and-tear allowance is only 9 per cent on the written-down, as distinct from the original value of the plant. It may be argued, of course, that since, at the time of replacement, tax relief can be claimed for the whole of the difference between the sum total of the wear-and-tear allowances and the original cost, the actual rate of the depreciation allowances is a matter of indifference. But this argument is hardly valid since the rate of the allowances affects the ability of industrialists to accumulate reserves. Its fallacy can be seen if it is pushed to its logical conclusion, when there would be no annual wear-and-tear allowances at all, but merely the obsolescence allowance at the time of replacement. But inadequate wear-and-tear allowances are not the only reason why, in many industries, tax is at present levied on an amount in excess of true profits. Thus, except under the scheme for the construction of munition factories, no wear-and-tear allowances are granted in respect of buildings which are used up as much as plant and machinery in the making of profits. Finally, capital, as distinct from current expenditure in respect of industrial research, is not eligible for tax relief. In sum, under the present system taxation is levied not on true profits but on an amount often substantially greater. It has undoubtedly been an obstacle—though not the only one—to the modernisation of British industry—during the inter-war years, though its effect was probably negligible before the last war, when the rate of income-tax was small.

### The Chancellor's Proposals

The proposals of Sir John Anderson represent a rough-and-ready, and in many respects bold, attempt to translate the principle he enunciated into practice. The initial tax-free allowances of 20 per cent on the cost of new plant and machinery, and of 10 per cent on new industrial buildings, together with a wear-and-tear allowance of 2 per cent per annum on all such buildings, whether existing or new ones, and the decision to relieve from taxation all expenditure on industrial research in all its stages from the laboratory to full-scale production, should go far in removing the present obstacles to industrial progress, insofar as they arise from the out-of-date fiscal system. Commendable and bold though the proposals are, it may be asked whether they go far enough, whether they are likely to translate the Chancellor's principle fully into practice. If industry is to have at its disposal the best tools that can be had, it must replace the existing ones not only when they are beyond repair, but also when technical progress has made available new and better tools to carry out a given process and where the process itself has been superseded by a new and better one requiring different equipment altogether. Since technical progress is unpredictable, it is obviously impossible to estimate several years in advance the real rate of depreciation necessary to calculate the true profits. This, presumably, explains why the Chancellor has chosen a uniform initial allowance in preference to a system of periodically adjustable allowances varying from industry to industry. There may be a case, however, for a re-examination of the annual wear-and-tear allowances, some of which are probably too low. But the proposal to grant the obsolescence allowance to a going concern, irrespective of whether the piece of machinery that has been scrapped is replaced or not, will enable an industrialist to buy a different machine. The assumption

of a life of 50 years for factory buildings in calculating the rate of depreciation may be criticised on the ground that the average life is probably shorter, and often no longer than that of the plant it has been designed to house. So far as industrial research is concerned, the Chancellor has gone the whole way in translating precept into practice. Taken together, Sir John Anderson's proposals represent one of the most important contributions in a generation to industrial taxation, even though they merely remove obstacles placed in the path of industry by former Governments. But an enlightened fiscal policy is only one of the conditions essential to rapid technical progress. It is now for industry to seize its chance.

### Exchange Market and the Currency Plan

The proposals for the establishment of an International Monetary Fund provide interesting hints of the experts' views on the shape of the future world exchange markets. There is the usual evidence of compromise in the clash of suggestions on the maintenance of exchange control, and on the return to free dealings. The plan states definitely that member countries must withdraw as soon as possible any restrictions which impede multilateral clearing on current account, and suggests a period of three years during which such withdrawal should be completed. On the other hand, the scheme seems to envisage a continuing control of capital transactions, and states that

a member country may not use the Fund's resources to meet a large or sustained outflow of capital, and the Fund may require a member country to exercise control to prevent such use of the resources of the Fund.

It is added, however, that this provision is not intended to prevent the use of the Fund's resources for capital transactions of "reasonable amount" required for the expansion of exports, or in the ordinary course of trade, banking and other business. The difficulty will be to square this desired control of capital transactions with the principles of freedom in current exchange operations. It is in the solution of this essentially technical problem that London may come to play a most useful part in translating the experts' scheme into the reality of an effective exchange mechanism. Each national exchange market will continue to function as though the Fund did not exist, since member countries will only deal with the Fund through their Treasury, central bank, stabilisation fund, or other fiscal agencies. Gold operations between member countries—though not necessarily within them—will remain free within the prescribed gold points. No member country will be allowed to buy gold above the parity of its currency, together with a prescribed margin and will, similarly, be debarred from selling gold at less than the parity minus the prescribed margin. Whether these provisions will allow gold arbitrage depends, first, on the restrictions placed by member countries on free gold dealings within their national markets, and, secondly, on the width of the prescribed gold points. In any case, some limited scope for free choice in gold dealings is suggested by the provision that operations with the Fund are not to preclude the sale of newly-mined gold by a gold-producing country on any market.

### Shipbuilding Policy

Throughout the war, chairmen of shipping companies have been at pains to impress upon their shareholders and the public the problems which Government policy and other wartime developments will bring in their train. Of the numerous comments, those of Sir Percy Bates, chairman of the Cunard Steam Ship Company, have been among the most provocative, and this year he made a suggestion for an immediate change in building policy. In his statement to shareholders he says:—

Since the outbreak of war, Cunard White Star has not been able to build either a passenger ship or a cargo liner which would be of any post-war use in their lines of trade, either West or East. Whatever the course of the war, at the end of it there is bound to be a surplus of the ordinary type of cargo ships and a very considerable shortage of specialised ships, such as our cargo liners, refrigerated liners and passenger liners. I think the time has arrived when the building yards should be opened to specialised ships, capable of serving their owners' needs when the guns stop shooting. . . . We shall need them in all our trades, and to-day we cannot build any of them even for delivery in 1946.

The need for specialised ships at an early date can hardly be overstated, and they take substantially longer to build and equip than the standard cargo ship. Also, it is tempting to argue that if it is possible to prepare for post-war housing now, steps should be taken to bring in food and to earn the exchange to pay for it. The real questions are, however, whether the tonnage of ordinary cargo ships likely to be available up to the end of the war will be such as would render it possible to face the delay involved in a partial change-over to specialised craft, and, if that is so, whether the man-power and other resources can best be employed in that way. With the information available, the layman cannot answer these questions, but there should be no avoidable delay in making provision for the conditions which will prevail when the European war is over.

### The Replacement Problem

Apart from the problem of when replacement of ships is to commence, there is the question of how it is to be financed. Mr Philip Runciman dealt with this question at the meeting called to mark the third anniversary of the formation of the General Council of British Shipping. He stated that the mercantile marine will be handed back to its owners after the war gravely diminished in size, and with its average standard of efficiency seriously lowered by lack of replacement of specialised tonnage. Permitted profits have fallen short of EPT standards, and income tax allowances have taken no account of the replacement problems created by the war. (This, presumably, refers to the abnormal rise in building costs.) Insurance recoveries, plus depreciation reserves set aside during the life of ships, are substantially less than sufficient to finance replacement. In this connection Mr Runciman struck a blow at exaggerated prices for shipping shares, based on break-up values, on the ground that shipping companies propose to continue in existence. It is to the joint problems of securing adequate finance for replacement and of ensuring that political action shall not reduce the amount of work available to the mercantile marine that the Council has continued to address itself during the past year. The slogan remains "Freedom and Efficiency," and the point has been reached where the Policy Committee is co-ordinating the reports of the sectional sub-committees, but there is no word about when a final report may be expected. Meanwhile, the Council continues to handle the sale of ships built for Government account, and to negotiate with shipbuilders schemes for regulating the post-war flow of orders. Until more information is provided, it is impossible to assess with any accuracy the extent to which shipping financial resources fall short of what will be requisite at any given level of prices—and the post-war price level is still a matter of guesswork. In the past, official policy with regard to tax allowances for depreciation has pressed most heavily in proportion as fixed assets are destroyed, or rapidly become obsolete. The shipping industry is a special instance of a very general problem, and it will reap benefits correspondingly great from the changes announced by Sir John Anderson. Whether they will suffice to fill the gap can scarcely be known at present.

### The Lamport Affair

An end will, presumably, be put to the unfortunate fluctuations in the value of the 6s. 8d. stock units of Lamport and Holt Line, which have gone on for a month past, by the announcement of a new offer to take over the shares. On this occasion the bid is made by an associate of Union Cold Storage, the Blue Star Line, on account of Frederick Leyland and Company, which it controls. The offer is 25s. per unit in cash. It is dependent on acceptance by holders of not less than 75 per cent of the units. Only the previous day a declaration by United Molasses that they had no intention of repeating or improving on the offer they had made for the units led to a 2s. 6d. fall in the quotation to 17s. 3d.; despite the fact that the information had been disclosed semi-officially some days before. There appears to be very little doubt that the offer of 25s. will be accepted, for it is very close to the best estimate of value which can be made on the basis of the balance sheet as at December 31, 1943, and it carries the recommendation of the Lamport board. It is difficult to escape the conclusion that the publicity of the affair might have been much better handled, and it would be interesting to know the origin of the repeated

reports that the value of the units, including Conference rights and other intangibles, was of the order of 40s. That statement at least is rebutted by the decision to recommend acceptance of 25s., which is within sixpence of the upper limit suggested on page 475 of *The Economist* on April 8th. It seems that control of Lamport and Holt Line is to pass to a close competitor, and it is not evident on the face of it why so high a price should be paid. Certainly the offer is not based on past published earnings. Presumably, what is being bought is in part a right to new ships.

In connection with the United Molasses offer, it is interesting to note that there has been a startling recovery in the net profit of Tankers, in which they have a majority holding. Two and a half years' arrears of preference dividend are to be paid off, the first payment since one year's arrears was paid out of 1940-41 earnings. However much of this goes to United Molasses, the shareholders of that company are to reap no immediate benefit, for the total distribution for 1943 is unchanged at 20 per cent less tax plus 2½ per cent tax free from capital reserve.

### Rhodesian Copper

Last January the Colonial Office announced that the output of copper in Rhodesia would be reduced by stages, beginning this month. This decision appears to have given the impression that the supplies of the metal available to the United Nations were more than ample, and that it was the first step in a gradual reduction in production. This impression seems to be correct so far as the United Kingdom is concerned; it is reported that the British Government has not only reduced its orders in Rhodesia but has discussed the possible reduction in imports from other countries with the Combined War Materials Board. But the United Nations as a whole, so it appears, by no means suffer from a surfeit of copper. In the United States, which, according to the American War Production Board, is now consuming one and a half times as much copper as the rest of the world, supplies appear to be tight rather than plentiful in relation to current needs. In order to correct any erroneous impression that might have been given by the decision to reduce production in Rhodesia, the Combined War Materials Board recently explained it by the statement that it was "due to the fact that copper is competing with vitally needed coal and metallurgical chrome for the limited rail facilities in that area." The War Production Board has reassured the copper industry in the United States by declaring that "the nation's copper requirements can be met only if industry and labour get together in an all-out production drive during the remainder of 1944." Moreover, in view of the shortage of manpower in the copper mining industry of the United States, the War Production Board has instructed the Metals Reserve Company to increase its copper purchases abroad to the highest possible level. Given America's need for heavy imports, it would be interesting to know whether the previous decision to curtail output in Rhodesia is to be modified, for the profits of the Rhodesian mining companies are obviously dependent, among other things, on the rate of production. The tightness in the copper supplies of the United Nations as a whole is a reflection not of a reduction in the volume of metal available but of the enormous rate of munitions production. The United Nations control about nine-tenths of the world's copper production, and current supplies are probably higher than ever before.

### Industrial Yields

Whatever the next few weeks may produce on the war fronts, it seems virtually certain that, from now on, movements in investment values will increasingly reflect attempts to assess post-war conditions rather than either fluctuations in military fortunes or exceptional results by individual companies. Both the latter will have short-term effects, but when the interest of the investor reawakens, his eyes will be turned to the former consideration. This fact and the publication of the new index of ordinary share dividend yields by *The Financial News* warrant a review of the war period. The accompanying chart provides this. The figures used are monthly averages; the price indices are to the usual base of July 1st, 1935 = 100. The yield on 2½ per cent Consols provides a useful datum line from which all measurements should be calculated and the *Actu-*

aries' dividend yield provides a check. The reasons for the main divergencies between the two dividend yields were explained on page 544 of last week's issue. A comparison between the price and yield indices of *The Financial News* shows that, for over two years past, the more marked

fluctuations in the former have, in large measure, been due to changes in dividend rates. Prior to that period, movements in yield were much more closely inverse to those in price. In recent months there has been a slight increase in the divergence between the two dividend yield indices. This is presumably associated with the growing uncertainty

### "Why I read The Yorkshire Post"

"I'm not a Yorkshire man but I feel I am missing something when I don't see my Yorkshire Post. This is why I have read it for years. It gives me a clear idea of what people in the North are thinking, and that's important to me. I haven't always got time to work things out for myself, and I have

come to know that I can rely on its considered point of view.

"Many men I know also think it's a good idea to read a paper other than a London one. I chose The Yorkshire Post because of its sane, balanced outlook on politics, finance and industry; because its leading articles are excellent, and because it gives me the news without sensationalism but with reasoned comment."

about what the future will bring and the fact that market leaders, which form the basis of the figures of *The Financial News*, tend to alter less in value than less-known shares.

### Monopoly in Ironmongery?

A section of the ironmongery and hardware trade has recently submitted for general consideration a proposal to form a trade alliance. The idea seems to be to build up a kind of combine. The aims of such a scheme have been outlined by its promoters at an exploratory meeting. Profit margins would be fixed; distributors who were not members would not be specifically penalised, but in course of time reciprocal treatment between member firms might be evolved, and the industry would be able to speak with one voice to the Government on the subject of regulating imports. All the familiar advantages enjoyed by a monopoly are here present in embryo. Nevertheless, the trade is not one which can expect to evolve smoothly into a monopoly. A number of important manufacturers' associations are said to favour the scheme, and—on the distributive side—it is believed to be supported, among others, by the National Federation of Ironmongers. The National Federation has 2,500 members, but—according to the scheme's promoters—there are 5,000 firms outside it who would need to join individually, while an alternative estimate, made recently, gave the higher total of 12,000 retail outlets for ironmongery. In addition, the trade lends itself to a number of outlets which are not ironmongers proper, such as bazaars selling cheap hardware goods. It will be a difficult task to secure unified action, and to stop gaps, at least in distribution. The National Federation of Ironmongers have always been in favour of fixed resale prices, and, before the war, had formed an alliance for this purpose with the Retail Hardware Distributors' Council, which proved, however, too weak to prevent undercutting. In view of the many difficulties, the war is seen as providing a unique opportunity, which is unlikely to recur, for securing an agreement. The proposed organisation has been christened the National Hardware Trade Alliance, and its inaugural meeting is to take place in May. For so young a body, the path that it is likely to tread is only too clear. All the arguments used as yet by the scheme's supporters refer to the desirability of propping up profits rather than to any benefits which the public may expect to derive. Yet on them is surely the onus of proving that the scheme will increase technical efficiency in the trade. Otherwise the "fair trading" which the alliance is designed to secure is likely to militate very strongly against the public's interest—and pocket.

### The Price of Coal

The wages agreement between miners and owners has ended the labour difficulties in the coal-mining industry, at least temporarily. But the coal problem has not yet been solved. There remains the urgent need for adequate supplies to meet essential war and civilian demands; and, looming ahead, there remains the urgent need of reducing the cost of coal through higher productivity if British industry is not to be fatally handicapped after the war. This is one aspect of the problem that has been almost overlooked in the recent excitement. The statistics given by the Minister of Fuel and Power in answer to a question in the House of Commons on April 19th, reproduced below, came as a sharp reminder. The salient feature of these statistics is that average wages per ton of coal have more than doubled between the second half of 1937—a period of high industrial activity—and the second half of 1943. Far from having brought an increase in productivity, the rise in wages per shift worked has actually been accompanied by a slight reduction in productivity and in the average number of shifts worked. The rise in the actual earnings of coal-miners has probably been no greater than in other industries—and pre-war earnings in the coal-mining industry were relatively low. But whereas

more than half the rise in industrial earnings has been due to longer hours, overtime and other special factors which will cease to operate after the war, the earnings of coal-

#### COAL PRODUCTION AND WAGES

|                                            | 1937<br>July-<br>December | 1943<br>July-<br>December |
|--------------------------------------------|---------------------------|---------------------------|
| Average number of wage-earners .....       | 783,700                   | 702,700                   |
| Output of saleable coal (million tons) ... | 119.9                     | 96.3                      |
| Average number of shifts worked per week   | 5.14                      | 5.03                      |
| Average proceeds per ton .....             | 16/2.82                   | 28/11.15                  |
| Average wages (excl. allowances in kind):  |                           |                           |
| (a) Per ton .....                          | 10/0.47                   | 20/7.31                   |
| (b) Per shift .....                        | 10/9.06                   | 19/3.36                   |

miners will continue at the higher level now established, lifting the price of coal well above that at which it is produced in the United States, for example. This is the nemesis of a policy of getting cheap coal with cheap labour. The technical reorganisation of coal-mining—coupled with a drive for further improvements in the utilisation of coal—is no longer merely desirable; it is imperative if Great Britain is to remain in the vanguard of industrial nations.

### Railway Wages

The claims of the railway workers and railway shopmen for an increase in their war wage have been negotiated separately, but the same settlement was reached. All categories of adult railway workers are to receive an increase of 5s. in the war wage, bringing this up to 25s. 6d. a week for males, with appropriate increases in the rates for juniors. The unions had asked for an increase of 12s. in the war wage. It is estimated that the total cost of the new addition, with extra payments involved, will amount to about £10 million a year. In 1942, the total wages bill of the main-line railways and London Passenger Transport Board was £170 million for 655,000 workers employed, compared with £122 million in 1938 for 668,000 employed. Average weekly earnings on the main-line railways increased from £3.46 in 1938 to £5.47 in 1943. The principal and most satisfactory feature of last week's settlement was the speed of the negotiations, in contrast to previous experience, when railway wage questions have dragged on interminably. It was reached by direct negotiation between the unions and the companies, without reference to the industry's arbitration machinery. Another feature was that the claim was presented collectively by the three railway unions—the National Union of Railwaymen, the Railway Clerks' Association and the Locomotive Engineers' and Firemen's Union. The other demand put forward by the unions, for an extension of holidays with pay, remains to be settled by further negotiation.

### Engineers' Claims

The conference of London engineers on Sunday served a valuable purpose in two directions. It provided an opportunity for one of the Amalgamated Engineering Union's Executive (Mr J. Scott) to explain to the rank and file members the union's policy and programme on certain outstanding issues, and it enabled the rank and file to "let off steam." If the same procedure were adopted in other areas and by other unions, it might have a useful effect in keeping the mass of union members in touch with their leaders. One of the factors which has contributed to the development of unofficial strikes has undoubtedly been the lack of contact between the unions and the leadership. The three main issues immediately confronting the engineers are, first, their own claim for an all-round increase of 10s. a week in wages. This demand has been refused by the engineering employers, on the ground that there have been no substantial changes since the Arbitration Tribunal made its award in April last year, and the claim has now been referred to arbitration. Average earnings in the engineering and shipbuilding group are higher than in any other industry (108s. 3d., compared with 93s. 7d. in the industries surveyed by the Ministry of Labour in the first payweek of July, 1943), but the high earnings result mainly from overtime and other special war-time factors, and the union is concerned about the position after the war. Independently of this claim, the AEU is pressing for a grading of skilled and semi-skilled jobs in engineering, as the present method of wage determination is, in its view, outmoded. The second main issue is the question of women's rates. There is an anomalous

disparity between the basic rate of a woman "on work commonly performed by women," which is 50s. a week, and the man's basic rate (66s. plus 21s. 6d. national bonus). A third problem, which has an important bearing on post-war entry into engineering, is that of training and apprenticeship. The union is asking for higher rates for youths in the industry, and has suggested their attendance at technical school, on at least one day a week in the employers' time. Many of these matters will be discussed at the union's annual conference in June, and the problems affecting women (of whom there are now 138,000 in the AEU) will be raised at a special women's conference at Leicester next week. It is to be hoped that the engineers' union will turn its attention equally vigorously to the post-war organisation of the industry, and in particular to the question of removing obstacles such as rigid demarcation lines that impede adaptability and technical efficiency.

### South Durham Earnings

South Durham Steel and Iron Company, whose accounts are analysed on page 583, show a profit for 1943 of £482,080, against £409,672. This increase of £72,000 odd compares with one of £128,000 odd from the year before. But, whereas last year's increased earnings were fully swallowed up by increased provision for taxation, this year the gross amount required for taxation is actually smaller by £25,000, so that altogether there is some £100,000 more available. Dividends, however, are not increased, being left at 8½ per cent on ordinary and 2½ per cent on "B" ordinary stock. The extra £100,000 is transferred to contingencies' reserve. Provision for contingencies is included in the balance-sheet, together with sundry creditors, and the chairman, Mr Talbot, has explained that there are a number of unsettled contracts with Government departments for which provision needs to be made. The indications are, in fact, that the allocation for contingencies is not wholly a reserve, while the provision for taxation is not clearly related to the earnings of the year, otherwise it would not have fallen for 1943. The South Durham is one of those companies of whom it may be safely said that their turnover is mounting and their earnings are rising, but about whose year-to-year changes of fortune the balance-sheet is a sorry guide.

### Brazil's Exchange Needs

The Brazilian Finance Minister recently reviewed his Government's financial policy, and in the course of his speech gave interesting details of Brazil's impressive gold and exchange reserves and of the various claims that are being built up against them. It is evident that the accumulation of Brazil's exchange reserves is in part the result of a wholly abnormal stimulus of manufactured exports—cotton textiles to West Africa, for example—which may disappear with the end of the war. It is also the result of a considerable leeway in imports, which will have to be made up after the end of the war. Taking as the basis of comparison the average imports of machinery and equipment for industry in 1938-39, Brazilian imports in the four years 1940-43 showed a deficiency of 472,000 tons. After allowing for the new domestic iron and steel production, the total value of imported industrial material needed to re-equip Brazilian industry would amount to the equivalent of US \$90 million. The leeway in imports of machinery and manufactured consumer goods amounts to \$240 million. With allowance for the reserve required to meet normal fluctuations in the balance of payments, a balance to meet remittances of refugee capital and the gold backing for the note circulation, a total reserve equivalent to about US \$365 million is needed by Brazil. Against this sum, the Finance Minister stated that Brazil already possessed gold and foreign currency balances valued at over \$450 million. The figure is probably an understatement of the present position, since an official Brazilian spokesman in the United States has recently placed these reserves at the equivalent of \$500 million. The gap between this figure and the conservatively estimated requirement of \$365 million given by the Finance Minister underlines once again the poverty of the terms given to foreign bondholders under the recent external debt settlement.

### Profit and Loss & Balance Sheet

Irrespective of the amount of information given, there are few matters arising from the form in which published accounts are presented which cause more trouble to the

layman than the diffusion of information about earnings throughout the report and accounts. So long as the auditor is responsible only for the balance sheet, there is a great deal to be said for all information being included there, and Mr P. D. Leake takes this view in a letter to the current issue of *The Accountant*. The opposite view has, however, been expressed by earlier correspondents, and there can be no doubt that, from the standpoint of the investor and his advisers, what is required is a full trading, profit and loss and appropriation account for which the auditors are responsible. The investor tends to place more weight on the earnings of the year than on the valuation of assets, and in this he is right, for the value of all but current assets depends on their power to earn profits. Even yet, the truth of this contention is not as fully realised as it should be. It is only by a knowledge of the true earnings of a company and a supervision of their allocation that any class of investor can secure a just valuation of his holding or any protection against the dissipation of the resources on which that valuation rests. While there is every reason for further reform of balance sheets, anything which tends still further to increase their importance compared with that of a full profit-and-loss account is to be discouraged.

### Retail Sales Index

The basis of the retail trade index numbers, which are published monthly in the *Board of Trade Journal*, has been changed. Formerly, the basis was the average value of daily sales in 1937; the new series is based on 1942. Details are given in the *Board of Trade Journal* dated April 1st. The change has been made for a number of reasons. Probably the most important is that the new basis will make for greater accuracy in the index. The returns made to the Bank of England, from which the index numbers are calculated, are made in the form of comparisons with the corresponding month the year before. In peace-time, the retail year ran through a pattern of well-defined seasonal variations, and the calculation of the index numbers appropriate to individual months was made with reasonable accuracy. During the war, the seasonal pattern of trade has been lost. In apparel the date of coupon releases is the vital factor, and in other departments sales depend on receipt of goods for sale. Except for Christmas, the seasonal influence is almost entirely gone. It is therefore more important now to compare one

AVERAGE VALUE OF DAILY RETAIL SALES IN GREAT BRITAIN  
(1942=100)

|            | Apparel | Household Goods | Non-food Merchandise | Food and Perishables | Total |
|------------|---------|-----------------|----------------------|----------------------|-------|
| 1937 ..... | 94      | 126             | 98                   | 88                   | 92    |
| 1938 ..... | 96      | 120             | 98                   | 92                   | 95    |
| 1939 ..... | 98      | 115             | 100                  | 96                   | 97    |
| 1940 ..... | 106     | 112             | 105                  | 98                   | 101   |
| 1941 ..... | 97      | 103             | 98                   | 97                   | 98    |
| 1942 ..... | 100     | 100             | 100                  | 100                  | 100   |
| 1943 ..... | 88      | 89              | 93                   | 102                  | 96    |

month with another than any month with the corresponding month in a previous year. The sources of error which were inevitable in calculating the monthly index figures have been increased by the war. In addition, the composition of the sample has changed during the war, mainly by the introduction of new contributors. The figures reported for 1942 have been carefully checked in order that the results for the new base year shall be as accurate as possible. It was felt necessary to introduce weighting, but only in the case of sales of boots and shoes—in this category, contributors to the sample have increased disproportionately, and the figures are halved before inclusion in total sales. Monthly index numbers have been calculated, on the new basis, for 1941, 1942 and 1943. Annual figures on the new basis have been calculated back to 1937. These are given in the accompanying table. The new series will be useful as a guide to wartime movements in retail trade, but comparison with pre-war trends will be made more difficult. Although the change may be a necessary one, it cannot be deemed to be permanent. The year 1942 might be taken as a typical war year, but with the return to peace-time conditions another basis will be needed. That might provide an opportunity for an entirely new and improved series of index numbers.

(Continued on page 583)

### THE ALEXANDRIA WATER COMPANY, LIMITED

NOTICE IS HEREBY GIVEN that a Dividend of Eleven Shillings per £5 Share on Coupon No. 111 will be paid without deduction of British Income Tax but less Egyptian Government and Alexandria Municipal Taxes amounting to 1s. 5.028d., making 9s. 6.972d. net, on and after the 15th April, 1944, at the National Bank of Egypt, in Alexandria at Rue Toussoun, or in London at 6, King William Street, E.C.4.

Dated, Alexandria, Egypt, the 6th April, 1944.

By Order of the Board.

T. D. KEY } Joint Managers.  
ROBERT WALTON }

## COMPANY MEETINGS

TELEPHONE AND GENERAL TRUST  
LIMITEDSIR ALEXANDER ROGER ON CAPITALISM, SAVINGS AND  
TAXATION

The eighteenth ordinary general meeting of the Telephone and General Trust, Limited, was held at Domington House, Norfolk Street, London, W.C., on the 25th instant.

The following is the statement of the chairman and managing director, Sir Alexander Roger, K.C.I.E., circulated with the report and accounts for the year to December 31, 1943:—

Profit at £115,469 shows an increase of £11,864. Dividends paid and proposed are now shown net after deduction of income-tax, and comparative figures have been adjusted accordingly. Income-tax absorbs £53,000, against £42,247, and after providing for the usual preference and ordinary dividends of 7 per cent. and 8 per cent. respectively, £73,708 is carried forward, as against £70,443 brought in.

Balance-sheet.—There is an increase of £43,364 in general investments. Cash has decreased by £176,476, which reflects the increase in general investments and a reduction of £135,180 in loans at call from subsidiary companies, which amounted to £192,272. Capital reserve amounts to the substantial figure of £275,000 after transferring £10,000 from investment suspense account. The balance to the credit of this latter account represents a further substantial reserve, and is deducted from the book cost of general investments.

## VALUATION OF SECURITIES

The quoted investments have been valued at middle prices current on December 31, 1943. The directors consider that the book values of unquoted investments, which are mainly in subsidiary telephone operating companies, are in the aggregate fair and reasonable. The valuation shows an appreciation of 9.15 per cent., compared with 2.21 per cent. in December, 1942. Eighty per cent. of the investments are in the British Empire, and 20 per cent. in foreign countries, the major portion of which represents our foreign telephone operating interests.

Government stocks, debentures and loans amount to 13.6 per cent., preference (including subsidiaries) to 16.3 per cent., ordinary to 41.1 per cent. and subsidiary ordinary to 29 per cent.

## TELEPHONE OPERATING COMPANIES

Portugal.—The Trust's association with the Anglo-Portuguese Telephone Company, Limited, commenced 17 years ago. In addition to its financial connection, the Trust has, through its own organisation, supplemented from time to time by that of associated interests, provided engineering and technical services required through long years of experience. The value of these services is acknowledged by the company both in Portugal and London. The difficulties of supplies under war conditions, which affect practically the whole world, are being increasingly felt, but the company is maintaining its position.

Venezuela.—The Nacional Telephone Company of Venezuela, in which, as you are aware, the Trust has a substantial investment interest, largely through the British holding company, Telephone Properties, Limited, is also hampered by the shortage of telephone material, and in the circumstances its progress is satisfactory. The evidence of its potential development is increasing, and when equipment is once more available the prospects of expansion are encouraging.

## WEST INDIES

As a result of negotiations with the Government of Jamaica, an offer has been

made on behalf of the Jamaica Telephone Company by representatives of the Trust to purchase the Government telephone system which operates over those parts of the island outside the company's franchise area. The Legislative Council has approved the sale by the Jamaica Government and the granting of a licence to the Jamaica Telephone Company for operating the island telephone system in conjunction with its existing system, subject to the approval of the Secretary of State for the Colonies, to whom the matter has been referred. There is no doubt that in an island the size of Jamaica the operation of all telephones under one expert telephone administration must prove of benefit to the community generally.

During the year a visit was made by our chief consulting engineer to each of our associated companies in the Caribbean to investigate urgent operational problems. The abnormally heavy traffic, with consequent overloading of the telephone systems, increases the problems of maintenance and operation. Under these circumstances, wear and tear of machinery, plant and equipment becomes progressively greater, and until a reasonable supply of relief equipment is released by the supply authorities maintenance difficulties will increase. However, in spite of these difficulties, efficient management and engineering have enabled the services to be maintained at a reasonable level.

## CAPITALISM SAVINGS AND TAXATION

Last year I drew attention to the fact that the war had enormously increased the number of capitalists in the country, and by reason of investment directly in savings certificates and national defence bonds, and also indirectly through friendly societies, trade unions, insurance companies, Post Office and Trustee Savings Banks, we had become a veritable democracy of capitalists. Taking the Post Office Savings Bank alone, there are 17,300,000 depositors. This great stabilising force of taxpayer-investors must have grown in numbers and in saving capacity during 1943, because about £730,000,000 was contributed by small investors alone, making the total since 1939, through this unprecedented patriotic savings movement, over £2,500,000,000.

It is worth repeating today, therefore, that we are a nation of capitalists. These vast totals are almost impossible for the ordinary person to grasp as mere figures, but their import can easily be grasped, and it must be considered and pondered. A change of equal magnitude and importance arises from the fact that the average earnings of men and women in all industries has increased by 76 per cent. in the last five years.

In 1938-39 some 3,800,000 persons were chargeable for income-tax. A year ago the number reached £10,500,000, and today it must be considerably higher. Out of these 10,500,000 some 9,500,000 taxpayers had an earned income of from £2 to £10 a week, and their total tax amounted to £270,000,000 out of a total tax of £835,000,000. It is scarcely necessary to say this is a tremendous contribution by the lower income earner towards the total raised.

## ESTATE DUTIES

Another phase of saving and tax paying should be studied carefully. For the year ended March 31st the tax called "estate duties" produced the sum of £99,000,000. The dictionary has a variety of meanings for the word "estate," but principally it is described as landed property, which is also the popular interpretation, but when applied

to "estate duties" this is, of course, fundamentally wrong. In fact, it is a tax payable at death on the possessions—assets—savings of the late owner, and landed property, if any, is only part of the total taxed. It may be true that the larger part of this great sum of £99,000,000 has been derived from a comparatively few people, but it includes an increasingly large number of smaller fortunes, as the figures I have quoted of small saver-investors and taxpayers amply show.

High crippling taxation of incomes is sufficiently serious, but the reduction of capital by taxation on the present scale lessens the ability and willingness of people of wealth to risk capital for reproductive ventures, whether they possess or have saved £1,000 or £10,000. If this capital had been left in private hands it is safe to assume that a large part of it would have been ventured in new enterprises, a shop, a garage, a new motor-car, paint, or similar things, all designed to add to the national wealth through individual endeavour. But if enterprise and profit earnings is taboo, it can only be a matter of years before all the capital available for enterprise disappears.

It would be very interesting, incidentally, to hazard a guess what proportion of "estate duties" paid to the state is used in reproductive expenditure, as opposed to what would ordinarily happen if the money were left in the hands of the owners. It was easy to legislate with the wealth of a small class of people by introducing steep taxation in the higher incomes, super-tax, possession duties, etc. The lower income earner who did not have to pay direct taxation had the natural and indeed comfortable feeling that the state could be run on other people's money, and that all he had to do was to participate.

## THE TAXPAYER-ELECTOR

Outside and inside Parliament the impression exists that the Treasury is a body which holds a moneybox available for projects of various kinds, and that it is the business of a member or party to get as much as possible out of the Treasury in favour of elector constituents. The taxpayer-elect today, however, is no longer able to say that money demanded from the Treasury for various projects can be taken out of the other man's pocket. He and she is realising that the money comes out of their own pocket, and each Member of Parliament will have to answer more precisely to his constituents how money contributed by them in taxation is being spent, and what benefit the constituents will get out of the expenditure. No longer will "they" be the persons who will pay. This fateful word will be substituted by "we," and the people will realise that the fund available to Government consists of the taxation directly and indirectly levied on themselves, and that it increases or decreases in proportion to the demands we, the people, make upon it.

## RESPONSIBILITY IN RULERS

All this places a great additional responsibility on our rulers, who will be held accountable by the electors, just in the same way as directors and workers are held accountable by shareholders. I confess I am reaching a conclusion which appears inescapable, that when the war is over the saver-investor will want great argument to induce him to accept regimentation telling him how he must live, how he must spend his money, and how his possessions shall be disposed of. Having expressed these thoughts, I return to today's realities. Whatever the war costs, we must pay for it, we must work for it, and we must fight for it until complete victory is ours.

Management and Staff.—I welcome the opportunity to ask you once again to join with me in recording our appreciation for the untiring efforts and splendid work of our staffs at home and overseas. The burden upon the seriously depleted staff at home is particularly heavy, but is being carried loyally and cheerfully.

RUGBY PORTLAND CEMENT  
COMPANY, LIMITEDTHE MEANING OF ENTERPRISE  
MR HALFORD REDDISH'S SPEECH

The annual general meeting of The Rugby Portland Cement Company, Limited, was held on the 27th instant. In the course of his speech the chairman and managing director, Mr Halford W. L. Reddish, said:

You will see that the trading profit for the year, after providing for taxation and contingencies and for adjustments under the C.M.F. Pooling Scheme, amounts to £130,496. The net profit of £76,215 compares with £69,196 for 1942. We propose that the dividend on the ordinary shares should again be at the rate of 7½ per cent., leaving £75,961 to be carried forward, against £64,967 brought in.

In all the circumstances of a difficult period I venture to think that you will regard these results as satisfactory, and that you will wish me to pay tribute to those of our staff and workpeople who have toiled long hours to overcome the many difficulties which are inevitable in these days. The liquid position disclosed by the balance-sheet is strong, while our fixed assets stand in the books at figures which are 10-day substantially below their real values. You may be interested to learn that in recent years we have made considerable additions to our reserves of raw materials by the acquisition of several hundreds of acres of quarriable land.

## THE FUTURE

At previous annual meetings since the beginning of the war I have declined to attempt any prophecy of future results. But on this occasion I feel it my duty to indicate that it is unlikely that in the current year our trading profits can be maintained. It is of course impossible to foresee the precise consequences which will flow from the impact of coming military developments, but it will be surprising if both production and distribution are not affected from time to time. Further, some shrinkage in the demand for cement may be anticipated this year in the absence of any unforeseen development.

If I am right in painting not too rosy a picture of the immediate future, then the very conservative policy which your directors have always followed, and which is a tradition of this century-old business, will prove to be justified and I hope that from a dividend point of view we may gaze upon this period with a reasonable degree of equanimity.

## PROSPERITY—IF...

Your directors have been giving serious attention to the possibilities which lie ahead, and it is because they feel that they should be in a position to take advantage of any suitable opportunity for expansion which may present itself that they are proposing an increase in the authorised share capital, which purpose notices of the necessary meetings have been sent out. No immediate issue is contemplated, and I should like to emphasise that no further capital will be issued nor any programme of expansion embarked upon after the war unless the board is reasonably certain that there will be adequate freedom for industrial progress.

As to the wider future on which our eyes are set when Germany has been defeated, I think we may anticipate without undue optimism a long period of demand at a level which will keep our plants, and possibly some of the extensions already planned, comfortably employed. Whether, however, this will be a period, as it should be of rising prosperity not only for the cement industry but for the nation at large will inevitably depend on whether we are able to develop on sound and tried lines, whether we are going to fritter away a golden period of opportunity in haphazard economic experiment in disregard of the example of other countries which have tried them and reduced their peoples to untold misery.

A war for our very survival essentially

calls for centralised direction of the nation's activities but it is a war also for the maintenance of our traditional British freedoms, which we expect to enjoy when it is over and when conditions of military necessity no longer call for the regimentation of the individual by the chill hand of bureaucracy.

## ENTERPRISE DEFINED

What is enterprise? Surely it is a combination of brains, "guts" and faith—qualities which emanate essentially from an individual, and which by their very nature cannot proceed from conglomerations of officials. It is therefore nonsense to talk of public enterprise. Even the term private enterprise is not a very happy expression, since the enterprise of any individual must react to the benefit of others, however much he may legitimately gain himself. If, therefore, the nation is to be prosperous it follows that incentive must be given to individuals to exercise those qualities which they alone are capable of producing. The greater the incentive the greater the enterprise, and the greater the ultimate benefit to all. Let those of us who are engaged in industry, whether as workers or shareholders, face the simple fact that any political or economic system which seeks to glorify the State at the expense of the individual must inevitably mean the negation of the personal freedom and must quickly lead to the dictatorship of an ever-growing bureaucracy.

Let us remember, too, that the State as such cannot produce—it can merely control the ultimate distribution of the wealth which individuals have produced. State ownership cannot therefore in itself increase the wealth of the community nor raise the general standard of life. As I pointed out on a previous occasion, the average individual shareholding in our joint stock companies in this country is very small. What, then, is our system of joint stock companies but a form of ownership in common, yet in a way which does nothing to choke the breath out of individual enterprise, but on the contrary does much to encourage it? Let us not exchange the substance for the shadow.

## THE SHORT ROAD TO RUIN

We are often told (whether in sheer ignorance or from more sinister motives is not always clear) that a well-organised industry is inevitably a monopoly and will restrict production in order to keep up prices and exploit the consumer. Let us examine the position of the cement industry in relation to such a charge. In the first place, there is no monopoly by existing companies of the raw materials required for the manufacture of portland cement, all of which are indigenous, and all of which are in plentiful supply in different parts of the country.

Next, let us remember that the business of producing cement has certain characteristics which may not be so widely appreciated as is desirable. Cement is manufactured by large and expensive units of continuous process plant. From this it is at once obvious that the prosperity of the industry is entirely dependent on the extent to which this plant can be kept running. Therefore we must do everything we can to increase the use and the uses of cement, to enhance efficiency, and to achieve the utmost economy in production, marketing, and distribution. To restrict output deliberately would be the short road to ruin.

## CONCRETE FACTS

The cement industry works on a very small margin of profit per ton—substantially less to-day than the cost of the 20 paper sacks in which it is packed. This again calls clearly for the fullest measure of production if profits are to be maintained. You may be interested to know that while cement must of necessity play a vital part in practically all forms of building and construction work, both in peace and war, it represents an amazingly small part of the total cost.

In the case of the new reinforced con-

crete Waterloo Bridge, for example, the cost of cement was less than 2½ per cent. of the contract price, and even that includes the not inconsiderable item of transport to the site. In the average small house the profit to the cement industry on the cement consumed is a matter of shillings only. Lastly, cement is virtually useless by itself, and is in effect used only in conjunction with other materials to form concrete. If then the demand for cement is to be stimulated, it is clear that every effort must be made to improve the quality of concrete and to advise on its manifold uses.

It was for these reasons that the industry brought into being in 1934 the Cement and Concrete Association, and in peace-time spent large sums through the organisation on research, technical advice, and propaganda in connection with all forms of concrete construction.

## A PROUD RECORD

The cement industry—and we are proud of the fact—is a well-organised industry. Its pre-war policy has alone made possible the great contribution which it has been able to make to the war effort. In the pre-war years the demand for cement was steadily growing and the productive capacity of the industry was always maintained year by year ahead of the demand. In the five years before the war, for example, obsolete and uneconomic plants with an annual capacity of less than 125,000 tons were scrapped and were replaced by efficient modern plants with a capacity of no less than 2,250,000 tons.

Since 1924 there was a steady and consistent reduction in the price of cement to the consumer, notwithstanding the fact that from 1933 onwards the price of coal was steadily rising. Now it takes over eight hundredweights of coal to produce a ton of cement, but only in 1938 did the continuing rise in coal costs force a slight reversal of the downward trend of cement prices.

During those pre-war years the industry was able to make substantial increases in the wages of its employees, while it also materially improved the quality of its product. Although holidays with pay have been a feature of the industry for very many years, we have this year gone a step further and introduced the principle of payment to workpeople for the recognised Bank holidays. As between manufacturers arrangements exist for the free exchange of technical information in connection with the manufacture of portland cement.

## AN ENLIGHTENED POLICY

In this comprehensive record there is no tittle of evidence of any anti-social "monopoly," but proof, I submit, of an advanced and enlightened policy. When peace returns, and industry is freed from the crippling and wasteful (even though inevitable) controls of war-time, we hope to return to our pre-war policy in the service of the nation and to the legitimate advantage of all concerned—workers, shareholders, and consumers of our products.

In the difficult period of transition and demobilisation immediately after the war, many controls will clearly have to remain for a time until a reasonable equation between supply and demand has been achieved; and I venture to suggest that nothing would be more calculated to promote the enthusiastic co-operation of all concerned during this period than a definite announcement by the Government that no control will be retained merely for the sake of control and that the fullest measure of freedom will be restored to industry and to labour as soon as may be practicable.

But let us not forget, while we peer into the future, that the war is not yet won; and that while we may hope for victory before we meet again next year we must relax nothing of concentration and of effort as we enter the last lap. Afterwards if we can all settle down to hard work and honest endeavour, remembering that it is worthy labour, whether of hand or brain, which gives substance and meaning to life, I am confident that we shall find ahead abundant opportunities for adventurous and satisfying enterprise.

## THE LONDON ASSURANCE

## FURTHER PROGRESS

The annual general court of the London Assurance will be held on the 3rd proximo, at 1, King William Street, London, E.C.

The following is an extract from the statement of the Governor, Mr R. Olaf Hambro, circulated with the report and accounts for the year ended December 31, 1943:—

My comments on each section of our operations indicate once again a record of satisfactory progress. The life department new business for 1943 totalled £1,752,709, being an increase over the previous year of approximately £142,000. The premium income for the year amounted to £893,908, being an increase over the previous year of £30,831.

## FIRE AND ACCIDENT FIGURES

The fire department premium income shows an increase of £85,502 over that of the previous year, the total being £2,598,558. The ratio of claims paid and outstanding is 46.4 per cent., against 43.4 per cent. in the previous year. Commission, expenses of management, contributions to fire brigades and overseas taxation absorb 48.5 per cent., against 48.9 per cent. in the previous year. After providing for the increase in the premium reserve on account of increased income of £34,200, there is available for transfer to profit and loss account the sum of £99,405, being 3.8 per cent. of the premium income.

The accident department premium income of £1,320,209, as I predicted last year, shows a reduction of £42,452, one of the factors contributing to this being a further decline, owing to war-time conditions, in the business of motor insurance. Claims paid and outstanding are 50 per cent., compared with 49.8 per cent. in the previous year, and commission, expenses of management and overseas taxation total 33.5 per cent., compared with 32.3 per cent. in 1942.

After taking credit for the slight decrease in reserve on account of decreased income, there has been transferred to profit and loss account the sum of £234,793, being 17.8 per cent. of the premium income compared with 18.6 per cent. last year.

In the maritime department, the progress of the war happily established a reduction in the war risk hazard, which is mainly responsible for the decrease in our marine premium income. At £2,249,585, the total premium income shows a reduction of £377,815 compared with the previous year.

On the other side of the account, the claims paid show a very substantial reduction of £801,833, the total figures in respect of the 1943 account being £1,105,342.

The amount of £600,000 is transferred to profit and loss account, and after providing for this transfer, the amount of the marine insurance fund at £2,823,404 shows an increase over the previous year of £401,530, which, expressed in percentages, now stands at 125.5 per cent. of the premium income, compared with 92.2 per cent.

## ASSETS EXCEED £27,000,000

The profit and loss account opened with a balance brought forward of £988,334. Our interest, dividends and rents, less tax, total £198,251. The total transfers from underwriting accounts amount to £934,198. The balance stands at £1,215,649, being an increase over the previous year of £227,315. The balance-sheet figures are self-explanatory, the main item of variation being an increase of £1,321,234 in our holdings in British Government securities. The surplus over market value in regard to the Stock Exchange securities amounts to £671,416, which, coupled with the item of appreciation of £752,406 in the life fund, shows a total of £1,423,822. The total premium income for the year 1943, including the life department, is £7,072,943, and the total assets now exceed the sum of £27,000,000.

INTERNATIONAL NICKEL  
COMPANY OF CANADA,  
LIMITED

## MR R. C. STANLEY'S REVIEW

Mr R. C. Stanley (the chairman and president) presided at the annual meeting of The International Nickel Company of Canada, Limited, held in Toronto on the 26th instant, and in the course of his remarks said: Production of nickel in 1943 approximated the all-time high of the previous year, notwithstanding that during the last six months the output from our mines dropped to per cent. below their increased capacities. The decline was due to a shortage of labour as well as to the fact that we had to use many inexperienced workers.

Prices of nickel have remained at levels prevailing for many years. Production costs have risen and are still rising. Moreover, in expanding operations a heavy financial burden has been assumed. Copper deliveries in all forms, including copper in "Monel" matte and copper refined for others, amounted to 316,000,000 lbs., compared with 336,000,000 lbs. in 1942. Cash and time deposits, Canadian treasury bills, British and United States tax notes and other securities at the close of the year amounted to \$64,086,020, compared with \$62,219,245 on December 31, 1942.

## EARNINGS AND DIVIDENDS

The profit and loss statement shows that net profit was \$31,127,204, as compared with \$33,301,829 for 1942. 99.88 per cent. of the net profit was disbursed to shareholders. On November 12th last I mailed a letter to shareholders stating that because of increasing costs it was quite probable that our earnings would be less and that it might be necessary to lower the common dividend. Your directors decided that in the best interests of the company it would not be prudent under present conditions to appropriate funds from our surplus account to aid in paying dividends. The consequence was that the common dividend payable March 31st was reduced from 50 cents to 40 cents per share. I mention this because, while mailing such a letter was unusual, the response from shareholders was most satisfactory.

Capital expenditures were \$5,445,248 and are much less than the \$12,009,497 in 1942 and the \$11,739,041 in 1941. The amount required for 1944 will approximate \$6,000,000. During the past five years more than \$43,000,000 has been expended by the company to expand production.

## LONG LIFE STILL AHEAD

At our annual meeting two years ago I stated that war requirements of nickel by the United Nations forced the discontinuance of our long-term economic mining plan and that we had undertaken a production expansion programme involving a capital outlay of nearly \$35,000,000. I emphasised that under this production expansion programme, the company is paying a great toll in the form of non-replenishable ore reserves.

I mention this drain on our ore reserves, which is serious but not irreparable. With the end of the war in sight, as we all hope, a long life still lies ahead for the company's mines.

I believe that we are capable of gaining sufficient new business from our war work to make up for any losses to competitive materials. Our metallurgical processes are being studied with the idea of making all possible improvements which may lead to lower costs of production. Following the last world war many process improvements were made and there still exist numerous opportunities to alter plants and equipment and thus make desired savings.

What the future holds in store for us is naturally problematical. Our immediate job is to help win the war and to aid in securing a just and durable peace. When this has been accomplished, the company is well prepared to carry on its business successfully into a long period of world peace.

BEIRA RAILWAY COMPANY,  
LIMITEDMR ARTHUR E. HADLEY'S  
STATEMENT

The forty-third ordinary general meeting of this company was held on the 26th instant, in London. Mr Arthur E. Hadley, C.B.E. (the chairman), presided.

The following is an extract from the chairman's statement, which was issued with the report:—The working of the line during the year ended September 30, 1943, resulted in a gross revenue of £840,197, a decrease of £65,562, as compared with the previous year, accounted for principally by continued decline in import traffic. Expenditure, at £474,908, was £20,572 higher than in the previous year, and net revenue at £365,289, therefore declined by £86,124.

The profit for the year, after provision of a reserve for taxation, increased by £20,000, to £7,619, adding to which the undivided balance from last year—£37,721—makes a total of £45,340.

Your directors propose that a dividend of 1s. per share, less tax at 5s. 11d. in the £, be paid.

Rhodesia Railways, Limited, has agreed to a temporary reintroduction of an allowance in excess of our strict mileage division on certain special traffics as from October 1, 1943. The effect of this should be an estimated increased net revenue to our company of some £50,000 during the current financial year.

The chairman added that they had now received the traffic figures for the month of February, and the net earnings for the five months—October, 1943, to February, 1944—amounted to £188,961, as compared with £163,772 in the previous year, an increase of £25,189. On these figures he thought he was justified in saying that the prospects looked more hopeful.

The report was adopted.

MANGANESE BRONZE AND  
BRASS COMPANY, LIMITEDMR. J. C. COLQUHOUN'S  
STATEMENT

The forty-fifth ordinary annual general meeting of this company was held, on the 21st instant, in London, Mr J. C. Colquhoun (chairman and managing director) presiding.

The following is the statement by the chairman, which was circulated with the report and accounts:—Turning to the accounts, the surplus of current assets has increased by £22,050 to £114,528 and the total of net assets has increased by the surplus for the year of £16,263 to £324,860.

Before leaving the balance-sheet I would refer to the other important figures of stocks and debtors, which together have increased from £445,062 to £472,204, and also the company's total liability for taxation, which has increased from £153,426 to £209,956.

In the appropriation account you will see that £230,405 is available for taxation and dividends, against £146,969 for the previous year. The proposed final dividends are 3½ per cent. on the preference shares (making 7½ per cent. for the year) and 17½ per cent. on the ordinary shares (making 25 per cent. for the year), all being the same as in the previous year. You will see, therefore, that out of £230,405 available, taxation, including the tax withheld from dividends, takes £193,321, leaving £37,084 per cent. Dividends (net) for the year take £20,821 and the surplus of £16,263 remains in the business.

The chairman added: I should like to make it clear that the proposal (to consolidate the free reserves mentioned in the directors' report) in no way affects the board's dividend policy and must not be construed as foreshadowing any change in the capital structure.

The report and accounts were unanimously adopted and the dividends recommended were declared.

THE ROYAL LONDON  
MUTUAL INSURANCE  
SOCIETY LIMITED

## TOTAL ASSETS EXCEED £59,000,000

The eighty-third annual general meeting of this Society was held, on the 25th instant, in London.

Mr J. K. Wiseman, joint managing director, who presided, said:

The total income for the year amounted to £10,636,000, an increase of £485,000 over the previous year.

The combined premium income amounted to £8,554,000, an increase of £374,000 over the previous year.

The total claims and surrenders paid during the year amounted to £4,008,000. This, however, only partially represents the amount applied for the benefit of policyholders, as a proportion of the premiums being paid now are set aside to provide for sums assured which emerge for payment in the future. In this way, in addition to the £4,008,000 paid to policyholders during the year, the sum of £3,926,000 has been added to the Funds as provision for future repayments to policyholders, these two items together making a total of £7,934,000.

The premium income in the ordinary branch (including consideration for annuities granted) amounted to £2,202,000, an increase of £68,000 over the previous year. The new sums assured amounted to £2,953,000. The amount paid in respect of claims and surrenders amounted to £1,370,000. The amount disbursed in surrenders again showed a reduction.

In the industrial branch the premium income for the year amounted to £6,352,000, showing the excellent increase of £307,000 over the previous year. Claims and surrenders amounted to £2,634,000.

The amount added to the fund during the year was £2,841,000, which includes £1,513,000 interest on investments. This addition to the fund is money put aside as a provision for future payments to policyholders. Adding this item to the actual disbursements to policyholders during the year the total is £5,475,000. Thus the actual amount paid to policy-

(Continued from page 579)

## Wings for Peace

This is the title chosen for the report on the future of civil aviation published by the Labour Party this week. As was to be expected, it is a plea for the adoption of the ideal of complete internationalisation of military and civil aviation. The Labour Party's aim is to substitute a "super-national air force" for the existing national air forces and a "World Air Authority" in civil aviation for private or public national enterprises. The World Air Authority would comprise an assembly on which the participating countries would be represented; a council, including representatives of countries with major interests in air transport and other elected members; a board of management responsible for technical and operational control; and a director-general appointed by the assembly. It would have the sole right to own and operate "World Airways" on behalf of the community of nations; this would include all the main trunk routes of the world. Subsidiary to the World Air Authority and World Airways would be regional air authorities, and regional airways, such as a Europa Airways. If complete internationalisation cannot be achieved at this stage, it would be necessary to fall back upon a system of British Commonwealth Airways; meanwhile Britain's air services, internal as well as external, should be wholly nationalised.

Only the public ownership of all civil air transport will provide the people with a service which is fully efficient and fully dedicated to the interests of the community as a whole.

The report has the merit of stating an ideal solution; but does nothing more. A statement of ultimate aims hardly counts to a policy.

## Shorter Note

The decision of the members of the Provincial Brokers Exchange, taken last week, to re-elect their old committee en bloc may appear reactionary. In fact it is a blow

holders, plus the amount added to the fund, which provides for future payments to policyholders, together make up a sum equal to 86.2 per cent. of the premiums.

In the general branch the premium income amounted to £70,000, an increase of £3,000 over the previous year.

The whole of the fire and accident and general insurance business was reinsured. I would again call attention to the necessity to increase amounts insured in order to cover increased values.

The fire insurance fund at the end of the year amounted to £65,000, the accident and miscellaneous insurance fund to £35,000, the capital redemption assurance fund to £16,000, and the general branch reserve fund to £100,000.

The balance-sheet shows that the assets total £59,686,000, an increase of £3,931,000 over the previous year. Stock Exchange securities represent 80.3 per cent. of the total, the remainder consisting mainly of mortgages, loans on public rates, freehold and leasehold properties, and ground rents.

The report and accounts were unanimously adopted.

LACRINOID PRODUCTS,  
LIMITED

## MR T. L. HORABIN'S STATEMENT

The seventh annual general meeting of Lacrinoid Products, Limited, was held, on the 26th instant, at the company's registered office. Mr T. L. Horabin, M.P., the chairman of the company, presided. The chairman's statement, circulated with the report and accounts, was as follows:—

The net profit for the year under review, after charging depreciation and making provision for taxation, amounts to £5,559 as compared with £5,523 for the previous year. Owing to the incidence of excess profits tax, it is not possible to show a variation to any large extent in the profit of the company.

## INCREASED OUTPUT

Practically the whole of the output of the company has been directed to supplying

Government requirements. Buttons are still the company's main product, but much of the output today is different from its normal specialities. Output has been increased substantially, although the labour situation has become increasingly stringent during the year. For the way in which this and other difficulties faced by the company have been overcome, the managing director, his colleagues, and the employees of the company, have deserved the greatest credit.

The management have continued their policy during the present year of improving the conditions for the workers. A new canteen has been built in which subsidised meals are supplied to the workers at low prices, and a social club has been started. During the year an efficiency bonus scheme has been instituted for all employees, which is yielding satisfactory results. In addition a contributory pensions scheme for the staff has been inaugurated.

The research laboratories of the company have been used to carry out research on new lines, some of which may be of importance in the post-war period. Button production methods have been developed and improved, as a result of which it is hoped that the company will be in a favourable position to export after the war. In this connection it must be remembered that 80 per cent. of the buttons used in this country before the war were imported mainly from Germany, Italy and Japan.

## BUILDING ACCESSORIES

I referred last year to the fact that the management were preparing plans for the production of building accessories to enable the company to play its part in the vast housing schemes which will have the prior claim on the production capacity of the country after the war. The company's ranges of building accessories are now nearing completion, and production can commence immediately demand arises.

We regret that, owing to pressure on space, the reports of the following companies have been held over for insertion in our next issue: Royal Exchange Assurance, Anglo-Palestine Bank, B. Morris and Sons.

for progress insofar as it ensures that the PBSE retains its new found power of co-operation with London and the Associated Stock Exchanges. The decision is a further blow to those who wish to combine the advantages of membership of a national body with the liberty to be guided only by their own views about what is in the public interest.

## Company Result

## South Durham Steel and Iron Company.

## FINANCE AND BANKING

**THE MONEY MARKET.**—There was a sudden tightening of credit conditions in the early part of the week, and the position in the money market had to be helped by considerable official purchases of bills. The immediate causes of the stringency were calling of loans by some clearing banks which were making up this week, and the withdrawal of substantial American balances of which the market had had the use for a few days. The appearance of these balances is now a regular monthly event. The funds in question are in the main destined for the pay of American troops, and disappear as they are transferred to the clearing bank which handles the American army accounts.

† Trading suspended.

† Nominal.

By Wednesday the position had been considerably eased, and with the resumption of considerable purchases of bills by the clearing banks, credit was in abundant supply towards the close of the week. Another factor making for stringency was the heavy volume of Treasury bills which the market had to take up this week, the syndicate having obtained a 35 per cent allotment on its £110,000,000 applications at the tender on Friday of last week. The Bank return reflects the easing of the position in the increase in bankers' deposits by £21,097,000 to £198,479,000. An increase of £35,100,000 in Government securities provides most of the explanation of this expansion in bank cash, though the movement has been offset to the extent of £11,858,000 by a fall in other securities, and to the extent of £3,716,000 by a further increase in the circulation.

**MONEY RATES, LONDON.**—The following rates remained unchanged between April 21st and April 27th:—

Bank rate, 2% (changed from 5% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-½%; 6 months 1½-½%. Treasury Bills: 2 months, 1-½%; 3 months, 1-½%. Day-to-day money, 1-½%. Short Loans, 1-½%. Bank deposit rates, ½%. Discount deposit at call, ½%; at notice, 2%.

**Exchange Rates.**—The following rates fixed by the Bank of England remained unchanged between April 21st and April 27th. (Figures in brackets are par of exchange).

A change has been made in the method of showing an excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £18,878 to £2,771,329, the other operations for the week (no longer shown separately) raised the gross National Debt by £6,726,321 to £19,794 million after allowing for £15 million for sinking funds 1943-44.

(Incorporated by Royal Charter 1853)

CAPITAL (PAID UP) - £3,000,000

RESERVE FUND - £3,000,000

Branches and Agencies throughout INDIA and the EAST  
AFFILIATED BANK IN INDIATHE ALLAHABAD BANK LTD., with 15 Branches & Sub-Agencies  
The Bank offers a complete Banking Service and provides exceptional facilities for financing every description of trade with the East.

Deposits for Fixed Periods or repayable at call or at short notice are received at rates which may be ascertained on application. The Bank also undertakes Trusteeships and Executorships.

Head Office: 38, BISHOPSGATE, LONDON, E.C.2

West End Branch:

28, CHARLES II STREET, HAYMARKET, S.W.1

Manchester Branch: 52, MOSLEY STREET

New York Agency: 65, BROADWAY, NEW YORK CITY

## THE UNION BANK OF AUSTRALIA

ESTABLISHED 1837. LIMITED

Capital Authorised and Issued ... £12,000,000

Paid-up Capital ... £4,000,000

Reserve Liability of Proprietors ... £8,000,000

£12,000,000

(Not capable of being called up except in the event of and for the purpose of the bank being wound up)

Reserve Fund ... £3,250,000

Special Currency Reserve ... £1,600,000

Head Office: 71 CORNHILL, LONDON, E.C.3

West End Agency: 15 CARLOS PLACE, W.1

Drafts are granted on the Bank's Branches throughout the Australian States and Dominion of New Zealand. Telegraphic Remittances are also made. Commercial and Circular Letters of Credit and Travellers' cheques issued. Bills are purchased or sent for collection. Deposits are received for fixed periods on terms which may be ascertained on application.

## THE BANK OF AUSTRALASIA

Incorporated by Royal Charter 1835.

Paid-up Capital ... £4,500,000

Reserve Fund ... £2,500,000

Currency Reserve ... £2,000,000

Reserve Liability of Proprietors under the Charter ... £4,500,000

£13,500,000

Court of Directors:

D. F. ANDERSON, Esq. HON. GEOFFREY C. GIBBS.

DAVID J. ROBERTS, Esq.

SIR JOHN SANDERSON, K.B.E.

ARTHUR WHITWORTH, Esq.

HEAD OFFICE: 4 Threadneedle Street, London, E.C.2.

Manager: G. C. COWAN.

Numerous branches throughout the States of VICTORIA, NEW SOUTH WALES, QUEENSLAND, SOUTH AUSTRALIA, WESTERN AUSTRALIA, TASMANIA and the DOMINION of NEW ZEALAND.

The Bank offers facilities for the transaction of every description of Banking business in Australia and New Zealand. Negotiates or collects Bills, issues Telegraphic Transfers, Letters of Credit and Drafts, also Circular Credits and Travellers' Cheques. Deposits received at interest for fixed periods on terms which may be ascertained on application.

## BANK OF SCOTLAND

Constituted by Act of Parliament 1695.

AUTHORISED CAPITAL ... £4,500,000

CAPITAL FULLY PAID ... £2,400,000

RESERVE FUND &amp; BALANCE carried forward ... £2,259,161

DEPOSITS &amp; CREDIT BALANCES

as at 29th Feb., 1944 ... £62,235,580

Head Office: THE MOUND, EDINBURGH

Over 200 Branches and Sub-Branches throughout Scotland.

London Offices:

CITY OFFICE, 30 BISHOPSGATE, E.C.

PICCADILLY CIRCUS BRANCH, 16/18 PICCADILLY, W.

## THE ENGLISH, SCOTTISH & AUSTRALIAN BANK, LTD.

Head Office: 5 Gracechurch Street, E.C.3

Subscribed Capital ... £5,000,000

Paid-up Capital ... 3,000,000

Further Liability of Proprietors ... 2,000,000

Reserve Fund ... 1,785,000

Currency Reserve ... 1,385,000

Chief Office in Australia:

Collins Street, Melbourne

and many Branches and Agencies throughout Australia.

With its widespread connections, this Bank offers every facility for the conduct of all classes of Banking and Exchange business with Australia.

J. A. CLEZY, London Manager and Secretary.

## THE UNITED MOLASSES COMPANY, LIMITED

NOTICE TO STOCKHOLDERS

Owing to circumstances beyond the Directors' control, the publication of the Accounts of the Company for the year ended 31st December, 1943, will be delayed and the Eighteenth Annual General Meeting of the Company will therefore be postponed until such time as the accounts are available.

In the circumstances the Directors, at a Meeting held to-day declared a Second Interim Dividend of 12½ per cent. (actual), less Income Tax, together with a Cash Distribution of 2½ per cent. (not subject to Income Tax) out of Capital Reserve payable on the 12th June, 1944, to the holders of the £1,954,500 Ordinary Stock in the capital of the Company entitled to participate therein registered in the books of the Company as at 5th May, 1944.

It is not the intention of the Directors at the Annual General Meeting to recommend a further Dividend for 1943.

The Registers of the Ordinary Stock will be closed from the 5th May, 1944, to the 19th May, 1944, both dates inclusive.

The Directors announce the following appointments:—Mr R. G. Simpson, M.C., C.A., as Deputy Chairman of the Board, Mr G. W. Scott, as Joint Managing Director, and Mr C. G. Allott, A.C.A., as Secretary to the Company.

Mr H. T. Schierwater has been appointed Deputy Chairman of Athel Line Limited and Tankers Limited, subsidiaries of the Company.

Dated this 25th day of April, 1944.

By Order of the Board.

C. G. ALLOTT, Secretary.

Leighton Buzzard, Beds.

## REFUGE ASSURANCE COMPANY LTD.

Chief Office: OXFORD STREET, MANCHESTER.

## Election Illusions

THE personal issues of the American election are gradually narrowing themselves down. On the Republican side, Mr. Wendell Willkie and General Douglas MacArthur—two of the three men who, for a year past, have led the public opinion polls—have bowed themselves out. Governor Dewey is thus left not only as favourite but a long way ahead of the field. Conventions are unpredictable, and they have often seemed to take a perverse delight in rejecting the too-confident suitor. But to beat the favourite the convention must first be deadlocked, and to deadlock it requires an alternative name, and with only a few weeks to go none of the alternative names looks nearly big enough. The odds are very heavily on Mr. Dewey's nomination.

The Democratic nomination depends on the Republican. The President can undoubtedly have it by acclamation if he wants it, and his decision will turn on his estimate of the prospects after the opposition standard bearer is chosen. There are two circumstances in which he might conceivably stand down: if the Republicans nominate a candidate so good, from the President's point of view, that his election would involve no break in policy; or if they nominate a candidate so bad that some other Democrat can beat him. Lieutenant-Commander Stassen might answer to the first description; Governor Bricker might conceivably answer to the second. But Governor Dewey fills neither rôle, and if he is nominated, Mr. Roosevelt will be, top.

Mr Dewey's recent speech has made it plain that he would not make a campaign issue of foreign policy. If the contest is Dewey versus Roosevelt, both champions will be talking the same language on the external relations of America. There is one point of view from which this circumstance, otherwise so gratifying, is a matter for regret. There is a foreign policy issue before the American people, conventionally presented as the fight between co-operation and isolation—renamed nationalism. But the election will not decide it. Both candidates look like being on the same side—or at least saying that they are on the same side. In the short run, this is pure gain, since it means that a change of administration would not mean a change of foreign policy. But in the longer run, it leaves the issue undecided. If it is Mr Dewey and Mr Roosevelt who go to the polls on November 7th, then the world will be no wiser on November 8th than it is to-day about the ultimate course of American policy.

This is unfortunate; but it is also unavoidable. Every country always sees every other country's politics as less complex and more clear-cut than they really are. British opinion is making this mistake at present about America. There is a real issue of foreign policy, but it is not of a nature to be settled by a single vote even if it were clearly posed. Even if next November's election were between an avowed internationalist and an avowed isolationist—say between Mr Willkie and Colonel McCormick—the vote would be no more than the second

reading of a Bill which would then enter an indefinite committee stage. The issue is not the state of mind to which the American people will give expression on November 7th, but the state of mind that they will induce in their Congressional representatives through the long years that will follow. It will be a great advantage to have a sincere internationalist in the White House, but not so great as to be decisive. It is sometimes forgotten that, if the party platforms and the campaign speeches were any guide, the position in 1920 was very similar to what it is to-day. Both candidates agreed on the necessity for a League of Nations of some sort; it was the mood of the country after the election that settled the policy to be pursued. This is the first mistake that British opinion is making: it lies in thinking that a single vote on a single day will pronounce a clear yea or nay.

The second mistake lies in misinterpreting the nature of the question to be answered. The conflict is represented as one between co-operation and isolation, between internationalism and nationalism, between altruism and selfishness, between white and black. It is, of course, nothing of the sort. Doubtless there are extremists on either side who preach the pure milk of the gospel. But political parties are the embodiment of compromises, and the difference between the practical alternatives is very much smaller. The furthest that any American administration, clothed with the responsibility of office, could possibly go towards isolation would be a refusal to accept any specific commitments, or to join any organisation which did not leave the United States with full liberty of decision in all circumstances. The lesson of 1940 cannot be denied, and none but the lunatic fringe

would try to maintain that America can disinterest itself in what passes beyond the oceans. On the other hand, it is becoming clear that not even the most internationalist administration that is politically practicable is likely to go much beyond the League Covenant of 1919—that is, to surrender no significant segment of its sovereignty, but to promise to exercise that sovereignty in consultation. There is a difference, but it is much less than is popularly supposed. At one extreme, no American Government will be able to ignore the posture of world affairs. At the other extreme, no American Government is likely to feel able not merely to join an international association but also to pursue a firm and consistent policy within it—for to do so would involve making burdensome commitments. It is not even certain that, in its practical working out from day to day, the choice that now seems the preferable would yield most satisfaction to America's partners. France, between the two wars, might have been glad of less need to consult British susceptibilities in detail, since she was not to get more support; and the British relationship to America after this war may not be so very different from the French relationship to Britain after the last.

It is no doubt a disappointing fact that the issue is so restricted, that the champions of black and white are not to run at tilt, and one unhorse the other decisively and for ever. But it is a fact none the less and should be recognised as such. Nothing could be more dangerous to the future of that "durable cohesion" between the major allies of to-day on which the future of the world depends, than that any one of them should harbour illusions about any other.

## Appointments Vacant

ONE thing at least is certain about education in this country after the war. There will be a seller's market for teachers. At the pre-war rate of recruitment there will be many more jobs to fill than there will be teachers to fill them. Before the war there were 200,000 full-time teachers in elementary and secondary schools. After the war the school leaving age is to be raised; secondary education is to be reorganised; both technical and adult education are to be extended; and the size of classes is to be reduced. The teaching force—one in ten of whom is now serving with the Forces or in other war work—will have to be increased by a third at least. It is a far cry from the days, not so long ago, when young teachers had to take any job they could find, if they could find one at all, and were used mainly as casual labour in the schools.

Before the war, at any one time, there were about 15,000 candidates for teaching in the training colleges and universities. The figure after the war will have to be more like 30,000; and the task is to recruit them without lowering the quality of teaching. Here the experience of the United States, where a comprehensive system of public education grew with great rapidity, is a warning as well as an example. There is a double danger in the process of expansion. There is the danger of diluting the teaching profession; and there is a possibility that the local authorities, who pay teachers' salaries, may not be able to bid high enough for the numbers and talents needed. In terms of both manpower and money the means of the community after the war, however large, will nevertheless be limited, and there will be many requirements.

The need, indeed, is for better teachers as well as for more teachers. This is above all the angle from which the McNair Committee, which reported on Thursday, has approached the problem. The temptation to shorten training courses in order to pass more trainees through in a given time has been resisted; in fact, it is proposed that the normal course for recruits from school should be lengthened from two years to three. The most important single item in the Committee's recommendations is the proposal that the net should be cast much more widely to catch recruits of various ages, attainments and experience. Other professions concerned in the expansion of the social

services, such as medicine and nursing, will make much increased demands on the same young and able men and women from whom new teachers will normally be sought. Both industry and the armed Forces will require more technicians and administrators than before the war. The supply of professional and technical skill may be an even narrower bottleneck in peacetime than in wartime; and teaching cannot be broken down into simple processes and done mechanically. The McNair Committee is therefore to be congratulated on its good sense in suggesting a search for teachers wherever they may be found; and the quality of teaching itself may gain much by the recruitment of new kinds of teachers.

Yet, whatever reforms may be made in the methods and scope of recruitment, it will be necessary to increase the material attractions as well as the professional attractiveness of teaching. It is a problem of supply and demand. Both pay and conditions will have to be much improved. But other services, such as public health, will also have a much enlarged lien upon rates and taxes and upon private purses. The added cost of education to the local authorities under the Butler Bill represents a prospective increase in rates, on the average, of almost 3s. in the £; and the further additional cost of improving the pay, status and quality of teachers, as well as of increasing their numbers, has not yet been counted. It was noticeable that the MPs who recently pressed for equal pay for men and women teachers, on very sound grounds, nevertheless did not stop to reckon the extra cost in a profession where women outnumbered men by 2½ to 1.

These difficulties of supply and finance are not arguments against either the educational reforms which require these additional teachers or the very sensible recommendations of the McNair Committee for attracting and training them. But they are arguments for suggesting that it may very well be necessary to look cautiously at any fresh claims, over and above those already registered, upon educated manpower and public money. It is a question of priorities, among which teachers must be ranked with industrial technicians and scientists; and, with the best will in the world, there is a limit to the commitments that can be undertaken in the near future. Moreover, even with

priority, it is by no means certain that the new schools will get all the new teachers they need of the required quality; and, if they do not, there may be a case, however reluctantly it has to be conceded, for preventing the pace of expansion from outrunning the supply of personnel. Immediately after the war, the gap will be filled by short-term emergency methods of intensive training. Local teams of instructors are already being got ready, and their "shock" methods of instructing new kinds of recruits, older and more experienced, may themselves bring some fresh air into the schools. But, on balance, the results of the makeshift schemes must be more or less makeshift, and the plea of the McNair Committee that this training should be carried out in the light of its own long-term proposals deserves special attention.

The reference of the McNair Committee, which was set up two years ago, is to the permanent problem of supplying sufficient teachers of the right kind, year by year (as well as to the important but ancillary problem of training "youth leaders," which is not dealt with in this article). Before the war, the annual output of teachers was 6,500, 5,000 from 83 training colleges and 1,500 from 22 university training departments. After the war, an annual output of over 10,000 a year will be required. The number of teaching candidates in the colleges and training departments at any one time will be from 30 to 40 thousand—that is, not far short of the total number of university students in all faculties before the war. Clearly, in considering the best organisation and inter-relation of the training colleges and universities, it is important not only to see that the standards of teachers' training are not depressed, but also to see that the universities, whose main functions are very different, do not simply become annexes of the training scheme. For training departments to dominate their parent university bodies, as occasionally happens, is bad; and for training departments to be treated as inferior side-lines, as sometimes happens also, is no better.

The Committee sees teaching as a vocation in itself and not simply as a technical veneer upon more cultural and scientific studies.

We must ensure that those who intend to be teachers . . . have the chance to enjoy a period of education and training which, above all else, will encourage them to live a full life themselves, so that they may contribute to the young something which arises as much from a varied personal experience as from professional studies.

It is in this spirit that the proposals to widen both the field of recruitment and the scope of training are made. It is recommended that training, with maintenance and family allowances if necessary, should be available to

men and women of maturer years who desire to be trained for the teaching profession and are judged fit for such training.

It is proposed that, in addition to three (instead of two)

year courses at training colleges and one-year courses for university graduates,

suitably qualified persons other than graduates should be eligible for a one-year course of training; and that courses of training varying in duration should be provided to meet the needs of others whose attainments and experiences, however obtained, justify their entering upon a course of training.

Both to swell the number of teachers and to enhance their quality, the Committee looks with special hope to this "leaven of people who do not approach the profession along the normal avenues." The vast majority of teachers will still come straight to training from the schools. But the profession will be enriched by the addition of recruits, not only from the Forces, but also from industry, commerce and the professions. It is argued in the Report that not only secondary schools should qualify for teachers' training; but that technical colleges, art and musical schools, agricultural institutes and adult education should also provide ways in. The search should be for men and women who want to teach and can do so; the test for a teacher, say, of music should be his ability as a musician and instructor, not how or where he was previously educated. The Committee has in mind a more variegated and less stereotyped body of teachers than in the past, more representative of the life, work, culture and crafts of the community; and it is proposed to bring in men and women from other walks, to do part-time teaching.

The rest of the Report is on the same high level of practical sense. The Committee insists that pay should be higher all round—with equal basic salaries for all categories of teachers plus special supplements for special qualifications—and that greater freedom should be allowed to teachers to take their place in local and public affairs; and it is certain that, if these steps cannot be taken, the teachers will not be obtained. Similarly, better working and living conditions are proposed for teachers in training, who will no longer be under bond to teach in return for financial aid from public funds; and proposals are made for the reform of training itself which will bring trainees very much closer to the practical problems of their profession.

The principle throughout is that teachers should have much closer contact with the community to which they and their pupils belong. There is, first, the fact that, if these proposals are accepted, teachers will no longer tend to be a narrow and isolated group of public servants, and they will be much more mixed in their qualifications and experience. Secondly, during their training they will get to know the schools. In addition to the present arrangements for short periods of teaching practice in schools, an entire term in the extended three-year course will be devoted to continuous teaching as a member of a school staff; and, in turn, the staff of every training college will include a number of school-teachers seconded for a period.

Thus the bias of the Report is towards closer links in the training of teachers with the world outside, on the one hand, and with the schools on the other. The only issue on which there was apparent division of opinion within the Committee was the link with the universities. There was general agreement that the universities should assist in maintaining academic standards in tests and examinations. There was disagreement about the extent to which the universities should direct the whole process of training. The Committee proposes the appointment of a small Central Training Council for England and Wales to advise the Board of Education. Below the Council, two alternative schemes for the organisation of training in each area of the country are put forward. In one, the work would be done by University Schools of Education which would embrace "an organic federation" of training institutions and be directly responsible for the training of teachers. In the other, the present system of Joint Boards, on which both universities and training colleges are represented, would be preserved and improved. It seems almost certain that this second solution is the right one. No form of professional or technical education is properly the first function of a university; and, in general, university training departments have not been good advertisements for the direct responsibility of universities for teachers' training.

It is possible that, while keeping the representatives of universities on the Joint Boards to advise and scrutinise—and, in academic matters, even to lead—the Committee should have gone still further and recommended the abolition of their training departments, except in special cases. This is not to suggest that all the training colleges have

been signal successes in the past. Many of them have stayed firmly in a rut. But they ought to be the right places for training teachers; and university graduates intending to be teachers would benefit most from their one year's training if it was taken, not as an epilogue in their own universities, but at a training college with a spirit and a status of its own. At bottom, however, the question is complicated by two considerations. There is, first, the genuine and praiseworthy desire of the universities not to see the scholarly standards of teachers' education allowed to fall too far, which is essential. Secondly, there is the question of finance. Too many of the poorer university institutions depend far too much for their subsistence upon grants to teachers in training—a situation which will be even more decisive for the future of the universities when the number of teachers in training and the total of university students (which, of course, overlap) are roughly equal.

The success of the McNair proposals will depend upon matters outside the Committee's purview. The Committee could not say what its programme will cost and whether it can be afforded. Nor could the Committee tell whether, even with wider recruitment, sufficient candidates of the right kind will be available for training. There is a case both for the most careful costing of the proposals which have now been tabled for better education and better health and for some census, survey or budget of the manpower that is likely to be available for all the professional and technical appointments already envisaged. Finally, there is the core of the problem—what are the teachers to teach? So far, the Government has said nothing about the important recommendations on curricula which were submitted by the Norwood Committee last year.

## The Tractor and the Plough

At the beginning of this war European countries had found no solution for the smouldering agricultural crisis that affected with varying intensity one country after another. The farmers in European countries are mainly peasant proprietors; but most of the land is still concentrated in big estates. This is true, not only of highly industrialised Germany, but also of Poland and Hungary. In the south-east, Bulgaria is the peasant country *par excellence*, like Denmark in the west. But there is a vast difference between the peasant in south-eastern countries and the peasant in Denmark, who, before the war, manufactured bacon, butter and eggs, for export, using the cheap cereals and oilseeds imported from overseas for feeding stuffs. In the east and south-east, the peasant plot is still worked as a self-sufficient unit chiefly for subsistence. Consumption is frequently near the starvation line, and the amount of marketable produce sold in exchange for absolutely necessary commodities varies with the vicissitudes of climate and weather. If the peasants in eastern and south-eastern Europe were to increase their consumption to the minimum recognised by scientific research, the export surpluses of most of the agricultural products would disappear.

The experience of this war has again proved that the agricultural production of the continent of Europe as a whole is insufficient for the subsistence of the peoples living on it. The predominantly agricultural countries in the east and south-east have been unable to replace the former imports of agricultural products from overseas. In other words, the industrialised peoples of the Continent still depend essentially on cheap agricultural raw materials and processed agricultural products and fruit from outside Europe. Every country that has entered the stage of industrialisation has experienced the same change in diet. The high percentage of carbohydrates provided by cereals and root crops, typical in the peasant diet, declined, and foodstuffs containing proteins, fats and vitamins formed a steadily increasing part. The most suitable diet for industrialised populations is now recognised everywhere as a mixed diet in which proteins, fats of all kinds, vegetables and fruit are predominant. Climatic conditions vary this diet slightly, but the basic

composition remains the same. Rye, the standard cereal in the flat lands of northern Europe, has a low protein content and has lost its importance as a bread cereal compared with wheat, which contains more protein.

In Germany, rye was definitely on the point of being "degraded" to an animal feeding stuff during the prosperity of the 1920's. The price consequently declined, and the large estates became unprofitable, since they were unable to compete with cheap imported wheat, whose production costs in the most favourable regions in Germany were double the cost in overseas countries.

A radical change was necessary if Germany's agriculture was to become profitable again. The duty-free import of agricultural raw materials, that is, of cereals and oil seeds, would have given Germany's large peasantry, assisted by efficient credit and co-operative organisations, the chance of reaching the efficiency of Danish meat and dairy producers. Protective duties before Hitler and the policy of self-sufficiency under Hitler arrested these changes, which were already visible, and then deliberately reversed the trend. The consumption of meat, fats and fruit was reduced. The large estates went on producing cereals at production costs far above world prices, and required enormous direct and indirect subsidies. Germany's agriculture became a planned industry. Large numbers of peasants were bound to their land by the hereditary farm law. The system of compulsory deliveries followed fixed prices, and year by year cultivation was ordered by a production programme. After ten years of this Nazi agricultural policy, the whole industry has become unprofitable. Peasants and agricultural workers have left the land in great numbers. This disastrous policy has had its repercussions on the whole continent. It made agricultural agreement with Poland almost impossible. At the same time, it enabled Germany to draw the agricultural countries of the south-east into a state of dependency by guaranteeing relatively high prices. Denmark and Holland, large exporters of agricultural products to Germany, were almost cut off from the German market, and overseas imports of cereals were curtailed.

All over Europe the big estates, which from a technical

point of view could be highly efficient units of production, have been and still are, as remnants of feudalism, an obstacle to any lasting reform of European agriculture. Peasant proprietorship, on the other hand, making for small inefficient units, is in its present form equally an obstacle. The peasant proprietor has shown an amazing productive power where co-operative organisation has provided the framework of a division of labour. The chief difficulty for the individual peasant is that he is owner, manager, worker, salesman and book-keeper rolled into one. Relying on his own resources, he must cultivate his fields and rear his stock without knowledge of science and without modern machinery. The different forms of free co-operatives, which vary from country to country, provide all these necessities. The sales organisations of the Dutch and Danish co-operatives are world famous. The education and training centres of the Danish co-operatives are unparalleled. Co-operatives enable the pooling of finance and machinery, the running of the most modern dairies, slaughterhouses, and other processing plants. In short, modern free co-operatives effect the division of labour without taking away the ownership of the land from the peasant. They assure all-round efficiency, even in the cultivation of cereals, on plots of land which would be totally insufficient for the subsistence of a single peasant. These co-operatives need the active assistance of the state, the only organisation which is able to establish research institutes, experimental stations and statistical offices. No doubt countries whose climate and soil conditions are suitable to large scale cultivation of cereals, oilseeds and similar crops could find a way for the co-operative use of peasant land, combining small plots to the necessary optimum size.

Where the co-operative system is fully established peasants have changed from self-sufficient occupiers into manufacturers for markets. They are no longer mere toilers on the land to inspire romanticism in townspeople, who regard the ploughman as a philosopher, or like the Nazis discover mystical qualities in the affinities between blood and soil. The single peasant without co-operative organisation, wherever he may live on the Continent, earns the barest minimum, and is rather an object of pity.

The following table shows the average yield of wheat per hectare for the average of 1931-35. It illustrates in the most simple and generalised form the differences in the agriculture of certain European countries. The figures in brackets give the percentage of persons gainfully occupied in agriculture.

|                   | Quintals<br>per hectare |                  | Quintals<br>per hectare |
|-------------------|-------------------------|------------------|-------------------------|
| Holland .....     | 29.8 (20.0)             | Italy .....      | 14.7 (47.6)             |
| Denmark .....     | 29.7 (35.0)             | Hungary .....    | 13.1 (73.1)             |
| Belgium .....     | 26.6 (17.1)             | Poland .....     | 11.3 (76.2)             |
| Germany .....     | 21.2 (29.5)             | Bulgaria .....   | 11.3 (80.9)             |
| Czechoslovakia .. | 17.0 (38.3)             | Jugoslavia ..... | 10.3 (80.0)             |
| France .....      | 16.0 (35.7)             | Roumania .....   | 10.2 (76.6)             |

The first and most important point is that the countries which are highly industrialised, and those whose peasants have an efficient co-operative system, obtain the highest yields. Germany lags far behind, which is the result of maintaining wheat cultivation on a large scale on unsuitable soil. The purely agricultural countries are at the bottom of the list. The table also gives a clue to the fact that the agricultural crisis in most European countries cannot be solved without radical changes. Agriculture becomes efficient in the same degree as a country is industrialised. The different stages of industrialisation are faithfully reflected in agriculture. At the time when the steam engine was the sole power generator, the cable plough was used in agriculture on big estates. At present, electricity, the tractor, and the stationary internal combustion engine are revolutionising agriculture, in combination with scientific farming and stock breeding. Yet the most important source of power, the tractor, is useless on the small plot of a peasant. In fact, neither in Germany nor in any other European country can most peasants use tractors. They are used on the larger farms and big estates, and have set free large numbers of workers. An American expert gives the following estimates of the number of man-hours neces-

sary for growing and harvesting one acre of wheat yielding 20 bushels:

|               | Man Hours |                                             |
|---------------|-----------|---------------------------------------------|
| In 1830 ..... | 55.7      | (Seeding and harvesting done by hand)       |
| In 1896 ..... | 8.6       | (Horse-drawn drill and binder)              |
| In 1930 ..... | 3.3       | (Tractor-drawn drill and harvester combine) |

At the same time the tractor has made the cultivation of semi-arid steppe country possible. All necessary work in growing cereals and root crops can to-day be done by machines. In land reclamation and drainage, machinery is also used. Soil conditions can be changed by the use of chemicals and modern plant selection; seed preparations have put a stop to disastrous crop failures. The modern farm can be almost fully mechanised. Stock breeding is largely freed from hazards if science is applied. The possibilities of artificial insemination have hardly been realised. In short, the division of labour, which is the basis of industry, has become the basis of modern agriculture. The cereal factory in America and Russia has given full proof of its possibilities. The same factors, changes in demand and division of labour, have resulted in the standardisation of almost all agricultural products. Lastly, the methods of processing and refrigeration demand more factories beyond the scope of peasants.

The policy of self-sufficiency in Germany was actually an attempt to feed an industrial population without participating in the international division of agricultural labour. The result was a decrease in consumption and a flight from the land. At the same time the eastern and south-eastern countries experienced the difficulties of agricultural over-population, without any prospect of emigration. Industrialisation, on the other hand, was slow in south-eastern countries. Most important of all, however, is the fact that such modern factories as have been started in these countries use the labour-saving methods of the highly industrialised countries. New industries do not therefore employ the large numbers of workers absorbed in the early period of industrialisation in Great Britain and Germany. Industrialisation in Britain, and later in Germany, provided the markets for American agriculture. During the decades after the last war, Germany, the largest market for agricultural products on the continent, put itself in a paradoxical situation. It offered only limited possibilities for south-eastern countries to sell farm produce. Using the greater part of its industry for armaments, it was not able to industrialise the agriculture of the Balkan countries. In spite of the fact that German firms tried to organise centralised buying on the lines of the compulsory marketing of Germany itself, Balkan agriculture remains unchanged.

War conditions in Hungary and Roumania show that the reduction of labour on the farms by military service immediately reduces production if there is no change in production methods. The problem cannot be solved simply by opening up industrial employment for the surplus agricultural population. Labour emigrating to industries in towns reduces the number of consumers on the land, but industry produces no foodstuffs. Industrialisation, moreover, must proceed on a large scale if the agricultural population is to be appreciably reduced. The problem has changed. Industry must go to agriculture in the eastern and south-eastern countries. The tractor will have to be used. Science will be necessary to improve cultivation and stock breeding. In short, the process of the division of labour, which took generations in western countries, will have to be accomplished in years. British, German and American industry will find great markets in European agriculture, provided that Germany's agriculture ends the unprofitable production of cereals. The agricultural revolution in eastern and south-eastern Europe, which began after 1918 under the pressure of the revolution in Russia, was arrested after a few years. The limited division of big estates was immediately followed by a reduction in exportable surpluses, a result of the increasing consumption by peasants. After this war peasants will again demand more land. Yet more land is in itself no solution. A redistribution of land and co-operative organisation should be the first step to the industrialisation of agriculture.

## NOTES OF THE WEEK

### In Conference

There is not much that can be said at this stage about the Empire Conference which is taking place in London. Most of the personal background of the Conference has been given, at great length, in the daily press. Most of the diplomatic topics that may be under discussion have been canvassed: the next phase of the war; the problems of peacemaking; the treatment of Germany; postwar trade and aviation; and the question of some closer and more permanent machinery for peacetime consultation. The fact that these Dominion Prime Ministers are here in London, in the fifth year of a war in which from the first few days—when Poland had been attacked but not Britain—they were participants equally with Britain, is sufficient proof of the degree of co-operation already achieved in the natural course of events. It is a proof, too, of the fact that, here in the British Commonwealth, the problem of international collaboration has been brought vastly nearer a solution than in the case of any other group of nations. Perhaps the outcome, for the Commonwealth, may be some sort of permanent secretariat, together with some historic statement recording the extent of the interdependence which in fact already exists among its members. More important for the present is the token of common action against Germany and Japan and in the making of the peace settlement. More important for the future, perhaps, is the political aspect. Two of the Dominion Prime Ministers, Mr Curtin and Mr Fraser, came from countries which, uniquely in the British world, have possessed settled Labour governments for some time. Mr Curtin is more strongly in power in Australia than any of his predecessors as Prime Minister, despite the virulence of the opposition to him; and Mr Fraser, despite a setback in last year's election, is well entrenched. Here are experiments of importance for the future of democratic politics. General Smuts, though he is poles apart in his politics from Mr Curtin, triumphed equally in last year's South African elections. But this was too largely a personal triumph for the future of South African politics to seem so settled during the next decade as that in Australia. Dr Malan's Nationalist opposition, which has drawn tighter together, still stands for an Irish solution to South Africa's problems; and even General Smuts cannot go on for ever. In Canada the contrast between the present position and future possibilities is even greater. Mr Mackenzie King has reigned for a long time; his position is high, his authority great, but the tides of politics have been running against him. On the face of it, the only question is whether Mr Bracken's progressive conservatism or the socialist policies of the CCF will prevail in the next chapter. Perhaps, round the Conference table, Mr Churchill himself will be able to add to this conspectus of political possibilities the likely outcome of the next elections in this country. Certainly there will be no lack of topics, in the small talk between the big decisions, about both political theory and political practice.

### Southern Rhodesia at the Conference

The presence of Sir Godfrey Huggins, Prime Minister of Southern Rhodesia, at the Empire Conference is significant from the viewpoint of colonial affairs rather than from the more outstanding items on the agenda. His country is not a Dominion, but has a position still unique in the Empire as a self-governing colony. It has, that is to say, complete independence in internal affairs with one important proviso—that any legislation affecting the native population must have the consent of the Dominions Office before it takes effect. It is well known that in recent years this consent has become a matter of course with regard to the colony's own natives, but the Government of Southern Rhodesia has not been able to have its own way in the question of the amalgamation of the two Rhodesias and Nyasaland. Since, however, colonial regionalism is apparently to be discussed at the present Conference, this question is bound to be raised again, and Sir Godfrey Huggins will doubtless use the occasion to press his case to the utmost. There is clearly a great deal to be said in favour of it on administrative, geographical and economic

grounds. But the main reason why the Bledisloe Commission decided against amalgamation still holds good to-day—native policy in the self-governing colony and in the two dependent colonies is inspired by completely opposite principles. The Colonial Office policy maintains the paramountcy of native interests and the ability of the African eventually to govern his own territory. Southern Rhodesian policy is based on the paramountcy of European interests and the complete segregation of the African in the colony's social and economic life. Nevertheless, native policy in the dependent colonies has much to learn from Southern Rhodesia. Under Sir Godfrey Huggins's premiership, a great deal has been done to improve the welfare of the African. The latest measure, announced at the time of the Prime Minister's arrival in this country, is the formation of co-operative organisations, in which the natives would become shareholders, in each native reserve and the establishment of model native towns. It is hoped thereby to raise the native standard of living, but, at the same time, a way of life which can take the place of the old barter economy based on the tribal system is to be encouraged. The Colonial Office is right in steadfastly resisting the amalgamation scheme so long as Southern Rhodesia's native policy is based on restraint of the African's rights. But its hand would be strengthened if it were equally energetic in pursuing social and economic development schemes and equally willing to spend money on them as is the Government of Sir Godfrey Huggins.

### Lord Portal's Houses

The Minister of Works has achieved the first concrete results of reconstruction policy. The first of any Ministers, he has something more than paper plans to show. The prototype of his temporary, pre-fabricated houses is actually on view in London. In external appearance it is undistinguished and very much what the word "pre-fabricated" suggests. Internally, it is very good indeed. These temporary houses are going to be not merely up to the contemporary standard in fittings and amenities, but well in advance of them. As Lord Portal said in the House of Lords, whatever else we shall accomplish by the manufacture of these houses, we shall have helped to initiate and popularise the type of fittings which should in time be incorporated in all the permanent houses in this country.

Indeed, it is in the interior of houses rather than in their external structure that pre-fabrication can render its greatest services. The prototype house includes such fittings as a complete kitchen—gas stove, refrigerator and sink—arranged back-to-back with bath, hand-basin, clothes copper and hot water tank. Another fitting serves the dual purpose of party-wall and built-in cupboards. If the planning of the state can achieve sound design and reap the economies of mass production, there should be a new and large industry, for export as well as the home market, in these units. Nor will these houses be expensive. Lord Portal said he was aiming at a price of £550, exclusive of land, but including quite £100 worth of what are usually regarded as tenants' fixtures. In view of the fact that the materials alone in an average pre-war brick-built house costing £461 have increased by £188, this price is highly reasonable. (It would nevertheless be interesting to know how much cheaper it would be if all the materials, and especially the steel, could be bought at competitive prices.) Lord Portal said that production can begin as soon after next November as the materials are available, and that within three months from the start of production it would be possible to produce from 2,000 to 2,500 a week. They will be publicly owned and licensed for a period. What the rent will be will depend on the cost of land, the rate of interest charged, the amount of subsidy offered, if any, and the decision that is taken about depreciation.

The purpose of this emergency housing programme, as Lord Portal explained once again, is

to make a substantial contribution to the interregnum period, using as little site labour as possible, to enable our labour force to build itself up for the permanent building programme.

Unquestionably, this is right. There will be a large demand for houses immediately after the war, but building is a long-period industry and nothing could be more foolish than to allow it, under the impact of a sudden demand, to expand to a size larger than there will be continuing demand to maintain. The solution is to meet part of the immediate demand by temporary houses. But they will not serve their purpose unless they are ready immediately. This Lord Portal is now well on the way to securing. He deserves the fullest credit for this achievement, not merely in the usual sense that he has been the responsible Minister, but because it is most peculiarly his achievement. It is a most refreshing thing in these days to find a Minister who really leads his Department.

### Rural Rents

Of the 3,000 rural cottages, for which plans were presented fifteen months ago, 1,000 are now ready and a further 1,300 are nearing completion. Despite the pre-war opinion of observers that the greatest demand was for cottages with three bedrooms and no parlour, the great majority of the new cottages will have parlours. This fact no doubt reflects the present prosperity of agriculture. But it means that the majority of tenants will have to pay between 11s. 6d. and 13s. in rent and rates. This figure compares with one of 4s. to 5s., which was generally accepted as the maximum sum which a farm worker could afford to pay in rent and rates before the war. Wages, though they have soared, hardly match this increase in rent, the present national minimum wage of 65s. a week comparing with an average minimum of 32s. in 1937. The rough-and-ready calculation that the farm worker can allow one-sixth of his wages for rent and rates is perhaps met in the case of the new cottages at the moment; and, clearly, higher wages may increase the proportion that can be thus afforded. But, after the war, agricultural wages will probably not rise again, and there is no guarantee of this in the case of building costs. The 1938 Housing Act met a long-felt need by providing Exchequer subsidies for new houses built to meet the general needs of the agricultural population. The new cottages, in addition to the £12 a year for 40 years from various authorities made available under this Act, have also received a special block grant of £150 per cottage from the Ministry of Agriculture to meet wartime costs of construction. It is possible that even to hold rents down to their new high level such additional subsidies may need to be continued, initially at least, for post-war rural housing. After the last war the rents of new houses rose too high for the average farm worker, who in many areas tended to be squeezed out by the overspill of urban and industrial population. It will be a tragedy if this process is repeated. There is still a very great housing shortage in rural areas, due not only to urban competition, but also to the smaller size of the family unit, caused partly by the ability of pensioners now to live on their own. Rural rents must be kept down. And the way to do this lies not only in generous subsidies, but in the reduction of building costs and in the provision of houses which, while good, are not too good for the farm worker, in his post-war circumstances, to be able to afford.

### "Slightly Purified"

After prolonged negotiations, the British and American Governments have secured an agreement with Spain. The German Consul-General is to leave Tangier and all German agents are to be expelled from Spanish Morocco and the Gibraltar zone. The Italian merchantmen which took refuge at the Armistice in Spanish ports are all to be released, save two whose ownership is in question, and the case of these vessels and of the Italian warships is to be submitted to arbitration. The Spanish Government announces that all volunteers have been withdrawn from the Russian front. Finally, the export of wolfram to Germany is to be considerably reduced; 20 tons may be sent in May and June, 40 tons in the following months—if communications between Spain and Germany have not then been cut by the next Allied advance into Europe. It was over the question of wolfram that the negotiations dragged on so long. The Americans sought a complete embargo. The British, believing that this course would end in deadlock and anxious to continue obtaining certain supplies from Spain, urged the need for a compromise in the interests of speed. It is in the next months that it is important to limit German

espionage; and one of the dangers of reaching no solution was the possibility that large stocks of wolfram stored near the Spanish frontier might all have been despatched. The State Department finally accepted the British point of view, but has made known publicly its preference for a "tougher line"—a somewhat discourteous attitude towards an Ally once an agreed policy had been worked out. Shipments of oil to Spain will now begin again, and the Allies' attention will be turned to Portugal, which is still supplying Germany with liberal amounts of wolfram, considerably more than Spain has been sending. The agreement with Spain is satisfactory up to a point. It can give the Germans no pleasure. Yet it is hard to welcome it as a major diplomatic triumph. It is something to have got the Germans out of Tangier. As Mr Eden put it, the situation there is "slightly purified." It will be better still when the Spaniards follow suit. No partial war-time agreement can alter the fact that the Allies have a long unsettled account with General Franco, and do not regard a war-time agreement based on sheer necessity as in any sense a diplomatic buttress to his unstable and unpopular regime.

### After the Mutiny

M Papandreou has embarked on the task of creating a Greek Government of national unity in a difficult hour. It is obvious from the extent of the mutiny in recent weeks that earlier Greek Governments have not enjoyed the confidence of important sections of their own military forces. It is not clear whether the objection of the resisters in North Africa and of the Committee of National Liberation in Greece is to the King of the Hellenes, whatever Government he may seek to form, or only against the constitution of his Governments hitherto. Unfortunately, it is impossible to find this out. A censorship has been imposed on all Greek news so drastic that Allied correspondents have formally protested against it. Under such conditions, comment, favourable or unfavourable, is in the dark, and the only possible conclusion must be that where such strenuous efforts are made to smother news, there must be a great deal to cover up. If it is to the King himself

## OVERSEAS REFERENCE BOOK OF THE UNITED STATES OF AMERICA

Compiled and Edited by  
**CECIL BROOKS**

Within the compass of some 390 large pages is contained more specific and up-to-date information about America than can be found elsewhere (if at all) in many volumes. Surveys of the 48 States with their counties and towns, articles, statistics and charts on the resources, the economic and industrial set-up, plans for post-war development, and hundreds of maps and diagrams are some features. An essential book for reference libraries and those interested in trade with America. £5 5s. net

**TODD PUBLISHING CO., LTD.**

*Distributed by Harrap's*

that a mass of patriotic Greeks object, then something more formal in the way of underlining his provisional status may be necessary. As Mr Churchill rightly put it in his letter of support to M Papandreou

at the earliest moment the Greek nation, free from foreign interference of all kinds, will choose the form of democratic government under which they wish to live, whether it be a monarchy, or a republic. The king is the servant of his people. I am sure he has no wish to force himself upon the Greek nation.

The difficulty in the case of Greece, as of other eastern European governments, is to ensure that the Allies back a reasonably representative government and do not find themselves committed to supporting regimes opposed strongly by the mass of the people. Again to quote Mr Churchill:

It is the Greek nation, not small bodies of soldiers, sailors and politicians resting under our shield, who will decide the future.

This argument is used in the main to prevent recognition of any group of guerillas who may pick up a rifle and claim to speak for the nation. But it applies equally to a King or a Prime Minister if they no longer command majority support. The important thing is not to allow a false picture of legitimacy to overlay the real legitimist issue—the representative and popular character of a regime. For this reason, the best status any émigré government can hope for is to be provisional, and the more its provisional character is underlined, the better its chances of being finally legitimate.

### On Trial

The fate of Regulation 1A (a) is a sad one. Against most strikers it is not applicable. Nor can it be used against Mr Aneurin Bevan. In last week's debate on the Regulation, Mr Bevan accused Mr Bevin of treachery to the trade union movement, and in a week-end speech Mr Bevin replied in kind. Indeed, the Minister of Labour went even further and all but declared that Mr Bevan, who had opposed Regulation 1A (a) on instructions from his mining association in South Wales, was guilty of treason against the state. The Labour Party then decided to have done with Mr Bevan. The proposal was to expel him. Some pretty constitutional points were raised. The federal character of the Labour Party gave Mr Bevan much justification for doing as his constituents told him. Moreover, there were 15 other supporters of his prayer against the Regulation, who were apparently to be treated as merely misguided. Mr Bevan had another card up his sleeve. He incited a strike. He announced that his companions in crime, who included Mr Grenfell, an ex-Minister and member of the Party Executive, also under instructions from his constituents, would go with him if he went. The Labour Party has failed conspicuously—and inevitably—to maintain the tightness of its Parliamentary discipline in the peculiar conditions of wartime coalition. Mr Bevan, who is confessedly a man of much irresponsibility in his utterances, may be compelled to follow Mr Brown and Sir Stafford Cripps into the wilderness. But this now seems unlikely; and, if it does happen, there is little doubt that this time the Labour Party will at last be shaken by its determined opposition to dissenters—and that Mr Bevin, who has made this issue a matter of confidence, may find that his undoubtedly strong position in the Government is based less and less upon the natural dispositions and prejudices of the working men with whom, in the discharge of his immense and invaluable official duties, he has lost touch more than he would care to admit, either in the Cabinet or in the House of Commons.

### Local Duties

In a BBC discussion on local government some time ago one good point was made. It was agreed that British practice is free from corruption; but it was agreed, no less, that there was "a good deal of wangling." This is, in effect, the conclusion of the report made by Mr Roland Burrows, KC, to the Home Secretary on

the administration by the Council of the City and County of Newcastle-upon-Tyne and its committees and officers of their functions in relation to the fire, police and civil defence services.

Mr Burrows found that the misuse of public property and personnel by certain individuals was proved; and that the delegation of responsibility to certain officers had been done without a sufficient check in the public interest.

Escape from the worst charge of graft should not hide the importance of this finding for local administration at large. No doubt the danger of personal irresponsibility is bigger in wartime when the system of local democracy, with elections and continuous control by representative assemblies, is often more or less in abeyance. But there is little doubt that such excesses, minor though they are—the Newcastle case is exceptional but not unique—are only an exaggeration of tendencies that exist in peacetime. The habit of regarding public possessions and staff as the perquisites of local office is too widespread for comfort; and it should be said, incidentally, in reply to critics of the rôle of bureaucrats in democracy, that one of the reasons why these petty failings are more evident in local government is the absence, compared with Whitehall, of a municipal civil service of proved character and tradition. The steps that were being made before the war to create such a civil service deserved every assistance. Certainly the state of affairs in which some councillors can regard the use of official property, whether it be vehicles, fuel, institutions or garden produce, as theirs to use, should be brought to a sudden end. This is the very thin end of a very sinister wedge. The best cure is publicity and criticism. There is a strong case for the reinstatement in every area of a full committee system in which the conduct of councillors and officers is reported regularly to elected representatives. Wartime is no longer an excuse for negligence in these matters. Most of all, peacetime or wartime, there is a great need for much more widespread interest by citizens in the affairs of local government, and for the fullest and most responsible possible examination of local administration by all the agencies of public opinion.

### Farm Policy Illustrated

The Tory Reform Committee has varied its workaday documents on public policy with a handsome tract on agriculture, illustrated with drawings by Thomas Derrick. ("The Husbandmen Waiteth." By Three Members of Parliament. Tory Reform Committee. Price 9d.) The more sober reader, not put off by these admirable but meretricious aids, will look first at 'the pamphlet's proposals, which are not very helpful. The price structure should be "designed to encourage a well-balanced variety of crops and livestock." Prices, "based on efficient costs," should be settled by the Government "after consultation with the industry." "The quantities of food to be produced by British farmers should be agreed upon, whenever possible, for a considerable period ahead." "The quantity and price of our principal imports of food from overseas should be negotiated and settled by the Government." But there should be "the minimum of interference with individual freedom" compatible with "a high standard of ownership and cultivation." The saving clause is "based on efficient costs." It may be that "a well-balanced variety of crops and livestock" simply means the preservation of those activities which, though not themselves economic, are indispensable to the carrying on of those that are. It may mean that British agriculture should be free and willing to implement the nutritional programme—dairy produce, fresh vegetables and fresh meat—which it is best able, economically, to do. Equally, it may not. For one thing there is no admission of the paramountcy of the consumer and the virtues and advantages of cheap food. It may mean that traditional considerations of farm technique—and farm profits—are intended to outweigh economic realities. Until the Tory Reformers give some clearer idea of the guaranteed prices they propose and of the products and quantities they propose to apply them to, there must be doubts—despite the delightful pictures.

### The Russo-Czech Agreement

Although the new agreement between the Russians and the Czechs was not concerted, officially between the Allies, the model for the treaty was the arrangements already made between the British and American Governments and the Allied nations in northern and western Europe. To this extent, it represents a joint policy, and both Britain and the United States have given their approval to the agreement. It is, in fact, a model agreement. While the Soviet Commander-in-Chief "is to have full

authority in the actual fighting zones, the Czechoslovak Government will take over the full administration of liberated territory as soon as it "ceases to be a zone of direct war operations." A Czech delegate will be attached to the Soviet High Command to create and direct the administration of liberated territory "in conformity with Czechoslovak laws," to establish Czechoslovak military forces, to give the Soviet Commander-in-Chief every possible assistance, and to issue instructions to the local authorities. A Czechoslovak Military Mission will also be appointed. The Soviet Commander-in-Chief will have jurisdiction over all Soviet soldiers on Czech soil, but Czechs, military and civilian alike, will come under Czech jurisdiction even when crimes are committed against Soviet troops. The financial arrangements are postponed for later discussion.

This agreement has a political moral. It shows that when a European government is anxious to be on good terms with Russia, ideological prejudices, past history and territorial questions are not a very great obstacle. The Prime Minister of Czechoslovakia is a Catholic priest. The Communists are unrepresented. The background of the whole Cabinet is bourgeois and traditionalist. In the recent past, although Russia did not condone Munich, it did recognise Slovak independence and the Government of Dr Tiso. Even the frontier issue could have been delicate if the Russians had chosen to raise the question of Ruthenia, the only remaining Ukrainian territory to which they have not laid claim. Why is it that obstacles which are thought to be insuperable in the case of Poland are non-existent in the case of the Czechs? The chief reason is surely that the Russians have no reason to doubt the friendly intentions of the Czechs nor their acceptance of an "eastward orientation" in their politics.

### Stalin's May Day Order

When in 1812 the Russian armies reached the river Niemen a violent dispute broke out between Kutuzov and the Czar, Alexander. Kutuzov urged that the Russian armies should not be compelled to advance any further.

As soon as the armed foe disappears from Russian soil, hostilities ought to cease. There is no reason why we should shed our blood to save Europe. Let Europe save itself by its own exertions.

Kutuzov was overridden. Alexander ordered the Russian armies to advance, and they fought on to bring the war against Napoleon to an end and to draft the peace with their British and Prussian allies. In the course of this war the Germans have regularly hinted at the possibility of a separate peace, and in particular they have made great play with it during the lull which has followed the sensational Russian advance in the Ukraine. The Germans have reminded the world that the clearing of the enemy out of Russia has hitherto been Stalin's chief war aim, and have hinted that this lull marks the end of the Red Army's contribution to Hitler's defeat. But Marshal Stalin is an Alexander, not a Kutuzov. His May Day Order to the Red Army and the nation makes it clear that victory, not liberation, is the first war aim of Russia.

Our task cannot be confined to the expulsion of enemy forces from the boundaries of our country . . . in order to eliminate the menace of enslavement from our country and the countries allied to us, it is imperative that the wounded German beast be hotly pursued, and finished off in its own lair.

Marshal Stalin paid a warmer tribute to the co-operation of the British and Americans than in any previous Order of the Day, and the whole tone of his message suggested a real and deep appreciation of the Grand Alliance and of its value to Russia—a happy augury for the military and political tasks that lie ahead. The greatest single obstacle to full agreement between the Russians, the British and the Americans is still distrust. The more it can be dissipated in the coming months, by joint military efforts and by mutual political forbearance, the greater the chance of a commonly agreed armistice and peace.

### Building on Sand

Relations between Poles and Russians in eastern Poland are still enigmatic. Some weeks ago the Polish Government received news of cooperation between the Polish under-

ground and Russian troops. No further information about the scope of this cooperation has been available so far. On the other hand, the Polish-Soviet radio "Kosciuszko" has flatly denied the Polish reports from London and stated that friction and even fighting between the two sets of guerillas still continue. Owing to the temporary lull on the eastern Polish front, the issue has not yet become much more acute than it was when the Russians crossed the old Polish frontier early in January. The impending summer offensive is, however, likely to carry the Russians far beyond the Curzon line. The problem of a Polish administration to the west of that line will immediately come to the fore. Nothing has yet been done to prepare any workable solution. The Czechoslovak-Russian agreement on the administration of Czechoslovakia might serve as a model to be applied at least in the undisputed Polish territory. But with whom would the Russians conclude such an agreement? The Polish Government in London is no less representative than the Government of Dr Benes—but Marshal Stalin apparently does not believe it. The arrival of a delegation of American Poles to Russia can have little to do with the setting up of a pro-Soviet Government in Poland. Both delegates, Father Orlemanski and Professor Lange, are American, not Polish, citizens. Perhaps Marshal Stalin wanted to demonstrate in this way that his attitude towards Catholic Poland is not unfriendly. Significantly enough, he received Father Orlemanski at the Kremlin, but not Professor Lange, who, before he left for the USA, was one of the leading intellectual leaders of Socialist youth in Poland. But Stalin's friendly gesture towards Father Orlemanski is not at all likely to impress Catholic circles in Poland favourably. He is even less representative of Polish Catholic opinion than is, say, the Dean of Canterbury of the Church of England. Russian attempts to establish contacts with friendly Poles seem to be based on very unreliable information about the comparative importance of various groups and personalities in Polish politics. But it is not only misinformation that leads the Russians astray. Marshal Stalin clearly does not want to base his policy in Poland solely or even mainly on Communist elements. He is at the same time reluctant to deal

## Conserving the FOOD VALUE of our Milk

MILK Chocolate is a convenient medium for carrying, storing and conserving milk, but there is much more to it than that. . . Fresh dairy milk consists of two elements—water, which averages 87½%, and 'milk solids' (fats, protein and milk sugar), which contain calcium, phosphorus and Vitamin D and which constitute the whole food value of the milk. As the chart shows, Cadburys Milk Chocolate retains all the milk solids of all the milk used, and only the water is eliminated.

## Cadbury means Quality

with the parties and groups that really count in Poland, because those parties and groups support M. Mikolajczyk's Government. What follows is a desperate and somewhat tragicomic search for "friendly" personalities in Poland's political no-man's land. But a genuine Polish administration cannot be set up on the basis of this no-man's land. If it is, it will be built on the sand of Poland's national humiliation.

### The Reproduction Rate

The number of births in England and Wales in the last quarter of 1943 showed the same improvement over the previous year as the earlier quarters. The result is that the total for the year, now released, is the highest for many years. The crude birth-rate, at 16.7 per thousand, was the highest since 1928. That this rise in natality is likely to be of short duration is shown by the slump in marriages, which were the lowest for an even longer period. In short, as has often been pointed out, the high wartime birth-rates are largely a reflection of the acceleration of marriages during the early years of the war—and therefore of first

|            | Marriages                    | Births  | Stillbirths | Deaths  |
|------------|------------------------------|---------|-------------|---------|
|            | (Numbers)                    |         |             |         |
| 1938.....  | 361,768                      | 621,204 | 24,729      | 478,996 |
| 1939.....  | 439,694                      | 619,352 | 24,309      | 499,902 |

\* Provisional.

† Persons married.

births—which would otherwise have occurred later. The Registrar-General states that "the proportion of the marriageable population at the marrying ages" is now the lowest on record. The slump in marriages that has now begun will continue, and it will be followed by a slump in births. What is of more permanent importance is the continued improvement in the general (civilian) death-rate and in the infant mortality rate. The latter, at 49 per thousand live births, was the lowest on record. As a result of high births and low deaths, the net increase was more than double the average of 1937-41. Even so, it was only 181,000, out of a total population of over 41 millions.

For the first time, the Registrar-General has calculated a series of net reproduction rates for the population of England and Wales. The defect of the crude birth-rate is that it takes no account of the age-distribution of the population. A high birth-rate may be merely the reflection of an unusually high proportion of people in the marrying ages; it may mean much or little about the extent to which the population is reproducing itself. The net reproduction rate measures the extent to which 1,000 female children born now are likely, in the course of their life-times, to give birth to 1,000 female children of their own. A rate of unity implies an exact reproduction, a rate of .75 would imply that each generation would be three-quarters the size of its predecessor. The Registrar-General's reproduction rates are as follows:—

|           |      |            |      |
|-----------|------|------------|------|
| 1933..... | .747 | 1939.....  | .808 |
| 1934..... | .766 | 1940.....  | .772 |
| 1935..... | .764 | 1941.....  | .761 |
| 1936..... | .774 | 1942.....  | .853 |
| 1937..... | .785 | 1943*..... | .903 |
| 1938..... | .810 |            |      |

\* Provisional.

It is a great gain to have official estimates of this essential statistical instrument for discussing population policy. Unfortunately, however, the Registrar-General has seen fit to define the reproduction rate in a way of his own. Instead of basing the estimate on fertility and mortality as they were in the year in question, he has preferred to assume "a continuing improvement in survivorship conditions." That is to say, instead of giving the girl babies born in 1943 the expectation of life that existed in the year of their birth, he has given them a slightly better expectation, on

the ground that the death-rate will probably continue to fall. By this means, he assumes that slightly more of these children will live through the child-bearing ages. The difference is slight, but it is none the less regrettable, since it means that the British statistics will be on a slightly different basis from those of other countries. It is difficult to see why he should have chosen to make the calculation in this way, unless it was simply to be different from all other demographers. It is quite true that the children born in 1943 will have a mortality experience different from, and probably better than, that of 1943. But they will also, when their turn comes, give birth to children at a different rate from that of 1943—and quite possibly at a lower rate. If assumptions are to be made about the future of mortality, why not about the future of fertility also? And if future mortality is being assumed, what allowance is being made for the possibility of future wars? Clearly, once the solid ground of ascertained fact is abandoned, the whole matter becomes speculative. The Registrar-General's optimistic bias has led him into demonstrable error before this in recent years, and seems to have done so again. Is it too much to hope that he will reconsider the matter?

### Tax Troubles

Pleas were made in this week's Budget debates for special reliefs of taxation in particular cases of hardship. The two most mentioned were the plight of elderly persons in receipt of fixed incomes and, surprisingly in view of common talk, the financial difficulties of girl workers in war factories. It is hard to see how the Chancellor of the Exchequer could have given any other answer than a negative one, though there is a case, without radical innovation, for some reconsideration of the treatment of annuities for taxation purposes. But it is not possible, within the confines of a uniform and far-reaching system of direct taxation, to make special exceptions. If there are grievances to be redressed the remedy must be sought elsewhere. The problem of age, as the Beveridge Report showed, is perhaps the one of our social issues that most cries out to be settled, especially in view of the steadily increasing number of old people. Some heart can perhaps be taken by those who are anxious about the effect of income tax upon the elderly from the fact that Government spokesmen have roundly told Sir William that their proposals for old age pensions will be much more generous than his. On the other hand, it is probable that the critics had in mind, not the aged poor, but the genteel poor, whose conventional standard of living and established commitments eat away their incomes. So far, except in the case of children and their schooling, it has not been possible, democratically, to allow for committed personal expenditure in assessments for income tax. There is, however, the question of the taxation of annuities; and the other plea can probably be dismissed more easily. If girl war workers cannot make both ends meet, which is sufficiently doubtful to need more proof, then they should be paid more by their employers. The puzzle is why, if they are really paid so inadequately, they should still earn enough to be liable to income tax.

### The Unit of Local Government

Local government reformers tend to be of two sorts—a priori radicals and traditionalists. The Labour party wishes to change all the existing units. The Liberal National Committee proposes to keep them all—with the one exception of the parish meeting. It is right that the traditional structure of local government, well tried however illogical, should be kept in preference to a clean break made for merely theoretical reasons. But this does not mean that it should not be considerably adapted to new needs. Many authorities are clearly too small or unwieldy in shape. To deal with these, the Liberal National Committee proposes a permanent boundary commission, which would, in the first instance, arrange amalgamations to ensure a minimum population in any area of 10,000—population being preferred as a criterion to rateable value or acreage. This is not going far enough. Whatever the objections put forward to the idea of single all-purpose authorities centred around large towns—the most cogent being that for many functions they would be too large to be representative—

urban and rural districts need to be regrouped so as to strike a better balance between town and country, and to secure large enough units for efficient administration. The size of areas cannot, of course, be considered without reference to the division of functions. It is becoming clear that many vital services such as health, education, and town and country planning must, in practice, be dealt with, in part at least, on a regional basis. But it is probably better to erect regional authorities in an *ad hoc* manner, which can then take over all or some of the local powers, rather than to establish a new—or a rigid—regional hierarchy.

### Labour's Fuel Policy

The Labour Party's postwar coal and power policy, to be discussed at the Whitsun conference, states a number of sound and unexceptionable principles about the fuel industries. One is that Britain's future depends upon coal. Another is that the processes of extraction, processing and utilising coal should be regarded as a whole, and the various industries integrated. A third point is the importance of planned development and research. The central theme of the report is the necessity for the nationalisation of all three industries as the only means of benefiting the whole community. Nationalisation would take the form not of state administration but of a public corporation, and in this sense it is a departure from earlier Labour doctrines. The administrative structure proposed is a National Coal and Power Corporation, appointed by the Minister of Fuel and Power, on the basis of technical competence and including representatives of labour. Under the Corporation there would be separate Boards for coal and for gas and electricity. The Coal Board would be responsible for production, distribution and by-products; a marketing board would be set up to sell at home and abroad and to regulate prices and exports; the Board would appoint Regional Boards and Pit Committees, with trade union representation, to deal, at the pit level, with questions of production, dismissal and welfare. The same kind of administration is proposed for the gas and electricity industries.

There is much in this report that will repay study. The case for the nationalisation not only of the mining industry, but also of gas and electricity supply, is made out largely by historical reference and by illustration of the present

uneconomic organisation of all three industries. The gas industry, for instance, has nearly 800 owners owning 1,079 different undertakings, and there has been a lack of co-ordination of technical development. The same criticism of multiplicity of undertakings applies to the electricity supply industry. But there is little in the report which could not have been written five, ten or even twenty years ago. Remarkably little attention is paid to the wartime experience of coal "control," and not nearly enough to the means of achieving greater productivity in the industry. "A higher standard of wages" is, very properly, one of Labour's aims, but it cannot be assumed—to say the least—that this would be achieved automatically through nationalisation, and there is barely any mention of mechanisation and modernisation of the pits. The question of compensation is left in the air, as a matter to be assessed by selected Commissioners, on the basis of conditions prevailing at the time of the state's acquisition of existing undertakings. The relation of the Ministry of Fuel and Power to the Coal and Power Corporation is not defined. It is unfortunate that the opportunity should have been missed by the Labour Party to state the case for nationalisation, not only on high moral principles, but on sound technical grounds. The only case for nationalisation is that it would enable the coal industry to be more efficient than in private ownership, and this report hardly begins to argue this, let alone prove it.

### Shorter Notes

After the sensational talk of the last few months, the communiqué issued at the end of the Anglo-American oil conversations may serve to bring public opinion down to earth. The statement speaks of "abundant oil supplies" and makes it clear that there is no British opposition to the proposed American pipeline in the Middle East. One of the reports—though not the official statement—says that there is to be a permanent joint body for discussing oil problems.

The lengthy and sometimes contentious negotiations about the promised British loan of £50 million to China have been concluded, and the agreement was signed on Tuesday. The money is to be available "for the financing of goods and services required by China in the sterling area for purposes arising out of the war."

## AMERICAN SURVEY

### Green Pastures and Hot Asphalt

(From Our Washington Correspondent)

COMMENTING on a recent conversation on the future of industrial risk, in which the initial remarks all dealt with post-war opportunities abroad, a business man observed: "The side lanes leading to the possibly green fields of Russia, China, Latin America, etc., are so nicely shaded that travelling the sun-beaten highway, paved with our own domestic industrial problems, appears too mentally laborious."

The attractions of the side lanes certainly are demonstrable—even for operations not in themselves shady. When talk around Washington runs to what is rather anonymously called "an average year in the post-war decade" a gross national product of at least \$165 billion is anticipated, of which some \$25 billion or better would be used for private capital formation. Of the \$25 billion, however, only about \$2 billion are thought likely to be invested abroad. Yet in spite of this, opportunities abroad seem to be the ones which come most enthusiastically to mind when the subject of new investment is mentioned.

How much of this enthusiasm is nostalgia? Hero stories of Americans improvising their way out of tight spots in far-flung places can now be found on page 3 of any daily. The glamour of the vanished frontier is upon them. They

carry no hint of a social security registration number. Perhaps it would be possible to do business like that, again. No government forms to fill out, maybe. Take an undeveloped country and use the know-how that made the Middle West; old hands at that, aren't we?

Specific evidence of this nostalgia is the emotion which currently surrounds the word "cartel." The indictments brought by the Department of Justice against various American firms because of their relations with I. G. Farben have concentrated on cartels the popular—and largely political—antipathy which has always been available at mention of the word "monopoly." It seems reasonably clear that the inference to be drawn from some of these indictments, to the effect that a chief sin of the companies with foreign trade agreements lay in not fully informing the US Government of what they were about, leads to the further inference that in the future the US Government means to be informed and that therefore considerably increased public participation in post-war international deals is likely. But not in the public mind. The alternative to cartels is too widely assumed to be the kind of private enterprise by individuals that was the stock alternative to monopoly when that word—and the American economic world—were young. The

public is thus enjoying a period of being against something that is unlikely to exist again in its previous form, while being for something that was characteristic of an even earlier era.

Too much of this reaction is available when spokesmen for business such as Mr. Eric Johnston of the US Chamber of Commerce or Mr. John Fenelley of the Committee for Economic Development make statements like the latter's comment that "we learn that English post-war planning is largely interested in bigger and better cartels, in the establishment of quotas, and the division of world markets. . . . I only hope our understanding of this British trend is erroneous, because I am profoundly convinced that if Britain pursues this course she can only look forward to lower and lower standards of living and a progressively greater degree of state socialism. In the United States we are determined to set our course in the opposite direction in a great collective attempt to see if we cannot solve our problems through steadily increasing production under a genuinely free system of private enterprise."

Such comments are sound to this extent: it is a healthy mood when business feels itself efficient enough to go into a competitive situation without the restrictions on output, territory, and prices characteristic of cartels. The spreading impression that American business wants to, and can, go it alone, however, is poor popular preparation for actualities. Such an impression ignores the fact that the economies of the major nations will be on a war basis when hostilities cease, and that strategic considerations will not immediately go out of mind. It ignores the close connection between business and foreign policy in other nations. It leaves the general public in a mood in which no pressure will be exerted on the Government to have an economic foreign policy that is both informed and consistent, and also one in which the maximum political antagonism can be mustered against any co-ordinated business-government moves that do take place.

Various businesses are acutely aware of the present anachronisms in public thinking and of the relative absence of government thought. Oil and aviation are only two rather flamboyant instances of industries whose post-war future is very obviously going to be conditioned by Government decisions. Meanwhile, the future of these industries is turning into the present. At the same time, wide ranges of disagreement still exist within the industries themselves, while any integration of their interest with the general interest appears remote.

### Government Aid

In this situation the speech on Peace and Foreign Trade, made on February 23rd by William L. Batt, vice-chairman of WPB and member of the Combined Raw Materials Board and the Combined Production and Resources Board, is of practical interest. Mr Batt believes that increased Government assistance to business in meeting the problems of foreign trade is an inevitable development. The protection of American business against Government-assisted competitors abroad called for an equally strong organisation of American Government agencies dealing with foreign trade. It was rather far-fetched to conclude that such a policy represented the abandonment of private enterprise and the surrender to Government control.

The tradition which regarded America as a land of unlimited natural resources belonged, said Mr Batt, to the past. The economy of the country, it was true, had been built on these resources, but the conclusion was inescapable that many of them were now approaching their end. In future the country would have to look forward to a position, comparable to that of England, depending on imports for the life-blood of her existence. This situation, which might hurt the pride as it challenged the realism of the American people, had led Mr Batt to consider a recent proposal made by a few of the soundest thinkers in this field. He suggested that the precious remaining supplies should be carefully husbanded while every effort was made to import as much as possible of the critical raw materials.

Stockpiles resulting from this policy, Mr Batt suggests (in tones that sound like Mr Wallace's ever-normal granary done in metal), might be kept as strategic safeguards. The administrative details of holding these reserves was immaterial at the moment. What mattered, in Mr Batt's opinion, was that a limited production only of dwindling home resources should be continued at a level consistent with national security, irrespective of the private interests of any particular bloc. Once the American people are

shocked into a realisation that their vast natural resources are fast being dissipated, he said, it should be easy for them to accept a positive programme of exploitation of imports of these same critical materials under restrictions by which these imports can be made useful and not harmful.

The part played by the Government in such a policy need not exclude participation by private traders. Some government agency would be required to lay down certain over-all controls—the amounts to be purchased, some limitations on the price to be paid, storage and handling, and the necessary Congressional appropriations. In the interests of national defence, the Army and Navy would have to be represented on the Board. Such an arrangement, however, would hardly usurp the functions of the private trader, who would be assured a market for whatever he could produce. Whatever industrial purchasers could not absorb would be taken up by the Government agency, acting as a buyer for the national stockpiles. Certainly, Mr Batt believes, such a programme would appear to be a great stabiliser of metals prices.

There will probably be other statements like this one, from a wide range of sources. The other day Captain Rickenbacker proposed that Lend-Lease should be repaid in raw materials. They are likely to indicate that the side lanes of foreign commerce are not so different from the sun-beaten highways of our domestic industrial problems—and equally in need of being paved with something harder than the shapeless hot asphalt of good intentions.

## American Notes

### Agreement on Essentials

With General MacArthur's final renunciation of Presidential hopes, and Mr Willkie's withdrawal, it looks as though Governor Dewey were bound to be the Republican candidate, not only for his own virtues, but by the very lack of any alternative of comparable stature. His speech last week to the American Newspaper Publishers' Association shows that he has at last determined to face the fact. Governor Dewey had many sound things to say about the connection between democracy and the freedom of the Press, which were calculated to endear him to his audience of newspapermen and magnates; but it was his endorsement of Secretary Hull's foreign policy which made it a significant occasion. He insisted that in the United States today there is overwhelming agreement on three main objectives: to carry on the war to total, crushing victory; to organise in co-operation with other nations a structure of peace backed by adequate force to prevent future wars; and to establish and maintain in relations with other nations conditions calculated to promote world-wide economic stability, and raise the American standard of life. Urging that to win the peace would require at least as much determination as to win the war, and over a long period, he pointed out that no drastic initial measures against Germany and Japan would have permanent value unless they fell within the setting of a "durable cohesion" between the United States, Great Britain, Russia, and China. Admitting that co-operation with Russia involved the greatest difficulties, because of the long history of mutual distrust, Mr Dewey argued that the war had brought some improvement; and that political dissimilarities need not be a cause of friction if American representatives prove themselves as "realistic and devoted to their country" as the Russian leaders. In the attainment of world economic stability, Mr Dewey urged that the greatest contribution the United States could make was by restoring its own economy to vigour and growth. He rejected the idea that the American economy had reached a stage of static maturity—a belief he attributed by implication to the Administration; and held out the conviction that once more the United States might become a "land of opportunity."

Governor Dewey's speech has disappointed the McCormicks, the Pattersons, and others who had hoped that he would become the spear-head of a new nationalism. He has clearly decided against any controversy over the basic issues of foreign policy. This is an impressive tribute to the popular appeal of Mr Hull's recent pronouncements, for Governor Dewey, who has won the label of the "politician's politician" is an acknowledged expert at deciding

which way the wind is blowing. Outside the "Chicago set" this first intimation of his stand has been welcomed by members of both parties, by the Willkie-ite *Herald Tribune* and the Democratic (though not New Deal) *Times*. It has even received Senator Connally's blessing. One commentator, indeed, pointed out that this was only a "promissory note" and urged Governor Dewey to take up Mr Willkie's fight for the soul of the Republican party. But even if Governor Dewey declines to undertake a purge of the Old Guard—and Mr Willkie has provided vivid proof of the political unprofitability of trying to do so—it can hardly be denied that he has made a handsome first instalment. Governor Dewey was at pains to avoid another of Mr Willkie's mistakes—his too close identification with Administration policies. He has endorsed the principles of Mr Hull's foreign policies; but his fire is to fall upon their application and the "private" conduct of foreign affairs by Mr Roosevelt. The Versailles treaty failed, in his view, because those who drafted it were "tired war leaders who could not find within themselves the physical and mental strength to make the peace a living reality." Nor will Mr Dewey accept the label of idealist, which hampered Mr Willkie. His speech was shot through with references to realism, hard-headedness, and devotion to American interests; and his one mention of idealism was severely qualified by the adjective "practical." It would be both ungracious and untrue to say that Governor Dewey wants the best of both worlds—or both parties. He has come out flatly for the "responsibilities which two world wars have shown are inescapable." How successfully he would be able to weld the Willkie following with the harder-headed members of his party over a term in the White House is problematical; but he has made a skilful beginning in the opening of the campaign.

### Civilian Supply

The War Production Board recently issued an order, which appeared reasonable, if tardy, in view of manpower shortages in war production centres, freezing civilian production at existing levels in critical labour areas. Three days after Mr Truman, Chairman of the Senate War Investigating Committee, announced a study of the order, it was modified to allow expansion of civilian production, even in these critical shortage areas, in plants which have no war contracts and which employ unskilled workers. Plans for reconversion after the defeat of Germany, when it is estimated war production will be cut by 35 per cent, are going ahead, but there has been considerable difference of opinion between Administration agencies, on the one hand, and the Truman Committee, on the scope for an expansion of civilian supplies before the conclusion of the war with Germany. Mr Nelson, of the WPB has, in general, taken the line that these opportunities were slight, and that it would be dangerous to start any substantial upswing in civilian production until it is certain that the labour and plant will not be needed to fill emergency war orders. The Truman committee, on the other hand, has taken the view that there is no obstacle to very considerable increases in the production of civilian goods, although it admitted in its report in March that information on "cut-backs" was too indefinite to permit accurate forecasts of the course of war production. Assuming, however, that the amount of cancellation of contracts would be very large, as the Services complete the bulk of their initial equipment, and noting that except in the case of copper, there are sufficient basic materials to supply not only war needs, but some items for civilian use, the Committee urged that civilian production should be resumed as soon, and on as large a scale, as possible. Its argument is based, not only on the desirability of raising home-front morale, but on the need for avoiding unemployment and filling urgent civilian needs such as new farm machinery and replacement parts. The Committee was particularly concerned that after war requirements and such basic civilian needs were met, manufacturers should be given the widest possible freedom to make their own decisions as to production, in order to avoid perpetuating the wartime strait-jacket. There can be no quarrel with the contention that where real manpower and material surpluses exist they should not be allowed to go idle. It is difficult, however, to reconcile the expansion of civilian production in manpower shortage areas with the alarm recently voiced by the Services on the manpower position.

### A Post-War Military Establishment

Now that Mr Dewey has spoken and there is apparent agreement on both sides on the party fence on the need of force to implement the peace settlement, the question of the size and character of the American post-war military establishment becomes an urgent consideration. As the *New York Times* has pointed out, American military policy not only constitutes one of the essential underpinnings of the peace; it will have important effects on problems of re-employment and reconversion. The House Military Affairs Committee already has heard testimony from Secretary Stimson and other Army witnesses on the desirability of a merger after the war of the Service Departments. This week Mr Forrestal, Acting Navy Secretary, and suggested as a likely successor to Colonel Knox, showed himself less convinced. While emphasising that the voluntary unification of command which now exists should be retained, Mr Forrestal opposed the creation of a single Department of Defence, pointing out that "size is no guarantee of efficiency." His emphasis on the success of the Navy's use of air power also appeared designed to ward off the proposed consolidation of the Air Forces. Of equal if not greater importance is the question of the industrial capacity and manpower to be retained for military purposes after the conclusion of hostilities. The setting aside of certain plant facilities for military procurement appears to be a foregone conclusion. The maintenance of a two-ocean Navy in itself will require substantial industrial capacity. But the industrial price of preparedness is comparatively simple compared with the problem of peacetime conscription. It is generally accepted that the use of American forces to preserve the peace will be largely a matter for the Navy and the Air Force. But even so, there is a strong argument for universal military training. Colonel Knox, before his death, had put the case with great force, not only from the point of view of national defence, but on the grounds of the benefits it provided for the trainees. It has been supported by Major-General Hershey, the head of the Selective Service, and by Brigadier-General Palmer. But there are few signs of popular understanding that peacetime conscription may be one of the prices of a secure peace. It will hardly be paid without violent controversy, and if it is left until after the war the chances are that it will not be paid at all.

### Magna Carta in Chicago

The great mail order house of Montgomery Ward, in Chicago, is said to be planning to use a photograph of its chairman, Mr Sewell Avery, being carried out of his office by the Army, to illustrate its slogan, "We take orders from everybody." This may be true in its commercial transactions, but the company takes a different line in its labour relations. Behind the strike which started on April 12th, and in the words of the President's order, "caused delay in the delivery of farm equipment, repair parts, electrical appliances, automobile tires, and other goods essential for the economy in wartime," lay three months' refusal on the part of Montgomery Ward to recognise a CIO union and to obey an order of the War Labour Board, with the result that the firm's premises were ordered to be operated by the Secretary of Commerce, and Mr Avery discovered that the Army was willing to take extreme measures. The military have now been withdrawn, with the granting of a court injunction restraining company officials from interfering with Government operation. The company insists, however, that there has been no such violation of civil liberties since the days of King John; and anti-Administration papers have acidly contrasted the Ward case with the more diplomatic handling of last year's coal strike. Even moderate opinion, while granting Mr Avery's record of calculated obstruction, has found the episode distasteful. This may be what Mr Avery expected. Already in Congress there has been an attempt to deprive the War Labour Board of its authority to order maintenance of membership clauses as a wartime compromise between the open and the closed shop. Judged by the account given in the President's order, both the Government and the union have shown considerable patience under great aggravation, but it cannot be denied that the case, in unfriendly hands, has the makings of a campaign issue, especially in Chicago and the orbit of Colonel McCormick's *Tribune*.

# THE WORLD OVERSEAS

## Poles, Ukrainians and Jews

RECENT events in the Polish Army—the “desertions” of Jewish and Ukrainian soldiers and the courts-martial that followed—have focused attention in this country on Poland's old problem of minorities. The question of the Jews in the Polish Army has been raised in the House of Commons; the question of the Ukrainian soldiers has been taken up even more strongly by the Soviet press.

Of the two, the Ukrainian question is politically by far the more important, though the number of Polish soldiers of Ukrainian nationality is very small. The Ukrainians are Poland's strongest minority. They are also an irredentist minority, which the Jews are not and cannot possibly be. Diplomatically, the court-martialing of the Ukrainians may cause more trouble, because the Russian Government regards the Ukrainians as Soviet citizens, and consequently may treat their forcible retention in the Polish Army as a hostile act. Long before the recent Ukrainian “desertions,” it was said that the Russian Government had formally objected to the recruitment of Ukrainians in Canada for the Polish forces.

Moreover, the Polish-Ukrainian feud has taken an unfavourable turn for the Poles. Since 1939 no political group among the Ukrainians, either in Poland or in exile, has spoken in favour of co-operation with the Poles. Both the pro-Soviet Ukrainians and the anti-Soviet Ukrainian nationalists are opposed to the continuation of Polish rule in Ukrainian lands; and not a single Ukrainian representative has adhered to the Polish Government or to the Polish National Council in London. In such conditions the forcible retention of Ukrainians in the Polish Army in exile is politically useless, no matter how strong the legal ground.

The issue is much wider than the “desertions” of a few soldiers. It is part of the general and still unsettled problem of Poland's eastern lands. While the Ukrainian “desertions” foreshadow a wider conflict that has not yet reached its climax, the “desertions” of Jews from the Polish Army are the sad echo of an antagonism that belongs largely to the past. The so-called “Jewish question” in Poland has been irrevocably and tragically settled in Nazi slaughter-houses. The Jews formed more than 10 per cent of Poland's pre-war population; they numbered about three and a half million. It is a highly optimistic assumption that after the war they may number between 1 and 2 per cent, that is between three and six hundred thousand people, most of them human wrecks. Many of the Jews in Poland who have escaped the slaughter-houses have found refuge among the guerrillas who fight under Soviet direction; some have been saved by the Polish underground organisations.

### Anti-Semitism

Viewed against this grim background the continued existence of anti-Semitism in the Polish Army in exile must appear as an extraordinary instance of moral and political perversity. Its existence cannot be denied. True, its violence has been exaggerated. It is not true to say, for instance, that the attitude towards Jews in some Polish units in Scotland recalls the practices of an SS detachment. Brutal treatment of Jews has been the exception rather than the rule. But discrimination in milder though hardly less harmful forms has been fairly systematic. Chances of promotion for soldiers of Jewish descent are extremely poor. No responsible jobs in the Polish Army, even when promotion is not involved, are given to Jews. The “Aryan paragraph” is more decisive than the skill or conduct of the soldier. More important still, soldiers of Jewish descent are surrounded by an atmosphere of distrust and hostility that pervades their daily life in barracks. It is the anti-Semitic state of mind rather than anti-Jewish excesses that form the background of the “desertions.”

Clearly, a state of mind cannot be cured by stern disciplinary measures. It could probably be gradually dispelled by good example, enlightenment and educational work. In this the Polish military authorities have strikingly failed. True, now and then the pressure of Allied opinion has caused the Polish Command to issue formal orders against

racial discrimination. But such orders have invariably been conveyed to the rank and file in a way that encouraged rather than discouraged anti-Semitic feeling. The “explanation” has almost always been added that on foreign soil anti-Semitic feelings ought to be kept under control, and that the time for Poles to behave as they would like has not yet come.

### The Polish Army

Most of the trouble has been due to the peculiar composition of the Polish Army in exile. This is not a normal army drawn from various sections of the population. Its rank and file consist largely of the former bureaucracy, the only element that was able to escape from Poland after the defeat of September, 1939. The Polish people in the mass has never been really influenced by anti-Semitic propaganda. The zealous efforts of the corrupt and inefficient Rydz-Smigly and Beck administration to make the Jews scapegoats for their own failures met with remarkably little response. Apart from a section of the Polish lower middle class, for which Jew baiting was an auxiliary weapon in commercial competition, anti-Semitism in pre-war Poland was a bureaucratic concern rather than a popular movement. But this is precisely the reason why it is relatively so strong in the Polish Army in exile.

Even so, it is a policy of very dubious wisdom for the Jews to ask for wholesale transfer to the British forces. So far such demands have been made only by a section, probably a minority, of soldiers of Jewish faith. In the course of four years, only sporadic and individual transfers had taken place. This was so in spite of the propaganda for a separate Jewish army made by Jewish nationalists some time ago. The overwhelming majority of Jews saw plainly their place in the ranks of the Polish Army. The awareness of the common fate of Jews and non-Jews in Poland was the strongest link that tied them to their Polish comrades in arms, irrespective of political differences. However, this link has now been largely severed. The Jewish community in Poland has been annihilated; and the Polish Jew abroad asks himself in the name of what ought he to go on serving in an inimical environment.

The position has been made worse since General Sosnkowski took over the supreme command after the death of General Sikorski. General Sosnkowski himself was responsible for setting up the first concentration camp for Polish Jews as far back as in 1920, at a time when such practices were still unknown to the rest of Europe. This clearly creates for many a Polish soldier of Jewish descent a painful conflict of allegiances. In addition, a certain number of Volksdeutsche taken as prisoners from Rommel's Afrika Corps have recently been enrolled in the Polish Army. The wisdom and expediency of that enrolment is, to say the least, doubtful. Among the Volksdeutsche, there are certainly some good Poles; but there are also some of a much more doubtful national and political complexion. Their enrolment was undoubtedly due to the anxiety of the Polish Command to strengthen an army which is greatly overstuffed with officers and understaffed with men. The new arrivals have clearly caused new friction and more brutal incidents.

Under the Allied Forces Act of 1940 the Polish military authorities have, of course, the right to try their soldiers in accordance with Polish military law. Yet the whole question has been utterly mishandled by the British as well as the Polish authorities. At first, 200 soldiers were smoothly transferred to the British Forces. Then dozens of soldiers have been court-martialled and convicted for an attempt to do what their colleagues had just done, without any punishment. An act that was first legalised, by implication, suddenly became a crime. The convicted soldiers might easily say that, in a sense, they had been induced to seek a transfer. It is difficult to see what the Polish Command gains through insisting on its formal right to convict the alleged deserters. It is much easier to say what the Polish Government loses. The affair has clearly been used for a purpose that has nothing to do with the Polish-Jewish issue, that is for undermining the position of the Polish Government.

## Germany at War

### Food Tactics

HERBERT BACKE, who replaced Walther Darré, Nazi Germany's first Minister for Agriculture, as acting Minister some twenty months ago, was recently made Minister. Backe's term of office was a period of contraction in supplies of foodstuffs and increasing control over their production and consumption. The retreat from the Ukraine and Bessarabia has noticeably lessened Germany's sources of food supply and the feeding of both civilians and soldiers depends more than ever on current production in Greater Germany itself.

There were two alternatives. Either the Minister could reduce the rations of cereals, potatoes and other root crops with the object of keeping up the number of pigs, Germany's main source of meat. Or he could maintain cereal and potato consumption, which would mean that the number of pigs would have to be drastically reduced. Backe has taken the second course. Compared with 1939 the number of pigs in the summer of 1943 had been reduced by nearly half. A total of about 15 million pigs could have been maintained if the potato harvest had been normal. The harvest was a failure, and during autumn and winter of 1943-44 the heavy slaughter of pigs had to be continued in order to leave potato supplies for the towns. The fact that the potato ration was recently generally reduced from 3.5 kilogrammes (7.7 lb.) per week to 2.5 kilogrammes (5½ lb.) shows that the potato crop was very small. The good cereal harvest, however, made it possible to compensate this with an increase in the bread and flour ration.

So far it has always been possible in German agriculture to shift the emphasis in production from one crop to another. The record level of production was reached in 1939. After a failure of the cereal harvests, production was concentrated on potatoes. Now, after the failure of the potato crop, the emphasis is being shifted to sugar beet, swedes and other root crops for feeding purposes. There has been a steady expansion of the acreage under oilseeds, largely to the disadvantage of the acreage under cereals. It all adds up to the most completely vicious circle that can be imagined. Every year these shifts have taken place, always with a considerable increase in costs of production.

Before the war Nazi agriculturists had a curious obsession. They firmly believed that a prodigious use of fertilisers would increase yields accordingly. Actually, while the use of fertilisers per hectare doubled between 1932 and 1939, average yields hardly changed. The present consumption of fertilisers is roughly equivalent to that of 1932, and this is sufficient to produce normal yields. Only the supply of phosphates is far below normal.

The picture of Germany's agriculture now is very different from 1914-18, though naturally the main deficiency is again fats and meat. It has so far been possible to maintain dairy herds, although the total number of cattle has been growing noticeably smaller recently. In 1943-44 the first real supply difficulties became apparent because of the bad potato and vegetable crops. The available stocks from last year's harvest, including imports from the Balkan countries, Denmark, Bohemia and Moravia, and France, will be just about sufficient to supply the population with the present rations until the new

harvest. But there are no more reserves to fall back on. Where is the food to come from for next year?

A big effort is being made to fill the gap. Hundreds of so-called agricultural leaders who were administering production in the Russian provinces have now been transferred to Italy and France, to act as advisers and controllers. Particularly in France, large tracts of agricultural land have been cultivated under German supervision. The so-called Warthegau and the “General Government” of Poland have been producing considerable surpluses—on the basis of exceedingly small rations for the Poles. Machinery and whole factory installations have been transferred from Russia to German provinces, and the cattle herds evacuated by the German armies were slaughtered to build up new stocks of tinned meat. But the main compensation for narrowing food supplies must be sought in Greater Germany itself.

Perhaps the most interesting point is that the number of agricultural workers in many parts of Germany has been increased by evacuees from bombed towns. The evacuated women will receive the special rations of agricultural workers if they actually work on the land. But these “elastic” tactics do no more than replace workers called up for military service. The main fact is that it has to be recognised that any actual expansion or intensification of agriculture is not possible.

### Backyard Poultry and Rabbits

There is absolute control over Germany's agricultural industry. This does not mean that peasants and people in towns find no ways of evading the decrees. For many years people have been encouraged to keep poultry and rabbits, which are classified as “Kleintiere” (small animals). The meagre fat, meat, and egg rations were encouragement enough in themselves for a prodigious increase mainly in rabbits. Official statistics state that the number of rabbits has increased during the war from 8 to 34 millions. This breeding of small animals by townspeople as well as small-holders seems to have created something like a black market in foodstuffs, particularly grain, potatoes and vegetables. In other words these foodstuffs, supplied for human consumption, have found their way, perhaps in considerable quantities, to the backyards, where the poultry and the rabbits are being kept. Last autumn Minister Backe, hard pressed to maintain supplies of food and feeding-stuffs, opened a campaign against this “misuse” of foodstuffs. But this did not stop it, and now a number of decrees have been issued which severely restrict the breeding of poultry and rabbits.

Apart from the influence of weather conditions Germany's agricultural overall production has been comparatively stable during this war. But the costs of production have been extremely high, in terms of the labour and material used for cultivation and stock-breeding. Moreover, the general decline in the nutritional value of the food produced has been only partly compensated by the complex system of differentiation in rations and by the use of all kinds of synthetic vitamins, supplied mainly to soldiers, heavy workers and children. If there are no catastrophic crop failures the present narrowed agricultural “Lebensraum” may still be just sufficient for the production and supply of a minimum diet.

## THE STANDARD BANK OF SOUTH AFRICA LIMITED

Bankers to the Imperial Government in South Africa and to the Governments of Southern Rhodesia, Northern Rhodesia, Nyasaland and Tanganyika.

# Letters to the Editor

## Irish Neutrality

TO THE EDITOR OF THE ECONOMIST

SIR,—I cannot help thinking that the long absence of Mr Frank Pakenham from Ireland has made him unfamiliar with recent events, otherwise he would certainly not have written to you as he did on April 15th criticising the statements in your article of March 18th with regard to the treatment, at the present time, of Protestants in Southern Ireland.

He has probably not seen the pamphlet published by Professor W. D. Stanford, M.A., Litt.D., a Fellow of Trinity College, Dublin, entitled "A Recognised Church." The title is based on words in the Eire Constitution of 1937 which says:

The state also recognises the Church of Ireland, the Presbyterian Church in Ireland, etc., etc.

Professor Stanford complains of the pressure brought to bear against the Church of Ireland, which, he says, began soon after the Treaty. He describes the two forms which it has assumed—the politico-economic and the religious. In the first kind of pressure the desired results have been achieved by excluding Irish Churchmen from public and private appointments; by obstructing purchase of sites, houses, land, shops; by preventing Irish Churchmen (or, indeed, any Protestants, if possible) from sharing in the control of public works and charitable organisations; by emphasising their social fewness and loneliness; by arguing that to be a true Irishman one must be a Roman Catholic; by banning practically all literature which criticises the Roman Church, and encouraging that which criticises any form of Protestantism.

Further, I wonder whether Mr. Pakenham has seen the statement by the Executive Committee of the County

Monaghan Protestant Association, recently published. Monaghan is one of the Ulster Counties included in Eire and, with the exception of County Dublin, has the largest percentage of Protestants of any county in Southern Ireland. The following is the unanimous declaration of the Committee:

Although the Protestants in this county represent roughly one-sixth of the total population and have proved themselves to be law-abiding citizens, making a valuable contribution in many directions to the well-being of the state, and do not engage in subversive activities, not a single position of any importance has been given to a Protestant.

Every position of importance in the country, legal public bodies, medical services, public institutions, and all public offices, without exception, whether the appointment was made by the Government or local public bodies, has been given to Roman Catholics.

I have received numerous letters from all parts of Eire, sent to me here at Westminster, from loyal Protestants, complaining of unfair treatment. They ask me to raise these questions in Parliament; I am obliged to inform them that it is quite impossible for me to do this, as they would be ruled out of order on the ground that there is no Minister responsible in this country for what takes place in Eire.

I have received pitiful replies, in one of which my correspondent said: "We pray every Sunday in our Protestant churches for the King, and can the King do nothing to help us?"

I feel certain that Mr Pakenham, as a distinguished historian will, before coming to conclusions, like to hear the other side of the case and when he does so, perhaps he may regret the somewhat hasty letter which he wrote in your columns.—I am, etc.,

D. L. SAVORY.

House of Commons.

## Depreciation Allowances

TO THE EDITOR OF THE ECONOMIST

SIR,—I notice that in your current issue (April 29th, page 515) you underwrite the Chancellor of the Exchequer's view that the present fiscal treatment of depreciation of equipment may be a contributory factor to the slow rate of replacement in a number of British industries.

Even after your endorsement, however, I remain entirely unconvinced. Is there any system better designed to speed up re-equipment than one in which the bulk of allowances is being made conditional upon the actual scrapping of the old machine? What better inducement could there be for scrapping?

Take the marginal case of a firm replacing all its equipment within the same income-tax year in which it was installed. Such a firm would be allowed the full write-off straight away. What more could one want?

Or is it suggested that with the present practice of self-financing and the enormous growth of business deposits, firms are lacking the temporary finance required to bridge the gap between the expenditure on the new machine and the income-tax set-off? Or that they would have been unable to secure this temporary accommodation from the banks, at a time when the banks were crying out for genuine industrial business?

No, Sir, this won't do. The causes of out-of-dateness of equipment must be sought elsewhere. Could *The Economist* give us some second thoughts on the subject?—Yours, etc.,

University of Manchester.

H. W. SINGER.

[Mr Singer's point is partly taken in an article on page 617 of this issue.—EDITOR.]

# THE NATIONAL FINANCES

The purpose of this special section is to provide a conspectus of the statistical material that is available on the national finances. It is divided into four parts:—

1. The National Economy.—A commentary on the facts revealed by the figures. This is based on official sources, but includes a number of estimates by THE ECONOMIST.

2. The National Income.—A complete reprint of the estimates of national income and expenditure appearing in the Budget White Paper. ("An Analysis of the Sources of War Finance and Estimates of the National Income and Expenditure in the years 1938 to 1943"—Cmd. 6520.)

3. War Finance.—A digest of the remainder of the Budget White Paper, containing all but one of the tables and a summary of the text.

4. The Budget.—A collection of tables relating to the revenue and expenditure of the Exchequer and to the National Debt. This replaces the Budget Supplement that has been published for many years. All the figures are derived from official sources.

## I The National Economy

(NOTE.—In order to distinguish figures taken from official sources from those which contain an element of THE ECONOMIST'S own estimation, the latter are placed in brackets.)

The Budget White Paper which, in four years, has become the indispensable foundation of any discussion of the British national finances, concerns itself with two subjects—the sources of war finance and the national income and expenditure. The two subjects are connected and it is hardly possible to discuss one without reference to the other. Nevertheless, they are distinct subjects and can be treated separately.

The national income is, of course, the more all-embracing topic. By means of the estimates of its size, it is possible to answer such questions as how large is the annual production of wealth of the British community?; how has it increased since before the war?; how is this income earned?; how does the community spend its income of wealth—in particular, how is expenditure divided between that which is directed by the Government and that which is at the free disposal of individuals? The answers to these questions can only be given in the form of sums of money. But in all national income matters, money serves only as a measuring device. National income calculations are concerned with real magnitudes, they attempt to show the physical volume of the community's earnings and expenditure.

The other subject of the White Paper, the sources of war finance, as its title implies, is a financial inquiry. From the estimates of national income and expenditure, it is possible to get an idea of the physical volume of the goods and services used up by the Government. As will appear shortly, this physical volume, measured by pounds of 1938 purchasing value, increased from £837 million in 1938 to probably about (£3,840 million) in 1943. This is a statement of what has happened. The financial inquiry attempts to elucidate how it has happened. For physical resources are not transferred from the public to the Government solely by physical requisition. They have to be paid for in money, and the Government has to possess itself, by one means or another, of the money to effect the purchases.

In this commentary, the first attempt will be to set out the official estimates of the national income and expenditure in the various possible definitions of the terms. Next there will be a discussion of the problems involved in adjusting the estimates for changes in prices. After that the discussion will turn back to the financial problem of where

the money has come from. And finally, there will be some discussion on the shares of the national income accruing to personal incomes of different kinds and sizes.

### Expenditure and Income

The goods and services expended by the British community in 1938 and in the last two years have been as follows:—

| (£ million)                                                                                        | 1938  | 1942  | 1943   |
|----------------------------------------------------------------------------------------------------|-------|-------|--------|
| Personal expenditure on consumption:                                                               |       |       |        |
| Food, drink and tobacco.....                                                                       | 1,640 | 2,126 | 2,317  |
| Rent, rates, water, fuel and light.                                                                | 694   | 753   | 750    |
| Clothing and other household goods                                                                 | 721   | 701   | 631    |
| Travel .....                                                                                       | 289   | 217   | 227    |
| Other services.....                                                                                | 490   | 512   | 520    |
| Other goods.....                                                                                   | 238   | 448   | 536    |
| Total personal expenditure on consumption at market prices                                         | 4,072 | 4,857 | 4,981  |
| Personal expenditure involved in the acquisition and transfer of property and life assurance ..... | 66    | 68    | 68     |
| Total private expenditure.....                                                                     | 4,138 | 4,925 | 5,049  |
| Government expenditure on goods and services.....                                                  | 837   | 4,594 | 5,187  |
| Total expenditure.....                                                                             | 4,975 | 9,519 | 10,236 |

Where did these goods and services come from? The obvious, and almost complete, answer is that they came out of the current output of the British community. Expenditure, in other words, came out of income. The income of the community can best be ascertained by aggregating the sums that were paid out to the various factors of production in the course of generating the output. This was as follows:—

| (£ million)                                                               | 1938  | 1942  | 1943  |
|---------------------------------------------------------------------------|-------|-------|-------|
| Rent of land and buildings.....                                           | 380   | 384   | 384   |
| Interest and profits, including farming profits and professional earnings | 1,317 | 2,321 | 2,427 |
| Salaries .....                                                            | 1,099 | 1,337 | 1,366 |
| Wages .....                                                               | 1,728 | 2,701 | 2,909 |
| Pay and allowances (in cash and kind) of H.M. Forces.....                 | 80    | 861   | 1,086 |
| Net national income at factor cost..                                      | 4,604 | 7,604 | 8,172 |

This "factor cost" total cannot, however, be directly

compared with figures of expenditure at market prices. For example, if a bottle of whisky is produced and consumed, it will figure in the first of the above two tables at its full price including duty, for this is what has been spent on it, but it will be entered in the second table at the rent, interest, profits, salaries and wages that went to make it—that is, at its selling price less duty. It is therefore necessary to convert the national income figures from a "factor cost" to a "market price" basis by adding in indirect taxation and by deducting subsidies:—

| (£ million)                                       | 1938         | 1942         | 1943         |
|---------------------------------------------------|--------------|--------------|--------------|
| Net national income at factor cost, as above..... | 4,604        | 7,604        | 8,172        |
| Add Indirect taxation.....                        | 636          | 1,376        | 1,473        |
|                                                   | 5,240        | 8,980        | 9,645        |
| Less Subsidies.....                               | 15           | 175          | 190          |
| <b>Net national income at market prices</b>       | <b>5,225</b> | <b>8,805</b> | <b>9,455</b> |

These totals, it will be noticed, do not exactly tally with the totals of expenditure. Nor is there any reason why they should. With a community, as with an individual, the difference between income and current expenditure represents additions to or drafts upon capital. The reconciliation is shown below:—

| (£ million)                                                                   | 1938  | 1942  | 1943   |
|-------------------------------------------------------------------------------|-------|-------|--------|
| Total expenditure.....                                                        | 4,975 | 9,519 | 10,236 |
| Private* net investment (+) or disinvestment (—) at home:                     |       |       |        |
| Increase in work in progress on government account held under private finance | +100  |       | +75    |
| Expenditure incurred in making good war damage to buildings.....              | +61   |       | +49    |
| Other private net investment at home.....                                     | —240  |       | —250   |
| Private and government net investment (+) or disinvestment (—) abroad....     | —55   | —635  | —655   |
| Net national income at market price.....                                      | 5,225 | 8,805 | 9,455  |

\* Government capital expenditure at home cannot be separated from the total of Government expenditure at home.

In this table, drafts on capital (disinvestment) have been shown as a deduction from expenditure to arrive at income. They could equally well, of course, be shown as additions to income to arrive at a total of "available resources," which would equal expenditure.\*

#### Income in Real Terms

All the above calculations are in current terms—that is, they ignore the inflating effect of the rise in prices that has taken place since 1938. For a proper understanding of what has been happening to the national income during the war, it is essential to have at least an approximate notion of the adjustment that ought to be made on this

\* The whole of the above discussion has been based on the net national income. For some purposes, the use of the gross national income is the more enlightening. Net income is calculated on the assumption that any resources devoted to the maintenance and replacement of existing capital should be excluded. This is in line with the ordinary practice of individuals, when depreciation allowances are set aside before income is struck. Gross income (or, to avoid a confusing use of the word 'income,' gross product) includes the whole flow of goods and services available for consumption, for government use, and for the maintenance, replacement and increase of capital. The advantage of using the gross concept is that, although existing capital must be maintained before any long-term comparisons of income can be made, these resources are available in any one year, and especially in a wartime year, for current consumption or for government purposes. Moreover, the actual goods in question are indistinguishable—i.e., a machine that replaces an existing machine is identical with one that is a net addition to capital. The great obstacle to using the gross product is that one of the constituents—the total of depreciation, etc., allowances—is known only for the single year of 1938. For later years a *pro forma* estimate of gross product can be made only by the artificial assumption that these allowances remained constant. On this assumption, the net tables in the text would have to be modified, as follows:—

score. Unfortunately, this cannot be done on the basis of official estimates. The White Paper, it is true, estimates the price rise that has taken place in the sphere of consumption, but there is also an express warning that these estimates of price changes "should not be used for other purposes such as the reduction of the net national income or the expenditure of public authorities on goods and services to terms of constant prices." Indeed, it is clear that the rise in the level of prices paid by the Government for the goods and services it buys has not been nearly as large as the 54 per cent rise in the average market price of consumption goods and services. Any outside estimate of the rise in these prices can only be a guess. Nevertheless, the advantages for a clear understanding of the real economic effects of war to be derived from a series of constant-value figures is so great that some approximations are here given. It has been assumed that the rise in prices, applicable to the Government sphere, over the level of the same prices in 1938, was 6 per cent on the average of 1939, 15 per cent in 1940, 25 per cent in 1941, 30 per cent in 1942 and 35 per cent in 1943. The same ratios have been applied to investment items. It should be emphasised that the resulting figures, though probably of the right order of magnitude, are no more than approximations:—

#### NATIONAL EXPENDITURE IN 1938 POUNDS

| (£ million)                                  | 1938         | 1939           | 1940           | 1941           | 1942           | 1943           |
|----------------------------------------------|--------------|----------------|----------------|----------------|----------------|----------------|
| Government expenditure*                      | 837          | (1,195)        | (2,660)        | (3,365)        | (3,530)        | (3,840)        |
| Private expenditure on consumption†          | 4,138        | 4,138          | 3,640          | 3,390          | 3,350          | 3,270          |
| Private net investment at home.....          | 305          | (342)          | (95)           | (—42)          | (—60)          | (—95)          |
| Private and government net investment abroad | —55          | (—217)         | (—655)         | (—638)         | (—490)         | (—485)         |
| <b>Net national income at market price</b>   | <b>5,225</b> | <b>(5,458)</b> | <b>(5,740)</b> | <b>(6,075)</b> | <b>(6,330)</b> | <b>(6,530)</b> |

\* Including government investment at home. † Including the small item of "personal expenditure involved in the acquisition and transfer of property and life assurance," to which it has been assumed that the consumption price ratios apply.

As was stated at the beginning of this commentary, money figures are used in national income calculations only as a measure of real resources. This being so, it sometimes assists clarity to put the figures on a simple proportional basis. In the following table this has been done, the basis selected being the net national income of 1938:—

#### NATIONAL EXPENDITURE IN REAL TERMS (N.N.I. of 1938=100)

|                                              | 1938       | 1939         | 1940         | 1941         | 1942         | 1943         |
|----------------------------------------------|------------|--------------|--------------|--------------|--------------|--------------|
| Government expenditure*                      | 16         | (23)         | (51)         | (64)         | (67½)        | (73½)        |
| Private expenditure on consumption†          | 79         | 79           | 69½          | 65           | 64           | 62½          |
| Private net investment at home.....          | 6          | (6½)         | (2)          | (—3½)        | (—1½)        | (—1½)        |
| Private and government net investment abroad | —1         | (—4½)        | (—12½)       | (—12½)       | (—9½)        | (—9½)        |
| <b>Net national income</b>                   | <b>100</b> | <b>(104)</b> | <b>(110)</b> | <b>(116)</b> | <b>(121)</b> | <b>(125)</b> |

\*† See footnotes to previous table.

| (£ million)                                                                                                                                                         | 1938  | 1942    | 1943     |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|---------|----------|
| Net national income at market price (as above).....                                                                                                                 | 5,225 | 8,805   | 9,455    |
| Depreciation, etc., allowances.....                                                                                                                                 | 340   | (340)   | (340)    |
| Gross national product at market price.....                                                                                                                         | 5,565 | (9,145) | (9,795)  |
| Total expenditure, as above.....                                                                                                                                    | 4,975 | (9,519) | (10,236) |
| Private expenditure at home on maintenance, replacement and increase of capital (i.e., depreciation allowances plus net investment or minus net disinvestment)..... | 645   | (261)   | (214)    |
| Total gross expenditure.....                                                                                                                                        | 5,620 | (9,780) | (10,450) |
| Less overseas disinvestment.....                                                                                                                                    | —55   | —635    | —655     |
| Balance (=Gross product).....                                                                                                                                       | 5,565 | (9,145) | (9,795)  |

This is, of course, only an alternative way of saying the same thing. It can be said that in 1943 either there was net domestic disinvestment of £126 million after providing (£340 million) for depreciation, etc., or that (£214 million) was spent on the maintenance, replacement and increase of capital which fell £126 million short of meeting the depreciation requirement.

#### Cost of the War

From these last two tables it is possible to show the sources from which, in real terms, the cost of the war in 1943 was met—on the reasonable assumption that the increase in Government expenditure since 1938 can be regarded as the cost of the war:—

|                                                     | In £ million at 1938 Purchasing Power (3,003) | In % of 1938 net National Income (57½) |
|-----------------------------------------------------|-----------------------------------------------|----------------------------------------|
| Cost of War (=inc. in govt. expenditure)            | (3,003)                                       | (57½)                                  |
| Sources from which derived—                         |                                               |                                        |
| Increased effort (=inc. in nat. inc.)...            | (1,305)                                       | (25)                                   |
| Reduced consumption.....                            | 868                                           | 16½                                    |
| Reduced provision for domestic private capital..... | (400)                                         | (7½)                                   |
| Increased drafts on overseas capital..              | (430)                                         | (8½)                                   |
| <b>Total</b>                                        | <b>(3,003)</b>                                | <b>(57½)</b>                           |

It is, finally, of interest to show the changing incidence of the burden of the war as it has developed. In the following table, each year is compared in turn with 1938:—

| (N.N.I. of 1938=100)                                     | 1939       | 1940        | 1941        | 1942         | 1943         |
|----------------------------------------------------------|------------|-------------|-------------|--------------|--------------|
| Increase in national income (since 1938).....            | (4)        | (10)        | (16)        | (21)         | (25)         |
| Reduction in consumption.....                            | (0)        | (9½)        | (14)        | (15)         | (16½)        |
| Reduction in provision for domestic private capital..... | (—½)       | (4)         | (6½)        | (7½)         | (7½)         |
| Increase in drafts on overseas capital                   | (3½)       | (11½)       | (11½)       | (8½)         | (8½)         |
| <b>Cost of war</b>                                       | <b>(7)</b> | <b>(35)</b> | <b>(48)</b> | <b>(51½)</b> | <b>(57½)</b> |

It will be seen how the country was served in the early phases of the war by being able to make immediate drafts on overseas capital, thus leaving time both for total output to be expanded and for the tightening of the consumer's belt to be imposed gradually. It should be remembered that that part of the reduction in overseas disinvestment from 1941 onwards is due to the operation of Lend-Lease.\*

#### Sources of War Finance

Government expenditure on goods and services was given in the first table of this commentary as £4,594 million in 1942 and £5,187 million in 1943. These figures differ, however, from the expenditure of the Exchequer as it appears in the financial accounts. For one thing, they include the expenditure of the local authorities. Moreover, there are some items of expenditure—for example, the interest on the national debt, pensions and social insurance benefits—which are not purchases of goods or services and are therefore excluded from the national income calculations.

For the financial exposition, therefore, it is necessary to begin with a new set of figures, from which the revenue (nearly all of it taxation) is deducted to give the amount of the deficit:—

| (£ million)                       | 1941         | 1942         | 1943         |
|-----------------------------------|--------------|--------------|--------------|
| Central Government Expenditure... | 4,626        | 5,110        | 5,782        |
| Central Government Revenue.....   | 1,836        | 2,344        | 2,876        |
| <b>Deficit</b>                    | <b>2,790</b> | <b>2,766</b> | <b>2,906</b> |

This deficit is, of course, covered by borrowing. The

\* The last four tables are all calculated on a net basis. As before, it may be convenient to translate the figures on to a gross basis.

| (£ million of 1938 purchasing power)                                                 | 1938  | 1939    | 1940    | 1941    | 1942    | 1943    |
|--------------------------------------------------------------------------------------|-------|---------|---------|---------|---------|---------|
| GROSS NATIONAL EXPENDITURE                                                           |       |         |         |         |         |         |
| Government expenditure                                                               | 837   | (1,195) | (2,660) | (3,365) | (3,530) | (3,840) |
| Private expenditure on consumption.....                                              | 4,138 | 4,138   | 3,640   | 3,390   | 3,350   | 3,270   |
| Private expenditure on maintenance, replacement and increase of capital at home..... | 645   | (660)   | (390)   | (230)   | (200)   | (160)   |
| Private and government net investment abroad                                         | —55   | (—217)  | (—655)  | (—638)  | (—490)  | (—485)  |
| Gross National Product                                                               | 5,565 | (5,776) | (6,035) | (6,347) | (6,590) | (6,785) |

problem is to know where the money that is borrowed comes from. Two answers are possible—the first by showing the channels through which the money reached the Exchequer, the other by showing its economic origins. The channels of receipt were as follows:—

| (£ million)                                                                                    | 1941         | 1942         | 1943         |
|------------------------------------------------------------------------------------------------|--------------|--------------|--------------|
| Borrowing from Government agencies: Unemployment, National Health, Local Loans funds, etc..... | 153          | 38           | —62          |

| Funds arising from net disinvestment abroad.....                                                         | 797          | 635          | 655          |
| <b>Total (=total borrowing)</b>                                                                          | <b>2,790</b> | <b>2,766</b> | <b>2,906</b> |

In his Budget speech, the Chancellor gave estimates of how he expected to cover the deficit in the financial year 1944-45. The figures are as follows, with a comparison with the last calendar year:—

|                                           | Calendar Year 1943 | Financial Year 1944-45 |
|-------------------------------------------|--------------------|------------------------|
|                                           | £ mn. %            | £ mn. %                |
| Revenue.....                              | 2,876 50           | 3,102 52               |
| Extra-budgetary funds and war claims..... | 327 5½             | 300 5                  |
| Personal savings.....                     | 1,490 26           | 1,550 26               |
| Business savings.....                     | 259 4½             | 225 4                  |
| Domestic disinvestment.....               | 175 3              | 110 2                  |
| Overseas disinvestment.....               | 655 11             | 650 11                 |
| <b>Total expenditure</b>                  | <b>5,782 100</b>   | <b>5,937 100</b>       |

The Chancellor described his estimate of personal saving as conservative, which it would certainly seem to be in view of the fact that he has allowed for an increase of only £60 million in fifteen months, while the previous twelve monthly increases have been more than double that figure. It may therefore be that there will be no net private disinvestment at home this year.

| (G.N.P. of 1938=100)                                                                 | 1938 | 1939  | 1940  | 1941   | 1942  | 1943  |

## Personal Incomes

Personal incomes can be differentiated according to either their nature or their size. A division of the total according to nature is shown in the following table. A final column has been added in which the 1943 figures are adjusted by the rise in the market prices of consumption (55 per cent), which gives a first approximation to the changes in real values of the different classes of income. All these figures are of incomes before taxation:—

|                                                           | 1938  | 1943  | 1943<br>in 1938<br>Pounds |
|-----------------------------------------------------------|-------|-------|---------------------------|
| Property income (rent, profits and interest).....         | 1,594 | 2,059 | (1,330)                   |
| Salaries.....                                             | 1,099 | 1,366 | (880)                     |
| Wages.....                                                | 1,728 | 2,909 | (1,880)                   |
| Pay and Allowances (in cash and kind) of H.M. Forces..... | 80    | 1,086 | (700)                     |
| Transfer incomes (pensions, insurance benefit, etc.)..... | 278   | 288   | (186)                     |
| Total personal incomes.....                               | 4,779 | 7,708 | (4,976)                   |

It will be noticed that, in spite of the growth in the Forces and of the high figure taken to represent the rise in prices, the real value of wages is almost (10) per cent higher than in 1938. In 1938, wages were 37 per cent, before tax, of the total of all personal incomes other than the pay and allowances of the Forces. By 1943, the figure had risen to 44 per cent. If it were possible to give a division of incomes after tax, the rise would be still greater.

What can be done, with the aid of some new tables in the White Paper, is to show the changes between 1938 and 1942 in incomes, before and after tax, by sizes of income. These figures still suffer from one defect—namely, that while an estimate is given of the total of income contained in incomes of less than £250 a year, no figure of the number of such incomes is given. But since the number of all other incomes has increased from 2,545,000 in 1938 to 7,015,000 in 1942, it is obvious that the number of under-£250 incomes has fallen. (Husband and wife are counted as one income.) Nevertheless, the total of income going to this lowest category has increased from £2,681 million to £3,356 million.

Moreover, the figures of the £250-£500 group are equally remarkable. The number of incomes in this group has increased from 1,745,000 to 5,500,000. In spite of this very large influx, most of it presumably from below, the average gross income in the group has fallen only from £340 to £337. The average net income has fallen from £330 to £289. The numbers in the £500-£1,000 group have more than doubled, and those in the £1,000-£2,000 group have increased by 50 per cent. It is clear that there

has been a very large and widespread upward movement in individual incomes. The following table gives the aggregate income in each class:—

| AGGREGATE INCOME AFTER INCOME TAX AND SURTAX |       |     |       |      |  |
|----------------------------------------------|-------|-----|-------|------|--|
|                                              | 1938  |     |       | 1942 |  |
|                                              | £ mn. | %   | £ mn. | %    |  |
| Under 250.....                               | 2,676 | 65  | 3,254 | 56   |  |
| 250-500.....                                 | 578   | 11  | 1,584 | 27   |  |
| 500-1,000.....                               | 311   | 7½  | 533   | 9    |  |
| 1,000-2,000.....                             | 224   | 5½  | 253   | 4½   |  |
| 2,000-10,000.....                            | 256   | 6   | 176   | 3    |  |
| Over 10,000.....                             | 84    | 2   | 35    | ½    |  |
| Total*.....                                  | 4,129 | 100 | 5,835 | 100  |  |

\* Excluding private income unallocated to sizes.

If the classes are reduced to three—the working class up to £500, the middle class from £500 to £2,000, and the upper class above £2,000—some interesting generalisations emerge. The working class has probably increased from about (23½) to (25½) million incomes, and its share of the total personal incomes after tax has risen from 79 to 83 per cent. The number of middle class incomes has increased from 695,000 to 1,405,000, and their share in the total of net incomes has remained almost exactly stationary. The upper class is the most static of the three; in 1938 there were 105,000 such incomes with £530 million of income before taxation; in 1942 there were 110,000 incomes with £536 million of gross income. But their share of the total of net incomes has fallen from 8 per cent to 3½ per cent. This is due much more to the steep rise in taxation than to the fact that the increase in personal incomes has been in the smaller ranges. If the distribution of gross incomes remained as at present, but taxation returned to 1938-39 rates, the readjustment would be as follows:—

|                  | Share of Total of Private Incomes after Tax |      |                           |
|------------------|---------------------------------------------|------|---------------------------|
|                  | 1938                                        | 1942 | 1942 at 1938 Rates of Tax |
|                  | %                                           | %    | %                         |
| Under £500.....  | 79                                          | 83   | 79                        |
| £500-£2,000..... | 13                                          | 13½  | 15½                       |
| Over £2,000..... | 8                                           | 3½   | 5½                        |

This suggests the reflection that the final effect of the war on the redistribution of incomes may be different from what it appears to be at the moment. During the war, the working class is the largest beneficiary. But it may be that the final effect will be to leave the middle class the gainer—not by an enrichment of the individuals in it but by a large increase in its size. The effect of economic upheavals, in other words, is not to make the rich richer and the poor poorer, but to drive both of them towards the middle.

## 2 The National Income

## I.—NET NATIONAL INCOME AND EXPENDITURE (£ million)

|                                                                                                       | 1938  | 1939  | 1940  | 1941   | 1942   | 1943   |

(For Notes on the above tables, see pages 26 to 31 of the White Paper.)

### 3 The Sources of War Finance

The sources of war finance in the last four calendar years are given in Table A. The residue shown in the final line is the amount of net domestic disinvestment. It is made up of (a) sales to public authorities of fixed capital assets; (b) depletion of stocks and work in progress; (c) additions to depreciation, obsolescence, etc., funds; less (d) new investment out of private funds; (e) replacements, renewals, etc., charged to depreciation funds; and (f) replacements of war losses other than those for which compensation is paid under Part I of the War Damage Act. It is pointed out that this residue, being a balancing item, is a very precarious figure.

Table B continues the figures for personal expenditure on consumption first given last year. The totals for earlier years have been revised upwards, the chief increases being in other services and other goods. In general, these figures relate to expenditure met out of personal income, including that of charities and other non-profit-making bodies as well as of individuals. The figures include purchases by civilians and by members of the Forces out of their pay and cash allowances. Expenditure on consumers' goods and services by businesses and public authorities is, as far as possible, excluded.

Tables C.1 and C.2 correct the figures of consumption expenditure for changes in taxation, subsidies and prices. The first stage (Table C.1) is to remove the effect of indirect taxes and subsidies, thus converting a rise of £909 million in consumption expenditure into one of £450 million. The second stage is to estimate the rise in prices. The method was to take the average of the change between 1938 and 1943 in the cost at market prices of buying the collection of goods and services entering into personal expenditure on consumption in 1938 and 1943 respectively. It is stated that the two components of the final average do not differ widely. The results are shown

in Table C.2. There was a fall of 21 per cent in five years in the real volume of personal consumption; in terms of 1938 pounds, the total fell from £4,072 million to £3,217 million. It should be noted that the final line of Table C.2 represents retail prices after the effect of indirect taxes and subsidies has been removed. Indices of retail prices are usually calculated on a gross basis—i.e., line (1), not line (2), divided by line (3). On this basis, the figures would be 100, 103, 120½, 136½, 147, 154½. Neither price series should be confused with the cost of living, as usually defined. It is also stated that price movements in other sections of the economy have been very different from those applicable to consumers' expenditures.

Table D is wholly new, and its value resides not only in the fact that it is the first attempt to make a direct estimate of net investment by private persons and institutions at home, but also in the estimates that are given, also for the first time, of allowances for maintenance, depreciation, etc. The figures include the capital outlays of the Post Office and of the housing and trading services of local authorities, but all other capital expenditure by public authorities is excluded. The total of depreciation allowances is surprisingly low. This is partly accounted for by the fact that it excludes, except in the case of buildings, the greater part of outlays for current repair work. It is also, presumably, partly due to the fact that only the Inland Revenue allowances have been counted.

Table E assembles the estimates of personal and impersonal saving. ("Impersonal" means by business firms and the like.) The estimates have been revised upwards, for reasons stated later in connection with Table H. Net personal savings in 1942 were given at £891 million last year, and are now estimated, on fuller information, at £1,073 million. The increase in gross personal savings

(The figures in square brackets in the following tables refer to the tables on pages 608 and 609.)

#### A.—SOURCES OF WAR FINANCE

|                                                                                                                                      | 1940  | 1941  | 1942   | 1943  |
|--------------------------------------------------------------------------------------------------------------------------------------|-------|-------|--------|-------|
| 1. Central government expenditure [93]....                                                                                           | 3,340 | 4,626 | 5,110* | 5,782 |
| 2. Less Overseas disinvestment [13].....                                                                                             | 756   | 797   | 635    | 655   |
| 3. Expenditure requiring domestic finance..                                                                                          | 2,584 | 3,829 | 4,475  | 5,127 |
| 4. Less Central government revenue [77+81+85].....                                                                                   | 1,258 | 1,836 | 2,344  | 2,876 |
| 5. Less Surpluses of extra-budgetary funds and local authorities† [48+49].....                                                       | 1,326 | 1,993 | 2,131  | 2,251 |
| 6. Less Compensation received under war risks insurance schemes, etc.....                                                            | 189   | 220   | 223    | 191   |
| 7. Less Private saving, including reserves against taxation [46+47].....                                                             | 1,137 | 1,773 | 1,908  | 2,060 |
| 8. Residue of central government expenditure not covered by the above sources of finance [10+11].....                                | 36    | 219   | 154    | 136   |
| 9. Less Private saving, including reserves against taxation [46+47].....                                                             | 1,101 | 1,554 | 1,754  | 1,924 |
| 10. Residue of central government expenditure not covered by the above sources of finance [10+11].....                               | 1,210 | 1,472 | 1,614  | 1,749 |
| 11. Excluding expenditure equivalent to the Canadian contribution of £225,000,000. This sum is also excluded from lines (2) and (4). | 109   | 82    | 140    | 175   |

\* Excluding expenditure equivalent to the Canadian contribution of £225,000,000. This sum is also excluded from lines (2) and (4).  
† Excluding the Exchange Equalisation Account, changes in which are already included in overseas disinvestment.

#### B.—PERSONAL EXPENDITURE ON CONSUMPTION

|                                                                                               | 1938  | 1939  | 1940  | 1941  | 1942  | 1943  |

#### C.—PERSONAL EXPENDITURE ON CONSUMPTION AT CURRENT AND CONSTANT PRICES

##### C.1.—PERSONAL EXPENDITURE ON CONSUMPTION AT CURRENT PRICES

|                                                                  | 1938  | 1939  | 1940  | 1941  | 1942  | 1943  |
|------------------------------------------------------------------|-------|-------|-------|-------|-------|-------|
| 1. Personal expenditure on consumption at market prices [7]..... | 4,072 | 4,178 | 4,310 | 4,557 | 4,857 | 4,981 |
| 2. Plus Subsidies [14].....                                      | 15    | 20    | 70    | 140   | 175   | 190   |
| 3. Less Indirect taxes specifically on consumption [15].....     | 4,087 | 4,198 | 4,380 | 4,697 | 5,032 | 5,171 |
| 4. Personal expenditure on consumption thus adjusted [27].....   | 439   | 489   | 588   | 777   | 939   | 1,073 |

##### C.2.—EFFECT OF PRICE MOVEMENTS (1938=100)

|                                                                                                                | 1938 | 1939 | 1940 | 1941 | 1942 | 1943 |
|----------------------------------------------------------------------------------------------------------------|------|------|------|------|------|------|
| 1. Personal expenditure on consumption at market prices, including indirect taxes and excluding subsidies..... | 100  | 103  | 106  | 112  | 119  | 122  |
| 2. Personal expenditure on consumption, excluding specific indirect taxes and increased by subsidies.....      | 100  | 102  | 104  | 107  | 112  | 112  |
| 3. Personal expenditure on consumption in terms of constant prices.....                                        | 100  | 100  | 88   | 82   | 81   | 79   |
| 4. Retail prices, excluding specific indirect taxes and increased by subsidies.....                            | 100  | 102  | 118  | 131  | 138  | 141  |

#### D.—PRIVATE INVESTMENT AT HOME IN 1938

|                                                                                                     | Gross Investment | Allowances for Maintenance, Depreciation, etc. | Net Investment |
|-----------------------------------------------------------------------------------------------------|------------------|------------------------------------------------|----------------|
| 1. Fixed capital, work, etc.:<br>(a) Public utilities.....                                          | 145              | 80                                             | 65             |
| (b) Other branches of activity, including housebuilding:<br>(i) Buildings.....                      | 360              | 105                                            | 255            |
| (ii) Plant and machinery.....                                                                       | 120              | 100                                            | 20             |
| (iii) Other fixed capital, etc.....                                                                 | 65               | 55                                             | 10             |
| 2. Change in the value of stocks and work in progress as implied in the calculation of profits..... | (-45)            | —                                              | (-45)          |
| 3. Private investment at home.....                                                                  | 645              | 340                                            | 305            |

in the war period has been truly phenomenal; over the five years the increase is six-fold, and nearly nine-fold in the net figure after provision for taxation.

Table F shows the true burden of taxation on private income, which has increased by slightly more than half since 1938. The percentages in the bottom line are somewhat lower than in last year's White Paper (where, for example, the 1942 figure was given as 38 per cent). This reduction is due partly to the adjustment of line (5) as a result of "pay-as-you-earn" (see below in connection with Table H) and partly to the upward revision of private income in line (1).

Table G gives a comparison of the distribution of private income received in 1938 and in 1942. There have been enormous changes in the numbers of incomes in the different groups. This makes it difficult to compare what has happened to identical blocks of income in the two years. The incomes of husband and wife are reckoned as one income.

Table H compares, in proportionate form, some of the more important series as given in last year's and in this year's White Papers. The differences are small. The principal changes that have been made in the light of fuller knowledge are as follows:—

#### E.—PRIVATE SAVING

|                                                                                    | 1938 | 1939 | 1940 | 1941  | 1942  | 1943  |
|------------------------------------------------------------------------------------|------|------|------|-------|-------|-------|
| 1. Gross personal saving, including allowance for accrued taxation [32+33+34]..... | 259  | 380  | 858  | 1,081 | 1,369 | 1,594 |
| 2. Less Death duties, etc. [32].....                                               | -90  | -87  | -85  | -94   | -100  | -104  |
| 3. Gross personal saving after allowance for death duties, etc. [33+34].....       | 169  | 293  | 773  | 987   | 1,269 | 1,490 |
| 4. Less Increase in allowance to meet accrued taxation* [33].....                  | -11  | -32  | -46  | -37   | -196  | -83   |
| 5. Net personal saving after allowance for accrued taxation [34].....              | 158  | 261  | 727  | 950   | 1,073 | 1,407 |
| 6. Gross impersonal saving, including allowance for accrued taxation [40+41].....  | 182  | 266  | 437  | 485   | 345   | 259   |
| 7. Increase in allowance to meet accrued taxation* [40].....                       | -12  | -86  | -247 | -290  | -145  | -49   |
| 8. Net impersonal saving after allowance for accrued taxation [41].....            | 170  | 180  | 190  | 195   | 200   | 210   |

#### NET PRIVATE SAVING (PERSONAL AND IMPERSONAL)

|                                                                                 | 1938 | 1939 | 1940 | 1941  | 1942  | 1943  |
|---------------------------------------------------------------------------------|------|------|------|-------|-------|-------|
| 9. Net personal saving after allowance for accrued taxation [54].....           | 158  | 261  | 727  | 950   | 1,073 | 1,407 |
| 10. Net impersonal saving after allowance for accrued taxation [41].....        | 170  | 180  | 190  | 195   | 200   | 210   |
| 11. Aggregate net private saving after allowance for accrued taxation [46]..... | 328  | 441  | 917  | 1,145 | 1,273 | 1,617 |

\* This item shows the excess of the liability for direct taxes accruing on current incomes at current rates of taxation over current direct tax payments.

#### F.—PROPORTION OF PRIVATE INCOME DEVOTED TO TAXATION

|                                                                                                                                                    | 1938  | 1939  | 1940  | 1941  | 1942  | 1943  |
|----------------------------------------------------------------------------------------------------------------------------------------------------|-------|-------|-------|-------|-------|-------|
| 1. Private income [43].....                                                                                                                        | 5,038 | 5,402 | 6,375 | 7,326 | 8,059 | 8,703 |
| 2. Direct taxes, social insurance contributions of employees, War Damage Act contributions and premiums, etc., met out of private income [80]..... | 549   | 599   | 789   | 1,230 | 1,520 | 1,905 |
| 3. Indirect taxes and rates specifically on consumption less subsidies [29].....                                                                   | 424   | 469   | 518   | 637   | 764   | 883   |
| 4. Other indirect taxes, etc., met out of private income.....                                                                                      | 165   | 170   | 190   | 230   | 240   | 180   |
| 5. Excess of tax liabilities over payments [33+40].....                                                                                            | 25    | 118   | 293   | 327   | 341   | 132   |
| 6. Total tax liabilities in respect of private income, i.e., (2)+(3)+(4)+(5).....                                                                  | 1,123 | 1,356 | 1,790 | 2,424 | 2,835 | 3,100 |
| 7. Line (6) as a percentage of line (1).....                                                                                                       | 23    | 25    | 28    | 33    | 35    | 36    |

(i) An upward revision of the figures for profits and salaries. This is partly due to an increased allowance for income received in kind.

(ii) Personal expenditures involved in the acquisition and transfer of property and life assurance have been directly estimated for the first time.

(iii) The estimate of private net investment at home in 1938 has been increased.

(iv) Work in progress on Government account held under private finance is now estimated separately.

(v) The introduction of "Pay-as-you-earn" involves a reduction in the amount that has to be set aside to meet accrued income tax on Schedule E. If strict logic were followed, this would result in a large increase in net personal saving in 1943. In order to avoid the discontinuity that this would introduce into the figures, the excess of income tax liabilities over payments in respect of Schedule E has been removed from the "tax accruals" item in each year and transferred to "net personal saving."

The general effects of the revisions are to increase the estimates of savings and to diminish those of domestic disinvestment. They therefore show the position to have been more favourable than was originally supposed.

#### G.—DISTRIBUTION OF PRIVATE INCOME, 1938 and 1942

| 1938                                                                                      |                   |                                   |                                                  |               |                                                                       |               |

\* Motor spirit duty, repealed 1921. † Including British wine, table waters, cider and perry, coffee and chicory, dried or preserved fruits, railway passenger duty, patent medicines, other licences, and miscellaneous. ‡ Safeguarding, abnormal importations, hops, and (1936-37) onwards beef and veal. § Included in duties under the Imports Duties Act. ¶ Provisional figures for payments into Exchequer. Actual receipts are lower by £1,218 thousand.

### DIRECT AND INDIRECT TAXES.

|               | Direct<br>£ million | % of Total | Indirect<br>£ million | % of Total |
|---------------|---------------------|------------|-----------------------|------------|
| 1913-14 ..... | 78.0                | 47.8       | 85.0                  | 52.2       |
| 1929-30 ..... | 376.9               | 55.6       | 300.0                 | 44.4       |
| 1937-38 ..... | 447.1               | 53.2       | 394.1                 | 46.8       |
| 1938-39 ..... | 499.3               | 55.6       | 397.1                 | 44.4       |
| 1939-40 ..... | 565.8               | 55.6       | 451.2                 | 44.4       |
| 1940-41 ..... | 778.0               | 57.3       | 580.7                 | 42.7       |
| 1941-42 ..... | 1,205.5             | 61.4       | 756.5                 | 38.6       |
| 1942-43 ..... | 1,554.0             | 62.6       | 928.6                 | 37.4       |
| 1943-44 ..... | 1,860.2             | 63.1       | 1,088.0               | 36.9       |

The above table shows how the contribution of direct taxes (i.e., income tax, surtax, estate duties, National Defence Contribution, Excess Profits Tax, and other inland revenue) to total tax revenue has been rising steadily in the last few

years at the expense of indirect taxes (i.e., customs and excise, stamps, and motor duties).

### INCOME TAX RATE AND ALLOWANCES.

|                                                                   | 1938            | 1939            | 1940            | 1941             | 1942-45         |
|-------------------------------------------------------------------|-----------------|-----------------|-----------------|------------------|-----------------|
| Standard rate in £ ...                                            | 5s. 6d.         | 5s. 6d.         | 7s. 6d.*        | 8s. 6d.*         | 10s. 6d.        |
| Personal allowance:—                                              |                 |                 |                 |                  |                 |

‡ Included in self-balancing until 1942-1943.

revenue and borrowing in meeting wartime expenditure:— It will be noted that the difference, amounting to £10,980 million, between ordinary revenue on the one hand, and total expenditure (including sinking funds and debt repayments) on the other, was met as to £3,447 million by borrowing from the money market (i.e., by additions to the floating debt); £1,451 million by small savings (3 per cent defence bonds and national savings certificates); £6,030 million by other borrowing; and £51 million by miscellaneous receipts, in which is included contributions received under the War Damage Act. The items shown as net are given after allowing for repayments and receipts.

\* Provided out of Vote of Credit.

† From Appropriation Accounts, 1941-42 and 1942-43: latest estimates, 1943-44 Budget estimates, 1944-45.

This table gives estimates of purely civil expenditure for 1943-44 and 1944-45, compared with the amounts actually spent in the two previous years. The pensions items continue to increase, particularly the estimate for supplementary pensions, which are becoming a more and more important part of the pensions system. Details of the amounts actually spent in 1943-44 are not available.

### THE COST OF SOCIAL SERVICES.

The latest available figure for expenditure on public social services by central and local authorities appeared in *Hansard* of December 16, 1943, from which the following table has been compiled. The expenditure figures include payments out of taxes and rates, and also contributions by the persons benefiting in the case of the contributory schemes. Many persons shown in the last two columns as receiving benefits do so under two or more of the Acts mentioned in the first column, and are, therefore, accounted for more than once.

| Deduct estimated assets                     | 8,042.4        | 10,518.4       | 13,102.8       | 15,753.0       |
| Deduct Exchequer balances                   | 7,372.8        | 9,840.9        | 12,432.5       | 15,087.2       |
| Net total                                   | 7,370.4        | 9,838.3        | 12,430.1       | 15,084.3       |

Table 12 gives the net total of the internal debt after allowing for the accrued interest on national savings certificates, which is not included in the figure of principal given in the previous table, and after deducting Exchequer balances at the Banks of England and Ireland at the end of the financial year, and the state's estimated assets. The largest single item of the latter total is the £575 million of the Exchange Equalisation Account; it also includes the

Suez Canal shares (£32 million); India and Burma—outstanding liability of 5 per cent War Loan (£16.7 million); Land Settlement loans outstanding (£12.5 million); issues to Czechoslovakia (£6.3 million); and issues under the Overseas Trade Guarantees Act, 1939 (£8.6 million).

## COST OF THE NATIONAL DEBT.

## SOURCES OF THE TABLES

A great many of the official sources of material relating to the national finances are now no longer published. Among those which still appear are the Finance Accounts of the United Kingdom, the Civil Appropriation Accounts, the Revenue Departments Appropriation Accounts and the Civil Estimates.

There are two methods open to a firm which achieves its centenary: it can dilate with understandable pride on the superiority of its products or it can say 'Thank you'.

This is Godfrey Phillips' one-hundredth year: and it is 'Thank you' they wish to say to their host of friends and customers in the Trade the world over.

## FERTILITY

AGRICULTURE today recognises that though fertility—the power of the land to produce abundant and healthy crops—is the result of many factors, it is inseparable from chemistry and the work of the research chemist. Fertility depends on light and air; on methods of cultivation; and on the presence in the soil of water; organic matter (humus); of bacteria; of nitrogen, potash, phosphates and calcium; and of small quantities of what are known as the minor elements. All these factors are inter-related so that all must be maintained at the right level if fertility is not to suffer. Nitrogen particularly is essential for all vigorous plant growth, and except for such special districts as the Fens, the soil of Britain is nitrogen-starved. It is important to note that nitrogen is released by the decomposition or disintegration of organic matter. In the past all sorts of methods were used to obtain it. It was extracted directly from waste products, or recovered in the form of sulphate of ammonia as a by-product of coal. Then came the great chemical discovery of how to combine the nitrogen released to the air with hydrogen from water to form ammonia. Nitrogen applied to the land as an inorganic fertilizer enables heavier crops to be grown and therefore more vegetable matter to be ploughed back. Heavier crops make it possible to feed more stock, which means more dung. In other words the element released from organic matter is applied inorganically, but then passes back again to the soil through plant or beast as organic matter. The "fertilizer" of this season supplies more dung or humus next year. Fertility is a cycle in which the products and processes of Nature and the skill of the farmer are inseparable from chemical research and the products of the chemical industry.

## HOW TO MAKE IMMEDIATE SAVINGS in the use of Gas and Electricity in Industry

Economy in the use of fuel in all factories is now a matter of *first* consideration. Managements are seeking every opportunity to reduce fuel consumption. The following suggestions will be helpful.

### FACTORY GAS

Any of the following will show an immediate saving of Gas:

Plan the work so that furnaces and such-like are run only when fully loaded; avoid lighting them for odd jobs; don't put more into use than are absolutely essential;

Insist that every single burner must be turned off when not actually needed for work;

Furnace doors should not be left open a moment too long—be adamant on this point;

Moving parts which work freely stand a better chance of being handled properly; see that all controls can be adjusted easily;

Mark the air shutters on natural draught furnaces and the control valves on furnaces using high pressure air so that the plant can be worked at the most economical settings;

Insist that lids of liquor tanks and salt baths are kept on as much as possible.

### FACTORY ELECTRICITY

Any of the following will show an immediate saving of Electricity:

Be ruthless in cutting out idle running;

Plan the work so that plant operated is fully loaded;

Check the lagging of ovens, tanks and other plant; repair at once broken or faulty lagging;

Make a spot check for electric furnace doors left open; give strict instructions that they are not to be open a second longer than is necessary;

If you have bigish transformers, see that they are never left on to supply negligible load;

See that *every* electric appliance is switched off when not actually in use (read the riot act to all offenders).

Factory managements will find many more practical suggestions for quick savings in their Fuel Efficiency Bulletins. Look them up straight away. You need Bulletins Nos. 5 and 14 for gas savings, and No. 13 for electricity savings.

**MOST IMPORTANT**—make every effort to strengthen your Fuel Watching System. Keyed up it will make possible astonishing savings of gas and electricity. Study afresh your Fuel Efficiency Bulletin No. 7.

## THE BUSINESS WORLD

### The Taxation of Industry

THE aim of Sir John Anderson's proposals for the reform of industrial taxation is to accelerate the rate of increase in the productivity of industry, or, in his words, to put Britain "more on a level with other industrial nations in regard to this important matter of the modernisation of plant and buildings." The growth of productivity depends, first, on the rate of technological progress and, secondly, on the speed with which new ideas and inventions are translated into new tools and commercial practice. The invention of better instruments of production and the discovery of new and more economical processes is largely a matter of—often expensive—research and experiment. Their speedy adoption in commercial practice involves the replacement of existing plant, not merely when it is beyond repair—that is, when it is physically obsolete—but also when it is economically obsolete or, in technical language, when the prime costs of existing equipment begin to exceed the prime cost plus the fixed charges on new equipment. New inventions and discoveries may render obsolete not merely individual machines and processes—as riveting in shipbuilding—but whole plants—as in the manufacture of tin plate—or even whole industries—as the coach-building trade.

During the inter-war years Great Britain tended to lose ground in industrial research as well as in the speed of its translation into commercial practice. The reasons were inertia, monopolistic practices, and lack of finance. The Chancellor's proposals are designed to remove some of the financial obstacles in so far as they are due to the present method of taxing profits. By relieving from taxation all expenditure on research—from fundamental research to the full-scale development of the product—he intends to give a fillip to technological progress; by granting additional relief from taxation in respect of plant and equipment, he intends to assist industry to accumulate funds for speedier replacement and modernisation; and, finally, by granting the tax-free obsolescence allowance unconditionally to a "continuing business," he hopes to facilitate the change-over from obsolete to new processes of manufacture requiring different equipment.

The ability of a concern to carry out adequate research, and to keep its plant and processes in line with technological progress, is conditioned by its ability to set aside adequate funds. This depends in the first place on the earning of profits. And in the second place it depends on the extent to which gross profits are paid away to shareholders or to the Inland Revenue when they ought to be used to accumulate funds for the replacement of capital. The necessity for an adequate definition of amortisation for tax purposes is very much greater when income-tax is levied at 10s. in the £ than it would be at lower rates. This follows from the fact that, in many industries, the allocations for depreciation can be the greater part of the gross profits. This can be illustrated by the following hypothetical examples. In the first, tax is levied after full allowance for the reduction in the capital value of all assets; in the second, only a partial allowance is made, and in the third none at all.

|                                                | A          |             | B          |             | C          |             |
|------------------------------------------------|------------|-------------|------------|-------------|------------|-------------|
|                                                | £          |             | £          |             | £          |             |

|                                                | Tax at 5s. | Tax at 10s. | Tax at 5s. | Tax at 10s. | Tax at 5s. | Tax at 10s. |
| Assessed for income tax                        | 100,000    | 100,000     | 200,000    | 200,000     | 250,000    | 250,000     |
| Tax payable                                    | 25,000     | 50,000      | 50,000     | 100,000     | 62,500     | 125,000     |
| Available for amortisation and dividends       | 225,000    | 200,000     | 200,000    | 150,000     | 187,500    | 125,000     |
| Available for dividends or additional reserves | 75,000     | 50,000      | 50,000     | Nil         | 37,500     | -25,000     |

The middle case is the most characteristic—that is, the case in which the Inland Revenue's allowance is less than the

directors provide. When tax is at 5s. in the £, the dividend is smaller than it should be—it is 5 per cent free of tax, or 6½ per cent gross, where it should be 10 per cent gross—but there is still a dividend. With tax at 10s. in the £ this company could not prudently pay any dividend, although it was earning true profits of 10 per cent.

The Chancellor has attempted to meet this case, at least in theory. He has propounded the doctrine that "tax should be charged on true profits reasonably measured, but not more." The difficulty arises when it comes to translating this admirable principle into practice. For many years past the Inland Revenue have followed what might be called the accounting principle. If a company has been allowed to make tax-free deductions from profits which add up to the original cost of a piece of equipment by the time that piece of equipment is in fact scrapped, then, according to the accounting theory, all is well. The existing scheme purports to do this. An allowance is made year by year of a given percentage of the written down original cost. The funds thus accumulated will never amount to the full original cost since they get smaller year by year as the original cost is written off. But when the plant is scrapped—provided it is, in fact, replaced—an obsolescence allowance is made equal to the balance of the original cost. Thus, under the existing system, taxpayers do get the full allowance in time, though most of it comes in a large instalment at the end of the asset's life, and is dependent on its being replaced. The case against this system has been that companies cannot accumulate

## More NEWS of WHITE HORSE

### When distillation ceased

You can make bricks without straw, but you cannot make Scotch Whisky without barley. Since the war began the fruits of each golden harvest have been called up for National Service. No more whisky is being made: distillation has ceased.

Yet in this fifth year of war you can still, with good fortune, obtain White Horse. This is because stocks have always been laid down many years ahead of the time when they will be released for your pleasure. White Horse was growing old when this war was young. It is therefore in your own interest that supplies should be very carefully regulated so that in the years to come you may still be able to enjoy White Horse, fine as a fine liqueur.

MAXIMUM PRICES: Bottles 25/9; Half-bottles 13/6

as fixed by The Scotch Whisky Association.

funds rapidly enough, and that the final obsolescence allowance may be useless, since it is, after all, only a permitted deduction from profits, and if the profits are not there it cannot be enjoyed. Moreover, the requirement that the scrapped plant must be replaced may be impossible of fulfilment if technical methods have changed.

The Chancellor has attempted to meet these objections in four ways. First, he has given a special initial allowance of 20 per cent of the cost of new plant and machinery. This is entirely additional to the existing allowances, which are not affected by it. Thus (with certain exceptions where different allowances or the "renewals" system apply) the iron and steel industry—to take one example—would be allowed, in the first year of an asset's life, to make deductions from profits, before tax is charged, of 20 per cent plus the "agreed normal rate" of 9 per cent—this 9 per cent being calculated, it is understood, on the full original cost, not on the original cost *minus* the 20 per cent allowance. The "agreed normal rates" range as high as 24 per cent for some types of equipment, so that the effect of this provision is to allow the tax-free writing off in the first year of between 25 and 44 per cent of the cost of plant and equipment. The effect of this, it will be noticed, is not to increase the allowances that can be claimed over the whole life of an asset, but to permit industry to claim them earlier—and, in some cases, where profits are low, this may mean a larger total allowance.

Secondly, to a "continuing business," the obsolescence allowance is to be granted unconditionally. This will permit a definition of "replacement" more in accordance with economic realities. Thirdly, buildings are for the first time brought within the scope of wear-and-tear allowances. There is to be an initial allowance of 10 per cent, and thereafter an annual allowance of 2 per cent. These figures seem to be too low, since the useful life of many industrial buildings is no longer than that of the plant they are designed to house. Finally, all expenditure on industrial research is exempted from taxation—capital expenditure can be written off within five years or less if the life of the assets is shorter.

Within the bounds set by the accounting principle, these amendments of the law go a very long way towards meeting the criticisms that have been made. It will be an exceptional firm that fails to recover the full original cost of an

asset over its useful life. But the Chancellor has not in the least met the criticisms of the accounting principle itself. There are, in the main, two such criticisms. The first is that a company should not merely be able to recover the original cost of its plant before paying tax, but should be enabled to expend such sums as are necessary to maintain its plant in the most modern state. Technical progress involves a steady increase in the amount of plant required to perform a given operation; this is the mechanism by which the productivity of the national economy advances, and the state should encourage it rather than tax the process. An oven to bake a certain quantity of bread per day will naturally cost more each time it has to be replaced, and the baker should be allowed, during the economic life of his oven, to accumulate tax-free funds sufficient, not merely to recover the cost of that oven, but to buy a better one.

This is the argument, and it has a great deal of force. The answer would presumably be that the replacement of one piece of plant by a better piece of plant is not a replacement of capital, but an increase of capital, and that the generation of capital out of income in this way should no more be free of tax than in other ways. And the rejoinder to that would presumably be that there is no form of capital generation more deserving of lenient treatment by the state. The second form of the objection to the accounting principle has even more force. It relates to rises in the cost of replacing plant by completely identical plant—leaving aside all questions of replacement—owing to changes in the value of money. For example, to a firm operating in France during the inflation of 1914-26 it would be very cold comfort to be able to accumulate the original cost of plant bought in 1914. To apply the Inland Revenue system, even with Sir John Anderson's amendments, to such a firm would be to compel it to pay tax on the consumption of four-fifths or nine-tenths of its capital. To this objection the defenders of the accounting system have no reply. But reply or not, the point to be observed at the moment is that the Chancellor of the Exchequer has not begun to meet, has not even mentioned, these objections. He has made some very welcome modifications within the framework of the existing system. He has not acknowledged any possibility of an amendment of the existing system. On this issue the controversy will doubtless continue.

## Business Notes

### Speculation or Investment

The price rise, set in motion by the Chancellor's tax reliefs and his assurance about the certainty of the EPT refund, has exceeded expectations, and has brought a substantial recovery in activity. Last Monday's total of bargains received in the industrial and commercial list was the highest since early August, 1943, and the total for all sections the largest since the previous January. The equity price index of *The Financial News* has climbed to a new high level for recent years of 107.9 against 105.5 on the eve of the Budget speech, and the new yield index is, at 3.87 per cent, the lowest for the war period with the exception of some days in last September. In addition, there have been a number of market rises, for instance, in home railways and insurance shares, which are not reflected in this index. At first glance these movements look like an unexpectedly early response to important stimuli to industry, and it may be that they are just that. That explanation is not, however, generally accepted in Stock Exchange circles. The rise is too rapid, and the buying of the wrong quality, to create confidence that the improvement will be maintained. Their explanation is that the speculator has been held back from buying only by fear that temporary bad news, following the opening of the second front, would cause a fall in prices. The force of this factor has worn thin with the lapse of time, and the speculator has seen the price of ordinary shares rising gradually. As shown by *The Actuaries' Investment Index*, of which some details are given on page 628, the aggregate price index had crept up to a new high on the eve of the Budget. But this rise was due to larger dividend payments and the yield was far from being at a new low. The indications suggest that institutional investors have been selling, rather than buying, in recent months. It may well be that the Budget provisions have prevented their unloading on this occasion, but they seem to be waiting for more light on the military situation and the Government's intentions before buying.

### Motor Taxation

The subject of the taxation of private cars has three aspects. These are the problems of the total taxation levied on private motoring; of the proportions in which it is to be levied in the form of a licence duty on the vehicle and a tax on petrol; and of the form in which the licence duty is to be levied. In his Budget speech on April 25th, Sir John Anderson expressed himself against any change in either the total taxation on private motoring—"it is almost impossible for me to sacrifice revenue"—or its distribution between the vehicle and petrol duties—"I have reached the conclusion that the balance of argument against this course is formidable." On the third aspect, that is, on the form in which the licence duty on cars is to be levied, the Chancellor said that he had "an open mind," and that he would be "ready to listen sympathetically to representations." Sir John Anderson, in fact, has left the initiative to the industry. But, as he confessed in winding up the Budget Debate, on April 27th, "there is an embarrassing conflict of expert opinion as to how any changes that may be desirable should be carried out." From the statements made by Sir Miles Thomas, chairman of the public relations committee of the Society of Motor Manufacturers and Traders, and vice-chairman of the Nuffield organisation, it would appear that the industry is in favour of substituting a tax on the cubic capacity of the engine for the tax on the diameter of the bore of the engine. This change would remove at least one defect of the present horse-power tax in that it would enable the industry to produce more efficient engines. But it would not remove the anomaly whereby the present duty weighs most heavily on the cheapest cars, and, what is crucial from the point of view of exports, it would still concentrate home demand on the small car. The industry is faced with the alternatives of being content with an assured home market with a relatively small export trade in little cars and luxury cars, and of utilising the enormous world demand for cars

immediately after the war to establish itself as one of the major car exporting industries. If it adopts the first alternative, it may be content with the substitution of a tax on the volume of the engine for the duty on its diameter; if it is willing to take the plunge and raise its sights, it might ask for the substitution of a licence duty on the original cost of the car, at a rate declining with its age, for the tax on horse-power. The higher aim inevitably would involve a risk—though the industry's home market would still enjoy the protection of a substantial import duty—but there is no progress without risk. The choice cannot be delayed if the opportunity is not to be missed. Whatever it will be, it will vitally affect the industry's future.

### Oil-Based Chemicals

During his Budget speech on April 25th, Sir John Anderson emphasised the importance of the new oil-based chemical industry. He recognised that there was "a vast field to be opened up" and he regarded it "as of the first importance that this country should play a large part in these developments." He felt that it should be possible to make sure that the tariff offers no obstacle to the chemical industry in obtaining the necessary raw materials from oil. Sir John Anderson was not in a position to make specific proposals to clear the path for the growth of an oil-based chemical industry in this country, but the facts on which recommendations can be based are to be ascertained by an inquiry which he and the Minister of Fuel and Power are to arrange "shortly." Much, of course, will depend on the personnel and terms of reference of the committee conducting such an inquiry. As the Chancellor of the Exchequer pointed out on April 27th, the inquiry is to be comprehensive and he will be

perfectly ready to consider such questions as, for example, subjects on which the Government might undertake research or small-scale experimental development in such matters as the production of mineral oil from coal by new processes.

### Conversion Fives Repaid

Conversion Five Per Cent Loan, the last remnant, among Government securities, of the abnormally dear money period, disappeared from the scene at the beginning of this week. The £318 million which remained outstanding was repaid in cash. Even for these days of exceptionally large monetary turnover this operation was one which had to be carefully prepared by the authorities. The main part of that preparation was the persistent buying of the maturing loan by the Government broker over many months past. This tempted all the loan held by banks and other financial institutions out of its lair and only left the stock frozen in certain trusts and private holdings to be dealt with. It is probable that the amount which had actually to be disbursed to the market on May 1st, when the loan was repaid, was between one-quarter and one-third of the total loan outstanding. The impact of this payment of between £80 million and £100 million on the money market was hardly perceptible. A good deal of the money was immediately reinvested in one of the Government's tap loans. The banks, for their part, anticipating a substantial inflow of cash at the beginning of the week, had arranged to make large Treasury Deposit Receipt payments. The discount market, moreover, has this week taken up a large amount of Treasury bills, of which £110 million were issued at the last tender, against current maturities of only £90 million. So well did the counter measures come into operation that by Tuesday of this week the credit position was becoming stringent and open market assistance had to be given to the market by the authorities. With the repayment of Five Per Cent Conversion Loan, the most expensive items in the national debt are now three four per cent loans. They are the four per cent Consolidated loan (£400,703,000) repayable on or after February 1, 1957, four per cent Funding loan 1960-90 (£326,498,000) and four per cent Victory bonds redeemable by drawings (£289,277,000), a total of £1,016,478,000.

### Gold Redemption in South Africa

A new Reserve Bank Bill was introduced in the South African House of Assembly last week. Its most interesting clause reimposes on the Reserve Bank the obligation to

redeem its notes in gold. This does not imply an immediate return of the Union of South Africa to the gold standard. The Bill provides that this obligation to redeem notes may be suspended by the Governor-General, and the Finance Minister, Mr Hofmeyr, introducing the Bill, promised that such suspension would be decreed immediately after the passage of the Bill. The present obligations of the Reserve Bank are governed and defined by the Currency and Exchanges Act of 1933, which relieved the Reserve Bank of the obligation to redeem its notes in gold. The decision of the South African authorities to fill the dangerous void caused by this negative measure can hardly cause surprise. The new clause, though it will not operate immediately, will do good service in advertising South Africa's main product, and its introduction at the present time is no doubt *pour encourager les autres*. The new Bill also extends the Reserve Bank's sole right of note issue for another 25 years beyond 1945, the date set by the original Currency and Banking Act of 1920 as marking the end of the bank's monopoly of note issue in the Union. A third amendment proposed by the new Bill concerns the allocation of the Reserve Bank's profits. By the original Act, 10 per cent of the profits had to be allocated each year to the reserve fund until it equalled the amount of the paid-up capital, namely £1,000,000. That ceiling was reached some years ago, and since then the Bank has been unable to plough back profits except through building up hidden reserves. The new Bill removes the ceiling on the published reserve fund, which in future will again regularly receive 10 per cent of the declared profits. After payment of a 10 per cent dividend the balance of profits will, as before, go to the Government. The restriction of votes on holdings of Reserve Bank shares has been tightened. At present voting rights are restricted to individual holdings of £10,000 of capital. Shares in excess of this figure, in single holding, carry no voting rights. This restriction is to be made to apply to holdings by companies with interlocking directorates, which, for this purpose, will be treated as one and the same shareholder.

### Mexican Hopes

Mexican bankers have recently been meeting in a national convention at Monterey, and have passed some far-reaching resolutions. One of them, proposing a ban on exports and imports of gold, except those handled by the Bank of Mexico, has already been accepted by the Government, and an embargo on such gold operations was decreed at the end of last week. The decree states that the ban will prevent the Axis countries selling confiscated gold in Mexico. The move must, however, be viewed in a somewhat wider context. As originally propounded by the Mexican bankers at the Monterey convention, the control of gold movements was a mere subsidiary to a wider resolution suggesting that gold be ousted from its dominant position in the world's monetary system and supplanted by silver. Mexico's reasons for fathering this revolutionary scheme need not be too closely investigated. Unfortunately for that country, it will need more than a Presidential decree to implement that proposal.

### The Patents Committee

The announcement last week of the appointment of a Committee to look into various aspects of the Patent legislation and its operation is a welcome step. *The Economist* has more than once expressed the view that very substantial reform is necessary if a check is to be placed upon the growing elements of monopoly which are permeating many sections of British industry, and has advocated, as a solution

For the Child's future —  
consider a  
**MAGNA CARTA POLICY**  
which affords protection should the  
father die during the child's minority.  
**NATIONAL PROVIDENT INSTITUTION**  
FOR MUTUAL LIFE ASSURANCE  
Founded 1835  
48 Gracechurch Street, London, E.C.3

in some cases, the Licence of Right. The terms of reference of the Committee are:—

To consider and report whether any, and if so what, changes are desirable in the Patents and Designs Acts, and in the practice of the Patents Office and the Courts in relation to matters arising thereunder. In particular, the Committee is requested to give early consideration to, and to submit an interim report or reports on—

(a) the initiation, conduct and determination of legal proceedings arising under or out of the Patents and Designs Acts including the constitution of the appropriate tribunals; and

(b) the provisions of these Acts for the prevention of the abuse of monopoly rights; and to suggest any amendments of the statutory provisions or of the procedure thereunder which, in their opinion, would facilitate the expeditious settlement and the reduction of the costs of legal proceedings in Patent cases and would encourage the use of inventions and the progress of industry and trade.

These terms are sufficiently wide to enable the Committee to make the fullest inquiry and the specific points mentioned cover most of those commonly raised by critics of the existing law and practice, with the significant omission of any mention of the practice of pooling. They fail, however, to give any indication of policy. What the critics find most objectionable is the assistance given to monopoly. What they would like to see is a definite instruction to discover whether some alternative could not be found which would ensure the widest use of inventions without conferring monopoly rights. In the absence of any such recommendation there is considerable danger that any Committee, consisting, as it must, largely of experts in the details of the existing law and practice, will lose sight of the wider issues which amendment is, or ought to be, designed to serve.

### Taxing Overseas Enterprise

The decision of the Government to grant additional reliefs of taxation on sums used for the amortisation of industrial equipment was bound to raise hopes of similar treatment for profits earned overseas which had already paid tax in the country of origin. The present position is, broadly, that the UK Government taxes at the full standard rate all net profits earned overseas after payment of overseas taxes, provided that the owners are UK residents. There are three major exceptions to this rule: special arrangements relating to profits from shipping, air transport and certain types of agency business; Dominion income tax relief; and the provision that, when the control of a company established overseas is merely shareholders' control, only the profits remitted to this country are subject to UK tax. The last of these means that, when effective control of operations passes into the hands of local residents, the company receives more favourable treatment than it would if domiciled at home and operating either at home or abroad. While this may fit very well with the desires of foreign Governments, it is a question, to be decided in each case, whether overseas operation, combined with foreign management, should confer advantages not possessed by British-run concerns, wherever they operate. As to Empire relief, this is by no means general between this country and the Dominions—although it prevails with most colonies. Even where the Dominion adopts the prin-

ciple, its effect is often restricted by the imposition of taxes such as EPT and corporation taxes which are outside the scope of relief and reduce the remaining income on which relief is given. In view of these facts, there has been continuous pressure for a change of policy, and in this the British National Committee of the International Chamber of Commerce has played a prominent part. It has seized upon the conjunction of a visit of US financial representatives here with the more lenient attitude of the Chancellor and his statement that exports are a matter of life and death to present a memorandum to him on the subject. Briefly, this asks that profits earned and taxed overseas shall be relieved of further UK taxation, except insofar as the profits are distributed, and that on distributed profits the total tax paid at home and abroad shall not exceed the UK standard rate or the overseas rate, whichever is higher.

### Criteria for Relief

The proposal of the National Committee amounts to asking the British Treasury to bear the whole burden of relief for British residents, and it claims that this is the only hopeful line of approach, since many other countries have been working towards this type of solution, whereas progress by means of sharing the relief between the country of origin and that of ownership has, in their view, been negative. A rough estimate, made by them in 1937 on the basis of a standard rate of 5s. in the £, suggested an initial cost of £6 million for relief on all overseas profits, including Dominion and Colonial. They believe that the figure would not be very greatly different now, and they maintain that, even from the narrow viewpoint of revenue, the loss would quickly be made good by the encouragement given to the establishment of overseas enterprise. It may be said at once that, so far as selling goods and rendering services overseas is concerned, there is a very strong case for putting the British-owned concern on an equal footing with that in local ownership, provided that there is some reciprocal arrangement which prevents the local Government from imposing differential taxation on foreign-owned undertakings. If no such arrangement can be reached, it is a matter of grave doubt how far the British Government should grant what is in effect a subsidy to enable Britain to maintain trading interests in areas where their presence is not actively desired. This argument applies with greater force in the case of manufacturing concerns, since it is certainly not desirable to encourage manufacture overseas if the goods could be made at home and exported. Certainly, instances of tax differentials being the determinant in the siting of industry making for export are rare compared with those where tariffs are the cause and the principle of giving the overseas company an advantage has already been established in the case of exception three above. Evidently, there is a strong case for the removal of the disabilities from which British overseas enterprise suffers. This is a matter which, like depreciation allowances, can best be treated by adopting a company tax, divorced from income-tax. But, apart from the method, just what the relief should be is a question which cannot be determined in isolation from the action of other Governments or the future policy of this country with regard to the export—and import—of capital.

### Primitiva Gas Expropriation

After a very substantial delay, considerable light has been shed on the intentions of the Argentine Government with regard to the expropriation of the Primitiva Gas Company of Buenos Ayres. Detailed information is not available, but it appears that the company at no time received a concession from the Argentine Government, but operated under an agreement with the BA Municipality. This agreement was extended to July, 1945, and the capital upon which payment was to be based was to be subject to negotiation. No agreement has been reached, and the Municipality has granted to the State Oilfields Monopoly the sole right to supply gas to the town of BA. In these circumstances the Argentine Government proposes to pay only some £230,000 to the company in complete compensation, the figure being based on the value of installations less the cost of removing them. The company objects to the valuation and rejects the suggestion that they should bear the cost of removal. They claim that much, if not all, of the installations can be used, and have refused to accept the offered price. On April 27th the Argentine Embassy in London issued a statement that the expropriation was necessary to ensure that the new

arrangement will be working by January 15, 1945; that the company was guaranteed by the intervention of the judicial authorities, and that it would be able to appeal to the Supreme Court, the High Court of Appeal, with which the final decision rests. Two days later Primitiva Holdings—which owns 99 per cent of the Gas Company's capital—stated that the Argentine Minister of Agriculture had given the local representative an assurance that expropriation was chosen so that impartial judges should determine the definite value of the assets to be expropriated, and that the company will be given every opportunity to state and defend its case. Finally, on Tuesday last the Secretary of State for Foreign Affairs stated in reply to a question in the House of Commons, *inter alia*, that

His Majesty's Government are watching the development of this case with particular reference to the question whether the amount of compensation to be paid to the company will, as provided by Argentine law, be either mutually agreed or determined by the Supreme Court on the basis of a valuation of experts appointed by both parties.

The operative phrase is that in italics. It is impossible to believe that there is no part of the Primitiva organisation, which has been built up over a period of some 23 years, which will not be of material value to the new supplier.

### Distribution of Bank Deposits

The estimates of the distribution of bank deposits which were given for the first time in last year's White Paper on the sources of war finance have been brought up to date in the latest issue of this publication (Cmd. 6520). The movements since the end of 1941 have been as follows:—

|                         | DEPOSITS HELD BY THE CLEARING BANKS |               |               |               |               |
|-------------------------|-------------------------------------|---------------|---------------|---------------|---------------|
|                         | (£ million)                         |               |               |               |               |
|                         | Dec. 31, 1941                       | June 30, 1942 | Dec. 31, 1942 | June 30, 1943 | Dec. 31, 1943 |
| Total deposits . . . .  | 3,329                               | 3,263         | 3,629         | 3,630         | 4,032         |
| Less advances . . . .   | 807                                 | 800           | 773           | 744           | 743           |
| Net deposits . . . . .  | 2,522                               | 2,463         | 2,856         | 2,886         | 3,289         |
| Personal deposits . . . | 692                                 | 704           | 820           | 859           | 972           |
| Other deposits . . . .  | 1,830                               | 1,759         | 2,036         | 2,027         | 2,317         |

No attempt has been made, in arriving at these figures, to allow for the amount of bank accommodation obtained by the discounting of bills of exchange. Personal deposits exclude the accounts of businesses, financial institutions, public authorities, and also those of individual traders, shopkeepers, farmers and professional men where the accounts are known to be used for the purpose of business. Non-resident and sundry accounts are also excluded. The growth in business deposits has slackened in comparison with that of private deposits. The expansion in each item since the end of 1941 was 40 per cent and 27 per cent respectively. Yet if the period of comparison is taken from June 30, 1941, when the estimates were begun, the corresponding figures are 58 per cent and 161 per cent. This disparity suggests that inadequate sampling, or some change in classification, occurred soon after the series of estimates was begun.

### Essential Work Orders

The principle of the Essential Work Order has now been in force for nearly three years, and between eight and nine million workers are covered by such Orders. It is universally recognised that the Orders have been an indispensable part of wartime legislation and that without them the manpower situation might have been chaotic. Their purpose is "to prevent loss of production owing to unnecessary turnover of labour, absenteeism or indiscipline." In spite of many features which have been criticised both by managements and workers, the Orders have many positive advantages. The guaranteed working week, especially in casual industries, the right of appeal against dismissal, and the provision of the "fair wages and conditions" clause, are among the benefits conferred. Because of the importance of its implications both for war and peace, a conference held by the Labour Research Department last week-end was timely, and indicated some of the points about which there has been most criticism. The main grievance seems to be the alleged different treatment meted out in the Courts to employers and workers. The relatively trivial fines imposed on Messrs A. V. Roe in May, 1942, and Messrs Desoutter Brothers in February this year, in both

cases for refusing to obey the National Service Officer's direction to reinstate a dismissed worker, were compared with the sentences of imprisonment passed on workers on many occasions. Another demand is for an interpretation of the term "serious misconduct," for which an employee can be summarily dismissed. There is no definition of the term in the Orders. A legal authority gives as examples "wanton injury to the master's property; making false entries; indecent or profane behaviour; gross insubordination or refusal to do work within the meaning of the contract." But workers have been dismissed, and their dismissals upheld, for far less serious offences. Another abuse, it has been alleged, is in connection with the employer's right of suspension without pay on disciplinary grounds for up to three days. Most difficulties, perhaps, occur in connection with reinstatement. An employer is obliged to reinstate a man in his old job, at the same rate of pay and under the same conditions, if directed to do so by the National Service Officer. Employers have sometimes argued that the old job is non-existent, or have paid the man his wages without providing the work. A further point at issue is that wages and conditions must not be less favourable than the "recognised terms and conditions" provided for in the Conditions of Employment and Arbitration Order, 1940, before a firm can be scheduled. This clause, it has been said, is often insufficiently enforced. Most of these points are under constant consideration by the Trades Union Congress, and if some form of EWO is to be continued after the war it seems essential that the questions of doubt should be clarified.

### Export Finance

Mr Olaf Hambro has some hopeful things to say about the revival of the international acceptance business in his statement to shareholders of Hambro's Bank. He points out that the London acceptance was mainly utilised for financing the transport of goods, not only by way of imports into the United Kingdom, but throughout the world. He is confident that this type of credit can also be utilised to finance British exports. Mr Hambro argues that to in-

## IODINE: mystery story

It may seem strange to some of us to call iodine a mystery when so much is already known. Isn't iodine an element, vital to life and health? Isn't it true that no organism can live without it? It is the best known germicide, and for some purposes the only effective one. It is a counter-irritant, an aid in arthritis and rheumatism, a specific in the prevention of goitre. Lack of it will kill animals as well as men. Its importance is recognized and growing. Where is the mystery?

The mystery lies in what is yet to be discovered. Biochemists, veterinary surgeons, industrial scientists, working on a hundred facets of the subject, are finding in iodine one of the most fascinating problems of research. Consider some of iodine's recent applications: "Thermometer" Paints, which reveal in colour changing temperatures; Polaroid, which makes possible such diverse magic as non-glare headlights, stereoscopic films and visible representation of changing strains in plastic materials; and infra-red photography which makes hitherto invisible things visible.

So many new facts have been brought to light in the last hundred years that it has been necessary to set up an organization to disseminate this knowledge. This organization is the IODINE EDUCATIONAL BUREAU. It was formed in 1938. The services of this bureau are available free to any industrial or commercial undertaking with an iodine problem.

### Iodine Educational Bureau

## Important Notice to our Sherry Customers

FINDLATER'S FINO, well-known to Sherry drinkers all over the World, will in future be known as

FINDLATER'S DRY FLY SHERRY

The reason: Findlater's Fino cannot be registered and protected from imitations under that name. FINDLATER'S DRY FLY is registered, ensuring protection for our customers throughout the World.

FINDLATER, MACKIE TODD & CO. LTD.  
Win Merchants to H.M. the King 92 Wigmore Street, W.1.

crease British exports by the required amount it will be necessary to export to poor countries where credit to the buyer will be essential to enable him to turn over his goods. Two types of credit risk will have to be covered. The first is the commercial risk based on the buyer's personal credit-worthiness. The second is the more general transfer risk applying to all credits granted to the buyer's country. Mr Hambro suggested that while the first type of risk should fall to the lending bank, the second type of risk would be more difficult to assess on the part of private institutions. The machinery for covering this second type of risk was already operated before the war through the Export Credits Department. It will no doubt be available in perfected form after the war.

### Coal Supplies and Output

Even though production has been fully resumed throughout the coalfields, the decline in output during the past month makes it as necessary as ever to continue strict economy both in the domestic and industrial use of fuel. The restrictions on domestic consumption are maintained, but the limit of stock allowed has been slightly raised. For two months from May 1st to June 30th, 10 cwt. of house and kitchen coal and coalite may be supplied in the South of England and 15 cwt. in Scotland, Wales and the North of England. Consumers are recommended to start laying in stocks for the winter within the prescribed limits. The cuts on industrial users of 25 per cent in gas and 10 per cent in electricity are to remain in force. These cuts were imposed by the Ministry of Fuel at the beginning of April, with the threefold object of compensating for output lost through stoppages, conserving stocks and maintaining transport services. The Ministry claims that the cuts have brought economies at the rate of 200,000 tons a month and is well satisfied with the results. It claims that no essential war production has been held up because of fuel shortage, and that where there was any risk of this considerable discretion in the application of the Order has been allowed. In fact, it appears that there must have been considerable waste of fuel before if the cuts of this Order have made so little difference to production. The combined effect on coal output of strikes and the Easter holidays is reflected in the fall in the average weekly rate of production from 3,637,800 tons during the four weeks ended March 18th, to 3,204,900 tons during the four weeks ended April 15th. Two districts, South Derbyshire and Leicestershire, qualified for the output bonus. In South and West Yorkshire, the proportions of standard tonnage reached were only 55.6 per cent and 66.5 per cent respectively. Two encouraging features about the otherwise disappointing record were that loss of tonnage through transport difficulties was negligible and that the production from opencast workings increased from an average of 108,300 tons a week to 124,000 tons.

### Cocoa and Chocolate

The two main products derived from raw cocoa beans are drinking cocoa and chocolate. Broadly, drinking cocoa, which is sold in powder form, is produced from the beans by extracting a proportion of the cocoa butter. Chocolate is made by adding cocoa butter to raw cocoa, besides other ingredients. The proportions in which cocoa butter is used varies from firm to firm. Thus it is not possible to calculate accurately how much raw cocoa is used in the making of its two main products. Figures of the tonnage of raw cocoa now being manufactured are not available, but there is some evidence of an increase in cocoa drinking. Cocoa is not rationed, and is in plentiful supply. It provides an alternative to tea, of which in 1938 more than 10 lb. per head was consumed. Whether its compulsory reduction by rationing to 7½ lb. a head has had a fully compensating effect in cocoa drinking is not known, but probably of all beverages, cocoa has been more used as an alternative to tea than any other. The working class budget figures compiled by the Oxford Institute of Statistics confirm that there has been an increase in cocoa drinking. It is known that chocolate production for the civilian market has been halved since the war. Output as a whole is about two-thirds the pre-war quantity, which is produced by one-third the labour force in half the factory space. The two concentration schemes, the restrictions on variety and packing, and the fixing of a maximum rate of labour per ton produced, have made these economies possible. Economy had been carried so far, that the Govern-

ment's demand for large quantities of vitaminised chocolate for post-war relief could not be undertaken in addition to current production. The problem of maintaining the civilian ration of 3 oz. a week was solved by increasing the amount of sugar confectionery made. Even so, current civilian consumption of sugar confectionery amounts to only about 40 per cent of pre-war civilian consumption. Prices of chocolate and sugar confectionery are controlled, under an elaborate scheme of classification, with a maximum price of 5s. a lb., but only a small proportion is dearer than 2s. 8d. The zoning scheme introduced in June, 1943, is estimated to have saved 35 million ton miles so far. The various schemes of control have been operated partly by the Ministry of Food and partly by the industry itself, through the wartime associations.

### Mr Hawtrey on "Futures"

Addressing the Manchester Statistical Society on the significance of forward purchases, Mr R. G. Hawtrey was speaking to the converted, for no industrial centre has tested the justification of a futures market to better purpose than has Manchester. Mr Hawtrey opened his address by a defence of speculation—an element which, he pointed out, enters into all enterprise, even in the purveying of services. It is obviously present in all industrial undertakings. In the course of actual production speculation is directed to comparatively short periods. The development of futures markets has made it possible for the manufacturer to cover himself effectively against a considerable part of the speculative risks he is running. Mr Hawtrey was particularly interesting in his description of the nature of futures' dealings.

A futures market enables the merchant to hedge. When he engages to buy wheat or cotton he can at the same time effect a future sale of wheat or cotton. A sale in the futures market differs from a sale of an identifiable parcel of produce in that the seller becomes a mere debtor of the commodity. In fact it is not a sale, but a promise to sell. The obligation under the contract is to deliver goods of the agreed quantity and grade at the due date in return for the agreed price in money. For the purposes of the contract, the commodity approximates to the status of money. Money in the eye of the law is *res fungibilis*, that is to say any good piece of money is treated as the full equivalent of any other good piece of money. One who has received money, and has to restore it, is not required by the law to hand over any particular pieces of money; his obligation is only to pay the specified sum in good money. Thus a banker is a simple debtor to his depositors; that is why he is free to employ the money received from them in any way he pleases, so long as he is able to pay his debts on demand or on due notice. The seller of wheat in a futures market becomes a debtor of wheat. Detached critics often waste their irony on the bear speculator who sells stuff which he has not got. But a forward sale of 10,000 tons of wheat for £100,000 by a man who has no wheat in his possession is no more anomalous than the forward purchase by one who has not the money in hand.

Mr Hawtrey foresaw a threat to the great and important futures markets that have developed in this country. Exchange control which makes a currency "a mere parochial medium" is one of the dangers. The other is the competition from other countries in the business of merchanting. The commercial supremacy which Britain held until the outbreak of the war has over the history of the world changed hands many times. Britain's supremacy will certainly be challenged at the end of this war and successfully challenged if an attempt is made to do the merchanting through departmental committees; as Mr Hawtrey pointed out:—

The process by which a crowd of independent speculators arrive at a resultant market price seems cumbersome and hazardous in comparison with an official organisation administering a control in consultation with the pooled wisdom of the merchants. But the independent speculators have the advantage that they do not have to account for their opinions. The expert reporting through an official hierarchy, or discussing across a committee-room table will often fail to convey considerations which would enter into his calculations and materially modify his judgment if he were acting independently—and silently.

### Shorter Notes

Negotiations are well advanced for the fusion of the Leeds Permanent and the Woolwich Equitable into a new unit to be entitled the British Building Society. If all goes well, it is intended to add the Liverpool Investment and the Dunfermline societies to the group. The two main constituents

have total assets in excess of £80 million, so that the new unit will be third in the class of the giants, and it is difficult to see what organisation economies are likely to result from the grouping. The geographical spread, insofar as it is real, is presumably an advantage, although it would appear that differences in the law north and south of the border may eliminate any gains from taking in a Scottish society.

The number of working days lost through trade disputes during March was 1,600,000, compared with 273,000 in February, and 123,000 in March 1943. Of this total, 1,263,000 days were lost in coalmining, or over 80 per cent. The stoppages in South Wales and Yorkshire involved 220,000 people. Some 315,000 working days were lost in the metal, engineering and shipbuilding group, and 15,000 in transport. Of 285 stoppages, 110 were caused by wages grievances, and 175 by other causes. The apprentices' strike, not being an industrial dispute, is excluded from the Ministry of Labour's returns.

The monthly debt return for April marks another milestone in the expansion of the national debt. It is the crossing of the £5,000 million line by the total floating debt. The total outstanding on April 29 was £5,059,775,000 and represented increases of £126,630,000 on the total for the end of March and of £955,270,000 on the figure for April, 1943. Of this twelve months' increase in the floating debt £387,500,000 is accounted for by Treasury Deposit Receipts and is thus held almost wholly by the domestic banking system. Another £207 million is accounted for by Ways and Means advances from public departments and is thus held wholly within the Government. Of the total expansion of £361 million in Treasury bills, £210 million is attributable to bills issued through the tender and £151 million to bills issued through the tap. The tap bills will have gone partly to public departments (for example, to secure the additions to the fiduciary issue) and to Empire central banks. A considerable part of the increase in bills issued through the tender must, if one may judge by the published banking figures, have gone to official quarters. It will thus be seen that of the increased floating debt, rather less than half has actually gone to the market and more than half is either held by public departments or represents the investment of abnormal sterling area balances held in this country.

### UNIVERSITY OF LONDON

The Senate invite applications for:—  
(1) University Readership in Social Studies tenable at Bedford College (Salary, not less than £800).  
(2) Chair of Social Institutions tenable at London School of Economics (Salary, not less than £1,000).  
Applications (10 copies) must be received not later than Monday, 22nd May, 1944, by the Academic Registrar, University of London, Richmond College, Richmond, Surrey, from whom further particulars should be obtained.

## COMPANY MEETINGS

## ROYAL EXCHANGE ASSURANCE

## 224th ANNUAL REPORT

## LORD BICESTER'S REVIEW

The two hundred and twenty-fourth annual general court of the Royal Exchange Assurance was held, on the 26th ultimo, at the Royal Exchange, London, E.C.

The Rt. Hon. Lord Bicester (the Governor) was in the chair.

The Governor, in the course of his speech, said:

## LIFE DEPARTMENT

Dealing first with the results of the Life department, the number of new policies issued amounted to 3,019, assuring £2,185,066, a figure which, after allowing for reinsurance, shows only a slight reduction upon the previous year. The premium income of £1,433,315 shows a slight increase. When it is remembered how stringently our outside staff has been curtailed, with the result that more and more business has to find its own way to us, I think we have good grounds for feeling that the service and protection that the Royal Exchange affords to its assured are very widely appreciated.

Shortly after the war began the Royal Exchange decided to include the risk of air attack in the terms of new policies issued on approved civilian lives, without extra premium. We realised that, although this decision was extending a facility of great practical service to the general public, it was one that must necessarily be subject to review from time to time. At that stage of the war the risk to the civil population of air attack, while unknown, might well have been grievous. So far your directors have fortunately not been called upon to reconsider their decision, and it is to be hoped it will not prove necessary for them to do so, and that our practice may be continued throughout the remaining stages of the war.

## INTEREST EARNINGS

I should perhaps also mention the figure of the gross interest earned, which was £670,661, being £4 3s. 8d. per cent. on the Life fund, compared with the figure of £4 4s. 8d. earned for 1942. The further decrease of 1s. per cent. compares favourably with the previous three years, when the average rate of decrease amounted to approximately 1s. 8d. per cent. Naturally it is not pleasant to see year by year this figure of interest yield decrease. The Life fund now amounts to over £16,500,000, and for all practical purposes all new money accumulating on this fund has, since the commencement of the war, been invested in loans raised by the British Government. These loans have, generally speaking, carried with them a rate of interest not exceeding 3 per cent. Indeed, for shorter dated securities, of which, for certain reasons, the Life fund must hold some proportion, the rate is no more than 2½ per cent.

With every curtailment in the field of investment, and for every decrease in our rate of interest, it is eventually the individual down to the smallest policyholder who suffers. For this reason, therefore, when victory has been won, I trust that amongst the many freedoms for which we are fighting, freedom of action for our financial institutions will eventually also be restored.

From the figures of our trustee and executor department you will see that the amount received in fees varies very little from that of the previous year.

## GOOD FIRE FIGURES

The results presented this year by our fire department are extremely good. The premium income has increased from £1,645,409 in the previous year to £1,814,678. It is probable that this increase is largely accounted for by the

higher values at present attaching to both goods and property, making additional insurance cover necessary. At home this tendency has been particularly marked. In the general foreign field, which term embraces the whole of our business abroad other than the United States of America, considerable expansion has also occurred.

In this connection it may interest you to know that, although so many countries in which we had important insurance interests still remain under the heel of our enemies, the premium income derived from the general foreign field exceeded that of the immediate pre-war year—namely, 1938. Meanwhile, I am happy to be able to tell you that business has been recommended—though only to a small extent at present—in territories until recently occupied by the enemy, while when the time comes again to operate in the countries still occupied it will be found that we have not been idle in the preparation of our plans.

## A PROFITABLE YEAR

As to the underwriting results, with the important exception of the United States, fire business generally both at home and abroad appears to have experienced a profitable year, and this general experience is reflected in our figures. Doubtless there has been a growing and helpful appreciation of the fact that fires directly retard the war effort, and a consequent concentration on measures to limit such outbreaks. At the same time, shortage of supplies of all kinds, and realisation of the difficulty and, in so many cases, impossibility of replacement doubtless contributes to the exercise of greater care being taken against the fire menace.

The actual figure of profit covering the whole of our fire business, including net interest of just under £40,000, amounts to £285,840, which amount has been transferred to profit and loss account. It is a fine result, and reflects the greatest credit upon all those of our executive and staff who are responsible for it. I should, I think, add that it can scarcely be hoped that this figure can be soon repeated.

I am again able to give you a favourable report upon the results of our marine department. As concrete evidence of this you will see that we have decided this year to transfer the sum of £75,000 to the general profit and loss account, an amount which is the largest transfer we have made for some years. But marine underwriting is a long-term business, and therefore it can easily occur that at times when results are definitely satisfactory one must also take into account future potentialities. In our present accounts we show a net premium income of £598,837 against a fund which stands at £1,165,460, that is a percentage cover of 194 per cent. For 1942 the relative figure was 132 per cent.

## ACCIDENT FIGURES

The Corporation has again experienced a satisfactory year in the Accident department, and the premium income at £1,053,935 is somewhat larger than the previous 12 months. The volume of motor-car insurance is of course still very restricted on account of war conditions, but the Corporation seems to be holding its fair share, and we are ready to develop again as soon as the opportunity occurs.

With the exception of increased compensation benefits to workpeople, I do not think the Employers' Liability section of our business calls for special comment. In previous addresses to you I have said that the cost of workmen's compensation insurance is regulated by agreement with the Home Office, and in cooperation with them the companies who, like ourselves, are members of the Accident Offices' Association agreed not to make any immediate

increase in the rates of premium, but that the additional benefits to workpeople should be absorbed in the calculations on which the premiums are annually adjusted. This adjustment will still result in a rebate to policyholders on renewal of their insurances during the current year. I mention this as showing a further instance of where private enterprise in collaboration with a Government department is serving the public need.

## PROFIT AND LOSS ACCOUNT

The combined departmental transfers together with the proprietors' valuation surplus, and a small amount accruing from transfer fees, amount to a total of £564,564 which I feel sure you will agree is a very satisfactory figure indeed. On the other side of the account—the expenditure side—we have made provision for taxation in the United Kingdom to the extent of £275,000. In spite, therefore, of this very successful year, the balance of profit and loss account of £1,292,445 which is carried to the balance sheet is in effect only some £90,000 more than the amount carried forward last year.

You have already been informed of your directors' recommendation to pay a final dividend of 19 per cent. for the year, and I shall presently seek your confirmation of this proposal. The dividend, together with an interim dividend of 11 per cent. paid in November last, will make a total amount of 30 per cent., less tax, on the capital stock of the Corporation for the year 1943.

I think we can all feel proud of the results that I have just been able to give you, but personally I feel even more satisfaction in the knowledge that they are based upon, and are the outcome of solid and broadening foundations.

## PART PLAYED BY BIG COMPANIES

There is a good deal of talk these days about the disadvantages of private enterprise, as compared with Government control. As I see our great insurance companies, they are big employers, their staffs are well looked after, working reasonable hours, having reasonable holidays, and looking forward to a pension when they retire; equally these great companies are most efficiently managed, and their worldwide business is a valuable asset to the country; moreover, their shareholders have also benefited through wise and conservative management.

One cannot see how these conditions would be improved upon if these big companies were ever administered by the Government. On the other hand, I think that if they ever came under Government control they would lose what is to-day an enormous advantage, and that is the personal pride and satisfaction which every one feels who is connected with these companies. I think the personal feeling which our staff has for the corporation is one of our greatest assets, and it is of incalculable value to every one concerned. In dealing with human beings it is surely a thousand pities to do anything that diminishes this personal element.

## STAFF ON SERVICE AND AT HOME

You of course know that a large number of our staff are away working in the many forms of service which a country waging total war must necessarily demand of its citizens. In each and every sphere of work, and wherever they may be, we extend to them our good wishes. To the relatives of those who have given their lives in our cause, we wish to send our respectful sympathy.

Finally, I know you will wish me to convey on your behalf, and on behalf of the members of your court, both our congratulations and thanks to our manager, the executive and staff, and to our local boards and agents both in this country and abroad, for the services they have rendered and the results they have achieved for the Royal Exchange Assurance during the year 1943.

The report and accounts were unanimously adopted.

## ARMY AND NAVY STORES LIMITED

## INCREASED DISTRIBUTION

The seventy-second annual general meeting of this company was held, on the 3rd instant, in London.

Major-General Guy Dawnay, C.B., C.M.G., D.S.O., M.V.O., the chairman, said: The final result shows a balance to appropriation account which, at £324,413, is no less than £138,370 higher than in the previous year. This profit, however, is arrived at before provision has been made for income tax, Indian excess profits tax, and National Defence Contribution. When these are provided for the distributable net profit is £76,860, against a distributable net profit last year of £65,293, or £11,567 more.

This, I think you will agree, is a satisfactory state of things in these difficult times, but I must point out that this increased distributable profit is not due to increased turnover in London nor to any other form of trading prosperity here, nor to any additional profits from our Indian branches.

## CURTAILMENT OF SERVICES

It is due partly to economies and to further curtailment of many of the services normally rendered to our customers. Of one such we are particularly conscious; it is a service which our customers now largely perform for themselves and which he stores rendered free in pre-war days. I refer to transport. A very large sum is saved yearly by customers taking their own vehicles—in most cases unwrapped. This assistance is most valuable to us, as it helps us to economise in manpower, petrol, and packing materials. Our increased profit is also due partly to the fact that a large part of the stores premises has been taken over by the Government, which has helped us, not only in the matter of the rent receivable, but also by relief in respect of rates, lighting, heating, cleaning and other expenses.

Although our Indian branches have helped to swell our figures, they have made no extra contribution to the distributable profit owing to the incidence of Indian excess profits tax and income tax.

Our recommendation is that the shareholders should receive 10 per cent.—that is 9d. per share—plus a bonus of 3d. per share, less tax. That is 2½ per cent. (or 2d.) per share more than last year.

## MODERNISATION AND ALTERATIONS

Reverting to the strength of our liquid position, one of the purposes for which we all require money is the general modernisation and other structural alterations of our buildings, which we had aimed to carry out when the war intervened with our programme. Nothing has happened in the past four or five years to use us to alter the beliefs which we then held and on which this programme was based. It is the opinion of your directors at a great future awaits the departmental premises situated in London and the large provincial towns. I wish to stress the fact that we have no wish whatever to drive all shopkeepers out of their business. They are essential to their districts and are in a better position to supply local needs than many commodities than are the big ones.

As regards the immediate future, I am not going to hazard a guess. Everything contingent on the duration of the war. regards the further future, given some approaching normal conditions, your directors have complete confidence in the prosperity of the stores after the war. Our policy will be a progressive one.

The report and accounts were unanimously adopted.

## B. MORRIS AND SONS, LIMITED

## IMPROVED POSITION

The annual general meeting of B. Morris and Sons, Limited, was held, on the 27th ultimo, in London.

Mr Arthur J. May (chairman and managing director) said: The profit and loss account, after providing for National Defence Contribution, shows a balance of £10,368, which is disposed of in the appropriation account as follows:—The balance of loss £2,270 is wiped out; income-tax and provision for future taxation absorbs £2,520; preference dividend net £1,750; and the proposed final dividend on the ordinary share capital £3,359, leaving for the first time for some years a balance forward of £468.

I mentioned last year that part of the 1942 profit was due to circumstances not likely to operate in 1943, so we could hardly anticipate doing so well in the following year. Also during the year our trade was affected by the fall in sales of pipe tobaccos. This was common to the trade as a whole, and the high price and shortage of pipes had a great deal to do with it. Increased cost of leaf and difficulty in obtaining more skilled workers for the cigar side also played a part.

We have wiped out the debit balance on the profit and loss account and completed writing off the cost of the air-raid shelter, which is, I might mention, a permanent addition to our building. The two items, together totalling £2,560, have been provided out of the year's profits, so that we start 1944 with a clean sheet and a small balance in hand, and we can look forward with confidence to the future. Our finances are in very good order, creditors being negligible.

The report was adopted and a dividend of 5 per cent. on the ordinary share capital approved.

## LONDON ASIATIC RUBBER AND PRODUCE COMPANY, LIMITED

## STRONG FINANCIAL POSITION

The annual general meeting of the London Asiatic Rubber and Produce Co., Limited, was held in London on the 1st instant.

In his address circulated with the accounts and report the chairman, Mr H. J. Welch, said: We still have no information concerning conditions on the company's estates.

The company's financial position is strong; the balance-sheet shows net liquid assets amounting to £360,605, after deducting £52,325 to make provision for certain liabilities actual or potential. The chief item of expenditure is the provision made for the estates staff. This provision has now been brought up to a considerable sum, and the annual charge will be very much less in future.

The revenue account shows a debit balance for the year of £8,830, which is less than the amount charged for provision for staff. This balance has been met by a transfer from the reserve for contingencies.

Much thought has been devoted by the Inland Revenue authorities and the Rubber Growers' Association and others to the question of taxation of companies whose activities have been interrupted by invasion, and such companies are now allowed to elect provisionally to be treated either as continuing trade or as having discontinued trade with an option to reverse their provisional election after the war if it is found that a reversal would be more favourable to them. This company has given provisional notice of discontinuance, and becomes entitled to relief from taxation otherwise assessable and to a refund of certain taxation previously paid estimated at £70,000.

The accounts were adopted unanimously.

## LEGAL &amp; GENERAL ASSURANCE SOCIETY LIMITED

Established 1836

## EXTRACT FROM REPORT &amp; ACCOUNTS FOR THE YEAR 1943

"At the Annual General Meeting held on 2nd May, the Chairman, Mr. Ernest E. Bird, in reviewing the business of the year, gave the following details."

|                                           | 1943               | 1942               |
|-------------------------------------------|--------------------|--------------------|

## ASSETS EXCEED £67,000,000

CHIEF ADMINISTRATION, ALDWYCH HOUSE, LONDON, W.C.2.

General Manager: VERNON E. BOYS

## THE EASTERN BANK LIMITED

SIR JAMES LEIGH-WOOD'S STATEMENT

The annual general meeting of The Eastern Bank, Limited, will be held, on the 10th instant, at 2 and 3, Crosby Square, London, E.C.

The following is an extract from the statement by the chairman, Sir James Leigh-Wood, K.B.E., C.B., C.M.G., issued with the report and accounts:

The accounts now presented for your consideration closely follow in pattern those of other British banks operating in the East inasmuch as we record a substantial increase of £4,700,000 in current and deposit accounts, with a corresponding increase in cash of £1,700,000 and of £3,000,000 in securities. It is also encouraging to note an expansion of £400,000 in advances to customers. The fall of £360,000 in bills receivable is mainly due to a lower holding of Treasury bills. It will be noticed that freehold property in India shows a reduction of some £100,000, brought about by sales at advantageous prices; since the date of the balance-sheet further properties have been sold to our satisfaction.

### IMPROVED PROFIT

Turning to the profit and loss account, the net profit shown after making full provision for contingencies is £98,560, slightly greater than the corresponding figure for last year. The board have had under consideration the strengthening of the reserve fund, and from the profits of the year £50,000 has been so applied together with a further £50,000 released from contingencies fund, thus increasing the published reserve to £600,000.

The first interim dividend for 1943 was raised to 2½ per cent., while the second and final dividend was 3 per cent., thus making a total distribution for the year equal to 5½ per cent. on the paid-up capital as against 5 per cent. for the previous year. This is not a great increase, but no doubt it has met with approval by shareholders. The net result of these transactions is a carry-forward of £79,171 as against £85,610 brought into the account.

### CONDITIONS IN INDIA AND CEYLON

The commercial situation in India and Ceylon continues to be dominated by Government requirements. Exports consist mainly of commodities essential for the prosecution of the war, purchased by the Ministries concerned. We receive a fair portion of the resulting exchange. There is as yet no marked recovery in exports of commercial goods from this country to the East.

Attention has been drawn in the Press to a paper written by a group of Indian merchants and industrialists in which is set out the policy for a long-term development of their country. In the main I find myself in agreement with their aspirations.

### POSITION IN IRAQ

As you know, we have substantial interests in Iraq, and the story there is very similar to that of India. Heavy disbursements on behalf of the allied Governments resulting in a great expansion in the note currency have raised prices to a fantastic extent which press heavily on the cost of living, especially felt by those on fixed incomes. It is not easy to control prices in an Oriental country, but I am glad to see that delegates from Iraq are attending a conference in Cairo to discuss methods of checking inflation in the Middle East. It is understood that the Government of Iraq is considering the flotation of internal loans which should be beneficial by absorbing in some degree the floating cash surplus.

The statement concludes with a tribute to the general manager and staff and a brief reference to the retirement of Mr Montagu Norman.

## ANGLO-PALESTINE BANK, LIMITED

### POSITION OF ABNORMAL LIQUIDITY

### INDUSTRIAL DEVELOPMENT IN PALESTINE

### MR L. BRAUDO'S STATEMENT

The forty-second annual ordinary general meeting of the Anglo-Palestine Bank, Limited, was held at the bank's London office, Stafford House, 20, King William Street, London, E.C. 4, on the 1st instant, at 12 o'clock noon.

The following is the statement of the chairman, Mr. L. Braudo, circulated with the report and accounts:—

Following the prevailing custom, I am circulating the present statement, together with the report and accounts, to take the place of the chairman's address to the shareholders at the general meeting. As no such address has been published since the outbreak of war, it will be useful to state some facts and figures relative to the development of the bank and of the country in which its business is conducted.

### INFLATION IN THE MIDDLE EAST

The fact that considerable inflation prevails in all Middle Eastern countries is well known; it has been the subject of much comment. However, inflation in Palestine has been much more moderate than in any other Middle Eastern country; only Egypt can to some extent bear comparison with Palestine. In Syria, the Lebanon, Iraq, and Iran the cost-of-living and commodities price indices stand at present at anything from 500 to 1,000 (on the basis of a pre-war 100). They are constantly rising and show a position very different from that of Palestine, where the cost-of-living index stood at 248 in June, 1943, and stands at 233 at present.

What is perhaps more important, there are reasons to believe that the situation has not got out of hand. At the cost of some exertion and of considerable expenditure by way of subsidisation of a few essential commodities, it has been possible not only to prevent for the time being a further rise in the cost-of-living index, but also to bring about a moderate decrease. While it must be said that most probably much more could have been attained if greater and wider efforts had been made at an earlier time, as was done in the United Kingdom, it should not be forgotten that in all the surrounding countries controls are far less strict than in Palestine and that as a consequence the local authorities have found themselves to some extent hampered in their task.

I should also mention that direct taxation by way of income-tax was introduced in September, 1941, and that there is a considerable amount of saving, although only a small proportion of it has been canalised into direct purchase of Savings Certificates and Defence Bonds.

While it is difficult to measure the force of all the factors which may yet influence the situation, and prophecy would be rash, I think I may still say that there are grounds for a fair measure of confidence and for the expectation that on the whole inflation will not get out of hand, at least in Palestine. This gives us reason to hope that the problems presented by such deflation as will be unavoidable when more normal times return will be manageable.

### INDUSTRIAL AND AGRICULTURAL DEVELOPMENT

Much—I sincerely believe not too much—has been said and written about the remarkable development of industry in Palestine during the war, and the assistance it has been able to give to the armed Forces in the Middle East. The number of industrially employed persons has been more than doubled during the war. I am happy, and indeed proud, to be able to say that in the financing of this development we have played a leading part.

The same may equally be said of agriculture, which has considerably increased production.

The citrus growers have throughout the war been in a most unfortunate position. They have been unable to export, and they would not have been in a position to maintain their groves had the Government not stepped in and requested the banks to grant cultivation loans under fairly complete Government guarantee. At the end of each season the Government has made good its guarantee and again renewed it for a new loan. The result is that growers are accumulating large debts, and this has given rise to a problem that now forms the subject of official discussions. The area under citrus cultivation has been somewhat reduced and the loans granted being insufficient for full maintenance, crops are far below the normal level. However, with judicious care and further investment it is expected that a few years will suffice to bring the plantations back to full production, and European markets, once they return to more or less normal conditions, should easily be able to absorb orange crop. We have always taken an active part in the seasonal financing of this industry, and intend continuing to do so in the future.

### RISE IN DEPOSITS

General conditions prevailing in Palestine are faithfully reflected in the figures of the bank's accounts. Current, deposit and other accounts which stood at about £7,270,000 in the 1938 balance-sheet now appear at £25,446,000. There was a fairly big setback on the outbreak of war, and there were withdrawals on a further two or three occasions when military events in the Middle East gave rise to local concern; but since Alamein there has been a steep and uninterrupted increase.

There has been no concurrent demand for accommodation, and the aggregate items of loans and advances, bills discounted, and advances to subsidiary companies, which stood at about £3,951,000 in 1938, are now reduced to £3,172,000.

The accounts, therefore, show an unprecedented and, indeed, abnormal liquidity. Cash in hand and at bankers (nearly all in London) stands at about £10,450,000, being 41 per cent. of deposits. British Government securities (all of them relatively short-dated) stand at £11,828,000, being 46.5 per cent. of deposits.

The profit for the year amounts to £101,933, out of which £50,000 has been appropriated to contingencies reserve, this amount being somewhat in excess of last year's appropriation. The directors again recommend a dividend on the Ordinary and "A" Ordinary shares at 6 per cent., less tax, being the same rate as for the previous five years.

### DOMINION TAX RELIEF

However, through the incidence of Dominion income-tax relief, the net benefit to shareholders will be considerably greater than the apparent rate of dividend.

This is the first year in which we have been able to pass on to shareholders the Dominion income-tax relief, and although we have already drawn shareholders' attention to the matter in our last two annual reports, I feel that I should take this opportunity to explain the position in somewhat greater detail.

Income-tax was introduced in Palestine in September, 1941. The rate of tax on companies for the fiscal year ended March 31, 1942, was fixed at 10 per cent. (2s. in the £), but as only seven months of the fiscal year remained, the effective rate was seven-twelfths of 10 per cent.

(1s. 2d. in the £). The rate was increased in April, 1942, to 15 per cent. (3s. in the £), and in April, 1943, to 25 per cent. (5s. in the £). The bank is liable to both United Kingdom and Palestine income-tax, but under the reciprocal arrangements between the Empire countries the bank obtains in the United Kingdom relief in respect of Palestine tax to a maximum of one-half of the United Kingdom rate.

This relief the bank is bound to pass on to its shareholders by reducing the rate of tax deducted from dividends (Finance Act, 1920, Section 27).

The computation of the relief granted and the further computation of the relief to be passed on to the shareholders are very intricate matters, and only during a few weeks have these rates of relief been agreed with the Inland Revenue. The relief to be passed on in respect of 41 is 10½d. in the £, and in respect of 42 is 6½d. in the £. For 1943 the rate of relief has been fixed provisionally at 2s. 0½d. This accumulated relief of 6d. is being passed on to the shareholders in the 1943 Ordinary and "A" Ordinary dividend, with the result that read of receiving their dividends under deduction of 10s. income-tax they will receive it under deduction of 5s. 6d. (10s. relief 4s. 6d.), making a net tax-free sum of 4.35 per cent. instead of 3 per cent.

The Dominion income-tax relief to deference shareholders will be passed the next dividends payable. In future years the passing on of interim income-tax relief will be a regular feature in dividend payments.

It is now some years since circumstances made it a desirable precaution to continue interim Ordinary dividends. In view of unforeseen developments it is in directors' intention to resume payment of interim dividends (in about the 1st of October) and I am sure our shareholders will welcome such decision.

### CONFIDENCE IN THE FUTURE

You may perhaps expect me to say a few words about our future prospects. It would be very difficult for me, as a banker, to say that the future is bright, but I am sure that the conditions will naturally depend on general post-war trends and even more on the decisions concerning the political future of the country, which are still in

the balance. Given large and well-directed immigration and consequent opportunities of enlightened development under a firm administration, we may confidently look forward to considerable progress. As you are aware, our bank has always taken a broad view of its duties and of its responsibilities, and I am glad to be able to say that we have at all times found that the true interests of our depositors, of our shareholders and of the public which we serve are really concurrent and readily shape themselves into one single broad policy. It is in this same spirit that we face the future.

## AMALGAMATED METAL CORPORATION, LIMITED

### MR WALTER GARDNER'S STATEMENT

The fifteenth ordinary general meeting of Amalgamated Metal Corporation, Limited, will be held on the 10th instant at 95, Gresham Street, London, E.C.

The following is the statement of the chairman, Mr Walter Gardner, which was circulated with the report and accounts:

After the death of Sir Edward Beatty, and since the last annual general meeting, Mr W. S. Rugh was elected a director. Mr Rugh is vice-president in charge of sales of the Consolidated Mining and Smelting Company of Canada, Limited, with whom we have had the most cordial relations for many years.

There is really nothing fresh for me to tell you. Current conditions continue to restrict severely the opportunities of earning revenue. The figures in the accounts speak for themselves, but you will note that on this occasion we have recommended for distribution nearly the full combined earnings of the constituent companies during the past year. We feel justified in this course by the fact that in previous years we have added substantially to the undivided profits of the concern as a whole.

In conclusion, I wish to thank all associated with our joint concerns for their continuing good work. Our chief function is to render service, and without intelligent co-operation on the part of all that would not be possible.

## NORTH BRITISH AND MERCANTILE INSURANCE COMPANY, LIMITED

### ANOTHER GOOD YEAR

The annual general meeting of North British and Mercantile Insurance Company, Limited, will be held on the 11th instant at Edinburgh.

The following are extracts from the statement by the deputy chairman (The Hon. Arthur O. Crichton) circulated with the report:—

The net new business for 1943 in the life department amounted to £2,237,697 as compared with £2,394,670 for the previous year. Claims by death or maturity mounted to £2,498,527 after deducting re-assurances.

The premium income in the fire department at £3,744,618 showed an increase of £104,130, while the loss ratio of 44.37 per cent. was higher by 1.35 per cent. Expenses were 45.69 per cent. against 48.80 per cent. in 1942.

Our casualty business is transacted by the Railway Passengers Assurance Company. The premium income at £1,385,800 was £96,075 higher than in 1942, and the loss ratio at 46.04 per cent. was down by .33 per cent.

Premiums of The Ocean Marine Insurance Company at £731,129 were less by £355,015. Claims and expenses together were correspondingly lower. £100,000 has been transferred to profit and loss account from profits of past years now closed.

The premium income of The Fine Art and General Insurance Company at £421,211 was £39,809 higher than in 1942 and the loss ratio at 34.28 per cent. was lower by 14.05 per cent. The underwriting profit was 28.48 per cent. compared with 14.83 per cent. in the previous year.

The combined underwriting profit, fire, casualty and marine, was £677,794 against £623,004 in the previous year. The directors are pleased to be able once again to submit such good results. We are recommending the same rate of dividend as last year.

Source: Ministry of Labour Gazette.

"The Economist" Sensitive Index.—There was no change in the index during the week ended May 3rd. The complete index (1935 = 100) was 158.6; crops 135.6; and raw materials 185.5.

**Non-Ferrous Smelters Association.**—An association comprising the British smelters of the primary ores of aluminium, antimony, magnesium, tin, zinc and the precious metals has been formed. Its object is "The consideration and furtherance of the common interests in the maintenance and development of the non-ferrous smelting industry in Britain." The following companies are members of the Association: The British Aluminium Company, Ltd.; British Tin Smelting Company, Ltd.; Copper Pass and Son, Ltd.; Consolidated Tin Smelters, Ltd.; Goodlass Wall and Lead Industries, Ltd.; Imperial Smelting Corporation, Ltd.; Johnson, Matthey and Company, Ltd.; Magnesium Elektron, Ltd.; South Wales Aluminium Company, Ltd.

**Coal Output.**—The output of saleable coal in the four weeks ended April 15th averaged 3,204,900 tons, compared with 3,637,000 tons per week in the previous four weeks. Disputes accounted for an average loss of 325,700 tons a week. The pro-

duction from opencast workings averaged 124,000 tons per week, compared with 108,300 tons per week during the previous four weeks. Leicestershire and Derbyshire qualify for the output bonus, at rs. 9d. and 9d. per shift respectively. Approximately 13,800 miners are eligible.

**Bedding Supplies.**—The Board of Trade have arranged for people who have lost their homes by bombing or who are setting up house, to apply for priority dockets for sheets, blankets and mattresses at the same time as they apply for permits for utility furniture. It is hoped to introduce this scheme, of which further details will be published later, during June. About three-quarters of supplies will be outside the docket scheme and therefore available for the general public.

## FINANCE AND BANKING

**THE MONEY MARKET.**—The countermeasures taken by the authorities to offset the repayment of Conversion 5 per cent. loan on May 1 (discussed in a note on page 619) have proved more than adequate and credit has been in short supply during the week. The Bank return shows that despite the big payments made by the Government on Monday, bankers' deposits had by Wednesday fallen to £158,585,000, a drop of £39,894,000 on the total shown in the previous return. The main counterpart to this movement is a fall of £36,360,000 in Government securities, a movement which veils the modest help given to the market this week by way of special purchases of bills. The note circulation continues to expand and at £1,129,170,000 is £4,697,000 higher on the week. The latest expansion leaves only £21,071,000 of unissued notes in reserve and a further increase in the fiduciary issue thus appears to be in the offing. The banks were called upon to pay about £60,000,000 of fresh money against Treasury Deposit Receipts this week, while Treasury bill payments of £110,000,000 were £20,000,000 in excess of the current maturities. The market syndicate obtained a 37 per cent. allotment in its applications for this week's bills and, since it applied for the whole of the bills on offer, must have taken up rather more than £40,000,000—a figure which helps to explain the difficulty experienced in balancing the books this week.

**MONEY RATES, LONDON.**—The following rates remained unchanged between April 28th and May 4th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1¾%; 6 months, 1¾%; 12 months, 1¾%; Treasury Bills: 2 months, 1½%; 3 months, 1½%; 6 months, 1½%; 12 months, 1½%. Short Loans, 1½%. Bank deposit rates, 1½%. Discount deposit at call, 1½%; at notice, 1½%.

**Exchange Rates.**—The following rates fixed by the Bank of England remained unchanged between April 28th and May 4th. (Figures in brackets are par of exchange).

|                             |         |                             | 126,069 |
|                             |         |                             | 458,605 |

## GOVERNMENT RETURNS

For the week ended April 29, 1944, total ordinary revenue was £61,105,000, against ordinary expenditure of £123,545,000, and issues to sinking funds of £20,000. Thus, including sinking fund allocations £232,965, the deficit accrued since April 1st is £264,133,000 against £319,348,000 for the corresponding period a year ago.

## ORDINARY AND SELF-BALANCING REVENUE AND EXPENDITURE

## The Labour Coalition

THE policies, personnel and general behaviour of the Labour Party are matters of national importance. It is not conceivable that, after the war, a third Party should arise to challenge the elector's choice of a Government between the Conservative and Labour Parties. The Liberal Party, split as it is, is likely to remain odd man out. Is the Labour Party more likely after the war than before to produce the policies and attract the talents required to rule the country, if the need arises, and to rule it well?

These questionings are awakened afresh by the somewhat melodramatic case of Mr Aneurin Bevan. Mr Bevan, among the younger generation (politically speaking) of the Labour Party, is conspicuous for his intelligence, but also for his determination to play the part of the Pickwickian Fat Boy in the Party. The Administrative Committee of the Parliamentary Labour Party decided to turn him out. Then they discovered that his expulsion might mean the departure of other less ebullient but worthy members and the disclosure of deep cleavages within the Labour Party as a whole. It was decided on Wednesday, by a close vote of the whole Parliamentary Labour Party, and against the wishes of both the Administrative Committee and those leaders of the Party who spoke, not to proceed with the expulsion of Mr Bevan, but to discuss the whole question of Party discipline with the National Executive of the Labour Party itself.

The most striking feature of this episode is its complexity. It was the Administrative Committee, not the

Parliamentary Labour Party, that decided to expel Mr Bevan. It was the Parliamentary Labour Party, not the Labour Party itself, that decided on the motion of Mr Shinwell not to expel him. It will be the Labour Party, not the Labour MPs, who will finally decide the issue. This is not all. Mr Bevan's crowning offence was that, after a considerable record of Party indiscipline, he offended Mr Bevan, a Labour member of the Government, who is not, however, a member of the Administrative Committee of the Parliamentary Labour Party.

The fact is that the Labour Party is a Coalition, and like all Coalitions it has grown ineffective with age. The Labour Party, in the political sense, is comparatively small. It depends for its dues mainly upon the affiliation of trade unions, and in return it accepts the dominance of trade union votes at the Party Conferences which have the final say upon policy and procedure. This arises, of course, from the fact that the Labour Party first came into being to speak for working men and to pursue their interests. In the same way as the Government Coalition is dominated by Conservative votes and ideas, the Labour Coalition is dominated by the trade unions, which in their own way are equally conservative.

Even this explanation is over-simple. Mr Bevan is as good a spokesman of one trade union point of view as Mr Bevin. Indeed, his apology for moving a prayer against Regulation 1A(a), despite its approval by the Cabinet, Mr Bevin and the Trades Union Congress, was the instruction he received from his own trade union con-

stituents. In fact, a double division in the Labour councils has been revealed by this episode. The first is the old and increasing gap between the politicians and the trade unionists, a gap which has been much advertised recently by Mr Bevin's attacks upon Professor Laski, the deputy chairman of the Labour Party, and without naming any names, upon Mr Herbert Morrison, who has had the courage to state a policy for Labour which does not start from trade union premises. The second division is within the trade unions themselves. Mr Bevin seems to believe that the time has come for the biggest collective bargain of all, for a direct deal, preferably with Government sanction, between the trade unions and the employers, in order to stabilise wages and working conditions in return for a corresponding stabilisation of profits. Trade unionists who think like Mr Bevin are alarmed by this prospect; they see in it the approach of the corporate state.

Possibly the acceptance of Mr Shinwell's motion to shelve the expulsion of Mr Bevin will prevent these cleavages from immediately becoming an open split. The fact that the leaders of Labour are members of a wartime Government at this crucial stage of the war may be sufficient reason why these domestic matters should be temporarily settled without going to extremes. It seems probable that, when the Whitsun Conference of the Labour Party meets, a formula will have been found to prevent the present very real divisions from being dragged into the light for decision. Nevertheless, from the national viewpoint, it is important to know how these problems are likely to be solved when a decision can no longer be put off.

There are two alternatives. The first is, unfortunately, the more likely; the second is much the preferable. Either the Party can go on as it is, without any effective policy except that accepted by the trade union leadership and profiting at the polls only by the failures and shortcomings of the Conservatives; or else it can carry through a radical regrouping. The first is the more likely, if only because the vote at Labour conferences is determined by the trade unions according to a crudely representative card system. In this Coalition, the Labour politicians, as distinct from the trade unionists, now get the worst of both worlds. Normally the affiliated trade unionists are not even affiliated to the local Labour Parties, on the basis of individual membership, but *en bloc* to the Labour Conference itself. Genuine local Labour Party membership is minute compared with the votes cast at the Conference.

The alternative would be to end the Labour Coalition. The Party would then emerge without its dependence upon the trade union hierarchy, and could look for its strength, in addition no doubt to the individual allegiance of very many individual trade unionists, in the main to the broader non-Conservative portion of the general electorate, which is now considerable. Historically, the trade unions no

longer need the tutelage of a political party. They have power in their own right; they now dictate to their tutor. Moreover, while the formal Coalition of the Labour Party and the trade unions has become ponderous and unreal, the recruitment of local trade unionists as Labour Party members would represent a healthy alliance. But the Labour leaders are disinclined to risk a breakaway. They see the consequences in terms of a sudden drop in membership and subscriptions. They talk of the solidarity of the Labour Movement, without recognising that this solidarity, at present represented by a formal constitutional connection at the top, will really only be worth while if it becomes spontaneous, local and personal. The effects of the present set-up are plain enough. There are these unhappy quarrels whenever any member of the Labour Party offends against the trade union leadership. It is as difficult for men and women of ability and progressive principles to pass the trade union tests as for the camel of the parable to pass through the needle's eye. Moreover, even those men of talents who are attracted to the Labour Party cannot be found likely seats in Parliament, because so many possible Labour constituencies are earmarked for the representatives of trade unionism. Most important of all, it proves impossible to produce a positive policy on any important topic, home or foreign, except insofar as it directly affects trade union interests. The Labour Party's recent utterances on foreign policy, civil aviation and fuel are proofs of this. The suspicion in which Mr Morrison's persistent speeches are held is another illustration.

The alternative of cutting the trade union painter is in many respects as attractive as it is unlikely. This is a two-party system, dependent for its liveliness and worth upon the alternatives between Government and Opposition, upon there being in fact two parties of the same or similar stature. Many electors would give much for a second main party that could come to the polls with a positive policy and a definite progressive programme. It would be realistic, however, to face the likelihood that the Labour Party will probably be enabled, by some arrangement, to put off this choice of its future until the German war is over at least; and that, when the decision is made, it will probably go the wrong way.

The result of this would be one that all good democrats, Conservative and Labour alike, should lament. It would mean, not simply another twenty years of Conservative government, but another twenty years of bad Conservative government, since there would again be no alternative. In the party system, the strength of Box is in direct proportion to the strength of Cox. It is the stimulus of real challenge and rivalry that makes for progress and bold performance; and it is not necessary to be in any way a supporter of Labour doctrines to lament the pit which this party seems to have dug for itself.

new facts have arisen—the changes in the last months have mainly been aggravations of the deplorable conditions existing before—yet the lapse of time makes it perhaps easier to get a proper perspective.

The fundamental factor is distrust. The Polish Government has no confidence in the intentions of the Soviet Government and the Soviet Government has equally little trust in the Polish Government. The Poles argue that although many of their leaders, including the late General Sikorski, have agreed on the necessity of frontier adjustments, the Russians will not abide by their side of the bargain. "What is the use," they argue, "of making concessions when they will only turn out to be the basis of the next Russian claim? The Czechs may have thought they were only giving up the Sudetenland, but that was the first step towards their loss of independence. We Poles believe Russia means to swallow us up and Eastern Poland is only a first bite."

The Russians deny that they mean to absorb the

western neighbours, but they are determined not to tolerate neighbours who are actively hostile. This, they claim, is the attitude of the Polish Government. They accuse the Poles in Britain of wishing to fight Russia and to build up a new anti-Soviet front in the West. Since the British Government gives these people asylum, the Russians cannot believe that the British are not in some way supporting the Polish attitude towards Russia.

If the fears on both sides were wholly groundless, it might be easier to counter them. Unhappily they are not. The Poles' fear of Russia is thoroughly understandable. Historical memories apart, the Russians' recent record in 1939 and 1940 has thrust the roots of suspicion deeply down. The Soviet Government's handling of the frontier question has been exceedingly maladroit—to use no stronger term. In the hour of need, in 1941, General Sikorski obtained from Russia the understanding that all territorial questions should be postponed until the peace settlement. When the tide of battle turned, Russia's restored confidence took the form of raising the demand for Eastern Poland in uncompromising terms. This, rather than the Katyn murders, was the real issue underlying the Soviet Government's sudden decision last year to suspend relations with the Polish Government in London. Since that time, the Russians seem to have gone out of their way to arouse more and more intense Polish distrust and suspicion. The increasing publicity given to the Union of Polish Patriots, the virulent attacks in the Soviet Press on the "fascist émigré Polish Government" in London and on the "pro-German" military underground in Poland, and finally, last January, the Russian Government's brusque dismissal of the Poles' offer to negotiate on the frontier settlement, based on an obvious misreading of the Polish reply—all these have had the cumulative effect of convincing many Poles and even some British and Americans that the Russian talk of Polish independence refers to a refined, rarified and specialised conception of independence known only to themselves.

On the other hand, Russian distrust of the Polish Government is equally understandable. It is useless to deny that in certain sections of the Polish diaspora, hatred of Russia is stronger than any other hate. Here one must distinguish very sharply between the Polish civil government and the Polish army. M. Mikolajczyk's Ministry is not made up of inveterate Russophobes. It is a thoroughly representative Government, which, beyond much doubt, enjoys the confidence of the great mass of the Polish people resisting in Poland. It is made up of those former parties that were in violent opposition to the Pilsudski-Beck tradition of foreign policy. It accepts the need, in the choice between good relations with Russia or with Germany, to work for Polish-Russian understanding. If it makes reservations about the manner in which the Soviet Government has seen fit to raise the frontier issue, it does no more than would supporters of international good neighbourliness anywhere. A more genuinely popular Polish administration cannot be found, and the proof of it

lies in Moscow's failure to set up an alternative administration in Russia or in the Polish underground and in its evident hesitation over giving anything like full governmental status to the Union of Polish Patriots.

The trouble lies not with Poland's statesmen but with its army. Here, in certain circles, anti-Russian feeling is openly paraded. The speeches which General Anders and General Sosnkowski have made to Polish troops in Italy and the Middle East can only be interpreted as a declaration of open hostility. The Polish press is full of insults and attacks on Russia. The civil Government and even the military underground in Poland itself were compelled to intervene to ensure that the Polish guerrillas received specific instructions to co-operate with the advancing Red Army. How are the Russians to interpret all this? They note that the most notorious Russophobe, General Sosnkowski, is Commander-in-Chief, that he derives his powers not from the Government but from the President, and that the Government is powerless to remove him or to override him. They note that the Polish army carries on its anti-Russian activities on British soil. They note that courts-martial of men whom they hold to be Soviet citizens occur without British intervention. Since they cannot possibly understand the lengths to which the British Government has been prepared to go to give effective autonomy to the Allied armies in this country, they wrongly but strongly conclude that the activities of General Sosnkowski and the other anti-Russian elements enjoy the support or at least the connivance of the British Government. They are, of course, completely wrong in this, but it is difficult to see how, given their views on the authority that a Great Power should exercise in its own territory, they could imagine anything else.

This, then, is the unhappy background of the Russo-Polish dispute. Can any new initiative at this stage clear the air of the lowering clouds of distrust, and prepare the way for a new understanding? It must be admitted that if the Polish view of Russian intentions is correct, then no solution is possible. But the case for arguing that the Poles are misjudging Russian policy is quite strong. There are, first of all, the repeated declarations of Marshal Stalin that Russia wishes to see a "strong and independent" Poland—declarations which Mr Churchill fully accepts. There is the fact that in the year which has elapsed since the breaking off of relations, Moscow has done nothing to give official recognition to an alternative administration. There is the reassuring evidence of the Kremlin's attitude towards Finland, where, after two rebuffs, they still declare themselves to be ready to negotiate; towards Roumania, where they demanded neither social changes nor government reorganisation as a condition of peace; towards Czechoslovakia, where they have just concluded an agreement based on the practice of Britain with its allies in Western Europe. None of these actions suggests a policy of aggressive expansion. The fact that in no other case do historical memories, frontier difficulties or ideological differences influence the Russian attitude suggests that the

## The Polish Deadlock

THE prolonged military lull on the Eastern front has allowed the Russo-Polish conflict to slip to the back of people's minds. Yet it is still the storm centre of international politics. The military lull will not last much longer. Then the Red Army will cross the Curzon Line. The Russians will reach Warsaw and will be obliged to set up some kind of civilian administration in liberated Poland. Either they will recognise the London Government or they will set up a regime of their own choosing. The latter course can only have disastrous results.

Since the resolution of the deadlock cannot wait, and since neither the Russian nor the Polish Government seems inclined to take any action, it is necessary to ask whether, in spite of past failures, British and American diplomacy cannot again attempt a reconciliation. Is there, on a careful analysis of the facts, any course open to the Allies which could still, at this eleventh hour, restore some flexibility to a situation where *rigor mortis* has apparently already set in? The analysis can and should be made. Few

### CREATE AN ESTATE

Every man who effects a Life Assurance Policy immediately creates for those dependent upon him a personal Estate of known amount free from the risk of depreciation

Temporarily removed to

163/4, STRAND, LONDON, W.C.2

real issue is none of these. To judge by the Czech analogy, it is that the Russians will not tolerate an anti-Russian administration on their Western frontier.

If this is the case, there is just possibly still a solution of the Russo-Polish crisis. It involves concessions or at least a new attitude from all the parties concerned. And, whatever the Russian contention, Britain and America are deeply concerned in the question—if not in its details, at least in the manner in which it is solved. The first need is to convince the Russians that the Polish Government in London is not anti-Russian and that neither Britain nor America disputes Russia's demand that its western neighbours should be friendly. This appears to have been made clear at Teheran, but it might now be reasserted in a more definite form. Yet no assertions will carry much weight so long as the anti-Russian activities of the Polish Army are permitted to continue. General Sosnkowski is not indispensable as Commander-in-Chief. If the French can abolish the office because their troops are to fight on different fronts, cannot the Poles accept the same logic? Difficult and delicate as it would be for the British and American Governments to intervene in this question, it is surely better for them to insist on a drastic step—the resignation of the Polish Commander-in-Chief—than to drift into a position in which they are forced to choose between the Polish Government in London and a Soviet-supported Polish Government in Warsaw. It is no kindness to the Poles to keep an unrepresentative General at the cost of losing a representative Government.

Once the Russian case had been met to this extent, it should be the task of British and American diplomacy to bring home to the Kremlin how serious the consequences would be for lasting peace and co-operation, if the reply to concessions from the Polish end were to be a further Russian refusal to recognise and negotiate with the London Government. There are some diplomatic actions so drastic

and so irrevocable that they block for ever the hope of a constructive peace. A Russian refusal in this case would be such a one. It would prove that the elimination of Polish independence, not the setting up of a genuinely popular and representative Polish administration friendly to Russia, was the aim of Soviet policy and no one should know better than the Russians that peace cannot be built on the enslavement of the Poles.

The Russians have shown some preference in all their negotiations for direct dealing with their neighbours, although with close consultation with their Western Allies. In the Polish issue, too, there is a strong case for the direct approach, provided always that the position of the British and American Governments is made plain. After the essential preliminary of a reorganisation of the Polish command, the best step would probably be a direct appeal from the Polish Government to the Kremlin to receive a Polish delegation, restore relations and negotiate on an orderly basis a temporary demarcation line in Eastern Poland, postponing the final decision until the peace settlement.

It is hard to believe that such an appeal would meet a rebuff. The Polish people have suffered so terribly in the four years of occupation, resisted so unitedly and maintained so faithfully their allegiance to the Allies, that they deserve to be treated at the hands of the Russians no worse than their Czech neighbours and far better than the Finns or the Roumanians. Surely the Poles have a prior claim on Russia's generosity in its hour of victory. Some of their leaders have made mistakes. There has been some provocation and some ill will, but nothing that a Power of Russia's might and prestige could not dismiss, had it the will and the imagination to do so. Poland is the first real test of the statecraft of the Soviet Union since its emergence as one of the greatest of world Powers. It is no exaggeration to say that war and peace in the future depend upon the manner in which this test is passed.

## New Trends in India

THERE were several reasons for Mr Gandhi's release without conditions after nearly two years in detention without trial. The physical ones are obvious. Mr Gandhi is a very sick man. For an Indian he is of a very great age. The recent death of his wife was a grave personal loss. But perhaps the most significant reason is a political one. Mr Gandhi's day is probably done. A contest has already started for control of the policy of his Congress party.

Many millions of the poorest Indians still look to Mr Gandhi with love and reverence. He could still be the figurehead of a popular movement; but it is unlikely that he would be its real director. The situation has changed very greatly since Mr Gandhi was in effect the political dictator of Indian nationalism. Possibly it has changed most of all in the past two years since the Cripps offer was refused, the Congress leaders were imprisoned and the campaign of violence started. Opinions differ about the main constituents in the new situation; but there is general agreement on certain elements in it.

The most important single fact is that the Indian industrialists who have been the financial prop of the Congress Party have now come out into the open and taken the initiative from the politicians who have failed to deliver the goods. They have put forward a striking programme for Indian economic development. The so-called Bombay or Birla-Tata plan was not fairly reported in the first cables from India and did not therefore deserve the sweeping condemnation passed upon it at first by the British Press. But it is nevertheless not a very impressive document when examined in detail. Its figures of Indian resources, income, expenditure and investment are illustrative exercises in economic arithmetic rather than representations of the actual facts of the case. Almost certainly, in view of the enhanced post-war price level, the costs of this plan to bring about, within fifteen years, a doubling of agricultural income, a trebling of service incomes and a six-fold increase in industrial income are much underestimated. The

amount of "created money" that would be necessary to finance the investment envisaged would be considerably larger than the plan suggests, and the probability of inflation correspondingly greater. Nor are the methods by which this massive programme of investment could in fact be carried out made clear, whether by forced saving and compulsorily curtailed consumption or by inflation itself, and to what extent. The neatly rounded figures in the plan are somewhat too notional and imprecise to give any real guide.

Nevertheless, the political implications of the plan are plain enough.

Practically every aspect of economic life will have to be rigorously controlled by the Government so that individual liberty and freedom of enterprise will suffer a temporary eclipse.

This is what the authors of the plan say themselves, and they add, rightly, that

no development of the kind we have proposed will be feasible except on the basis of a central directing authority which enjoys sufficient popular support and possesses the requisite powers and jurisdiction.

If this sort of programme becomes the new Congress policy, the political question at once becomes whether national planning of a kind seen only so far in Germany and Russia is either possible in India or desired by the Indians. The issue ceases to be one of national independence and democratic freedom—the old slogans of nationalism—and becomes one of state planning of the most authoritarian kind. The rank and file of the Congress, as well as other Indian politicians, are faced with a challenge.

The Bombay plan has had a most significant double effect on Indian politics and particularly on Congress politics. On the one hand, its conception of state planning has attracted support from many Congress followers and other nationalists who are more than a little disillusioned about the prospects for Liberal Nationalism; and the Con-

gress party has in any case always had a strong tinge of authoritarian doctrine. On the other, it has caused grave anxiety among those who are still convinced democrats. It would be unfair to impute deliberate ulterior political motives to the plan's authors. A practical and effective programme to increase national income per head in India is a most urgent necessity; and the Bombay industrialists are probably to be congratulated for nailing these colours to their mast. But it would be unrealistic to disregard the political impact of their plan.

It must be admitted that this project for planning fits in with other tendencies in present Indian thought and politics. The war has brought, not only increasingly authoritarian rule both at the centre and in the provinces, but also increased planning of Indian resources and an enlargement of Indian industry for war purposes. Moreover, and most important, the terrible famine of last year, whose consequences are by no means spent, underlines the dire nature of Indian poverty. Finally, many Indian intellectuals and politicians, who drew their earlier notions of democracy from Western sources, have now derived, also from the West, a hope that Planning may succeed where Liberalism has failed. Certain totalitarian trends in Congress politics have often been pointed out. Now there is a strong undercurrent of disillusionment, even bewilderment, among the minority of educated Indians who make political opinion in that crowded country. Plans to make India rich instead of poor, whatever the political implications, have a powerful attraction.

Thus the business men, for so long the powers behind the Congress throne, have chosen the moment shrewdly to turn the attention of the Congress Party from Dominion Status, in the old interpretation, to Five-Year Plans. It is an unassailable fact that, without large-scale economic development, the old aspirations of Indian nationalists seem unsubstantial. If not the Bombay plan, then there must be some other scheme, some other policy of economic reconstruction. Mr Gandhi saw the likelihood of the present situation long ago when he determinedly set the course of his policy, not towards national strength and material wealth, but towards national freedom in the old traditional and spiritual ways of poverty and the good life. The spectacle now is that the materialism which Mr Gandhi, in his difficult Eastern fashion, always distrusted is coming into its own. Earlier ideas of political freedom and social justice seem discredited. The war, by increasing the industrialisation of India, has increased the political strength of Indian industrialists, who have influence on the present Viceroy's Council, where the old style nationalist politicians, by their own refusal, have none.

In effect, the chronic opposition-mindedness of both the Congress politicians and the leaders of the Moslem League has opened the door to this business *démarche* from the effective Congress headquarters. Suddenly, it seems that the aim of Indian nationalism may be, not some form of democracy fitted to the peculiar needs and circumstances of India, but State Capitalism at a bound. There may even come a moment when English Socialists and Liberals, who have called so long for the end of Imperialism, may ask for its continuance in some form to save the Indian people from Indian exploitation. The parallel of China, where a fervent and popular movement of nationalism has temporarily resulted in the control of a financial dynasty, with maladministration, acute economic difficulties among the masses of the people and a stout and wary Communist fringe, is apt, but not encouraging.

Mr Rajagopalachari, the moderate who resigned from the Congress Party in 1942 when the Cripps offer was refused, puts the position in this way:\*

Indian industrialists, while shedding copious tears for nationalism, are making their pile by quiet and uninterrupted services at the call of a bureaucratic Government.

The "way out" proposed by Mr. Rajagopalachari is to turn back the clock. He has spent the last two years in seeking to bring about the agreement between the Congress Party and the Moslem League that was not forthcoming when Sir Stafford Cripps abortively gave Indian nationalism its greatest opportunity two years ago. He believes that it is still possible to save the day for Liberal nationalism; that the Congress and the League might now agree if the Cripps offer were to be restated and the Congress prisoners were permitted to enter into negotiations with other politicians.

It is my firm belief that had there been a Gandhi-Jinnah meeting in May, 1943, we should have had a Congress-League bargain with far-reaching potentialities resulting in a solution of the constitutional issue, the end of the present deadlock and the transfer of the responsibility for the administration both at the centre and in the provinces to popular leaders.

Having failed with the leaders, Mr Rajagopalachari is now convinced that the followers are ready, after the exposure in 1942 of the bankruptcy of mere political manoeuvring, to make a fresh start towards national agreement. He does not believe that the rank and file of the Congress party is either wedded to the intransigence of its older leaders or won over by the new conception of progress by industrial planning—carried out by industrialists.

If Mr Rajagopalachari is right, if side by side with the disillusionment that is so evident among a large part of the rank and file there is also a new will to co-operate, both outside and inside the Congress party, then the British and Indian Governments have a plain duty to take up the challenge and try again. There are other signs that the sudden lifting of the voice of Big Business and the fear among would-be Liberals of authoritarian developments have inspired a new wish to work out India's salvation in the democratic British way. The Moslem League is not a democratic body, but its policy is anti-

### The scene changes

LITTLE more than a hundred years ago Britain was an agricultural island. Its resources were undeveloped, its roads often incredibly bad; power-operated machinery was almost unknown... but the invention of the steam engine was destined to change the scene and by the middle of the nineteenth century the tide of industrial development was in full flood. In almost the span of a lifetime, Britain became the centre of the world's trade and in this vast change the Westminster Bank (founded in 1836) played its part, providing—as it does today—a complete banking service for industry and the individual.

**WESTMINSTER BANK**  
LIMITED

\* "The Way Out." By C. Rajagopalachari. Oxford University Press. 1s. 3d. pages.

industrial, and it is implacably opposed to "Hindu millionaires." Most of the Moslems are engaged in agriculture. The followers of Mr. M. N. Roy—the Radical Democrats—have stated their fears and their wishes frankly in recent weeks.

The Swaraj of the Congress conception, when analysed, reduces itself into a demand for independence for a minority of the privileged and property classes who desire unfettered freedom to exploit the masses. The economic plan recently published by Tata, Birla and other patrons of the Congress bears this out. They are indeed in a hurry to form their national government . . . the Radical Democratic Party never had any doubt of the *bona fides* of HM Government in making the historic offer communicated through Sir Stafford Cripps.

But the Radical Democrats, despite the intelligence of many of their younger leaders, are not a big factor. The party's effective membership is less than the 50,000 claimed. They are certainly outnumbered by the Communists—who, however, are still apparently nonplussed by the appearance of Big Business bearing their own banner of Planning. The question is whether these Indian Democrats, who are turning to co-operation with the British in order to avoid "the millionaire's exploitation of India"—or the possibility, which they also envisage, of a deal between Indian and American business men—are sufficiently important in the turbulent stream of Indian politics to offer the chance of a solution on the old lines. The British and Indian Governments, necessarily pre-

occupied by the needs of war and defence and surveying what Mr. Rajagopalachari has called "this entanglement of forces," may reasonably doubt it.

Nevertheless, it is probable that no harm could be done and much good made at least possible if the deadlock were now to be tentatively broken by the renewal of negotiations on the Cripps lines. There must of course be one over-riding condition; that a sufficiently broad agreement should be reached by the Indian politicians to make its political execution probable. Given that, there could be the utmost participation in the conduct of the war, together with freedom to work out, with the widest possible consultation, plans for both the economic development and the political independence of post-war India, on a basis of political freedom and social justice. But, if these steps are taken, it should be made plain that nothing can be contemplated which might plunge India into renewed conflict during wartime; and, however reluctantly, it must be realised that there are as many signs today in India of social revolution and counter-revolution as there are of resurgent nationalism of a democratic kind. The saving graces are that British Imperialism is no longer the chief object of Nationalist denunciation, though British wartime rule is much criticised. In fact all groups look to Britain to implement their schemes. They all take for granted that the British pledge of Indian independence is real. So far, they all assume British disinterestedness. This attitude is both a tribute—and a challenge.

## Road to Serfdom?

IT is now half a century since Sir William Harcourt made his celebrated remark, that "we are all Socialists now." At the time he made it, it was wholly inaccurate, but during the intervening decades, and particularly in the course of the last ten years, it has become almost true. There is, as least, a very large consensus of opinion that some form and degree of purposive direction should be exercised over the economic life of the community. So great is the popular pressure for "Planning" that the dangers of a precipitate approach to it are being ignored. That a wholly planned state can exist, that it can show considerable efficiency in at least some forms of economic activity, that it can be strong in war and fully employed in some kinds of peace—all these are by now established facts. But still they do not answer the crucial question, whether those who now live in the liberal democracies, and yearn for a fully planned state, would like it if they got it. The state that is fully planned, that is democratic and that preserves the basic rights of the individual does not exist. Do we really want to surrender the virtues of freedom and democracy to get the advantages of complete planning?

It is an obvious question; but it is not asked often enough, and Professor Hayek has done well to ask it in very direct form\*. He has no doubt of the answer. Complete economic planning, to him, would be the end of all democracy and all liberty. He gives a number of very cogent reasons for this belief. In the first place, he denies that complete economic planning could be done by agreement.

Planning creates a situation in which it is necessary for us to agree on a much larger number of topics than we have been used to, and in a planned system we cannot confine collective action to the tasks on which we can agree, but are forced to produce agreement on everything in order that any action can be taken at all.

Secondly, Professor Hayek believes that the only protection of the individual against arbitrary government is a Rule of Law which is general and blind as to persons. Once the law begins to make distinctions between one

case and another—as, with complete planning, it must—civil liberties are at an end.

There is no justification for the belief that so long as power is conferred by democratic procedure, it cannot be arbitrary; it is not the source, but the limitation of power which prevents it from being arbitrary . . . Unless (the present) complex society is to be destroyed, the only alternative to submission to the impersonal and seemingly irrational forces of the market is submission to an equally uncontrollable and, therefore, arbitrary power of other men.

Thirdly, a planned state is necessarily totalitarian.

Economic control is not merely control of a sector of human life which can be separated from the rest; it is the control of the means for all our ends.

These extracts are necessarily an inadequate summary of Professor Hayek's thesis. The reader may sometimes feel like Coleridge, who once remarked to a young lady, "I accept your conclusion, but you must give me leave to provide the arguments for it." But the main conclusion is unassailable: a completely planned state would be neither democratic nor would it have much freedom for individuals. It is doubtful whether this conclusion is seriously contested by more than a fanatic minority.

The important issue is not whether the conclusion is sound, but whether it is directly relevant to our present state. On this Professor Hayek gives confused—or at least confusing—counsel. The solid core of his argument makes it clear that the "Planning" against which he inveighs is something that is still very remote, at least from this country. He is at very great pains to make it clear that he does not advocate *laissez faire* and that there is a "wide and unquestioned field for state activity." He speaks of the "many obvious tasks" for the state "such as our handling of the monetary system, and the prevention or control of monopoly, and an even greater number of less obvious, but hardly less important, tasks to be undertaken in other fields." He does not deny that "where it is impossible to create the conditions necessary to make competition effective, we must resort to other methods of guiding economic activity." He admits that there is often a divergence between private interests and social welfare, "and

whenever this divergence becomes important some method other than competition may have to be found." He approves of planning to provide social security for the individual and to prevent industrial fluctuations. It is only complete planning that he condemns, and if a list were made of all the forms of purposive direction which are blessed in the course of the book, it would be seen that Professor Hayek does not want to go back, but quite a long way forward. Indeed, "even war and the greatest peril had led in this country only to a very moderate approach to totalitarianism, very little setting aside of all other values in the service of a single purpose."

This very moderate argument—that there are dangers in complete planning but that Britain is nowhere near the danger zone yet—is the only one that is logically sustained. Nevertheless, it is clear from the reception that the book has had that it is regarded as a statement of the extreme individualist case. There are, indeed, many passages in which Professor Hayek's constitutional apprehensiveness gets the better of him, and in which he insists on seeing things under the bed, even though he has just proved with the clear torchlight of reason that there is nothing there. Thus, though he says, over and over again, that there is a great deal of planning to be done, he can still write that "both competition and central direction become poor and inefficient tools if they are incomplete." But if this is true, it suggests an extremist solution, either complete planning or complete freedom from planning. And in his Conclusion, the author throws his carefully sustained argument overboard, and declares that "we had before this war once again reached a stage where it was more important to clear away the obstacles with which human folly has encumbered our progress and to release the creative energy of individuals than to devise further machinery for 'guiding' and 'directing' them." So he is sounding the retreat to *laissez faire* after all. The truth is that Professor Hayek's heart and his head are not at one, and the heart will keep breaking in.

There is, perhaps, some reconciliation between these two contradictory attitudes to be found in the warning from German experience which echoes all through the book. Maybe we are not in danger yet, but are on a slippery slope which will lead us inevitably to disaster. The Germans have gone through all this before—"most English socialists are still unaware that the majority of the problems they begin to discover were thoroughly discussed by German socialists long ago"—and look at the extremes they have gone to. It is related of King James II that, standing on the cliffs and watching the battle of La Hogue, and knowing that his only chance of regaining his throne lay in a French victory, he still could not refrain from exclaiming "See how my English fight!" So Professor Hayek, though he detects their conclusions, cannot stifle the cry "See how my Germans argue!"

It would be foolish to say that "it can't happen here," but something must be allowed for the accumulated

wisdom of centuries of political experience. Burke had the same alarms about the French and democracy that Professor Hayek has about the Germans and planning; but the English managed to contrive a solution of the problem of freedom and organisation in the political field which stopped short of the Terror. It would be a cowardly abdication to abandon the similar attempt in the economic field simply because it has gone wrong elsewhere.

Professor Hayek, who knows his Acton, would object that national character is the poorest basis for any conclusion. It is true that it is an inadequate basis. It is also true that, though economic planning in Great Britain has not yet gone so far as to become the road to serfdom, and does not look like going so far, there is a real danger which should not be ignored, as it has been in recent years. It is right that the problem should be constantly under discussion. It is right that there should be freedom fanatics just as there are planning fanatics. But, fanatics apart, it is also right that the great mass of moderate opinion should cease to bother itself with the purely theoretical question whether complete planning would be preferable to complete absence of planning. To believers in the dignity of man, living in the twentieth century, either one would be intolerable. The problem of this century is to find the most fruitful method of combining planning—the right kind and degree of planning—with freedom. Competition and central direction may, indeed, be so applied that they spend all their energies merely in frustrating each other. But if they are not allowed to be "alternative principles used to solve the same problem," if they are sorted out and each applied by itself to the problems for which it is appropriate, there is no inherent reason to doubt that an economy based on both planning and free enterprise would be superior to either of the extremes. That, at least, is the only faith for a democrat. If he cannot accept it, he must be either a totalitarian or a defeatist.

"Planning and free enterprise"—but the second half is at least as important as the first, and if Professor Hayek's book serves to restore the balance it will have done good. Even when all the essential economic activities of the community are planned, it will still be necessary to foster and cherish the initiative and enterprise that can come only from the free individual. Without the qualities of the adventurer, economic progress will go on crutches. Without the possibility of economic independence there can never be any political freedom. Without a wide dispersion of the function of decision, a corrupting concentration of power will fall into the hands of every politician who can lay his hands on the mechanism of the state. The projectors of economic reform should draw up their proposals in parallel columns, and for every planning entry they make, they should try also to contrive some emancipation of the principle of free competition from the obstructions that hold it in check. The two principles have got to live together, and economists and political scientists would be better employed in working out the terms of the marriage settlement than in retailing the grounds for divorce.

## NOTES OF THE WEEK

### The Monetary Debate

The joint plan of the American and British experts for international monetary arrangements after the war got a rough handling in Wednesday's debate. Colonel Elliot's motion was accepted without a division, but its terms went no further than to describe the scheme as "a suitable foundation for further international consultation," and the course of the debate made it clear that this phrase was to be narrowly interpreted. Almost every speaker expressed some doubts and some, from all parties, were openly hostile. The objections grouped themselves under four heads. First, there was the strongest opposition to anything that looked like the gold standard. Secondly, there was insistence that no international currency arrangements must be allowed to interfere with a domestic policy directed towards full employment and economic stability. Thirdly, members complained that it was putting the cart

before the horse to discuss currency before trade. And fourthly, they urged that nothing should be done to undermine the sterling area or to prevent this country from entering into arrangements with other like-minded countries to expand the volume of their mutual trade exchanges. On none of these points was there any dissent, and the Chancellor of the Exchequer's reply perforce took the line of denying that the monetary plan infringed any of them. The Government's attitude to any suggestion of a return to the gold standard would be "one of most vehement opposition." He had a general preference for the multilateral solution of trade problems.

always provided that there was nothing in the plan which would prevent us from entering into reciprocal trade agreements with other countries either in the monetary or commercial fields. . . . We have made it clear to the representatives of the United States that we considered this plan subject to that stipulation, and it would be only if that under-

\* "The Road to Serfdom," by F. A. Hayek. George Routledge and Sons, Ltd. 184 pages. 10s. 6d. net.

standing could be given effect to that we should be prepared to enter into it. . . . We wanted to be in friendly collaboration with the United States, but we did not want to be in a position in which, if, unhappily, misfortunes befell the United States, we should have to go down and suffer with them.

The upshot of the debate is that the scheme is now to be "adjusted and improved." The debate will have done a great deal of good, and that the British negotiators' hands will be strengthened by this clear statement of British opinion. The Chancellor was right in saying that the currency proposals, as such, do not represent "any deep or dark design to get the better of this country in these matters." As was said in *The Economist* of April 29th, they are neutral in their effect on international trade. But the views expressed in Parliament have a very direct bearing on the negotiations that are proceeding on international trade, and if rumour is correct about the nature of the proposals that are emerging from these negotiations, they will have to be considerably "adjusted and improved" before they are acceptable to Parliament.

### A Parliamentary Success

The much-abused Members of Parliament who moved an amendment to the Education Bill in the last week of March, stating the principle of equal pay for men and women teachers, have now had their reward. When the original unamended clause of the Bill, defining the powers of the Minister to require the payment of standard salaries, was reinstated on Tuesday, on the report stage, it was announced that a Royal Commission would be set up to consider the desirability, cost and effects of equal pay for public servants, irrespective of sex. The movers of the amendment in March were surprised when they defeated the Government in the division. They were much more surprised, and justifiably indignant, when they were accused of sabotaging the Government's conduct of the war. The Government gained nothing, and lost a deal of good will, by making this a matter of confidence and insisting, pompously, on an "overwhelming" vote accordingly. The amendment could not, of course, be kept in the Bill. Teachers are only one, if the best, instance of the case for equal pay for public service. Both financially and politically, the matter had to be discussed and decided more widely. But the commonsense course was the one which in fact has been adopted that is, the reinstatement of the original clause, unamended; and the Government's majority was always vastly more than ample to secure this, and the deletion of the amendment, in a decent, orderly way. Nevertheless, Mrs Cazalet Keir, who moved the amendment, can congratulate herself. Despite flouts and gibes, and helped by the alarums and excursions which were not of their seeking, she and her friends have made equal pay the matter of immediate moment it ought to be.

### Equal Pay

Whether the appointment of a Royal Commission is the correct and quickest way, at this stage, of reaching a decision on equal pay, may, perhaps, be open to question. The arguments for and against are well enough known, and the machinery of a Royal Commission is much more ponderous than say, that of a Select Committee. Indeed, it is conceivable that the Government, after consultation with its experts on the cost and economic consequences of equal pay, could have announced a decision without any extra apparatus of investigation. At any rate, the Government cannot shelve the responsibility that falls upon it, exclusively, to make the final decision; and any suggestion that the Royal Commission was being used for this purpose, or to procure delay, would arouse a notable outcry. There is no question, after the experience of a second Great War, of the general principles involved. Women are, in principle, entitled to equal economic rights, which includes "the rate for the job." Equally, with this principle accepted, it is a duty of the state, not to follow modestly behind the best private practice, but to take the lead, if only because the state is the largest employer of women. The difficulties are practical problems of application. Industries and occupations mainly employing women will be faced with a sudden increase in the wages bill. In other instances, pay being equal, firms may be more ready to take on men who will not leave on marriage as most women do. On the other hand, much too much can be made of these

difficulties. Arguments like these have been used against most improvements in the pay or conditions of labour for a century. Moreover, the Government is already committed to three policies which, if successfully applied, will minimise all the practical obstacles to equal pay. They are full employment, which will minimise the chance of women not being engaged; no ban (in teaching, at any rate) on married women workers, which will minimise the numbers leaving on marriage; and family allowances, which will take account of the greater number of dependants that men normally have.

### Irish Election

While the London Conference continues, one Dominion Prime Minister is otherwise engaged. On Tuesday, the Irish Government was beaten in the Dail by one vote on the Transport Bill, which proposes to merge the Great Southern Railway Company and the Dublin United Tramways Company. The only surprise about the defeat of Mr De Valera's Government is that it did not come sooner. A General Election will be held, just short of a year after the last one, in which both Mr De Valera's Government Party, Fianna Fail, and the main Opposition Party, Fine Gael, lost seats to the Farmers' and Labour Parties. Mr De Valera was left in a minority of four in the Dail and so became dependent upon the support or abstention of the Farmers' and Labour Parties, with both of whom his policies sharply disagree. It was plain that Mr De Valera, although his Party remained over twice as big in the Dail as its nearest rival, Fine Gael, had lost power to govern effectively. He refused to consider proposals for a National Coalition during the present world emergency; and it was expected that he would take the first chance to go to the country again. Now, later rather than sooner, he has decided to do so, after a somewhat unsavoury episode in which charges have been made of speculation in the shares of the Great Southern Railway Company on advance information of the proposed statutory merger. Mr De Valera himself has instituted a Government inquiry into these allegations, but this did not prevent his defeat on the Bill, which is widely opposed. The question now is whether Fianna Fail can reassert its authority among the electorate, or whether the real division in present Irish politics, which is between town and country, will be further reflected by additional gains for the Labour and Farmers' Parties, respectively. If the latter were the outcome, it would not be possible to carry on the Government of Eire without some kind of Coalition. Mr De Valera is still implacably opposed to this. He has little in common, except agreement on Irish neutrality, with other parties, and there is thus in theory the possibility that there may be a new Prime Minister after the election. But the protests of the Opposition against his decision to appeal to the electorate do not suggest that Mr De Valera, who has been in office since 1932, is in any grave danger. It is believed that neither the Labour Party nor the Farmers' Party is so strong as it was a year ago; and Fine Gael is obviously unsure of its chances. The truth is that politics in Eire have come to a somewhat dreary halt, and no party has behind it the impetus of the times.

### Negotiations with the French

Last week, Mr Eden was asked in the Commons whether any agreement had been reached with the French National Committee on the administration of liberated territory in metropolitan France. Mr Eden replied that

conversations are now in progress between the Supreme Allied Commander and the French Military Mission in this country under General Koenig with a view to working out detailed arrangements.

When Mr Eden was questioned further whether this meant that the French Committee was the authority with which the Allies would deal in France, he replied that it was. His reply has reassured the French in Algiers, who are still perturbed at the hesitations in Washington. But, apparently, it does not go far enough. Both General de Gaulle and the representatives of the French Committee in London have appealed for more specific recognition, and it is difficult to see why, now that the practice has been so far conceded, the principle should not be conceded, too. To delay recognition merely exasperates French national susceptibilities and creates difficulties and obstacles which might not

otherwise exist. To give the most obvious and urgent example, the negotiations with General Koenig to which Mr Eden referred so hopefully have come to a standstill because the Committee in Algiers feel they cannot conduct negotiations through the British cipher. It is, to put it mildly, a ridiculous stand to take when invasion is only a matter of weeks, and the first priority for both France and its Allies must be to ensure that all the necessary preliminary discussions have been completed. The French can surely have nothing to say to General Koenig that they would wish to hide from the British, for, obviously, the only basis for sound collaboration is complete honesty and trust. Why, then, do they take so violent an exception to the ban on diplomatic secrecy? Ostensibly, it seems, because their national status is in doubt. In their present indeterminate position, it appears to them intolerable to submit to the rule even though other fully recognised Allies have accepted it and even though vital negotiations are prejudiced as a result. The simplest solution of the difficulty would surely be not to lift the ban but to recognise the Committee.

### Conference Continued

The secrets of the Conference of Dominion Prime Ministers have been well kept. Accounts in the press of the topics under discussion have been no more than statements of the obvious. The meetings have been small in size, without any formal programme or formidable delegations, and the military topics first discussed could not safely be even breathed outside the council chamber. The questions of foreign policy and Commonwealth relations, however, which have now come up, are by no means so obviously matters for secrecy. Indeed, this is an instance where secret diplomacy would be singularly inappropriate; and, when the full fortnight is over, it may be hoped that an account will be issued of the general decisions reached on international and economic policy. About the conduct of the war—now that Australia and New Zealand are satisfied that sufficient weight will be exerted in the Far East, even while Germany is being beaten, to prevent a Pacific deadlock—there is probably unanimity. About the conduct of the peace, unanimity is unlikely. The outlook and interests of the Dominion Governments, internal as well as external, are made different by environment. In any meeting of sovereign national states such differences are bound to be important, but the saving grace of this meeting is that they would be less important than in any other international assembly. The Dominions possess, not only the bond of history, but also the psychological advantage of having co-operated for five years in a second World War. The differences of outlook have probably been focused by Mr Curtin's proposal for a permanent inter-Commonwealth Secretariat to provide continuous consultation and make easier a common policy. The proposal is in itself obviously innocuous. Such a Secretariat would be merely a matter of convenience. It is the implications of its setting up that are questioned, at least by the present Government of Canada. The point at issue is whether the concerting of common policies by the Commonwealth will aid or hinder good international relations in the wider world framework. Mr Mackenzie King, Prime Minister of Canada, believes that it would be dangerous. But Mr Bracken, leader of the resurgent Canadian Conservatives, believes that it would be both helpful and necessary. Moreover, in a matter of convenience of this kind, it is probably true to say, as Mr Curtin has expressed it, "If I cannot have four brethren and can have three, well, three's better than none."

### The ILO and Germany

The Russians gave a variety of reasons for not attending the Conference of the International Labour Office at Philadelphia, but probably the chief obstacle was their determination not to accept the international basis of the ILO and to demand instead that it should represent the victorious nations only. This proposal, if accepted, would mean the exclusion of enemy nations after the war and the setting up of two different types of international standards—one for the victors, the other for the vanquished. The absence of Russia has not meant the disappearance of this line of policy from the Conference. Two main problems have occupied the delegates. An international code covering full employment, economic freedom, economic opportunity and decent labour standards has been elaborated and its recommendations have been accepted and incorporated

in the "Philadelphia Charter" which will be presented to the various governments for ratification. On the other hand, the Conference is sharply divided on the issue of whether these standards should be applied to the "totalitarian countries" or whether the needs of reparations labour, of restitution and even of direct punishment will not mean the exclusion of German workers from the ILO for many years to come. The dispute came to a head when a resolution was brought up before a sub-committee, recommending that a United Nations Labour Commissioner should be set up in Germany and be empowered to abolish the Labour Front, to encourage the speedy re-establishment of free trade unions, and to administer social and labour laws presumably on lines laid down in the Philadelphia Charter. By nine votes to two, the Resolution was killed in Committee and the reason for its rejection was, broadly, the belief expressed by most of the delegates that Russia's attitude towards Germany in the matter of restitution and reparations is the right one. The British case was forcibly put by Sir Walter Citrine, who declared, not only that Britain could not be committed on so important an issue without consultation with Russia, but that it was impossible to distinguish between the guilty and non-guilty Germans. German workers had worked and voted for Hitler and must be punished. The ILO Conference will leave the issue of Germany's post-war treatment undecided. Yet the problem cannot be shelved for good. Either the Allies intend finally to restore the defeated peoples to the family of nations or they must commit themselves to a policy of lasting repression and control. It is, perhaps, discouraging to hear the voice of British Labour raised so vehemently on the side of a "realism" that in the long run, and carried to extremes, will turn out to be the purest phantasy, and will defeat the peace into the bargain.

### A Farmers' Charter

The general principles upon which a comprehensive representation of farming interests, under the auspices of the Royal Society of Agriculture, have now agreed make up a reasonable agricultural policy in the main, and in very general terms, mixed with relapses into sectional pleading. The consumer and the taxpayer will agree that the land should be used

for the production of the foodstuffs which it is best fitted to provide and which are most required to satisfy nutritional needs.

They may even concede the clause "while maintaining the fertility of the soil," though doubting whether this pseudo-scientific plea is not usually a smoke-screen for the sectional claims of this or that branch of farming. But they will, or should, look dubiously at the undefined phrases—"raising the standard of rural life and the increase in the rural population." The first of these must be earned; farming can only claim to be what it does, in terms of costs and sales. The second seems to run against nature as well as economics. There is a case for efficient farming; there is none, on economic or national grounds, for a larger agriculture that employs more, not fewer, workers. Is it seriously proposed that workers should be tied to the land in increasing num-

### INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

bers—or, rather, bribed to stay there by inducements in the shape of subsidies and the higher cost of food, at the expense of the community as a whole? "Mixed farming" is another smoke-screen. That some economic activities on the farm require the support of some uneconomic activities may be admitted. That this gives a sanction for the maintenance of an all-purpose agriculture, whatever the cost, is nonsense. A "stable level of prices," related to costs of efficient production, should no doubt be guaranteed, as requested, in order to even out fluctuations. But this surely cannot mean simply the level that

will yield a reasonable return to the producer and on the capital employed in the industry, and a scale of wages sufficient to secure a standard of living comparable to that of urban workers.

What is sought is a policy, not this kind of moral and social absolutism. What will it cost? What will be got in return? These are the questions. Whatever assistance the state may give should be arranged to secure the size and type of farm production that is wanted by the eaters of food. The size of the assistance must be what can be afforded by the taxpayer, having regard to his other commitments. Beyond this point the farmer must earn his prosperity off his own bat.

### Civil Aviation

On Wednesday Lord Beaverbrook, chairman of a Cabinet Committee on post-war civil aviation, made a progress report to the House of Lords on the stage reached in international discussion and in the formulation of Empire and domestic policy. In the international sphere, the recent deliberations with representatives of the American Government had been a long step forward in the formulation of international policy. The United Kingdom delegation submitted as a basis for discussion the Canadian Draft Convention, which contained a detailed plan (outlined on page 647 by our Ottawa Correspondent) for an internationally regulated authority with powers of enforcement. But this, perhaps the ideal form of organisation, was considered too rigid by the American delegation as a starting point. It was therefore agreed—though not without reluctance on the part of the British delegation—to go ahead on the basis of the somewhat less ambitious proposals agreed during the Commonwealth conversations six months ago; broadly, these provide for an international organisation whose task would be to evolve standards, to devise means for the avoidance of uneconomic competition, for equitable participation in air transport—on the basis of the right of innocent passage—for the maintenance of a broad equilibrium between transport capacity and the volume of traffic. The agreement reached between the British and American delegations will pave the way and provide a basis of discussion for the forthcoming international conference. On the issue of domestic policy, Lord Beaverbrook's pronouncement was less clear. His reference to the British Overseas Airways Corporation—he was satisfied that BOAC would continue—might be interpreted as a decision to continue the policy of the chosen instrument. This does not mean that newcomers would be debarred from engaging in international air transport; but it may mean that they would not receive a subsidy. Lord Essendon, not surprisingly, criticised the policy of the chosen instrument and made a strong plea for the participation of the shipping industry in world air traffic. Lord Kennet, again, championed the cause of the railways by supporting their wish to engage in Continental traffic; the companies, he promised, would find the necessary capital and would not ask for subsidies. Much remains to be done before the conditions of post-war civil aviation take final shape. But progress is being made.

### Economic Intelligence

Lord Nathan is to be congratulated on the part he has played in securing from Lord Selborne, the Minister of Economic Warfare, a very important statement of policy—even though his wish to see the whole armoury of economic warfare preserved for the purpose of the economic disarmament of Germany after the war was not satisfied. In the debate on economic warfare in the Lords on May 9th, which Lord Nathan initiated and organised, Lord Selborne announced that:

the Secretary of State for Foreign Affairs had decided to create an Economic Intelligence Department of the Foreign Office and it was clear that he could not have better servants for that purpose than the very efficient and experienced staff which had hitherto been working in the Ministry of Economic Warfare. He (Lord Selborne) had, therefore, recently agreed to transfer the control to the Foreign Office of all that part of his department which was concerned with intelligence in enemy territories.

The transferred department will continue to be responsible to Lord Selborne for all its old functions. For everything else it will now be responsible to the Foreign Secretary, and Lord Selborne stressed the importance of its work in preparing armistice terms and watching over their enforcement. It is to be hoped that the establishment of an Economic Intelligence Branch in the Foreign Office is not thought of only as a wartime arrangement. One of the most obvious deficiencies in the training of British diplomats has been ignorance of economic subjects and of their social and political implications. The fusing of the diplomatic and consular services last year was a first step towards remedying this lack. The presence in the Foreign Office of trained experts who can be consulted at will on any topic is another big improvement. The existence of an Economic Intelligence Branch also has the incidental advantage of cutting across the rigid departmentalism of the Foreign Office approach. Economic interests straddle national frontiers and departmental divisions. The experts should be able to secure greater inter-departmental cooperation, if they use their knowledge rightly. But to secure the full benefit from these changes it is probably necessary to go further in reorganising the Foreign Office. The trouble is now that Britain has no proper instrument for conducting a coordinated and thought-out foreign policy. The departments within the Foreign Office cooperate badly. From outside, the Colonial Office, the Dominions Office, and the India Office, secure little collaboration. Foreign propaganda is carried on by the Ministry of Information, the BBC and the Political Warfare Executive. Trade questions are referred to the Department of Overseas Trade. In disposing of such war-time departments as the Intelligence Department of MEW or of PWE, it is necessary not only to transfer them to the Foreign Office, but to ensure that they will be brought into a more orderly framework. Lord Elibank asked in the Lords whether the Intelligence Department would serve the Department of Overseas Trade as well. Such a question ought to be unthinkable. All the various sectors of Britain's foreign activities—trade, diplomacy, propaganda, information—should be grouped together under the Secretary of State for Foreign Affairs and served by fully competent research and intelligence branches, both in politics and economics.

### Chinese Disunity

On May 3rd, Mr Eden announced in the House of Commons that the protracted negotiations with China over the British loan had ended in agreement. The British Government is to advance £50 million to the Chinese Government for purchases in the sterling area. Another agreement covers the transfer of armaments to China on Lend-Lease terms. The immediate effect of the loan will be political, not economic. As Mr Eden put it:

The limit of our assistance to China remains, as always, one of transport and not of finance.

But anything that enhances the prestige of Chungking by strengthening its international position encourages stability in China. Some Members of Parliament suggested that conditions should have been attached to the loan, binding the Chungking Government not to blockade the Chinese Communists or to use Lend-Lease arms against them. Mr Eden refused to enter into any discussion of China's internal position, and, indeed, it is difficult to see what else he could do. It is a tragic fact that two rival centres of authority exist. The official policy of the Chinese Government, outlined by General Chiang Kai-shek, is one of conciliation by political

negotiation. Yet the chances of reconciliation must remain remote so long as the Communists do not recognise Chungking's authority as a Central Government—and this they are unlikely to do, for to recognise Chungking effectively would mean the end of their power in Shensi and occupied North China. The most that can be hoped for during the war is a truce, and the military events of recent weeks have underlined its necessity. The Japanese army has moved to the offensive and has chosen to strike along the Lunghai railway in the direction of Sian. If this advance were successful, it would succeed in cutting off the Kuomintang armies from the Communist forces, and would be well on the way towards capturing the back door into Chungking itself. In the face of this threat, all Chinese forces, Communist and non-Communist, have every reason and interest to unite, and if military co-operation can be made effective, a new political situation may arise.

### Domestic Workers

A debate on the adjournment last week was useful in calling renewed attention to the shortage of domestic workers in hospitals and other institutions, and to the difficulties of private families without domestic assistance. It also drew from Mr McCorquodale, Joint Parliamentary Secretary to the Minister of Labour, a review of progress since the Hetherington Committee's report was accepted by the Government. In February, 4,000 domestic workers were placed in hospitals and institutions, 500 in children's homes, and 460 in school meal services. In March, a further 4,000 were placed in hospitals and institutions. But there is still a serious shortage, especially in hospitals, in spite of the fact that domestic work has been given high priority, and although the Ministry has been carrying on a campaign to raise the status and attractiveness of such work. The Ministry's position in regard to private households is more difficult, because it cannot direct workers into private domestic service. About 3,000 people have been placed in "difficult" households, such as the homes of doctors, farmers, war workers, mothers with young children and old and infirm people without domestic assistance. But, obviously, thousands of households not classified as

"difficult," where war workers have to do the housework on top of their day's work at the factory, are in need of domestic help. The Member for Spennymoor gave a telling example of the difficulties in miners' homes. No figures were given about the extension of the "home helps" service, though this would perhaps be the best solution of the problem. It is satisfactory to know that the Ministry of Labour has set up a special department to inquire into the whole position of domestic service in the future, thus continuing the work of the Hetherington Committee.

### Water Supplies

One of the demands made by the spokesmen of agriculture is for an adequate supply of piped water. This is the first rural need to be tackled statutorily by the Government. The Rural Water Supplies and Sewerage Bill, presented by Mr Willink last Thursday, is the 1934 Rural Water Supplies Act writ large. The outstanding demerit of the present structure of water supplies is the variation between facilities and financial resources in rural areas and those in urban areas. Instead of £1 million odd, the derisory sum set aside for rural water needs ten years ago, the local authorities are to be allowed to call on the Exchequer to the tune of £15 million, with £6 million odd added for Scotland, and the new grants are to cover sewerage as well as water supply. In return for these much-improved facilities, local authorities are now put under obligation to extend piped supplies to within the reach of all houses and schools, so long as this is "practicable at a reasonable cost"—a point that the Minister will judge. How many of the two million people whom Mr Willink estimates to lack piped water can be reached at a reasonable cost remains to be seen, even assuming generosity from the centre and local initiative. Clearly, many farms cannot. But here, again, money is available. Mr Hudson, for his part, is to provide financial assistance—of what order is not known—for the supply of water to outlying farms and farm buildings, of which he reckons 220,000 to be waterless. In general, it is not the financial generosity of these measures that is open to criticism. It is the idea that money by itself is a panacea, without the much-needed overhaul of distribution. Of this no change is suggested.

## AMERICAN SURVEY

### Labour and the Election

(By an American Labour Correspondent)

(Since this article was written, Mr John Lewis has withdrawn his application for affiliation with the AFL (see Note on page 645) and Mr Philip Murray, President of the CIO, has committed that body to support of Mr Roosevelt.—EDITOR.)

BY and large, the average American industrial worker is a political supporter of President Roosevelt, in an apathetic sort of way. For eleven years he has been hearing his own union leaders praise the social and economic programme of the Roosevelt administration. Despite taxes (which he had been brought up to assume only rich people paid) and the relatively minor irritations of war, like a reduction of pleasure driving and the occasional shortage of rationed goods, the war worker's economic position is better than it has been within living memory. It is doubtful that many workers would vote "against" President Roosevelt. In the Congressional elections of 1942 they stayed away from the polls in large numbers, strengthening by default the anti-administration forces in Congress. In November, however, assuming (as everyone does) that President Roosevelt will be a candidate for re-election, there may possibly be a return of a little of the political verve of the industrial cities.

It is in the leadership of the labour movement that confusion reigns. Bitter rivalries between the two main bodies of organised workers, the American Federation of Labour and the Congress of Industrial Organisations, and conflicts of interests within each of these parent bodies themselves, have established something of a record for complicated political situations.

Two important labour leaders, John L. Lewis of the

United Mine Workers and "Big Bill" Hucheson of the Carpenters, are bitterly opposed to the re-election of President Roosevelt. It can be assumed that whoever the Republican Party nominates, Lewis and Hucheson will still be against Roosevelt. They would have sulked in their tents if Wendell Willkie had become the Republican nominee, but they will come rushing to the aid of Governor Dewey. It cannot safely be assumed that either Lewis or Hucheson would persuade his own union members (who number all told about 1,000,000) to follow this political advice. The coal miners in 1940 ignored the urgent plea of Lewis that they vote for Willkie.

The United Mine Workers Union is unaffiliated, having been withdrawn from the CIO by Lewis in the latter's feud with Philip Murray, the president of the CIO. Hucheson is working to have the miners accepted for reaffiliation with the AFL, in which Hucheson is a power. The obvious purpose of this move has been to consolidate the anti-Roosevelt forces in the labour movement within the AFL. Friends of the President in the AFL, notably Dan Tobin, head of the teamsters' union, have so far blocked the return of Lewis and thus staved off the amalgamation of anti-Roosevelt forces during the early period of the election year.

These political manoeuvres have in turn set up a dispute between Tobin and Hucheson, who, because of their large memberships, can together dominate the AFL, but who in a bitter enough fight could shake that organisation to its roots. Hucheson recently issued a denunciation of the Roosevelt administration, declaring that labour wants a new man in the White House. Tobin's answer was to commit

his union to a fourth term for Roosevelt, the first such unqualified commitment from any of the large unions in the country. One of the newspapers published by the teamsters' union added fuel to the factional fire in the AFL by taking note of Hutcheson's observation that "labour wants a change," and suggesting that "the kind of change labour needs is in its own leadership. If there must be any new presidents, let's start with the Carpenters' Union." Meanwhile, several local unions in the carpenters' organisation have repudiated the anti-Roosevelt stand of their president.

Within the CIO there is a confusing conflict of economic and political interests. Given a different set of circumstances surrounding the system of domestic economic controls, the CIO would have endorsed the President for a fourth term before now. This organisation has launched a political Action Committee, endowed it with \$700,000, and placed it under the direction of Sidney Hillman, head of the Amalgamated Clothing Workers. The committee has set up regional offices, and is conducting an intensive campaign to get workers and their families registered and conscious of their duty to vote. While Hillman is an ardent supporter of President Roosevelt, the Political Action Committee has emphasised its devotion to "New Deal Principles," rather than to President Roosevelt himself.

The railroad workers, who number about 1,250,000, and who are for the most part members of unions affiliated with no parent body, have already come close to the breaking point with President Roosevelt, over the wage crisis that occurred last Christmas. The railroad union leaders, that is, came close to the breaking point. There was division among these leaders themselves over support of the President's arbitration of their wage dispute, so that not even this select group can present a unity of political attitudes.

The AFL and the CIO are each and severally waging a fight to "adjust" wage controls. Because the President's economic advisers, especially James F. Byrnes, the "assistant president," have turned a stern face toward the plea of labour to revise the "little steel formula" (under which wage rate increases are limited to 15 per cent above the rates prevailing on January 1, 1941), there is the germ of conflict here between the President and his labour leader friends, so long as the President's advisers appear to have his blessing in their fight for rigid economic stabilisation policies.

The leaders of the two great labour bodies, Philip Murray of the CIO and William Green of the AFL, are in a manner of speaking victims of their own unswerving loyalty to the President. The President knows that they have no rival to turn to with their political affections, and thus has allowed his advisers to tread heavily at times upon the toes of the labour leaders. But for all the germs of conflict between the labour leaders and the President, it seems highly unlikely that they could or would support another candidate in the coming elections. If the labour leaders' distress at the lack of favours from the White House reaches the extreme stage, they would at the worst simply decline to participate actively in the Presidential election. This would be rather difficult for the CIO's Political Action Committee, dedicated as it is to the preservation of "New deal principles." However, it is difficult to believe that the President would permit a serious estrangement between himself and his two friends, Murray and Green. His genius for compromise and last-minute conciliation would probably muddle him through this situation.

Although there is little question that the rank and file of labour, CIO, AFL, or independent, are supporters of President Roosevelt, from force of habit if for no other reason, the political atmosphere has increased the bitterness of rivalry between the two parent organisations. On the lower organisation levels, AFL local unions and city central bodies had begun to participate with the CIO's Political Action Committee in efforts to have workers register, and to lay the groundwork for the defeat of certain reactionary members of Congress who were re-elected by small margins in 1942, in the year of labour's great political apathy. Those AFL organisations which attempted to collaborate on the political front with the CIO have been officially reproved by President Green, and ordered to withdraw from their position under pain of expulsion from the AFL. The theory for this action is the "non-partisan" tradition of the parent body of the AFL, but Washington observers profess to see the heavy hand of "Big Bill" Hutcheson behind the move.

As for the men with the lurch buckets, they have been ruminating for eleven years with the thought "look what Roosevelt done for labour." If the weather is not too inclement on the November election day, they will probably go to the polls, and if they go they will probably vote for F. D. R.

## American Notes

### The Road Back

There was an encouraging area of agreement between the demobilisation plans made public under the names of Mr Baruch and Senator George; and this has led to an early, if tentative, compromise, on the main issue between them, whether Congress or the Administration is to lay down a policy and supervise its execution. The Senate this week sent to the House the George-Murray Bill for contract termination, the aspect of demobilisation which has received the bulk of attention so far. It carries a provision for the creation of a separate Office of Demobilisation, to be responsible to Congress, and in this respect it represents a concession by the Administration, for the Baruch Report urged that the unscrambling should be done by the same agencies that made the omelette. It appears, however, that the Senate is willing to see the new office headed by Mr Byrnes, who, as head of the Office of War Mobilisation, would have had the controlling voice under the Baruch plan; and it has been agreed that Mr Clayton, Mr. Roosevelt's appointee as Surplus Property Administrator, should be allowed to continue his work experimentally, until sufficient experience is accumulated to lay down an effective national policy. At one time there appeared to be a feeling in Congress that the President had acted with such speed in putting the Baruch Plan into execution that the legislature might be deprived even of its function as watchdog; and it is good news that the rivalry between Capitol Hill and the White House to control demobilisation shows signs of such early and amicable solution. The Senate Bill follows the main lines of the Baruch recommendations—liberal treatment of contractors, speedy settlement of claims, and generous provision for loans to avoid any delay in the resumption of peacetime production. Despite a plea from Senator Kilgore, no provision for discharged employees is included. This problem of manpower reconversion, which includes the issue of dismissal pay *versus* broadening the unemployment insurance laws, will be tackled separately in the near future.

### Hornet's Nest

It is becoming clear that the Administration made a bad political mistake in its handling of the Montgomery Ward case, and one for which it may pay heavily in November. Since Mr. Avery's historic exit, it has overshadowed all other topics in the press; and as the newspapers are predominantly conservative, and on no subject more so than labour relations, it is the case for the company which has been put before the country rather than that for the government. The controversy is still in its formative stages. One question of fact has been decided this week, when the election was held to determine whether the union involved is indeed the choice of the employees, despite the heavy turnover in staff. It resulted in a victory for the union. A court decision also is expected on the hotly disputed question whether the Government had the legal authority to order the taking over of the company. It was Mr Biddle's contention that the President had such power, not only under the Smith-Connally anti-strike law, but under the Constitution; and it is this which has lent colour to the conservatives' fear that now "not even the corner grocery is safe." Much hangs on whether Montgomery Ward can properly be classified as a war industry. There is no doubt that it produces essential civilian items, such as farm machinery for both home and Lend-Lease consumption and that it has, for that reason, obtained priorities for material; but there is a disinclination to regard the mail-order house as a war industry under the terms of the Anti-Strike Act. Mr Jesse Jones's hasty return of the company's properties to the management this week, and the earlier withdrawal of the army, will hardly subdue the agitation. Should the Federal Court in Chicago uphold Mr Biddle's interpretation of the President's powers, there is little doubt that the case will be pursued to the Supreme Court, where, in time, the question of Presidential powers, Montgomery Ward's status, and the authority of the War Labour Board will be threshed out. But the damage has been done. There has seldom been a more deadly shot than that of Mr Avery's military bearers. Governor Dewey has been presented with a magnificent issue, involving abuse of the constitution, the disregard of property rights, and favouritism to labour.

### Solid South

In ordinary times the renomination in the Florida and Alabama primaries of two Democrats—Senator Pepper and Senator Hill—who stand firmly behind a Democratic President would hardly be news. But under present conditions the Administration has cause for rejoicing. It had been feared by the Democrats, and hoped by the Republicans, that Senators Pepper and Hill, both Administration stalwarts, might be replaced by anti-Roosevelt Democrats, thus swelling the bloc in Congress which feels free to vote with the Republicans and proving the strength of sentiment against the fourth term. It now appears that the "revolt" of the Democratic bloc in Congress has not spread perceptibly to the grass roots. There are more non-partisan grounds for congratulation. The South, whose representation is made up largely of conservative old Southern gentlemen, on the one hand, and rabble rousers on the other, has great need of representatives like Senator Pepper and Senator Hill. Mr Pepper has made himself a spear-head for a number of good causes; he was an indefatigable supporter of aid to Britain and collaboration in the dark days when they were less popular than they are now. Senator Hill, another internationalist, was an author of the Hill-Hatch-Burton-Ball resolution of last summer. The Democrats have triumphantly seized on these—and other—early primary results as proof that the country will demand a continuation of Mr Roosevelt's leadership. In fact, the campaign, minus its main actor, has already been launched by Mr Hannegan and Senator Barkley. There never has been any doubt that Mr Roosevelt could have the nomination by acclamation if he wished it. But the South has special reasons, among which habit is not the least, for remaining regular. One is the popularity of the President's foreign policy; another the race question. Despite the President's Commission to ensure equal treatment for negroes in industry, and even despite the poisonous rumours concerning Mrs Roosevelt and her interest in negro advancement, the Republicans remain the party of negro emancipation; and their recent gains among the negroes in places as far apart as Harlem and Kentucky will not endear them to the supporters of white supremacy. The South must feel about the Democratic party something akin to Franklin's observation "If we don't hang together we shall all hang separately." One of the main obstacles to Mr Roosevelt's Fourth Term—his ill-health—appears to have melted away in the Carolina sunshine. Nevertheless, the Republicans, always conspicuously solicitous over the President's health, and his ability to carry his heavy burden, will hammer away at Mr Dewey's indictment of "tired war leaders." In fact, Mr Dewey's phrase is rather like the visible part of an iceberg; the largest and most dangerous portion—in this case the inevitable whispering campaign—is out of sight.

### The Hyphenates

The case for the Poles against the Russians has been espoused nowhere more warmly than in the United States, not only because of the existence of substantial numbers of Americans of Polish descent, but also because of a belief, often genuine, although admittedly sometimes politically

inspired, that the Polish-Russian boundary dispute provides the test-case *par excellence* of Allied war aims. There is a sombre significance, therefore, in the appearance this week in four outstanding newspapers of leaders warning Americans of Polish descent to put their Americanism first and to refrain from "meddling" in American politics in the furtherance of Polish interests. Two events have combined to disturb American public opinion. One is the violence of the Polish agitation over the granting of passports to Father Orlemanski and Professor Lange to visit the Soviet Union; the other a report published in *P.M.* to the effect that the Department of Justice has discovered evidence, in the books of the Polish Information Centre in New York, that the Polish Government-in-Exile has attempted to stir up anti-Roosevelt feeling among American citizens of foreign origin. The Poles can hardly help being aware of holding the balance of power in certain large cities in some of the key states like New York, Pennsylvania, and Illinois. Some Poles, notably those headed by M. Matuszewski, have been persuaded that their strategic position might be used to do a deal with the Republicans, thus reversing the traditional Polish adherence to Mr Roosevelt. Colonel McCormick, who can hardly be suspected of disinterested devotion to the cause of Polish independence, has been very generous with space in the *Tribune*. In the narrower sense, the political sagacity of such an alliance is dubious; campaign promises are notoriously inflated currency, and Colonel McCormick is a thorny bed-fellow. But there can be no doubt that in the long run this relatively small group of Polish-Americans have done real disservice to the cause they serve and their fellow Polish-Americans. During the last war it was the hyphenates of German extraction who were suspect and persecuted. There is a danger this time that resentment may be turned against the hyphenates of friendly origin, if some of their members are imprudent enough to spread the belief that they put Polish, Finnish, or Lithuanian interests ahead of those of their adopted country.

### Mr Lewis and the AFL

Mr John Lewis has grown weary of being left waiting at the church. This week, in a sharply worded letter, he has withdrawn his application for the reinstatement of the United Mine Workers in the American Federation of Labour and asked for his money back. One of the main difficulties in readmitting the Mine Workers was the status of its Local 50, organised during the period of separation, which could hardly be reconciled with the jurisdictional rights of other established AFL unions. Mr Lewis, however, has chosen to blame Administration politicians, "who are opposed for political reasons to unity in the ranks of labour," for the postponement of the nuptials. In view of persistent rumours that Mr Lewis hoped to deliver the AFL vote to the Republicans, it can hardly be imagined that the Administration would have exerted pressure on the Federation to re-admit him; but it hardly seems necessary to look much further than the violence of his present attempts to discredit the AFL as a "political company union" to understand why it hesitated so long to slaughter the fatted calf for such a very prodigal son.

## French Faith in the State

FOUR years of defeat and captivity have resulted in a general impoverishment of France. The industries of France, of which so many specialised in the production of consumers' goods, have been thrown back in their development. French industrial technique has not benefited—except very rarely in factories working directly for Germany—from the progress that has taken place under the impact of war in the belligerent countries. France's agriculture is in decline owing to the dilapidation of its equipment, to the decrease in the number of cattle and, above all, to German loot. The finances of France present a picture of monetary chaos and the inflation of the national debt. Nor has the impact of war upon French economy yet spent itself; it cannot be measured precisely before the final liberation of France.

Economic ruin is a ruthless foe of orthodoxy. It is not surprising to see that very few Frenchmen think about the economic reconstruction of their country in orthodox and traditional terms. Nearly all French economic thought—whether expressed in underground papers in France itself or in periodicals published abroad—seems to be engaged in the search for some short cut that will allow their country to make good the enormous leeway accumulated in the last five years.

This is not to say that Frenchmen are discussing the problems of their economic future with any great precision or concreteness. On the contrary, most of this economic discussion has been remarkably vague. No clear trends or ideas seem to have crystallised. What has taken shape is an economic mood rather than an economic theory. There has been a general, and not unnatural tendency to view critically the experiences of the Third Republic in economics as well as in politics.

### The End of Peasant France

Traditionally, for instance, an "equilibrium between industry and agriculture" was regarded as the outstanding feature of French economy. The "soundness" of French economic relations was then seen in the fact that France had not given itself to the "excesses of industrialisation"; that the medium and small size enterprise still retained a strong position; and that the farmer had not become the Cinderella of the nation. The Second German War (the third for Frenchmen) revealed the drawbacks of that "equilibrium." The industrial potential of France proved inadequate to cope with the tasks of modern warfare, quite apart from the social and political factors which accounted for the fact that even the existing potential was not properly utilised. It is very natural indeed that many Frenchmen are now ready to renounce their old pride in the extent to which their country had retained its rural and peasant-like character. Post-war France will have to make a tremendous effort in industrialisation; this seems to be the first and common conclusion.

Under the Third Republic, the economic ties between Metropolitan and Overseas France were fairly loose, in spite

of the relatively high degree of political control from the centre. The division of labour between manufacturing and primary production on an Empire scale was markedly underdeveloped. Metropolitan France was to all intents and purposes treated as a separate entity. Hence the concern to maintain the "balance" between industry and agriculture within its framework. The new concept of a more intensively industrialised France would lead to a more intensive development of agriculture in the colonies and dependencies. In other words, Metropolitan France could not maintain and strengthen its economy without a radical revision of its colonial policy. An undercurrent of such a new Empire-mindedness has manifested itself in all the French economic schemes of the last few years, even in the grotesque Vichy plans which were designed to meet the demands of economic collaboration with Germany. It would be premature to speak of any Gaullist economic doctrine; but an emphasis on Empire economy also appears in all the statements of economic policy that have come from Gaullist quarters.

The need for a re-division of labour between Metropolitan and Overseas France leads back to the controversy over private and state enterprise. Here the significant feature is the extent to which free enterprise in its classical form has lost its appeal. *L'étatisme* seems to be the common denominator of the economic inclinations, if not the actually stated views of moderates, Gaullists, Socialists, and Communists. True, there are differences in emphasis. Some would give more scope to private enterprise than others. Some would give more scope to state intervention than to state ownership. But nearly all seem to agree on the need of a combination of three forms: state enterprise, state intervention and private enterprise. While, on the Left, the Communists and the Socialists have undoubtedly made very significant concessions from the old programmes of socialisation, the Right looks as if it had deserted the temple of unrestricted private property. Nearly all agree that, left to the unregulated mechanism of demand and supply, French economy would not be able to stand on its feet again, let alone to re-organise and expand.

The question may be asked whether this common denominator of *étatisme* does not hide many equivocations and misunderstandings which time is bound to bring into the open. The motives behind the new faith in *étatisme* are widely different. From the point of view of the "moderates," who have not abandoned all faith in private enterprise, state intervention and state control appear to be the indispensable factor of discipline and unity during the process of regeneration. Private enterprise remains the ultimate goal; but, in its weakness and exhaustion, due to war and defeat, it must lean on the state. True, nobody can say at what point or at what time the rescuing rôle of the state may come to an end. Nor can a complete withdrawal of the state from the economic field be expected.

### National and Socialist Economics

Another motive behind the seemingly common faith in *étatisme* is national justice. The Popular Front inscribed on its banners, the struggle against the "two hundred families that owned France." The expropriation of the two hundred families was the popular slogan of social revolution. The two hundred families, it is said now, have collaborated with the enemy on the basis of "business as usual." Their expropriation appears no longer as the programme of a social revolution, but as the demand of national justice. "It seems certain that, couched in patriotic rather than socialistic terms, this demand commands a wider measure of popular support than it did in the years of the Popular Front. What in 1936 appeared to the great non-political mass of the *petite bourgeoisie* and of the peasants as a provocative act of civil war may now seem to be merely part of the great national purge that is to cleanse France from traitors and collaborators.

On the other hand, the socialist programme, dressed up

in patriotic trimmings, probably carries with it the seeds of its own defeat, simply because it is not true that all the two hundred families have been involved in collaboration with the enemy. Some big business groups have been against collaboration. Others have maintained the attitude of *attentisme*. Still others will probably claim that they have collaborated only under duress. Even so, the new scope for state ownership and state control will probably be large if only because the government of liberated France will be the only possible successor to the German concerns that have acquired substantial participating interests in French industry and banking.

Still another motive behind *l'étatisme* is military. The revival of France's military grandeur—the central point in General de Gaulle's own political programme—is hardly possible without a more or less permanent enlargement of the field of state economy. The military motive mingles with the patriotic and social. No clear line of demarcation between them can possibly be drawn. More important still, as long as the economic programmes are drawn up either in the somewhat artificial atmosphere of exile and Algiers, or in the condensed atmosphere of underground movements, the divergence in motives is still not much more than academic. The touch of an exiled or underground radicalism inevitably colours general principles proclaimed by the various political groups. It is only in contact with the reality of a country's daily economic life that the true meaning of programmes and motives can reveal itself. The test of the new *étatisme*, therefore still lies ahead.

## Canadian Air Transport

[FROM OUR OTTAWA CORRESPONDENT]

CANADA is the first country in the world to outline the kind of international air authority its Government believes to be necessary in the future and, at the same time, to indicate with precision how it proposes itself to participate in future international air services. The new Canadian Air Transport Board represents an important development in domestic supervision and control of aviation. Canada's proposal for an international air authority was disclosed in Ottawa after important details of it leaked out elsewhere. It rejects the operation of air services by an international board or commission, which would be a licensing and regulating authority only.

Since the report on Canadian air transport policy in *The Economist* on May 1, 1943, developments have come in rapid succession. Trans-Canada Air Lines has expanded its services, now operating across the North Atlantic. The Royal Canadian Air Force, with its own air transport command, is carrying its own traffic in many parts of the world and, in addition, its mail squadron is carrying mail to Canadian forces on several fronts. The Canadian Government recently purchased all American-built installations in military airports anywhere in Canada, including United States wartime construction in the northwest, on the staging route to Asia, and in the northeast, on the European route. Lastly, it has been announced that contracts will be let, to Canadian Vickers, Ltd., Montreal, for the construction of Douglas DC-4 aircraft for TCA domestic service after the war.

International operation of air routes is now regarded in Ottawa as unlikely to attract much support from the governments which are now discussing aviation policy. The Australian and New Zealand Governments are the only exceptions, both of whose Prime Ministers have advocated the principle during their visits to North America. The international authority proposed by Canada would issue licenses to air companies designated by member governments. Thus the "chosen instrument" policy would be recognised. Places on the Assembly of the air authority would be available to all nations, large and small, with voting strength in proportion to aviation interests. Voting powers would be calculated every three years. The board of directors, 12 in number, elected for six years and retiring in rotation, would obviously be dominated by the great powers. The whole arrangement is an example of what Ottawa calls "the functional principle," which has become the foundation of official Canadian views on world organisations of this kind. Licensing to restrict uneconomic duplication, control of rates and flights, uniform safety regulations and related matters would be handled by the air authority. But air services between contiguous countries would be removed, for bilateral agreement. Finally, the Canadian doctrine of freedom of the air goes further than most recent

statements in other countries. Canada would concede the right of innocent passage, the right of landing for non-traffic purposes, and the right to handle two-way traffic originating in, or destined for, the owner state.

Meanwhile, in his statement of March 17th, Mr Howe, the Minister of Munitions and Supply, stated domestic air policy in unequivocal terms. His declaration of Government policy to divorce air-line companies from railway companies meant that Trans-Canada Air Lines (TCA) would be severed from Canadian National Railways, and Canadian Pacific Air Lines (CPA) from the Canadian Pacific Railway. It is this that has become the most contentious feature of the policy. An equally new departure is the divorce of air transport regulation from the old Board of Transport Commissioners and the creation of the new Air Transport Board. As it stands, TCA remains Canada's chosen instrument upon international air routes and upon main trunk lines inside Canada. The feeder line services, mostly extending into northern Canada, which have been run largely by CPA, will now revert to smaller private companies.

Canadian Pacific Air Lines, a monopoly in the field of feeder lines, had come to challenge the TCA in its trunk line field. At least, that is the implication of CPA development in which, by adding a few connecting lines, a full network of air services across Canada, was coming into sight. That Canada cannot support two competing transcontinental air services, is accepted with little argument. What is less certain is the wisdom of reversing the consolidation of north-land feeder service carried out by the Canadian Pacific company since 1940. Mr Howe has proposed that expansion in this field should be reserved for airmen returning from the war. This would probably involve considerable Government assistance in the formation of new, small companies. Referring to "the chaotic conditions produced by destructive competition between a number of small air line companies, chiefly in northern Canada," Mr D. C. Coleman, president of CPR, said: "The Canadian Pacific then, with the encouragement and approval of the Government, undertook to acquire control of a number of competing air lines and consolidate their position." In spite of this, the CPR has lost money on its air lines.

The new policy will not become operative until one year after the end of the war. Allowing for possible change, it is apparent that the principle of monopoly operation of transcontinental lines will persist. It was universally approved in 1937, when TCA was created. Moreover, little chance is seen that the Government policy or public opinion in favour of TCA as the sole chosen instrument of Canada in flying on international routes, should change. The divorce of air lines from railways, modelled after the United States precedent contained in the 1938 Aeronautics Act, will mean added cost to the air lines in providing their own ticket offices, traffic solicitation services, and related facilities. There is, moreover, an argument that national benefits are found in substantial collaboration between various forms of transportation, rather than in absolute divorce. This then is one of the chief weaknesses in the new policy. The other is that profitable operation of small private companies on side-line routes is unlikely, since all air lines so far require public aid in the form of subsidy. The place which CPA is being ordered to vacate may have to be, in the long run, filled by a public monopoly.

## "Stabilisation" in Finland

At the beginning of the protracted Finnish-Russian peace negotiations which reached no decision, the general economic situation in Finland suggested that, during 1943, the efforts to establish some sort of stability in finance and production had not been entirely unsuccessful. Total expenditure for civil administration and the war increased to Fm. 30,000 million against Fm. 27,000 million in 1942. Notes in circulation amounted at the end of the year to Fm. 10,840 million, almost the same as at the end of 1942. The large deficit on the Budget was covered by loans and by a compulsory war loan akin to a capital levy, which had yielded Fm. 1,800 million by the end of 1943. For the current year no change in taxation has been announced, and the introduction of a special war profits tax was rejected in favour of another compulsory war loan.

Towards the end of the year a comprehensive system of price control was instituted which generally prohibits any rise in prices above the level of July, 1943. Wages were increased by 4 per cent, which is still only a fraction of the previous increase in prices; and price subsidies had to be increased considerably, to keep prices down. The country is largely dependent on imports of foodstuffs and industrial raw materials, particularly fuel, iron and steel and textiles. Steadily rising import prices have been an important source of the tendency of internal prices to rise. It was officially estimated that, during 1943, import prices rose by 30 per cent, and that, during the whole war period, they have risen by roughly 300 per cent.

Export prices, on the other hand, rose by only 10 per cent during 1943 and by 150 per cent between the autumn of 1939 and the end of 1943. The normal method of adjustment by changing the exchange rate could not be used because Germany is forced to maintain, almost at any price, the artificial exchange rates established in foreign trade relations with the occupied and satellite countries. The Finnish Parliament therefore passed a Bill setting up a Price Compensation Fund. The Bill became law in April, and a special committee regulates the collection of levies on export prices and the payment of subsidies out of these levies to reduce import prices.

Roughly three-quarters of Finland's foreign trade is conducted with Germany. Total trade in the last two years has been as follows:

(In million Finmarks)

|            | Imports | Exports | Import Surplus |
|------------|---------|---------|----------------|
| 1942 ..... | 11,700  | 6,000   | 5,700          |
| 1943 ..... | 12,900  | 8,700   | 4,200          |

If the large increase in import prices is taken into account, the figures suggest that the volume of imports fell again, whereas the volume of exports actually increased. It seems that German grain deliveries to Finland were slightly smaller than in 1942, but increased at the beginning of 1944. There is no doubt that exports of metals, mainly copper, nickel and a number of ferro alloys, especially ferro-silicon and ferro-molybdenum, increased. The wood and timber industry manufactured considerable quantities of prefabricated wooden houses, huts and barracks, mainly for delivery to Germany and South-Eastern Europe. As a result of Finnish deliveries, Hungary has now begun to build wooden houses and Germany has been supplied with millions of wooden soles for shoes.

The leading cellulose and timber manufacturers, the *Enso-Gutzeit* concern, reported a slight increase in production in 1943, although several of its works had to be closed down for lack of machinery and labour. Occasional figures indicate that the number of workers employed in felling timber fell by almost one-third during 1943. The preparation of firewood and the clearing of forests in order

to increase the arable acreage has largely been done either by conscripted labour or by a voluntary labour service. The decrease in the number of workers engaged in forestry and the tightening of labour conscription suggests, however, that labour has been diverted to agriculture and industry, especially to the iron and steel and metal industries. The number of effectives in the army has probably fallen, and military activities seem to have been mostly rather in the nature of frontier patrols. This has made possible a somewhat greater agricultural and industrial effort.

Before the war, Finland had an iron and steel capacity amounting to roughly 100,000 tons. Actual production, however, was much smaller. During the war operations in the two main steel works have been stepped up, but the main effort has been directed towards expanding nickel production in the Petsamo areas and towards the mining and refining of copper, molybdenum, chromium, wolfram and manganese ore. These activities are of the greatest interest to Germany, and very little labour or raw materials have been left for keeping the small textile industry going. As in other northern countries, the greater use of peat for fuel and as a raw material for manufacturing synthetic petrol has meant that more labour has been needed.

Since the beginning of the war the agricultural industry has declined because of the loss of imported feeding-stuffs, on which the relatively large livestock and dairy industry depended. War itself has also put valuable agricultural land out of use. Harvest, measured in "fodder units," show a big falling-off.

(In million fodder units)

|                                |       |
|--------------------------------|-------|
| Average harvest, 1931/35 ..... | 3,300 |
| " " 1940/41 .....              | 2,400 |
| 1942 .....                     | 2,200 |
| 1943 .....                     | 3,000 |

The improvement in 1943, the first since the beginning of the war, is largely the result of extending the acreage under grain and potatoes. Yet essential imports of bread grain for the year 1943-44 are still estimated at some 230,000 tons, which will probably not be fully covered by imports from Germany or, rather, Hungary. Any further expansion of the acreage seems to be impossible because of the shortage of labour, draught animals and fertilisers. Supplies of fats and sugar in some occupied European countries is below the necessary standards. The butter supply depends largely on imports from Denmark. The general level of economic activity is comparatively low, but some measures designed to stabilise them at this low level have undoubtedly been successful.

## Letter to the Editor

### Depreciation Allowances

TO THE EDITOR OF THE ECONOMIST

SIR,—I do not think that your new article on the subject takes the matter any further.

You rightly criticise the "accounting principle" under which the initial cost of equipment is written off, but not its replacement value. But the delusion of fixed money value is so deeply rooted in business in general and the accounting profession in particular, that you can hardly blame the fiscal practice for following suit.

Moreover, business might gain (in times of falling prices) just as well as lose under this system. In times of rising prices, when the method might be held to retard re-equipment, the "inducement to invest" is likely to be strong enough to override such handicap. The "accounting principle" as used by the Inland Revenue results in anti-cyclical (i.e., desirable) equalisation.

Your new point seems to be that any anticipation of depreciation allowances, such as now introduced by the Exchequer, may be equivalent to a genuine increase, if no profits are made at a later period. If this uncertainty of future profits from which write-off would be allowed by the Inland Revenue is considered as the main obstacle to rapid re-equipment, surely the answer is not an initial write-off of 20 per cent, but some concession to firms which make a loss, equivalent to the fiscal concessions to a profitable firm. A straight subsidy rather than an increase in permitted rates of depreciation would seem to be called for.

Yours faithfully,

The University, Manchester.

H. W. SINGER.

### THE MESSAGE WENT THROUGH

All wars have one battle in common, the battle of communications. It opens with the declaration of war and ends only when the last shot has been fired.

In spite of enemy action, Cable and Wireless communication has never faltered. As the tempo of war rises so does the number of messages flashed across the world. Approximately two million words pass through the central telegraph station of Cable and Wireless every day.

To meet the growth in traffic, forty-five new transmitting stations have been put into service since the war and more are being added. Because of this foresight and bold planning the messages still go through.

#### WHAT TIME IS IT 'OVER THERE'?

When it's 12 NOON  
in LONDON  
it's about:

## WHEN will you get *Black Magic* again?

[WE GIVE YOU ONE GUESS]

All the nice things that used to be in *Black Magic* Chocolates — are they dead?

No.

They exist.

But they might as well be dead, for all the use they are.

The Mauritius sugar that gave the tang to the *Black Magic* caramel — it's in Mauritius.

The Valencia almonds that went into the *Black Magic* truffle-and-nougat and *montelimar* — they're in Valencia.

Brazil is no longer where the nuts come from. It's where the nuts stay.

Venezuela no longer sends us its peculiar fruity cocoa beans. It sends us petrol.

We didn't use petrol in *Black Magic*.

All the nice things are in all the nice places — except Britain.

They'll come again. When they do, so will *Black Magic*.

You can call that a threat or a promise, as you please.

## ROWNTREES

### Wordy Warfare

Should parsons smoke? Strange to relate, this was once a hotly-debated topic in the correspondence columns of the newspapers. A witty Dean offered the disarming suggestion, 'It depends on the tobacco'.

For our part, we have always taken the utmost care to ensure that the tobaccos we use are exactly right for each desired flavour. You can judge the result by our Pall Mall de Luxe cigarettes, which make smoking a conscious pleasure instead of a mere habit. At 12/10d. a hundred, the cost is very little more than that of ordinary standard brands.

Call in at any Rothman shop, or send your order direct to headquarters for delivery by mail, post free. Rothmans Ltd. (FolioET3) 5 Pall Mall, London, S.W.1.  
DUTY-FREE parcels to Prisoners of War and H.M. Forces overseas (including India). Ask for special order form which includes full particulars.

# THE BUSINESS WORLD

## The Motor Industry's Choice

THE British motor industry is faced with the choice between the alternatives of remaining content with the home market and a comparatively small and specialised export trade, mainly to the Empire, and of making a bid for a leading position on the world markets. The one course would mean the continuation of a safety-first policy, with a home market doubly protected by an import duty and a horse-power tax. The other would involve a policy of expansion with an element of risk, but with far greater prospects. At no time since the birth of the industry has the second and more courageous policy offered better prospects than it will offer after the war. The production of cars has been virtually suspended for several years in all major producing countries; a substantial proportion of existing vehicles will be worn out at the end of the war; the satisfaction of the pent-up replacement demand and of the demand from prospective new owners is a task that would occupy even the huge American industry for several years. The size of the prospective demand after the war is such as to provide the industry in this country with the opportunity of establishing a strong foothold on the world's markets. That the industry should make a bold attempt to gain such a foothold is not merely in its own interests, but it is also in the national interest in that a substantial expansion in the export of motor-cars would assist in offsetting any reduction in the exports of the older industries, such as coal and cotton. Before the war, in 1938, the value of exports was £7.3 million for private cars and £3.9 million for commercial vehicles; in the same year exports of coal amounted to £37.4 million and those of cotton goods to £49.7 million.

No doubt the industry will have no difficulty in securing a temporary foothold on foreign markets after the war; for a time the market in cars will be a seller's market. But, as Sir John Anderson pointed out in his Budget speech on April 25th, "we must not abuse that opportunity by taking a short view." The aim of the motor industry should be to take advantage of its opportunity in securing a permanent expansion in its exports to foreign countries, "rather than to snatch quick gains in a seller's market." It will only achieve this aim if it produces the kind of cars overseas buyers want, at competitive prices; that is to say, bigger cars as attractive to buyers in design, quantity and price as American cars.

If the industry chooses a bold policy of expansion and decides to go all out for a leading place in world markets it will have to create the conditions of expansion. The first condition is a home demand for the kind of car which is suitable for export as a means towards the realisation of the economies of large-scale production. This would involve the replacement of the present system of motor taxation, which concentrates home demand on the small car and cramps the style of the designer, by one that would stimulate home demand for bigger cars and free the designer from his present handicaps. The second condition is the achievement of costs comparable to American levels, by the adoption of the most economical methods of assembly, and by a concerted drive designed to secure raw materials, parts and fittings at the lowest possible cost.

Although topography and short distances have played a part in concentrating home demand on the small car, the horse-power tax, combined with a rising petrol tax, have powerfully reinforced this trend. Few motorists, if any, would not willingly exchange a small, cramped car for a bigger one if a bigger one did not cost appreciably more to buy and to run. The trend towards the small car has been a consistent one. In 1927, half of all sales of new cars were cars of 12 horse-power and less, and barely a quarter consisted of vehicles of 10 and fewer horse-power; by 1938, the proportion had risen to more than three-quarters for cars up to 12 horse-power, and to nearly two-thirds for vehicles up to 10 horse-power. It is true that the horse-power tax remained stable at £1 per horse-power between 1921

and 1934 and was actually reduced to 15s. in 1935 before it was raised to its present level of 25s. in 1940. But, since a large proportion of the new motorists consisted of persons of small means, the stability of the tax does not disprove its deterrent effect on the purchase of bigger cars. The reintroduction of the petrol tax in 1928 at the rate of 4d. per gallon — it had been repealed in 1921 — and its advance, mainly for revenue reasons, to 8d. per gallon in 1931 and to 9d. per gallon in 1938 naturally accentuated the motorist's bias in favour of the small car.

At the present time, as Sir John Anderson pointed out in the House of Commons on April 25th, "it is almost impossible to sacrifice revenue"; nor did he see any advantage in a redistribution of total taxation between the horse-power tax and the petrol duty. In suggesting a revision of taxation, the motor industry is, therefore, limited, at least for the present, to a reconsideration of the horse-power tax which, during the year ended November, 1938, yielded £16.8 million, equivalent to an average of £8.78 per car. But even within these limits, some of the obstacles in the way of the designer and of the demand for bigger cars can be removed. The substitution of a horse-power tax based on the capacity instead of the diameter of the bore of the cylinder would free designers from the need to produce freak engines. But it would do little more. The best solution would be to abolish the tax and to substitute for it an annual

licence duty on the original wholesale price of the car—the yield of the duty to be the same in the aggregate as at present. This would not merely free the designer from his present handicap, but it would appreciably reduce the tax on cheap big cars and thus stimulate the demand for them. The tax on luxury cars would be heavier, especially on the small cars, but this is unlikely to have a serious effect on the demand for them; besides, it would remove the anomaly of the present horse-power tax, which weighs most heavily on the motorist of small means. The effect of the change would probably be to encourage the demand for a cheap big car and to leave the demand for luxury cars virtually unchanged. This would, of course, reduce the production now enjoyed by the British manufacturer. But he would still have the import duty of 43½ per cent, which ought to be enough in all conscience. And in any case, there is little risk of heavy imports for many years, so great will be the domestic demands on the capacity of the American industry.

This is not the occasion for an elaboration of detailed tax schedules appropriate to an annual licence tax based on the wholesale price of cars. The simplest method would probably be to apply the tax only to new cars and to continue taxing the existing one,—most of which will, in any case, be due for early replacement—on the present horse-power basis. An analysis, by wholesale value, of the cars sold in, say, 1938 would show the rate of tax that would have to be imposed in order to secure the same revenue as the existing horse-power tax. An allowance would have to be made for the rise in costs—the costs of production are expected to be between 40 and 50 per cent higher after the war—in order to avoid overtaxation. The rate of tax could be expressed as a percentage of the original wholesale price of the car or chassis. A schedule would have to be drawn up showing the agreed value for every type of car or chassis—but this would not be a very large task. The rate of duty, expressed as a percentage of the agreed value, might be left unchanged for, say, the first three years of the life of each car; during each of the subsequent four years, it might be reduced by small stages, but after the seventh year the rate of tax might be maintained unchanged in order to speed the car to the scrap heap. The principle of a licence tax, expressed as a percentage of the original wholesale value of the car, could be applied in more than one way—and it might, with advantage, be extended to goods vehicles. The rate of tax might be uniform for all new cars, whether big or small, expensive or cheap; or it might be on a scale ascending with the value of the car after a given limit in order to provide an additional stimulus to the purchase of the kind of cars that can best be exported. This, obviously,

is a matter for expert investigation. Broadly, the application of the principle would mean that the tax on the cheap big car need be no higher than it is at present on the small car.

But while the substitution of a licence duty for the present horse-power tax might well have the effect of transferring part of the demand from baby cars to bigger vehicles, this would constitute no more than a first, if essential, step towards the aim of securing a substantial export trade to foreign countries. Equally important, and far more difficult, will be the task of producing cars as attractive in design, quality and price as American cars. One disadvantage from which the motor industry in this country is said to have suffered in the past is the relatively high prices it has had to pay, compared with American manufacturers, for the materials, parts and fittings it has to purchase. Together, these purchases form a substantial proportion of total costs. The remedy is largely in the industry's own hands. It consists of a greater measure of standardisation of components and parts, of larger and more regular orders and, where prices are kept up by monopolistic practices, of concerted action. But even if the industry succeeds in obtaining its materials at reasonable prices, there remain the important problems of design and assembly costs. There is no reason, however, why the British industry should in future lag behind the American. There is no evidence of a lack of competent technicians in this country and prospective sales at home and abroad are big enough to enable the industry to reap the economies of large-scale production; moreover, it has the most insignificant advantage of lower wage rates.

The British motor industry, it would seem, will have an opportunity of expansion such as it has never had before. It has also the goodwill of the Chancellor of the Exchequer who is "ready to listen sympathetically to representations" about a revision of the present vehicle duty, and who is no doubt prepared to accept any proposals on this subject that are likely to assist the industry's exports to foreign countries. Indeed, the Chancellor may be too sympathetic. There is an issue of public policy in the matter which may conflict with the industry's desire for a smaller, but very heavily protected, market at home. On this, the Chancellor should himself take the initiative. The choice between a policy of security and one of expansion cannot be delayed. The plans must be prepared now if the opportunity is not to pass, possibly for ever. On April 27th, Sir John Anderson, regretfully, spoke of "an embarrassing conflict of expert opinion" in the industry. It would be a pity if, at this crucial stage in its history, with a fine record of war-time achievements in the production of munitions, the industry lacked the vision and the courage to seize its chance and to seize it boldly.

## Business Notes

### Speculation

The very sharp expansion in stock market activity, following the opening of the Budget, carried *The Financial News* index of industrial ordinary shares from 105.6 (July 1, 1935 = 100) on April 25th to 108.1 on Thursday of last week. Friday confirmed the belief that there was a speculative position open by producing a reaction in many quarters, but the falls left this particular index unchanged. On Monday, the number of bargains received reached a new high level for recent months, but everybody was sure that the money turnover had fallen very sharply. In fact, the big operator had retired, leaving it to the crowd of sparrows to gather what crumbs they could. The market, which continues to hold that speculative activity on the eve of the second front—however protracted that eve may be—is slightly improper and likely to have troublesome effects, suggested, hopefully, that there was to be a return to normal, by which they meant a steady upward drift of the general price level, occasioned almost solely by the pressure of money on a restricted supply of securities. Tuesday, however, produced a fresh change. The sparrows continued to drive up industrial quotations at a reduced rate—the index quoted is now 108.3—but there was a fresh burst of buying in Far Eastern securities and particularly in rubber plantation shares. It is no doubt true that, in many cases, the old quotations in this market did not fully discount recovery. But, if it is felt that the second front is slow in coming to fruition, how much time is to elapse, how much money is to be spent and how much

organisation will be necessary before the rubber and tin of Malaya come to market? But on Wednesday the number of bargains rose to a record for the present system of marking and prices increased by leaps and bounds. The speculator has succeeded in catching the public fancy. Prices of shares in companies with an unfortunate pre-war record are in many instances higher than they have been since before the Japanese War began. But in general this is not so for the sounder concerns. Brokers are advising all holders to take the opportunity to sell plantation shares of doubtful value, and it seems improbable that the boomlet can outlast this week.

### The New Franc

The problem of fixing invasion exchange rates is complicated by the uncertainty which persists about the ranking of the currency issued in the occupied countries over the past four years. Apparently authentic reports from Washington suggest that the French National Committee intends to block all currency and credit in liberated France and only to allow conversion of such assets into new franc currency under certain conditions. If the comparable action taken in Tunisia and Corsica may be taken as a precedent, such conversion would be at par, but only on condition that the liberating authorities approved of the manner in which the assets in question had been accumulated during the occupation period. In other words, the conversion would form part of the process of *épuration* and would provide the oppor-

tunity for partial or complete sequestration of liquid assets acquired by suspect means. This procedure will admittedly be liable to abuse and give opportunities for discrimination, in which innocents may suffer with the guilty. That, however, is a matter that must be left to the French authorities themselves. If, over and above this selective conversion of Vichy into new francs, there is a definite attempt at funding; if, for example, all cash and credit holdings over a certain reasonable minimum are compulsorily converted into long-term Government obligations, it may be possible to achieve an appreciable contraction of currency and credit—though not of the national debt. In that event the new franc may come to command an exchange value which could not be justifiably claimed by the Vichy franc. Those, however, are calculations and contingencies which it will be very difficult to make and provide for when the invasion of France starts. That, unfortunately, is the time when exchange rates will have to be fixed, since it is now understood that the invading Allied armies will, for a short time at least, use their own military currency in the liberated territories.

### Invasion Exchange Rates

Although it may be assumed that all decisions about the exchange rates to be applied in liberated European territories have now been taken, the public debate on the subject has been far from stilled. The latest contribution to it is by Dr Thomas Balogh and appears in the current bulletin of the Institute of Statistics, Oxford. Dr Balogh is no new-comer to this discussion and his views are by now familiar. They are based on the desire to save the liberated territories from denudation of goods and services and other kinds of exploitation at the hands of the liberating armies. Dr Balogh argues that

the sole justifiable criterion for fixing rates of exchange between the free and the liberated territories is to establish socially sound relations between the armies of liberation and their civilian allies.

The calculation of parities should, therefore, take no account of price movements, monetary inflation and other comparable data. They should be based solely on the prevailing level of wages in the liberated regions, and the exchange rates chosen should give the average wage a value comparing not unfavourably with the pay of the most highly paid liberating troops. Dr Balogh is prepared to admit that the curtailment of Allied troops' expenditure in liberated territories might be achieved by more direct means than through the appropriate fixing of rates of exchange, namely, by blocking part of their pay, but he does so with obvious reluctance. What is new in the argument is Dr Balogh's candid exposition of the reasons for refusing to consider the criteria which have in the past determined the exchange value of currencies, namely, those factors that make up the domestic purchasing power of each currency. These considerations for *laissez-faire* economic systems, writes Dr Balogh, are not relevant under the conditions that are likely to obtain in Western Europe. He argues that

all internal and international economic relations of the liberated territories will remain under strict direct control for an indefinite period. Internal production and consumption and a fortiori exports and imports will be determined not by the free interaction of demand and supply in the free markets and the resultant prices and income distribution, but by deliberate decisions.

An "indefinite period" is a very long time to assign to the completely centralised control of the economic system which countries such as France, Holland, Belgium and Norway will tolerate after the war. Perhaps Dr Balogh has unconsciously distorted the sequence of his argument. By arguing in favour of rates of exchange which are "socially desirable" but at variance with every economic criterion, does he hope to maintain the chaos and confusion in which the continuance of wholly centralised controls is the only method of making the machine work?

### Pacific Currency

A joint statement issued by the US Treasury, War and Navy Departments contains full details of the currency arrangements made by the invading American forces in the Central Pacific. The armed forces have brought with them for their own use and for the use of the inhabitants of these islands the "Hawaiian dollar." This special currency was first issued in July, 1942, at a time when the Japanese, though just defeated in the battle of Midway, had landed forces in Kiska, and when responsible American naval and military

leaders were pointing out that a threat to Hawaii still existed. In the circumstances the US Treasury decided to withdraw all regular US currency in circulation in the territory of Hawaii and to replace it by a new one. This currency consists of US silver certificates and Federal Reserve notes bearing the overprint "Hawaii" across the reverse side of the note. After August 15, 1942, no currency other than this new series could be held or used in Hawaii without a Government licence. At the same time a prohibition was placed on the export of the new currency from Hawaii. This new currency, first devised for defensive purposes, is now being used offensively. Instead of the yellow seal currency used by American troops in North Africa and Italy, it is the Hawaiian dollar which is being taken to the reconquered islands of the Central Pacific. The rate of exchange established for these liberated islands is 20 Japanese military yen to one Hawaiian dollar. As the Hawaiian dollar is equal to the US dollar, this would give the yen a sterling value of 3d. as compared with the pre-war rate of 1s. 2d.

### Report on Transport

On the occasion of the presentation of the transport estimates in the House of Commons on Friday last week Mr Noel-Baker, Parliamentary Secretary to the Ministry of War Transport, gave an impressive account of the organisation and control of transport in war, of its magnitude and complexity, and of the achievements of the Ministry. He gave some interesting figures of railway traffic. Exclusive of season tickets, the number of passenger journeys in 1943 was 20 per cent higher than before the war; the total passenger mileage was up by 60 per cent, partly because of the longer average distance; passenger train mileage was reduced by 30 per cent and, as a result, train loadings rose by 120 per cent, one of the reasons for the growth in the revenue of the railways. In freight traffic, light merchandise was up by 86 per cent on the figure for 1938, heavy merchandise and minerals by 68 per cent, and coal by 13 per cent; moreover, the average haul was longer. Inland waterways are moving almost as big a tonnage of freight as before the war, that is at the rate of about 1,000,000 tons a month. Substantial economies had been achieved in road traffic, on the passenger and on the goods side. Long-distance goods traffic by road is handled by a wartime organisation which, recently, came in for strong criticism from hauliers, published in a recent report of the Select Committee on National Expenditure. One of the allegations made, namely that there had been an increase in empty running, and the inference that the road haulage scheme is operated inefficiently—its detailed operation is in the hands of members of the industry—was countered by Mr Noel-Baker by facts and figures. About the future of transport he had little to say except that

long and careful technical study of each individual form of transport is required before we can begin to consider a general plan.

The Ministry's approach to the problem is the correct approach. Nothing would be more inadvisable than the hasty formulation of a long-term transport policy. But the process of technical investigation should be pressed ahead as speedily as possible. Although Mr Noel-Baker did not specifically say so, it now seems unlikely that the Government's post-war transport plan will be ready before the end of the war.

### Directors' Compensation

The most interesting information in the full statement of the terms offered for the acquisition of Lamport and Holt Line is that compensation of £150,000 is to be paid to the directors if the deal goes through. On the supposition that holders of 75 per cent of the capital accept the offer, this compensation amounts to 5.6 per cent of the price payable. The directors are six in number including Sir Philip Haldin, chairman, and Mr F. H. Lowe, managing director from July 1, 1934, when this board assumed office. Since 1938 these two have been joint managing directors. The normal total of directors' fees is £2,100 per annum, but it is provided that the ordinary remuneration shall be doubled in any year in which profits are more than sufficient to pay 5 per cent. The company was running at a loss in 1934, but in 9½ years to December 1, 1943, disclosed revenue after taxation, other than tax on dividends, has amounted to £1,170,126. Of this £475,000 went in depreciation, £32,550 in directors' fees, £366,048 in dividends, gross. Other expenses amounted to some £88,000, and it was possible to add £208,658 to the carry forward. Fixed assets, after

depreciation, show, according to the accounts, a fall of £364,262 in the 9½ years, but net liquid assets are up by £2,496,842. Virtually the whole of this expansion has occurred since 1939. According to the accounts at the end of 1943, net assets amount to £2,777,583. The offer for these assets and all intangibles, including Conference rights and the assumed right to replace ships, is equivalent to £3,498,014, including directors' compensation. After 1936, profits permitted regular, if modest, dividends, and the directors usually received £4,200 in fees. There must, surely, be service contracts in addition to these fees to form a basis for a compensation payment of £150,000, which is equivalent to an annuity of some £10,000 for 20 years with interest at 3 per cent. But the owners of the business know nothing of any such contracts. The desirability of any but the most modest compensation for loss of office is very questionable. In this case the payment seems extreme. Even if it is based on total annual emoluments of £20,000—that is 7½ years' purchase, an ultra-generous basis—the directors have received over the period sums equivalent to 51.9 per cent of the total dividends paid and are now to have a further 41 per cent as compensation. The proprietors had the right to know of any such arrangement, and even at the eleventh hour full disclosure ought to be demanded and made. There is no information of what treatment is to be accorded to employees who may be displaced by the arrangement.

### Rebuilding Merchant Fleets

The impression that the shipping industry believes the time ripe, not only to press for concessions to finance replacement of lost ships, but to commence the physical reconstruction of their fleets, is strengthened by the remarks of Lord Essendon at the annual meeting of the Royal Mail Lines. In addition to a general complaint about the inadequacy of accumulated funds to finance the rebuilding of lost ships, he made the further point that the fleets which remain will also need replacement. In view of the heavy losses, this point has not been mentioned sufficiently often in the past, and it may well prove that the discrepancy between available resources and replacement cost will be greater here than when heavy insurance payments have been received. Royal Mail Lines have a number of ships about 15 years old which will soon be due for replacement. When that time comes, Lord Essendon says,

the depreciation which will have been accumulated for these vessels by the end of their careers cannot, by any stretch of the imagination, approach the total cost of replacement.

On the matter of physical rebuilding he refers, in the case of the cargo lines section, to

the urgent necessity for the acquisition of suitable tonnage to enable liner owners to get back the trades they have had to relinquish during the war,

and he expresses the hope that,

consistent with war requirements, every possible facility will be given for this construction so that when peace arrives as many of these vessels as possible will be available.

This is substantially the point raised by Sir Percy Bates and dealt with on page 576 of *The Economist* of April 29th. It is a matter on which a valid opinion can only be expressed with a full knowledge of the requirements for the successful prosecution of the war.

Meanwhile Mr Alfred Wilson, general secretary of the Mercantile Marine Service Association, has made a statement which may be intended as a contribution to solving the problem of financing replacement. Referring to the rise in the price of shipping shares on the tax concessions of the

Budget speech, he suggests that investors have forgotten the lessons of the past, and goes on to say:

I am convinced that shipowners are just as anxious as organisations representing their seagoing employees that the profits of industry should be more equally apportioned and reserves set aside to maintain it in a healthy state.

It is, of course, the case that, if there is any justification for the current level of shipping shares, it is largely because reserves have been set aside over a period of years. Unfortunately for all concerned, it is virtually impossible to obtain from published accounts any real idea of the amount of these reserves. It is doubtful, however, whether companies could be expected to accumulate, except during a protracted period of real prosperity—which means an ample margin between costs, including wages, and charges—reserves sufficient to provide against the effects of total war. That would involve, as a minimum, a drastic reform of the taxation of retained profits, in so far as they were necessary to ensure replacement.

### Women in Engineering

Over a third of the workers engaged in the engineering and allied industries are women, compared with 16 per cent in 1940—an increase of 112 per cent. The principle of equal pay for equal work, or the "rate for the job" has been accepted in the industry. Exactly four years ago the Engineering Employers Federation and the Amalgamated Engineering Union concluded the "relaxation" agreement, allowing for the replacement of men by women and providing, among other things, that where a woman does a man's job, without extra supervision or assistance, she should, after 32 weeks, receive the full man's rate. Yet the criticism that this agreement was not being observed was widely made at last week's conference of AEU women, as it was at a similar conference a year ago. It was alleged that the argument was used by some employers that so many new processes have been introduced and jobs broken down into component parts, that it was difficult to determine what the job is, or what the appropriate rate should be. This was the cause of the trouble at a Glasgow aero-engine factory last October, which led to the appointment of a Court of Enquiry under Lord Wark. This court recommended that the jobs in the factory should be graded, and appropriate rates fixed, and the AEU is now negotiating for a national grading of jobs in the industry, according to skill and irrespective of sex. But this may take some time, and in the meantime the union is pressing for the implementation of the 1940 Agreement where it is being evaded, and for women in the industry to be paid the district male labourer's rate when they start work. These negotiations have an important bearing on the post-war position of women in industry. It may be that Mr Jack Tanner was right when, in his Presidential speech to the AEU women, he said that the Government's policy was "cheap tributes to cheap labour" and warned against any tendency to regard women as cheap labour after the war. He was also probably right in estimating that the wartime developments in the direction of simplification and mass production, and the use of new materials and methods (largely originating from the necessity of employing inexperienced labour) would continue into the post-war period, and would make the continued employment of women, not only possible but necessary. Mr Tanner's argument is that these increases in skill and technical efficiency, by raising productivity, should provide the basis for an expansion in exports without raising costs. In other words, the industry could pursue a high wage policy and be prosperous—or, rather, the industry's ability to pursue a high wage policy depends on its being prosperous. In the meantime the union's arguments are being put to the test. The National Arbitration Tribunal on Wednesday heard the claim, affecting 1½ million workers, for a 10s. increase in weekly wages.

### Debate on Electricity

The various sections of the electricity supply industry have all prepared memoranda on the future of the distribution side of the industry. It is reported that the draft proposals published last January under the names of the Incorporated Municipal Electrical Association, the London Electricity Supply Association, and a group of "power" companies has been accepted, in an amended form, by the IMEA, which, though a signatory to the original draft, had not given it unqualified approval. The various reports reveal a substantial measure of agreement on the need for technical and administrative re-

organisation, such as the standardisation of voltages, a speed-up in the changeover from direct to alternating current, greater uniformity of forms of tariff, an extension of supply to unserved streets and rural areas, and, last but not least, the organisation of the industry in larger areas, if this is necessary to realise the technical objectives. Inevitably, they reveal disagreement on the question of ownership, which is an important factor when it comes to organising the industry into larger areas. Broadly, the companies favour the solution suggested by the McGowan Report in 1936. That Report suggested

the retention and utilisation, where possible, of the larger and more efficient of the existing undertakings—both public authorities and companies—and the absorption by such undertakings of the smaller and less efficient undertakings.

Some of the large municipalities appear to be not unfavourably disposed to this solution, but others—that is, those that might be absorbed by company undertakings—are said to be against it. The London and Home Counties Joint Electricity Authority, which distributes electricity in about one-tenth of the London and Home Counties area, apparently sees the solution of the problem in a series of district authorities. The large measure of common ground that exists on the need for technical reorganisation should assist the Minister of Fuel and Power in shaping his policy. But insofar as technical reorganisation requires the grouping of existing undertakings, this should not be delayed by disagreements about ownership. There is little to be said for imposing a system of untied regional boards upon the whole industry, merely for the sake of removing patches of inefficiency. The views expressed by the Association of Electric Power Companies in its reply to the Labour Party's Coal and Power plan will probably be shared by most sections of the electricity industry. It rejects the thesis that state control and monopoly

would provide consumers with better and cheaper service and accuses the Party of arguing from general principles and not from concrete evidence—a change which is not altogether unjustified.

### The Banks' Salute

The clearing banks' returns for April are of particular interest for their revelation of the banks' direct contribution to London's Salute the Soldier week. This is shown in an increase of £16,224.00 in the aggregate holding of investments. The movement is almost exactly balanced by a reduction of £17 million in Treasury Deposit Receipts, and though the correspondence between the two movements is partly accidental, it helps to emphasise the extent to which the banks' direct contributions to Government loans in the Salute week were financed by the pre-encashment of TDRs. The increase in investments is modest, and approximately equals that which occurred a year previously during the Wings for Victory week. The biggest movement revealed by the April returns is a rise of £35,469,000 in bills discounted. This shows that the increase in the weekly issue of Treasury bills by tender is duly making its way to the banking system, though some of the additional bills are remaining in discount market portfolios, as may be seen from the rise of £9,519,000 in the banks' short loans last month. After their considerable expansion over the first quarter of the year, bank advances, last month, fell by £17,948,000. This movement still leaves the total some £11 million above what it was at the end of 1943. The April contraction seems to confirm the view that the first quarter's expansion in this item, unusually large though it was, represented in large part an increase in bank loans to finance tax payments. The net

## THE PENNSYLVANIA RAILROAD SUMMARY OF 97th ANNUAL REPORT

### THE YEAR 1943

The war continued to dominate the ever increasing transportation effort. While performance was highly satisfactory from the standpoint of meeting every demand of the war emergency, it could not of necessity be wholly adequate from the standpoint of the character of the service performed, particularly the passenger service. Nevertheless, considering the abnormal conditions that prevailed throughout the year, the results as a whole can be viewed as a creditable achievement.

### THE NATIONAL EMERGENCY

The ability of the railroads to handle a record volume of traffic was due to further improvements in facilities and operating methods; to splendid co-operation between the railroads, the shippers and employees, the Army and Navy, and other agencies of Government, and to the continued helpful attitude of the Office of Defence Transportation.

### TAXES

Sound public policy not only justifies but should require the accumulation by the railroads of large post-war reserves to meet post-war changes in transportation practices and methods, but the tax policy of the Government is heading them along the same unfortunate path as at the close of the last war, when the rail-

roads had to borrow large sums of money and go into debt to revamp their properties.

Today, while the railroads are doing the largest business in their history, it would be advantageous not only to them, but also to the public at large and to railroad employees as a whole, if the tax laws were amended so as to permit the creation now of the reserves needed for post-war rehabilitation, with resulting greater employment in the post-war period.

### THE EMPLOYEES

The Board takes pleasure in acknowledging the continued efficiency and loyalty of the employees, which made possible the handling of a volume of traffic exceeding that of any year in the history of the Company.

44,448 employees of the System have entered the Armed Forces, serving in every part of the world, of whom 123 have made the supreme sacrifice.

Many thousands of new employees have had to be trained to take their places, including 21,730 women who are now in the railroad service.

Never were the demands upon the employees so great; never have they met the burden more efficiently and more courageously.

M. W. CLEMENT, President.

### OPERATING RESULTS

effect of these widely contrasting movements in assets has been to raise the total of deposits by £28,575,000 to £4,016,747,000, a figure which has only been exceeded once before, namely, at the end of 1943.

### Post-War Inflation in US

Mr Marriner S. Eccles, Chairman of the Federal Reserve Board, has recently delivered a lecture on the possibilities of post-war inflation in the United States and on the appropriate taxation policy. The text of the address is reproduced in the March, 1944 *Federal Reserve Bulletin*. As often with American pronouncements, the official views expressed are unexceptionable, in keeping with the soundest fiscal and monetary traditions, but somewhat divorced from current practice. Mr Eccles openly admits this. He points out that "taxation is never neutral" and that "even if levied ostensibly for revenue only, taxes have a direct influence on these basic factors of consumption, savings and investments, which, by getting out of balance, produce economic ups and downs." He then goes on to assert that "our tax effort so far has been entirely inadequate in relationship to our huge wartime expenditures" and urges that the United States should strengthen in every way its stabilisation programme during the war period.

since it will be impossible to do so after the war, when the impulse of the people to return to normalcy will make it very difficult even to maintain established controls.

Mr Eccles thus foresees a period of heavy inflationary pressure immediately after the war, due to the huge purchasing power held by the public (partly the result of the relatively low tax effort made during the war), to the inevitable delay in converting the industrial machine to peacetime production, to the desire of customers to satisfy their deferred demands, and to the maintenance of heavy export demands. Mr Eccles has no doubt that during the transition period

continued rationing and price controls will be needed in the domestic market and licensing control of exports should be retained.

Assurance must be given to the millions of bondholders that they will not lose by delaying their purchases until ample supplies are again available. After the scarcity period, the main problem will be to maintain the high level of expenditure on consumption which will enable the United States national income to hold at a figure of around \$160 billion and to employ at least 55 million people as compared with 46 million in 1940. Mr Eccles does not believe that a permanently unbalanced budget will help to create the required flow of consumer expenditure. But, within the framework of a balanced budget, taxes should interfere as little as possible with expenditure on consumption goods. The first step suggested by Mr Eccles is a substitution of direct taxes on income for indirect taxes on consumption.

The personal income tax should be the main source of Federal revenue in the post-war period because it is the most flexible and equitable type of taxation and because consumption is less affected by it.

The maintenance of the required flow of consumption expenditure should, according to Mr Eccles, be the task of an expanded social security programme.

### CPR Outlook

The decision of the market to mark up the price of Canadian Pacific ordinary shares on the news that there is to be consideration of an interim dividend in August seems a trifle optimistic. The general purport of Mr D. C. Coleman's address at the annual meeting was rather discouraging. As to the immediate future, the company is faced with the demand that wages shall be raised to US levels, while it is felt that, following an excellent first quarter, the rest of the year may bring decreases rather than increases in certain classes of traffic. If this is a true forecast, and unless there is a halt in the upward trend of costs—all evidence points the other way—the peak of net income will have been passed. It would take an average decline against last

year of some 6 per cent in the closing three-quarters of the year to offset the rise in gross traffics of the first quarter, but it is evident that the rise in costs may more than eat up any favourable balance which may be secured in the gross figure. No attempt is made at a general assessment of the less immediate future, but on one point there is a disclosure of some interest. This concerns the Canadian policy for air transport, on which an article appears on page 647. There is intended to be no confiscation, but the railway companies "are to be required to divest themselves of the ownership of airlines within one year after the close of the war." Since the railways have no power to retain the lines, they will be battling on a bowler's wicket in the negotiations. It seems extremely doubtful whether the CPR's feeder lines did in the past, or could in the near future, yield a profit after bearing their due share of charges. But they, presumably, ensured that a certain amount of traffic was brought to the CPR and not to the National system. In the near future, at least, the change of policy will mean a loss to the company of prestige rather than of profit. On the larger post-war issues, it remains as difficult as ever to reach an opinion. Canada will emerge from the war with greatly increased productive capacity and the CPR with an improved financial position. How far political and economic policies at home and abroad will enable the Dominions, or the stockholders, to benefit from this potential productivity remains quite uncertain.

### Accountants and Co-ordination

The most important matter raised by Mr C. J. G. Palmour in his presidential address to the Institute of Chartered Accountants is that of co-ordination within the profession. Unfortunately, the progress made in over a year of negotiations is slight. Virtual agreement has been reached between the Institute and the Incorporated Society, but the Scottish bodies show little desire for a scheme which will include them, while the Association of Certified and Corporate Accountants has recently put forward amendments which cannot be accepted by the two main bodies. While hoping that agreement may still be possible over the wider field, Mr Palmour suggests that, in the event of failure, a joint committee of the Institute and the Society be formed to speak for the two senior English bodies. No information is forthcoming about the scope of the agreement which it was sought to obtain, but it is believed that it dealt mainly, but not solely, with the accountant as auditor. There can be little doubt that to obtain more informative accounts it is necessary to improve the status of the auditor. Nor can it be doubted that a stepping up of the standards required of auditors is a necessary preliminary to that end. It is difficult to see how this can be done without agreement between the principal bodies, and it is probable that in view of the evidence tendered to them by several witnesses the recommendations of the Cohen Committee on Company Law amendment will contain some suggestions on this matter. In dealing with the matter exactly a year ago, *The Economist* supported what it took to be a demand for licensing, subject to action being taken which would prevent the profession from becoming a closed shop and ensure a wider training for both auditors and industrial accountants. The problem of standardisation is much more acute in England than in Scotland, where there exist only the Societies of Chartered Accountants of Edinburgh, Glasgow and Aberdeen, with their co-ordinating body. For them by far the most important aspect of the problem is that it involves some diminution of independence. It is intelligible that they should not be prepared to take definite action until they know what, if any, concessions their brother CAs in England may be prepared to make to secure agreement. It is a pity, however, that, if this is their sole objection, they should not say so.

### New Copper Decision

The statement of Colonel Stanley, Secretary for the Colonies, that the whole question of copper supplies has been reviewed is welcome. The original decision entailed stepping-up production in America, where costs are high, and cutting it in Rhodesia, where they are low. The underlying motive appears to have been to save transport, and one effect was to diminish still further the profits of the Northern Rhodesian copper companies. The revised policy is that production shall be maintained in all areas, as far as is practicable. Any production in excess of requirements from areas previously allocated to the UK is now to be made available to the US or the USSR. This puts an end

to the full rigour of the contemplated cut of 20 to 25 per cent in Northern Rhodesian output—of which only about one-third has so far become effective. It does not, however, mean that there will be no cut, for the UK Government is not prepared to sanction exceptional outlays on plant replacement. Thus, there will be some reduction on the 1943 figure of output for the Rhodesian mines as a whole, but how great it will be, or how distributed, is not clear.

### Rubber in Peace

No tears need be shed over the final dissolution, after four months' reprieve, of the International Rubber Regulation Committee. In its place, as previously announced, it is proposed to put an advisory instead of a regulatory body, and one that, it is hoped, will contain representatives of all interested countries in addition to the three members of the dissolved committee—the United Kingdom, Holland and India. The new committee would contain, if possible, producers of synthetic as well as of natural rubber, and its advice should pay equal attention to the needs of producers, consumers, and the native inhabitants of producing areas. These are the correct principles to work on for securing the equal access to and equal availability of essential raw materials promised by the Atlantic Charter and at Hot Springs. Certainly, there should be no return to the pre-war restrictionist policies. During the period of reconstruction there will be no lack of demand for rubber of all types; but thereafter it may be a different story. It is rumoured that during Mr Stettinius' recent visit understandings were reached between Britain and the United States which included rubber distribution. If so, it is not known in what form or for how long agreement can be expected—nor how the wide divergences of interest between different classes of producers and between producers and consumers are to be resolved. To judge by the recent remarks of Mr Copeman, the chairman of the Rubber Growers Association, the industry is equally in the dark. Mr Copeman was annoyed that the termination of the recent agreement should have been handed to the industry as "a fait accompli," and that while the Government consulted individuals it was less forthcoming towards recognised associations—like his own presumably. But, while Mr Copeman recited past achievements in welfare and research by the British rubber producers, he did not say what it is he wants for the future. The Far Eastern producers, which his association mainly represents, will have many difficulties—among them, the rehabilitation of their plantations; competition both from synthetic rubber and from new sources of natural rubber which have been opened up under pressure of war-time needs; and the loss of such quasi-monopolistic powers of control as they previously possessed. Difficulties of this sort are among the problems which any long-term international agreement must take into account—and for overcoming which the interests concerned should state their policy.

### And Rubber for War

Meanwhile, the problems of overproduction of rubber must seem an ironic mirage to those in charge of wartime supply. Stocks of crude rubber have reached their lowest level both here and in the United States. While supplies from Ceylon and Africa have fulfilled expectations, and several types of shrub rubber have added a further quota, the output of Latin America has been less than was counted on. The disappointment of the United States in Brazilian rubber production is shown in a change over, reflected in the recent revision of its rubber buying agreement with that country, from subsidising Brazil's capital costs to paying more for its current output. In the past, the United States has paid all rubber development costs in Brazil—at a charge to public funds, up to the beginning of this year, of \$83 million—but for the future this will be the concern of the Brazilian Government; on the other hand, the US Government will now pay 60 instead of 45 cents per lb. of Brazilian crude rubber. Current output from Brazil may now increase, but hardly sufficiently to fill the gap in the crude rubber supplies of the United Nations. The development of synthetic rubber in the United States and Canada has nearly reached its peak; all plants have been completed and are expected to be in full production shortly. Various technical obstacles in the utilisation of synthetic rubber have now been overcome. Suitable cords for synthetic tyres are now becoming available, partly due to the compulsory pooling of technical knowledge by rayon manufacturers, who are making good progress in fulfilling the

United States demand for 240 million lb. of high-tensile rayon for use in such cords. The use of Buthyl rubber (one of the principal types of synthetic rubber) for inner tubes, made difficult by the smaller elasticity of synthetic rubber, is now not only possible, but, on some points such as the air retention property and tear resistance of the tubes, preferable to the use of natural rubber for this purpose; and mass production of inner tubes for motor cars and aeroplanes from synthetic rubber has been started in the United States. These technical advances are important, but they do not end the need of crude rubber for admixture with the synthetic. The rubber position of the United Nations will remain tight until the reconquest of at least some of the main centres of crude rubber production.

### Furniture Prices

War-time exigencies have compelled a drastic reduction in the manufacture of new furniture. The small output of reasonably priced utility furniture is quite inadequate to meet the demand. As a result, the prices of second-hand furniture have soared in spite of the Government's attempt to stem the advance. Last week, Mr Craven Griffiths, secretary to the Price Regulation Committee, North Midland Region, compared the cost of furnishing a small home with new furniture in 1939 and with second-hand furniture in November, 1943. These are the figures he gave:—

|                    | Cost of New Furniture in 1939 | Cost of Second-hand Furniture in Nov., 1943 | Percentage Increase |
|--------------------|-------------------------------|---------------------------------------------|---------------------|
| Bedroom .....      | £ 28 14 0                     | £ 86 15 0                                   | 300                 |
| Sitting room ..... | £ 31 5 0                      | £ 94 1 0                                    | 300                 |
| Dining room .....  | £ 26 5 0                      | £ 85 14 0                                   | 325                 |
|                    | 86 4 0                        | 226 10 0                                    | 308                 |

## COULD YOU ADDRESS

a public meeting to-night without notes?  
RAPIDISM will develop for you  
(1) mental alertness. (2) personal courage.

Write now for free Booklet to:  
THE RAPIDISM INSTITUTE,  
421, TUTION HOUSE, London, S.W.19.

tary to the Board of Trade, announced in the House of Commons that the control of the prices of second-hand furniture is to be made more effective by a new Order prescribing schedules of maximum prices for furniture of the types most commonly in use; maximum prices will apply not only to sales by dealers but also to sales by auction and on commission. Administratively, the problem is one of considerable difficulty. Obviously, it would be more economical to enforce a reduction in the prices of second-hand furniture—though this might lead to a reduction in supplies—than to increase the output of new furniture. But, unless the prices of second-hand furniture can be brought within the means of those who need it, the best solution might be to increase the output of utility furniture, at least to the limit of the materials available. Any additional labour required could probably be drawn from that now engaged on the more profitable occupation of refurbishing expensive second-hand furniture.

### Shorter Note

The Board of Trade has so far published only the first three parts of the Final Report on the 1935 Census of Production, the type of Part IV having been destroyed. In view of the widespread demand, however, the Board of Trade is now making available reproductions of the corrected proofs of the reports relating to all the remaining trades. The first section relates to building and contracting, timber and building materials; it forms a volume containing about 200 pages, size 10 in. by 8 in., and the price is 15s. a copy. The other sections, which will be issued subsequently, relate to (1) Paper, Printing and Stationery Trades (5s.), (2) Mines and Quarries (5s.), and (3) Public

Utility Services and Government Departments (7s. 6d.). Copies of these sections will only be obtainable on application to the Assistant Secretary, Statistics Department, Board of Trade, Romney House East, London, S.W.1. A set of Summary Tables, giving particulars for the Census as a whole, can be obtained for 2s. 6d.

## COMPANY MEETINGS

# SCOTTISH UNION AND NATIONAL INSURANCE COMPANY

## INSURANCE AND THE NATIONAL EFFORT

### AN IMPORTANT EXPORT

#### MR JAMES L. MOUNSEY'S VIEWS

The 119th annual general meeting of the Scottish Union and National Insurance Company was held, on the 10th instant, at Edinburgh, Mr James L. Mounsey, W.S., presiding.

The Chairman said: Gentlemen,—Since last we met to consider our accounts, the company has sustained a sad loss in the death of Mr Colin Mackenzie Black, W.S., who had been a member of our board for 35 years. His wide knowledge and sound judgment were valued by his colleagues, who will miss him very much in their deliberations. To fill the vacancy thus caused, your directors have elected Mr Geo. Francis Henderson, W.S., whose knowledge of the company's affairs covers a number of years, during which time he was law agent for the company. We extend to him a cordial welcome. Consequent upon Mr Henderson's election to the board, Mr A. Logan McClure, W.S., has been appointed our law agent.

During the course of the year the war has taken a further toll of our staff, and I regret to have to report that three have been killed and two wounded. To the relatives of these we offer our sincere sympathy.

The staff remaining to carry on the affairs of the company have given us most loyal and devoted service through an extremely difficult time, and we express to them and to our branch managers, local directors, trustees, representatives and agents, both at home and overseas, our sincere appreciation for all that they have done.

Turning to the accounts, you will notice a slight alteration in their form of presentation. Without omitting any necessary information, the life account has been contracted, and throughout shillings and pence have been omitted. This is largely due to the request to save paper.

### LIFE AND FIRE RESULTS

**Life Department.**—New business, while falling slightly below that for 1942, was well maintained considering the severe reduction in the field staff. The good quality of the business which we have written is reflected in the average rate of premium of £5 per cent. per annum on the business which we have written. The revenue account shows a healthy progress, and the net rate of interest earned on the life funds is £3 3s. 2d. per cent.

Notwithstanding claims due to hostilities, the mortality experience during the year was very favourable. Matured policies showed a large increase over last year's figure, and constituted a record in the history of the company. This figure gives an indication of the growth in the company's business after the last war. The expense ratio at 12.9 per cent. of the premium income is an improvement on last year.

**Fire Department.**—Although the profit realised in the fire department was less than in 1942, the general operations of this department during the year can be regarded as satisfactory. In spite of the restrictions imposed by the shortage of manpower and the Standstill Agreement, our net premiums showed an increase of £56,794. The increase in claims was due largely to the unfavourable loss experience in the U.S.A.

At home our fire loss experience was better than it has been for many years.

Our general manager and this department have devoted considerable time to the campaign against fire wastage which was inaugurated by the companies to assist in reducing damage and destruction by fire of all types of property valuable to the war effort. We are continuing to assist the Government in its various schemes of war risk insurance.

### ACCIDENT AND MARINE FIGURES

**Accident Department.**—In the accident field our trading has followed very much the pattern of the previous year. Every section of the department has contributed towards the aggregate profit. As might be expected, the motor premium income is slightly less than in the previous year as a consequence of the cars being laid up. The total premiums in the accident department show an increase of £26,602.

**Marine Business.**—In the marine account there was a decrease in premiums of £230,000, principally due to three factors—reduction in the amount of tonnage insured in the open market, in the war rates of premium and in the amount of cargo insurances.

On the other hand, there was a reduction in claims of more than £200,000, and after making provision for Excess Profits Tax of £107,000, we were able to transfer to profit and loss account £150,000 compared with £50,000 last year.

### INVESTMENTS AND RESERVES

As regards investments, we have contributed to the maximum extent to the War Loans of our Government. Since the beginning of the war we have subscribed over 2½ million pounds to British War Loans. Substantial support has also been given in the Dominions and the United States. Interest rates everywhere are under tight Government control, and the return from these investments is meagre. These low interest rates are also reflected in high market prices for older securities which provide us with a large margin over book values.

**Balance-sheet.**—It will be noticed that a transfer of £100,000 has been made to general reserve funds. This has been set aside for the benefit of our marine department to strengthen their general reserve and to provide for unforeseen contingencies in respect of outstanding losses. The assets in the balance-sheet have increased by £298,082 to £19,165,289 and the reserve funds of the company have been fully maintained.

### SUPPORT FOR GOVERNMENT FUND

I cannot allow this occasion to pass without making some reference to the great part which the insurance industry is taking in the nation-wide effort to win the war. What the companies are doing cannot be stressed too strongly. The millions of pounds which they have invested in the various Government Funds—the valuable protection which they provide in respect of fire cover for industry generally and the attention which is constantly being paid to the avoidance and prevention of acci-

dents to workpeople are but some of the items which have our continuous care. These matters and many others will be prominently before us when hostilities cease and we are called upon to put our post-war plans, both at home and overseas, into operation. The Government and the public know a good deal about these matters, but they cannot too often be brought to notice.

In this connection Colonel Cotton makes reference in his speech at the "Maritime" annual general meeting to points, which I am sure will be of interest to you, and with your permission I will quote them:

"Insurance is one of the largest of our exports, one for which the only raw materials needed, brains and character, are still happily found in great quantity in this country, and it is, I believe, the interest as well as the duty of the Government to see that restrictive and discriminating legislation in foreign countries is not allowed to go unnoticed and unchallenged. British insurance asks for no favours only for a fair field, and I cannot help feeling that if half the time and thought which is given by Government Departments to the nurture of infant and often sickly industries were devoted to the defence of this major existing export against the attacks of excessive nationalism, both time and thought would be well spent."

### TRIBUTE TO MANAGEMENT

Before concluding I would again like to emphasise that for the satisfactory results to which I have referred our thanks are due in no small measure to the drive and energy of our general manager. Despite all his preoccupations in this country, he, with our fire manager, exposed himself to the personal discomfort and risk of Transatlantic travel in order to examine on the spot the progress of our activities in the USA and Canada, and I am glad that he has been able to report on satisfactory arrangements in these countries.

The report and accounts and dividend were approved.

## BECALMED

"As idle as a painted ship upon a painted ocean"—without the motive power of wind the sailing ship is useless. Without adequate funds the Christie Cancer Hospital, the largest Cancer treating hospital of the Empire, is unable to extend its increasing fight against Cancer. Don't let our work falter or fail from lack of your help; send a donation to-day.

## THE UNION BANK OF SCOTLAND LIMITED

### SATISFACTORY RESULTS

#### SIR A. STEVEN BILSLAND'S REVIEW

The annual meeting of shareholders of the Union Bank of Scotland, Limited, was held on Wednesday, the 10th instant, Sir A. Steven Bilsland, Bt., M.C., D.L., chairman of the bank, in the chair.

The chairman in submitting the directors' report mentioned that the balance-sheet total had now reached a figure of £63,000,000, an increase of nearly £6,800,000 over last year's figure. This was, of course, largely accounted for by the continued increase in the amount of deposits which, at £51,500,000, were £4,900,000 higher than last year. The volume of their note circulation continued to expand, and at £6,100,000 showed an increase of £630,000. For some years prior to the outbreak of war one of the features of the balance-sheet had been the comparative steadiness of the figures of deposits and note circulation; but it was inevitable that the very large increase in Government borrowing for the purpose of meeting war expenditure should result in a considerable expansion of bank deposits and note circulation. In this connection it was interesting to recall that in 1939 their note circulation amounted to £2,600,000, their deposits to £33,000,000 and their balance-sheet total to £40,000,000.

#### STRONG LIQUID POSITION

On the assets side, cash and money at call amounted to £14,670,000, an increase of £1,470,000. Bills under discount, at £1,580,000, were almost entirely Treasury bills. They showed a reduction of £560,000, which was much more than offset by an increase of £1,000,000 in Treasury deposit receipts, which stood at £5,000,000. These liquid resources amounted, in all, to £21,250,000, or 37 per cent. of their liability on deposits and notes in circulation. Taking into account their British Government securities, which stood in the books at £27,850,000—an increase of £4,300,000 during the year under review—it would be seen that they had £49,100,000, or 85 per cent. of their liabilities, in the form of cash or readily realisable securities.

Although they continued to finance to a considerable extent many of their customers who were actively engaged in vital war production, either as main contractors or sub-contractors, they had to record a reduction in loans and advances of £580,000 compared with last year. The decline in advances was, of course, due to the direct financing of commodity purchases by the Government and to the inevitable reduction in war-time of the normal stocks held by traders. Prior to the outbreak of war the assistance afforded to industry and agriculture had been on a liberal scale, and they would be most happy to see a return of conditions which would enable them once again to employ their resources in this way.

#### THE PROFIT

The profit for the year amounted to £313,000, an increase of £7,000 compared with last year. This expansion of profits was entirely due to their increased resources, as the margin of profit was still extremely low and costs continued to rise steadily. A sum of £50,000 had again been placed to reserve fund, making it £2,000,000, and on this occasion it had been thought desirable, in view of the existing restrictions on property outlays, to allocate £20,000 to deferred repairs and renewals, as against a sum of £10,000 applied last year to bank and other premises account. In view of the higher range of salaries, the directors recommended that this year the amount set aside in respect of

their liability for pensions and allowances should be increased from £25,000 to £30,000. As usual, full provision had been made for all bad and doubtful debts, and a valuation of their investments at April 1st showed a considerable surplus over the figure standing in their books.

#### TRIBUTE TO MANAGERS, OFFICIALS AND STAFF

The chairman expressed their most cordial thanks to Mr Norman L. Hird, general manager, and Mr John A. Morrison, assistant general manager, for their valuable services to the bank during these difficult times, and also their warm appreciation of the devoted and efficient service of the officials, managers, agents and other members of the staff, both permanent and temporary, at the offices in Scotland and London.

The report was unanimously adopted, and a dividend at the rate of 18 per cent. per annum declared.

Sir A. Steven Bilsland, Bt., M.C., D.L., was re-elected chairman of the bank.

## THE LIVERPOOL AND LONDON AND GLOBE INSURANCE COMPANY, LIMITED

In a statement circulated with the 108th annual report of the Liverpool and London and Globe Insurance Company, Limited, the chairman, Mr P. R. England, indicated that total fire, accident and marine premiums were £10,244,258 against £10,485,292 in 1942. Underwriting profit was £732,666 against £949,528.

New life business at £1,319,589 was £55,000 higher. Following quinquennial valuation, reversionary bonuses were declared—25s. per cent. per annum for whole life policies and 20s. per cent. per annum for endowment assurances.

Fire premiums at £3,905,437 compared with £3,705,732 in 1942.

Accident department trading was again favourable, premiums at £5,018,075 comparing with £5,045,712.

Marine premiums at £1,320,746 showed a decrease of £413,100 against the 1942 figure.

Net interest was £303,942 against £317,251.

The directors recommended a final dividend of 13s. 6d., making 27s. per share, less tax, for 1943.

## WILLIAM BEARDMORE AND COMPANY, LIMITED

### ORDINARY GENERAL MEETING

The ordinary general meeting of William Beardmore and Company, Limited, was held, on the 11th instant, at the offices of the company in Glasgow.

Sir James Lithgow, Bt., M.C., D.L., chairman of the company, presided.

The secretary (Mr D. M. Cameron, C.A.) read the notice convening the meeting, and the report of the auditors was read by Mr H. MacRobert, C.A.

Resolutions adopting the report and accounts for the year ended December 31, 1943, authorising the payment of the dividend on the ordinary stock and confirming the placing of a further £100,000 to war contingencies reserve were carried unanimously.

The retiring directors (Mr. Wilson Harvey and Mr Frank Hodges) were re-elected, and the auditors (Messrs J. Wyllie Guild and Ballantine) reappointed.

The proceedings concluded with a vote of thanks to the chairman.

## ALLIANCE ASSURANCE COMPANY, LIMITED

### ANOTHER OUTPUT RECORD REVIEW OF DEPARTMENTS

The annual general Court of the members of the Alliance Assurance Company, Limited, will be held at the office of the company on the 24th instant.

The following is an extract from the review by the chairman, Mr Richard Durant Trotter, which has been circulated with the report and accounts: In the life department the net new business completed during the year amounted to £1,210,839, against £1,401,180 for the previous year. In 1942 I foreshadowed the possibility that the amount of new life business might fall off owing to the fact that we had agreed not to use manpower for the purpose of seeking new life business. The fall, therefore, is not entirely unexpected. The claims by death in 1943 amounted to £701,082, which includes £91,969 for war claims. The claims by death in 1942 amounted to £681,444, of which £91,398 was in respect of war claims. The total sum paid in respect of war claims from the outbreak up to the end of 1943 now amounts to £308,459. At the close of the year the "Alliance" Life and Annuity Funds amounted to £23,278,785, in comparison with £23,346,453 on December 31, 1942.

#### QUINQUENNIAL SURPLUS

The quinquennial actuarial valuation of the life and annuity business of the company fell to be made as at the close of the year. The rate of interest used in the valuation of the life fund was 2½ per cent., against 2½ per cent. in 1938, and the rate for the annuity fund was 3 per cent. as before. This has resulted in strengthening the reserves by over £600,000. The total surplus disclosed was £1,498,294, and of this sum £1,042,847 has been divided in the form of a compound reversionary bonus to with-profit policyholders at the rate of 1 per cent. per annum. The quinquennial actuarial valuation of the Economic Life Annuity and Capital Redemption business was also made as at December 31, 1943. The surplus disclosed amounted to £91,424, and of this £75,950 was allotted to the policyholders, the balance being carried forward.

In the fire department, the net premiums amounted to £2,333,122, being an increase of £71,692 over those for 1942. Claims and contributions to fire brigade absorbed £683,255, and after adjusting the reserve for unexpired risks, £327,154 has been carried to profit and loss. The additional reserve in this department has been increased to £3,000,000. The overseas business increased during the year.

#### ACCIDENT AND MARINE FIGURES

In the accident department the net premiums amounted to £1,243,552, showing an increase of £97,056 over those for 1942. After adjustment of the reserves for unexpired risks, the surplus, amounting to £236,440, has been carried to profit and loss account.

In the marine department the net premiums are £1,027,562, £646,642 less than those for 1942, due to the lower rates for war risk insurance, resulting from the improved shipping situation. The underwriting account for 1941 has now been closed, with a balance of £239,545, which is £88,136 more than the surplus on the 1940 account. The reserve fund for previous years has been increased to £425,000 and £139,287 has been carried to profit and loss.

The trustee department continues to make satisfactory progress.

Turning to our investments, the Stock Exchange securities (all funds) again appreciated in value during the year, and we have been able to invest a further £1,475,000 in Government War Loans.

## SUN INSURANCE OFFICE, LIMITED

### 234TH YEAR'S OPERATIONS MR. W. M. PRYOR'S REVIEW

The annual general meeting of the Sun Insurance Office, Limited, will be held, on the 23rd instant, when the usual formal resolutions will be submitted. The chairman has followed the procedure of earlier war years, however, and issued a statement to all shareholders, a summary of which is given below:

Since the last annual meeting the office has suffered an irreparable loss through the death of Sir William Goschen, who first joined the board in 1900 and has been chairman since 1918. To his leadership much of the success achieved is due. The death of Mr Charles V. Sale is reported with deep regret.

Mr H. W. Stokes and Mr J. A. Miller, formerly assistant secretaries, have been appointed assistant general managers. Mr W. R. Stevenson and Mr S. V. Bangert have been appointed assistant secretaries.

Premium income in both the fire and accident sections of the business advanced once more, but in common with the general experience marine premium income showed a recession. In the aggregate there has been a decline in income of only £25,797.

The additional reserves, which have in the past been included in the fire and accident revenue accounts, have been transferred to the general reserve in the balance-sheet as it is felt that no purpose can be served by the continuance of the former practice, and the alteration gives a clearer picture of the position. The general reserve now stands at the substantial figure of £3,250,000.

#### REVENUE ACCOUNTS

The claims experience in the fire account was again favourable, whilst the expense ratio, in spite of the heavy burden of taxation abroad, showed a welcome decline. The underwriting profits at £305,149 amounted to 11.96 per cent. of the premium income.

Notwithstanding a further decline in motor premiums, the income from accident business showed an increase, and the claims experience has been favourable. In this account also the ratio of expenses to premium income was substantially lower. The transfer to profit and loss account amounted to £230,253.

Marine premium income at £986,238 reflected the fall in rates of premium consequent upon the marked improvement in the war risk at sea. After transferring £100,000 to profit and loss account the marine fund stands at £1,719,278, which sum now includes the additional reserve of £130,000.

The transfers from the three revenue accounts totalled £635,404, which compared with £493,683 in 1942. Net interest earnings at £184,528 increased by £3,142. The provision made for British taxation was £300,000, whilst a sum of £50,000 has been transferred to the general reserve. A contribution of £100,000 has again been made to the pension fund.

#### DIVIDEND AND BALANCE SHEET

An interim dividend of 1s. 3d. per share was paid last January and a final dividend of 1s. 6d. per share has now been declared, the cost of these two dividends, which are subject to income-tax, being £176,000.

The book value of the investments at £10,400,968 advanced by £944,238, the market value of the securities being substantially in excess of the figure at which they stand in the books.

In concluding, the chairman pays tribute to the energy, loyalty and whole-hearted efforts of the management and staff. Meetings are sent to all members of the office now serving with the Forces.

## CALEDONIAN INSURANCE COMPANY

### SATISFACTORY RESULTS MR WILLIAM BLAIR'S REVIEW

The one hundred and thirty-ninth annual general meeting of the Caledonian Insurance Company was held within the company's office, Edinburgh, on the 11th instant.

The chairman, Mr William Blair, W.S., in moving the adoption of the report, said:—

In continuation of its support of the Government's financial requirements, the company invested in new Government loans in 1943 the sum of £841,000, raising the total thus invested since the outbreak of war from £1,377,600 to £2,218,600. I may add that our total holdings of British Government securities now amount to over £4,577,000 out of total assets of £13,139,000.

#### LIFE DEPARTMENT

You will observe that the net new life assurances granted during 1943 amounted to £1,137,746, as compared with £886,248 in 1942, which I think shows a satisfactory increase, especially considering that we have now practically no field staff. This clearly shows the measure of the goodwill which exists between the company and its agents. In this connexion may I remind shareholders that they can augment this goodwill greatly by giving all assistance in their power to increase the new business of the company.

There was a decrease of £86,000 in the death claims and a small increase in the surrenders, which latter, however, at £33,723 for the year are very moderate.

The expenses for the year 1943, excluding those applicable to annuities, showed a ratio to the net premium income of 15.0 per cent., compared with 15.2 per cent. for 1942.

The average net rate of interest earned for the year 1943 on the Life Assurance and Annuity Fund was £3 4s. 2d. per cent., as compared with £3 3s. 8d. per cent. in 1942.

As regards the assets the Stock Exchange securities stand in the balance sheet in the aggregate at less than the value at middle market prices as at December 31, 1943. The directors believe that the other assets are in the aggregate fully of the value stated in the balance sheet.

As already announced in the Press, it has been decided to pay, until further notice, an interim bonus of £1 per cent. per annum on ordinary participating whole life, endowment and double endowment Assurances becoming claims by death or maturity in 1944, in respect of each year's premium due and paid for the years 1937 to 1940 inclusive and the year 1944. No interim bonus will be allotted in respect of premiums due and paid for the years 1941 to 1943 inclusive.

#### FIRE DEPARTMENT

The premium income for 1943 was £910,493, as against £883,231 in 1942, and the profit was £57,081, compared with £55,068.

#### ACCIDENT DEPARTMENT

The premium income for 1943 was £485,478, as compared with £489,591 in 1942, and the profit was £48,235, compared with £43,871.

#### MARINE DEPARTMENT

The premium income for 1943 showed a considerable decrease, being £387,292, against £621,315 in 1942. This decrease is not in any way disturbing, as the premium income for 1942 was altogether exceptional owing to the inclusion of certain blocks of war risk business which proved unprofitable and which we are not now writing.

We have not made any transfer to profit and loss account in 1943, but I would mention that the marine fund at £628,001

represents 162 per cent. of the premium income for 1943 of £387,292. This fund, in the opinion of our underwriters, is sufficient to meet all liabilities and to provide a substantial profit. The directors, however, have thought it advisable to retain the profit in the fund until conditions become more stable.

#### PROFIT AND LOSS ACCOUNT

If the recommendations of the directors be approved, the balance to be carried forward in this account, after payment of a dividend of 15s. per share and the allocation of £20,000 to the Staff Pension Fund, will be £72,523, as against the corresponding figure of £89,197 for the previous year.

#### OFFICIALS, STAFF AND AGENTS

During the year Mr W. Graham Robertson, formerly branch manager at Nottingham, was appointed branch manager at Glasgow in succession to the late Mr Aird, and Mr D. M. Reid, formerly Superintendent at our Inverness office, was appointed to succeed Mr Robertson at Nottingham. Mr W. M. Shepherd, who was formerly chief assistant in the Foreign Accident Department, was appointed Foreign Accident Superintendent.

I feel it would be ungracious to close my remarks without referring to the loyal service to the company on the part of our general manager, Mr Cameron, and of the other officials at head office and the branches, as well as to the interest and devotion displayed by our local directors, staff and agents at home and abroad.

I now beg to move that the report be adopted, that the allocation of £20,000 to the Staff Pension Fund be approved, and that a dividend of 15s. per share, subject to deduction of income tax, be declared for the year 1943, payable in equal half-yearly instalments on May 15th and November 11th next.

The report and accounts were unanimously adopted.

## STEEL BARREL SCAMMELLS SUSTAINED WAR EFFORT

The seventh annual general meeting of Steel Barrel Scammells and Associated Engineers, Limited, was held, on the 10th instant, in London, Mr H. R. Hood Barrs (chairman and managing director) presiding.

The following is an extract from the chairman's address circulated with the report:

The directors have made payment of two interim dividends at the rate of 6 per cent. and 9 per cent., together with a bonus of 5 per cent., making a total of 20 per cent. for the year. The combined net profit of the three subsidiaries subject to tax amounts to £80,314. This shows a satisfactory increase of £7,104 on the profits of the previous year. The financial position of the group is indeed very strong, and will be most gratifying to all shareholders.

The very considerable volume of work on which all the companies are now engaged is largely attributable to the high standard of design and technique for which the companies have held a leading reputation in their respective fields for so many years. The name of Steel Barrel is known not only in this country but in many others for its specially improved containers of all types, and the many thousands of Steel Barrel tankers on the roads of the world are proof of the high quality and specialisation of this company in these productions. Similarly the names of Scammell and Carrimore are foremost in their fields, and shareholders can look forward with confidence to those great names drawing a very large volume of business on the cessation of hostilities.

The directors regard production efficiency as of first importance. The introduction of the latest methods and the installation of modern plant at all the companies' works are the subject of continuous attention. The report was adopted.

## E. POLLARD AND COMPANY, LIMITED

### ANOTHER OUTPUT RECORD

The thirty-second annual general meeting of E. Pollard and Company, Limited, was held, on the 10th instant, at 159, St. John Street, Clerkenwell, E.C.

Mr H. E. Pollard (chairman and managing director) presided.

After the preliminary proceedings had been concluded, the chairman said: Gentlemen,—You will see from the printed accounts that the trading profit for the year ended December 31, 1943, was £112,866, after provision for Excess Profits Tax. From this is deducted the usual charges of depreciation, amortisation, and interest, etc., leaving £89,258 to be dealt with in the appropriation account. This compares with £62,497 in 1942, when the amount carried forward after the appropriations was £34,783. This amount, added to the 1943 profit, gives £124,041 to provide for income-tax, reserves, war damage and dividends.

Your directors have placed £10,588 to reserve, which now stands at £31,000. They have paid the 7 per cent. on the preference shares and they propose to recommend a dividend of 7½ per cent. on the ordinary shares. The reserves for income-tax and debenture redemption and the war damage contribution are provided for, and we have left a carry forward of £35,827. Once again we have experienced a year of record output, and, as the work in progress figure of £588,557 net—as against £430,992 last year—suggests, we had a large number of valuable contracts in hand at the turn of the year.

### PROVISION FOR TAXATION

The increased bank overdraft is due to the cash requirements to meet taxation and to the accumulation of outstanding settlements of some of the larger uncompleted contracts. All taxation liabilities in respect of profits earned up to the end of 1942 have been agreed with the Inland Revenue, and tax on these profits has been discharged. In the 1943 accounts provision has been made for the estimated liability for Excess Profits Tax based on the profits of that year. In addition to this, a further provision has been made increasing the income-tax reserve to cover £36,000 of tax on these profits. This does not become due for payment until January 1, 1945. The corresponding figure at the end of 1942 was about £10,000.

After protracted negotiations, it was found that a comprehensive pension fund scheme to cover all grades and trades was too costly, and your directors therefore decided to return to the discretionary system used in the past and so avoid a guarantee of an ever recurring annual payment. The amount shown at December 31, 1942, has been incorporated in the present accounts.

### A SATISFACTORY STATE OF AFFAIRS

Taking the accounts as a whole, I think you will agree that they show a satisfactory state of affairs, and whilst your directors give continual thought to the prospects of peace-time trading, they do not let this interfere in any way with the present essential production. Undoubtedly we shall then experience difficulties of material shortages, but with reasonable substitutions and not too severe control we can turn our production over to our peace-time products, as existing contracts drop, without any serious difficulty.

The report and accounts were unanimously adopted and the dividend of 7½ per cent. on the ordinary shares for the year was approved.

Mr M. J. Larkin and Mr B. L. Marley, the directors retiring by rotation, were re-elected, and the auditors, Messrs A. R. Welchman and Company, reappointed.

## ROYAL INSURANCE COMPANY, LIMITED

### 99th ANNUAL REPORT

#### MR P. R. ENGLAND'S SURVEY

In a statement circulated with the 99th Annual Report of the Royal Insurance Company, Limited, the chairman, Mr P. R. England, said that fire premiums, at £6,575,895, were higher by over £200,000 than in 1942. Underwriting profit was £612,343 (9.31 per cent.) against £548,084 (8.61 per cent.) for the previous year.

Accident and General premiums were also higher by more than £200,000. Underwriting profit was £916,648 (12.93 per cent.) against £876,392 (12.75 per cent.).

The 1942 Marine Account had been closed with a loss of £172,857—not unexpected, for war losses falling upon American business in that year were heavy. Premiums for the 1943 account, at £2,736,367, were less by £1,200,000, but the results so far were promising.

Total premiums were £16,399,000.

Total Underwriting profit after deducting the Marine loss, amounted to £1,356,000, compared with £1,762,000 for 1942.

New Life business was completed for net sums assured of £2,750,145 (against £2,664,759). War claims increased to £88,000 (compared with £48,000); but even so, total death claims, at £767,311, were the lowest for any year since 1937.

Net interest in profit and loss account, at £866,000, was practically unchanged since the previous year.

### NEW INVESTMENTS

New investments consisted largely of subscriptions, which had been substantial, to Government War Loans in this country, in U.S.A., and the Dominions.

The company's capital position was strong, the market value of its securities showing a substantial margin over book value. Its funds were increasing, but the advantage to the company's interest account therefrom was offset by the lower rates obtainable on re-investment of maturities.

### ROAD ACCIDENTS

In reference to road accidents in this country, the chairman mentioned that according to the figures of the Ministry of War Transport, over 588,000 people had been killed or injured on the roads of Great Britain since the war began, compared with total British casualties on the fighting fronts—killed, wounded and missing—of 388,000. No protest could be too strong or too insistent.

The post-war outlook was particularly disturbing in its potential aggravation of the problem. The first flush of new motor-ing liberty might be fraught with serious risk to drivers, passengers and pedestrians. Numbers of drivers would take to the roads again—possibly with a dimmed appreciation of the hazards to be met; vehicles would be brought into use in poor condition, may be with inadequate brakes, and tyres aged to the point of danger; long stretches of road would be in urgent need of repair; adequate road signs might, for a time, be lacking; and the civilian population—above all, the children—might have lost their awareness of danger, in the diminished traffic we had seen during the war, and possibly in their temporary evacuation from cities to the country.

It was encouraging to know that the Ministry of War Transport, through the Road Safety Committee, was alive to these dangers, and was preparing a programme to cope with the situation. It needed to be a programme of propaganda and education—particularly for children; of careful and strict regulation, especially in built-up areas; and above all, of intelligent road policy—providing for the construction and layout of roads on modern lines, with lanes to segregate different kinds of traffic, fly-

over crossings, subways, and other safety devices. Only when the question was handled as incisively, from the safety aspect, as in the case of railways, should we hope to put an end to the destruction and maiming of life which was wasting one of our most precious national assets. The design, and safety record of the Liverpool-Birkenhead Tunnel under the River Mersey was a shining example of the high standard of safety which was attainable.

### POST-WAR PROBLEMS

Post-war problems were gradually assuming greater reality and urgency. British insurance was part of the Empire's financial armament, and had an essential job to do in the work of world reconstruction. Consideration was already being given to some of the broad questions, both imperial and domestic, which will arise in the years ahead.

### BUSINESS OVERSEAS

The need to develop the country's exports took a high priority in its post-war programme, and the chairman pointed with pride to the record of British insurance in that direction. Its net contribution to the country's available foreign exchange was comparable with any single exporting industry. It acquired a special value in time of war, for it called for no import of raw materials and demanded no shipping space. Insurance was one of the few exports—if not the only one—whose foreign exchange earnings had been maintained and even enhanced during the war. That enviable position was no accident. It had been achieved by the world-wide reputation which British insurance had built up for integrity, technical skill, and financial stability. It reflected a world-wide faith in the British "promise to pay"—a faith firmly based on confidence.

## JOHNSON AND PHILLIPS, LIMITED

### INCREASED TRADING PROFIT

The thirty-ninth annual general meeting of Johnson and Phillips, Limited, was held, on the 11th instant, in London.

Mr G. Leslie Wates, J.P. (the chairman), said that they were again able, for the eleventh successive year, to report an increased trading profit. Their activities had been solely aimed at the manufacture of goods for the prosecution of the war, directly and indirectly, and the company had well justified its existence in this connection and had made a not inconsiderable contribution to the nation's effort. During the year the standard profit allowed to the company had been increased by some £17,000. The balance-sheet figures reflected the continued expansion of the company's business. It had been decided to transfer this year the sum of £15,000 out of profits to research and development account, and they had further increased the contingencies reserve by £30,000, bringing it up to £170,000. The board recommended the same final dividend as last year, namely, 7½ per cent., which made 15 per cent. for the year. This was the fifth year they had paid that dividend.

The amount of debentures now outstanding was £356,792. The board felt that with a company of their standing and total assets it was hardly appropriate to have any capital raised on debentures and, further, that the rate of interest of 4½ per cent. was higher than they ought to pay. It was therefore proposed to give notice to repay the present issue on January 1, 1945. Arrangements to finance the repayment for the time being would be made with their bankers at a substantial saving of interest, which would automatically enure for the benefit of the shareholders. The permanent re-financing might be accomplished in many diverse ways. It would be premature to attempt to settle the matter now.

The report was unanimously adopted.

## JOHN SUMMERS AND SONS, LIMITED

### RESULT OF YEAR'S OPERATIONS

The annual general meeting of John Summers and Sons, Limited, was held on the 5th instant at the company's offices at Lawarden Bridge Steelworks, Shotton.

Mr. Richard F. Summers, the chairman presided.

The proceedings were of a formal nature, covering the adoption of the report and accounts, the re-election of retiring directors and the re-appointment of the auditors.

No detailed review of the operations of the company was given by the chairman either at the meeting or in circulation form to the shareholders.

The following are extracts from the report:—

### PROFIT AND APPROPRIATIONS

The profit for the year and the appropriations recommended by the directors are summarised as follows:—

|                                                                                                         |                       |
|---------------------------------------------------------------------------------------------------------|-----------------------|
| Balance of profit after providing for depreciation and taxation...                                      | £ 451,173             |
| Balance from last account .....                                                                         | 185,183               |
|                                                                                                         | <hr/> 636,356         |
| Provision for war damage insurance ...                                                                  | 23,210                |
| Transfer to general reserve including £43,681 covering debenture stock redeemed December 15, 1943 ..... | 160,000               |
| Transfer to war contingencies reserve .....                                                             | 50,000                |
| Dividends on ordinary stock—                                                                            |                       |
| A" stock, 8½ per cent., less income tax 170,000                                                         |                       |
| B" stock, 4½ per cent., less income tax 45,000                                                          |                       |
|                                                                                                         | <hr/> 215,000         |
|                                                                                                         | <hr/> 448,210         |
|                                                                                                         | <hr/> <u>£188,146</u> |

In arriving at the above profit, depreciation of £350,174 has been written off in the accounts of the various companies and all provision has been made for all known liabilities and contingencies, including provision at the current rate for all taxation—respective of when payable—on the profits earned up to December 31, 1943.

### DEATH OF SIR ROBERT HILTON

The directors record with much regret the death of Sir Robert S. Hilton. Although he had only been on the board for a comparatively short time, his wide experience of the steel industry has proved of the greatest value to the company and his loss will be keenly felt by all those who were privileged to work with him.

The directors wish once more to place on record their appreciation of the sustained efforts that have been put forward by all the company's staff and employees. The report and accounts were adopted.

(Continued from page 664)

"The Economist" Sensitive Index.—There was no change in the index during the week ended May 10th. The complete index (1935 = 100) was 158.6; crops 135.6; and raw materials 85.5.

Labour for Cotton Trade.—About a year ago, under the auspices of the Cotton Board, there was formed a Recruitment and Training Department for the industry, and since then a large amount of work has been done by the director, Mr E. M. Gray, and his colleagues. The labour shortage in the cotton industry has been serious for a long time, but there are now signs of some improvement. According to the Ministry of Labour, 716 juveniles under 18 years of age entered the industry through the employment exchanges and the juvenile employment bureaux in the first quarter of 1944, compared with only 245 in the same period of 1943. The increased recruitment of juveniles may be a reflection of the improvement in working conditions.

## PINCHIN, JOHNSON AND COMPANY, LIMITED

### RECORD YEAR

#### MR EDWARD ROBSON'S REVIEW

The annual general meeting of Pinchin, Johnson and Company, Limited, was held, on the 10th instant, at Tigbourne Court, Witley, Surrey. Mr Edward Robson (the chairman) presided.

The directors' report stated that trading during the year continued under the difficulties of extended control of essential materials and labour, but despite such difficulties the company's turnover expanded satisfactorily.

All foreign and overseas units, with the exception of those in enemy occupied territories, continued to operate successfully.

The chairman's statement was as follows:—

Although present conditions require my survey to be as short as possible, there are one or two features which I should like to emphasise.

Firstly, the amount of net profit reported for the year constitutes a record for the company, although taxation absorbs the whole of the increase over 1942. Secondly, the further addition this year of £60,000 to the reserve for contingencies raises that fund to a total of £260,000, and, thirdly, the balance forward to 1944 is slightly increased to £173,343.

Your directors consider last year's results to be satisfactory, and it gives them pleasure to be able to recommend a small increase of 1½ per cent. in the dividend for the year.

You will note that changes have taken place in the board of the company. In addition to the appointment of two new working directors, I have to tell you that, owing to the many very important technical and other developments which are taking place, considerably increased demands are being made upon the time of Mr C. G. Heywood, your technical director, so much so that he has felt impelled to relinquish his day-to-day duties as a managing director in order that he may devote his time to technical developments and trade association activities of great importance to the industry, especially in its relationships with the Government.

### PLASTICS INTERESTS

Another point which will interest you is that your board has not been unmindful of the increasing importance of the development of plastics in association with the paint industry, and steps have been taken to ensure that your company will participate in the eventful benefits which will accrue to either industry.

Finally, I wish to pay tribute to my co-directors and the staff for their loyalty and unstinting efforts which have made the year 1943 an outstanding one in the company's history.

The report and accounts for the year 1943 were adopted, and a final dividend of 7½ per cent., less tax, was declared on the ordinary shares, making 10 per cent., less tax, for the year. The retiring directors were re-elected and the auditors re-appointed.

## MOSS' EMPIRES, LIMITED

### INCREASED PROFITS

The forty-fifth general meeting of Moss' Empires, Limited, was held in London on the 10th instant.

Mr R. H. Gillespie, the chairman, presided, and the following are extracts from the chairman's statement which was issued with the report: The trading profits for the year have increased from £326,355 to £332,238. Certain theatres are still closed owing to enemy action and otherwise. The provision for Imperial taxation for the year amounts to £227,763, an increase of some £25,000 over last year. In addition, the company paid almost £450,000 in Entertainment Tax, making a total of over four and three-quarter million pounds since the tax came into operation in 1917. In view of the present war situation and of what the future operations may be, the directors have decided to make a reserve for future taxation and not to declare any further dividend on the ordinary stock at this time beyond the 10 per cent. already paid. Additional provision has been made for sinking fund policies. Investments have been increased by the purchase of £50,000 National War Bonds.

The company have presented at their theatres throughout the country the best entertainment available, including ballet, opera, high-class musical plays and plays by Shakespeare and distinguished modern dramatists, as well as variety and revues, and have provided artistes and shows for the entertainment of many thousands in the camps and war factories and also for war charities.

Normal income has been considerably curtailed by Government restrictions on the sale of ices, teas, etc., and the limitation of bar and other supplies.

In the present year to date our business has been satisfactorily maintained, and every step was being taken to meet the difficulties which arise from time to time.

The report was unanimously adopted.

## CAMP BIRD LIMITED

The forty-second ordinary general meeting of Camp Bird, Limited, was held, on the 11th instant, in London, Mr F. W. Baker (the chairman) presiding.

The following is an extract from the chairman's statement circulated with the accounts: Profit for the year at £15,307 is slightly in excess of last year. The reserve fund, which has been increased by the year's profit to £241,580, has been utilised to write down investments and advances to market or estimated values. Our interests compared with last year are substantially unaltered. In South Africa we have added a minor interest in option and prospecting contracts in the Orange Free State. Our large holding in West Witwatersrand Areas, Limited, is retained.

Recent advices from the operating company in Australia of Lake George Mining Corporation, Limited, report the location by diamond drilling of a new ore shoot below the eighth level near the main shaft, which may prove to be of major importance.

The report was adopted.

## FINANCE AND BANKING

**THE MONEY MARKET.**—The authorities have throughout the week kept the credit position somewhat strained. The banks had to pay £80,000,000 against Treasury Deposit Receipts, while current maturities, allowing for pre-encashments, amounted to about £55,000,000. In addition to the £25,000,000 of net additional money found in this way, the Treasury bills to be paid for again exceeded maturities by £20,000,000. Government outlays up to the middle of the week did not altogether justify this volume of floating debt borrowing, and the Bank return shows £12,144,000 immobilised in Public deposits, an unusually high figure in these days. The total of bankers' deposits has risen by £7,560,000, but at £166,145,000 is still at a level denoting a bare sufficiency of bank cash. This figure, moreover, was only reached as a result of considerable special purchases of bills from the market earlier in the week. These open market operations are reflected in the rise of £12,655,000 in Government securities. By the second half of the week the position was easing appreciably and the clearing banks were again buyers of bills from the market. The note circulation over the past week has hardly shown any movement, though the latest total of £1,129,223,000 is a new high record.

## MONEY RATES, LONDON.

The following rates remained unchanged between May 4th and May 11th:—

A change has been made in the method of showing an excess of Post Office Expenditure over Post Office revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £33,215 to £2,876,749, the other operations for the week (no longer shown separately) raised the gross National Debt by £72,379,705 to £19,929 million.

## THE CHARTERED BANK OF INDIA AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

**CAPITAL (PAID UP) - £3,000,000**  
**RESERVE FUND - £3,000,000**

Branches and Agencies throughout INDIA and the EAST  
AFFILIATED BANK IN INDIA

THE ALLAHABAD BANK LTD., with 15 Branches & Sub-Agencies

The Bank offers a complete Banking Service and provides exceptional facilities for financing every description of trade with the East.

Deposits for Fixed Periods or repayable at call or at short notice are received at rates which may be ascertained on application. The Bank also undertakes Trusteeships and Executorships.

**Head Office: 38, BISHOPSGATE, LONDON, E.C.2**

West End Branch:

**22, CHARLES II STREET, HAYMARKET, S.W.1**

Manchester Branch: 52, MOSLEY STREET

New York Agency: 65, BROADWAY, NEW YORK CITY

### YOUR WILL

Have you thought of the anxiety which may be caused to your dependants if for any reason your affairs have not been satisfactorily arranged?

In these days when life is so uncertain, the advisability of appointing a corporation rather than an individual as the executor of your Will or in the capacity of Trustee needs little emphasis. By so doing, continuity is preserved and you are assured of efficient administration.

Full details can be obtained, whether you are a customer of Lloyds Bank Limited or not, from any Branch or from its Executor and Trustee Offices at

Ewhurst Place, Ewhurst (near Guildford), Surrey, 39 Threadneedle Street, E.C.2,  
5 Albemarle Street, W.1, Birmingham,  
Bournemouth, Bristol, Exeter, Liverpool,  
Manchester, North (Glamorgan) and  
Newcastle upon Tyne.

## LLOYDS BANK LIMITED

Head Office: 71 Lombard Street, London, E.C.3

## REFUGE ASSURANCE COMPANY LTD.

Chief Office: OXFORD STREET, MANCHESTER, 1

ANNUAL INCOME EXCEEDS - £14,500,000

ASSETS EXCEED - £83,000,000

CLAIMS PAID EXCEED - £155,000,000

(1943 Accounts)

## THE SOCIETY OF INCORPORATED ACCOUNTANTS AND AUDITORS

### EXAMINATIONS

The next Examinations will be held at Taunton School, Somerset, Manchester, Leeds, Glasgow, Dublin and Belfast as follows:—

Preliminary Examination: 2nd and 3rd August, 1944

Intermediate Examination: 3rd and 4th August, 1944

Final Examination: 2nd, 3rd and 4th August, 1944

Applications on the appropriate forms must be lodged on or before 23rd May, 1944, with the undersigned.

A. A. GARRETT, Secretary.  
Incorporated Accountants Hall, Victoria Embankment,  
London, W.C.2.

## THE PROVIDENT ASSOCIATION OF LONDON, LIMITED

PROVIDENT HOUSE, 246 BISHOPSGATE, LONDON, E.C.2.

FOUNDED 1877. Authorised by Act of Parliament, Intituled Provident Association of London Act, 1910.

LIFE ASSURANCE WITH HOUSE PURCHASE PRIVILEGES. ATTRACTIVE ANNUITY RATES

TOTAL FUNDS

**£16,037,306**

W. W. BENHAM, Chairman.

Total Advances upon House Property to Policy-holders exceed

**TWENTY-FIVE MILLIONS**

J. G. SLEIGH, Managing Director.

AGGREGATE ASSETS  
at 31st March, 1943.  
£67,128,395

Established over 80 years

**BANK of  
NEW ZEALAND**  
Incorporated with limited liability in New Zealand

Represented at over 200 points  
in New Zealand and at Melbourne,  
Victoria; Sydney, New South Wales;  
Suva, Fiji; Apia, Samoa.

London Office:  
1 Queen Victoria St. E.C.4  
John Forbes, Manager.

Head Office: WELLINGTON, N.Z.  
H.R.H. Chalmers, General Manager.

## The STOCK EXCHANGE THEIR STOCKBROKER

Investors are invited to apply  
for Government Loans through

**3% Savings Bonds 1960/70**

**2½% National War Bonds 1952/54**

are at present on sale @ 100.

There are also

**3% Defence Bonds**

Your Stockbroker will give you advice and full details,  
and put forward your application FREE OF CHARGE.

A detailed list of Firms acting as Brokers  
may be obtained from:

**The Secretary, Stock Exchange, London, E.C.2**

**CITY OF JOHANNESBURG**

## The Cart and the Horse

A DEBATE was initiated in the House of Lords on Tuesday by a motion of Lord Bennett's which asked the Government for information on their general economic policy, as a preliminary to next week's debate on the international currency proposals. Lord Bennett's case was that there is an inseparable connection between currency matters, on the one hand, and tariffs, preferences, bulk purchasing, export policy and the like on the other. There was rather more than a hint in several of the speeches—as there was in last week's debate in the Commons—that to discuss currency before trade is to put the cart before the horse.

In the particular form in which the criticism has been put forward in recent weeks, it is easily answered. It is perfectly true that all these subjects are closely interconnected. The currency proposals, as Lord Woolton pointed out, are specifically declared to be part of a general plan for international co-operation. But it is also perfectly clear that all these matters cannot be discussed at once. "It is perhaps an accident," said Lord Keynes, "that the monetary proposals got started first and are therefore more fully developed. . . . As we cannot talk about everything at once, let us talk about these first."

This is the plainest common sense. Nevertheless, there is a serious problem lurking behind the conflict of priorities. Priority of time is one thing; and there is no

reason why the bits of the jigsaw puzzle that at first should not be fitted into place first. But priority of importance is another matter; and if the procedure of going ahead with some matters leads to a belief that they are the more important, real damage may be done. This is the danger that is now being run. Economic questions are being handled in advance of political problems, and within the economic sphere, it is the financial aspect that is being treated before the industrial and commercial. If these are merely accidents of chronology, well and good. But they must not be allowed to obscure the basic truth that, as a matter of relative importance, the financial should be entirely subordinate to the economic, and the economic to the political. The financier can go ahead on certain assumptions about the movement of goods, the state of employment and the volume of production; but his work is entirely dependent on those assumptions. Similarly, economic plans can be laid in advance of political decisions, but they necessarily depend upon, and may be upset by, the politicians' labours. Politics, economics, finance is the order of dependence.

There are many who would take issue with this statement. There is a widespread tendency to argue that, if only the Versailles settlement had paid proper attention to economic questions, this second war would never have occurred, and that the shortest path to a stable world

order lies through a solution of economic problems. It is argued that the peacemakers, if they had wished, could have prevented the Great Depression, and that without the mass unemployment of the years from 1929 to 1933, there would have been no Nazi regime. All that is needed, this time, is to concentrate on the solution of a few simple economic problems, and political problems will look after themselves. The view has even been expressed, from time to time, that no attempt should be made to draw up a political settlement for several years after the war, in the expectation that economic measures would, in the interim, produce such a state of contentment that political difficulties would disappear.

This is the argument. So far as it relates to the past, it is a distortion. So far as it relates to the future, it is escapism. It is wholly wrong to suppose that the Treaty of Versailles ignored economic problems. It was shot through with economics and finance. Moreover, the efforts, and the controversies of the succeeding years were very heavily economic. The first international conference to be held after the Paris Peace Conference itself was a meeting at Brussels convened to discuss such matters as exchange rates, the gold standard and central banks. Of all the post-war problems, Reparations got more attention than any other. It is true that the solutions proposed to the economic problems now seem to us to be imperfect. But it simply is not true that economic matters were not given the proper amount of attention. Indeed, it can more truthfully be argued that if an equal amount of care had been devoted to building up the political foundations of peace there would have been no war in 1939. It may or may not be true that the Great Depression spawned Hitler. It is certainly true that he made great play with economic slogans. But his crimes against the world were political crimes and it was a sound political order that would alone have stopped him.

Very little of the doctrine that economic arrangements alone, without a political framework, can ensure a workable world order comes from the economists. Most of it comes from the politicians who, perplexed by the difficulty of their problems, find it consoling to believe that there is some magic in economics which will release

them from their painful duties. This is, of course, a pure delusion. Economic policy-making cannot proceed without a secure political framework. Nor is it only the preservation of law and order that is necessary. Before a country can determine how much self-sufficiency to plan for, it must be in a position to form a judgment on the risks of war, and with which of its neighbours it is likely to have to fight. Employment policy will be radically affected by the level of armaments and the form of military service that it is decided to adopt. There are those who believe that a working international order can be built up by a number of functional organisations for transport, for industry and for commerce. But before these organisations can come into existence, political decisions have to be taken. Nothing, it might have been supposed, was more appropriate for international, functional handling than relief and rehabilitation in the immediately post-war period. But at the Atlantic City conference political decisions were taken which will very largely confine UNRRA within a number of separate national compartments. There is no economic backdoor to European integration or federation. So long as the political framework is that of sovereign states, these states will be just as able, and just as willing, to slam their back doors as their front to any infringements or abatements of their sovereignty. Economic possibilities will continue to depend upon political decisions.

This is not a pessimistic view, for it serves to clarify the region in which progress must be made if it is to be made at all. That region is the political, and until the politicians have made up their minds about the relationships that are going to exist between the nations after the war, nothing that the economist and the financier can do will be other than provisional and hypothetical. That does not mean that work should not proceed. In the making of a moving picture, the later scenes are often photographed before the earlier ones, with the purpose of economising the time of the stars. But the picture stands and falls by the performances in the lead parts. Sooner or later the stars will have to play their big scenes, and unless they do it well, some of the minor incidents that are now being enacted will never appear upon the screen at all.

## Liberation—The First Phase

AGREEMENTS have been reached between the Governments of Belgium, Holland and Norway and the British and American Governments covering the steps to be taken immediately after the Allied landings. Norway has also signed a parallel agreement with Soviet Russia. The question of the status of the French National Committee and the Committee's resentment of the withdrawal of cypher privileges between Algiers and London still prevent the conclusion of similar agreements with the French, and this gap is the most alarming political phenomenon of these pre-invasion weeks. All the agreements are said to follow the pattern of the Soviet agreement with the Czechs. It is unfortunately impossible to verify this, for such is the Western Democracies' devotion to "open covenants openly arrived at," that not one word of the agreements is to be made public, ostensibly on grounds of military security. Such a liberal interpretation of security bodes nothing but evil for the future of democratic discussion on foreign politics. It is impossible to believe that the agreements contain anything which might not be published from the house tops. Certainly the Russo-Czech agreement was a model of political propriety. The peoples of Britain, America and Western Europe are thus left to imagine the worst either of their governments' intentions or of the intelligence of the military censorship.

Even though it is impossible to verify the assumption, it seems likely that the new agreements differ in one important respect from the Soviet treaty with Czechoslovakia. There was no mention there of any technical or political activity to be carried on by the Red Army on Czech soil. Even in the actual zone of operations, Czech

authorities are apparently to undertake all civilian tasks, though under the jurisdiction of the Soviet High Command. In Western Europe, a period is envisaged between the Allied landings and the setting up of effective local administration. During this time, Allied officers are to see that the work of civilian government is carried on. A Civil Affairs Division with its own separate staff—G5—has been attached to General Eisenhower and its officers are specially trained to deal with all civil emergencies in the rear of the advancing armies.

What conditions will the G5 officers find in Europe when they land and begin their operations? Obviously the most staggering confusion and dislocation will go in the train of the fighting. Economically, the structure of all the Western nations, with the partial exception of Denmark, has undergone a revolutionary change. The old trade unions and employers' associations, the old markets, the old distribution of industry, the old balance between industrial and agricultural production have all been disrupted. In their place is a highly artificial but highly organised imitation of the German totalitarian economic system. The task of reorganising each national economy is a long-term issue; but certain aspects of the Nazis' economic revolution will be relevant at once and will be among the first problems with which the G5 officials will have to deal. Every country, again with the exception of Denmark, is already short of food. Fighting may mean that this year's harvests will not be brought in, in which case, the shortage will be catastrophic. To counter this, it will not only be necessary to bring in foodstuffs, but also to maintain rationing and price control. The staffing of a

cumbrous system of economic control will entail some reliance on the officials who were working it before. In most countries, the civil servants belong to the great mass of passive citizens who have not "collaborated" in the strict sense but have carried on with their jobs, and in most cases to use them will not involve unfortunate political precedents. But there is a danger here for which the Civil Affairs Division must be prepared and to which there is no "technical" answer.

It is, indeed, on the political side that the Civil Affairs Division will face the real test, and it is much harder to make a really balanced and well-informed judgment on the political outlook in Western Europe than on the economic. One or two points are, however, certain. The first is the disintegration of the quisling movements. In Norway, in Holland and in Belgium, the followers of Quisling, of Mussert, of the Rexist Degrelle and of the *Vlaamsche National Verbond* are fading away and the movements themselves are split between an extremist wing—the various *Waffen S.S.* groups, for example, or Jonas Lie and his Norwegian police or the *Deutsch-Vlämische Arbeitsgemeinschaft*—which supports full co-operation with the Nazis and a more moderate group who are looking with feverish anxiety for opportunities to prove that they are not really "collaborationist" and have only temporised with the Germans for the good of their country. The position is different in Denmark where the Germans have at no stage relied on a quisling movement, and in France, where Vichy is not as discredited as neighbouring quisling movements, and there has been no split in the collaborationist ranks. On the contrary, the extremist, Deat, has joined Laval's government. Yet here, too, the disintegration is rapid. Laval had recently to admit that the Gendarmerie could not be trusted in the event of an invasion.

Between the quislings and the active resisters lie the passive mass of the people. There is no doubt that, though their chief concern is simply to live, in itself a full-time occupation, their sympathies are pro-Allied and their hatred of Germany is intense. In the last year, however, they have been influenced by bombing, and there is a good deal of evidence to suggest that the destruction of life and property has weakened somewhat the people's sympathy for Britain and America. This tendency appears to be very marked among the active resistance movements. It is the inevitable result of their long vigil, and will disappear when the real day dawns at last. But it will leave a critical flavour in their attitude towards the Allies, with which G5 must reckon, especially since it is coupled with an intense desire to control their own contribution to the war effort. Resisters of four years' standing feel that they are the veterans of the struggle against Germany, and are prepared to resent any "talking down" or any patronising on the Allied side. The Germans and the quislings have done all they can to encourage this state of mind. Henriot, the Vichy Minister of Information, recently described the invasion in these terms:

Should the landing take place, the occupied territories

would be administered by a British general, assisted by a US officer: that is the liberation.

In France, this fear of dictation is very strong. Unhappily, Britain and America have done little to reassure their Allies. The refusal to give the status of a provisional Government to the French National Committee at Algiers and the cypher difficulty appear to have given rise to very sinister rumours inside France. The decision to exclude French war correspondents—and all other Allied correspondents, except the Russians—from the Second Front may yet be rescinded. Even so, it is an almost unbelievable psychological blunder.

This growth of a critical attitude towards the policy of Great Britain and the United States is probably the most significant change in the attitude of the resistance movements. There are others. All show a slight tendency to divide. With victory in sight, their differences are beginning to break through the old unity of resisting the Germans. This fact has complicated the always difficult problem of securing any sort of unified control inside the country. Local leadership tends to be strong, centralised direction weak. This is especially true in Norway. Finally, the degree of contact between the resistance movements and their governments abroad varies greatly.

This, then, is a general and very inadequate review of the political and psychological conditions awaiting G5 in Europe. The aim of their activities is obvious—to prevent any interference with the smooth working of the military machine and to avoid if possible any decisions which might prejudice the final right of the liberated people to choose their own forms of government. The problems which await the officials of G5 will all have a local and specific context. It is therefore difficult to generalise over the kind of decisions they ought to take. Yet it is possible to lay down some broad principles. The first and most important is to treat the liberated peoples as allies, to accept them as fellow-fighters and to avoid at all costs the impression that liberation means what the Germans say it means—occupation by another foreign Power. The wave of enthusiasm for the Allies will be tremendous. For a time it will sweep away all reservations, but the hesitations will return if there is any hint that the British and Americans have arrived to "run the show" and mean to exclude the people from the management of their own affairs. It may seem an obvious point, but too much has been done already to make the peoples of Europe—particularly the French—feel that they count for too little. It is, therefore, essential that G5 should be thought of as the most ephemeral institution the Allies can contrive to make it. Amgot lasted a few months. In any one locality, the Civil Affairs Division should last at the most a few weeks and, better still, a few days. The moment the local authorities can function, G5 must disappear. There is no other way of restoring self-confidence and securing the maximum co-operation and support.

Since this is the first necessity, the choice of the right

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

local people becomes G5's central problem. Admittedly, some mistakes will be made, for the confusion will be very great, yet it is possible, once again, to establish some general principles. There can be no parleying with proved collaborationists. No matter what appeal they may make to the soldier's instinct for law and order, the local quislings must be arrested and held for trial. Unless some promise of justice is held out to the people, they will relapse into apathy, which is bad, or they will take justice into their own hands, which is worse. But there must be no general indictment of every citizen and every official who has not actively proved himself a hero. The great mass of the people have simply survived. They cannot be blamed or penalised. The Dutch Government has already made a very sensible statement on these lines, reserving punishment only for proved collaborators, and offering an amnesty to the average unheroic man and woman.

The most difficult task will be the positive choice of administrators. Three groups are concerned, the active resisters, the representatives of the government abroad, and the ordinary people. If the system is to function, officials must be drawn from all three groups. The task of G5 will be to persuade them to work together. The resisters may not always see the value and the claim of the government representatives. The government representa-

tives may claim an authority which the local people are not prepared to accord to them. The secret lies in persuading each to accept the usefulness of the other's contribution and to recognise to the fullest extent the provisional nature of their own authority and the extent to which they hold it on trust for the people.

The real factor—both for G5 and for the local national administration—is their provisional status. If the emergency is used either by the Allied military authorities or by the governments or the resistance movements to jockey for position and to attempt to perpetuate their power, then the outlook for peace behind the lines and co-operation after victory is slight indeed. The British and the Americans can give the example of self-effacement by securing from the very first hour the full co-operation of their allies, and they can try by tact and persuasion to secure a co-operative and generous attitude among the liberated peoples themselves. But, in the last analysis, in this, as in the immediate tasks of invasion, the British and Americans must trust their allies. Democracy, free government, the rule of law will be reborn in Western Europe if the peoples of Western Europe so desire. The Allies can frustrate freedom by wrong decisions, by exciting distrust and xenophobia, by bungling. This, at all costs, they should avoid. But they cannot destroy freedom if the will to it is there.

## Restraint of Trade

THERE are many economists who believe, with good reason but not a great deal of actual evidence, that the restraint of output by restrictive and monopolistic practices before the war caused a greater curtailment of national income than unemployment itself. The Government, it is now forecast, is to make the control of monopoly an important, but not very satisfactory, part of its proposals for achieving the highest possible employment of national resources. Yet Government spokesmen, when approached about the desirability of an official factual enquiry into the extent of monopoly and the restraint of output and trade before the war, have replied that such a proposal would be a delay, and would not help. The view of Dr Dalton, who is said to be primarily responsible for the anti-monopoly proposals of the coming White Paper on full employment, is that the demand for an enquiry would merely postpone remedial action. In other words, the official view is that sufficient is known about monopolistic and restrictive practices to make preventive legislation possible forthwith. The trouble is that the legislation proposed is not likely, in fact, to be preventive; and that, in spite of official optimism, it would not be effective, even if it were preventive, because of the prevailing ignorance of the precise facts.

In general, restraints upon the use of national resources for the efficient production of goods and services are grave offences against the national wealth and well-being. But it is doubtful whether sufficient is yet known about the restrictive practices of manufacturers and traders to make a completely watertight programme of punitive measures and regulations immediately practicable. It would be easy—indeed, it is essential—to draw up an anti-monopoly programme that would make the fixing of maximum prices, the restriction of output, the restraint of trade or the limitation of entry into a trade, punishable offences, unless they had been specifically licensed after full consideration of the national interest. Unfortunately, from all reports, the Government is not willing to go anything like as far as this, even in general principle. But, even if these necessary steps were taken, it would still be very difficult, on the present knowledge of what goes on in industry and trade, to decide upon the range of organisations, practices and agreements to which this legislation would have to apply. It is for this purpose that considerably more information is required. The present danger is that any anti-monopoly laws, effective or ineffective, may so easily be directed against the shadow

rather than the substance of restriction; that price fixing and the rest might be prevented in the conduct of formal trade associations and legal trade agreements, while actual cartels and combinations in restraint of trade continued to exist on the unrecognised fringe. Moreover, even in the interests of those who contend that the extent of restrictive practices has been much exaggerated, it is only fair that the true facts should be collected and made known.

This point is well illustrated by the most recent publication of Political and Economic Planning, which in its examination of the structure and techniques of legally constituted trade associations, finds the questions of monopoly and restriction singularly elusive. This pamphlet expresses the view that trade associations—"non-profit making associations of financially sovereign business enterprises formed to protect and advance the trading interests of their members"—have increased five-fold in number since the Committee on Trusts reported in 1919. But these associations are, according to this account, in themselves largely innocuous. Their expressed policy is simply to pursue the interests of their members; their membership is usually voluntary; their purpose, according to the terms of their association, is merely to secure co-operation between firm and firm and between capital and labour, and to advance efficiency in technique. All these characteristics are unexceptionable and exemplary. It has never been denied by any reasonable critic of trade combinations that associations of this kind can do very much good in achieving better methods of manufacturing and distribution, and in carrying through joint schemes of research.

The authors of this enquiry frankly admit that the net which they have cast has failed almost entirely to catch the kind of association and agreement for which they were seeking. The fact is that restrictive combinations are what they do, not what they are, nominally, at law. This is why much closer and more authoritative scrutiny is needed. There is one striking contrast in the findings of this enquiry which gives clear proof of the need for an objective investigation of the facts of the case and for the examination of witnesses on oath. On the one hand, PEP's sample enquiry deals almost exclusively with registered companies, which by definition leaves out most of the combinations that in fact operate agreements to hold up prices or hold down output. These are, on the face of it, bodies which are genuinely and usefully con-

cerned with matters of trade technique, with the pooling of information, the settlement of disputes, the standardisation of products and the development of good relations with the Government on the one side and the public on the other—all estimable purposes in themselves. On the other hand, the investigators have collated considerable scattered evidence of other habits and objectives among organised manufacturers and traders and write, with some regret, that

it is of course not possible to give any existing indication of the quantitative importance of price regulation.

In other words, it is well known that, in addition to the formal activities of trade associations, many of which are most useful for the expansion of output and sales, there is a penumbra of informal understandings directed towards quite different purposes. It is pointed out, for instance, in the PEP pamphlet, that, in the rubber, glass, gas and electrical industries, while there is no compulsory price control among the members of the respective trade associations, there are agreements which effectively enforce minimum prices over a wide range of production and trade. In many vital materials and components there is a system of rebates, tied contracts and resale price maintenance agreements which determines the prices paid by consumers. This is as true of heavy steel making as it is of books and radio equipment. Moreover, there are agreements for the restriction of sales or output in industries ranging as widely as tinplate, steel sheet and wire, engineering and many chemicals. Finally, in retail trade itself, where the remaining number of independent traders is largest, there is virtual control through these and similar means by trade associations such as the Proprietary Articles Trade Association, the Motor Trade Association and the embryonic Hardware Trade Association. By means of boycotts, price lists, black lists, stop lists and the like, the price and quantity

of a majority of goods and materials are—according to the suggestion of the scanty evidence so far available—controlled in the interests either of producers or of an alliance between producers and distributors. It is obviously of enormous importance that the evidence should cease to be scanty, and that its sifting should not be left exclusively to the zeal and insufficient resources of even such competent private investigators as, say, Dr Hermann Levy (retail trade) and Mr D. L. Burn (steel-making). It is obviously in the highest public interest that a investigation should at once be set on foot, not simply to examine the formal constitutions of trade associations, but to find out what in fact association of manufacturers and distributors are doing by agreements of varying formality and by practices of varying degrees of tyranny. It was reported thirteen years ago by the Committee on Restraint of Trade that

the imposition of conditions upon retailers and wholesalers regarding the resale price to be charged is a widespread and growing practice among manufacturers.

It was asserted that the method of enforcement was normally that of boycott, by one means or another. Plainly this charge requires the most careful documentation with reference to the latest evidence, which can only be collected with official power to require disclosure.

If the Government could, after all, be persuaded to set its face against the bolstering of prices, the restraint of output or trade and the restriction of entry, this would be a most important step forward. But it would still miss its mark if the facts of the case were not fully known. It would be a sad dissipation of good intentions if, sooner or later, a code of legislation against monopoly and restrictive practices were to be laid down without sufficient knowledge of the actual evils that have to be combated to make the programme good in fact.

## NOTES OF THE WEEK

### The Italian Overture

The Germans have acknowledged both the rupture of the Gustav Line and the evacuation of Cassino. The fall of the latter, the site of so many massive attacks and so dogged a defence, is symbolical of the strong probability that General Alexander's tremendous overture to even bigger events elsewhere may have broken the spell which has brooded for so long upon the Italian military scene, with its harsh terrain, its bitter clashes, and its several disappointments. Symbol of the uprising of all Europe is the new fame won in this fighting by Frenchmen and Poles. The enemy is under no illusions about this so-called "sideshow." He has stout positions to retire to, and a belt of fortresses, natural and made, to defend; and there is a long way yet for the advancing Allies to go. But, in weight of metal these are major battles in a major campaign. What the ultimate objective may be, beyond Rome, to the north, north-west or north-east, the Germans cannot make out; and as they go back, tenaciously fighting, they look over their right shoulder to the Anzio beach-head and, far away, to the hosts gathered here in Britain, and over the left shoulder to the mighty Russian array in the east.

\* \* \*

### Poles and Russians

A fresh diplomatic attempt to break the Polish-Soviet deadlock has apparently been made by the Americans. The Polish Government is reported to have received informal proposals for a solution that might be acceptable to the Russians. Obviously the value of those proposals depends upon whether the Russians will be ready to put them forward formally and officially. If they are, then—provided the Poles can accept the proposals—a solution may be in sight. The proposals are reported to envisage the return of Lwow to the Poles, and possibly also Vilna or parts of the Vilna area. This would represent an advance on the "Curzon line" proposals of last January—though it was then reported that, given "goodwill" on the part of the Poles, a concession

in the case of Lwow might be "considered." In exchange for these territorial concessions, the Russians are said to demand the inclusion of representatives of the Russian-sponsored Union of Polish Patriots in the present Polish Coalition Government in London, and the unification of the Polish armed forces in Great Britain, Russia, Italy and the Middle East, under one collective High Command. Opposition to the inclusion of the Polish Patriots in the Government is extremely strong among the Poles. During the two decades of Polish independence the Communist Party was illegal in Poland. It was politically beyond the pale, both as a revolutionary organisation and as an agency of a foreign power. The Union of Patriots is a body much "broader" than the Communist Party. It propagates no revolutionary doctrine; but in the eyes of the Poles it is still a foreign agency. The fact that it is regarded as the instrument of a neighbouring Power makes it even harder for these Poles to accept its presence in the Government than it was, say, for Badoglio to bring in the Communists into his Government. The same sentiments apply, though to a lesser extent, to the Polish army in Russia. But it is doubtful, to say the least, whether the Poles in Britain and the United States are either right or wise to wage the present campaign of abuse and denigration against this Polish Army in Russia. Whatever its origins, this "other army" has become a factor in Poland's political life, largely through the faults of Polish policy. Most important perhaps, it is shedding its blood in the fight against the German invader. A unification of the Polish Armies would seem to be a reasonable step. Similarly, even the objections to the inclusion of the Union of Patriots in the Polish Government, in which they would in any case form a small minority, might perhaps be waived—provided that the territorial concessions are real and that, in their desire to secure Poland's friendship, the Russians are satisfied with "good neighbourly" influence and abstain from interference in internal Polish affairs. These are, admittedly, two big provisos. So far the "style" of Russian diplomacy has not persuaded the Poles that the risk is a reasonable one to take.

### The Polish Crisis

The new Soviet proposals for a settlement with Poland have coincided with an internal crisis in the Polish Government in London. For a fortnight the Polish National Council has been discussing a motion—tabled by the Socialists—of non-confidence in General Kukiel, the Minister of War. The immediate occasion of this was the recent happenings with Ukrainians and Jews in the Polish Army. But a deeper reason is the constant tension between M. Mikolajczyk's administration and the Army leaders. This tension has also been reflected in another Socialist motion which demands the separation of the post of Commander-in-Chief from that of President-Designate of Poland—both posts are at present held by General Sosnkowski. The motion of non-confidence in General Kukiel does not seem to have much chance of being passed by the National Council, because opinion as to responsibility for the political troubles in the Army is divided. The Socialists insist on the formal responsibility of the Minister of War, General Kukiel, whereas the Peasants and the Christian Democrats attribute it to the Commander-in-Chief, General Sosnkowski. As the various groups find it difficult to agree where the blame lies, probably neither general will be brought to account. The motion which demands the removal of General Sosnkowski from the post of President-Designate has been passed unanimously, but the appointment of his successor is a prerogative of the Polish President, whom the Polish Constitution has invested with the powers of an absolute monarch. It remains to be seen whether the Polish President will accept the verdict of the Parliament in exile. The evolution of the present crisis, though it has arisen over internal issues, will one way or another affect also Poland's foreign policy. The two generals criticised by the National Council are precisely the two personalities against whose activities the Russians have raised the strongest objections. General Sosnkowski's reputation of being anti-Russian is well known. General Kukiel, a historian rather than a militarist, and belonging to the supporters of the late General Sikorski, very unwisely put his signature to the Polish appeal to the Red Cross in the matter of the Katyn murders, and so he, too, has incurred Russian wrath.

### To Heel?

The crisis in the Labour Party is temporarily over. On Tuesday a joint meeting of the National Executive of the Labour Party and the Administrative Committee of the Parliamentary Labour Party passed a resolution deploring Mr Aneurin Bevan's repeated acts of indiscipline and calling upon him, on pain of expulsion from the Party, to give a written promise that in future he will obey its standing orders. There are two interpretations of this edict, which was unexpectedly severe in tone. One is that Mr Bevan is merely being asked to confirm in writing the assurance that he gave verbally last week at the meeting of the Parliamentary Party, when Mr Shinwell's motion to refer the matter to a joint conference with the National Executive was carried against the wishes of the Administrative Committee. In this interpretation, which on the face of it has much excuse, it was primarily the business of the joint meeting to settle the matter of party discipline, if possible without expulsions. According to the other interpretation, however, this threatening resolution offends against the spirit, if not the letter, of Mr Shinwell's motion, which was definitely worded to deprecate any question of expulsion. What has happened, in this view, is that the Administrative Committee, baulked of its prey by the fact that, last week, the Parliamentary Party did not even discuss the motion to expel Mr Bevan, has now returned to the hunt—emboldened, so it is suggested, by the fact that the Whitsun Labour Conference has been cancelled to spare Second Front transport. The Conference would have been the final court of appeal, and there was the possibility of the election of an appreciably more Bevan-disposed Executive. As it was, the Administrative Committee could press its case against Mr Bevan without the immediate prospect of an open split in the Party as a whole—though if Mr Bevan had stood fast and taken with him the fifteen MPs who voted with him on the amendment against Regulation 1A(a) which precipitated the crisis, the consequences would have been no less serious in the long run. The easiest way out, of course, was for Mr Bevan to sign on the dotted line, which he did on Wednesday. It was, after all, a question of whether he wished to stay a member of the party as it is or not—and apparently he does. It would be very unwise for the Administrative

Committee to assume that they have heard the last of this affair; standing orders can be tricky things.

### Parliament and the Executive

A notable example of the healthy working of the Parliamentary method, even in wartime, was given on Wednesday when the Home Secretary announced the Government's agreement, in principle, to the setting-up of a Select Committee to scrutinise the statutory Rules and Orders made by the Executive in the process of delegated legislation. A year ago both Parliament and the Government were in the wrong in this important matter. On the one hand, the Parliamentary critics of delegated legislation, then drawn mainly from a single group on the Conservative back benches, seemed more anxious to get rid of the practice altogether—an entirely impossible task—than to check or scrutinise it more effectively. On the other, Mr Morrison on behalf of the Government was then unwilling even to consider the establishment of any scrutinising committee that might delay or impede the business of government. Now greater common sense has prevailed on both sides, and the Conservative "agitators," to whom the Tory Reformers and many Liberals have added their aid, are to be congratulated on both their success and their moderation. The experiment is to be made of trying to combine more effective Parliamentary vigilance with the administrative expedition and efficiency that make the granting of these powers to Ministers quite essential in modern conditions. Without a very large amount of delegated legislation the King's Government could not be carried on. Four or five major Bills are about all that Parliament can get through in a session even in peacetime, and many matters are too technical for Parliament to deal with in detail. It is essential, as the Government has contended, that nothing should be done to lessen that power to act which, backed by a majority in the Commons, is the leading mark of the British system of Parliamentary and Cabinet government. It is no less essential, however, that nothing practicable should be left undone to enable Parliament to speak its mind on the way in which this power is used.

### Security and Politics

No voice of importance has been raised against the cancellation of Whitsuntide, and Summer conferences because of the further need to cut down rail traffic in view of coming military events. This is, no doubt, as it should be. There is no sacrifice that the people of this country would not make in order to speed and assure the success of the Second Front, and this particular deprivation is not in itself considerable. Some, who were not to have shared in the junketings, will even welcome the scratching of a dreary annual procession. On the other hand, the political implication of this security measure has no doubt been carefully weighed. By a coincidence the Labour Party Conference has been put off at a moment which is most fortunate for the present leaders of the Party, and it is hard to escape entirely the suspicion that an additional argument for its cancellation was the undesirability of heated controversy at this critical time. A feature of the war so far has been the continued freedom of discussion and criticism, and it should at least be reckoned a disadvantage that it should now prove necessary to restrict, even in the slightest, the public exercise of this freedom. This may not be the last measure tending in this direction. There is, for instance, a strong view—and in *The Economist's* opinion, a pernicious view—among certain of our more important Allies that any discussion of the political implications of the arrangements which are now being made for the liberation of Europe, the occupation of enemy territory and the re-establishment of peace should be treated as matters of military security. It would be vastly unfortunate if, in the long and bitter hour of victory, we were to have to accept limitations upon essential democratic processes which, even in the worst hours of possible defeat, nevertheless remained intact. Moreover, it is obviously not wise to keep plans and projects a secret from the very people who later on will be expected to carry them out.

### Teachers for the Services

The pre-war period of training for teachers was two years or, for graduates, one year after graduation. The McNair Committee has proposed, on very good grounds,

that the duration of training should be raised to three years, with one-year courses for graduates or for others with previous qualifying experience. This week the Board of Education has published its own plan, worked out in discussions with local education authorities, teachers' associations and training colleges, for the emergency recruitment and training of teachers, to fill the post-war gap before the McNair scheme (or some other similar scheme) can be put into practice. There are to be many emergency training centres, in urban areas and associated with existing universities and colleges. They are to be staffed with an existing combination, both full-time and part-time, of seconded lecturers, teachers and qualified persons from other occupations. The period of training proposed is one year, half the present duration and only one-third of the normal course recommended by the McNair Committee. It is doubtful, however, whether—even apart from the urgency of the demand, which is decisive—the McNair Committee would demur from this proposal for brief intensive training; certainly they will approve the spending of one entire term of the four in continuous teaching practice at a school. The recipients of the training will be mature students from the Forces or other forms of national service. They will be precisely of the kind for whom the McNair Committee proposed special short courses in order to widen the range of choice for teaching personnel beyond merely the products of secondary schools. Moreover, it is definitely laid down in the Board's proposals that the one-year course should be supplemented by a two-year part-time course of study, in order to place these teachers on a par with their colleagues both in status and in eligibility for promotion.

### The Educational Dilemma

Both in the short run emergency period and in the longer term, it will be a great gain to teaching that a leaven of men and women with maturer experience and more varied qualifications than most schoolchildren should be introduced. But it would be disingenuous to ignore the fact that the prime reason for this wide recruitment is sheer shortage of teachers. The authorities are conscious of the dilemma in which they may find themselves. On the one hand, there is an over-riding need for more teachers. Local education authorities and the governing bodies of secondary schools have been urged to draw the possibilities of teaching as a profession to the attention of all pupils and to encourage, by this means and by maintenance grants, the continuance of schooling with training to teach in mind. On the other hand the authorities are equally aware of the dangers of "dilution," of the output of very large numbers of inferior teachers. Perhaps the most important educational problem of the near future—apart from the subjects which are to be taught in post-war schools which has still not been settled—is which of these will prevail: the disadvantages of mass production or the advantages of recruitment from a new and broader field?

### Training for Public Service

Some attempt to tackle the problems of improving the efficiency and adaptability of the public servant has been made in the recently published Report of the Ascheton Committee on the Training of Civil Servants. The Committee has been well aware of the many criticisms levelled at the Civil Service, but it has been equally aware of the limitations imposed by its terms of reference.

Our terms of reference restrict us to the question of training. Training cannot, however, be considered in isolation; it involves consideration of such matters as recruitment, allocation, probation, transfer and promotion.

The Civil Service must not only train its members in the best possible way, but must also get the best possible people to train in the first place. Having got them, it needs to revise the machinery which puts them in positions where they are most suited and most valuable. And it needs to overhaul the nature and methods of their work. Ultimately, these matters are of far greater importance than the methods of training. As a first step, however, the Committee proposes that general control over training, which should form part of a planned scheme for each Department, should be entrusted to the Treasury, as the central Department on all Civil Service questions. The report proposes that departmental training officers should be carefully selected, to supervise the instruction of new entrants and

the extension of background and vocational training to those already in the public service. The Government should arrange for free compulsory part-time education of all Civil Servants up to the age of 18 as soon as possible after the war. In addition to fairly detailed proposals for the clerical and executive grades, the Committee has suggestions for broadening the outlook of members of the administrative grade. Sabbatical leave for research and study, opportunity to study specific aspects of Government administration abroad, and two-way exchanges with local government should all add to the interest and scope of the public service. The Committee do not recommend a national administrative staff college, and feel that the training it would provide would be better organised within the Civil Service itself. Nor do they believe that it would be practicable to second Civil Servants to commerce and industry. Clearly, such temporary transfers would present innumerable difficulties. Their purpose would be far better served if the process were reversed, and the Civil Servant recruited from the ranks of industry rather than given the responsibility and then asked to absorb the necessary technical knowledge by a temporary transplantation into alien corn.

### The BMA and the White Paper

There will be disappointment at the report of the Council of the British Medical Association on the health services White Paper, which is submitted for the consideration of the profession. Only too clearly does it seem that what happened in 1911 is to happen again. Criticism from the doctors about a service for the success of which they will be mainly responsible is natural and welcome and has been invited by the Government. But criticism of the sort expressed in this draft statement of policy is not likely to do anything but intensify the differences between those in favour of a whole-time state service and the extreme individualists, and drive the moderates into one or other of the opposing camps. It is true that the Council's report contains what it calls "some positive proposals" for the implementation of the general principles of the White Paper, and that some of the details of these proposals are constructive and tenable. Its criticism of the White Paper's proposed joint authorities, for instance, is justifiable, and its suggestions for making the central advisory council more independent are sound. But the "positive proposals" are prefaced by "some general considerations" and "some criticisms," which can only be described as an attack on the whole of the White Paper's scheme. Its two main objections on specific proposals are to the powers to be granted to the Central Medical Board, particularly to the power of requiring a doctor intending to take up public practice in any area to obtain in advance the Board's approval, and, secondly, to the policy adopted towards the voluntary hospitals. On both these points there is certainly room for a great deal of discussion before legislation should be formulated. But the BMA's report seems to be using these and other controversial points in the White Paper to turn down any form of planned health service—other than its own. It declares itself opposed to any service which would be available and free to all, irrespective of means. It proposes instead that the service should only be available to those who need it. Since the Government is not thrusting the national health service down everybody's throat but is putting it in precisely the same position as education, with private practice and the voluntary hospitals taking the place of the public schools, this proposal of the BMA Council is tendentious in the extreme.

### Von Papen's Secret Weapon

The Germans have naturally protested at the Turkish ban on chrome exports, and are demanding the repayment of the balance of their chrome credits; but it is possible that their retaliation is taking a deadlier shape. In the last week, the Turkish Government has been very alarmed by mass demonstrations, largely drawn from Ankara University and led by a group of professors. The students took to the streets, demanding the resignation of the Government, the setting up of a totalitarian regime and the adoption of extreme racist policies—discrimination against all non-Moslem and non-Turkish minorities and the recovery for Turkey of the Turanian diaspora—in other words, the provinces of Soviet Russia inhabited by people of Turkish race. The demonstrations have been countered by mass

arrests. The Turkish Government is obviously much perturbed—and with good reason. The continuance of the Turkish experiment of benevolent autocracy depends upon its ability to keep a middle road between the rival totalitarianisms, and although a mass demonstration from the university may not seem very formidable, it must be remembered that the politically effective groups in Turkey are very small, and that after the army the universities probably provide the largest educated and self-conscious grouping in the country. Above all, to raise the question of the Turanian lands is dynamite to the delicate balance of Turkish-Soviet relations. Yet the Turkish Government has to some extent brought these troubles on itself. The laws of 1943 which expropriated a large section of the foreign community in Turkey, gave a vivid example of effective racialism; while the continuance of friendly relations with Germany has given a position of power and prestige for Von Papen which he has, very naturally, abused.

### Russia and the Vatican

At a press conference in Chicago, on his return from Russia, Father Orlemanski reported that he had asked Marshal Stalin two questions, to which Marshal Stalin had replied, giving Father Orlemanski, in a signed statement, complete freedom to publish the questions if he thought fit. To the first question:

Do you think it admissible for the Soviet Government to pursue a policy of persecution and coercion with regard to the Roman Catholic Church?

Marshal Stalin replied:

As an advocate of freedom of conscience and of worship, I consider such a policy to be inadmissible and precluded.

To the second question:

Do you think that co-operation with the Pope in the struggle against the coercion and persecution of the Roman Catholic Church is possible?

Marshal Stalin said:

I think it is possible.

The fact that the local bishop and the Apostolic Delegate suspended Father Orlemanski from his priestly functions was widely interpreted as a Vatican rebuff to Stalin's peace offer. Now, however, the suspension has been raised. Yet it is obvious that the Vatican would not accept a gesture of reconciliation made, from the Catholic point of view, in so indirect and tortuous a manner. It is only a few weeks since the Russian Patriarch (who has since died) was attacking the position of the Vatican in the *Moscow Church Bulletin*. The Church authorities may be excused if they doubt whether the new line of reconciliation is likely to be sustained. However, it should not be thought that doubts about the sincerity of Marshal Stalin would deter the Catholic Church from reaching an agreement, if the interests of the Soviet State and its own interests could be reconciled. The reason why the Orlemanski gesture has met with this rebuff is first of all because of the unofficial and unrepresentative character of the intermediary so naively chosen by Marshal Stalin, and, secondly, because the Vatican is very doubtful whether the interests of Russia and the Church can be reconciled. This is primarily a question of the Polish dispute. The Vatican would do nothing at this moment to weaken the authority of the Polish Government.

### Civil Air Transport

One of the most useful and lively of recent House of Lords debates was held last week on the Government's policy for civil aviation. The occasion was the signal for Lord Beaverbrook to make clear the nature and results of his discussions with Mr Adolph Berle. It was as well that the statement should come now rather than later, since it has revealed certain misunderstandings which were current in the United States. The sooner these are resolved before the impending international conference the better. Particular objection appears to have been taken to two of Lord Beaverbrook's assertions—that the United States had agreed to grant the "four freedoms of the air" to foreign aircraft, and that the right of cabotage—that is, the right of a country to reserve to itself its internal traffic—had been extended, by agreement, to traffic between a country and its dependent colonies. It would seem to be fair to conjecture that wishful thinking has had something to do with the interpretation given by some Senators to Mr

Berle's testimony. It seems unlikely, to say the least, that he could have concealed the fact that the right of colonial cabotage has been accepted by both parties. The whole affair reveals all too clearly how much ground has still to be covered before American opinion accepts the fact that American aviation cannot expect more privileges in foreign territories than will be conceded to foreign aircraft in the United States.

As for the vexed and familiar question of an international authority, a compromise between the American and Canadian ideas of its functions was found in the outline agreement reached during the Commonwealth conversations of November, 1943. The American approach was too narrow, suggesting only a non-executive technical authority with no power to enforce its regulations, the Canadian too rigid, giving power to the international authority to allocate national quotas of participation and to regulate the frequency of services. The Commonwealth programme, on the other hand, is really too vague to be completely satisfactory. Its very "flexibility," which made it an acceptable basis of Anglo-American agreement, also lays it open to widely different interpretations. It is clear that there is still a great deal of work to be done before there is complete agreement. But it is also clear that some general principles are beginning to emerge. For example, it is apparently agreed that an international authority, part technical, part regulatory, should seek to eliminate uneconomic competition and uncontrolled subsidies, should work out for each nation an equitable part in world air transport, and should maintain broad equilibrium between transport services and traffic on offer. The basic principle for operation is neither internationalisation nor any of the usual meanings of the "freedom of the air" (Lord Beaverbrook's four freedoms were apparently a rhetorical flourish), but the right of innocent passage, subject to a minimum of control. This may not be all that has been hoped for, but it is at least an improvement on the 1930's.

### Air-Borne

There are three views about the request of both the railway and shipping companies for the opportunity to run air lines after the war. The most natural reaction is to ask "Why not?" Neither the railways nor the shippers ask for either subsidies or a monopoly of routes, and their request is, in fact, in the form of a challenge—"Give us the chance and see what we can do." The other two views are more cautious. They are also contradictory. One says that these older forms of transport, in fact, want to stifle air travel and traffic as the railways once stifled the canals. The other says that their object is to skim off the profitable cream of the business, leaving the rest to be borne on public funds. Unless the Government's policy is to plan and run all air lines, internal and external, these arguments are not convincing. If there is competition it will not be possible for particular railway or shipping companies either to stifle air transport or to skim off the cream of profitable business. In fact, on the face of it, this request for opportunities to fly represents enterprise, and should not be prejudged unfavourably. The real obstacle is the supply of aircraft. What will these, or any other, companies fly with? And, for some time after the war, whether it is home-made or American-made machines that are in question, the Government will be compelled to allocate and apportion them where they will be most needed on national grounds.

### The Cost of Planning

The latest news of the Government's preparations to produce a policy for the planning of land use does not bear out recent optimistic reports. It is still the intention of the Government to bring before Parliament both a Bill to give powers to rebuild bombed areas and a White Paper stating its views on the wider questions of land planning, including industrial location, decentralisation and compensation. But both the Bill and the White Paper have been held up, the former by the not unnatural insistence of the local authorities (afraid that 1944 values might make local rebuilding prohibitively expensive) that the price of the land to be publicly bought for reconstruction should be pegged, as promised, at the 1939 level, and the latter by the persistent inability of the Cabinet to make up its mind. In

the latter as well as the former case finance is a crucial factor, for the chief obstacle now to an agreed scheme for compensating the owners of land reduced in value by planning is the failure to find a price that appears both fair to the landowners and reasonable to the Treasury. So the planning programme limps along. Either both Bill and White Paper will be further delayed, it is reported, or even when the Bill does emerge, the White Paper will still not be ready—which would mean that all the really important planning legislation, and the plans, will be indefinitely held up.

### Labour on Employment

It is difficult to express a single opinion on the Labour Party's report on "Full Employment and Financial Policy." On the one hand, it has a number of good points and is certainly a great improvement on previous documents of the sort from the same source. There is no attempt to hold that unemployment would automatically disappear after a few doses of nationalisation. There is a most welcome insistence on the necessity for raising the level of production to the maximum—a change since the days when the Labour Party thought that the problem of production had been solved and that the chief purpose of employment policy should be to make an equitable distribution of leisure. There are some sensible paragraphs about the location of industry. On the other hand, there is much that is calculated to hinder rather than to help the development of an effective policy. A certain amount of party fustian is perhaps to be expected, and even perhaps to be excused, in such a document, and it may be wrong to take offence at the suggestion that everything the Labour Party (which presided over the Great Depression) has ever done was right, and everything that everybody else has ever done was sinister or stupid. A becoming humility is not to be expected of a political party; but this attitude will be the ruin of employment policy if it is persisted in. The Labour Party admits in one place that the modernisation of "the machinery of every industry" should be one of the objects of policy, and in another place that "increased expenditure on development can take place either in the public or in the private sector of the national economy," but the only treatment it prescribes for the private sector is an apparatus of controls that are apparently expected to be restrictive, if not punitive. The Labour Party is still prescribing for a dream world, not for the Britain of 1944 or 1954.

Apart from these comments on the politics of the report, there are some criticisms of its economics. According to the Labour Party, the whole problem is a purely financial one.

Blame for unemployment lies much more with finance than with industry. Mass unemployment is never the fault of the workers; often it is not the fault of the employers. All widespread trade depressions in modern times have financial causes.

This is simply untrue. And not only is it untrue, it is mischievous. For what conclusion will be drawn from it? That there is some monetary magic (iniquitously monopolised by the bankers) that can put everything right, and that no effort of mind or body is required from anybody else. And what will some future Labour Chancellor of the Exchequer make of the statement that

We should give people more money, and not less, to spend. If need be, we should borrow to cover public expenditure.

The cranks have captured the Labour Party with a vengeance. The second criticism is that the Party, as always, is obsessed by institutions and their powers and ignores their policies. It affects to believe that changing the brass plate at the entrance will alter the way in which an institution acts. Thus, in the present report there is a great deal about the exercise of control by the state over the

Bank of England and the joint stock banks, but hardly a word about the different way in which they are expected to behave. This attitude reaches sublimity with the paragraph devoted to the International Development Board.

It would be the business of this body to use the immense industrial resources of the wealthier parts of the earth to raise the productivity and purchasing power of the thousand million human beings who live in China, India and Africa, and who are at present without the elementary means of subsistence. Foreign lending has been accompanied by great evils in the past. But the time has come to destroy these evils by international control and at the same time to create a great instrument of human progress.

Magnificent, but what does it mean? And how can it be done? On these matters, the Labour Party is silent.

### The Philadelphia Charter

The ILO Conference at Philadelphia has crowned its discussions by framing and adopting a Charter that goes farther than any previous international document in recognising the rights of Labour and underlining the need to raise the status and prosperity of the working man. It is mainly concerned with such matters as the Right of Association, free Trade Unionism, welfare and social security, but it also launches out into the wider and more ambitious field of full employment. A motion was passed recommending representatives of the Governments of the United Nations to confer with the ILO as soon as possible to draw up plans for world-wide full employment. The British delegates abstained from voting on this motion and their hesitation was probably one of the reasons why some criticism has been directed against the British delegation for "obstructing the Conference" and preventing delicate questions from being pushed to a decision. The criticism is an unfair one, for the record of the British in social security, labour relations and the elaboration of full employment policies is well ahead of any other state represented at the Conference. Idealism apart, it is not in Britain's interest to see other countries keep down their labour costs by restricting the rights of labour. But the British delegation seemed to have realised more clearly than any other that the ILO is not an executive body, cannot bind Governments and, indeed, may be doing itself harm by launching out so ambitiously into the realms of general economic problems. In the past, the ILO has been effective because its sphere of action has been circumscribed and its activities mainly advisory. It is more likely to secure lasting influence by specialising on questions of labour policy and labour-management relations than if it undertakes to discuss problems which go to the roots of economic sovereignty—which questions of full employment obviously do.

### A Caribbean University

Probably the greatest single evil in the West Indies is the illiteracy of the population, which blocks progress towards self-government and is a formidable obstacle in the way of all schemes of development and welfare. In the face of this illiteracy, the proposal of a committee appointed by the Commission on Higher Education in the Colonies that a university should be set up to serve the West Indies area seems, at first sight, to be beginning at the wrong end. As the Stockdale Report on development and welfare in the islands pointed out (Colonial No. 184), what is primarily wanted is more teachers for elementary schools. To provide a 90 per cent attendance of children aged 6-15 in classes of 40, the report estimates that 17,580 teachers are required, whereas there are at present no more than 8,500, including pupil-teachers, quite apart from the deficiencies in buildings and equipment. To obtain the needed teachers in elementary schools means more secondary schools from which they could be recruited, and this again involves more staff—with qualifications which the islands' resources can ill afford to recompense adequately, with the result that in some schools there is only one university graduate. Against this background, the proposed university, which would only cater for 500 students in residence, with an annual recruitment of 120—for all faculties—hardly seems to touch the main educational problems of the area. Yet there is both a short-term and a long-term need for it. In the short term, it will help to satisfy the aspirations of the intellectuals among the young West Indians, who at present can, for the most

## SUN LIFE ASSURANCE COMPANY OF CANADA

(Incorporated in Canada in 1865 as a Limited Company)

### SPECIAL ANNUITY PLANS

141 SUN OF CANADA HOUSE, PALL MALL EAST, LONDON, S.W.1

part, only take a course in higher education by obtaining one of the few colonial scholarships to a university abroad. In the long term, its influence should be two-fold. It should help to create an informed and educated body of leaders, at present badly needed in an area where an illiterate population with highly developed political aspirations is at present too easily swayed by demagogues. And, since it is to be a central institution, to serve the whole area, and not only individual islands—though there will be extramural centres in the larger ones—it may well foster a wider nationalism, and promote a political consolidation, to the advantage of them all.

### Mobilising Millions

The pamphlet "Manpower—the story of Britain's mobilisation for war" (Stationery Office, 9d.), whose publication coincides with the fourth anniversary of Mr Bevin's appointment as Minister of Labour, is timely. Earlier pamphlets from the Ministry of Information have described the achievements and heroism of the Armed Forces and of civil defence workers; the parallel achievements and sacrifices of industrial workers have not been so generally recognised. It is also most useful to have set out in popular language the various stages in the process of total mobilisation and the machinery by which it was accomplished. But the story still lacks precision. None of the intricate pattern of recruitment and labour supply, one of the marvels of war management, really emerges from this general account. The real powers of mobilisation—starting with periodic budgets of all labour available and demanded for all purposes, going on to its apportionment from the top and its allocation locally, and kept in motion by the constant replenishment of wastages in every factory and district—is the cardinal operation of war. It remains to be recorded by the historians, with all its new findings, under pressure, about the possible mobility of both industries and workers. The total numbers engaged in one kind of war work or other have often been given; but it seems a pity that the Government cannot lift the statistical veil still further and give more exact facts about the numbers in the different industries and the proportion of women employed. Thus something of the most fascinating of war stories might be seen; and it could surely be of little assistance to the enemy at this stage.

### War Workers

This manpower pamphlet is, not unnaturally, primarily a tribute to Mr Bevin and the Ministry of Labour. It will be conceded that the process of mobilisation has been accomplished on the whole without tears and that the Department deserve the highest credit for their part. Very real benefits have been secured by the workers—the guaranteed week, improvements in security and conditions, encouragement to joint consultative machinery, as well as the £105 million in wages for which the Chairman of the TUC has thanked Mr Bevin—and much of the wartime labour legislation could with advantage to the whole community be carried over into the postwar period. But there are certain statements in the pamphlet which gloss over facts. The call-up of miners during the summer of 1940 is vindicated, despite the subsequent course of events. Too rosy a picture is painted of welfare arrangements; in spite of the Minister's edict, many factories have unsatisfactory provision for health and welfare, as well as for training and upgrading. Some, again, still say that Mr Attlee's pledge in May, 1940, that the Government would assume "complete control over persons and property . . . all persons, rich and poor, employer and workmen, man and woman, and all property" has been operated somewhat one-sidedly.

### Aid for the Farmer

Mr Hudson pointed out, at its second reading on Tuesday, that the Agriculture (Miscellaneous Provisions) Bill is more than a collection of bits and pieces and that it contains two measures of major importance. The first of these is the setting up of a national advisory service for agriculture, to be under the direct control of the Minister and to be paid for by the Exchequer. General advice is to be given over county areas, and more specialised advice by provinces, although these are not to be reduced to the six large areas suggested by the Luxmoore

Committee. Mr Hudson argued that if, as he trusted, agriculture was to be stabilised after the war, it was essential that the same authority which helped the farmers should be able to see that they were efficient. For this purpose a national advisory service is essential. Mr Hudson's constant pressure for more efficient farming is most praiseworthy and most necessary. At the same time, the farm institutes are not to be put under central control. This step was recommended by the Luxmoore Committee, but, as *The Economist* pointed out at the time of its Report, this would involve a dangerous split between responsibility for general and technical education. Instead, a more uniform service is to obtain under the Education Bill, which requires each county to have at least one farm institute. But responsibility for education remains with the education authority. The second main provision of the Bill is to facilitate agricultural loans on mortgage. Farmers are urgently demanding better credit facilities with which to finance the work of replacing and modernising their buildings and equipment. Owing to an unlucky financial history, the Agricultural Mortgage Corporation, which was formed in 1928 for this purpose, has so far been a failure. It can lend at no lower than 4½ per cent, and borrowing from it has progressively decreased. Further Exchequer assistance will now enable its rate to be lowered to 3½ per cent, and the amount that can be lent to be expanded from £13 to £31 million. All of this money will be needed after the war.

### War-damaged Churches

A new category of war damage payment, known as "church payments," has been defined in an agreement between the War Damage Commissioners and a committee representing the Christian churches. The hypothetical nature of the market price of a church has rendered any "value payment" inappropriate, and the "church payment" has been defined as the smaller of either (1) the reasonable cost of "plain repair" of the war damage; or (2) the reasonable net cost of building a "plain substitute" church. The most significant word is "reasonable," since a "plain repair" to one church might well involve many times the cost of a "plain repair" to another church, although the original damage might be equally extensive. It is comforting to learn that the situation, character and tradition of the damaged buildings are to be taken into account, and that allowance is to be made for the cases in which for architectural, historic or other reasons, "it may be in the public interest to secure exact reinstatement." In a similar way, the building of "plain substitute" churches does not imply the planting all over the country of standard or utility churches. The new churches will vary in type or size according to the needs of the congregation, and consideration will be given to the environment in which the new church is to be built, as well as to the type of building previously standing. For example, where in rural areas the church forms an integral feature of the landscape, it is laid down that replacement should be in materials and style to suit its situation. Wherever appropriate the aim will be replacement in the former materials.

### Shorter Notes

The following table gives the number of civilian casualties in air-raids since September, 1939:—

|                         | Killed | Injured and Detained in Hospital | Total Serious Casualties |
|-------------------------|--------|----------------------------------|--------------------------|
| Sept., 1939-Aug., 1940. | 1,494  | 1,980                            | 3,474                    |
| Sept.-Dec., 1940.....   | 22,282 | 28,522                           | 50,804                   |
| Total, 1941.....        | 20,863 | 21,839                           | 42,702                   |
| Total, 1942.....        | 3,221  | 4,149                            | 7,370                    |
| Total, 1943.....        | 2,357  | 3,462                            | 5,819                    |
| November.....           | 119    | 238                              | 357                      |
| December.....           | 10     | 41                               | 51                       |
| 1944—                   |        |                                  |                          |
| January.....            | 107    | 270                              | 377                      |
| February.....           | 961    | 1,712                            | 2,673                    |
| March.....              | 279    | 633                              | 912                      |
| April.....              | 146    | 226                              | 372                      |
| Totals to date.....     | 51,710 | 62,793                           | 114,503                  |

Those killed during last month's air-raids included 65 men, 63 women and 18 children under 16.

## AMERICAN SURVEY

### Industrial Effects of War

(From a Correspondent in Ohio)

*Cleveland*  
THE outline of principles for the termination of war contracts contained in the recent Baruch-Hancock report urges that legislation for such settlement ought not to be delayed—"The result, should Germany collapse suddenly, might be calamitous." Ohio manufacturers, among others, are in accord; they believe that businessmen should be prepared for quick changes in outlook, no matter what they may be.

Businessmen in the Cleveland and Detroit districts have been particularly concerned with the making of two immediate arrangements: for prompt payments on war contracts in order that the funds may be used in restoring establishments to civilian work; and for the prompt removal, by the procurement departments of the forces, of Government-owned machinery from private premises formerly under operation for civilian goods. Compared with these concerns, the problem of the ultimate disposition of the entirely Government-owned plants is of less serious moment for the months immediately ahead, even though about \$16 billions' worth of plant is involved. Many thousands of special tools, obtained from the Defence Plant Corporation, many of them of no use after the war, have been set up in factories which were, before the war, privately owned and managed. Last fall, Detroit manufacturers began to wonder whether it would be possible for their industries even to plan the resumption of peacetime production until they knew how soon after the war these machines would be taken out of the way of a reconverted production flow.

Questioned recently on reconversion plans, Charles F. Kettering, vice-president of General Motors, said the automobile industry could not guess what parts of its organism would first be released from war production. It would depend, he said, on what the armies and navies are using in largest quantities at the end of the struggle. It might not be airplanes, which are most often mentioned in this connection; but if airplanes still have to be produced in great quantity the automobile industry may be among the last in this country to return to normal products.

About half the motor industry's equipment and personnel is now engaged on aircraft work. The entire eastern system of General Motors is thus employed, and much of the central group of plants. Large sections of Ford, Chrysler, Packard, Studebaker are similarly engaged. Of all the automobile plants, Packard is said to be the most completely engaged on aero-engine (Rolls Royce) and marine engine work; the company is regarded in Detroit as having turned out more production per square foot of space than any other automotive plant. Chrysler divisions have so many different contracts in each plant that each would have to have three cancellations before it could move on car production. Where special works have been built, like Henry Ford's engine plant near Detroit and his airplane plant farther west, operations could be continued while the older plants returned in part to automobile manufacture—Ford is believed to be as well situated as any manufacturer for a quick return to normal work. Other concerns with their war production so arranged as to make partial resumption of civilian production not too difficult are Studebaker and Willys-Overland. It is possible that the latter firms, since they are smaller than the industry's leading three, may be given preference from Washington in the form of releases and quotas which will enable them to get away first in the race for the postwar market.

The order of return to peacetime production is of serious concern to many industries, not only to the makers of automobiles. A company which is allowed to bring out its own brand of product ahead of its competitors will have a

considerable and perhaps long-enduring advantage. Manufacturers themselves are in no agreement as to how this question should be handled.

Passenger-automobile production is unthinkable for the near future, due to shortages of bearings, electrical equipment, carburetors and tyres. (The synthetic-rubber programme went along well enough on the chemical end, but the commodity developed "bugs" in the Akron tyre factories.) Yet even if all these parts were obtainable, as they would be if the aircraft programme were tapered off, automobile plant reconversion would be slowed because the companies would be able to get all-metal bodies only from one or two sources. It is estimated that three to six months would be required for the industry to get into volume production even if its entire organism were released at one time.

### Changes in Design

The industry's intention is to resume production with 1942 model cars, simultaneously starting its designing departments to work on improvements. What types of changes are apt to occur as a result of war experience?

Though the automobile and other metal-working industries of this part of the country have been able to make considerable savings in time and cost in the production of weapons, they have not hit upon methods of a great deal of peacetime value. They have achieved short cuts in airplane output, but they expect airplane production to drop to 15 per cent of what it is to-day. They have learned to produce tanks with great efficiency, but tank orders have been cut back. Changes instituted in the motor lorry have been almost entirely for military purposes, although the industry will henceforth be much more readily able to furnish motors which can withstand tropical heat and arctic cold. The automobile engine can be redesigned to generate much more power in proportion to its weight, and to use fuels of 100-octane anti-knock equivalent or higher, provided these fuels are to be available. It is expected the much smaller motor will eventually go back under the seat, where it was in the first passenger automobiles, but parts-makers, engineers and representatives of the petroleum industry who have questioned the automobile company officers say changes so radical are five years away. However at least one airplane company is likely to start making automobiles, and since it has no automobile reputation to lose, it may furnish competition in design.

The proposed redesigning of engines reflects the vastly increased yield of aluminium and magnesium that will be available to the metal trades. Economies in the metallurgical processes, particularly the newer ones, appear to be responsible for the statement occasionally made that technological unemployment will be accelerated after the war, but this would be true only if employment for a given tonnage of new material were comparable with employment for the same tonnage before the war.

The old bolt and nut industry has been watching the wartime inroads of welding with some concern. Chief recent applications of the process have been in the manufacture of tanks and ships, products not likely to be made later in very large quantities; but such postwar items as railroad box cars will be welded, and the spread of the process to civilian items will be accelerated by the availability of great quantities of new machinery.

The industries that have furnished the new machinery and workshop equipment seem likely to have a small market for which to reconvert, at any rate for several years after the war—their members have made an unsuccessful effort, in the renegotiation of their war profits, to get the probability recognised that they will have worked themselves out of their market for a long time. These trades

have been the backbone of industry in Cleveland and Cincinnati for two generations, and to a lesser extent in Chicago, and if the world now has all the machine tools and other capital goods of metal working that it needs, the older manufacturing sections of these cities are likely to compose a depressed area. Some American manufacturers have been arguing that all special machines should be held by the Government, and that a good deal of the existing Government-owned plant should be kept intact to meet any future emergency.

Changes in processes are only part of the wartime changes that are likely to carry over into reconversion. The method of sub-contracting, whereby a manufacturer took an order from the Army or Navy and divided the parts work among scores and even hundreds of other manufacturers, was derived from the automobile, household appliance and other industries of this section. It has been carried further in munitions work than ever before, and may persist in a number of chains or associations of companies.

## Inquest on Willkie

(From a Political Correspondent)

MR. WENDELL WILLKIE gave up his fight for the Republican Party nomination for the Presidency nearly three months before the June 28th Convention which makes the choice: it was obvious he was not going to get anywhere, and further struggle within the party would only compromise the principles he championed by identifying them irrevocably with a losing faction.

As a contender, Mr Willkie had many disadvantages besides his liberal and internationalist principles. For one thing, he was a defeated candidate. Now a defeated Presidential candidate in the United States is nominally leader of the party until the next nominating Convention, but this is strictly a courtesy title. The legal and actual control of the party's central headquarters rests in the National Committee of the party. The party's representatives in the Senate and House elect their own leaders and obey them or not, and act as a party or not, as they wish. State Governors are their own masters. America's two major parties are not close-knit organisations with a recognised leader at all; they are loose federations of office-holders and local get-out-the-vote organisations which work together in election years but have very few bonds of principle or interest apart from this. Party regularity means rallying around the standard in election years; both parties contain the most diverse regional elements and interest groups.

Before and after 1940, the bulk of the Republican delegation in Congress and the Republican National Committee held views violently different from Mr Willkie's; the Congressmen acted on theirs even during the 1940 campaign. Mr Willkie's defeat destroyed what little authority he had then, and not even the Japanese attack on Pearl Harbour and the declarations of war restored it.

Presidential politics in America shares the rule of the prize ring: once defeated, the champion "never comes back." It becomes his duty to step aside and give some other contender a chance. The repeated defeats of Democratic candidate William Jennings Bryan in the years before the previous war confirmed the maxim. Mr Willkie chose to disregard it: he was overruled.

Another fundamental maxim of politics Mr Willkie disregarded was that of the election-year virtue of party regularity. He himself had been an active Democrat as late as 1932. Deliberately he sought to appeal chiefly to the "tired New Dealers" and the voters independent of party among whom his greatest strength lay, and sought to convince the party regulars that they could win only by such tactics—which is probably true, but bitter medicine for the regulars. In an election year, in a primary campaign, Mr Willkie publicly praised the historic revolts within the Republican Party—Horace Greeley's in 1872, Theodore Roosevelt's in 1912, the elder La Follette's in 1924.

Mr Willkie did not indeed say in advance that he would bolt the party or sulk in his tent if he were not nominated, but he did say, "If my hand is not upheld, the Republican Party will go down in defeat" in the November election. He may be right, but you cannot run a party on that basis, and party men knew it, chiefs and followers both. One minor party chieftain refused to meet him on his campaign

Within individual plants training methods have been perfected to a great degree. Personnel work is greatly improved. Techniques of negotiation between unions and employers have been vastly elaborated, though the number of possible "grievances" has grown and strikes in this area frequently lead the nation in numbers. Factory workers have obtained a versatility of skill they never enjoyed before, although many of them are now trained in specialties which will have little market in peacetime. The numbers employed in the metal-working industries to-day are far larger than required for a well-balanced economy after the war. Most of the women and older people are expected to leave the shops at the end of the emergency, but there may remain a good many men for whom places will have to be found outside the metal industries, and even outside of industry. Some private advisers have been telling industrialists they should explain to their employees that industry's redundant employment will have to be shared with the mercantile and service trades and building construction.

tour because Mr Willkie had not recognised the obligation of the party hack to support anyone the Convention might nominate. On the contrary, Mr Willkie made it tolerably clear that he would prefer another four years of Mr Roosevelt to a nominee of Col. Robert R. McCormick.

Now the *Chicago Tribune* is the daily morning fare of nearly a million mid-western families, most of them good Republicans who are kind to children and animals, who enjoy the *Tribune's* comic strips, ignore its leaders, and soak in the poison from its cartoons and "slanted" news stories without noticing it. It surprises and annoys them when eastern Liberals denounce the *Tribune* as near-traitorous—the *Tribune*, which wraps all its insinuations in the flag. Incidentally, the *Tribune* has a substantial circulation in parts of Wisconsin, where Willkie campaigned before giving up.

### The Amateur Candidate

Nomination for President is the supreme honour a party can give, so normally it is reserved for those who have spent their lives in its service and attained some such high rank as Senator, Governor of a state, or Cabinet Member. While occasional exceptions are made for successful generals, there is a blue moon rareness about taking a nominee straight from business, as the scared Republicans did in 1940 amid the thunder of the Fall of France. Mr Willkie made light of the objection to his non-political past, saying if it was experience the party wanted President Roosevelt had had more than any of them. But custom is custom, and this one has a sound psychological basis. There are profound differences between politics and business, though each has its "bosses," its bureaucratic aspects, its horse-trading aspects. A man cannot learn the trade of politics quickly, as many brilliant outsiders have discovered to their sorrow. The "party of business" has always found it necessary to maintain and subsidise a whole class of professional politicians to carry out its policies: it works better so. Mr Willkie worked hard at learning the trade of politics and made substantial progress, but not progress enough to satisfy Republicans who had got over their 1940 scare.

These various objections alone would have been enough to make his nomination very difficult; it is notable that some of the leading Republican internationalists were keeping aloof or rallying to Commander Harold Stassen (who left the Governorship of Minnesota for active service in the Navy) or to Governor Dewey, rather than supporting the party's most prominent internationalist. Moreover, the Gallup sampling polls showed Dewey rather than Willkie the second choice of most Stassen supporters, though Stassen is committed to more thoroughgoing international government than Willkie is, and Dewey to much less.

But if there was no complete fusion between Willkie supporters and the internationalist wing of the party, it is nevertheless no use denying that his defeat is a big blow to Republican internationalism. There is still an element, particularly strong in the mid-west, which thinks the United

States could have remained neutral if its policies had been less provocative. Some parents of boys in the armed Services still think this and cannot forgive President Roosevelt for "taking their boys," and Willkie comes in for the same condemnation. The unfortunate doubletalk to soothe isolationists indulged in by both candidates toward the end of the 1940 campaign gives such people a passionate personal conviction that both broke their word. Willkie's later statement that one such bit of doubletalk was "just campaign oratory" has been deliberately distorted and disseminated to make this point stick.

Larger and more important is the group of pre-Pearl Harbour isolationists who say there are no isolationists any more, but whose newfound internationalism is a pale and tentative affair beside Willkie's. This group probably makes up the bulk of the Republican Party. Governor Dewey belongs to it. So does Mr Spangler, chairman of the National Committee. The Mackinac resolution of the Republican Advisory Committee represents about the limit of their venturesomeness.

Both groups joined with Col. McCormick's extreme "nationalists" to freeze Willkie out of the nomination. They did a good job of it, leaving the party's internationalists little to do except string along with those who give at least lip service to some sort of internationalism. That, however, is what the Republican internationalists did in the 1920 elections, with disastrous results.

On the economic issues, Willkie's fight has made more headway. However much they may denounce the New Deal and all its works, Republican regulars know that its major reforms are here to stay. And however much they would like to go back to the comfortable old Republican way of settling economic policy simply by dishing out favours to groups of supporters in the form of tariffs and subsidies, they are scared—scared of the economic consequences of the peace, as in 1940 they were scared of the military consequences of the fall of France. They are convinced that President Roosevelt is completely bankrupt as an economic statesman, and secretly they have lurking doubts of themselves. They know they will have to avail themselves of the best brains in the country in industry, agriculture, and, through them, even of the universities and labour unions to avoid disaster. One of their quarrels with Willkie was that he seemed to them too tolerant of President Roosevelt's makeshifts and too much a doctrinaire Liberal about substitutes. The fellow said the President wasn't all bad and that the republican tariff policy was.

The mid-west, now the most solidly Republican area of the country, was from the start the area in which Willkie was weakest as an aspirant for the nomination, not only among the professional Republican politicians and their regular cohorts, but also among the great mass of voters who were leaning Republican. Willkie's Indiana accent and heartiness never made him seem one of them. The "bare-foot boy of Wall Street" epithet told sharply. Not that Wall Street is any longer an effective bogeyman in a mid-west that is paying off its mortgages instead of having them foreclosed; but Willkie is so definitely an intellectual New York Liberal lawyer that his mid-west ties seem merely accidental. He gets excited about the civil liberties of Communists, the position of General de Gaulle, and all sorts of things that seem very remote to mid-west Republicans. "He talks too much" is a common mid-west comment; he also reads and writes a great deal more than is considered the thing to do for politicians in the mid-west.

It is possible to poke all sorts of fun at Governor Dewey for obstinately refusing to admit his candidacy for the nomination, but that appeals to the mid-west sense of fitness better than the frank and obvious pursuit of the nomination by Mr Willkie up to April 6th. Willkie's was too much a one-man show.

## American Notes

### The Foremen Go to War

The foremen's strike in Detroit, involving about 3,300 men in 13 war plants, has been called off, after unprecedentedly sharp official rebukes. Both Mr Patterson and Mr Forrestal, the newly appointed Secretary of the Navy, have pointed out that it threatened to stop the production of Mustang fighters and important parts for almost every American military aircraft. Mr Patterson commented bitterly, "We have bombed the Germans' aircraft engine factories: they do not need to bomb ours." The foremen's

strike had been going on for more than two weeks, and was reported to have caused minor riots at a Chrysler plant. The union's leader puts at least part of the blame for the stoppage on the War Labour Board's delay in handing down a decision. It is admitted by the Board itself that delay is made inevitable by the pressure of cases, many of which never would have been brought to it at all had the law been clearer. But in this instance there is an additional complication in the insistence of the companies that the foremen's organisation is attempting to "unionise management" and that if it is not halted, collective bargaining will become a farce through the presence of union men on both sides of the conference table. The Automotive Council—an employers' association—has taken space in a number of newspapers to put this view of the case. It no doubt will come as a welcome surprise to the foremen to discover that one of their duties is to carry on collective bargaining for the company; and if they are not to be allowed to organise it would be only logical for them to press for an adjustment of salaries and privileges in accordance with their enhanced status. The hearings being held this week by the War Labour Board may be somewhat inhibited by the public hostility still aroused by the Montgomery Ward case, although most of this animus now is directed against Mr Biddle, the Attorney General, and his insistence on the "great constitutional reserve of power enjoyed by the President as Commander-in-Chief." Mr Roosevelt in his press conference expressed the view that the election at Montgomery Ward's, which the union won by 1,750 votes to 1,230, would end the incident, as the company had agreed to sign a contract if the union was victorious. This appears optimistic. The company has now fallen back on a refusal to include the maintenance-of-membership provision required by the WLB—which it insists on calling the closed shop; and two parallel investigations into all aspects of the case are going forward in the Senate and the House. It is clear gain for the Administration that Senator Barkley has persuaded the Senate committee to inquire into the labour background, for this will include Mr Avery's intransigence; but there seems to be no good ground—except from a partisan standpoint—for a duplication of proceedings in the House.

## MILK CHOCOLATE & the Nation's Milk Supply

THE contribution of the Milk Chocolate Industry in ensuring Britain's milk supply during these critical war years is not generally realised.

Before the war this industry was using 40 million gallons of milk a year. Cadburys took more than half of this vast quantity. It came from the counties of Hereford, Gloucester, Salop, Stafford, Flint and Denbigh where Cadburys have consistently encouraged dairy farming over a number of years. In these areas they have established four Milk Factories which have greatly assisted in developing milk production. Today these four factories alone collect and distribute sufficient fresh milk for well over a million people.

## Cadbury means Quality

### Gauleiters' Round-up

The biggest round-up of foreign and native Fascists in United States history is now on trial in Washington, charged with conspiring to overthrow the American Government for a Nazi dictatorship and trying to demoralise the armed forces. In extremis, the accused have shown a devotion to democratic safeguards and due process of law new to their careers. Their lawyers have even objected that a fair trial was impossible, because the court reporter worked for a firm with a Jewish executive; and that there were too many policemen in court for a "relaxed" trial. The case has been a long time coming to judgment, and postponements are still the order of the day. Early in the war the Attorney-General, with the admirable intention of preventing the persecution of Left-Wing elements which characterised the last war, announced that only where there was "clear and present danger" would prosecutions be undertaken. This display of tolerance only served to encourage men like Joe McWilliams, the Brooklyn fuehrer; and by the summer of 1942 a first indictment, in the Winrod case, was drawn up. One of the legal difficulties has been the fact that most of the overt acts committed by the defendants took place before the war, so that the present trial relies upon the Smith Act for Alien Registration, passed in 1940, for a conviction. Proof of sedition therefore depends upon establishing a connection with the enemy as well as showing intent and a good chance of success. What Mr Biddle called "a most difficult, a terrible problem"—the distinction between legitimate free speech for critics of the Government, and spontaneous sedition—remains unresolved. No definition has yet explored the no-man's-land between sincere isolationism and the incitement to resistance to lawful authority which constitutes sedition. Even now, the *Chicago Tribune*, with more sensibility than sense, describes the trial as a New Deal attempt to "smear" isolationist Congressmen. How widely the net has been cast appears from the list of defendants, which includes Mrs Dilling, George Deatherage (Knights of the White Camelia), Joe McWilliams (Christian Mobilisers), William Dudley Pelley (Silver Shirts), Lawrence Dennis, the intellectual apologist for Fascism, and James True (America First). Whether any of the fish get away depends upon the ability of the prosecution to establish their connection with the absentee principals named in the indictment—the Nazi Party, the League for Germandom Abroad, the German Embassy, and others.

### Imperial Headache

It was reported from Washington recently that a Puerto Rican source had accused Governor Tugwell of living in palatial luxury, and averred that he was so hated in Puerto Rico that he had to travel with an armed guard. This is a new variation on an old theme. Mr Tugwell has been attacked, from time to time, as dictatorial, socialistic, and inefficient. Such stories do less than justice to the quality of American imperial administration over the 19 million souls in the dependencies. Admittedly Puerto Rico is a sore spot. Immensely overcrowded, with few resources besides sugar cane, riddled with disease and lacking elementary sanitary and educational facilities, the island presents an economic problem of great difficulty which can be solved only by taking thought and action over a long period. Unfortunately the execution of such a plan is impeded, not only by lack of widespread interest in the United States, but by the internal politics of both countries. Puerto Rican affairs in Washington are handled by an under-staffed and under-financed branch in the Interior Department's Division of Territories, and by committees on territories in the House and Senate. Indifference competes in the latter with an irresistible temptation to use Puerto Rico and its New Deal Governor as sticks to beat the Administration which appointed Mr Tugwell; and in this, ready assistance is offered by the representatives of Puerto Rican interests opposed to the reforms and enterprise of the island's present Government. An article in *Fortune* for May, by Joseph M. Jones, catalogues the results of Congressional wrath, from the cutting off of funds from the Puerto Rican Reconstruction Administration in 1940, the stopping of relief funds in 1943, despite unemployment of 200,000, to the mutilation of last summer's Home Rule Bill. The Puerto Rican Government has a three-point programme for land resettlement, industrialisation, and welfare which it is endeavouring to finance with the war increases

in the rum revenue. For its success, however, it needs the continuous participation of the United States rather than alternations of generosity, indifference, and interference, and machinery in Washington less sensitive to domestic politics. Imperial headaches are not exclusively British.

### Isolation in Wisconsin

Much ink was spilt six weeks ago in the American press to explain that Mr Willkie's catastrophe in Wisconsin was due, not to his internationalism, but to his own political ineptitude. New doubts about the degree of conversion in this traditional centre of self-sufficiency are raised by Senator Robert LaFollette's speech last week to the State Convention of the Progressive Party—a third party which exists in this state alone, but has considerable strength there. Senator LaFollette's address was frankly isolationist; he warned his audience against the dangers of buying "an international pig in a beautiful poke." Senator LaFollette's father was one of the "little group of wilful men" who opposed the last war and America's entry into the League. The present Senator carries on the family tradition. With Senator Taft's recent acknowledgment of the need for American participation in some sort of international machinery, isolationist sentiment appeared to have lost its intellectual leadership. It may be that "Young Bob" aspires to the mantle. It is too soon, however, to say that Mr Willkie did so badly because of his views on foreign policy. The very existence of the Progressive Party in Wisconsin—battered though it has been—has deprived both the national parties in that state of their brightest and best, the forward-looking element which would almost certainly have preferred Mr Willkie to Governor Dewey. The Wisconsin Republicans are for that reason regular and conservative to a degree remarkable even in their party. Nor does it follow, because Senator LaFollette remains true to the creed of his father, that the Progressives he was addressing are equally filial. In Chicago this week Governor Dewey received a dubious accession of strength. The *Tribune*, despairing of a candidate more unequivocally Nationalist, has decided to support the New York Governor.

### Relaxing the Draft

It is only a month since the Services pleaded with Congress to pass a National Service Act in order to maintain war production and essential civilian services, from which they would be forced to draw vast numbers of men in the near future. The prospects for the Austin-Wadsworth Bill were not brightened noticeably, but substitute measures were introduced in both Houses. The aim was to induct men classified as unfit for military service—the 4F's—into army labour battalions if they refused to enter essential industry. In the Senate a more extensive Bill was submitted by Senators Bailey and Brewster, which would freeze all essential male workers in their present jobs and would force non-essential workers into war jobs at the penalty of being forced to serve in army work battalions without gaining any of the perquisites of military service like mustering-out pay or military life insurance. Its sponsors claim that the Bill would reduce the waste now caused by the high rate of labour turnover and that it would be fairer than the House Bill, as well as more productive, because it would apply not only to the 4F's, but to men from 38-45 who are in no danger of induction because the Army does not consider them battle-worthy. Both Bills suffer from the fact that the Services, while all in favour of a labour draft, are not anxious to assume responsibility for the recalcitrants in any capacity. Nor does either appear very likely to overcome the hostility of both trades unions and employers, or the antipathy of the public. Their chances were not improved this week by the announcement of Major-General Hershey, the Director of Selective Service, that because the Services have an "entirely adequate reserve of manpower in the 18-25 age-group"—men over 30 in essential jobs may expect to be deferred indefinitely; and that those in the 27-30 age-group may rest easy for at least another six months. The resemblance to a complete somersault in Service policy may be greater in appearance than in reality. There is to be a tightening of deferments for men under 26, and this will leave both industry and agriculture short-handed. But the announcement can hardly fail to blunt the apparent urgency of measures for industrial conscription.

## THE WORLD OVERSEAS

### Icelandic Independence

THE common sovereignty of Denmark and Iceland, soon to be ended by unilateral action on the part of the Icelandic Government, has long been one of the curiosities of the political map of Northern Europe. Not since the peaceful division of Norway and Sweden in 1905 has a similar case arisen where the bond imposed by historical accident is to be peacefully severed. The circumstances in which the link to Denmark is to be dissolved serve, unfortunately, to obscure the true pattern of Icelandic development over the past century. An Icelandic government under American military and British naval protection would be, in any circumstances, in a position to cut loose from German-occupied Denmark with complete impunity. The possible misinterpretation abroad of Iceland's action is probably the only valid argument for waiting, as the King has urged, till each country is no longer occupied by a foreign power and is at liberty to conduct full negotiations on the subject.

Even if the final act of Icelandic separation is not carried through, for any reason, on June 17th, as the Icelandic Government proposes, there can be no doubt that it cannot long be postponed. To begin with, the union is an artifact of history, and originated in the tripartite union of Norway-Iceland-Denmark which dated from the fourteenth century. In 1814, Norway left the union and became part of the kingdom of Sweden. The sovereignty of Iceland was then left with the King of Denmark. A long struggle for independence through the last century at last gained Home Rule for the Icelandic Parliament, or "Althing," in 1904. The last step, by which Iceland became a free and sovereign state united with Denmark by a common king, was gained in 1918. Since then, Iceland has been independent and sovereign in domestic affairs. But the Act of Union laid down that the foreign affairs of Iceland were to be conducted by Denmark and that the citizens of each country were to enjoy civic rights in the other.

It is these limitations on independence which the Icelanders seek to remove. Cancellation of the union by either side was in any case provided for in the terms of the Treaty of 1918. It was arranged that either party could demand negotiations for revision after 1940. If these failed to lead to a renewed agreement within three years, unilateral cancellation could take place subject to a certain majority of agreement in the assembly and in a subsequent plebiscite. This clause providing for abrogation of the treaty was a clear recognition of the Icelanders' ambition for independence, and of the inevitability of separation if the threat of war between the Great Powers were to be continued. The experience of the Napoleonic war and of the two major wars of this century has shown only too clearly that in the event of a major European conflict the geographical separation of the two small states is of greater importance than their political unity. In each case, Iceland and Denmark have been forced to take a different way; Denmark can never be strong enough to dissociate itself entirely from a continental belligerent, while Iceland is equally unable to resist the nation exercising the greatest power at sea. In the present war, the truth of this conclusion has been demonstrated more clearly than ever. The German invasion of Denmark in April, 1940, made it impossible for the King to exercise his functions in respect of Iceland. The Althing decided to allow his responsibilities to devolve, first, on to the Icelandic Cabinet, and later on to a Regent, elected by the Althing. In May, 1940, the German consolidation of the western coast of Norway led the British Government to extend its occupation of the Faroe Islands to Iceland.

In May, 1941, the Althing decided upon the policy of securing complete independence from Denmark. A declaration was made of Iceland's right to make a unilateral break with Denmark according to the Act of Union. On the

grounds that Denmark had not fulfilled her obligations to Iceland under the Act, and that the provisions for abrogation now enabled the Icelandic Government to take unilateral action, the Althing announced its intention to exercise its right and to cancel the Treaty and establish a Republic after the lapse of three years. One month later, the British Government expressed its desire to remove its troops, provided they could be replaced by American troops, but since the United States was not then at war this could only be done if Iceland would invite the United States to assume the protection of the country. This invitation was issued, but only on certain conditions. The American troops will be withdrawn immediately after the end of the war and during their stay will not interfere in the national administration of the country.

The United States and British Governments have also given their full recognition of the absolute independence and sovereignty of Iceland and have given their promise to exercise their best efforts with the Powers making the Peace Treaty to gain universal recognition of Icelandic independence. Thus, the Anglo-American attitude to the impending action of the Icelandic Government has already been assured. In the present circumstances, little else is of major political importance. It had been intended to make the formal change on June 17th next, the anniversary of the birth of Ján Sigurdsson, the leader of the independence movement. This plan will probably be carried through, but a new element has arisen in recent weeks through the King's plea for delay. It is, however, only the date that is in question; there is no intention of withdrawing the decision to seek independence.

### Problems of Government

Once complete independence has been established, however, the future is less certain. In its foreign relations the security of Iceland, like that of every small nation, will depend almost entirely on the powers and duties allotted to an international organisation for maintaining peace. Iceland has to face the problem of government in a multiple-party Parliament. Some way of reconciling a multiplicity of parties with a firm Government will have to be found if the long tradition of Icelandic democracy is not to end in a series of weak, short-lived and ineffectual cabinets. Before 1942, a Conservative majority was able to gain sufficient support to maintain itself in power, under conditions roughly similar to those in Great Britain. A revision of the constituencies in that year, however, completely upset the balance. Some of the larger urban and coastal constituencies were split up to give a greater equality of representation compared with the very small rural constituencies. As a result, the members returned by all parties were increased, with the exception of the Farmers' Party.

Moreover, the old balance was further upset by the rudimentary machinery of proportional representation, whereby a certain surplus of seats in the Althing are distributed between the parties in proportion to the total votes recorded by each party. This mechanism resulted in 6 out of the 11 surplus seats being allotted to the Communist Party, 3 to the Labour Party, 2 to the Conservatives and none to the Farmers. The total distribution is now Conservatives, 20; Farmers' Party, 15; Communists, 10, and Labour, 7.

Since the Farmers refuse to co-operate with a party which brought about the change in constituencies, the only remaining combination that could command a majority are politically unworkable. The Communists could hardly work happily in a Conservative Government, and even the Labour Party cannot accept the Conservative policy towards wage disputes. Out of this impasse, the Althing achieved a temporary solution. The elected Regent was able to construct a Cabinet of six Ministers, none of whom are elected members of the Althing. Their political sym-

pathies being known, however, the Cabinet has been made to reflect the proportions of parliamentary parties. The present Prime Minister being conservative in outlook, two of his Ministers are sympathetic to the Farmers' Party and one each to Conservative, Labour, and Communist. The rigidity which such a solution imposes on the structure of democracy cannot, obviously, be maintained indefinitely. The establishment of a new and stable balance of political parties can be counted one of the main tasks before the independent Iceland soon to be created.

This latest recruit to the ranks of fully sovereign and independent states is one of the smallest. The population of the whole country is only 124,000. But the standard of education is high and the tradition of democratic government is very firmly rooted. Isolation would in any case make a high degree of local self-government inevitable and the chief effects of the coming change of status must be expected to be in the realm of sentiment. The events of the war and the growth of transatlantic aviation are bringing the Icelanders more closely into contact with the great society of nations than ever before. It is as well that they should henceforward conduct their own affairs.

## Allied Propaganda to Occupied Europe

[FROM A CORRESPONDENT LATELY IN NORWAY]

In the free world, Allied propaganda to occupied countries is discussed only sporadically. In occupied territory, it has, at any rate until recently, been a subject of daily discussion. To the free world, the subject is theoretical; critics and defenders alike lack first-hand knowledge of the conditions under which it is received and of its effect on its public. People under occupation know this, but for their part are in ignorance of the general background of events from which propaganda agencies select and adapt their material; nor do they know the policy guiding propaganda. In either case, discussion of the subject is handicapped. Given good will, some of the difficulties might be overcome, but it is necessary for people in the free world to try to acquaint themselves with the fundamental experiences and views of people living under occupation and to bring an open mind to the problem.

It is impossible in a short article to give people in the free world an adequate impression of the circumstances and attitude of the recipients of propaganda. It would involve trying to correct and supplement the picture the free world has constructed for itself of people under occupation, and which on so many points differs from reality. Active patriots, who come out from the stimulating, rich and alert political and intellectual life in an occupied country, feel astonishment, then consternation, and ultimately despair when they fully realise what assumptions neutrals and Allies have made about them.

Nazi occupation and democratic resistance is an experience with a deep and far-reaching effect on the community
