and on individuals. The citizen has had to face fundamental ethical and political problems, and individually to make up his mind about them; he has in consequence acquired a deeper insight and a clearer realisation about what those values are for which we fight. Political consciousness is found in wider circles than ever before. And it is not merely a primitive, emotional, nationalistic attitude; there has developed a calm, reasoned, democratic conviction, an open mind, and a readiness to discuss fundamental and controversial matters without prejudice. It is true that the loss of normal, ordered society may give rise to moral problems, but it is overwhelmingly clear that the self-discipline, co-operation, and mutual helpfulness which have risen out of the background of official lawlessness give great promise for further constructive developments; official lawlessness has created a heightened regard for constitutional law. A characteristic feature is also a strong and growing internationalism. The problems of state sovereignty and of the sovereignty of the people are regarded with deep interest, and a constructive attitude is prevalent.

### Freedom of Information

The first of the four freedoms, that of speech and opinion, is at the centre of interest. Circumstances have given an added perspective to the discussion, and the concept has received a twentieth-century interpretation. The primitive right to speak one's mind is not felt to be the central issue—experience has proved that it is difficult to prevent people from expressing an opinion—but the essence of the problem is felt to be the right of access to information. Even under oppression man finds ways of saying what he thinks and of influencing the views of others, even if it cannot be done publicly. But the use of power to withhold, or pervert, essential information is looked upon as the sin against the Holy Ghost.

Much disappointment might have been avoided if the policy behind the Allied propaganda services had been made available in a clear form. Recently *Time* described the function of the Office of War Information as being to supply "the truth, but not the whole truth." This tallies perfectly with the conclusions arrived at after four years' observation of Allied propaganda. Its underlying assumption is, presumably, that the whole truth would have a weakening effect. It is, of course, realised that some information has to be withheld for military and security reasons. But the restrictions operate more widely than that, with the result that people have to brave the Gestapo and listen in all day and night in the hope of collecting valuable items from all the different broadcast services. The answer to the assumption about the dangerous effect of truth on morale was given by an old politician, who said in a discussion of whether it would be wise to circulate secretly a straightforward statement about a patriotic reverse, "Truth has never weakened the front." His view was not followed, for fear of such a weakening, and the result was uncontrolled rumours which had a depressing effect.

### Nazi and Allied News

In practice, wartime information, both of the Nazis and the democracies, has two aspects: the provision of news, and political influence combined with the stiffening of morale. News is given the greatest space, and it also serves the other objective. The Allied news services aim at providing a corrective for the Nazi news services by publishing true items. This corrective function had a complete success over two years ago in the field covered, which is mainly that of military news. Until nearly the end of 1941, the German news services provided communiqués and other information with fictitious items. But the German propaganda authorities came to realise that too wide a discrepancy between their news and Allied news was a bad thing for them, and were sufficiently realistic to act accordingly. The unrestrained flights of imagination were given up, and since 1941-42 German communiqués have been materially correct. It must be considered a real victory that Allied information has forced the enemy to a complete reversal of his policy with regard to facts. But it is precisely after this achievement that the importance of the Allied news service has been constantly on the decline. Until 1941-42 it was in combat with the Nazi service in the field of war news. Now the enemy keeps quiet, although he still continues to be a menace, and the Allied news service is in a situation similar to that of "a fleet in being," which by merely existing blunts enemy forces. It is strange that the BBC should rest content with being a "propaganda machinery in being."

and that no forward move has been made. Or has it not noticed the victory?

The principles of selecting news material have caused comment. The ideal has been to provide encouraging military news in every programme, whether the whole of the news is good or not. The complete picture presented over a longer period may in consequence be distorted. Statistics about losses in Allied air raids made up of BBC figures can give curious results. It may happen that three raids are reported in the same transmission, and that the number of planes lost is mentioned for two where the figures are low, but passed over in silence for the third where the figure may be high. The policy with regard to military news has a hand-to-mouth character. This has shaken confidence, not in the truth of the details given, but in the whole picture they present. The effect is illustrated in a remark by a shrewd peasant woman. When asked whether she had had the day's news she said that she had not, but that that did not make much difference, "for the London news is always good." The cumulative effect of these daily doses of "good" news, which do not add up to great achievement, is that people begin to wonder whether there are forces making the Western Allies hold back.

### The Effects of Isolation

Other types of news have been entirely put in the shade by the military news. On the political side, the Germans almost have the field to themselves. Democratic institutions and functions hardly play any part in the propaganda of the democratic states. It is clearly impossible for those who have not experienced a long term of total isolation to realise what isolation means, or what the cumulative effect of omissions in Allied information can be. By these omissions, four years of Allied information leave listeners under occupation with the feeling that in the fight for democracy, democracy itself has gone under. In the political field, the right of access to factual information is denied us by our own Allies and compatriots, who keep us under a total blockade of ideas. The picture of the free world inferred from this is that politically and intellectually it has grown stale. This again undermines confidence in the prospect of constructive co-operation afterwards. We are becoming afraid of our Allies.

The attitude of propagandists to their Allies or compatriots under occupation causes concern. We are almost invariably talked down to. A recent report from a regular listener begins: "The circumstance which has caused the gravest difficulties in radio work is the feeling that they did not take their task seriously enough." Keen observers record that there is a remarkable difference in tone and frankness between the formulation of news in the BBC home service and in the European service. The motive for this must be that the European public is rated lower than the public at home. In occupied territory, one has a feeling of being treated like a child—patronised, encouraged and praised, but kept outside when serious matters are discussed. From one point of view the effect may be disastrous. In the propaganda directed to themselves occupied people are flattered more than they like, and nothing is revealed to them of the views held about them in the free world, as shown in a number of articles in periodicals and dailies. When the frontiers are opened, and the occupied peoples realise how their free Allies regard them, their reaction may be violent.

It is true that Allied propaganda works under great difficulties. Propaganda to neutrals, to free Allies, and to Allies under occupation present three entirely different problems. Contact with the public under occupation is meagre. The Allied propaganda agencies do not have the advantage of daily free criticism and interchange of views, and thus come to work in a somewhat rarefied atmosphere. And in the loud exchange of opinion in the free world it is difficult for the still, small voice from inside occupied territory to make itself heard, even when suggestions and requests have been got through the barrier. The result is that whereas as late as 1943 people were still eager to make and pass out suggestions and proposals for the radio, in 1944 there is a marked falling-off. It seems as if information workers inside the barrier, who are as active as ever, have resigned themselves to obtaining their material in other ways. The BBC seems to have been written off as a constructive collaborator in the political war. Its importance for military news is recognised. But it is difficult to understand why Allied propaganda has no higher ambition than to remain as "a propaganda arm in being."

## Portuguese Wolfram Exports

[FROM OUR LISBON CORRESPONDENT]

FOREIGN trade has recently been the subject of criticism, and the doyen of the Lisbon press, *O Jornal do Comercio*, in a series of articles, discusses the extent and distribution of both imports and exports. From figures published by the National Institute of Statistics, the returns for January and February, 1943 and 1944, are as follows:

| (Contos = £10)     |                 |                 |                 |
|--------------------|-----------------|-----------------|-----------------|
|                    | Exports<br>Tons | Value<br>Contos | Imports<br>Tons |
| Jan.-Feb., 1943... | 71,500          | 569,300         | 88,700          |
| " 1944...          | 74,000          | 609,500         | 168,500         |
|                    |                 |                 | Value<br>Contos |
|                    |                 |                 | 280,000         |
|                    |                 |                 | 345,500         |

The increase in imports is not so important as the export position, which is affected by wolfram shipments. Although there is admittedly some diminution of these, if the January-February, 1943, figures (1,764 tons) are contrasted with those for the same months of 1944 (964 tons), it should be borne in mind that these figures only relate to the ore that has passed through official channels. The point stressed by the journal already mentioned alludes to the undue importance of wolfram values in the current export returns. For January-February, 1944, they are put at 113,395 contos, a sum which is second only to the 170,000 contos brought in by sardines, and is even higher than the sum attributed to exports of wines and spirits, 92,000 contos. With some justice does *O Jornal do Comercio* say:

Unfortunately, whoever has visited the regions where wolfram has been found sees no trace of a general improvement resulting from receipts from this Eldorado. Nothing has been done to improve agricultural activity, either in methods or in tools. Wolfram has so far been but a factor of crisis . . . It is the major event in Portuguese mineral exploitation, yet it cannot be described as really beneficial.

This considered and wholly Portuguese opinion has, it must be conceded, a very special importance at this moment, both for Portugal and for her allies among the United Nations.

## Letter to the Editor Invasion Exchange Rates

TO THE EDITOR OF THE ECONOMIST

SIR,—A note in your last issue (p. 653) suggests that, in pleading for rates of exchange in Western Europe on the basis of "establishing socially sound relations between the armies of liberation and their civilian Allies" (in an article in the current *Bulletin of the Oxford Institute of Statistics*), I wish to fix "rates of exchange at variance with every economic criterion," hoping "to maintain the chaos and confusion in which the continuance of wholly centralised control is the only method of making the machine work."

This inference is unjustified. My argument in favour of a "high" franc rate was based on the internal policy of the British Government which successfully stabilised wages and prices and maintained the sterling exchange. A devaluation of the franc under present social conditions would lead to violent wage demands and thus nullify the "adjustment" to "every economic criterion." The restoration of "laissez faire" equilibrium in war is not likely to be hastened by the policy.

On the other hand the foreign income derived from Allied expenditure in terms of goods of the liberated territories would be cut. As, moreover, a rationing of the expenditure of the Allied soldiers is not likely, post-war relations between the Allies and Western Europe (so supremely important for Britain) are likely to be endangered.

This potential threat would be further aggravated by the fact that a policy which favours the speculator and the equity holder against the small rentier and wage-earner is likely to lead to further political extremism. The unfortunate diplomatic tactics of the US State Department, unhappily followed by Britain, increase this danger.

Far from speeding the return to "normal" as the Note suggests, the policy criticised by my article would in all probability end all hopes of a moderate solution. A return to pre-1939 is neither possible (c.f. your article p. 650) nor desirable.—Yours, etc.,  
T. BALOGH  
Oxford.

## AND WHEN THE WAR IS WON

Trade feuds, booms and slumps  
or . . .

co-operation, expansion,  
security?

Are trade slumps necessary? After the war world-industry will have on its hands the biggest job of reconstruction in history . . . the job of helping to redeem the pledges of the Atlantic Charter. Anything approaching a "slump" either in the production or the distribution of vital supplies will not only block world-recovery, but will mean starvation and death for countless people who have suffered bitterly in the same cause as our own. If we are to 'iron out the bumps' in the upward curve of world prosperity we must first check the irregularities of international trade . . . replacing economic rivalry with collaboration, merging self-interest in mutual benefit, and harnessing rugged individualism to the disciplined purpose of a new "combined-operations" of world-industry.

Finger-tip  
CONTROL

To meet and beat post-war competition you will need business equipment that is as efficient as the methods you will have to employ. That is why the trend will be more than ever towards steel. Only ball-bearing steel can provide that finger-tip control of drawer and door which never intrudes between intention and action. Steel furniture is durable and strong, fire-resisting, vermin-proof, and keeps clean. And Sankey-Sheldon will show in their post-war programme that steel furniture can be beautiful as well with new contours, new colours and coverings to please the eye and touch.

# THE BUSINESS WORLD

## American Wage Rates

(From Our New York Correspondent)

**A**MONG the numerous great changes which the war has wrought in the US economy, few may be more significant than the transition of a considerable part of American labour to an income of \$50 a week from \$25 a week. This, as the accompanying table shows, is what has happened in the five years from the beginning of 1939 to the end of 1943.

The move to \$50 and more from around \$25 has, as would be expected, occurred in those businesses most directly related to the war effort. Partly it has resulted from a lengthening of hours by something like a third, with much of the increase requiring compensation at overtime rates, and partly it has resulted from increases in hourly rates. The increase in hours has been much more pronounced in the "war" industries than in the "civilian" lines, as has been the rise in average weekly pay. And during the same period employment has shifted extensively toward the higher paying jobs. While total non-agricultural employment rose by 3,598,000 to 37,944,000 between January, 1939, and October, 1943, according to the Federal Reserve, employment in manufacturing rose 6,810,000 to 16,169,000.

In the change during these five years several basic factors have been at work. First, the need to utilise the incentive of higher pay to mobilise workers into war production was recognised; to a large degree demand and supply forces operated in the labour market. Second, the national policy of improving the lot of workers by enforcing the payment of overtime over 40 hours has been carried over generally from pre-war times; in some labour shortage areas a minimum week of 48 hours has been decreed without affecting the payment of overtime rates for the final eight hours. Third, the "Little Steel formula," and the official efforts to "hold the line" against inflation, while acting as a deterrent against increases, have not been too clearly defined nor too rigidly adhered to, especially where the need for increases was deemed large and where labour organisation was strong. And fourth, employers' ability to pay has generally been present: the Government has been the chief buyer and has provided the funds, and, even where it did not do so fully, existing tax rates on corporations have meant that much of the increased expense has come from the Treasury. According to Department of Commerce estimates, corporate profits before taxes rose from \$5,320 million in 1939 to \$22,800 million in 1943, and after taxes, from \$4,088 million to \$8,200 million.

There are large disparities in incomes between occupations; they run to \$25 a week and more in the averages, and even larger figures for specified jobs, companies and areas, and compare with disparities which were only of the order of \$10 a week five years ago. In terms of real wages, experience has differed widely: many have had increases far in excess of the 25 per cent rise in the cost of living shown by the (disputed) cost of living index, while many with fixed incomes have not. Many have experienced a major improvement after allowing for both higher living costs and taxes, while many others have had their standards of living sharply reduced. The rise in the cost of living has been different in different regions, which further complicates the picture.

In short, the country has experienced an extensive redistribution of income at the same time that total income payments have risen from \$71 billion in 1939 to an estimated \$142 billion in 1943. This redistribution is productive of labour troubles and of interruptions to production. The disparities also have presented difficulties which Congress has found insoluble in levying adequate taxes to close the "inflationary gap"; a tax adequate to

those who have had no increase in income, while a tax bearable to the latter is wholly inadequate.

This development presents problems for the future as well as for the present. Workmen accustomed to \$50 a week and more have already indicated their unwillingness to accept a reduction after the war, and have already announced the objective of achieving the same weekly compensation for a shorter work week. And other work groups which have obtained less of an increase demand that the disparity be reduced by raises for themselves.

Employers, on the other hand, protest that they cannot continue such large payments in peace-time, that competitive conditions will be impaired and ability to operate

### AVERAGE WEEKLY EARNINGS AND HOURS\*

| Texas.....                                           | 26.00           | 65.50      | ...        | ...        |
| South Carolina.....                                  | 15.75           | 31.00      | ...        | ...        |
| Jan., 1939                                           |                 |            |            |            |
| Cost-of-living index.....                            | \$ 100.0        | \$ 124.8   | ...        | ...        |
| Wholesale prices.....                                | 100.0           | 133.9      | ...        | ...        |

\* The figures for earnings and hours are not statistically comparable between the two dates, though figures in each column are comparable. The 1939 figures are simple averages, for 1943 are weighted; however, the trend they show is believed representative, if not precisely measured.

jeopardised. Those in lower-paying industries say they cannot close the gap. Those concerned with exports fear inability to compete.

Advancing technology has in the past provided the basis for higher wages. But this greater productivity of labour has in fact had little to do with labour skill: it has resulted much more from provision of better tools by capital investment. If this rapid rise in wage costs impairs profits (as many fear), capital investment might be restricted so that industry's ability to valorise higher wages will be impaired. While technology has advanced during the war, much of the increase in productivity has occurred in production of war materials and probably cannot be carried over directly into output of peace-time goods.

Labour, management and, by no means least, Government, have a knotty problem to face in the attempt to establish post-war conditions both of full employment and of full production for a higher standard of living.

# Business Notes

## Back to Normal

As was anticipated, the rubber share boomlet did not outlast the week, and from Friday of last week onwards selling pressure tended to predominate in this market. Some prices have fallen back substantially, but the general level is still higher than before the rise. There has been some profit taking, but selling quickly depresses prices, since jobbers are not prepared to take on stock at these levels. The undertone in rubber shares is, therefore, likely to remain weak for some time. The rest of the market has also returned to something like its pre-Budget condition of lethargy, but there are a number of spots where speculation is still considerable, notably the shares of certain shipping companies in respect of which offers similar to those for Lamport and Holt are thought to be likely. This speculative business and a rather larger flow of investment demand from the small man, such as always follows a sharp rise in prices, suffice to keep the number of bargains above the pre-budget level. This week has brought a scarcely perceptible reaction in both industrial equities and fixed interest stocks. By and large, however, the rise of 2.84 per cent which occurred in the former index of *The Financial News* in the two and a half weeks following the Budget, has been virtually maintained. The rise in the fixed interest index was less than one-tenth as great, and one-third of it has been lost. The rise in industrials appears to have been assisted by a few increases in dividend, but these have been rarer of late than in the early months of the year. The undertone is reasonably firm, but it may be doubted whether prices will stand up to any adverse development as well as seemed probable before the latest rise.

## Abnormal Sterling Balances

In the course of the House of Commons debate on the international monetary plan a speaker estimated the abnormal sterling balances accumulated in London during the war at £1,000 million. He was corrected by another speaker, who gave the figure as £2,000 million, and that estimate has quite unjustifiably passed into general currency as an authoritative figure. The latest figures of overseas sterling holdings (cash, bills and securities) are as follows:—

|                             | Latest Date | In £ millions |
|-----------------------------|-------------|---------------|
| India .....                 | April, 1944 | 721           |
| Eire .....                  | Dec., 1943  | 133           |
| Canada .....                | Now         | 157*          |
| Malaya .....                | July, 1941  | 58            |
| Australia .....             | Jan., 1944  | 74            |
| New Zealand .....           | Nov., 1943  | 31            |
| Argentina .....             | Dec., 1943  | 42            |
| Egypt .....                 | Dec., 1943  | 95            |
| Colonial Currency Boards .. | Mar., 1943  | 45            |
| South Africa .....          | April, 1944 | 14            |
| Total .....                 |             | 1,375         |

\* Interest Free Loan.

It would be wrong to regard this total as representing abnormal sterling. At the outbreak of war the sterling maintained in London by the monetary authorities of the above countries was around £250 million. This represented currency reserves and normal working balances. The currency reserve requirements will have increased considerably with the expansion in note circulation in each of the countries concerned. It would, therefore, be quite erroneous to put the "abnormal" sterling balances at more than £1,000 million at present. It may be interesting to compare the growth in these sterling balances with the total overseas disinvestment figure given in the White Paper on the sources of war finance. For the four years to the end of 1943 this disinvestment amounted to £2,843 million, a figure representing the sale of gold and foreign assets and the growth in overseas debt.

## Argentina's Sterling

The report of the Central Bank of Argentina for 1943 publishes the latest available figure of the sterling held in

London on official Argentine account. The figure as given in the report is 714 million pesos—say, £42 million for the end of 1943—and has risen from 295 million pesos, or £17,500,000, at the end of 1942. This increase in the Central Bank's sterling reserve is only a part of the exceptional strengthening of the gold and exchange reserve. For the year, the combined total increased by 1,298 million pesos, a movement which accompanied a favourable balance of payments of 1,181 million pesos for the year. The Central Bank computes that this favourable balance was made up as to 735 million pesos in "free" currencies and the remainder in "compensation" or blocked currencies (among which sterling must ruefully be classed at present). The increase in the Central Bank's holding of sterling would have been even greater had there been no repatriation of sterling debt during the year. Such operations amounted to 144 million pesos, or £8,500,000. Allowing for this factor, it would seem that the Argentine holding of sterling increased during 1943 at the rate of nearly £3,000,000 a month, and on the safe assumption that this rate of expansion has been maintained this year, the amount of blocked sterling held on Argentine account must by now have topped the £50 million mark. The value of this sterling, says the report of the Central Bank, is duly guaranteed by the British Government by a special gold clause. The more general comments of the Central Bank's report, dealing with the economic situation in Argentina, give some interesting information on the shift of Argentine economic activity from agriculture and towards industry. This diversion of economic activity has been partly enforced on Argentina, and is the outcome of inability to export primary commodities in their wonted quantities and to import the required amount of manufactured goods. But it would be unwise to assume that this greater diversification of economic activity will disappear after the end of the war as rapidly as it has taken place.

## India's Dollars

Messages from Washington suggest that some alteration may recently have taken place in the arrangements for the disposal of India's direct US dollar income. Hitherto, by arrangement with the British Government, India has surrendered to the UK Treasury any dollars it may have acquired in the course of its external payments and has taken sterling in exchange. The whole of the Reserve Bank's accumulation of foreign exchange has, therefore, taken the form of sterling. Now it is suggested that US dollars may be retained by the Reserve Bank and that their accumulation should allow India to place its post-war purchases of industrial equipment and other goods with rather greater freedom than if the whole of the exchange reserve consisted of sterling—that is to say, the orders can be placed in America as well as in Great Britain. The deductions drawn in the United States from this suggested change in the financial arrangements between India and the United Kingdom seem rather exaggerated. India's direct dollar income has, until now, been small. Most of the merchandise trade between India and the United States was canalised through British merchants before the war and is even more exclusively "sterlingised" now that the commodities in question are, for the most part, handled by official controls. The main direct United States dollar income of the Indian authorities would be that derived from American military expenditure in India for which rupees are required and which falls outside the reverse Lend Lease aid now being given by India to the United States (though not to Britain). The bulk of this American expenditure, however, is met by sales of gold in the open market and, therefore, involves no direct dollar payments to India. The present change in procedure would not have been possible if the British dollar position had not improved.

## Training of Craftsmen

Mr George Wansbrough, in an article in last Monday's *Times*, analysed the position of skilled craftsmen in industry. He made several constructive suggestions for raising their status and standards; and it would now be interesting

and useful to have the reactions of employers and trade unions to his proposals. It is generally agreed that the proposed provision for technical education in the Education Bill is still inadequate. In the past there has been a wrong attitude towards the skilled workman, due largely to the wrong kind of education. School teachers, parents and the boys themselves have tended to believe that the "white collar man" was inherently superior to the manual worker and that there was something degrading about working at the bench—while the need for a long apprenticeship and the preference for earning money at once acted as powerful deterrents. Mr Wansbrough urges that skilled workers should be put on the same level as office employees, in the matter of stability of employment, holidays, pensions and other benefits, and that they should be paid weekly or monthly rather than by the hour. Parallel with the raising of the skilled workmen's status, he asks for opportunities for a more rapid promotion to foreman grades and an altogether different evaluation of foremanship. Instead of the present Ordinary National Certificate in specialised branches of engineering, which does not give a sufficient grasp, either in theory or practice, of the fundamentals of engineering, he suggests a standard three-year course in engineering, with a single certificate covering engineering *qua* engineering. This would give a more satisfactory training and grounding, and would include courses in economics (a subject far too neglected at present), to be taken by all craftsmen, whether they intend to remain craftsmen or to become supervisors. Beyond this, there would be a Higher National Certificate, for those who wished to specialise. The whole programme of technical education would be worked out in conjunction with the education authorities. These suggestions should be carefully studied by all those responsible for education or industry. It is probably not an exaggeration to say that, unless something along these lines is done, Britain's ability to compete successfully in post-war markets may be endangered.

## National Defence Bond Drawings

The first drawings of National Defence 2½ per cent Bonds for redemption at par in September 15 next will amount to 20 per cent of the nominal amount of bonds created. These bonds were issued to the total of £100 million in April, 1937, and the prospectus stated that they would be redeemed at par by annual drawings beginning in 1944, each drawing being for "not less than 20 per cent of the nominal amount of the bonds created." The bonds are, therefore, at most a five-year maturity and they are widely held by banks and money market houses. There was some doubt whether the Government would exercise its option to redeem more than the minimum of 20 per cent at the next drawings and in view of the ease with which short-term debt of this nature could be replaced more cheaply than at 2½ per cent, there had been pessimists who anticipated that the Government might redeem the whole of the loan at the first possible opportunity. These fears have now been set at rest and the Government will, in fact, only insist on its minimum rights. The right to redeem at par more than the 20 per cent minimum in future years remains intact and the amount to be drawn on these occasions will be prescribed before each drawing.

## Co-operative Movement

The Co-operative Movement is putting forward important proposals for the development and greater co-ordination of its various branches and for a large scale expansion of its activities. These would have been considered by the Whitsun Congress had it not been postponed because of travel restrictions. The majority report of a special committee which has been inquiring into the structure and functions of the Co-operative Movement suggests that there are large gaps in the retail services which it provides, and that the retail side is not keeping pace with new developments in private retail trade. To remedy this, it is proposed that the Co-operative Union should be recognised as the central co-ordinating body of the Co-operative Movement. It is further proposed that a development council be set up in each district of the Co-operative Union to plan the filling of the gaps in retail services, and the further development of co-operative trading, both retail and wholesale. A minority report opposes almost

all the proposals of the majority, finding in their definition of spheres of influence an attack on the CWS Retail Society.

## ICI Results

The consolidated accounts of Imperial Chemical Industries and 80 of its subsidiaries for last year, dealt with in some detail on page 696, show a fall of some £3,548,000 in manufacturing and trading profit before tax to £17,222,253. This is fully absorbed by the EPT cushion and, owing to minor adjustments, the net amount available is higher than in 1942 by some £169,000. This is used to strengthen the war contingencies reserve of the parent company, which shows a net increase on the year of £500,000. The surplus of the group is up by £835,500. The fall in profits is ascribed mainly to rising costs without compensating increases in selling prices, probably a result of the scaling down of margins on Government contracts. The only information as to costs is that about £2,200,000 was spent on research and development in the group's own works and laboratories, exclusive of contributions to research associations. The statutory balance sheet shows a number of changes of substantial amount, due in the main to simplification of the group's structure. In pursuance of this policy, the ICI Dye-stuffs, Fertilizer and Synthetic Products, Lime and Paints companies have been liquidated during the year. Against this the group has acquired the whole capital, of a nominal value of £94,900, of Blacklock and Macarthur, paint manu-

## THE LIVERPOOL & LONDON & GLOBE INSURANCE CO., LTD.

## BONUS DISTRIBUTION

A Reversionary Bonus  
on **WHOLE LIFE POLICIES** of  
**£1 5 0 %**  
and on  
**ENDOWMENT ASSURANCES**  
**£1 0 0 %**

has been declared for each full year's premium due and paid during the quinquennium ending 31st December, 1943 on participating policies which have been over one year in force.

In view of the paper shortage, individual Bonus notices will not be issued on this occasion. No communication need be made to the office where the Bonus is to remain as a reversionary addition to the Sum Assured.

Policy-holders especially wishing to take the cash value of the reversionary additions accrued to date should communicate with the Company's Branch on the books of which their policies stand.

undertake to invest the proceeds in Government of India Defence Loans and leave them so invested until actually required. This decision of the Government of India must be viewed from two angles. In the first place it is an official recognition of the necessity for large-scale industrialisation in India after the war. It is hoped in official circles that the development may be greatly helped if corporations are already in existence at the end of the war with adequate funds at their disposal to finance the first stages of that programme. Secondly, the encouragement to raise money now and invest it in Government securities must be regarded as yet another of the Government's anti-inflationary devices. It should help to canalise purchasing power into the hands of the Government, which is where it can, in present circumstances, be most safely immobilised. It must be admitted that the Government of India have hedged their capital issues concessions with somewhat deterrent conditions. In the first place, no prospectus is to be issued until a prescribed proportion of securities for issue has been privately subscribed by and allotted to the promoters themselves and their friends or, in the case of old companies, has been allotted to existing shareholders. Secondly, capital so raised and invested in Government securities will not be released "until the Government are satisfied that the time has come to make corresponding payments for purposes which are consistent with the enforcement of any measures of control or restriction that may be in operation at the time when such release is applied for." The need for caution and for safeguarding the interests of the Indian investor

is self evident. But the virtual blocking of these funds at the discretion of the Government seems to be going rather beyond the strictest requirements and is likely to keep such capital issues down to very modest figures.

### Shorter Notes

The number registered at employment exchanges as unemployed on April 17th was 74,690, compared with 79,037 on January 17, 1944. The figures exclude 18,132 men and boys and 555 women and girls classified as unemployable. There were slight increases in unemployment in the London and South-Eastern region, the South-Western, Midlands, North-Western and Northern regions; the biggest decrease was in the North Midlands, with 2,370 fewer unemployed than on January 17th. A table giving detailed figures of unemployment on January 17th and April 17th appears on page 696.

The National Union of Agricultural Workers at its conference decided to press for a minimum wage of £4 10s. for a 48-hour week. The present minimum is £3 5s., and the union had previously demanded a £4 a week minimum. Another resolution asked for the extension of annual holidays with pay from 7 to 14 days.

#### COMPANY MEETINGS

### ASHANTI GOLDFIELDS CORPORATION, LIMITED

#### FINANCIAL POSITION STRONG

#### SUBSTANTIAL ORE RESERVES

#### MR J. H. BATTY'S STATEMENT

The forty-seventh annual general meeting of Ashanti Goldfields Corporation, Limited, was held, on the 11th instant, in London. The following is the statement by Mr J. H. Batty (chairman) circulated with the report and accounts:

You will notice in the balance-sheet that the conversion of the issued capital into stock, which was sanctioned last year, has been effected. Otherwise there is no alteration in the issued capital or in the share premium account.

The reserves now total £324,859. The amount due to sundry creditors was £134,480, which for the most part has now been paid.

On the other side of the balance-sheet, plant and machinery and main shafts show some reduction by depreciation. There was no shaft sinking during the year, and construction work was necessarily on only a limited scale.

The sundry debtors and payments in advance, amounting to £108,825, includes £72,000 for E.P.T. recoverable for the year under review.

As you will see from the accounts, the loan to Taquah and Abosso Mines, Limited, has now been reduced to £70,877.

#### COMPANY'S STRONG POSITION

The investments in British Government securities were £240,946 and the shares in other companies £529,375. These items have been taken at cost or under market value, whichever was the lower. We have also tax reserve certificates amounting to £400,000 and cash in London and West Africa (including bullion in transit) amounting to £199,266. These total in all £1,369,587.

I think you will agree that the balance-sheet indicates a strong and liquid financial position. I may mention also that the market value of the investments shows an appreciation of £720,000.

We have this year paid in royalty to the Gold Coast Government £91,944 and for Gold Coast export duty on gold premium £205,114. In addition, provision has been made for income-tax amounting to £537,104.

The profit for the year, after making provision for the items shown in the profit and loss account, was £1,088,971, as compared with £1,156,537 for the previous year.

As you are aware, certain of the producing mines were put on a care and maintenance basis in February of last year. This was to ensure the most profitable use of the available supplies of fuel oil and mining stores generally. The cost of the care and maintenance is being borne by the mines still working, in proportion to their respective output of gold. The Corporation's share for the seven months ended September 30 last amounted to £53,941 and is included in the profit and loss account.

As will be seen from the appropriation account, after making provision for taxation mentioned above and for the interim and final dividends amounting together to £499,423 net and the transfer to the pension fund of £10,000, there is a balance to be carried forward amounting to £412,637. This is an increase of £42,444 compared with the amount brought forward in 1942.

#### ADJUSTMENTS OF INCOME TAX

As mentioned in the directors' report, the Gold Coast Government has imposed an income-tax of 5s. in the £, which came

into force on November 1, 1943. The first year of assessment will be the fiscal year 1944-45, and the Corporation's assessment for that year will be based on the profits made in respect of the year ended September 30, 1943. In the case of the final dividend now recommended to be paid, should Dominion income-tax relief be due to stockholders as a result of the income-tax to be paid to the Gold Coast Government, the gross rate of the final dividend will be varied so as to leave the net dividend unaltered.

#### ENCOURAGING TECHNICAL REPORT

Owing to the shortage of paper, it is again not possible to publish the general manager's annual report. This can be seen, however, at the company's office by arrangement with the secretary. The London consultant, Mr G. W. E. Turner, has recently returned from a visit to the mines, and I invite your attention to his comments on the general manager's report. You will note that at the end of his remarks Mr Turner states that: "From all that I saw during my recent visit to the mines, I can assure you that the plant and property generally appeared to have been maintained in good order."

It was a great satisfaction to the directors that Mr Turner expressed a wish to visit the property, and since his return the detailed reassurance which he has given us of the general conditions there may be looked upon generally as most satisfactory.

#### PLANT AND PROPERTY IN GOOD ORDER

You will, of course, appreciate that our activities during the past year were governed by the supply of essential stores and labour at our disposal. Towards the end of the year our resources in both these directions were depleted and some reduction had to be made in our monthly returns. I am glad to be able to inform you that lately there has been some improvement in the supplies of stores and spares. The replacement of European staff, however, continues to give us some anxiety.

The returns for March indicate that the general manager is now finding the position somewhat easier. We are hopeful that before the end of the year our throughput will be of the order of 16,500 tons per month.

Mine development was still on a reduced scale, and although some good individual crosscut values were obtained, these did not enable any increase to be made in the ore reserve. With the lower grade Ayeinm mine closed, in order to save stores and spares, the whole of our throughput has to be drawn from the Ashanti mine.

It is hoped that the limited amount of development which it is possible to do will this year make some additions to the ore reserves as a whole. These now stand at 1,917,523 tons of an average value of 22 dwt., which, on an output of 16,000 tons per month, represents nearly 10 years' supply of ore.

Since the close of the financial year Mr G. W. Thomson has retired from the position of general manager. Mr O. G. H. Gale, who has been in the employment of the Corporation and its associated company (Bibiani (1927), Limited) since 1932, has been appointed to succeed him.

It will, I am sure, be your wish to record a hearty vote of thanks to the staff, both home and abroad, for the good work they have done during the year under review.

### BIBIANI (1927) LIMITED

#### ORE RESERVE POSITION GOOD

#### MR J. H. BATTY'S STATEMENT

The seventeenth annual general meeting of Bibiani (1927), Limited, was held, on the 11th instant, in London.

The following is the statement by Mr J. H. Batty (chairman) circulated with the report and accounts:

Dealing with the balance-sheet, you will note that the conversion of the shares into stock, which was sanctioned at the last general meeting, has been given effect to. There is no change in the amount of the capital or share premium.

The reserve for taxation amounts to £148,809. Sundry creditors at £72,634 is made up largely of trading and other accounts which have since been paid.

Plant and machinery stands at £595,925, which is about £45,000 less than last year, due to the depreciation written off being in excess of the expenditure for the year.

Mine development, after allowing for the amount of £16,800 written off to profit and loss account, is less by £13,000 and now totals £134,204, equal to 18.34d. per ton on the ore reserve of 2,082,106 tons.

Investments in Government securities, tax reserve certificates and cash (including bullion in transit since realised) amount together to £248,000.

In the profit and loss account it will be noted that after debiting our proportion of care and maintenance expenditure of the closed down mines for the seven months (February to September, 1943) amounting to £16,308, and making provision for excess profits tax amounting to £81,000, the profit for the year is £111,781.

In the appropriation account, the interim dividend of 7½ per cent. paid on September 15, 1943, and the proposed final dividend of 17½ per cent. (both less tax at 9s. in the £), amount to £68,750 and the provision for income-tax to £65,707. This leaves a balance to be carried forward of £72,512, which is £22,676 less than last year. It is expected that this will be made good by the amount to be received as the result of some taxation adjustments.

#### TAX ADJUSTMENTS

As mentioned in the directors' report, the Gold Coast Government has imposed an income-tax of 5s. in the £, which came into force on November 1, 1943. The first year of assessment will be the fiscal year 1944-45, and this company's assessment for that year will be based on the profits made in respect of the year ended September 30, 1943.

In connection with the proposed final dividend, I should like to mention that should any further Dominion income-tax relief be due to stockholders as a result of this new tax, the gross rate of the final dividend will be varied so as to leave the net dividend unaltered.

Turning now to the technical side, you will have read the London consultant's comment on the manager's report. Owing to restriction in the use of paper the manager's report is not being published, but can be seen at the company's office by arrangement with the secretary.

#### MINE CONSULTANT'S REPORT

Mr G. W. E. Turner, our consultant, has recently returned from a visit to West Africa, and his assurance that the company's property and interests are being well cared for is very satisfactory.

As you will notice, there was a slight reduction in the grade of ore treated and in the total output. Due chiefly to the increased cost of imported stores, working costs rose 1s. per ton and now total 22s. 11d. per ton, including development. Under the circumstances this is not unreasonable high.

No productive development was done during the year, and the ore reserves have been re-estimated and a small additional

allowance made for stopping losses. As Mr Turner observes, at 2,082.106 tons of 6.66 dwt. ore, our reserve position is an enviable one.

This figure represents 10 years' supply for the mill on the present scale of operations.

We are anxious to resume development to establish the continuation and dimensions of the low grade ore body between the shafts. A winze is being sunk from No. 10 to No. 11 level to prove the downward extension of the high grade ore north of central shaft.

It is hoped to maintain the present rate of output at about the same figure during the current year.

No doubt you will wish to record your appreciation of the excellent work done by the management and staff both at home and abroad.

## BRITISH MATCH CORPORATION, LIMITED

The seventeenth ordinary general meeting of British Match Corporation, Limited, was held, on the 17th instant, in London, Sir Clarence E. Bartholomew, O.B.E. (chairman and managing director of the company), presiding.

The chairman submitted the report of the directors, which states: The net revenue for the year ended April 30, 1944, amounted to £350,184, to which has to be added the balance brought forward, £104,874, and after allowing for the dividends already paid, which absorbed £92,297, there is a balance of £362,761 available for distribution.

The directors recommend placing to dividend equalisation reserve £50,000, the payment of dividend on the preference stock for the half-year to April 30, 1944, and a final dividend on the ordinary stock of 5½ per cent., making a total of 8 per cent. for the year, leaving £128,544 to be carried forward.

The report was unanimously adopted.

## EQUITABLE LIFE ASSURANCE SOCIETY

PREMIUMS EXCEED £1,000,000

The 182nd annual general meeting of the Equitable Life Assurance Society was held in London on the 17th instant.

The following is a summary of a statement by the President, Mr. Desmond Abel Smith:—The premium revenue for 1943 exceeded £1,000,000. After charging certain sums reserved to meet exceptional post-war expenses, the expense ratio was only 5.4 per cent. Claims by death amounted to £404,962, of which about £55,000 was due to the war. Claims in the whole life major profits class again showed remarkable results: on the average £2,219 was paid for each £1,000 of original assurance. New policies for sums assured of £1,858,559 were issued, which was proof of the continuing demand for life assurance. Without addition to the normal premium policies were still being offered under which the war risk was met by a comparatively small deduction from the sum payable at death during war time.

Stock Exchange investments at December 31, 1943, showed an appreciation over book values of about £900,000; margins on other securities brought up the figure to well over £1,000,000. The net rate of interest earned had fallen from £4 5s. 6d. per cent. in 1935 to £3 9s. 7d. per cent. in 1943. After careful consideration, eight years' bonus for the period since 1935 had been declared in the major profits class, for endowment assurance at the rate of 15s. per cent. compound plus 7s. 6d. per cent. simple payable only at maturity, and for whole life 15s. per cent. on the Society's special plan. In the latter case this gave bonuses ranging up to 5½ per cent. per annum for the oldest policy. £128,107 was carried forward, compared with £142,722 after the 1936 distribution.

The report and accounts were adopted.

## THE EMPLOYERS' LIABILITY ASSURANCE CORPORATION, LIMITED

### DANGERS OF UNDER-INSURANCE

The sixty-third ordinary general meeting of this company was held, on the 17th instant, in London, The Rt. Hon. Lord Courtauld-Thomson, K.B.E., C.B. (the chairman), presiding.

The following is an extract from the chairman's statement circulated with the accounts:—Our results for 1943 may be summarised as follows:—Our total premium income was £6,805,931, a decrease of £2,733 over 1942. Our underwriting profit of £239,635 (which is arrived at after charging Dominion and foreign taxes) and our gross interest income of £317,438, together amount to £557,073. The aggregate of the taxes, British and Dominion and foreign, paid or provided for in the accounts, is £652,826. We are recommending a final dividend of 2s. a share, which makes a total payment per share for the year of 3s. 6d. We then carry forward £613,598, an increase of £51,367 on the year. This carry forward of £613,598 is additional to the general reserve of £2,500,000.

The value of the British insurance business as a vital element in our export trade needs emphasis, especially at this present time, when the restoration of our foreign commerce must have a front place in any future planning.

### FIRE PREMIUMS

Our fire premiums show a further increase and produced a profit of £30,827. I think it a duty to remind our policy holders of the importance, in their own interests, of insuring their properties and goods (against both fire and burglary) up to the enhanced values ruling to-day. Insurance cover arranged a few years back, which has been left unrevised, has been found to be seriously inadequate. In most cases, it is not a question of thinking in terms of 10 per cent., or 15 per cent. increase, as frequently the value of the contents in dwellings and business premises has been doubled or trebled.

The premiums in our accident and general account at £6,315,623 show a reduction of not more than £51,612 over those of 1942. In the United States a reduction in premiums was to have been expected, but the skill, resourcefulness and enterprise in management of Mr. Edward C. Stone, our United States general manager and attorney, have once again enabled him to triumph over difficulties. The profit shown in the accident and general account is £208,808.

There is an increase of £415,259 in our investments, which (including freehold and leasehold properties and our associated companies) amounted at December 31, 1943, to £10,981,518.

### ENHANCED VALUES

The chairman, addressing the meeting, said that he wished to emphasise the paragraph in his circulated statement in which he dealt with the importance of insuring properties and goods, against both fire and burglary, up to the enhanced values ruling to-day. They felt a certain responsibility in the matter because, if they accepted premiums, that almost carried with it the implication that if fire or burglary took place they would pay a sum which would go substantially towards the expense of replacing the lost articles. He thought that few realised the extraordinary rise that had taken place in values and he drew attention to a recently published statement by Col. H. B. Spens, giving a comparison of pre-war prices with present-day second-hand prices, which justified his (the chairman's) statement to the effect that people should think not in terms of a 10 per cent. or a 15 per cent. increase but from the point of view that their articles had trebled or quadrupled in value.

The report and accounts were adopted.

## COMMERCIAL UNION ASSURANCE COMPANY, LIMITED

### MR. J. F. G. GILLIAT'S REVIEW

The annual general meeting of the Commercial Union Assurance Company, Limited, will be held on the 23rd instant in London.

The following is an extract from the statement of the chairman, Mr. J. F. G. Gilliat, circulated with the report:—

In the fire department the total premium income amounts to £6,298,368, being an increase of £352,795 over that for 1942. There was a substantial advance in the home premium income, largely because of enhanced values, and a welcome improvement in the loss ratio, although the year was not without fires of magnitude, but there was not the frequency of heavy losses which caused so much national concern in 1941 and 1942. Our business overseas represents a large portion of the total premium income. In the United States there was some expansion of premium income, but only a small margin of profit. In the Dominions, the Colonies and elsewhere overseas we have had a satisfactory year on the whole.

In the life department, for the first time since 1938 the new sums assured exceeded £5,000,000, of which, after deducting amounts reassured, the sum of £4,897,233 was retained at the company's own risk. In addition, 1,211 immediate and deferred annuities for a total of £44,146 per annum were issued. The total premium income for 1943 was £2,147,205, showing an increase of £57,031, whilst the life fund increased by £649,002 to £31,360,982.

### SATISFACTORY PROGRESS OF LIFE FUND

After a careful review of the facilities offered by the company for covering war risks under life assurance policies, the directors announced that as from October 1st, 1943, the extra premium charged to civilians to cover war risks within the land limits of the United Kingdom and Eire would be reduced to 5s. per cent. per annum. In view of the satisfactory progress and economical working of the life fund, the directors have decided to increase the rate of interim bonus applicable to claims by death or maturity during 1944 to a rate equal to the full rate of reversionary bonus declared at the last distribution of profits, which took place as at December 31st, 1942, but they reserve the right to amend the rate of interim bonus without notice if in their view it is necessary to do so.

The premiums in the marine department totalled £1,673,190, showing a decrease of £1,315,963. With the marine fund at 165.7 per cent. of the premium income we are satisfied that we have provided for all contingencies and can look to the future with confidence.

In the accident department the premium income amounted to £7,734,749—£845 less than that for 1942. The motor income (world wide) was further reduced by nearly £300,000, and this has been made up by increases in nearly every other class of accident business. Overseas accident business has contributed largely to the profit: we have valuable business in the British Commonwealth, the United States and in South America.

In the profit and loss account, gross interest, dividends and rents at £1,118,220 show an advance of £16,721, while the transfers from departmental accounts are £450,000 higher at £2,250,000. On the other side the amount paid and provided for United Kingdom taxation and for Dominion, Colonial and Foreign taxes exceed last year's figure by £295,232 and have now reached £2,210,915, very nearly absorbing the whole of the departmental transfers. The balance will meet the cost of the final dividend of 3s. 6d. per £1 stock recommended by the directors, and leave the amount to be carried forward £83,474 greater at £306,828.

## INCORPORATED ACCOUNTANTS

### 59th ANNUAL MEETING

The annual meeting of the Society of Incorporated Accountants was held at Incorporated Accountants' Hall, London, on the 18th instant.

Mr Richard A. Witty, F.S.A.A. (the president) said: The report cannot purport to reflect the many activities of the Council. I have communicated with members known to be prisoners of war. I am glad to say that our examinations were held in prisoner of war camps, and it is a tribute to British courage and to the character and tenacity of the men themselves that most of them passed.

The research committee have been engaged on matters of current and future interest and have made valuable contributions to Accountancy. The volume on the "Design of Accounts" has now been published by the Oxford University Press.

### DEMOBILISATION PROBLEMS

A committee of the council is considering problems which must arise on demobilisation. In the last issue of "Accountancy" the council published concessions to pre-enlistment article clerks and by-law candidates.

It was necessary to deal generously with all candidates whose training had suffered interruption, but at the same time to ensure, in the interests of the candidates themselves, that proof shall be given of fitness for the qualification of incorporated accountant. Briefly, the time spent by article clerks in the Forces will be considered as equal to two years of their training in the case of five-year articles and to one year in the case of three-year articles for graduates. Thus, the article clerks will only be called upon to prove actual professional training of three years or two years. In addition, they may be exempted from the intermediate, but must in every case pass the final examination. In the case of special by-law candidates the requisite periods of actual professional service are correspondingly reduced.

The inquiry by the Cohen Committee on Company Law Amendment has attracted considerable public interest; the views of the Society have been submitted, and oral evidence has been given by Mr E. Cassleton Elliott, F.S.A.A., past president, and Mr A. Stuart Allen, F.S.A.A. In conjunction with other accountancy bodies a memorandum on post-war fiscal policy was prepared at the request of the Board of Inland Revenue, and the Chancellor dealt extensively with the subject in his Budget speech.

Coordination between the various management bodies and the relation of accountancy to management have been under consideration. Widespread public interest has manifested itself in the future of small businesses, and the Society made

proposals to the Board of Trade as to financing small businesses after the war.

### COORDINATION IN THE PROFESSION

During the past year some definite progress has been made in the general scheme for coordination in our profession. Complete agreement has not yet been reached, but we are still hopeful. Should those hopes not be realised, then we may find that our labours may result meantime in a joint committee representing chartered and incorporated accountants in England and Wales, without the wider scheme of complete coordination for the whole profession.

Committees of the Council and other members have devoted a considerable amount of time to matters initiated by the Government. A big demand has been made upon the time of Council members, who have not hesitated to call upon other members of the Society who were particularly qualified to help in the matters under review. A still bigger demand has been made upon the time and energies of our secretary, Mr A. A. Garrett, and his staff.

## RIO TINTO COMPANY, LIMITED

### SUPPLY DIFFICULTIES

### LORD GEDDES ON THE POSITION

The seventy-first ordinary general meeting of the Rio Tinto Company, Limited, was held, on the 18th instant, at 11, Old Jewry, London, E.C.

The following is the statement of the chairman, the Right Hon. the Lord Geddes, G.C.M.G., K.C.B., circulated with the report and accounts:—

I hope that you will consider the accounts for the year ended December 31, 1943, satisfactory in view of all the circumstances and difficulties of the period. With the Continent of Europe outside Spain closed to us by war conditions it has not been easy to make ends meet. In 1942 we drew from the peseta balances built up in Spain £194,660, and even so we were only able to add some £7,000 to our carry-forward after meeting all our liabilities. In 1943, although the accumulated peseta balances had been used, we have nevertheless been able to pay our taxes; meet our debenture interest and redemption liabilities; earn our preference dividend and add more than £3,000 to the carry-forward. Owing to difficulties of supply, particularly as regards fuel, we have not, however, been able to maintain to the usual extent our installations and pre-extraction work.

I think I should explain that the large peseta balances formerly held by the company in Spain have now been utilised to defray expenditure during the difficult period through which we continue to pass. As the peseta balances now held are required for current expenditure, etc., the item "£ equivalent of net peseta balance utilised" disappears from the revenue account.

### OUTLOOK IN NORTHERN RHODESIA

For reasons of security I cannot give you any details about our great investments in Northern Rhodesia beyond saying that in my view their present situation and outlook are satisfactory, though, of course, there are many current and prospective problems to be solved. I have, however, no doubt that reasonable solutions will be found for all of them. Last year I addressed you at some length on the direct and indirect benefits the existence of the London Mining market confers on British industry. I am glad to be able to tell you that the views I then expressed appear to be gaining ground in responsible quarters, and I venture to hope that before long they will have found fuller acceptance.

In conclusion, I desire to express my thanks to the staff at home and abroad for the admirable way in which they have carried on in a time of very great difficulty.

The report and accounts were unanimously adopted.

## STEWARTS AND LLOYDS, LIMITED

### SOUND POSITION

The fifty-fourth ordinary general meeting of Stewarts and Lloyds, Limited, was held on the 18th instant, at the registered office of the company in Glasgow.

Mr A. C. Macdiarmid, the chairman, who presided, said: Gentlemen, I propose to read to you the relevant portion of my statement circulated with the report and accounts.

Stockholders will appreciate that it is still inadvisable and, in fact, impossible for me to review the company's multifarious activities in the manner followed in normal times. The accounts submitted show that the company's affairs are in a sound condition.

### STANTON IRONWORKS DIVIDEND

It will be noted from the statement of consolidated profits that no interim dividend has been included from the Stanton Ironworks Company, Limited, in respect of that company's financial year ended March 31, 1944. A full year's dividend from this subsidiary company will be included in the parent company's accounts for 1944.

The stockholders are indebted to the staff and employees of the company for a further year of unremitting effort. On your behalf the directors wish to express their appreciation.

The report and accounts were adopted.

It was resolved to pay the dividends detailed in the directors' report and carry forward £190,460.

The retiring directors were re-elected and the auditors were re-appointed.

# RECORDS and STATISTICS

## INDUSTRY AND TRADE

**National Arbitration Tribunal.**—On his appointment as a Lord of Appeal, Lord Simonds has given up the Chairmanship of the National Arbitration Tribunal. The Minister of Labour has appointed Sir John Forster, who has been one of the Appointed Members of the Tribunal since it was set up, to succeed Lord Simonds. He has also appointed Lord Terrington and Mr William Gorman, K.C., to be additional members of the Appointed Members of the Tribunal. In addition to Sir John Forster the members already serving on the Panel are Sir David Ross, Sir Francis Floud, Sir Hector Hetherington and Mr A. N. Shimmir.

**Coal Output Figures.**—Major Lloyd George announced in the House of Commons that monthly publication of coal output figures is to be discontinued, since the district output bonus

scheme has been abandoned in the new wage structure. Instead, a White Paper is to be issued in the near future, giving figures of output, manpower, absenteeism, since 1938. The salient items will be published quarterly in the *Board of Trade Journal*.

**Reconditioned Battledress.**—Limited supplies of reconditioned battledress uniforms, dyed green, are now to be made available to the general public at 21s. and 6 coupons a suit. (Blouse and trousers are not sold separately.) These garments have hitherto been reserved mainly for agricultural workers, but may now be sold without restriction. The bulk of the battledress uniforms will be in small sizes and supplies are not likely to be large.

**"The Economist" Sensitive Index.**—There was no change in the index during the week ended May 17th. The complete index (1935 = 100) was 158.6; crops 135.6; and raw materials 185.5.

change has been made in the method of showing excess of Post Office Expenditure over Post Office revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £78 to £2,833,671, the other operations of the week (no longer shown separately) added the gross National Debt by £31,533 to £19,978 million.

## Trade and Employment

THE dispute that has been proceeding, in both Houses of Parliament and in the correspondence columns of the press, on the latest version of the international currency proposals, has generated more heat than light. Clearly there is a bone of contention somewhere, but the ordinary citizen can be forgiven if he has difficulty in deciding what it might be. There is a twofold reason for the obscurity. The first is that the subject is technical and complex, with an intractable vocabulary. The second is that, though no one will acknowledge it publicly, the currency proposals are only the occasion for the dispute and not its substance. It is the conditions of trade that are in everybody's mind—the rules for buying and selling, not for making payment. Those who object to the currency plan do so because they suspect it of foreshadowing commercial arrangements (such as the abolition of imperial preference) which they consider undesirable. Those who most fervently support the plan do so as the first instalment of the system of trade they desire.

This obscurity is perhaps inevitable, but it is also greatly confusing. There is no reason why the currency plan, as a currency plan, should not be approved. In its revised form, it is sufficiently flexible to be accommodated with any trading regime that is likely to be agreed upon. That is a comprehensive judgment to which, perhaps, one or two qualifications should be added by

way of footnotes. There are a few obscurities which should certainly be cleared up, especially in relation to the precise nature of the reciprocal arrangements that it will be permissible, under the plan, for countries to make with each other—the point on which the Chancellor of the Exchequer himself has had to confess some uncertainty. But these are causes for clarification, not for condemnation. In regard to trading arrangements, the scheme is neutral, neither a positive help nor a negative hindrance. To accept the currency plan, as Sir John Anderson has said, is not to accept a commitment in the wider field. More than that, to reject this first of the agreed post-war plans on no better grounds than mere suspicion would make the worst possible impression.

The real argument, to repeat, is not about currency but about trade, not about finance, which it is generally agreed should be a camp-follower, but about economics. But here again there is a great deal of talking at cross purposes, and by far the greater part of it is due to the failure to make clear the assumptions on which conclusions are based. This is a criticism that cannot fairly be directed against the Report on "World Trade" issued by the British National Committee of the International Chamber of Commerce, for its assumptions are laid bare beyond any possibility of misunderstanding.

The Report is, in substance, a plea for a return to what

(Continued from page 696)

asked to pay £60,000,000 against TDR's this week which was about £7,000,000 less than the effective maturities. On the other hand Treasury bill payments were again £20,000,000 in excess of maturities. The discount market, moreover, had to find an exceptionally large proportion of the £110,000,000 paid for new bills this week, as the syndicate obtained a 41 per cent. allotment at last week's tender. The result of these various factors has been a further immobilisation of credit in Public Deposits, these having risen by £4,427,000 to £16,571,000 over the week to last Wednesday. Bankers' deposits have at the same time risen by £1,091,000 owing partly to a contraction of £2,932,000 in the note circulation.

**MONEY RATES, LONDON.**—The following rates remained unchanged between May 11th and May 18th:—  
Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-½%; 6 months, 1½-½%. Treasury Bills: 2 months, 1-½%; 3 months, 1-½%. Day-to-day money, 1-½%. Short Loans, 1-½%. Bank deposit rates, 1%. Discount deposit at call, ½%; at notice, 2%.

**Exchange Rates.**—The following rates fixed by the Bank of England remained unchanged between May 11th and May 18th. (Figures in brackets are par of exchange).

is commonly called "the liberal system of international trade." The Report believes that

the most effective instrument for securing the economical distribution of production is a world market to which all have access without favour or discrimination; and in which rules a world price, locally modified by transport charges and as little as possible by tariffs.

The chief recommendation of the Report for achieving the return to a world market is the acceptance by all nations of an Economic Code to govern their conduct. This Code would provide for the reduction of economic barriers, for "demolition of much of the vast structure of administrative regulation of economic relations," for friendly consultation between Governments before they take important decisions, for the abolition of all forms of discrimination and the like. The line of argument is familiar and need not be further specified. Indeed, it is incontestably right—within the bounds set by the assumptions on which it is based. In the circumstances envisaged by the Report, no other course of policy rests on any justification more worthy than the protection of vested interests.

One of the basic assumptions of the Report is that there shall be "a fundamental change of heart among the peoples . . . with the recognition that the prosperity of a neighbour is bound up in one's own prosperity." The authors have also made the deliberate assumption that "the peace which will follow the war will be a real peace, in which policies will not have to be framed in the fear and early prospect of a recurrence of war." The authors are also quite clear that, unless a high degree of economic stability (a better term than "full employment") can be attained, their hopes will not be realisable. All this is very logical. In a world that has abandoned short-sighted selfishness, that is firmly at peace and that enjoys economic stability—in such a world there can be no dispute that a free, open, non-discriminating world market is the incontestable object of economic policy. In the old arguments of the Free Traders *versus* the Protectionists, which were (sometimes tacitly) based on these assumptions, the Free Traders unquestionably won the victory.

It is right—and this can be said without any intention of irony—that these ultimate principles of world trade should be once more re-stated. They are the goal towards which all efforts should be directed. The Report does not, however, go on to consider in similar detail what should be done if its assumptions were, lamentably, not fulfilled, if the change of heart was incomplete, if the fear of war was not exorcised, if some countries continued to suffer from boom and slump. But the Governments have to take these contingencies into account, and the solution they find may be rather different. This divergence between precept and practice has been observable now for many years. At least since the first International Economic Conference at Geneva in 1927, there has been virtual unanimity among the experts, whether drawn from academic life or from chambers of commerce, on the necessity for a liberation of trade; and for at least as long the Governments, often consisting of exactly the same sort of people, have been equally unanimous in doing the opposite. This has not been due to any fault in logic on the one side or to any overdose of sin or stupidity on the other. It has simply been due to the fact that the experts have been prescribing for one world and the Governments have been acting in another. It is right that the principles of trade for a stable, peaceful world should be refurbished. It is also right that some thought should be given to the course to be pursued in other contingencies.

The most obvious of these other contingencies will arise in the period immediately after the war. Many of the United Nations will be devastated or despoiled, all will be dislocated. Great Britain will have escaped with comparatively little physical destruction, but since the accidents of war have led the British Treasury to assume the financial responsibility for large portions of other countries' real war efforts, we shall be substantially impoverished. It is quite clear that the transition from war to peace, and the adjustment, for Great Britain and other countries, to a new equilibrium of imports and exports, cannot be

achieved by the processes of the open market and the free fluctuations of the world price-level. On the contrary, very direct and possibly drastic methods will be needed. It will be the British endeavour to accomplish these adjustments by methods of trade and negotiation as closely similar as may be possible to those that would be prescribed in a code of fair conduct. It is certainly true that no strong-arm methods will avail for long if British products are not competitive in price and quality. But much will depend on the response of the outside world. To say that Britain will not be able to import unless other countries will buy British exports is not a challenge; it is a plain statement of fact. But it remains to be seen whether other countries, especially those that will be enriched by the war, will draw the obvious conclusions about their own behaviour without more direct reminders and more specific illustrations of the force of logic.

There is, however, no difference in principle over this transition period. By universal agreement, it is an exception from the more permanent prescriptions. Nor, perhaps, will there be any difficulty over the length of the transition period. The experts' plan seems to envisage three years, which is quite certainly too short; but in his speech in the House of Lords on Tuesday, Lord Keynes referred to it as "of uncertain duration." But the transition from war to peace is by no means the only possible set of circumstances in which the world will not be sane, peaceful and stable. On the contrary, much the same situation will inevitably arise whenever any major trading country allows itself to suffer a depression. It will soon be possible to judge whether or not the British Government's proposals for reasonable stability of employment give promise of being adequate and effective. But nothing is known of full employment policies in other countries; and in some the trend of opinion is away from any conscious economic management. The Report on "World Trade" holds that "a free and abundant flow of trade offers the greatest safeguard of stability." If this means that a flow of trade that is both free and abundant is an aid to stability, it is obviously true. But if it means (as the context would suggest) that the mere leaving free of international trade will make it abundant, it is obviously wrong. In international trade no more than in domestic economics will the mere absence of initiative and direction produce conditions of abundance. In a complex industrial society such as ours slumps are things that certainly will happen unless they are prevented. It is the purest common-sense that those countries that are taking effective steps to prevent depressions within their own borders should be allowed to protect themselves and to join together to protect each other against the "import of unemployment" from other countries that have either neglected their duty or have been unsuccessful in their efforts.

This is the crux of the question. Will the contemplated arrangements allow Great Britain to join with other like-minded nations in measures designed to maintain their mutual trade in the event of depression elsewhere—and will it be allowed to do so, not merely in a short transition period, but indefinitely? On this vital point, Lord Keynes sought on Tuesday to be reassuring. He appeared to maintain, in answer to Lord Balfour of Burleigh, that reciprocal arrangements between pairs of countries to maintain their mutual trade—the example given was of New Zealand undertaking to spend on British manufactures the proceeds of butter sales in the United Kingdom—would be permissible if they were voluntary on both sides and involved no blocking. If this is accepted by the Americans, it is a point of the most capital importance.

The essential point still in doubt is a simple one. Is the theory of international trade adjusted to the new doctrine of full employment? But simple though this is, it is nearly always misunderstood or misrepresented. It really serves no useful purpose to characterise as Schachtians or autarkists those who raise these very crucial questions. For the experts may draft and the Governments may sign a score of plans; but if they come to be believed to stand between any country and the prevention of mass unemployment, they will infallibly go the way of the gold standard.

## Good Europeans?

THERE are some occasions which seem in every sense designed to be the framework of some historic utterance. This week's debate on foreign policy in the House of Commons was such a one. Here on the eve of the liberation of Europe the leaders of Britain had the opportunity to tell the peoples of Europe the ideals and purposes for which the Allied armies would fight, to appeal for their co-operation in peace as well as war, and to give them a heartening message of goodwill and friendship on the eve of the terrible ordeal into which, through the process of liberation itself, they will be plunged. This was a time to speak for Britain.

Yet Mr Churchill did not take this opportunity. Not even his most fervent admirer could call his opening of the debate an historic speech. It was instead yet another progress report, another *tour d'horizon* in which a great many current problems were touched on and discussed and from which no broad picture or general statement of British policy emerged. Listeners were left to build what they could from the fragments. Only on the question of a world council did Mr Churchill give any reference to the larger perspectives of foreign policy, and here he only repeated what has already been many times underlined, that there must be a Council and it must command adequate force to keep the peace. Otherwise the only principle enunciated was a purely pragmatic one.

At this time, in policy and in war, our objective is the same—namely, to beat the enemy as soon as possible. And I am not aware of any action or of any studied inaction for which His Majesty's Government is responsible that has not been directly related to this single and dominant purpose.

Within the limits imposed by this principle, Mr Churchill had a number of interesting things to tell the House. Turkey, out of excessive caution, has refused either to enter the war or grant the Allies use of its bases. Now, Mr Churchill said bluntly, it was too late for the Turks to be of much service. The Balkans could be conquered without them, and they must not now expect a particularly good place at the peace conference. From Greece he reported the good news of M. Papandreou's success and the likelihood of restoring unity to the Greeks. From Yugoslavia he gave the news that King Peter, in reforming his Government, would break with General Mihailovitch, who had been himself inactive and some of whose subordinates had actively helped the Axis. Mr Churchill hinted that this change might lead to the restoration of Yugoslav unity. Turning to Italy, he referred favourably to the formation of Marshal Badoglio's new Government, and declared that after the war the people would be free to choose their own form of democratic government.

I emphasise the word *democratic*, because it is quite clear that we shall not allow any form of Fascism to be restored or set up in any country with whom we have been at war.

From Poland, Mr Churchill could report no progress, save his belief that the Russians and Poles are not so divided as they seem on the surface. Finally, in the case of France, he announced that General de Gaulle was coming to London to visit him, but that neither Britain nor the United States could give his Government full recognition. The reason was given with astonishing bluntness. There can be no recognition

because we are not sure that it [the National Committee] represents the French nation as the Governments of Britain and the USA and the Soviet represent their countries.

Such, with one important exception, was Mr Churchill's *tour d'horizon*. It does not tell either the British people or their Continental allies very much about future British policy. It cannot be said that it sounds a trumpet or sets beacons ablaze. Like so much in British diplomacy recently, it is temporary and military and expedient. Yet it is possible to trace one coherent line through the different negotiations. Nearly all the problems touched on by Mr Churchill concerned Governments, their representative or non-representative character and the extent to which this affected British recognition. The French Committee is not to be recognised because it is not "representative." The Greek government has overcome its crisis by coming to represent all the sectors of Greek opinion and action. The Yugoslav Government is being reorganised towards the same end. In Italy, the people are to choose their democratic government freely, and after the war neither Germany, nor Italy, nor Hungary, nor Roumania, nor Bulgaria, nor Finland, is to be permitted to set up a fascist regime. Can we then assume that British policy is committed to a rebirth of free constitutional government in Europe and that all its weight will be thrown into the scale on the side of genuinely popular and representative governments? If that were so, then undoubtedly Britain could play a great part in post-war Europe, giving precept and example both in political freedom and in economic progressiveness. Is it possible to conclude, from the scattered references in Mr Churchill's speech, that this is the direction in which British policy is moving?

It might be, were it not for the quite inexplicable references to Spain. In a speech made to the world on the eve of the greatest joint operation in history, Mr Churchill spent a good quarter of his time talking about neutral Spain. Now it may be that there is some vital if obscure military reason why, at this particular moment, the Prime Minister should be at such pains to mollify General

Franco. But if Spain is to help the Allies in the Second Front, it would surely be quite impolitic to give the enemy the least suggestion of it. And if Spain is not helping the Allies or about to help the Allies, why devote such fulsome praise to its leaders? If this is not military and expedient, then what is it? "I am here to-day," said Mr Churchill, "to speak kindly words of Spain." He certainly did; but why?

Mr Churchill is grateful to Spain, first, for not fighting the Allies, and, secondly, for coming to the recent agreement over Nazi agents, Tangier and wolfram. He is so grateful that he looks forward to increasingly friendly relations and to "extremely fruitful trade" with Spain after the war, and hopes that it will be a bulwark of peace in the Mediterranean. And obviously it is to this Spain, to Franco's Spain, that he refers. He had nothing but hard words for those who attacked Franco, and went out of his way to say that the government of Spain was a matter for Spaniards to decide. It is very difficult to make sense of the episode or to fit it into a rational framework. Why should Britain be grateful to a non-belligerent ally of Hitler because it was shrewd enough not to make Italy's mistake? It may have been a great convenience to us that Spain did not stab us in the back in 1940, 1941 or 1942; but Spain did not practise caution for the love of the British, and it is hard to see why Turkey should be blamed for caution at one end of the Mediterranean and Spain praised for it at the other. The wolfram agreement is niggardly compared with Turkey's complete ban on chrome. Yet Turkey got "blunt" not kindly words.

Spain has not been neutral. Until this year, its Fourth Arm of propaganda has been entirely at Germany's disposal and has done the Allies some harm in South America. With Russia, Spain has been unofficially at war, and it is sheer quibbling to say that just because the Blue Division was not fighting Britain in North Africa, Spain was not ranged among its enemies. The Hungarians have not fought the British; nor have the Finns. Yet, because of their attack on Russia, Britain is at war with both. At a moment when Russian confidence in Britain's intentions is a vital factor in the strategy of war and

peace, it is very curious procedure to give only a glancing reference to Russia's part, but four columns of quite extravagantly kindly words to Russia's enemy.

It is not only ill-judged in itself, it throws suspicion on all the more liberal passages in the speech. Mr Churchill admitted openly that he thought Fascism a cause of war. If in Italy, why not in Spain? The British know that it is not their business to impose a Government on Spain, but they are at a loss to understand why they should pretend to like this one, or why the French Committee should be thought so much less representative than a Government which had to fight a three-year civil war with massive foreign help to get into power at all. Since all the rest of Mr Churchill's speech was about free and representative government, would it not have been tactful to leave General Franco out?

Finally—and this is by far the most serious criticism—can anyone maintain that this is the time to praise and double-praise a neutral and hostile European government? The invasion will come any day now. Presumably it will not lie through Spain. It is not the people of Spain who will struggle and suffer. It is not the Spanish Army that will be fighting by Britain's side. It is not on the loyalty and steadfastness of Franco that the British will have to rely. What of Holland? What of Belgium? What of Norway? Above all, what of France? Was it really right to devote so many words to Spain and none at all to the sacrifice and devotion of the resisting peoples? If Mr Churchill had addressed to France and the French Committee one tithe of the effusions he devoted to Spain, every Frenchman would have faced the coming of British troops with warmer hopes and readier friendship. Of all the peoples in Europe at this decisive hour, the Spaniards are probably the least important. Thus Mr Churchill did not only miss a great historic occasion. It may well be that he also made a great historic mistake. The future of Europe will be decided by the fighting of the next months. Propaganda will be a factor not to be despised in the total conflict; and it must be regretfully recorded that on the eve of invasion, Britain's Captain General has sent out his forces to meet their allies with the wrong words ringing in their ears.

## Reparations and Recovery

IT is difficult for the countries which have escaped invasion to imagine the state of devastation and economic collapse to which their continental allies have been reduced by the German war machine. Russia is the supreme example of the sufferings and losses of this war, but by the end of the war the other European nations may have suffered quite as bitterly. It is not surprising that their approach to post-war problems is dominated by two ideas—the speediest possible reconstruction of their shattered economy and the ruthless punishment of the German aggressor.

These two desires tend to be fused together in a single policy of reparations. The Germans are responsible for the damage and the Germans must therefore make the damage good. The experience of the last war has made the nations rather chary of financial reparations. In its stead, the vogue is for physical reparations. There have been suggestions that the economic structure of Germany should be broken down, its factories dismantled and the machines despatched to the Allies to make up for the destruction of their own industrial capacity. The Russians have officially discussed, and may even have officially proposed, a scheme for mobilising a very large percentage of Germany's adult men to work in forced labour units in all the territories they have devastated.

Although these suggestions are not yet very precise, their direction is obvious, and it is extremely important at this early stage to disentangle the issues and make it perfectly clear that restitution and punishment are not the same thing and may easily be contradictory. Strong as the desire of Germany's victims must be to see

justice done and punishment imposed, their desire as ordinary men and women is still more to get bread into their mouths and a roof over their heads and to see orderly conditions of work and trade restored. There can be no question that after the first mood of victory has passed, the desire for recovery will be more widespread than the desire for vengeance and punishment. It would be politically dishonest to offer people the economic punishment of Germany as a means of Allied economic reconstruction, when every experienced statesman and businessman and economist knows that most forms of economic punishment delay the return of prosperity and the restoration of normal economic life.

Let us imagine that the most extreme forms of economic punishment are imposed and that Germans are sent in forced labour gangs to work in France, in Norway, in the Balkans, in Siberia, and that the German industrial system is systematically broken up and transferred elsewhere. This would mean that in the heart of Europe 70 million people would be condemned to so low a standard of living that they could make no contribution either as buyers or sellers to the recovery of European prosperity. The fact that they include the most disciplined and one of the most skilled labour forces in the world would increase the general loss in economic well-being. To suppose that the withdrawal from production of so great a productive machine could have any but disastrous consequences for its neighbours—and, indeed, for people with low living standards the world over—is so obvious that it is hard to understand how cheerfully some distinguished spokesmen seem to envisage the prospect. Or,

to turn to more specific examples, it is surely not necessary to repeat the experience of the last peace in order to learn all over again that financial reparations are a disruptive force in the economy of the receiving nation. Nor are the extreme varieties of "physical reparation" much better. Forced labour is notoriously the most unproductive and the most wasteful form of labour, and to dismantle old factories and to transfer worn-out plant could only be justified as a counsel of despair, if there were no other way of making good the Allies' losses. Besides, it is not possible to divorce the economic effects of a faulty reparations policy from its long-term political consequences. A nation of 70 million people deprived of their means of livelihood are not likely to recover any political stability. The policy is perhaps conceivable only as part of a plan of total and detailed control and supervision of Germany by the Allies, lasting one or two generations. It may be that the United Nations are ready for this. Everything in their past history suggests that they are not. It is the old problem of designing a policy which will be practical not only in the hour of victory but fifteen years after the peace.

Does this mean, then, that the two chief and perfectly legitimate desires of the ravaged countries—recovery for themselves and punishment for Germany—must go unsatisfied? Such an outcome would be so flagrant a deviation from justice that the Allies would be compelled to reject it. A plea for sanity on the question of reparations is not a plea for disappointing Germany's victims whilst sparing Germany itself. It is simply an attempt to keep recovery and punishment in two separate categories, and to prevent punitive policies directed against Germany from baulking all hope of rapid economic recovery among the Allies. Naturally, the devastated nations must receive help in rebuilding their economic system, but it should be real help, not illusory help such as forced labour gangs or reparations paid out of loans from the richer Allies. It should be possible for some definite period, say five or ten years, to give especially favourable trade advantages to Hitler's chief victims. Commercial treaties might include "most devastated nation" clauses. The contributions that can be demanded from the Germans will be much larger if they are allowed to continue to work an industrial economy from which to make that contribution. For example, the Allies could, perhaps, devise a scheme to keep the German people at their present standard of living for a three- or five-year period and to divert the surplus which now goes into armaments to the making of capital goods for the devastated nations. Russia would get far more out of the delivery of machine tools, precision instruments, tractors and cars turned out under mass production conditions in German ex-war factories than by carting off Germans to work in Russia. A policy of diverting German output to capital goods for the devastated areas would entail Allied control and Allied occupation. For this reason if for no other, it would have to be limited to a definite period of years.

The essential thing in any thinking on the subject of reparations is to preserve a sense of logic and realism. There is no reason why emotion and a passion for justice should be excluded. Indeed, they cannot be. The German people bear the heaviest measure of collective guilt of any nation in history. An outraged Europe demands justice, and to refuse it would invite disastrous results. But justice must be tempered with reason. When it is so tempered, three principles suggest themselves. The first is that all things change with time. For example, it is foolish to argue, in general terms, for or against a "severe" or a "lenient" peace. To suppose that the Allied peoples can love the Germans as their brothers on the very morrow of the war would be as absurd as to suppose that democracies will be willing indefinitely to shoulder the very heavy burdens of policing and administration that a severe peace would entail. Clearly, the peace should be planned to be severe at first and less rigorous later. To keep the German people at a condition of economic disadvantage for five years, consuming only half of what they produce and surrendering the rest to their

former victims, is reasonable. To inflict permanent impoverishment on them is not. Reparation can be pursued by the Allied Governments without any consideration for the German people's welfare for just as long as the Allied peoples have no consideration for the German people's feelings—but for no longer. Penal servitude for five years is as severe a sentence as can be enforced.

The second principle is that, even within the preliminary period of maximum severity, it would be foolish to pursue the economic punishment of Germany in such a way that it entailed the economic punishment of the Allies themselves. In short, it is right to transfer to the Allies the command over such wealth as Germany possesses. But to insist on transferring the wealth itself may, in most cases, mean to destroy it.

The third principle is that, since the supreme objective is to prevent the Germans from making war, not to make them poor as an object in itself, precedence should be given to the political over the economic. This has repercussions both in German and in Allied psychology. There is a limit to the amount of disability that the democratic Allies will be willing, after the first few years, to impose on the Germans. And since every disability imposed requires an effort of policing, there is an even clearer limit to the amount of disabilities that the Allies will be willing to go on enforcing. This being so, let us by all means concentrate our energies upon the enforcement of disarmament, with only such economic disabilities as are incontestably necessary for that end. And, at the German end, since no peace can be permanent to which the German people have a permanent objection, it is surely the path of wisdom to limit their lasting grievances to those to which they might conceivably become reconciled. There is a chance of the Germans settling down under military discrimination, if they are not at the same time deprived of their means of livelihood. But to combine economic impoverishment with military inequality is to make the German problem for ever insoluble.

## NEW HOUSES

are not being built yet . . . what about  
buying the house you are renting?

Your landlord may be willing to sell you the house in which you live. Consider the advantages. You know the house. You avoid the worry of house-hunting and the expense of moving. The price may in your case be as favourable now as at any time for years. So if you want to make sure of a home now talk the matter over with your landlord. We are very willing to help you; ask for our Home Ownership booklet.

## NOTES OF THE WEEK

### Towards Rome

Kesselring's long overdue withdrawal towards Rome seems now to be in full swing. A week after the fall of Cassino and the breach of the "Gustav Line" by the Allies, the "Hitler Line" has been cut in two by the Canadian advance to the Melfa Valley. In the coastal sector, Terracina has been taken by the Americans. After a series of alternating thrusts, and after much probing of the enemy's defences, his weakest spot seems now to have been found in the coastal region, where the German withdrawal has been deepest so far. It looks, indeed, as if Kesselring intended to retreat on his right flank, while using his left flank in the mountains around the Liri Valley as a fixed pivot, though the prospect that this pivot, too, may soon be unhinged by the Allies looks very likely at the time of writing. Kesselring's right flank is dependent for its supplies on the Via Appia, which is also the only convenient road for retreat. It is against this road that the main Allied thrust from the Anzio beach-head is directed. The Americans here have closely approached Via Appia on a fairly wide sector to the south-east of Cisterna, while the British attack across the Molletta seems designed to secure the flank of the American thrust. The chances of an interception of Kesselring's retreating right flank are very good indeed; and the Germans, it is to be hoped, will now learn how premature their sneers about the Anzio failure have been. The time has not yet come to try to unravel the riddle of the Italian campaign since its outset, or to analyse all the considerations that have dictated the prolonged lull there. Now that the lull has finally come to a close, the possibilities of the Allied pincer-moves from the mainland and the beach-head are obvious. The superiority of General Alexander's forces over those of Kesselring is still partly veiled by the advantages which the lie of the land offers to the defender. The Allied soldiers have already learned to reduce those advantages by a highly original co-ordination of weapons and men. In the attack infantry is accompanied and protected by tanks, a method which is very helpful in these conditions, but which obviously does not make full use of the mobility and striking power of the tank. Even so, Kesselring's shortage of reserves has already compelled him to shift forces from one sector to another somewhat nervously.

### Full Employment

The event of the week has been the Prime Minister's statement on foreign policy, which is discussed in an article on page 703. Another, and in the long run no less important, event was the publication of the Government's proposals for a full employment policy, which appeared too late to be discussed here. Plainly, however, the problem of providing work for all willing citizens when the war is over was much occupying the minds of Members of Parliament in both Houses during this week's economic debates. In the House of Commons, in the discussion of the Finance Bill, the extreme sceptical view was stated by Sir Herbert Williams, who described the project of full employment as "unutterable nonsense." His argument was that we would obviously be unable to "finance" the postwar social reforms that have already been suggested; and by a strange perversion of thought he seemed to include full employment as one of these reforms rather than, as it should be, a means of bringing them about. In the House of Lords, Lord Keynes was, in effect, replying, in his defence of the expert monetary plan, to critics in the House of Commons whose doubts had been mainly aroused by the fear that, if these currency commitments were accepted, we and other countries might be inhibited from pursuing the policies of economic expansion and the trade arrangements which would be necessary for a full employment programme to be carried out. Although there is much acrimonious controversy about all these topics there is, nevertheless, a very broad underlying agreement in the country about what the objectives of postwar policy should be, and full employment is both one of the objectives and a condition of the others. From this consensus three main problems

seem to emerge. The first is the problem of devising the best ways and means of preventing either idle resources or fluctuations in investment or consumers' demand. The second is the parallel problem of ensuring that full employment is also the most productive employment possible, because upon productivity depends, as the Chancellor of the Exchequer suggested on Tuesday, the level of the standard of living; capital as well as labour must be fully employed, skill and machine power as well as manpower. The third problem is the one which Sir Herbert Williams, behind his lack-logic, really had in mind, namely, the problem of reconciling the measures necessary for providing full employment with freedom of choice for entrepreneurs, workers and consumers. Sir William Beveridge at any rate, who has finished but not published his own plan for full employment, believes that this reconciliation can be made.

### The Tax Outlook

This week's debate on the Finance Bill was very properly concerned in the main with the present state and future prospects of taxation. Almost nothing that was new was said. The Financial Secretary to the Treasury, who moved the Bill's second reading, drew the attention of the Commons and of the world to the increase from one third to more than one half in the proportion of expenditure covered by taxation during the war years. Most Members who spoke were concerned, as was the Chancellor of the Exchequer, who replied, with the chances of relief from taxation when the war is over. In particular, a plea was made for the utmost adjustment of direct taxation in order to encourage industrial enterprise and development. Surprisingly perhaps, little or nothing was said about the obvious need to cut down indirect taxation radically *pari passu* with the return of consumers' goods. Sir John Anderson offered little hope of any abatement of the tax burden immediately after the war. He pointed out that expenditure would remain high while the stock of goods would still be scanty, with a persisting danger of inflation. "Priorities, high and low, will have to be part of the Government's policy and administrative equipment." On the other hand he stated explicitly—this was the most specific part of his speech—that a first objective of postwar policy would be to reduce taxation as soon as it would be economically and financially wise to do so. Probably the best that was hoped for by most MPs was the eventual reduction of income tax from 10s. to about 7s. in the £, with a very drastic cut in indirect taxes—which is indeed essential. Direct taxes are based upon ability to pay, while indirect taxes are not, and the normal aim will be to encourage consumption—when the goods are available—not to discourage it. At the best the level of taxation is likely to remain high, compared with past experience, and the net of the tax collector will continue to be cast more widely than in the past. The test of the high tax system will be the contribution made by Government spending to national security, efficiency and the standard of living; and there is a deal to be said for considering the project of Lady Rhys Williams, taken up by the Liberal Party, to bring the personal outgoings of taxation and social security contributions into a single system with the personal outgoings of tax allowances, family allowances and other social security payments.

### Greek Unity

After a period of desperate crisis, the negotiations between the various Greek parties at Mount Lebanon have been brought to an unexpected and most successful conclusion. All parties have agreed upon a common programme of action, and on certain broad principles which must underlie it. All Greek military forces are to be unified and strong discipline restored. All parties denounced the mutiny, and agreed that those responsible must be punished. Inside Greece, all the guerilla movements are also to be unified, and, as soon as possible, developed into regular armed forces. Politics are to be rigidly excluded in the army

and the guerilla movement. A National Government representing all parties will be formed presumably under M. Papandreou, and the future constitution of the economic and social framework in Greece will be left to the decision of the sovereign people. Meanwhile, however, the maximum amount of personal security and liberty are to be guaranteed to individual citizens. This agreement is so obviously the ideal solution to the dilemma which exists in many occupied countries that one may ask whether its example might not be helpful in the case of Yugoslavia. Such an agreement ought to be the aim both of King Peter and Marshal Tito. It ought to be the commonly pursued policy of Britain, America and Soviet Russia. Neither Yugoslavia nor its neighbours stand to gain by the possibility of civil war, and a movement of national unity is the only guarantee that the passage from war to peace will not be too turbulent. It is, however, difficult to see at this stage how such a reconciliation can be brought about, for conditions in the two countries have not much more than a superficial resemblance. The Greek Government has displayed more understanding than the Yugoslav, and King George has more fully recognised that his return must depend upon the popular will. The Greek Government, too, is not affiliated in any special way with any one of the resisting groups, and the status of some local Greek Mikhailovitch has not proved a stumbling block to better relations. In Greece, too, there are no racial divisions for the Germans to exploit. But the chief difference lies in the scale of the movements and of the fighting. Comparatively speaking, the guerillas have not fought very much. It follows that their groups and movements are fairly small and weak. The EAM has been more rigidly Communist than Tito's Army of Liberation, and has, therefore, had little chance to become a genuine national movement. Indeed, the representatives of EAM found themselves completely isolated at the Conference, and were bitterly attacked for splitting the resistance movement by their extremism. Marshal Tito's more moderate approach has won him nationally wider support, and he speaks with an authority that no one of the guerilla groups in Greece can claim. In a word, it has never come in Greece to a direct conflict between two competing centres of authority and only if both sides in Yugoslavia were ready to compromise on their claim to exclusive leadership would any sort of reconciliation on Greek lines be likely to take place. Mr Churchill's speech suggests that there is now some hope of this.

### Double Pressure on Bulgaria

Among all the satellites of Germany, Bulgaria appears to be in the best position to respond to the recent Allied appeal to break away. Bulgaria is not occupied by the Wehrmacht; and the Germans would probably think twice before occupying the country, even if political trouble was coming from Sofia. The Wehrmacht's chief preoccupation in the Balkans now is the defence of Roumania and Hungary; a further dispersal of forces to the south of the Danube would be a liability. Yet the ruling circles in Sofia have so far shown little disposition to make any drastic decision, and have been content to keep formal neutrality towards Russia, hoping that this will serve them as a reinsurance against the consequences of defeat. The hope must also have lingered in Sofia that after the war Russian diplomacy will find itself confronted with the old dilemma—inherent in all Slavophil or Panslav policies—of whether to support the Serbs or the Bulgars; and that the Bulgars may still be able to turn that dilemma to their advantage. The Russians, however, have now given a blunt warning to the Bulgarian Government that they, at any rate, have no illusions about the meaning of this sort of neutrality. The Bulgarian port, Varna, has become Germany's main naval base in the Black Sea, now that Odessa is in Russian hands, and Constanza has come within the range of Russian bombers. In such conditions the time for somewhat vague sermons on Slav and Orthodox solidarity has gone, and there are several strong reports that an early rupture of relations between Russia and Bulgaria is likely. What effect this threat will have remains to be seen. The Germans have apparently replied to it with some counter pressure which resulted in a crisis in Bozhilov's Government. There have been conflicting reports from Sofia. Some have spoken about Bozhilov's resignation, while others claim that he is still in office. What makes the rulers of Sofia still stick to their alliance with Germany at this

late stage of the war is the certainty that Allied victory will entail the loss of the Yugoslav and Greek territories acquired by Bulgaria. Apart from this, Sofia's more "astute" politicians, who see the inevitable coming, still prefer to play for time and to postpone decision until the first results of the Allied summer offensives become apparent.

### Balkan-Soviet Federation?

German propaganda has recently discovered "documents" about a sinister Russian plot to set up a federation of Soviet states in the Balkans. The discovery can be dismissed with the smile which most of Dr. Goebbels' recent inventions evoke. Russia's policy in the Balkans has shown little tendency to apply the old programme of Sovietisation, and still less disposition to support regional federations. No doubt Moscow is anxious to spread its influence in the Balkan countries, just as the Russian diplomacy was under Nicholas the First, Alexander the Second, Alexander the Third, and Nicholas the Second. In the second half of the last century two trends clashed in Russia's Balkan policy. One aimed at establishing a direct Russian protectorate over a Balkan federation. The other was satisfied with looser forms of political and spiritual influence. The more moderate trend won the upper hand in the Tsars' inner councils, and extremist claims were left to the world of dreams cultivated by unofficial Panslavist propagandists. In theory it is possible that the old conflict of these Balkan policies may in one form or another have reappeared in Moscow. But all the evidence available suggests that Stalin, like Gorchakov before him, has decided in favour of the more moderate trend. This is not to say that Russia is not striving tenaciously to strengthen and expand its influence in the Balkans. But in doing so it seems to support the separatists there rather than the unifiers. The slogan of a Balkan-Soviet federation was originally raised by the Comintern soon after the Russian Revolution. While the Soviet part of that programme met with not too ready a response from the peasant masses of the Balkans, the appeal of the federative programme was rather strong. Although Russia is not now making use of it, it is still an open question whether the peoples of the Balkans, though not their dynasties, would not welcome the prospect of a Balkan federation after this war.

### The Supply of Doctors

Whatever form the new national health service eventually takes, it is generally recognised that, like the new education service, it will be handicapped for some time by a shortage of practitioners. The problem for the medical profession, as for the teaching profession, is to obtain a great number of new recruits without lowering their quality. In fact, it is not enough to prevent the quality of the new generation of medical students from deteriorating. The planning committee of the Royal College of Physicians, in its report on medical education, states that the intellectual and personal qualities of the average medical student of today are already not good enough, and should be raised.

## The BRITISH MUTUAL BANKING COMPANY LIMITED

Founded 1857

By reason of its organization, this old established Bank is able to provide prompt and individual service for all classes of sound business, and customers in all parts of the country express their appreciation of the facilities provided.

LUDGATE CIRCUS, LONDON, E.C.4

There are probably many reasons why the standard has fallen, but one of the most important is the present structure of medical education, which presents to the student an overloaded and unintegrated curriculum requiring at least five years and generally seven years' study. The time and expense of qualifying prevent many from entering the profession, and in addition the best science students tend to turn away in despair from the unsystematic conglomeration of facts which makes up medical education to-day. The report of the Committee of the Royal College of Physicians, therefore, recommends, first, a widening of the field of selection in order to improve the average standard of the student; and, secondly, a drastic overhaul of medical education itself. For the former, it suggests a system of selection based on ability, character and personality, by a small board elected by the university or medical school. The committee has not realised fully the implications of selection by personal interviews, which, if it were to be done on the lines of the selection of Army officers, would involve a considerable amount of organisation and personnel, and which, undertaken haphazardly, could lead to entirely mistaken acceptances and rejections on the basis of personal likes and dislikes.

### Medical Education

The suggestions of the Committee of the Royal College of Physicians for the reform of medical education are on much sounder ground than those for the selection of candidates. The progress of medicine has far outstripped the methods of learning and teaching it. The old system has perforce been modified, but each modification has only increased the student's burden without attempting to train his mind. The result is that he no longer "walks the hospital," but staggers under an increasing load from department to department—the committee states no less than fourteen—until he has passed his final examination, when he dumps his load and begins to learn, and practise, medicine. The committee's main recommendation, therefore, for the reform of medical education is that far more time should be spent in teaching principle and method, and in developing the student's judgment. For this it proposes that undergraduate training should be designed for doctors as a whole, and that the acquisition of the detailed knowledge required by the different specialties should be a matter for post-graduate study. Moreover, it urges co-ordination and integration, not only between the clinical and preclinical stages, but also between the different divisions of clinical teaching. At present, medical education is largely in the hands of specialists in each department who lecture and demonstrate on their cases. There is little or no attempt to place these specialties in relation to medicine as a whole, and the committee proposes that the teachers of the different specialties should meet together to present their views in front of the student. This raises the question of the reform of the teachers. The committee recognises that its proposals would add to the clinical teachers' already heavy burdens, and it recommends that they should be paid for their teaching and hospital work. But more than this is needed. Clinical teaching should become a specialty of its own, for the practising specialist rarely has the time to undertake the study and thought required of the teacher even if, as is rarely the case, he has the teacher's temperament.

### All Clear?

With uncommon wisdom Mr Aneurin Bevan has decided to sign off for the time being in his contest with Mr Greenwood and the rest of the Administrative Committee of the Parliamentary Labour Party. Given some latitude by the cancellation of the Labour Conference, the Administrative Committee, in combination with the National Executive of the Labour Party, to whose joint deliberations the problem of Party discipline, on Mr

Shinwell's motion, had been referred by the Parliamentary Labour Party, put Mr Bevan on the spot, by demanding a written pledge of obedience to standing orders, with the alternative of expulsion. As was recorded in *The Economist* last week, Mr Bevan then signed on the dotted line. But his first reaction after this compliance was to put down a motion for the Parliamentary Labour Party criticising the way in which the National Executive had been allowed to act in a specific matter. Mr Bevan was out to get Party's own procedure. Plainly, Mr Bevan was out to get some part, at least, of his revenge—though in a far from satisfactory way. He has now decided on the question itself, which is sensible of him. Nevertheless, he still stands: plied in his proposed motion of criticism. And this: What is the Labour Party, and who runs it? And this: the continuing query is underlined by the decision of the General Council of the Trades Union Congress. Mr Bevan's steps in the trade unions on account of both his opposition to Regulation 1A (a) and his strictures on trade union leaders who have supported it.

### Progress in Reconstruction

When Lord Woolton was appointed to be Minister of Reconstruction last November, his prestige was high, because of what he was regarded as having done at the Ministry of Food, because of his reputation for energetic strength in the public service and for the excitement that were expected to flow from his appointment. Before the end of last year second thoughts were widely spread. Broadly the view was, and is, that if Lord Woolton is a strong man he is not as able as was expected, and if he is an able man, he is much less strong than was assumed. The test has been results—in particular, the Bill and White Paper to deal with land planning, first promised "after Christmas" and then "before Whitsun." At the time of writing, with Whitsun uncomfortably closer, neither has appeared, and though the Bill may still come, it is doubtful whether the White Paper will accompany it. As Lord Woolton has several times promised to deputationise Against this failure, Lord Woolton will, no doubt, set them White Paper on full employment which has been worked out under his eye. But it is doubtful, without having seen at the text, whether the critics, who were once Lord Woolton's strongest supporters, will regard either this White Paper or its successor on social security as a vindication of the high hopes of six months ago.

### French Foreign Policy

The fourth session of the French Consultative Assembly, which has now ended, has thrown light on the shape of Algiers' foreign policy. M. Massigli, the Commissioner for Foreign Affairs, laid down the guiding principles of policy with a clarity and conviction which Frenchmen have not been accustomed for many years to find in the pronouncements of their Foreign Ministers. Some of the points raised have already been discussed. M. Massigli stressed, for instance, the disappointment felt by Frenchmen because of the incompleteness of the recognition granted by the Allies to the Algiers administration. What he said was *fortiter in re* but *suaviter in modo* and in no way calculated to intensify feelings of xenophobia among Frenchmen. M. Massigli spoke with striking confidence in the intrinsic strength of the Algerian Government which is able to "wait calmly until reality imposes itself upon our friends." He could point to the trade treaties concluded with Spain and Portugal as instances in which "reality" is already breaking in even upon neutrals who are supposed to have more regard for the legitimism of Vichy. M. Massigli's vindication of France's rôle in Europe culminated in the phrase that "France will either be a Great Power again or she will not be anything." He had no doubt that if a Concert of Great Powers were to be set up "France would very soon have her place in it." In the meantime, however, France is absent from the Supreme Allied councils where decisions vital to her future are being taken. M. Massigli insisted on the right of the French people to know the terms of armistice, a right—one might add—that is partly withheld from public opinion in all Allied countries. He was especially outspoken on the terms of armistice for Italy. Last January the French protested to the Allies against the toleration of King Victor Emmanuel. Even now, they still "suspend judgment" on Marshal

Badoglio's new Government, which has not yet repudiated the crime of 1940, nor recognised the necessity for a final "clearing of accounts" between France and Italy. "The time has therefore not come for reconciliation." More important still, it is inconceivable that armistice terms for Germany should be formulated without any consultation with France.

### Western Union and Eastern Alliance

What are the positive principles of French foreign policy? In the centre of the discussion in the Assembly at Algiers there was the "Western Fringe." Recent reports in the press had spoken about negotiations at Algiers which aim at the creation of a customs union comprising France, Belgium, Holland and Luxemburg. From M. Massigli's speech it would appear that the discussion had not yet gone beyond "the exchange of general ideas"; but that the time had now come to examine the problem more closely. M. Auriol went a few steps further and spoke about the economic integration not only of the continental mother countries of the western fringe, but also of their colonial possessions. True, the speakers in the Assembly stressed the need to combine with Great Britain. But the discussion left the impression that this was regarded as the "next stage" for which the western continental countries ought first to prepare themselves by agreeing upon their own economic integration. In this preparatory stage at least Algiers is eager to keep the initiative. The "Western Fringe" is one bold line of the new French foreign policy as it is taking shape at Algiers. The other, and supplementary one, is friendship with Russia. M. Massigli was in keeping with an old French diplomatic tradition when he spoke about

the links that history as well as geography have woven between the two nations placed by fate in the west and in the east of Europe.

The tradition of the Russo-French Alliance—broken in 1917 and ineffectively and ephemerally upheld in the thirties—has now been brought back to life by the re-emergence of Russia as a great military Power. It has been additionally strengthened by Russia's straightforward policy with regard to Algiers. Russia had recognised the National Committee as the "only representative of French state interests" even before the Committee assumed the title of a Provisional Government; and the assumption of the latter title has not caused any of those legalistic scruples in Moscow to which it has given rise in Washington and seemingly also in London. It is easy to understand the effect of this on Frenchmen in whose eyes the problem of recognition has become a matter of national prestige. Members of the Consultative Assembly have demanded the conclusion of a 20 years' alliance with Russia on the lines of the Treaty between Russia and Britain.

### Civil Service Unions

It is natural that Mr Churchill should not wish to be troubled with extraneous matters at this time, or to raise friction with the Conservative Party. Anything to do with the Trades Disputes Act—as was shown last year—tends to produce controversy, and the Government may have thought it the best course to let sleeping dogs lie. But feeling against the Act is growing, not lessening, and both the Union of Post Office Workers and the Civil Service Clerical Association have at their annual conferences renewed their demand for the repeal of Clause 5, which disqualifies civil servants from membership of the Civil Service if they become also members of a body affiliated to the Trades Union Congress. Mr Churchill's latest letter, asking for further delay, has caused resentment, especially as the Prime Minister seemed to have accepted the idea of purely industrial affiliation. The unions have behaved with restraint, since the agitation last summer and Sir Walter Citrine's ill-advised and petulant outburst. They proceeded constitutionally with their application for affiliation to the TUC, and dropped for the time being the question of political affiliation—which is a far more debatable issue. As Mr L. C. White, General Secretary of the CSCA, pointed out, there is a marked contrast between the speed with which Regulation I AA was brought in, and the delaying tactics adopted over Clause 5 of the Trades Disputes Act. The Act has nothing to do with the prosecution of the war, whereas I AA has. But national unity does not mean one-way traffic.

### Fighting in Northern Italy

Since the collapse of the Mussolini Government last year the Germans have taken over the whole of central and northern Italy and developed it simply as a fighting base. The parade made of the "Social Fascist Republic" has been no more than a cover for the German armies of occupation, and although in the new "Republic" the corporate state has been replaced by direct state control and direct regimentation of labour on totalitarian lines, the real controllers are the "economic commandos of the Wehrmacht" and the food and agricultural advisers appointed by the Germans. There can be little doubt that the German hold on lines of communication and the centres of population is complete. It is thus all the more remarkable that inside this German base Italian guerrillas have compelled the German High Command to divert six divisions from the critical battle for Rome and to send them to suppress the Italian resistance movement. It must, therefore, be on a large scale. In the mountains of Northern Italy the conditions for successful guerilla warfare exist. The Italians have been helped by the Yugoslav partisans, and the proximity of the neutral Swiss frontier is another factor making for military confidence. The guerillas are well organised, and a military council is apparently to be set up in Naples to co-ordinate their activities with those of the Allied armies. The Italian resistance movement in the north seems to have shown more strength and maturity than that of any other country. Here alone has there been an effective general strike. Here, too, guerilla armies have sprung up. The habit of freedom is, after all, not so easy to kill.

### Mission to China

It is no light matter to allow a Vice-President of the United States to leave the country. Mr Roosevelt by sending Mr Wallace to Chungking shows how high a priority is set in Washington on China's problems and China's needs. From the point of view of the war against Japan, the mission is very timely. The Chinese armies have recently suffered a severe setback in Honan. A defeat cannot but have unfortunate repercussions in Chungking, discouraging the waverers and reducing somewhat the position of the Generalissimo. Mr Wallace's visit at such a moment will give face to the Chungking Government and once again there will be a diplomatic victory to redress the unfavourable military balance. But Mr Wallace is obviously going to China to do more than pay a ceremonial visit. Mr Roosevelt wishes to find out the state of China "at first hand," and Mr Wallace cannot fail to send a report on some of the very serious difficulties which beset the Chinese Government. The chief economic problem is inflation, the chief political problem, relations with Russia and with the Chinese Communists. Mr Wallace is an idealist, an enemy of corruption and a keen supporter of good relations with Russia. His report on China's economic plight will certainly deal very firmly with China's need for self-help, to check corruption, to attempt stabilisation and price control, and to get rid of the more notorious speculators, however highly placed. It may be, too, that he will point out to the Chinese Government the advisability of shelving the frontier issue in Sinkiang and Mongolia for the time being. The Japanese thrust to Loyang, which menaces equally the Communist base at Sian and the backdoor to Chungking, may offer a good opportunity for a new attempt to bring the two together. If Mr Wallace were to act as an intermediary, he could make no better contribution to stabilising the military situation in China.

### PRINCIPLES OF TRADE: A PAMPHLET

The series of eight articles on *The Principles of Trade* which appeared in *The Economist* in January and February this year has been reprinted as a pamphlet (Price 2s. 6d., post free), and can be obtained from *The Economist*, Brettenham House, London, W.C.2.

## The Nation's Milk

Mr Hudson made a good case to Parliament, on Friday last week, for the proposed transfer to his department of the supervision of milk production on the farm. The Minister of Agriculture pointed out that:

What we must aim at is, not only milk in greater quantities, but milk of a very much better quality, milk in which the public and the medical profession will have complete faith.

To get such milk, Mr Hudson is renewing financial assistance for tuberculin tested herds, establishing a national milk-testing and advisory service, planning to improve the quality of dairy bulls and of breeding—and to cap and to integrate these measures he asks for the powers of regulating and inspecting methods of production that now belong to local authorities. The question, in this interpretation, is one of the national imposition of national standards. But there are considerable objections. The chief technical objection is that it will take Mr Hudson a long time to collect the necessary veterinary and sanitary inspectors. What chiefly troubled Parliament was that here was yet another case in which the local authorities were to be shorn of yet another of their functions—and one that belonged to the field of health, which has long been one of their strongest prerogatives. Local authorities feel themselves to be in danger of what one MP described as the "death by the thousand cuts." In the case of milk, it is certain that some local authorities have been zealous in inspecting farms, making frequent or surprise visits, and that for some time to come these areas may be less well cared for under the Ministry. It is equally certain that other local authorities have shown slackness, and even dereliction of duty, in their supervision, to the detriment of the milk sold in towns. There is no uniformity in the performances of local authorities. Probably, the fact of a lack of uniformity is being used too frequently nowadays as an argument for centralisation; for within limits, it is, of course, an inevitable feature of all local government. In this particular case, Mr Hudson may again be able to plead that the disparities are too great and the service too vital for him to trust to local machinery.

## No Change in India

It is now clear that the release of Mr Gandhi from his detention at Poona was not intended to have any political significance. Nor has it acquired any such significance since he was set free. Mr Amery, whose habit of cautious and defensive statement does less than justice to his troubled spirit, has said explicitly, in reply to an appeal from a number of Labour MPs, that the release of Mr Gandhi was solely on health grounds, and that the reasons for continuing to detain the Congress leaders for so long as they will not retreat from the attitude taken up two years ago are, in his view, as valid as ever. In India, too, Lord Wavell has decided to continue the political standstill by extending the life of the Council of State and Legislative Assembly for another year, making ten in all, twice the Council's normal lease of life and over three times that of the Assembly. For the moment, both Mr Amery and the Viceroy are waiting for a sign; and there is, perhaps, something of a contradiction in the arguments of the Secretary of State for India, since he also asks that, in order to break the present deadlock, some gesture should be forthcoming from the Congress leaders, whereas, being imprisoned, they are not in fact able either to reconsider their policy in consultation with their followers or to discuss it with the spokesmen of other parties. Meanwhile, moreover, in addition to the interest aroused by the plan of the Bombay industrialists for Indian economic development, whose authors are

coming to visit this country, there continue to be reports that there is in fact a new mood of conciliation, even if mainly on cynical (or "realistic") grounds, among the rank and file of the politically-conscious minority of Indians. But one thing seemed almost sure. Mr Gandhi, however potent his name and prestige may still be among a great mass of country people, is too ill and too old, and too set in his earlier ideas, to play any leading part in bringing such a mood to the surface.

## Rural Housing

Rural housing is going to prove as costly as it is necessary. It has been plain for some time that 13s. a week for rent and rates is too high a charge for emergency cottages. The new report of the rural housing sub-committee of the Central Housing Advisory Committee, appointed by the Ministry of Health, concludes that, even on the basis of the present higher minimum wage in farming, 10s. to 11s. is the most that should be asked of the agricultural worker. A special Exchequer subsidy for five years is suggested. It will have to be a large one. Even the 13s. cottages required a block grant of £150 each in addition to existing subsidies. Current building costs are nearly twice their pre-war level. Unless they are pulled back into line with the rise in the general cost of living, the sub-committee despairs of achieving an adequate rural housing programme. But it is most unlikely that they can be so reduced immediately following the war. Inability to acquire land is also recognised as a heavy burden on local authorities. In the past, many rural districts have been slow, county councils have not been overhelpful, and the Ministry of Health has failed to prod both parties into action. The sub-committee asks urgently for a survey by rural councils of housing conditions within the next year. If big subsidies are to be made available for post-war rural housing, as they will have to be, they must be used with knowledge as well as with dispatch.

## Postwar Prisons

A prison officer's lot, like a policeman's, is not a happy one, especially if he happens to be stationed at Dartmoor. Indeed, Dartmoor officers are now asking for their "stretch" at the jail to be limited to three years, and for £1 a week "dreary life" money, to make up for their monotonous and comfortless existence. Their claim, which is now being referred to arbitration, has encountered certain obstacles. In the first place, Dartmoor warders—unlike their charges—are not apparently within a "well-defined class." Then, the Prison Commissioners have said that, as a condition of any increase, similar allowances of 3s. a week now paid at Parkhurst and Camp Hill prisons should be dropped. Dartmoor apart—probably the only solution may be to close the prison altogether—prison officers have many criticisms about their conditions, which were aired at their association's conference last week. Fundamentally, it is a question of the attitude of the community towards prisons and prisoners. Most prison buildings were put up in the days when a man could be hanged for sheep-stealing, and an early-Victorian atmosphere still pervades. Women wardresses, in particular, chafe under restrictions on their personal freedom and dislike their uniform, which makes them feel like convicts. The Criminal Justice Bill was shelved when war broke out, but penal reform will obviously have to be tackled at the earliest opportunity. Mr Morrison himself holds enlightened views. The other day in Birmingham he appealed for a new approach which would emphasise the psychological retraining of offenders as decent members of society, rather than the punishment of outcasts. He also attaches great importance to occupational training. The Treasury has recently turned down a recommendation from the Prison Commission that the allowance paid to the skilled instructors who teach trades to prisoners should be raised from 4d. an hour to 5½d.—an insignificant cost to public funds. At present, the combination of badly paid instructors and excessive concentration on the quantity of prison output make for low standards. If the right type of training is to be given, the right type of instructors must be recruited to the prison service, which will not happen under present conditions. Mr Bernard Shaw was not far wrong when he said that, for every two or three prisoners in jail, a fourth prisoner was needed to look after them. A twentieth-century prison system demands a new view.

# AMERICAN SURVEY

## Governor Thomas E. Dewey

(From a Political Correspondent)

**Washington**  
GOVERNOR THOMAS E. DEWEY is better known abroad than he is understood.

There are, it would appear, at least six truths which British readers need to fix in mind if they are to follow with meaning the election news which will soon be emanating from America and in which Mr Dewey is certain to figure prominently. These truths are:

1. Mr Dewey is a candidate for the Republican Presidential nomination. It is only in appearance that he is not such a candidate.

This is a central fact in any understanding of the opposition political picture in the United States and of Mr Dewey's large place in that picture. In all honesty, it has to be said that "not being a candidate" is his method of obtaining the nomination. Indeed, Mr Dewey's peculiar but not unprecedented political approach may well result in adding a new phrase to election parlance. While it cannot be said that Mr Dewey is actively running for the nomination, it can be said that he is actively not-running for the nomination—and there is very little real difference between the two.

2. Although Mr Dewey is too neat a political package for numerous American commentators, the increasing stream of pilgrims to Albany in recent months attests to the skill with which he has broadened his political base to fit the dimensions of a national figure.

Mr. Dewey has matured considerably in poise and viewpoint and grasp since he prematurely sought to hatch his Presidential hopes four years ago, and to-day he stands as the effective Governor of the largest state in the Union, from whose capital such stalwarts as Theodore Roosevelt, Charles E. Hughes, Alfred E. Smith and Franklin Roosevelt succeeded to the Presidential nomination of their party. Mr Dewey has expectedly proved himself an able administrator and has unexpectedly proved himself adept in dealing harmoniously with his Legislature—a vital art in America's governmental system of divided powers.

3. Mr. Dewey is vastly more knowledgeable than he was in the tentative, sometimes contradictory speeches on national affairs which he delivered in the 1940 pre-Convention campaign. He is a public official of manifest intelligence, but until recently his intelligence has not been used very greatly to elucidate his own position on controversial issues of national importance. Thus he stands as something of an unknown force who may quite possibly capture the Republican nomination without his views becoming any better known than they are to-day. It seems apparent that his own party may be quite willing to accept him without any further clarification of his position, but it is by no means evident that the country would accept him without a much more precise understanding of his views. Mr Roosevelt would be counted on to make the election campaign hot enough for that.

4. Recalling that Walter Lippmann appraised Franklin Roosevelt in the latter months of his Governorship of New York as likely to be a weak, indecisive President, if he were successful in being elected, one hesitates to offer anything approaching a definitive estimate of the kind of candidate or the calibre of President Mr Dewey might make. The fact is that the evidence is not in. That Mr Dewey has not been more outspoken on national and international policy, that he vacillated in his stand on the great issues of the Lease-Lend Act, opposing and later supporting the Bill, that he has not played a rôle of decisive leadership on the highest level of affairs when he could have done so during the past four years of crisis-laden events in his nation and in his world, have caused some to esteem him a political opportunist and a timid trimmer. But many believe that he is capable of being much more than an opportunist and a

trimmer if the nomination comes to him, and that as President he might prove to be more liberal than many of the ultra-conservative groups supporting his cause, and more collaborationist than his record would suggest. That remains to be seen. He has not really exposed himself.

5. Mr Dewey has made several decisive advances in his stand on foreign policy since 1940. He had a considerable distance to go to become effectively identified with the collaborationist sentiment of the country, but to-day the New York Governor is fully even with public opinion, and in words at least is well ahead of a large part of his own party. Though he campaigned in the supposedly isolationist state of Wisconsin in the 1940 primary by tossing isolationist implications in every direction, Mr. Dewey's avowed position in the same state this year was strongly against isolationism and decidedly in favour of the closest possible co-operation with Great Britain and the Commonwealth.

6. Finally, an estimate as to Mr Dewey's prospects: He has a better than even chance at winning the nomination, and a less than even chance of winning the election.

Mr Dewey, it should be appreciated, is a shrewd, sagacious and successful politician. His whole political position in 1944 appears at this date to be the reverse of 1940. Then, he started at the top with the largest number of pledged delegates to the Republican Convention. In 1940 he sought the nomination all over the country. This year, when he has declared that he is not a candidate and is busy appearing not to be a candidate, much support for his nomination is welling up from the bottom. One fundamental difference is that Mr Dewey four years ago had won no elective office other than a county district attorneyship in New York, and in 1944, after once being defeated, he has won the most influential Governorship in the United States. Not seeking the Presidential nomination is, he figures, his best chance of getting it.

It is for this reason that, while Mr Dewey is disavowing his candidacy, his trusted political spokesmen are avowing his availability. He is simply saying, with a slight but meaningful variation on the popular song, "No, No, 999 times No."

Governor Dewey does not intend to alter his stated position of not being an avowed candidate right up to the decision of the Convention itself, and he will not depart from this stand even if it fatally endangers his getting the nomination. He told the voters when he was running for his four-year Albany term in 1942 that he intended to serve his full term if elected, and that he was not seeking the Governorship as a quick stepping-stone to the White House.

Thus the Governor is faced with this dilemma. He himself cannot work openly for his nomination, but he would certainly not find it "patriotic" to refuse the nomination if it came to him without openly working for it.

He reasons in this way: To reject the request of a major political party to become its presidential nominee would be an act of "treason." To become an avowed candidate for the nomination after having declared that "he was not and would not be a candidate," and after affirming his intention to serve in Albany at least until 1946, would put him in the class of being both "insincere and a liar."

If Governor Dewey were himself discussing these matters, it would be safe to assume that he would use the very words "treason" and "liar."

Governor Dewey launched his second year in Albany this January still with the absence of overt national political intent, but it was impossible not to discern in his 1944 state programme, with its emphasis upon holding the boat steady for the duration and keeping it seaworthy for the strains of post-war readjustment, the thought of a man fully aware of national horizons and his looming rôle thereon.

"When the men of our armed forces and the workers in

## COBDEN CLUB PUBLICATIONS

Among the recent publications of the Cobden Club (at prices from 6d. to 2s. 6d.) are Foreign Policy; Gold, Silver and Paper Money; Problems and Fallacies of Political Economy; The Moral Case for Free Trade; The Labour Party's Programme Examined. Apply to the Secretary of the Cobden Club, Dunford House near Midhurst, Sussex. The Cobden Club was founded in 1866. Among its first members were W. E. Gladstone, John Bright and John Stuart Mill. Its motto is "Free Trade, Peace, Goodwill among Nations."

Advt.

our war plants return to their peacetime occupations, they have a right to expect that we at least shall have done our part to help create employment opportunities," he wrote of his determination to lock up the \$140 million state surplus for post-war reconstruction. This became Act I of the 1944 New York state laws.

Mr Dewey has recently made an excellent impression with his endorsement of the principles of foreign policy enunciated by Mr Hull, his acceptance of American world responsibilities in political, as well as economic affairs, and his insistence that the peace must be such as to promote the "durable cohesion" of the United States, Great Britain, Russia, and China. It is worth remembering, however, that as long ago as September, 1943, he offered the following resolution to the Republican Post-war Advisory Council:

Out of the suffering and horror of this war there shall rise, with God's help, the foundations of a lasting peace, a peace which will give to all peoples of the world the right to live and worship as they please without fear of persecution, and to minorities the fullest protection of inalienable rights as free human beings.

To that end, the United States must be prepared to undertake new obligations and responsibilities in the community of nations. We must co-operate with other nations to promote

the wider international exchange of goods and services, to broaden access to raw materials, to achieve monetary and economic stability, and thus discourage the growth of rampant nationalism and its spawn, economic and military aggression. As a further safeguard we must join with other nations to secure the peace of the world, by force if necessary, against any future outbreak of international gangsterism.

We know that as the other nations prosper, we prosper, that when the freedom of one nation is destroyed, the freedom of all nations is in peril. In our own enlightened interests, as well as in a spirit of good will toward our fellow men, we must help create a stabilised world.

There are those who felt that Mr Dewey could have worked harder to promote his resolution, but it was a strong resolution and marked a notable advance over the less collaborative words which were to be found in his previous public utterances.

It was at this meeting, after Mr Churchill had spoken in Washington of the desirability of continuing the Combined Anglo-American Chiefs of Staff after the war, that Governor Dewey gave his endorsement to an Anglo-American peace alliance which he hoped would also embrace the Soviet Union and China. His most recent views are, therefore, the end of nearly a year's steady movement toward a collaborationist platform.

## Stability Below the Border

(By a Correspondent recently in Latin America)

Washington

ONE of the chief counts in the indictment of American foreign policy, which is still a favourite topic in Washington, is the state of relations between the United States and Latin America. It has come as a profound shock to many that Latin America, which in the past decade has received such solicitous attention from the American people and State Department, should not be the safe preserve of American influence as repeated glorifications of the Good Neighbour Policy had led the public to believe.

For American opinion, no matter how cunningly informed, is stymied by a bald fact: the much-vaunted solidarity of the all-American front cannot be very solid with Argentina and Bolivia unrecognised by the majority of the American republics. In addition to that fact, rumblings of political disturbances in Peru and Colombia—as yet unidentified, but which seem likely to follow the general nationalistic lines of the Argentine and Bolivian government changes—foster the suspicion that something is basically wrong either with the attitude of the State Department towards Latin America, or with that of Latin America towards the United States and the Allies generally.

Washington civil servants, especially when thinking of Latin America, still tend to confuse democratic, representative and pro-Ally governments; these terms are really neither antagonistic, mutually exclusive nor synonymous. They tend also to see the opposite of these desiderata as Fascist or pro-Axis governments. By this kind of thinking the overthrown Peñaranda government of Bolivia is sometimes described as democratic, whereas it was really only pro-Ally.

Similarly, when Mr Sumner Welles, until recently Under-Secretary of State, criticises the State Department for not recognising General Farrell in Argentina, pleading that the Argentine people are entitled to the government they prefer and it is none of our business to interfere, he accepts the Farrell government as representative of the Argentine people. This is not only incorrect; it is absurd. For the Farrell government, like the Ramirez government before it, is at special pains to prevent the Argentine people from being represented. If Mr Welles's theory were accepted, the Argentine people must not be prevented from having the government they don't want.

Mr Welles, however, was really defending his own incumbency as Under-Secretary and US recognition of the Ramirez government in June, 1943. Beyond this action, he was also pleading for his consistent policy of stability-at-all-costs, whatever the political complexion of the governments involved. This policy has led naturally to Vargas, Morinigo, Prado, Trujillo, Somoza, Ubico, etc., being presented to the American public as great democrats, simply because the State Department, under

the Good Neighbour Policy, has abandoned intervention. The American people having sensed the hocus pocus involved in the stability-at-all-costs policy, the State Department has had to dress it up in pretty clothes and sell it thus camouflaged as "democracy." The net result of the stability policy is that Latin Americans to-day consider the United States not the champion of democracy—as its political pronouncements might indicate—but the mainstay of even the blackest reactionaries in power.

The stability-at-all-costs policy was by no means abandoned with the exit of Mr Welles. Its European form, camouflaged as "win the war first" and military expediency, is presented in the pronouncement of Mr Adolf Berle, one of the Assistant Secretaries of State, that revolution and "chaos" must be avoided (the echo says "at-all-costs"), in European liberated areas. Tested in Latin America, this thinking accounts for the Pétain-Darlan-Giraud negotiations, the maintenance of Badoglio, the appeasement of Franco and the snubbing of De Gaulle.

Somewhat paradoxically, US non-recognition of Bolivia and Argentina, apparently similar cases, caused different reactions in the American press. Non-recognition of the Villaroel government in Bolivia (which took power on December 20, 1943) was generally applauded. Non-recognition of the Farrell government (which ousted General Ramirez on February 25, 1944), after a preliminary round of applause, was accepted reluctantly as a half measure.

These diverse reactions are due to insufficient understanding of the diverse reasons causing apparently similar action. Recognition of Bolivia's Movimiento Nacionalista Revolucionario would have been a green light to Argentine imperialist expansion, and would probably have touched off a series of Nationalist revolutions elsewhere in Latin America, which might or might not have been pro-Ally. The Farrell government was unrecognised, according to an official statement released early in March, because of its intrinsically pro-Axis and anti-Ally position. Mr Stettinius emphasised that Argentina could improve relations with the United States by action under five headings: the internment of Axis diplomats and agents; the cleaning up of Axis spy rings, the stopping of smuggling of critical materials to the Axis; the breaking of communications with the Axis; and the control of black-listed firms in Argentina.

Criticism of this action by the State Department has centred on form rather than content. The American Ambassador in Buenos Aires was instructed to "refrain from entering into official relations" with the Farrell government. This was generally seen as a half-measure, which almost begged the question. A comparison of the treatment given to Bolivia and to Argentina also smacked of being tough with the smaller and easy with the bigger nation.

Furthermore, the State Department took from February

25 to March 4 to announce its decision regarding Argentina. Apparently, the State Department was caught in the wheels of its own system of consultation with the other American republics, a method sanctioned by convention at the Buenos Aires conference of 1936. Certain officials consider the system too cumbersome and excuse their delays with that plea. Yet it is possible that the Department is also hindered from making up its mind with more speed, by reluctance to take decisions and inability to think straight.

One result of Washington's delay in the Argentine case is that Chile continued relations with Farrell before Washington acted. And thus, in not recognising Farrell, Washington administered a wholly unexpected, gratuitous and unintended back-handed slap at Chile.

At the time of writing, US non-recognition of Bolivia and Argentina has had no visible effect one way or another. Rumours of sanctions ruffle Washington's surface for a day or two at a time. Such talk always ends in a despairing complaint that Great Britain cannot be relied on to join in concerted action to bring the Argentine government around to following a pro-Ally policy. Meanwhile Argentina seems to have taken the lead in sanctions, with heavy fines and penalties for trifling offences imposed on American firms, such as All-America Cables and the United Press.

Mr Stettinius is quoted by the Associated Press as stating that the Farrell regime in Argentina "could become acceptable to the United States by co-operating in hemispheric solidarity and taking the steps to prove it." Such a condition of recognition applies presumably also to Bolivia's Villaroel government. There is curiously little information to be squeezed out of Washington officials on the Bolivian question. But one definitely hears no complaints about Bolivia's co-operation. Bolivian assistance to the Allies consists mainly and almost exclusively in the production of tin, wolfram, rubber, antimony and quinine, all of which are essential to the war. Some unofficial opinion—unconfirmed in official quarters—is that the Villaroel government is not only continuing production at the levels attained by the Peñaranda regime, but is in fact exceeding those levels.

If this is true, it confirms the expectation of those observers who knew the MNR before it came to power. That political party—aside from its authoritarian, non-representative character—had, and presumably still has, two main principles. The first is to make Bolivian mining a national resource rather than allowing it to remain the privilege of the vested interests called "La Rosca." The second is to get a port for Bolivia, either from Peru or Chile. MNR leaders, before they came to power, were frank to explain that their continued collaboration with the United States during the war was essential, constituting a claim on diplomatic assistance of the United States after the war in their efforts to obtain a port.

## American Notes

### The Two-Thirds Rule

A new crusade appears to be in the making. An association is being planned, on the lines of the pre-Pearl Harbour "Committee to Defend America by Aiding the Allies," to save the peace treaty by abolishing the two-thirds rule. This is a logical sequence, and no doubt many of the old interventionists will rally to the new cause. In place of the constitutional provision that treaties must be ratified by a two-thirds vote of the Senate, they would substitute a majority vote in both Houses. Critics of the Senate prerogative argue from the record that the rejection of treaties negotiated by the President makes American foreign policy erratic and incalculable. They also emphasise the undemocratic nature of an arrangement which may give 33 Senators, perhaps from 17 of the least populous states, the right of veto over the rest of the country on issues of foreign policy vital not only to the United States but to the rest of the world. The reformers are said to have abandoned hopes of a self-denying ordinance by the Senate. This is only realistic. Senator Connally, head of the Foreign Affairs Committee, said only a few weeks ago that he would fight the proposal with every means in his power. The only alternative that remains is a constitutional amendment, a long, arduous, and frequently unsuccessful process, except where strong public emotion is involved. Only eleven amendments have been passed since the original ten in 1791. Proposed amendments must be ratified either by the legislatures or by specially called conventions in three-fourths of the States. Both interventionists and former isolationists, as well as the constitutionalists, may be counted upon to

generate a good deal of heat and light over the issue of shearing the Senate, but that the proposition will capture the necessary three-quarters of the public imagination is doubtful. Senate ratification of a treaty may be difficult to obtain, but it is comparatively easy compared with the obstacles the Founding Fathers placed in the way of alterations in their handiwork.

### The Power of the Spoken Word

Another Senate privilege was upheld this week when the Bill to abolish the poll tax was returned to the shelf. This hardy perennial would outlaw the collection of a tax ranging from one to three dollars which eight southern states still make a condition of the franchise. Its purpose is to keep negroes from the polls, although it incidentally disfranchises many poor whites; some observers believe that in practice more whites than negroes are excluded. The Senate vote was not on the Bill itself, but on a debate-limiting "cloture" petition. Once the proposal to limit debate had been defeated by 44 to 36, even the Bill's supporters had to admit the uselessness of proceeding further, for Senators from the States concerned had made no secret of their intention of staging a filibuster. Unparalleled collections of recipes, nursery rhymes, Bible stories, and novels were held ready for reading to paralyse action on the Bill, for Senators, unless a "cloture" is voted, have the privilege of unlimited debate, debate being defined in a rather wide sense. The late Huey Long once held the floor for nine days until the Senate wearily gave way. By this time most comment on the poll tax is chiefly characterised by boredom with the whole issue, and an inclination to leave it to state action. This may be a good thing. The Carnegie Corporation has recently published a monumental study of the negro problem by a Swedish sociologist, Dr Myrdal, in which he finds that the rights, which the South is most willing to grant the negro, like the vote, legal equality and economic opportunity, are those rights which the negro is most anxious to possess. The negro has no ambitions toward intermarriage, and relatively little interest in the abolition of segregation, two points on

## BEHOLD the invisible!

THE visible comprises all that can be seen by the naked eye. Within that range of vision man has learned wonderful things. But outside that range lie phenomena marvellous too. And man is now finding ways to 'see' those phenomena. Here are two instances.

Rays of light in the spectrum beyond the violet and below the red, which have vibrations too fine or too coarse for the human eye to receive, are within the range of specially treated photographic plates. Hence, many things about the ultimate structure of matter, hitherto hidden from sight, are now revealed.

Engineers have long sought easy means of gauging strains and stresses. Through the use of Polaroid the strains and stresses in transparent plastic materials can actually be seen.

Both these developments require iodine. They are but two of the many recent applications of this remarkable element.

The IODINE EDUCATIONAL BUREAU was set up in 1938 to collect and collate all available information on iodine. The services of this Bureau are available free to any institution or manufacturer with an iodine problem.

**Iodine Educational Bureau**

13 STONE HOUSE, BISHOPSGATE, LONDON, E.C.2

which Southern whites are most obdurate. What Dr Myrdal believes makes the problem seem insoluble is the refusal to split it up into manageable parts, and the tendency to make every reform a question of white supremacy. There is no doubt that the obstructiveness of Southern Senators is due in part to suspicion that the North is attempting to enforce its code on the South through Federal action. If this fear can be laid, Southern liberals working in their own states may make better progress toward ameliorating relations between the races.

### Tactical Retreat

The issues in the Montgomery Ward case are still being hotly debated, the more so because the return of the properties to their owners leaves the rights and wrongs of the matter hanging in mid-air. Supporters of the Administration are particularly critical of this inconclusive finish, feeling that the dismissal of the court suit leaves Mr Avery with a moral victory, and that his example will stimulate other employers to disregard the rulings of the War Labour Board. Mr Avery is so self-confident that he has brought a million dollar libel suit against the *Chicago Sun*. The news that Mr Roosevelt has ordered the Army to take over the Hummer Manufacturing Company, a subsidiary of Montgomery Ward, may, however, mean that the Administration is merely shifting to more favourable ground. Hummer, like its parent company, has defied the War Labour Board, but unlike Montgomery Ward, there is no question that it is a war plant, and thus more clearly subject to the President's powers as Commander-in-Chief and to the provisions of the anti-strike law. It is true that this limited application of authority would not serve the purpose of stimulating the deference of employers to the War Labour Board throughout industry. But the administration may feel that a favourable court ruling would prove a Pyrrhic victory. There is no doubt that there would be a widespread feeling of alarm should the courts uphold the right of the Administration to use the Army to enforce labour regulations on a civilian plant; the very authority of the courts themselves might be undermined by the suggestions—already current—that judges are unduly susceptible to New Deal philo-

sophy. On the other hand, a defeat in the courts would put the final stamp and seal on the Administration's retreat. Labour's standing with the public has hardly been improved by the fact that it required the urgent testimony of General Arnold to stop the foremen's strike last week, or by the fact that the Chrysler stoppage only ended this week. Relatively small numbers are involved in all these strikes, but they take place at the very heart of the war production programme.

### This is the Ticket

The results of the primaries make it clear, without waiting for the party conventions in June or July, that it will be Mr Roosevelt running against Governor Dewey. Both candidates already have a sufficient number of delegates to assure their nomination on a first ballot; and there are no alternatives in sight. At this late date it would be regarded as treason to the party for either man to exercise his supposed freedom of choice not to run, for there is no time left to groom another entry. Interest, therefore, is veering to the question of Vice-Presidential candidates. There was a time not so long ago when Mr Wallace's mission to Chungking might have been regarded as the equivalent of the Chiltern Hundreds. The rumour was that Mr Roosevelt, in order to prevent a supposed rebellion in the ranks of the Southern Democrats, would abandon Mr Wallace and choose a running-mate who could be counted upon to keep the conservative wing regular. The names of Mr Byrnes and Mr Sam Rayburn were mentioned. Now there is a reversal of rumour. Mr Roosevelt, in his farewell message to Vice-President Wallace, made it clear that he would return before the Democratic convention in July, and there are few doubts that Mr Wallace's name will be on the national ticket. In part, this is a tribute to the success of Mr Wallace's own campaigning. His prestige has been increasing steadily from the low point it reached when he seemed to have been fatally identified with the "quart of milk for every Hottentot." In part, also, it is due to a shift in the party scenery. Primaries in states as far apart as Florida and California have shown victories for New Deal candidates like Senators Pepper of Florida and Downey of California. The threat of a Southern rebellion has evaporated; and Mr Wallace's popularity with labour and progressive opinion has become correspondingly more important. The CIO's political action committee has already joined his name with that of the President in endorsing a fourth term. His romantic journey to China and Siberia will enhance the authority with which he speaks. Despite a certain disillusion with the Chinese Republic in sophisticated circles, there is a vast reservoir of sympathy for the Chinese people, and a more popular choice of envoy could hardly have been made.

### Shorter Notes

The 29 defendants in the sedition trial appear to be thoroughly enjoying their day in court. The press is full of pictures of Mrs Washburn obligingly giving the Hitler salute or thumbing her nose at the courthouse. Inside, pandemonium reigns, with the prosecutor regularly drowned out by the riotous behaviour of the defendants and their counsel. The determination to give even these undesirables a fair trial and every legal safeguard is an admirable one, but it is difficult to believe that even the United States—which is tolerant and fond of a good show—will long permit these subversive elements to enjoy a licence denied to common lawbreakers and even law-abiding citizens.

There is jubilation in liberal circles at the announcement that ill-health compels the retirement of Mr Dies to private practice in Texas. It is proposed that the Committee to investigate Un-American Activities should continue, but most of its vigour will depart with Dies. Ostensibly Mr Dies' function was to investigate both Communist and Fascist circles; but critics have always found him conspicuously left-handed.

The manpower "crisis" shows no sign of abating. Mr Nelson and representatives of the Services this week made it clear to Congress that they would prefer an outright National Service Act, but if this was impossible they urged the passage of the Bailey-Brewster Act which would extend military discipline and rates of pay to men from 18 to 45 refusing to enter or to remain in essential work.

"Well, to tell you the truth, it was Robinson who started me off. He's a pretty successful man and I noticed he always read it. So I began, largely out of curiosity. Then I found its judgments were pretty shrewd, its opinions authoritative and trustworthy. So I've kept on with it ever since. 'As you know, I've got a finger in many pies and it is essential for me to know what the North is

thinking and doing. I get to know by reading The Yorkshire Post. 'Another thing. Northern industries, politics and finance are more closely linked up with the rest of the country nowadays, and reading The Yorkshire Post helps me to see national questions in better focus. 'I also rely on The Yorkshire Post to give me full reports on many northern industrial meetings that I cannot get elsewhere.'

## KODAK FILM is in the Factories helping to increase efficiency

By photographing the path traced by a lamp fixed to a worker's wrist, a record is obtained of all movements made to complete a job. Such pictures often show how operations can be speeded and fatigue decreased. The countless uses of photography in industry to-day consume vast quantities of 'Kodak' Film. If you have difficulty in buying a spool, please remember it is because such vital work must come first.

## Your drinking water must be pure...

STILL MALVERN WATER the purest known water, can still be supplied without restriction of area throughout Great Britain. Specially recommended by the medical profession because of its purity and freedom from mineral content, it is supplied in sealed bottles (extra large size.) No home should be without a supply of Still Malvern Water, against possible emergency.

Obtainable from all Wine Merchants, Chemists and Grocers.

## WILLS' "THREE CASTLES" CIGARETTES

20 for 2'8

## More NEWS of WHITE HORSE

### When distillation ceased

You can make bricks without straw, but you cannot make Scotch Whisky without barley. Since the war began the fruits of each golden harvest have been called up for National Service. No more whisky is being made: distillation has ceased.

Yet in this fifth year of war you can still, with good fortune, obtain White Horse. This is because stocks have always been laid down many years ahead of the time when they will be released for your pleasure. White Horse was growing old when this war was young. It is therefore in your own interest that supplies should be very carefully regulated so that in the years to come you may still be able to enjoy White Horse, fine as a fine liqueur.

MAXIMUM PRICES: Bottles 25/9; Half-bottles 13/6  
as fixed by The Scotch Whisky Association.

# G.E.C.

*in war — as in peace —*  
at the service of the Empire

G.E.C. turbo-electric generating plant, up to the largest units required for modern utility or industrial power stations, has long been specified by power engineers at home and overseas.

The speed at which industrial electrification has been increased is a measure of the Nation's war production. Inevitably, this has resulted in the entire research and technical resources of the G.E.C.—the largest electrical manufacturing organization in the Empire—together with the Company's vast production of electrical equipment, being directed to the war effort, and diverted from normal supply channels.

When peace comes, however, the big technical advances made by the Company in all applications of electricity, including the important one of electronics, as a result of the urgent and ever-changing problems connected with the war, will be available to all concerned with reconstruction in any part of the world.

### Electrification Schemes

G.E.C. Electrification Schemes have been applied to all industries, including: Aircraft Factories; Chemical Works; Collieries; Food Factories; Gold Mines; Iron, Steel and Copper Works; Locomotive and Railway Carriage and Wagon Works; Motor Car Works; Oil Refineries; Ships and Shipyards; Textile Mills, etc., etc.

*G.E.C. — always in the  
forefront of electrical progress*

# THE WORLD OVERSEAS

## Irish National Finances

(From Our Dublin Correspondent)

THE outstanding feature of Irish finances in the war years has been the rising burden of taxation in relation to the taxable capacity of the country. Central Government expenditure has increased from £33,110,000 in 1938-39 to an estimated figure of £49,997,000 for 1944-45, while local government expenditure has increased from £7,464,000 to £9,600,000 in the same period. No official estimate of the national income is available, but it is probably about £200 million for a population of under three million, of which about a quarter, or £16 per head, is used annually for public services. It is obvious, however, that the taxable capacity of the country has not grown proportionately to the increase in public expenditure.

On the basis of existing taxation, tax revenue for 1944-45 is estimated at £39,050,000, compared with actual receipts of £37,168,000 last year. Customs are estimated to yield £11,605,000, of which tobacco alone will contribute £9,250,000, and Excise £8,780,000, of which duties on beer, spirits, betting and entertainment will provide £7,030,000. Inland revenue is expected to increase by £982,000 to £18,215,000. Income tax is estimated at the record figure of £11,570,000, and corporation profits tax, which at the beginning of the war yielded only £524,000, at £4,060,000, an increase of £279,000 on 1943-44. The increased yield of both taxes reflects the upward trend of business profits, and to some extent of profiteering. Non-tax revenue, derived mainly from Post Office receipts and land annuities, is estimated at £6,585,000, making the estimated total revenue £45,635,000, compared with £43,779,732, in 1943-44.

### Increased Expenditure

On the expenditure side of the account, supply services are estimated at £45,230,000, an increase of nearly £5,000,000 on last year, due largely to rising prices. The new children's allowances will cost £1,548,000 this year and about £2,250,000 in later years. The special provisions in the various state services to meet the higher cost of living amount to roughly £7,000,000. There will be further capital expenditure, including the construction of the Shannon airport, amounting to £1,069,000, which can properly be defrayed by borrowing. The total expenditure is estimated at £49,155,000, compared with £45,009,012 in 1943-44.

To meet the deficit of £3,520,000 no change in taxation is contemplated. If the war situation were to improve, some rise in the revenue from taxes could be expected, but it cannot be counted on. Whatever borrowing is necessary could largely be provided by an expansion in savings certificates and post office savings bank deposits, though conditions are favourable if the Government should decide to float a new loan.

On the whole, the problems of the present financial year have been satisfactorily solved; but the comparatively healthy condition of Irish public finance is no reason for complacency about the general economic condition of the country. Between 1938-39 and 1942-43, the gross volume of agricultural output fell by about 10 per cent, although net output rose by about 9 per cent. More is being taken out of the land than is being put in, and there is serious over-cropping added to a shortage of fertilisers.

Agricultural prices are 100 per cent above pre-war levels, largely as a result of high prices given to stimulate increased production. This has contributed to the relative prosperity of the farming community, but it is also an important factor in the 71 per cent increase on the pre-war cost of living. Output in industry has also declined, by 50 per cent in the important building industry, and by 21 per cent in those industries producing transportable goods. The war-time decline in trade is shown by a 71 per cent cut in imports and a 47 per cent cut in exports. Meanwhile, real wages have fallen, especially for those with fixed money incomes. Wages and salaries have only been allowed to

rise by 15 per cent and there is great poverty in the towns. Further discomfort arises from the severe fuel shortage and from a deplorable transport system which threatens to deteriorate even further.

### Post-War Plans

The Government is, however, making ambitious plans for the future. As in the United Kingdom, much of the Budget speech was concerned with the immediate post-war period. Large-scale public works are planned to absorb demobilised servicemen and workers returning from abroad. Besides a programme of public and private building, afforestation and tourist development, plans are being made for the exploitation of hydro-electric resources at a cost of £27,500,000, of which £10 million will represent a subsidy to rural electrification. If the scheme is successful, it should help to reduce agricultural costs and arrest the flight from the land.

The successful execution of this and other plans depends on a number of conditions. Eire possesses abundant sterling balances, but it remains to be seen how rapidly they can be used to purchase adequate supplies of much-needed imports. Present expenditure on defence and emergency services should be rapidly and drastically reduced; reductions of expenditure in other directions are imperative if the post-war employment plans are to materialise. Another condition is that the national income, especially the agricultural income, should be expanded.

## Films Follow the Flag

For some time the continent of Europe has been virtually self-sufficient in the supply of films. At present only neutral European countries distribute American and British films. Germany, the largest single producer on the Continent, seems thus to hold a monopoly in the supply of films.

The actual situation is, however, different. Before the war, roughly 50 per cent of all feature films shown on the Continent were American. Even in Germany, American films released in 1938 amounted to 21.7 per cent of the total feature films exceeding a length of 1,500 metres (roughly 5,000 feet). Measured by the number of films that have been produced during the war, Germany has not been able to replace American films. According to German statistics, the total continental production of feature films fell by roughly 34 per cent during the period from 1938 to 1943.

After an initial decline, Germany's production remained stable at an annual production of 100 to 110 films. In 1938 this production was 16.5 per cent of the total continental output. In 1943 Germany's share had increased to some 26 per cent. The production plan for 1943 shows that film production in Italy was almost as large as in Germany. Both countries were closely followed by France.

Nevertheless, in spite of an almost stable production, Germany managed to replace in most of the occupied and dominated countries a considerable part of American films. The share of American, British and German films was as follows:

(In Per Cent. of Total Number of Feature Films)

|                 | 1938 | 1938          | 1938    | 1942    |
|-----------------|------|---------------|---------|---------|
|                 | USA  | Great Britain | Germany | Germany |
| France . . . .  | 55.9 | 4.9           | 6.1     | 32.3    |
| Belgium . . .   | 57.7 | 2.9           | 15.1    | 65.7    |
| Holland . . .   | 64.9 | 4.2           | 16.1    | 73.1    |
| Denmark . . .   | 63.6 | 4.9           | 11.0    | 44.2    |
| Norway . . . .  | 62.4 | 3.8           | 11.5    | 58.3    |
| Finland . . . . | 53.0 | 2.5           | 13.7    | 31.0    |
| Roumania . . .  | 53.8 | 10.7          | 19.5    | 48.1    |

These figures are taken from German publications. Some of them may be estimates. Here and there the compilers may have overlooked that old American films were still shown even in 1942; but the fact remains that in Germany, and most other countries, cinemas put on regular shows.

The German film industry—that is, the production and distribution of films—is actually a nationalised industry. The cinemas have been left in private hands. But the private owner's position is comparable to the position of a branch manager in a large concern of retail shops. The final move for the complete nationalisation of the industry was made in 1942 when a holding concern controlling every single production and distribution company was founded under Uft. In Nazi language it is the central "steering organ."

Although not engaged in production, the central "steering organ" of the German film industry does plan production and adjusts the plans to the capacity of the producing companies, of which there are seven which continue to use the names of the former independent concerns. These are the Ufa-Filmkunst, Tobis, Terra, Bavaria, Vienna, Berlin and Prague companies. In addition, there are companies for special films, documentaries, and news reels.

It will be seen from the names of the companies that there is some kind of regional organisation for the production of films. Within the general plan imposed by the holding concern, which is, in fact, a department of the Ministry of Propaganda, the regional producers enjoy relative freedom.

But the distribution of films is in the hands of only one company. Here centralisation is absolute. In this way some 400 independent production companies and 300 distributors have been centralised as a state industry. For experimental purposes some very small firms are still allowed to function under the control of the big companies. Only the old "Ufa" company owned a considerable number of cinemas before the war, and, for the administration of all cinemas owned by joint stock firms, a new concern has been founded. Most cinemas, however, are owned privately, and special restrictions have been placed upon the accumulation of more than four cinemas in one hand. Inside this system financial problems are relatively simple. The cinemas pay to the distributors from 33 to 38 per cent of their takings. A short time ago this was increased by a special contribution amounting to 3 per cent, which is used for accumulating a fund for the rebuilding of cinemas destroyed by bombs. The revenue derived from the distribution of films is then allocated to producing companies according to the production plan drawn up by the "Ufa" Film Concern.

Since 1934, German cinemas have been restricted to showing one full-length feature film and one news reel; and one or two documentary films which are called "culture films" have been compulsory. At present a programme consists uniformly of one full-length feature film of about 2,000 metres, a news reel of 650 metres (against only 300 metres before the war), and cultural films of a length of 350 metres. Some 250 to 300 copies of each feature film are produced, against only 70 to 80 copies before the war. The same film is shown in about 4,000 cinemas. Before the war it was shown in 2,000 cinemas. About 800 copies of pre-war news reels were

produced. At present 1,250 copies are made for inland consumption—and for export to other countries additional copies in 35 languages are produced. The European market can therefore be supplied by the simple device of making the required number of copies, and by showing the same film in a greater number of cinemas.

The number of cinemas in Greater Germany remained practically unchanged up to the beginning of large-scale bombing. During the past year a considerable number of the larger cinemas have been destroyed, and cinema-goers face the prospect of the rationing of cinema tickets. In Greater Germany the number of tickets sold was as follows:—

| (In millions) |     |     |      |     |       |
|---------------|-----|-----|------|-----|-------|
| 1939          | ... | 624 | 1941 | ... | 829   |
| 1940          | ... | 834 | 1942 | ... | 1,100 |

These figures are slightly misleading, because of the incorporation of territory in the east and west. But there was no doubt a considerable increase.

Since the first conquests and the virtual incorporation of the so-called Protectorate of Bohemia and of Poland, the German film industry has a market of 8,299 cinemas. On the whole continent, including the neutral countries, there are some 27,000 cinemas, with 11 million seats. The density of cinemas is smallest in the south and south-east, and increases to record figures in the northern countries.

It is obvious that the concentration of the film industry in Germany is overwhelming for the smaller industries in occupied and satellite countries. Germany dominates the so-called International Film Chamber, which combines 17 countries, among them Sweden, Spain and Portugal. This International Chamber is a kind of clearing-house, with the object of adjusting the production and distribution of films all over Europe. Even before the war German film concerns held interest in Dutch and other foreign companies. Since the beginning of the war, the Ufa concern has built up a network of subsidiaries in south-eastern countries. The French film industry has remained formally independent, but the new company, "Continental Films," in Paris, is directly controlled by the Vichy Government. In most of the occupied and satellite countries state film departments have been set up which collaborate either with the German holding concern or with the German Propaganda Ministry.

During the war gross revenue of cinemas in Greater Germany from sold tickets has increased from Rm. 477 million to Rm. 935 million. The average entertainment tax in 1942 amounted to 6.8 per cent. Distribution costs leave producers ample funds for their restricted production, although the average costs of producing a feature film have increased considerably. A particular feature of the German film industry is a special bank, the "Film-Kredit Bank."

The European film industry during the war has showed a stabilised production in Germany, and a considerable increase in Italy, Hungary and Finland. In France there was a revival during 1942-43. Competition has been actually eliminated; and the producing companies suffer everywhere from lack of material and from rigid state control and planning.

## Letters to the Editor

### Irish Neutrality

TO THE EDITOR OF THE ECONOMIST

SIR,—In your issue of May 6th, Professor Savory quotes my recent pamphlet, "A Recognised Church," as evidence for pressure on Protestants in Eire. Please let me emphasise, as I have emphasised in my pamphlet, that the successive Irish governments have been impartial in opposing religious discrimination, and have had the support of most of the citizens in Eire in this.

The deliberate pressure is exerted only by some influential private citizens. Men of good will in all churches unite in deploring it. May I emphasise, too, that one of the main purposes of my pamphlet was to argue that the first political loyalty of the Church of Ireland in Eire is owed to the Government of Eire.

This, of course, should be a truism, unless we are to substitute St. Quisling for St. Patrick.—I am, etc.,  
Dublin.

W. B. STANFORD.

TO THE EDITOR OF THE ECONOMIST

SIR,—Professor W. B. Stanford is, of course, quite correct in asserting that in his pamphlet entitled "A Recognised Church," he has strongly insisted that members of the Church of Ireland should be loyal to the Government of Eire, but this certainly makes his statements on the treatment of members of the Church of Ireland all the more telling and striking, and I admire his courage in stating the case of his co-religionists with such firmness.

He points out that "conversions from Romanism are referred to in the Press as 'apostasies,'" and "in cases of conversion to Anglicanism intimidation, and even physical violence have been used against the persons concerned," and the figures that he gives of the decline of the numbers of the Church of Ireland in Eire show the pressure brought to bear upon the members of this Church.

He says that in 1911 there were 249,535, in 1926 164,215, and in 1936 the numbers had fallen to 145,030, and he states that "often political and religious pressure can be a more

insidious weapon against a community than open persecution." As a matter of fact, certain counties have been almost depleted of Protestants (as the census figures clearly show), many of whom have taken refuge in Northern Ireland and many have come to England. I have often conversed with those who have emigrated to Ulster, and though they come from many different counties, the tale that they tell is always the same—life had become intolerable, and they were forced to seek a more congenial atmosphere.—Yours, etc.,  
House of Commons.

D. L. SAVORY.

## The National Finances

TO THE EDITOR OF THE ECONOMIST

SIR,—Pages 605-614 of your issue of May 6th—10 pages of perhaps the most valuable figures you have published—can hardly have been completely digested at this date, but they lead me to wait no longer to say "Thank you," and to ask, like Oliver, for more.

It is interesting to compare these tables with the previous similar matter you gave us in May, 1943, and August and September, 1942. Taken altogether, they seem to me to be a fairly perfect parallel to the solving of a large jigsaw puzzle, of which no complete picture is available to build to.

In 1942, you had collected perhaps one edge of the puzzle, with quite a lot of gaps. In 1943, bits of all four edges were arranged, the sky at the top and the ground at the bottom, but there were quite obviously pieces in the wrong places. To-day we have the complete outside of the puzzle finished; all four edges are quite complete, and we know how big the final picture is. It is, nevertheless, only the outside edges of the picture we have, its frame so to speak, but we don't know the picture itself.

To continue the parallel, you have given us on page 578 of your April 29th issue two small items from the picture of the puzzle, complete in themselves, but we don't know where they fit. We know that in 1942, 655,000 workers were employed by the railways for a wage bill of £170 m., and also that in 1943 for the last six months, 702,700 wage-earners worked in the mines and received, for the six months, £99.2 m., or at the rate of £198.4 m. per year.

To complete the picture of our national industrial life, we need to know similar information for all the thirty million odd bread-winners of the country, and I believe it should be possible for you to give us this picture in the near future reasonably completely, although I appreciate that for a very long time there will remain one or two awkward little bits in the puzzle which won't fit in anywhere.

With such a complete picture, it should not be too difficult to criticise logically any Governmental national post-war planning. Without the picture, I fail to see how anyone can come to a decision on these points, and know, for example, whether 300,000 houses per year is inadequate or too large.—Yours, etc.,  
Sheffield, ro.

R. H. COATES.

TO THE EDITOR OF THE ECONOMIST

SIR,—Your conspectus of the statistical material available on the national finances was so explicit that one deplores the more the absence of a truly national balance-sheet to complete the story. What seemed lacking was a balance-sheet bringing into focus as a composite whole all the available resources of the nation (from which would be deducted those creditors outside Britain to whom amounts were owing in respect of any of the resources accounted for), suitably segregated and classified under appropriate headings, designating their nature, distribution of ownership, and location.

What board of directors would be content to present, and what body of shareholders would be content to receive, an income and expenditure statement without an accompanying balance-sheet depicting the extent and nature of the accumulated resources at a given date, from which to judge the strength or weakness of future potential income-earning capacity?

To illustrate only one feature of the usefulness of such a balance-sheet, its relation to our future export problem may be instanced. To maintain our standard of living after the war, it is estimated that we will require a 50 per cent increase in export trade.

Granted we find the markets, have we the capacity to produce that increase? With the prospect of a large proportion of manufacturing plants, factories, equipment, and armaments becoming redundant, obsolete, or scrapped, after the

war, how will we know whether we are actually in possession or not of sufficient available resources of the right kind, to produce the required increase, without initiating a thorough, co-ordinated, stocktaking, and incorporating the results in the framework of a National Balance-Sheet?—Yours, etc.,  
Harrogate.

WM. E. SPRUCE.

## Depreciation Allowances

TO THE EDITOR OF THE ECONOMIST

SIR,—I refer to Mr Singer's letter in your issue of May 6th. Mr Singer seems to me to write from theory without experience. In actual practice there were two points about the old taxation depreciation allowances which, with income tax at 7s. 6d. or 10s. in the £, had the effect of slowing down British industry.

The rates worked out fairly enough in the case of stable businesses cautiously operated where turnover and profits were relatively stable over a long period of years. In such cases, even with taxation at 10s. in the £, the business could look to recovering the capital invested during the life of a machine provided at the end it were replaced by another machine which cost no more than did the original one.

1. Apart from replacement, the question often arises of whether to invest in a new machine that is an improvement over the old one or to continue in the old way. The money this new machine costs has to be found out of reserve or from new borrowings. On the other hand, if a complete overhaul was undertaken of the old machine, that was treated as an allowable expense and the whole cost was all the cost and not subject to tax.

This produced a strong tendency in cautious minds "to mend and make do" rather than to venture into new ideas.

2. I have always said that a risky capital outlay should show a 20 per cent saving to justify itself, i.e., to enable it to be written off in five years. The following case recently happened:—

We design a piece of plant costing £6,000 which will save six men or £1,500 a year. This conforms with the rule of thumb which is given, and apart from taxation we should write off in four years and then be ready for something new. We know that business is likely to be brisk for the next three or four years. The following table shows that with taxation at 10s. in the £ it takes nearly seven years to write off this plant out of savings:—

|                                                                  | £     | £       |
|------------------------------------------------------------------|-------|---------|
| Capital outlay.....                                              |       | 6,000   |
| Annual saving (6 men).....                                       | 1,500 |         |
| Annual Income Tax Free Depreciation at 5% on capital outlay..... |       | 300     |
| Margin after depreciation.....                                   | 1,200 |         |
| Income tax at 10/- on this.....                                  | 600   |         |
| Net margin after income tax.....                                 |       | 600     |
| Net margin after income tax + income tax free depreciation.....  |       | 900     |
| Number of years to write off capital costs.....                  | 6,000 |         |
|                                                                  | 900   | = 6.2/3 |

Yours, etc.,

Street, Somerset.

BANCROFT CLARK.

TO THE EDITOR OF THE ECONOMIST

SIR,—As one reads the articles on the fiscal treatment of depreciation in the issues of *The Economist* of April 29th and May 6th, and the letters from Dr Singer which they provoked, it seems pertinent to inquire if it is so right to "criticise the 'accounting principle' under which the initial cost of equipment is written off, but not its replacement value."

Changes in the value of money only tend to emphasise the rigidity of relatively fixed operating costs. Fixed assets in the form of equipment are themselves but a store of delayed operating costs which sooner or later must pass into the operational account. In the last resort the ability to replace such assets is determined by a strong current position created in part by operational write-offs, but also by the policy of profit retention.

The accounting profession is not under "the delusion of fixed money value"; but if Dr Singer can suggest a better basis for drawing accounts than that which relies on the accounting principle of historical cost, I for one should be very glad to know it.—Yours, etc.,

London, W.C. 2.

F. SEWELL BRAY.

# THE BUSINESS WORLD

## Raw Materials in War and Peace

THE task of feeding the arsenals of the United Nations with raw materials has not been an easy one. Their needs of manpower could be met by cutting down civilian activities, by drawing on the pool of unemployed persons, and by denuding households of non-gainfully occupied women. Current supplies of raw materials, too, could be transferred from civilian to military uses. But supplies of many commodities fell far short of needs, either because of an expansion in total demand, or because some of the sources of supply were cut off. Steel, manganese, aluminium, magnesium, aviation petrol, and other materials were required in substantially greater volume than before the war; rubber, tin, silk, tungsten, Java sisal and Manilla hemp were doubly scarce because their major sources of supply were cut off from the United Nations by Japan. Production had to be stepped up, and substitutes found regardless of cost. But this is only one side of a complicated problem; the other was the need for distributing raw materials in accordance with military requirements, and with the needs of specific war production centres. A complete control of the flow of materials was essential to the fulfilment of the task of feeding the arsenals; the apparatus for it was set up by the creation, in January, 1942, of the Combined Raw Materials Board.

The CRMB, which has now issued its second annual report, has performed its task with considerable success. In its early stages, the supply and distribution problems were fraught with difficulties; many materials were scarce and prospective shortages appeared serious. Some 42 materials came under the Board's review, including, besides steel and other metals, balsa wood—essential in the production of the versatile Mosquito aircraft—fertilisers, hides and leather, kapok, nylon, pulp and paper, rubber, shellac, silk, sulphur and tung oil. As a result of a sustained effort to augment production in the countries accessible to the United Nations, to ensure the distribution of materials in accordance with military needs, and to secure economy in their use—assisted by the reduction in the loss of cargoes on the high seas, and the increase in shipping tonnage—it became evident about a year ago that "the military effort of the United Nations was not likely to suffer materially from an insufficiency of raw materials." The Board was therefore able to concentrate its main effort on a fairly narrow range of materials, such as rubber, nickel, mica, hides, pulp and paper and sisal. In other words, the major materials, especially steel and most other metals, are no longer causing serious concern, largely because shortages had been foreseen and provided for by increased production. Such bottlenecks as still exist are

chiefly in materials which were neglected initially because they seemed either unimportant or in plentiful supply. By the end of 1943 the position in many materials—especially metals—was so satisfactory that, by the test of their current use, surpluses were beginning to emerge.

In the matter of raw materials the United Nations are, in fact, already faced with some of the problems that will arise in the transition from war to peace. It should be emphasised, however, that such surpluses as have emerged or are likely to emerge, are merely surpluses over essential and mainly military requirements. It will thus be possible, as the Board suggests, to reduce production, to increase stocks, or to raise consumption, either by relaxing the degree of substitution that has been practised with materials hitherto in inadequate supply, or by relaxing the restrictions on civilian use. Any action that is taken should, of course, take account of the prospective supply and demand for individual materials. If the surplus over needs, as at present defined, is likely to be substantial, and part of current output is obtained at much more than average cost, there may be a case for a cut in supplies. Again, the relaxation of regulations about substitution is mere commonsense where the substitutes are of inferior quality and as costly as the material normally used. There is a strong argument for accumulating stocks of materials that are likely to be in heavy demand after the war. As the Board suggests, any increase in civilian consumption must be decided not merely by reference to raw material supplies, but, more particularly, by other factors, such as manpower, transport, and plant capacity. These factors are likely to limit severely the volume of additional raw materials that can be put to civilian uses, at least until the end of the war in Europe. But in a further prospect two considerations should be borne in mind. First, relaxations on restrictions upon civilian consumption should proceed on as equitable a basis as possible among the various members of the United Nations. It would obviously be inequitable if civilian consumption were allowed to increase substantially in one country and not in another; this may involve an adjustment in war production in the various countries to permit each of them to switch over a proportion of its resources to civilian production. Secondly, the principle of needs rather than money demand should continue to govern the distribution of essential raw materials for the period of the immediately post-war years. This principle has already been recognised in UNRRA.

There is, in fact, a strong case for maintaining the machinery of the CRMB not merely until the conclusion of hostilities—the report pleads for the maintenance of control over supplies and distribution until the end of the war—but during the period of reconstruction after the war. Control of allocation should not only assist in avoiding the inflationary rise in prices that would be inevitable in an immediate return to free markets, but it should make possible the distribution of materials on the basis of needs, not only between but also within the countries of the world.

But the emergency will be over some time. The question will then arise whether there should be a return to free markets or whether international Government control should be retained in the supply and distribution of raw materials. Policy, clearly, must be guided by the overriding need to ensure a steady expansion in the use of raw materials—a condition of a rising standard of living—at prices reasonably remunerative to efficient producers. If the choice were between completely free markets and a perfect system of international Government control, the latter might be preferable in that, by definition, it would eliminate excessive price fluctuations that have been the curse of raw material producers as much as mass-unemployment has been to industrial communities. But a perfect system of international Government control is hardly within the realm of practical politics, and an unsuccessful attempt at perfection is likely to produce the worst of both worlds. It is one thing to draft a perfect control scheme on paper; it is quite another

to translate it into practice. Almost inevitably, comprehensive planning in the sphere of raw materials would in practice show a strong bias in favour of the producers. In theory, the production of raw materials can be controlled without being restricted. In practice, any control scheme is likely to degenerate into a scheme for restriction in the interest of high prices, which would impede expansion in demand and industrial progress.

But, on the other hand, it is most unlikely that the public opinion of the world will be prepared to tolerate the wide fluctuations of prices that are usual on a free market, without making some attempt to control them. As between complete freedom and complete control, the world will not choose either extreme. Completely free markets have many advantages, which have been set out again in a report published by the British Federation of Commodity and Allied Trade Associations, Limited, an organisation of 40 trade associations set up in February last year for the joint consideration of post-war problems. Competition provides the incentive to cost reductions by the use of better methods, and it does not hinder geographical shifts in production to new low-cost centres. Moreover, the distribution machinery, with its "futures" markets, has performed the task of funneling supplies to consumers—in the quantities and grades required—with considerable efficiency. Free markets are hardly the

cause of excessive price fluctuations, which lie primarily in the variations of consumption, exaggerated by restocking and destocking movements. But complete freedom of the markets is incompatible with any attempt to mitigate those fluctuations.

The real problem that awaits solution is to find means of avoiding excessive price fluctuations without unnecessary restrictions upon the freedom of the markets. The mitigation of the trade cycle in industrial countries would go a long way towards bringing greater stability to the raw material markets. But it is hardly possible, at this stage, to place full reliance upon this remedy. Other means will have to be found to avoid excessive price fluctuations. But such measures as are taken—they will have to vary from commodity to commodity with the technical conditions of supply and demand—should be taken under the auspices and supervision of some international government agency of which the CRMB might well form the nucleus. It is only through concerted action by the Governments of producing and consuming countries that the worst evils of monopolistic practices can be avoided. Britain, more than any other country, depends for its future prosperity on a plentiful supply of cheap raw materials. And its influence is strong enough to enable it to insist on conditions that will be conducive to expansion.

## Business Notes

### A Matter of Interpretations

Much of the dispute on the international monetary plan which has recently enlivened Parliament and the Press concerns interpretations of the experts' joint statement. One serious misunderstanding was caused by the Chancellor of the Exchequer's remark in the House of Commons that there was nothing in the plan which would prevent this country from entering into "reciprocal trade agreements" with other countries. This was later corrected by Sir John Anderson, who said that he should have used the words "reciprocal arrangements" instead of "reciprocal trade agreements," and that what he had particularly in mind was "arrangements such as those governing what was known as the sterling area before the war." The sterling bloc before the war was a group of currencies tied to a single anchor, and therefore stable in terms of one another. It demanded no discriminatory practices on the part of its adherents and their currencies were freely convertible not merely in terms of one another, but in terms of other free currencies. Such arrangements would obviously be compatible with admission to a wider international monetary scheme, and Sir John Anderson's latest assurances on this subject were no more than the statement of the obvious. Another point which has been raised is whether the plan's injunction against "discriminatory currency arrangements" would not force Britain to apply control of capital movements within the sterling area if control of such movements were required between sterling and other currencies. These fears are unfounded. The scheme does not affect capital transactions except in so far as they involve "large and continuous use of the resources of the fund." The threat to sterling's position as an international currency comes, not from the experts' plan, but from those who seem to fear the general convertibility of sterling which the plan would restore after the immediate post-war transition period.

### India and the Monetary Fund

India's attitude towards the International Monetary Fund has been defined this week in a speech by Mr C. E. Jones, the acting Finance Member. India's position *vis-à-vis* the plan is of special importance and significance since that country will, in all probability, be the largest holder of abnormal external assets arising out of the war. It is in the light of that position, that is of India's exceptional holding of sterling, that Mr Jones viewed the currency scheme. He assumed that the abnormal balances would be funded and liquidated over a number of years. He thought it reasonable to assume that

the annual payment of sterling in accordance with that scheme of liquidation would be treated as current transactions for the purposes of the monetary plan.

On that assumption, the payments to India by Great Britain would rank for assistance from the Monetary Fund. Mr

Jones' support of the scheme was, therefore, largely based on the contention that such a scheme would strengthen the position of sterling and would bring about the multi-lateral convertibility of sterling at an earlier date than would otherwise be the case. The importance of such convertibility to India is that it would enable that country to plan its purchases abroad with greater freedom than if the sterling assets in question were only available for purchases in the sterling area. Provided, therefore, that India is given due recognition in the constitution of the Fund and granted a quota appropriate to its importance, the support of the Government of India will undoubtedly be given to the scheme.

### Bombay Silver Slump

The open market price for silver in Bombay has recently fallen headlong from the peak of 143 rupees per 100 tolas which was touched on April 24th last. With the exception of momentary halts, the fall since then has been continuous, but the pace of the movement has increased considerably this week. On Thursday of last week the quotation was still at Rs. 137 6 annas, but it broke by 3 rupees on the following day, and by Tuesday of this week the slide had taken the price down to Rs. 129. Two factors appear to have been responsible for this sudden relapse. The first is the improved situation on the Burma front. It was the token Japanese invasion of India, and the fear that the operations in Manipur might develop into a serious threat to India

which led to the rush for silver in March and April of this year, and caused prices to reach their record levels. With the evident passing of this threat, hoarders and speculators have been selling. The responsibility of this general military factor is apparent in the corresponding though more modest movements in the rupee price of gold. From a quotation of Rs. 76/15 on April 24th the price has come down to Rs. 73/12. The greater stability of the gold price is due in the first place to the fact that the British and American Governments have continued to sell gold in the Bombay market. These sales prevented the price from following that of silver in the past few days. A more specific influence on the rupee silver market has been the report that the Indian Government is about to begin sales of silver in the open market. It will be recalled that last March the Indian Government bought about 16 million ounces of silver from the Iran National Bank. This operation was generally interpreted at the time as the preliminary to official sales of silver in the Indian market. There are strong arguments in favour of such sales. The counter-inflationary effect of sales of gold loses some of its force by reason of the exceptionally high price of the metal which thus does not reach the small cultivator. Disharding of foodstuffs by the agricultural population might be considerably helped if the authorities made silver as well as gold available in the open market. Meanwhile, the basic factors making for inflation in India and, therefore, for still higher bullion prices, have lost little of their strength. With the development of East Asia Command operations in Burma the scale of Allied expenditure in India is still rising, and this is reflected in the increased holdings of sterling assets by the Reserve Bank. Over the three months to May 12th these assets have risen by £75 million to £738 million, a rate of increase which will bring the total to £1,000 million within a year. It is, therefore, difficult to avoid the conclusion that the recent fall in bullion prices is merely a temporary reaction, and that, unless heavy sales of gold and silver are made on official account, the trend is likely to turn upward again before long. In fact, both silver and gold quotations in Bombay were again rising towards the end of this week.

\* \* \*

### Double Taxation

In replying to the debate on the second reading of the Finance Bill on Tuesday, the Chancellor of the Exchequer made some reference to double taxation. Both Sir George Schuster and Sir Arnold Gridley had asked that the whole question be examined, but Sir John Anderson's reply can scarcely be considered as encouraging. He was able to confirm that conversations had been proceeding between British and US representatives on this subject and to state that there is hope of an agreement on somewhat different lines from those governing Dominion Income Tax relief. He referred to DIT, however, as though it were a satisfactory arrangement—a view which would be strongly contested by many—and, while admitting the importance of the matter, he gave no assurance of its general reconsideration. This will certainly not satisfy those who have for years been pressing for a new policy, but there is still hope that the Anglo-American agreement, if and when it is signed, will establish a new principle upon which it may be possible to build a wider and more effective system of reliefs.

\* \* \*

### Campaign Against Portal Houses

The Government's decision to relieve the housing shortage after the war by supplementing the construction of permanent houses with temporary factory-made steel houses has given rise to violent outbursts on the part of leaders of building trade unions. Mr Wolstencroft, of the Amalgamated Society of Woodworkers, is an encouraging exception. He has publicly given a welcome to new building methods and promised his union's co-operation. Mr R. Coppock, secretary to the National Federation of Building Trades Operatives, has repeatedly attacked the decision to build temporary houses on the ground that permanent houses can be constructed in the numbers required. Now Mr Luke Fawcett, general secretary of the Amalgamated Union of Building Trade Workers, has joined in the campaign by issuing a pamphlet under the resounding title "We Can Build All The Houses." The bulk of it is taken up by a chronicle of Russian achievements, with the conclusion that what Russian workers can

do British workers can do. Here is an example of Mr Fawcett's rhetoric:

We assert that to start the post-war housing programme by thrusting *ersatz* dwellings on the people is a tragic mistake—nothing short of a betrayal of the people's needs and hopes. Nor is it justified on the facts. Good houses can be built to any number required. The sole reason advanced is that the substitutes can be provided more quickly. That is not true . . . The elaborate fiction that hundreds of thousands of our people must be fobbed off with Nissen huts or "temporary" houses, pre-fabricated or otherwise, because of the time it will take to build good houses, is belied by the facts.

In reaching the conclusion that unorthodox methods are essential to a speedy solution of the post-war housing shortage, the Government has not been actuated by any base designs but by the facts of man-hours and materials likely to be available. Mr Fawcett boldly asserts that the Government's decision is belied by the facts. But he carefully refrains from quoting these alleged facts, and so long as he does not give chapter and verse, his challenge cannot be taken any more seriously than that issued by Mr Coppock. Without detailed evidence, the campaign against the construction of temporary factory-made houses leaves the impression that it is designed to create prejudice against them in the interests of a monopoly in existing methods of building rather than to ensure a speedy solution of the housing problem. Comparative speed in construction with a given volume of resources can be the only test, until every family that wants one has been provided with a separate dwelling. That test will soon be provided, for permanent houses will be constructed side by side with temporary houses after the war.

\* \* \*

### Industry and Education

The responsibility of industry for the education and training of its young recruits, both inside and outside the works, is acknowledged in a recent memorandum of the Education Committee of the Federation of British Industries. The memorandum recognises, in general terms, that the whole of the years up to 21 must be regarded as an educational period. It contains several suggestions for the practical implementation of this principle, but the educational system and its future development is necessarily examined primarily by the criterion of industrial needs. The emphasis is therefore on improved methods by which industry can be supplied with new entrants—especially in the lower grades—of a higher adaptability to its needs. In part, this complaint can, and probably will, be met by a raised school-leaving age, but the Committee make further proposals for the improvement of the present situation. One of the most valuable is an insistence on closer co-operation between industry and the local education authority, to the advantage of both. By such means, and by an extension of the local employment advisory committees, industry might be assisted in getting the type of new entrant most suitable to its needs, while the experience of industry as employer of the old pupils might be of considerable value to the schools. There is an obvious limit to the desirability of such an integration, however, and too great an emphasis can be placed on proposals such as these. To subordinate education to the needs of local industry might conceivably introduce a limitation on the mobility of labour, and even on the standard of general education. The issues raised by Mr George Wansbrough's suggestions for improving the status and standards of skilled craftsmen (discussed in *The Economist*, May 20th, page 688) are not directly dealt with in the memorandum. It recognises the fact that at present the children entering industry at 14 are below the average product of elementary schools, since the best of these tend to go on with further education, or take up office jobs. The general belief that "office jobs" are inherently superior to those of the manual worker, the Committee believes, may be partly dissipated by the placing of technical and modern schools on an equal footing with the grammar schools. The memorandum provides a useful basis for further examination of the part which industry can play in the future development of education.

\* \* \*

### Rank and Fox

An interesting agreement has been concluded between Mr J. Arthur Rank as chairman of Gaumont-British Picture Corporation and Mr Spyros Skouras, president of Twentieth Century-Fox Film Corporation. In 1941 Mr Rank acquired

51 per cent—the Ostrer block of shares—of the voting shares in the Metropolis and Bradford Trust, the company controlling Gaumont-British Picture Corporation with its large chain of cinemas and film-making facilities. But the actual transfer of the voting shares was subject to the consent of the American interests in the Metropolis and Bradford Trust—mainly Twentieth Century-Fox—which has hitherto been withheld. This consent has now apparently been given as part of the agreement between Mr Rank and Mr Skouras, which provides for close collaboration between Gaumont-British Picture Corporation and Twentieth Century-Fox. Mr Skouras, as well as Mr Laurence Kent—"one of the most experienced theatre executives in the United States"—are to join the board of Gaumont-British Picture Corporation, and shareholders in Gaumont-British Picture Corporation will be asked to remove the ban on the transfer of shares to non-British subjects. According to a statement issued by Mr Rank, Twentieth Century-Fox has agreed to make available facilities in the United States for the physical distribution of film produced by Mr Rank's organisation, and arrangements have been concluded for the distribution of such films in South Africa and Australia on more advantageous terms than have hitherto been available. Moreover, the American company is arranging for the production of films in this country in collaboration with Mr Rank; these films will be distributed alternately by Twentieth Century-Fox and by Eagle Lion, Mr Rank's distributing organisation. The upshot of all this seems to be that Gaumont-British Picture Corporation, while controlled by Mr Rank, will contain a strong element of American influence, and that Mr Rank will be able to draw on American technical experience as well as enjoy the distribution facilities of Twentieth Century-Fox in the United States. A prosperous Gaumont-British Picture Corporation is obviously in the interest of Twentieth Century-Fox. In one respect the advantages enjoyed by Mr Rank's organisation are therefore similar to those of Metro-Goldwyn-Mayer British Studios, the British subsidiary of Metro-Goldwyn-Mayer, of which Sir Alexander Korda is chairman.

\* \* \*

### Credit Stringency

The position in the money market has been strained in recent weeks and the provision of official assistance by special open market purchases of bills has become a frequent and almost routine occurrence. The authorities, for the time being, are running the credit position on a particularly tight rein. There is no danger in this, since the market's remedial counter-measures can be taken so easily and painlessly. The help of the official buyer of bills can be invoked at a moment's notice and with little fear of a refusal unless the authorities are satisfied that the credit for which the market is looking is to be found elsewhere by dint of more diligent search. The prevailing stringency of credit in the short-loan market is, however, of special interest on two counts. In the first place, it coincides with the attempts of the authorities to put more Treasury bills into the hands of the banks. Since the weekly issue of Treasury bills by tender has been increased to £110,000,000, the banks' purchases of bills from the market have been unusually small owing to the prevailing dearth of bank cash. The discount market has obtained comparatively large allotments of the new bills over the past three weeks, but in order to finance these additional bills it has probably had to sell an equal amount of bills to the authorities. The latter, therefore, would seem to have taken back with one hand what they have issued with the other—but with this vital difference, that the bills bought in the open market have been of exceptionally short maturity, while the additional bills put into market circulation have been full-dated three-months' paper. In due time the additional bills will find their way to the banks' portfolios, but the process would be considerably accelerated if the call on the banks for Treasury deposit receipts were kept down to smaller dimensions. The second item of interest in the recent shortage of credit in the market is that it has coincided with a sequence of bank returns showing unusually large accumulations of funds in Government deposits. This immobilisation of credit in public deposits has been purely accidental, and is probably due to under-estimation by the authorities of the results of provincial "Salute the Soldier" weeks. This week the position has been further aggravated by the banks' preparations for their May returns. All these are passing influences, and the

credit position should return to its accustomed ease before long.

### Coats Chairman on Control

Following the initial fall in earnings due to the war, there has been little fluctuation in the net profits of J. and P. Coats, and interest in the 1943 report centres around the remarks of the chairman, Mr J. O. M. Clark. As to the recent past and the immediate future, he is able to tell shareholders that last year brought a satisfactory increase in turnover, but that this was due mainly to heavy demands in North and South America. Difficulties of production in the former area suggest that this high level may not be maintained. From the standpoint of the proprietors, the EPT cushion is likely to absorb any effect this may have on gross earnings. More interesting are Mr Clark's views about the post-war position. Very clearly he favours both the removal of all controls at the earliest possible moment and the complete independence of the company. On the general question of controls he says:—

The matter is important but perhaps more important to manufacturers who are operating solely from Great Britain than it is to ourselves; nevertheless we should regret it if any further considerable part of our products should require to be manufactured abroad.

There could scarcely be a plainer indication of what the attitude of the large number of concerns with substantial export markets will be to any restriction which hampers them in competing with manufacturers who are more free to take their own course. As to any suggestion that Coats should be brought into any organisation of the cotton trade—or indeed any branch of textiles—Mr Clark points out that the sole connection in the past has been that the thread business used cotton yarns as its raw material and that

to remain abreast of the times and maintain the position of supremacy we hold on world markets, we must be free to take advantage of any discoveries in respect of raw materials available at any time of whatever nature they may be.

It is difficult to quarrel with his deduction that the

## WHEN will you get *Black Magic* again?

[WE GIVE YOU ONE GUESS]

All the nice things that used to be in Black Magic Chocolates — are they dead?

No.

They exist.

But they might as well be dead, for all the use they are.

The Mauritius sugar that gave the tang to the Black Magic caramel — it's in Mauritius.

The Valencia almonds that went into the Black Magic truffle-and-nougat and montelmar — they're in Valencia.

Brazil is no longer where the nuts come from. It's where the nuts stay.

Venezuela no longer sends us its peculiar fruity cocoa beans. It sends us petrol.

We didn't use petrol in Black Magic.

All the nice things are in all the nice places—except Britain.

They'll come again. When they do, so will Black Magic.

You can call that a threat or a promise, as you please.

ROWNTREES

industry must keep free from any restrictive legislation which may affect other branches of the textile industry. Indeed it might well prove fatal for them to have an agreement with any section of the textile industry which limited their freedom to use other materials. It is to be hoped that the type of control which is maintained beyond a short transitional period will not be restrictive and will be general and not detailed insofar as the matters mentioned are concerned. J. and P. Coats, however, with their associates, occupy an almost monopolistic position in the industry and the question whether some quite other type of control ought not to be exercised remains to be decided.

### Maypole Dairy Setback

The resumption of the falling trend in the profits of the Maypole Dairy Company last year suggests that the whole of the Lever group of store companies may be in like case. Sir George Schuster's review follows very much the lines of those of previous years, but he has rather more to say of the future. There can be no question but that wartime conditions have hit highly specialised shops, such as those of this group, with special severity. The contention of this group has always been that, by specialising in a comparatively narrow range of products, they were able to sell more cheaply, quality for quality, than the grocer with a wider range. One has to ask, however, whether this high degree of specialisation would have been followed had those in charge of the group been completely independent in the choice of their suppliers and the nature of their trade. It is interesting to speculate what would have happened in this respect had the projected amalgamation with the International Tea Company's stores—which more nearly approach the conception of general grocers—not broken down at the eleventh hour. About the future, Sir George, like so many other company chairmen in recent months, thinks the time ripe for some announcement of Government policy. He suggests that it should be possible to indicate the target for home agricultural production and, broadly, the quantity, nature and source of supply of food imports. Desirable as it is that such a statement should be made without delay, it seems rather optimistic to suppose that the authorities have advanced sufficiently far with their negotiations to permit of a very useful statement. Sir George's own view is that, to maintain a proper nutritional standard will fully employ home agriculture and still make it necessary to buy from the Dominions sufficient to provide adequate outlets for their own production. This may be true enough, but there is no certainty that those who most need a better diet will choose to spend their money in this way.

### Winter Milk Results

The production of milk during the second half of the winter season surpassed that of the first half, and the increase for the period September 1, 1943, to March 31, 1944, compared with the previous winter, was as high as 7.5 per cent. The trend of the increase in winter milk is shown in the following index figures, which refer to the consumption of liquid milk:—

|                         |     |
|-------------------------|-----|
| 1936-39 (average) ..... | 100 |
| 1939-40 .....           | 104 |
| 1941-42 .....           | 123 |
| 1943-44 .....           | 138 |

The latest increase represents an extra six million gallons a month, during the winter, in terms of actual milk produced. In wartime conditions, the achievement of the dairy farmer is remarkable, and his efforts are recognised, practically, by paying him more for milk in winter than in summer. A further increase in production can be

expected during the coming years. Winter milk is produced by winter calving, and the ultimate aim is for all calving to be done in winter, and none in the summer. Yields have been increased by better farming. The campaigns to increase production have been run by the County War Agricultural Executive Committees, and farmers have advised their neighbours on how to get the best results, by improved feeding and culling. Steps are being taken to improve breeding in the dairy herds by selection of better bulls. It is hoped that artificial insemination can be developed. Farmers are encouraged to record milk yields of individual cows, and to put their cows into the "Cows Panel," for regular inspection by veterinary surgeons. The War Committees' programme, although it provides immediate results, is an essentially long-term one. The final target at the moment is an additional 350 million gallons a year (the present rate is about 1,185 million gallons a year), which the Minister of Agriculture mentioned in the House of Commons on May 19th as the amount that would be required to remove the restrictions on non-priority consumers. Its achievement will take some years, but milk policy is not one designed solely for war. No doubt peace conditions, with better supplies of feeding stuffs and more labour, will accelerate the reaching of the target.

### Stock-in-Trade Valuations

There can be very little doubt that lack of economic training among both company directors and accountants results in accounts, prepared for the management of businesses, being much less useful than would otherwise be the case. To judge by published figures, this lack of training is nowhere more harmful than in the valuation of stock-in-trade and work-in-progress. This is a subject to which Mr K. Lacey has devoted considerable attention, and a note in *The Economist* of April 10, 1943, commented on an article of his on this subject. He has now carried the matter a stage further in a recent issue of *Economica*, and there propounds alternative solutions. Broadly speaking, his contention is that the system of valuing stock in trade on the first-in-first-out principle results in overstating earnings in times of rising profits and understating them when prices fall, and so accentuating the trade cycle. Further, he asserts that manufacturers tend to increase physical stock in times of rising prices and *vice versa*. These are, of course, two distinct problems, but it is possible that the impression of rising profits, created by valuing stocks at replacement cost, may encourage injudicious spending. Mr Lacey suggests as the better of two tried remedies valuation of stock on the last-in-first-out basis, which results in all stock being valued at a constant price. This he considers to be the correct gearing for "a potential age of plenty." Needless to say, the reserve representing the difference between base price and market price would accumulate in the hands of the company, and Mr Lacey suggests some income tax concession in regard to such reserves. The last-in-first-out method has been tried out extensively in the USA with full tax concessions for those who opted for this method of valuation. An alternative is the method adopted in France on the eve of war, which was to accumulate a reserve similar to that created under LIFO, while retaining the old method of stock valuation. This reserve was free of all taxation while it remained in the business. It is not sure that either of these methods is ideal, and Mr Lacey does not put them forward as such, but it is quite certain that the present system—or lack of system—is misleading to both managers and the public.

### Chain Stores Earn More

Four months ago the accounts of Woolworth for 1943 showed the third successive fall in published profits from the peak of 1940. The fall was 8 per cent, and the fact that earnings on the ordinary capital rose from 60.1 to 61.7 per cent was due to a sharp reduction in tax provision. This week Marks and Spencer announced an increase in net profit for the year to March 31st of 5.8 per cent to £1,940,000 odd. Provisions, other than tax, are down by almost £10,000, and tax is reduced by £73,000 to £790,000. In all, it is possible, after meeting preference dividends and maintaining the ordinary payment at 35 per cent, to add £320,837

### The Baltimore and Ohio Railroad Company

#### SUMMARY OF ANNUAL REPORT FOR THE YEAR 1943

The 117th annual report of the President and Directors for the year 1943, is being mailed to the Company's stockholders.

#### RESULTS OF OPERATIONS

The following is a summary of the Company's audited income account for the year 1943, compared with year 1942.

|                                                           | Year 1943        | Year 1942        | Increase over 1942 |
|-----------------------------------------------------------|------------------|------------------|--------------------|
| Railway operating revenues .....                          | \$358,142,152.08 | \$306,254,103.49 | \$51,887,958.59    |
| Railway operating expenses .....                          | 250,584,352.63   | 204,241,198.76   | 46,343,153.87      |
| Net railway operating revenue .....                       | \$107,557,799.45 | \$102,012,904.73 | \$5,544,894.72     |
| Railway tax accruals (including Federal income tax) ..... | 46,457,958.58    | 25,054,012.87    | 21,403,945.71      |
| Railway operating income .....                            | \$61,099,840.87  | \$76,958,891.86  | D \$15,859,140.99  |
| Equipment and joint facility rents—Net Debit .....        | 8,932,372.37     | 7,400,263.88     | 1,532,108.49       |
| Net railway operating income .....                        | \$52,167,468.50  | \$69,558,717.98  | D \$17,391,249.48  |
| Other income .....                                        | 8,637,968.62     | 8,670,683.14     | D 32,714.52        |
| Total income .....                                        | \$60,805,437.12  | \$78,229,401.12  | D \$17,423,964.00  |
| Miscellaneous deductions from income .....                | 2,035,995.35     | 1,685,984.95     | 350,010.40         |
| Income available for fixed charges .....                  | \$58,769,441.77  | \$76,543,416.17  | D \$17,773,974.40  |
| Fixed interest and other charges .....                    | 18,647,102.81    | 19,863,257.08    | D 1,216,154.27     |
| Income available for other purposes .....                 | \$40,122,338.96  | \$56,680,159.09  | D \$16,557,820.13  |
| Contingent interest charges .....                         | 9,612,858.50     | 11,356,562.50    | D 1,743,704.00     |
| Audited net income .....                                  | \$30,509,480.46  | \$45,323,596.59  | D \$14,814,116.13  |

(D) Denotes decrease.  
The decrease in net income of \$14,814,116 is the result of:—  
Loss due to suspension in 1943 of freight rate increases ..... \$7,100,000 |  || Increase in wage rates ..... | 9,282,000 |  |
| Increase in taxes after non-recurring tax credit of \$8,574,214 in 1942 ..... | 12,801,972 |  |
| Total ..... | \$20,123,972 |  |

Accruals for all taxes, year 1943, were \$46,757,209, absorbing 13 cents of each dollar of total operating revenues, 43 cents of each dollar of net railway operating revenue, and were equal to \$18.84 per share on the capital stock. As of December 31st, 1943, the record investment in property as related to railway operating income, is \$999,678,403, against which \$130,406,465 depreciation has accrued, leaving the net recorded investment \$869,271,938. There was no change in capital stock during the year, but there was a net reduction of \$58,661,935 in interest-bearing obligations of which \$57,537,050 were retired through the operation of the sinking fund created by the 1938 Plan for Modification of Interest Charges and Maturities.

## COMPANY MEETINGS

## SPILLERS, LIMITED

## ACCOUNTS FOR THREE YEARS

## MILLING TRADE CONDITIONS

## SIR MALCOLM ROBERTSON'S SPEECH

The fifty-seventh annual general meeting of Spillers, Limited, was held at the Great Eastern Hotel, Liverpool Street, London, E.C., on the 25th instant, the chairman of the company, the Right Hon. Sir Malcolm A. Robertson, P.C., G.C.M.G., K.B.E., M.P., presiding.

The Chairman submitted to the meeting his statement, which had been circulated to stockholders with the directors' report, as follows:—

Before proceeding with my review I desire to record the deep sense of loss to my colleagues, the staff and myself occasioned by the death during the past year of Mr. Edgar Baker. Mr. Baker, when he retired from the board in 1938, had been connected with the company for 52 years, during 35 of which he had been a director. He was chairman from 1926 to 1930, and deputy chairman from then until his retirement. His was a record of loyal and unfailing service, of wise counsel and of unobtrusive kindness. It will, I know, be your wish that a message of condolence from the company which he served so long and so well should be sent to his family.

The directors are glad that it has been possible to prepare accounts for the three years ended January 31, 1940, 1941 and 1942, and these have been laid before you. While a separate profit and loss account for each year is submitted, it was felt that no real purpose would be served by giving a balance-sheet at any date other than January 31, 1942.

## TWO YEARS STILL IN ARREAR

This represents a considerable degree of progress, but still leaves the position two years in arrear, a state of affairs which, though inevitable in the circumstances does not commend itself to the board. You have been apprised in the past of the vast amount of extra detail work involved as a result of operating under control conditions, and while every effort will continue to be made to expedite the matter, I do not consider that it will be possible—even at the best—to submit accounts less than one year in arrear so long as present conditions subsist.

Turning now to the accounts before you I must first emphasise that these are of a provisional nature. So far as they relate to flour milling operations the figures have not yet been agreed with the Ministry of Food. In addition, the taxation liability arising on the Company's results during the period covered has not yet been determined with the Inland Revenue, and the provisions made for taxation should be regarded more from the standpoint of the three years as a whole than in relation to each particular year. In the ordinary course the Directors would have preferred to await final figures, but they considered that by reason of the lapse of time since the last accounts were submitted to the stockholders it was desirable to present to you the most reasonably accurate statement which it was possible to prepare at this time.

## REARRANGEMENT OF BALANCE SHEET

The balance-sheet has been arranged in order to group the assets and liabilities in accordance with modern form. The first sub-total on the assets side represents the total fixed assets, while the second records the total floating assets. On the liabilities side the liabilities to members, viz., issued capital, reserves and the undistributed balance of the profit and loss account are brought together in contra-distinction to the current liabilities under the head of "creditors."

Fixed assets show a small decrease as compared with the corresponding amount at January 31, 1939. This derives largely from the annual writing down to provide for depreciation and obsolescence. It is important to note that no adjustment has been made in respect of premises and plant destroyed or damaged by enemy action. The amount involved is considerable, but it is not appropriate to deal with this matter until a settlement has been reached in regard to the war damage claims to which this has unhappily given rise.

Floating assets have increased considerably as compared with January 31, 1939, but this has to be considered in conjunction with the amount under "Creditors" which has also increased. The surplus of net current assets at January 31, 1942, was £2,603,848 as compared with £2,267,511 at January 31, 1939.

## TRADING SURPLUS

The profit and loss and appropriation accounts for the three years are shown in columnar form. It will be seen that the surplus on trading was substantially greater in the year ended January 31, 1940, than for the previous or the two following years. This arises from several factors, the most notable being that as a result of the change in methods of trading brought about by the imposition of the Control Orders, the profit on contracts open at the date of the Orders was realised during the year, and the normal situation whereby unrealised profit on contracts open at the close of the financial year is carried forward, did not obtain. Consequently the realised profit for that year was increased, but it is necessary to bear in mind the offset that may arise from the reverse situation that will occur in the year in which Control is terminated.

In the two following years the results of the flour milling operations were determined wholly by the terms of the agreement with the Ministry of Food, the general nature of which I have previously explained to the stockholders. In these years the volume of business in those sections of the company's activities which are not governed by that agreement—notably the animal foods department—while progressively reduced by war-time restrictions, had not shrunk to the low levels subsequently reached. It has to be appreciated in this connection that economies and price advances cannot make good the effect of diminished output when this reaches serious proportions. It is anticipated that the results from these departments will show a falling off in the years following these accounts.

## A MEAGRE RESULT

Over the three-year period covered by these accounts after providing for taxation and dividends there is a net surplus of £62,811 which has been appropriated as follows:—

|                                                                                    |               |
|------------------------------------------------------------------------------------|---------------|
| By transfer to general reserve.....                                                | £ 50,000      |
| By adding to the carry forward (which at January 31, 1942 stood at £180,980) ..... | 12,811        |
|                                                                                    | <hr/> £62,811 |

This is no more than a bare surplus in relation to the extent of our business and scale of effort, particularly when regard is had to the difficulties which will emerge in re-establishing our trade on a peace-time basis, in rehabilitating our factories and from the other adverse circumstances to which I have previously referred. Complete figures are not yet available in relation to

our subsidiary companies, and their earnings have not to any material extent been incorporated in these accounts. But in this connection it is important to note that as regards the principal of these concerns, Hosegood Industries, Limited, our interest was acquired just prior to January 31, 1939, so that nothing was included in our pre-war profits from this investment.

## GOVERNMENT TERMS NOT GENEROUS

Consideration of the position has confirmed the view which I previously put to you, that taking into account all relevant aspects of the situation, the terms of the arrangements between the Government and the milling industry are not generous to the millers and supports the contention that these terms should be improved if only to the extent of recognising the output that has been achieved in excess of the pre-war level under conditions of the utmost difficulty and for which no profit or remuneration has up till now been paid.

I think I may say not only of this company, but of the milling industry as a whole, that it has endeavoured to contribute to the war effort by attaining the maximum output with the fullest efficiency and economy possible under existing conditions without relying upon any financial incentive to greater effort. Such an incentive is unnecessary to responsible industry engaged in the production of vital supplies in time of war, nor is it sought as such. But some reasonable return for services performed by a key industry to enable it to make a modest provision against the grave difficulties which clearly lie ahead, if its position in the national economy is to be maintained, seems both advisable and just.

## DIVIDEND DECISION

I now come to the question of dividend for the year ended January 31, 1944, which had again to be considered by the directors without accounts showing the results of that year and in the light of the circumstances which I have outlined. They have decided that despite the uncertainty attending the level of earnings and the outlook for the immediate future, the strength of the liquid position which derives from the building up of reserves over a long period before the war justifies them in recommending to you the payment of dividends at the same rate as for the previous year. A resolution to carry this into effect will be submitted to you at a later stage in the meeting.

Once more it is my pleasure to express on behalf of the board and the stockholders our thanks to our staff and workpeople for their devoted and untiring efforts throughout the past year, under conditions which continue to be exceedingly trying and difficult.

I would especially thank our area general managers, senior officials and mill managers who have so successfully met the added calls made upon them as a result of war-time conditions. I know that they have faced their increased troubles without complaint, not only out of their traditional loyalty to the company, but also because they recognise so fully that they are engaged in maintaining essential supplies in time of emergency.

## EMPLOYEES IN THE FORCES

Finally, I would convey our greetings to our employees now serving with the armed forces. We hope the time is appreciably nearer when we shall be able to welcome them back, and meantime we send them our very best wishes for a safe return. The report was adopted and the dividends approved.

The retiring directors, Sir W. Norman Vernon and Mr. Laurence Hosegood, were re-elected, and the retiring auditors, Messrs. Impey, Cudworth and Co., and Messrs. Deloitte, Plender, Griffiths and Co., were reappointed. The meeting was then adjourned for the reception of the accounts for the year.

The adjourned 53rd, 54th and 55th annual ordinary general meetings were then resumed and the accounts for the three years ended January 31, 1942, adopted.

A vote of thanks to the chairman concluded the proceedings.

## J. AND P. COATS, LIMITED

## SUCCESS OF GOVERNMENT CONTROL

## GOOD POST-WAR DEMAND EXPECTED

## MR J. O. M. CLARK'S VIEWS

The annual general meeting of J. and P. Coats, Limited, will be held, on the 15th prox., in Glasgow.

The following statement by the chairman (Mr J. O. M. Clark) has been circulated to stockholders in advance with the report and accounts.

Following the practice adopted in recent years, I am again sending to the stockholders a brief statement dealing with the accounts to be submitted at the general meeting on the 15th prox., together with a few comments on the position of the business in general.

## ACCOUNTS

The balance-sheet shows little change in comparison with that of the previous year.

Amongst the liabilities, sundry creditors have dropped from £12,049,000 to £11,209,000, the decrease being due chiefly to a reduction in trade creditors for raw cotton supplies and to reduced balances due to third parties for monies borrowed abroad on our behalf by our selling agents.

On the assets side the item "Shares in Subsidiary Companies" has risen from £21,822,000 to £21,974,000. This change is explained by increases in our shareholdings in two wholly-owned foreign subsidiaries whose share capitals have been raised to put them more in accord with local conditions. The new shares were issued in each case in satisfaction of a corresponding amount of current account indebtedness.

It will be noted that general investments have come down from £4,368,000 to £3,903,000, due to sales of investments in 1943 to improve our cash position and, in a lesser degree, to normal redemptions.

Stock of goods and stores has decreased from £5,380,000 to £4,798,000. Last year about half of the increase then apparent was accounted for by a large purchase of raw cotton, which cotton, I explained, had been sold to the Cotton Control early in 1943. This sale accounts for part of the decrease in the 1943 figure. Sales of raw cotton were also made to subsidiaries during 1943 out of 1942 stock, but were more than offset by an increase in the stock of finished goods.

The profit and loss account shows a balance of £1,711,000 after providing £865,000 for excess profits tax. As before, our income-tax liability has been fully covered for the year of account, so that tax to be deducted from the final dividend on the ordinary stock, payable on June 30th next, will come into the 1944 accounts as an offset to the liability for that year.

The earnings for 1943 are not changed materially from those of 1942, but in 1943 we have had to make certain exceptional provisions of which the chief relate to foreign taxation.

It will have been noted that a few minor changes have been made in our accounts with the purpose of more precise description. We have considered making further changes along the line of the recommendations made by various accounting bodies, but having regard to the many factors which presently affect our foreign interests, we consider it inadvisable to make such changes at the present time.

Though the profit figure after deduction of E.P.T. has varied very little in the last three years, our sales have again shown a satisfactory increase on the high figure of the preceding two years. This has been contributed largely by North and South American markets. There is, however, evidence that the exceptional activity may not continue, particularly in the United

States, where as a result of difficulties of production a much more stringent system of rationing of our customers has now had to be introduced.

## FUTURE PROSPECTS

So far as the future is concerned, your board look forward after the war to a considerable demand for our goods from many parts of the world, and we hope that when the time comes we will be in a position to meet this.

At the moment it is not possible to do much by way of preparation so far as our home mills are concerned, and later on our plans will have to be governed largely by the extent to which controls are retained in this country. As I informed you on a previous occasion, I consider it will be essential that some of these be retained until stability is reached, but I hope that as many as possible will be lifted without delay. It is not an easy matter to get rid of restrictions once they have been imposed, and many of us can remember the tenacity with which certain war-time regulations were clung to after the last war. The matter is important, but perhaps more important to manufacturers who are operating solely from Great Britain than it is to ourselves, nevertheless we should regret it if any further considerable part of our products should require to be manufactured abroad.

## GOVERNMENT CONTROL

While speaking of controls I wish to add this. The thread industry is a very highly specialised one and requires long experience to understand it properly, and I should like to pay a tribute to those who have been called upon by the Government to control both our requirements of raw materials and our exports of finished products for the efforts which they have made to use information acquired from us in such a way that the business was damaged as little as possible by any restrictions on our activities made necessary by the war.

The only connection between the sewing thread business and the cotton trade has hitherto been in the use of cotton yarns as raw materials, but it is clear that to remain abreast of the times and maintain the position of supremacy we hold on world markets, we must be free to take advantage of any discoveries in respect of raw materials available at any time of whatever nature they may be. Our industry must therefore stand on its own feet, in no way encumbered in its natural development by any restrictive legislation which might affect other branches of the textile industry. The same considerations also hold good for our selling organisation which, under the management of fully trained experts, maintains in all foreign markets well assorted stocks of all articles necessary for local requirements.

A year ago I referred to the low level to which our cotton stocks had fallen, and I expressed some anxiety for the future. I am pleased to say that, thanks to the efforts of the Cotton Control, the position has improved greatly, and I hope our stocks will now assure us of ample cotton for some time to come.

## EMPLOYEES

To our employees and staffs at home and abroad I would like again to express our hearty appreciation of the services they have rendered. Conditions have certainly not been any easier during the last year, and they have cheerfully undertaken the many additional responsibilities which have fallen upon them.

NORWICH UNION LIFE  
INSURANCE SOCIETY

## INCREASED NEW BUSINESS

The one hundred and thirty-sixth annual general meeting of the Norwich Union Life Insurance Society was held, on the 23rd instant, at Norwich.

Sir Robert Bignold (the president), having alluded to his gratification in becoming president of the Society founded by his direct ancestor 136 years ago, said that the most outstanding feature of the report and accounts was the large volume of new business put on the books during the year. The net figure of £9,471,569 represented an increase of just over £2,000,000, a notable achievement under current circumstances.

They were able to show over the whole of their funds a net return of £3 8s. 8d. per cent, against £3 8s. 6d. per cent. for 1942. They had been able to invest substantial sums in carefully selected real property, giving a good return.

The mortality of the year had been remarkably favourable and, even allowing for war claims amounting to over £180,000, was below the normal expectation.

A warm welcome awaited every member of the staff who wished to return to the Society after the war.

This Society with the old Amicable, which was absorbed nearly eighty years ago, had seen the collapse of three would-be European Dictators, Louis XIV, Napoleon and the Kaiser, and would, he trusted, ere long see the final eclipse of the fourth. The Norwich Union, which had been carried on during the past centuries by individual enterprise, looked forward now with confidence. Insurance overseas represented a valuable contribution to invisible exports, and this Society hoped to continue and increase its world-wide business, particularly in the great Dominions and other parts of the Empire. The report was unanimously adopted.

NORWICH UNION FIRE  
INSURANCE SOCIETY

## VITALITY OF THE BUSINESS

At the one hundred and forty-sixth annual general meeting of the Norwich Union Fire Insurance Society, Limited, held, on the 22nd instant, at Norwich, Sir Robert Bignold (the chairman) said how pleasing and encouraging it was that in the first report since he was elected chairman of the Society, with which his forebears had been intimately associated since its inception, the figures should not only be extremely satisfactory but such a clear indication of the undiminished strength and vitality of the Society.

The premium income in the fire account had increased over the preceding year by £197,698, and the profit of £170,805 could be considered very satisfactory despite disappointing results of their American business.

The accident account had again been a good one, showing the substantial underwriting profit of £246,085.

As was to be expected, the marine premium income showed a somewhat large decrease, but in transferring an amount of £150,000 to profit and loss, they were entirely satisfied that the reserves were ample.

The total amount of transfer to profit and loss account was £566,891, a very gratifying return for the year's working. The balance carried forward was £307,011.

The total assets of the Society at £8,685,798 showed an increase of £533,959.

The Society would be ready and eager to play their part in the post-war rebuilding of the business world, both at home and overseas. The future would give much scope for extension of their services. In aviation insurance, and in other forms of indemnity, the vast experience of the insurance companies would be of the greatest value of commerce when peace was once more with us.

The report was unanimously adopted.

# FORD MOTOR COMPANY, LIMITED

EXCELLENT RESULTS AND GRATIFYING POSITION

SOUND FOUNDATION FOR POST-WAR ACTIVITIES

LORD PERRY ON EMPLOYEES' WELFARE

The fifteenth ordinary general meeting of Ford Motor Company, Limited, was held, on the 24th instant, at the registered office, 88 Regent Street, London, W.

The Rt. Hon. Lord Perry of Stock Harvard, K.B.E., LL.D. (the chairman), presided.

The secretary (Mr J. L. Claridge, C.A.) read the notice convening the meeting and Mr F. Pragnell, F.C.A., of Messrs Mellors, Basden and Mellors, the auditors, read the report of his firm.

The following is the Chairman's statement, which was circulated with the report and accounts:—

I am continuing the war-time practice of issuing a statement instead of addressing you from the chair.

The accounts and directors' report submitted herewith reflect a gratifying position following a year of intense activity. Your directors are proud of the company's contribution to the national and Allied effort, in which the motor industry is playing so large and vital a part, and record their gratification of the official commendation which the company and its products have received. This excellent result has been achieved by the unflagging effort of the personnel and the able support of many dealers and suppliers.

You will find the accounts self explanatory. The directors have continued their policy of maintaining a strong, liquid position, and I trust you will agree that every step possible is being taken to ensure a sound foundation for post-war reorganisation.

## CLARIFICATION OF ACCOUNTS

I am pleased to note the developments taking place in legal and accountancy circles regarding company law amendment and clarification of published accounts. The company has always given its members full information, and, where appropriate, the present accounts incorporate the recent recommendations of the Institute of Chartered Accountants. Under existing conditions the presentation of consolidated accounts of the company and its subsidiaries is not possible, but it is hoped to issue them so soon as circumstances permit. The annual accounts of the greater number of the continental associated companies are, of course, not available and others are delayed owing to postal restrictions; the 1943 accounts of some of the subsidiaries, however, will be available at the general meeting for inspection by stockholders.

What little additional information is available regarding associated companies in enemy or enemy-occupied countries does not permit of forming a clear picture of the magnitude and complexity of the post-war problems to be faced in effecting their reorganisation. However difficult the task may be it will be expedited to the fullest possible extent so that essential road transport facilities in those countries are restored.

The holding company, which for the time being operates from this country under special Board of Trade licence, earned an increased profit during 1943. Its liquid resources are accumulating because the directorate desires to be in a position to give post-war financial assistance to those continental associated companies requiring it.

## FINE RESPONSE FROM EMPLOYEES

The company now has 3,543 employees in the Services. I regret having to report that 96 employees have died in the nation's service and I am sure you will wish to extend deepest sympathy to the bereaved

families. Decorations for gallantry have been awarded to several employees and we congratulate them.

I pay tribute again this year to our employees for the continuation of their fine response to the call for lending to the nation. The Ford Savings Group membership is 91 per cent. of the entire personnel; total savings have now passed £1,442,250, and the flow of contributions shows no signs of abating. "Salute the Soldier" campaigns, which have yet to be held in localities where we have interests will provide further opportunities to support the nation's war effort. Contributions to Red Cross Penny-a-Week Fund are also outstandingly good.

The dealer organisation, which served the public so well in pre-war years, has a proud record of war service in many different forms. I am glad to be able to report that the company has been of help to the dealers in these difficult times and, with them, looks forward to considerable post-war activity in the interests of all users of motor vehicles and tractors.

The various funds inaugurated for the benefit of employees have continued to operate during the year and their scope is being extended as circumstances require. I am confident that employees—working in the factories or serving in the Forces—and their families appreciate the assistance thus afforded, especially as the strain of war years begins to make itself increasingly felt. These activities, combined with the high standard of Ford working conditions, are part of the company's long-established policy in everything affecting the efficiency and well-being of its workers.

## AGREEMENT WITH TRADE UNIONS

Members will have read in the Press of the recent agreement that has been concluded with the trade union movement. This is a new departure but it was felt that the time had come when joint collaboration in maintaining the best possible conditions for the employees was desirable. The agreement did not arise out of any discontent with conditions of employment. The company recognises what the nation owes to the trade union movement, and the unions have acknowledged the leading part taken by the company in providing good conditions for its own employees and in influencing the advancement of better conditions for all workers generally.

## POST-WAR PROBLEMS

The final phases of this world-wide conflict are approaching and, despite war-time pressure, time must be found to think of the country's interests and those of the world in the years of peace which are, I trust, near at hand. I make no detailed forecasts of the part which each one of us will be called upon to play but it is apparent to all that the Government must look to large organisations such as ours for effective help during the reconstruction period and in the later expansion of sound home and export commercial activities. This being so I welcome the approaches which already have been made to our industry by the Government, but I ask that there shall be no delay in taking us into their full confidence on such post-war matters as tariffs, forms and levels of vehicle taxation, export requirements, road development plans and similar matters of vital importance to future progress. I also ask that there shall be given ample scope for initiative and individual enterprise. The company will endeavour to play its part to the full with the hope that the post-war

world will be co-operative in developing international commerce to mutual advantage everywhere.

The company is again indebted to officials of His Majesty's Government for their courtesy and help in the many problems which arise.

I desire to thank my colleagues, the executive staff and all the personnel for their able and continued effort in serving the company and, through it, the nation during the period under review.

## DIVIDEND OF 6 PER CENT

The needs of the future require a conservative financial policy at the present time. The directors recommend therefore that the war-time level of annual distribution be continued and that a dividend of 6 per cent., subject to income-tax, be declared.

The report and accounts were unanimously adopted, and the dividend recommended was approved.

The retiring director (Major Sir Malcolm Campbell, M.B.E.) was re-elected, and the auditors (Messrs Mellors Basden and Mellors) were reappointed.

A hearty vote of thanks to the chairman, directors and staff concluded the proceedings.

## CENTRAL MINING AND INVESTMENT CORPORATION LIMITED

### IMPROVED REVENUE

The thirty-ninth ordinary general meeting of The Central Mining and Investment Corporation, Limited, will be held on 1st proximo in London.

The following is an extract from the statement of the chairman (Sir R. Sothorn Holland, Bt.) circulated with the report and accounts:—

The revenue for 1943 of £1,097,468 shows an improvement of about £370,000 over that of 1942. This result is exceptional. Our dividend income in fact was lower, but, in a more active market, we realised larger profits on the sale of shares and we also received a payment on account of debentures of the Anglo-Spanish Construction Company, Limited, the book value of which had previously been written down to a nominal figure. Revenue has been charged with an allocation of £50,000 for Contingencies Account and with the amounts necessary to write down quoted stocks to or below market price at the end of the year and certain unquoted stocks to directors' valuation.

## APPROPRIATION

The amount set aside for taxation, which is naturally higher, is estimated to cover the total liability for all taxation arising in the fiscal year ending April, 1945. We propose again to add to our reserves, and in placing £100,000 to a new account—Exploration Reserve Account—we are making provision now for financing an extension of our active search for new business when conditions are favourable for this to be undertaken. The directors propose the payment of a final dividend on the ordinary shares of 8s. per share, and the exceptional profits permit of the distribution this year of a bonus of 4s. per share, making a total for the year of 16s. per share, or 10 per cent.

The strong position disclosed by the balance sheet and the further strengthening of our reserves are features which, I am sure, will give shareholders great satisfaction.

The statistics in the directors' report show the further contraction which has taken place in the scale of operations of the gold mining industry of the Witwatersrand during another year of operating under war conditions. The causes of the decline are, as in the previous year, the serious shortage of native labour and the continued necessity for the strictest

economy in the use of imported stores of all kinds. So long as these conditions persist it is difficult to forecast any improvement. I think I must draw your attention to the effect which the continued curtailment of development operations may have on certain of our mines. You will readily understand that in order that mining operations can be carried out on the most economical basis there must be an adequate number of working places to permit the mining of the various grades of ore in proportion which will conform to the average grade of the reserves. These conditions are ensured in normal times by carrying development well ahead, thus creating a large ore reserve.

## CURTAILMENT OF DEVELOPMENT

As was mentioned in our report last year, the enforced curtailment of development footage would not be a serious matter if normal development could be resumed within a reasonable period. On some of our mines, however, the point is being reached at which the considerable fall which has already taken place in ore reserves may affect efficient mining operations, and in order to correct the situation before it becomes really serious managements may be faced with the necessity of diverting a portion of their reduced labour force from mining operations to development work, at the cost of a further reduction in the tonnage milled, with consequent adverse effects on costs and profit.

With regard to the Orange Free State, the areas in the Odendaalsrust district on which we hold options are situated somewhat to the north of the area on which the Basal Reef has already been located in boreholes, and boring operations are in progress on these options or on contiguous farms. The boreholes, however, have not yet reached the reef horizon.

## GENERAL ACCIDENT ASSURANCE

### SATISFACTORY RESULTS

The fifty-eighth annual general meeting of the General Accident, Fire and Life Assurance Corporation, Limited, was held, on the 24th instant, at Perth, Sir Francis Norie-Miller, Bt., J.P. (Governor and Chairman) presiding.

The following is an extract from the chairman's statement circulated with the accounts:—The results could be fairly described as satisfactory. While the new Life business is about £300,000 less than in the previous year, the claims by death and maturity are relatively low. The funds show the large increase of £413,000 and the expenses are under 11 per cent.

The Fire department again shows very satisfactory results, but in the Accident account we have again to report a falling off in income of slightly over £500,000, the real reason for which is that motor business continues to be restricted. The Marine department shows very satisfactory results. The report was adopted.

Mr Frederick Richardson (Deputy-Chairman) said that it fell to his lot to express their sadness on learning that their Governor and Chairman, acting on his doctor's advice, had decided to retire from active control of the Corporation's affairs.

The story of Sir Francis's connection with the "General" was the story of the company itself, for it was a very small local concern when he became the founder of its fortunes. His energy and genius had recognised no bounds and he had served the Corporation for over 57 years. The Board wished to express its gratitude for the immense services which its distinguished Governor had rendered the Corporation. It paid tribute to his great personal charm and his generous, hospitable ways, to his fortitude in difficult times and to those qualities that belonged to a kindly heart and it expressed the hope that he and Lady Norie-Miller would enjoy long life and much happiness in a world more at peace.

## ASSOCIATED GAS AND WATER UNDERTAKINGS LIMITED

### DEVELOPMENT DESPITE DIFFICULTIES

The eleventh ordinary general meeting of Associated Gas and Water Undertakings, Ltd., was held on the 25th instant, at 2, Chart Lane, Reigate.

The Chairman, Mr W. H. Bennett, M.Inst.Gas E., said: The satisfactory nature of the accounts now before you indicates that our business has been successfully maintained both as to gas and electricity.

The results achieved are particularly gratifying having regard to the extreme difficulties under which gas undertakings work. Although their primary raw material—coal—is a national resource, the mining situation has been allowed to deteriorate to a critical stage. Coal is in short supply and is not made available in quantities suitable for efficient and economical gas manufacture. This has necessitated Governmental directions requiring us to manufacture gas from more expensive materials, which have to be imported from overseas, thus increasing the demand for shipping. Is it not remarkable, therefore, that the engineers and managers of our companies, with the loyal co-operation of their employees, have been able to maintain uninterrupted supplies of gas to the public in general and for war purposes in particular?

They have successfully surmounted the obstacles of labour shortage and of control at every point of their operations. Our sincere thanks are due to them for their efforts, the maintenance of which has become increasingly difficult in this fifth year of war. But the continuance of uninterrupted supplies of gas should not be taken for granted by those in authority, and we need the fullest measure of support and understanding from the Ministries, especially as to labour, if the essential service we provide is to be adequately maintained.

## RECONSTRUCTION OF GAS INDUSTRY

Since proprietors last met the British Gas Federation has issued its report on the planning of the gas industry, an outstanding and vital document which was described by "The Times" as "a notable contribution to the discussion of industrial reconstruction." The report strongly opposes the nationalisation of the industry, but advocates its continuance on a basis of company and municipal enterprise with a substantial measure of "geographical and functional integration." By this is meant the reduction, by association or amalgamation, of the number of undertakings operating independently and the integration of their practice, policy and organisation. This is precisely what your company, as one of the pioneer gas corporations, has accomplished.

## SATISFACTORY ACCOUNTS

There are a few points in the accounts to which attention might usefully be drawn. Revenue shows an increase of £15,092, while expenditure—including the provision of £4,000 as an additional reserve for taxation and writing £4,150 off discount on Debenture stock—has only advanced by £9,541. The increase in net profit is, therefore, £5,551. If proprietors approve the directors' recommendation regarding the declaration of final dividends, £32,500 will remain to be carried forward. This sum, with the reserve for equalisation of dividend set aside last year, suggests there is good prospect, despite these difficult times, of the maintenance of the current rate of dividend upon the Deferred stock, a position which, it is submitted, is decidedly satisfactory.

The report and accounts were unanimously adopted.

## CROWN MINES, LIMITED

(Incorporated in the Union of South Africa)

### RESULTS OF A DIFFICULT YEAR'S OPERATIONS

#### MR W. H. A. LAWRENCE'S REVIEW

Mr W. H. A. Lawrence presided at the annual meeting of Crown Mines, Limited, in Johannesburg on the 17th instant. After reviewing the year's operations, he said that the total profit had been £2,638,747. Dividends had absorbed £895,909, provision for taxation had amounted to £1,606,131, capital expenditure had accounted for £105,016 and further provision made in respect of miners' Phthisis outstanding liability had been £45,588.

Expenditure on capital account had been mainly in respect of an air cooling plant at No. 17 shaft. That plant had been completed during the year and brought into commission with beneficial effects in the underground workings connected with the shaft.

The drop in tonnage milled had been due to the acute shortage of native labour, which had seriously hampered operations at the mine and which continued at the present time. In conformity with the general policy followed by the gold mining industry to conserve essential stores to the fullest possible extent, development carried out during the year had been again on a much reduced scale. The total had amounted to 36,109 feet, which had been an increase of 1,683 feet compared with the previous year's figure but which represented a drop of 79,951 feet compared with the footage developed in 1941. The bulk of the work had been carried out on the Main Reef Leader, where disclosures remained satisfactory, the total payable ore developed amounting to 804,700 tons of an average value of 6.1 dwt. per ton.

## ORE RESERVE POSITION

The available ore reserve had been re-estimated at December 31, 1943, to be 14,809,600 tons of an average value of 4.8 dwt. over a stoping width of 44.6 inches. Compared with the position a year previously there had been a decrease in the available reserve of 2,381,700 tons, the value being unchanged and the width 0.4 inch higher. Owing to the reduction in the scale of development, the ore reserve position could no longer be considered to be entirely satisfactory, and it would be necessary to increase development footage very considerably as soon as circumstances permit.

The price received for gold and the rate at which normal income tax had been payable by the company had remained unchanged throughout the year. As from January 1, 1943, however, the special contribution which was based on taxable income before deduction of redemption allowance and any tax loss brought forward from a previous year had been increased from 20 per cent. to 22½ per cent.

## INCREASES TO NATIVE LABOURERS' WAGES

Since the close of the period under review the report of the Witwatersrand Mine Natives Wages Commission had been published and shareholders would no doubt be aware that the Government had not accepted in full the recommendations made by the Commission but nevertheless had decided that as from April 1, 1944, certain increases should be made in the wages paid to mine native labourers. Briefly the increases amounted to fivepence per shift for natives employed underground and fourpence per shift for natives employed on the surface, with payment of time and a half for all overtime and Sunday work.

Since January 1, 1940, the gold mining companies had been obliged to pay to the Government a gold realisation charge and since September 1, 1940, that charge had remained fixed at 38s. 3d. per cent. The Government had now decided to place in

a pool the sums thus collected from the industry during the year ending March 31, 1945, and to distribute those funds amongst individual mining companies in proportion to their share of the increased cost of the industry in respect of native wages. It was hoped that the amount thus made available would be sufficient to meet practically the whole of the industry's additional direct burden.

In order to conserve paper stocks the

report of the proceedings at the meeting would not be circulated to shareholders. Copies could be obtained, however, on application to the head office in Johannesburg or to the London office.

At the end of the year 423 employees of the company had been on full time military service with the armed forces and in addition the mine had continued to carry out its share of munitions production. The report and accounts were adopted.

## MAYPOLE DAIRY COMPANY, LIMITED

### TRADING AFFECTED BY WAR CONDITIONS

### EFFICIENCY AND STRENGTH OF THE ORGANISATION

### SIR GEORGE SCHUSTER ON FUTURE POLICY

The forty-sixth annual general meeting of the Maypole Dairy Company, Limited, will be held in London on the 16th proximo.

The following annual review by the chairman (Sir George Schuster, K.C.S.I., K.C.M.G., C.B.E., M.C., M.P.) has been circulated with the report and accounts:—

**General Trading Results.**—In my statement to the shareholders last year I reviewed the special difficulties which war conditions have brought to the Maypole Company. The story of 1943 has again illustrated those difficulties and confirmed the warnings which I thought it right to give. We have been affected by the now familiar war conditions—shortage of supplies, rationing, the elimination of our power to use our peace-time organisation for securing special quality supplies of butter, eggs, etc., the tendency of housewives (encouraged by the Government) to shop near their own homes and to confine themselves as far as possible to one supplier for all commodities. We must accept the fact that these conditions have had an exceptionally damaging effect on the business of a specialist company like ours which has its best branches located in the main shopping centres.

### HIGH STANDARD OF SERVICE

Considering everything it can be said that our business has come through nearly five years of war much better than might have been expected; but I must ask the shareholders to appreciate that, so long as the war continues, the essential purpose on which all our efforts should be concentrated is to keep our organisation and staff up to a high standard of efficiency so that we may return to our true rôle with advancing success when the war is over. The achievement of this purpose is of much greater importance than the level of profit which we can earn during the entirely artificial period of war controls and restrictions. Some retail traders may benefit from conditions like these, which place us all in a strait-jacket and leave practically no scope for individual initiative or special qualities. To us they are an unqualified disadvantage.

The one distinctive characteristic which we can retain is good personal service in our branches and, though most of our regular staff are away on war service, we can still claim that a high standard is maintained.

The figures of trading results given in the accounts and directors' report reveal the full effect of the drop in registrations in August, 1942, and are in accord with the forecast which I gave last year. Actually they have turned out better than I had then anticipated, and I am also glad to be able to inform the shareholders that, throughout the last quarter of 1943 and the first quarter of 1944, our sales have shown an upward trend.

### DEPLETION OF STAFF

Acknowledgment is due to all members of our staffs—at headquarters and at all

branches—for the manner in which they have tackled and overcome the many difficulties incidental to war-time trading. We have continued throughout the year to lose more of our male staff, as well as many of our experienced women workers, to the Forces or to other forms of national service. We have, therefore, to rely largely now on such over-age employees as we have been able to retain—with the help of young juniors—to cope with the many and increasing problems connected with all the Government regulations.

The total number of employees at head office and the branches was: In September, 1939, number of shops, 975; male, 4,692; female, 1,642; total, 6,334. In April, 1944, number of shops, 902; male, 927; female, 2,973; total, 3,900.

### SERVICE ALL OWANCES SUPPLEMENTED

Over 2,400 of our former staff are now serving in H.M. Forces. The company has throughout the war granted special allowances to the dependants of all employees in the Forces who, without such a supplement to their Service pay, would have suffered hardship. In addition we are keeping up the pension fund contributions of all Service members of the fund, so that they continue to retain and increase their rights and benefits of membership. The sum charged in last year's accounts for these purposes, together with the company's pension fund contributions for the remainder of the staff, amount to £38,282.

This is a substantial sum when compared with what, according to our proposals, the ordinary shareholders will receive by way of dividend. But the directors hope that no shareholder will grudge these payments. To make them is in accordance with the tradition of this company, which has always endeavoured to make its employees feel that they and their welfare are an essential part of the business.

I have another special reason for mentioning this matter now. The question of Service pay and allowances has just been prominent in the Press and Parliament, and the Government have now proposed a more generous scale of allowances. We regard this decision as meeting a clearly established need and one which, as explained above, we ourselves had throughout recognised for our own employees. It is somewhat remarkable that in all the Parliamentary and Press discussions there has, so far as I can ascertain, been no mention of the fact that companies like ours have throughout supplemented Service allowances from their own funds, with the result that in fact a large number of men who have joined the Services from good employment have not suffered the hardships which have rightly aroused so much dissatisfaction and criticism in the case of those who were left to rely only on what the Government paid them.

Another matter of great importance concerning our staff is demobilisation. The return of our men from the Forces after many years' absence will call for much

thought and planning. The war is not yet over and it would be foolish not to recognise that much hard struggle still lies before us. Nevertheless it is not too early to be giving thought to the future, and the question of looking after our staff on their return is already receiving our serious attention. We desire to play our part in providing for the people of this country, when the war is over, a life of peace which will prove to have been worth fighting for.

### FUTURE POLICY

It is also right to be looking ahead to future business policy, though, of course, it is not yet possible to work out precise plans. We shall have to go through a transition period of some length before normal trading is restored. Post-war conditions cannot be predicted with certainty, nor do we know how far Government controls of trading will be continued, or what will be the policy of the Government in regard to the production in this country and the import from overseas of the commodities in which we mainly deal. I think the time has come when the Government could safely be more informative on the last two points. All those who are responsible for the conduct of important forms of economic activity would be greatly helped by having some knowledge of the shape of things to come in matters which depend on Government policy. It ought, for example, to be possible for the Government with their present knowledge to indicate what is to be the target for home agricultural production, and broadly what is to be the quantity, nature and source of supply of our food imports from overseas.

Personally I believe that a factual appreciation will show that, if we are going to give all the people of this country a proper nutritional diet, we can keep our own agriculture beneficially employed at full stretch and still buy from our good friends abroad, Canada, Australia, New Zealand, and I would add countries like Denmark and Holland, food products on a scale which will provide adequate outlets for their own production. It would then be only a question of these countries making it possible for us to pay them by taking goods from us. If I am right in this belief then the sooner the British Government make the position clear the better, since our relations with so many countries are affected.

### DIVIDEND PROPOSAL

We have for the first time this year included in the accounts a consolidated statement of the assets and liabilities of our company and its subsidiaries, and in the directors' report an analysis of the combined trading results has been given. I hope that these statements will help to give the shareholders a clear understanding of the position.

The net profit shown as available for distribution is £5,850 higher than for last year; but this result has only been obtained by reducing the provision for deferred repairs by £58,000. In so far as the directors consider that the resources already accumulated are quite adequate to cover the actual arrears of repairs, this is a justifiable change, but it may be necessary to restore the provision in future years, and in any case the directors have thought it right to take account of the reduced trading profit by making a reduction in the dividend on the deferred ordinary shares from 4 per cent. last year to 3 per cent. this year.

### FUTURE PROSPECTS

It will be seen that the liquid financial position of the company is very strong. Beyond this I can assure you that the spirit of the staff and the efficiency of the organisation are as good as ever. Therefore, while I will not venture on any prophecy about results for 1944, we look forward to the future, when more normal conditions return, with cheerful confidence.

## THE DAILY MIRROR NEWSPAPERS, LIMITED

### MR JOHN COWLEY'S STATEMENT

The annual general meeting of the Daily Mirror Newspapers, Limited, was held on the 24th instant, at the Memorial Hall.

The following statement by the chairman, Mr John Cowley, was circulated with the report and statement of accounts:—

I should like to pay a tribute to the memory of our old friend, Mr William Graham, who died a few months ago. He was from the inception of the company our legal adviser and dealt in most able fashion with matters calling for his professional attention on the commercial side of our business.

In framing our accounts this year we have given effect to some of the suggestions recently made by the Institute of Chartered Accountants. Stockholders will notice that items previously embraced under the heading "Creditors, etc.," are now shown separately. The information regarding investments has been amplified, and there are other alterations which we have no doubt will be welcomed as being an improvement on the old style of presentation. Necessary adjustments have been made in the figures for the previous year for comparison purposes.

### ANOTHER GOOD TRADING YEAR

Again we have had a very good trading year, but the amount of profit available for distribution to ordinary stockholders is governed by the provision needful to be made for Excess Profits Tax. We feel justified however in recommending the payment of a final dividend of 5 per cent. on the ordinary stock, making a total of 10 per cent. for the year. Our income from investments has improved and the outlook in this connection is satisfactory. We have received information by cable of the intention of the directors of Anglo-Canadian Pulp and Paper Mills, Limited, in which company we have a very big investment, to pay a small dividend in respect of their financial year to December 31, 1943. This is very welcome news.

Your directors felt it a duty, as well as a pleasure, to make a further investment of £50,000 in 3 per cent. Savings Bonds on behalf of your company during the recent London "Salute the Soldier" week in support of the financial side of the war effort. Stockholders will no doubt be interested in the market value of the company's quoted investments shown in the balance sheet against their book value. We have in addition to Government securities and large holdings in newspaper and newsprint companies, further interests in many first-class industrial undertakings.

### QUESTION OF NEWSPRINT

The Newsprint Supply Company continues to serve its purpose extremely well. During the year larger supplies of newsprint were made available to all papers. The chances of a further increase are at the moment problematical. The sales of the Daily Mirror continue to be highly satisfactory. We print close upon two million copies daily and are not able, by a big margin, to satisfy the insistent demands of would-be purchasers. The demand for advertisement space in the Daily Mirror is continuous and we have to apologise to the many advertising agents and their clients whose needs cannot be fully met. Editorially we make the best use of our limited space, giving a good service of news, views, and pictures, and displaying our many exclusive popular features to advantage. Although the drain on our manpower continues to give your management concern, so far the problem of securing qualified and skilled staffs for the many departments concerned in the production of a National daily newspaper has been met.

It will be noticed from the examination of the profit and loss account that we have not made any provision to increase the reserve account which stands at the very substantial figure of £420,000. We have, however, made a larger transfer to the

"Provision for Pensions," bringing this up to a total of £200,000. This I am sure will prove to be a very useful sum to have put on one side for this purpose.

### TRIBUTE TO STAFF

Again I have to commend the good work of all our employees. The burden of management is not light, but the task is eased through the loyal service received on every hand. During the year Mr John Coope was appointed a director. He will, I think, prove to be a valuable addition to the board—a man of wide experience of newspaper work whose talent in the years to come will be turned to the advantage of our business. To those members of our staff on National duty at home and in many lands I would like to convey greetings and thanks, and to wish them a safe return.

The report and accounts were unanimously approved, and the auditors, Messrs Deloitte, Plender Griffiths and Co., re-appointed.

## SUNDAY PICTORIAL NEWSPAPERS (1920), LIMITED

### MR JOHN COWLEY'S STATEMENT

The annual general meeting of Sunday Pictorial Newspapers (1920), Limited, was held, on the 24th instant, at the Memorial Hall.

The following statement by the chairman, Mr John Cowley, was circulated with the report and statement of accounts:—

In framing our accounts this year we have given effect to some of the suggestions recently made by the Institute of Chartered Accountants. Stockholders will notice that items previously embraced under the heading "Creditors, etc.," are now shown separately. The information regarding investments has been amplified, and there are other alterations which we have no doubt will be welcomed as being an improvement on the old style of presentation. Necessary adjustments have been made in the figures for the previous year for comparison purposes.

### GRATIFYING RESULTS

The results of the year's working are gratifying. We have maintained our trading profit and I am pleased to be able to record that the dividends received from our investments again improved. Since the period covered by our accounts we have received information by cable of the intention of the directors of Anglo-Canadian Pulp and Paper Mills, Limited, to pay a small dividend in respect of their financial year to December 31, 1943—you will recall that we have a considerable stake in this company.

It has not been thought needful to augment the amounts of the "General Reserve" and "Contingencies," which together total £725,000 in the balance sheet, but an extra £5,000, making £10,000 this year, has been set aside as a provision for pensions, so that the amount now standing under this heading is £100,000.

An interim dividend of 6½ per cent. was paid last November and the final dividend of 11½ per cent. proposed, against 10 per cent. last year, will make a total distribution of 17½ per cent. for the year on the ordinary capital, against 15 per cent. We feel that the decision made to recommend the increase is fully justified and will be approved by the ordinary stockholders.

### SUPPORT FOR GOVERNMENT FINANCE

We have continued the policy started in the early days of the war of subscribing to issues of Government securities. Recently, during the London "Salute the Soldier" week, we applied for £50,000 3 per cent. Savings Bonds, bringing the total invested by your company in war issues to £275,000. Although there is nothing very exciting about these investments, it is felt that the Government's plan to secure war finance at a low rate of interest should have our practical support. During the year the voluntary service performed by our employees in connection with

the War Savings Groups at our offices and works has been continued with good results.

There has been appreciation in the value of our quoted investments and I have no doubt stockholders will look with satisfaction at the figures shown in the balance sheet against this item. In the main our investments are in pulp, paper-making, and newspaper companies.

### SUNDAY PICTORIAL FOR THE FORCES

Again I am glad to be able to tell you that the Sunday Pictorial has prospered. Sales exceed 2,000,000 weekly. We are still in the unfortunate position, owing to the limited quantity of newsprint available, of having to disappoint a large number of potential customers. Here may I ask for your support of the scheme for the supply of Sunday newspapers for the Forces. If you will send your copy of the Sunday Pictorial every Monday in a wrapper (postage one penny), addressed: Newspapers for the Forces, 23, Farringdon Street, London, E.C.4, it will be a welcome addition to those already being received from other quarters. Sunday newspapers so sent are dispatched by the War Office to Forces overseas, and I can assure you that you will be doing a good turn to our men who cannot by other means get Sunday newspapers from home. Thank you.

We regret that we have had to disappoint many advertisers who have desired to use our columns for their announcements. The demand for space in our paper is insistent and augurs well for the time when we are able to print larger papers.

Once again it is very pleasing to say a few words of thanks to the members of our staff. In spite of very many difficulties they have contrived to carry out their duties to advantage and meet all calls made on their services.

The report and accounts were unanimously approved, and the auditors, Messrs Deloitte, Plender, Griffiths and Co., re-appointed.

## AULT AND WIBORG, LIMITED

### RECORD TURNOVER

The tenth ordinary general meeting of Ault and Wiborg, Limited, was held, on the 19th instant, in London.

Mr Gerald Wellesley (the chairman) said that during the year under review the total turnover in respect of all products now made by the company and its subsidiaries had been the highest in their history, being no less than 30 per cent. in excess of that of the previous year. Owing, however, to the lower margin of profit on sales, the net profit of the company only showed a 5 per cent. increase as compared with 1943 and amounted to £84,164. The directors recommended a dividend of 6½ per cent., less tax, and a further 3½ per cent., less tax, on the ordinary shares. It was perhaps worth pointing out that during the four years immediately preceding the war the average ordinary dividend paid was 14½ per cent., whereas for the four full war years the average had been 5½ per cent.

A considerable portion of the increased turnover had taken place in their peace-time products, namely, printers' inks and rollers, varnishes, industrial finishes and metal decorating products. Papers and periodicals carrying news to the public played a vital part in the lives of a people at war, and the board was well satisfied that they had been able not only to maintain but also to increase supplies to their good friends in the Press and printing trade generally.

The running of any manufacturing business during war-time was an anxious and strenuous job. Conditions governing orders, supplies and labour varied rapidly and at short notice, and it was never possible to see very far ahead. That notwithstanding, the board viewed the future of their company with confidence.

The report was adopted.

\* Conversions Excluded. † Includes Government issues to May 16, 1944, only. Above figures include all new capital in which permission to deal has been granted.

## INDUSTRY AND TRADE

**Retail Grocery Labour.**—The present labour position in retail grocery, compared with before the war, is well illustrated by the experience of the Maypole Dairy Company. The following figures are given in the chairman's annual statement of the number of employees at the head office and branches:—

| Year†            | No. of<br>Shops | Male<br>Employees | Female<br>Employees | Total<br>Employees |
|------------------|-----------------|-------------------|---------------------|--------------------|
|                  |                 |                   |                     |                    |
| Sept., 1939..... | 975             | 4,692             | 1,642               | 6,334              |
| April, 1944..... | 902             | 927               | 2,973               | 3,900              |

More than 2,400 of the former staff are serving in H.M. Forces.

**Cotton Exports.**—The Board of Trade has announced that in the first quarter of this year shipments of cotton cloth were 96,497,000 square yards against 80,899,000 square yards in the fourth quarter of 1943 and 82,130,000 square yards in the first quarter of 1943. The exports of yarn during the first three months of this year were 4,708,000 lb., against 4,840,000 lb. in the fourth quarter of last year and 4,678,000 lb. in the first quarter of last year. Since exports are strictly controlled by Cotton Board allocations to merchants, shipments cannot vary very much from quarter to quarter.

**Cotton Mill Deal.**—It was reported in Manchester at the beginning of this week that one of the cotton combines had purchased the Valley Ring Mill, Ltd., Rochdale. This mill has 49,276 ring spindles and has been closed since May, 1941, under the concentration of production scheme. If the sale is ratified

by the shareholders, the purchase price, together with the investments and cash in hand, will be sufficient to provide approximately 17s. per share. The current price of the shares is about 13s. The capital of the company is £144,000 in £1 fully-paid shares. It is estimated on the particulars given that the purchase price is about 35s. per ring spindle, and in view of current values, this figure is considered reasonable.

**"The Economist" Sensitive Index.**—There was no change in the index during the week ended May 24th. The complete index (1935 = 100) was 158.6; crops 135.6; and raw materials 185.5.

## FINANCE AND BANKING

**THE MONEY MARKET.**—The money market position, discussed in a business note on page 723, is well described by the latest Bank return. Bankers' deposits, at £177,156,000, have risen by £9,920,000 over the week, but still remain at a comparatively low level for the last week of the month when the banks are making up for their monthly returns. The main counterpart to this expansion in bank cash is a rise of £11,070,000 in Government securities, a movement which indicates the official purchases of bills made in the open market during the past week. Public deposits at £13,546,000 have fallen by £3,025,000, but still remain at a relatively high figure. The note circulation has only risen by £1,516,000 over the week, a small movement for the pre-Whitsun holiday return and one which indicates that the restrictions on civilian and military travelling are having an effect on spending plans.

**MONEY RATES, LONDON.**—The following rates remained unchanged between May 18th and May 25th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½%; 6 months, 1½%; 1½%. Treasury Bills: 2 months, 1½%; 3 months, 1½%; Day-to-day money, 1½%. Short Loans, 1½%. Bank deposit rates, 1%. Discount deposit at call, 1%; at notice, 1%.

**Exchange Rates.**—The following rates fixed by the Bank of England remained unchanged between May 18th and May 25th. (Figures in brackets are par of exchange).

United States. \$ (4.86) 4-02½-03½; mail transfers 4-02½-03½. Canada. \$ (4.86) 4-43-47; mail transfers 4-43-47. Switzerland. Francs (25.22) 17-30-40. French Empire. Francs 197½-200½. Syria. p. 8-81-85. Sweden. Krona (18.15) 16-85-95. Dutch West Indies. Florin (12.11) 7-58-62. Portugal. Escudos (110) 99-80-100-20; mail transfers 99-80-100-30. Panama. 4-02-04; mail transfers 4-02-04. Brazil. 83-64½ cr. (buying); mail transfers 83-56½. Uruguay. 7-6597 p. (buying).

Fixed Rates for Payment at Bank of England for Clearing Offices. Spain. Pesetas 44-00. Turkey. Piastres 520. Italy. 71-25 lire.

Market Rates.—The following rates remained unchanged between May 18th and May 25th.

Egypt. Piastres (97½) 97½-98. India. Rupee (18d. per rupee) 17½-18½ d. Belgian Congo. Francs 176½-180. China. National 3-3½. Iran. Rl. 128-130.

Special Accounts are in force for Chile, Peru, Bolivia and Paraguay, for which no rate of exchange is quoted in London. Rate for payment into Argentine special account: 16-16 pesos.

Forward Rates.—Forward rates for one month have remained unchanged as follows: United States. ½ cent pm-par. Canada. ½ cent pm-par. Switzerland. 3 cents pm-par. Sweden. 3 ore pm-par.

## GOVERNMENT RETURNS

For the week ended May 20, 1944, total ordinary revenue was £42,763,000, against ordinary expenditure of £103,440,000, and issues to sinking funds of £299,072. Thus, including sinking fund allocations £1,180,028, the deficit accrued since April 1st is £447,465,000 against £514,439,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £87,410 to £2,746,261, the other operations for the week (no longer shown separately) raised the gross National Debt by £61,325,489 to £20,039 million.

## THE CHARTERED BANK OF INDIA AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)  
**CAPITAL (PAID UP) - £3,000,000**  
**RESERVE FUND - £3,000,000**  
 Branches and Agencies throughout INDIA and the EAST  
**AFFILIATED BANK IN INDIA**  
**THE ALLAHABAD BANK LTD.**, with 16 Branches & Sub-Agencies  
 The Bank offers a complete Banking Service and provides exceptional facilities for financing every description of trade with the East.  
 Deposits for Fixed Periods or repayable at call or at short notice are received at rates which may be ascertained on application.  
 The Bank also undertakes Trusteeships and Executorships.  
**Head Office: 38, BISHOPSGATE, LONDON, E.C.2**  
 West End Branch:  
**28, CHARLES II STREET, HAYMARKET, S.W.1**  
 Manchester Branch: 52, MOSLEY STREET  
 New York Agency: 65, BROADWAY, NEW YORK CITY

## THE ROYAL BANK OF CANADA

Incorporated in Canada in 1869 with Limited Liability

**Assets exceed \$1,500,000,000**

### LONDON:

Main London Branch: 6, Lothbury, E.C.2.  
 E. B. McInerney, Manager  
 West End Branch: 2-4, Cockspur Street, S.W.1.  
 C. H. Hunt, Manager

HEAD OFFICE: MONTREAL  
 Agency in New York

## NATIONAL BANK OF EGYPT

Incorporated in Egypt  
 Liability of Members is Limited

Head Office - - - CAIRO  
 Commercial Register No. 1, Cairo

FULLY PAID CAPITAL - - £3,000,000  
 RESERVE FUND - - £3,000,000

London Agency:

**6 & 7 King William Street, E.C.4**  
 Branches in all the Principal Towns in EGYPT and the SUDAN

## THE BANK OF NOVA SCOTIA

(Incorporated in Canada with Limited Liability)  
 Established 1832.

General Office: Toronto, Canada.

Paid Up Capital ... £12,000,000  
 Reserve Fund ... £24,000,000  
 Total Assets over ... £400,000,000

Special facilities are available to the public through the Branches of this Bank for the transaction of business with Canada, Newfoundland, Cuba, Puerto Rico, Dominican Republic, Jamaica, and the United States at New York.

Address enquiries to  
 London Branch:  
**108 OLD BROAD STREET, E.C.2.**  
 E. C. MACLEOD, Manager.

## IS THIS MAN YOU?

A persuasive speaker in public, a cool, calm thinker, never embarrassed, a good loser, a good mixer, making friends without effort? If not, you need **RAPIDISM**, the fascinating new course, endorsed by leading psychologists.  
 Write now for free Booklet to:  
**THE RAPIDISM INSTITUTE,**  
 431, TUITION HOUSE, London, S.W.19.

## BANK OF SCOTLAND

Constituted by Act of Parliament 1695.

AUTHORISED CAPITAL ... £4,500,000  
 CAPITAL FULLY PAID ... £2,400,000  
 RESERVE FUND & BALANCE carried forward ... £2,259,161  
 DEPOSITS & CREDIT BALANCES  
 as at 29th Feb., 1944 ... £62,235,580

Head Office: THE MOUND, EDINBURGH

Over 200 Branches and Sub-Branches throughout Scotland.

London Offices:

CITY OFFICE, 30 BISHOPSGATE, E.C.  
 PICCADILLY CIRCUS BRANCH, 16/18 PICCADILLY, W.

## THE UNION BANK OF AUSTRALIA

ESTABLISHED 1837.

## Employment Policy

THE publication of the Government's White Paper on Employment Policy is a landmark in economic history. In the last half-century, and especially since the last war, there has been a steady and massive encroachment of the state in the economic domain. But—in this country at least—the process has been reluctant, hesitant, pushed forward by ineluctable circumstances, rather than deliberate and of set purpose. By the same token it has been piecemeal and incomplete of purpose. Now for the first time there is a bold and conscious assumption of responsibility and authority (the second necessarily follows the first) over a whole vast terrain of policy. The state, acting as the agent of the community, asserts its resolve to dominate one more aspect of the environment in which human society lives. The White Paper's opening words are that "the Government accept as one of their primary aims and responsibilities the maintenance of a high and stable level of employment after the war."

The revolution of thought involved in this new policy is far larger than dwellers in the present day can easily realise unless they are skilful at recapturing their own past moods. In most respects, the content of democratic policy has not changed very much since the closing days of the last war. Over most of the range, the world is fighting now for the same things as were fought for then.

Responsibility for economic welfare is the chief novelty. "Not long ago," says the White Paper,

the ideas embodied in the present proposals were unfamiliar to the general public and the subject of controversy among economists. To-day, the conception of an expansionist economy and the broad principles governing its growth are widely accepted by men of affairs as well as by technical experts in all the great industrial countries. But the whole of the measures here proposed have never yet been systematically applied as part of the economic policy of any Government. In these matters we shall be pioneers.

The boast is justified. It is true that full employment—and over-full employment—has twice been attained in this country in wartime. It is true also that some other industrial countries—Russia and Germany, notably—have attained it in peacetime—but only at the triple cost of employing a large part of their national industries on war preparations, of conscripting the persons and restricting the consumption of their citizens. What is now to be attempted in Britain is something quite new—and something much more difficult than any of these. For there are two unspoken assumptions in any full employment policy for a democracy. The first is that full employment is to be achieved without any departure from

methods of persuasion and agreement; it is to be achieved under free criticism and without conscription. The second is that employment is to be devoted to supplying the idiosyncratic wants of individuals. No community, of course, can survive if its citizens insist on devoting all of what they produce to current consumption. But it is the democratic dogma that the people themselves shall decide how much they will consume, how much they will provide for the needs of the state and how much they will set aside for additions to capital. A democratic full employment policy must attain its goal while obeying these instructions. No country has ever done this. Until last week, no country had even announced a policy for doing it. Irrespective of the precise nature of its contents, the first formal resolution of democracy to shoulder a new responsibility on behalf of its members deserves a round of applause.

Apart from this great general merit, the contents of the White Paper are good, much more virile and imaginative than could reasonably have been expected. Perhaps the most satisfactory feature of all is the wide scope of the policy outlined. The beginning of all wisdom in these matters is to realise that there is no one solution of the problem of employment. It may be that the financial aspect is the most important; but the more the financial aspect—the irregularity of total outlay as compared with total income—is examined, the more it appears to be merely the expression of non-financial emotions and circumstances. There is no Philosophers' Stone—least of all, as the White Paper so rightly and repeatedly points out, for a small island so closely dependent on foreign trade. Success can only come through the combined pursuit of several different policies at once.

The White Paper—which is fully summarised on pages 743 to 745—embodies, in all, ten separate lines of advance. The distinction of topics in the following paragraphs is not that of the White Paper, since several of the policies appear in different guises in different paragraphs. But it is the logical arrangement:

1. *The Transition from War to Peace.*—The White Paper is entirely right in giving the place of priority to the problems of the transition. Unless they are well managed, the longer-term policy in later years will be much more difficult. If the price structure is distorted by inflation there will inevitably be painful adjustments, which no policy, however well conceived, will be able to prevent. Similarly, if the pressure of immediate demand is allowed to swell some of the construction and consumers' capital industries (such as building and furniture) to a size larger than the permanent demand for their products would justify, nothing could prevent unemployment when the first peak of demand had been met. The policies the White Paper propounds are those of planned demobilisation and of maintenance during the transition period of the apparatus of control, including the rationing of consumer goods. The general order of priority is to be exports first, civilian necessities second, and industrial equipment third.

Beyond question, this policy is on the right lines, and it is reassuring to see the need for maintaining control throughout the period of shortage so uncompromisingly stated. It is impossible to foresee how far the policy will, in fact, be successful in attaining its object. The detailed difficulties will be very great, and they will depend on skilful administration as much as upon the enumeration of general principles. There is also a political hazard; nobody now can foresee to what extent the public will be ready to put up with restrictions once the fighting is over. But at least it can be said that policy can do little more in advance than what is laid down in the White Paper.

2. *International Trade.*—The emphasis that the White Paper, in every section, lays on the necessity of a proper ordering of the country's overseas trading relationships cannot possibly be gainsaid. It is also perfectly true that, while one Government can propose, only international agreement can dispose. But much depends on the nature of the proposals. Doubts have been expressed in *The Economist* in recent months whether the order of ideas that is being advanced in the international discussions takes sufficient account of the necessities of a full employment policy. The present White Paper does nothing either to increase or to remove these doubts, which must await further information. It is now acknowledged, as a deliberate act of policy, that

depressions in home trade cannot be avoided or cured by removing all purposive direction from economic affairs. The same truth applies with equal strength to depressions in foreign trade. It may be that the Government have plans for the organised maintenance of the volume of overseas trade; if so, nothing has yet been said about them.

3. *Industrial Efficiency.*—This is an enormous subject on which, perhaps, it would be unreasonable to expect more than a generalised sentence or two in a White Paper of this sort, particularly since further reports on the subject are promised. Nevertheless, it is legitimate to express a doubt whether the full magnitude of the task is fully appreciated. The Budget proposals for the amendment of taxation on the depreciation of plant were, within their limits, excellent. But it is a little disturbing to see them put forward as the main constituent of the Government's policy for assisting an increase in the productivity of industry.

4. *Location of Industry.*—In many ways, this is the most satisfactory chapter of the whole White Paper. Several important principles have been accepted. The first is that the Government has any responsibility in the matter at all. This in itself is quite a victory. The second reversal of policy is hardly less important. It is now accepted, as a general principle, that it is better, wherever possible, to take the work to the labour rather than the labour to the work. So far as whole regions are concerned, it is the Government's policy to take diversified industries into the Special Areas rather than to drain them of their population. The major instruments of policy to this end are to be the exercise of negative powers over location (that is, the prohibition of building in the wrong areas) with the "use of the Government's influence to steer new factory development into areas which call most urgently for further industrial diversification." The industrialist will be told that he must not build in London, and an attempt will be made to induce him to think kindly of Merthyr Tydfil. Trading estates and assistance with the raising of capital are also to be provided. All this is very much to the good, and a great advance on the policies of the past. Nevertheless an obstinate core of doubt remains whether the policy will be quantitatively large enough to achieve its objects. The areas from which new factories will be banned will be few—London is the outstanding example—and many of those who have their applications for London turned down will prefer to build in a "neutral" area rather than yield to the rather mild blandishments of the Government's "steering" towards the special areas. It may well prove that, to secure an adequate flow of new enterprise to these areas, one or other of two new hurdles will have to be taken—either the Government will have to exercise positive compulsion, telling the industrialist where he is to build his factory, or else direct financial assistance will have to be provided.

5. *Mobility of Labour.*—The new policy on the location of industry will not diminish the necessity for mobility of labour between industries. The right lines are, once again, laid down: training facilities, training grants at a rate better than unemployment benefit, re-settlement grants and the like. But the White Paper frankly acknowledges that the success of the policy depends upon the cooperation of the trade unions. Judgment must again be suspended until it can be seen whether the necessary and very considerable change in individual and collective habits can be secured.

6. *Stabilisation of Private Investment.*—This, by general consent, is the most important of all lines of policy. The policy sketched by the White Paper, if it is to be regarded as a final statement, cannot be called anything but weak. There is to be some use of the weapon of interest rates—which is, in any case, apter for restriction than for expansion. There is to be "encouragement" of large private enterprises to plan their capital expenditure, with the vaguest hint of tax inducements for so doing. And that is all. This is the point on which the attack on the White Paper will concentrate. There will be many who will use the dilute nature of these proposals as an argument for the wholesale nationalisation of heavy industry. The argument is very largely fallacious—a Government-owned industry will be even harder than a private firm to persuade into large expenditures at times when its managers expect to lose money—but it will be widely accepted unless it can be effectively countered. The only acceptable counter is a really thoroughgoing policy of influencing private capital expenditure which is prepared to use every weapon, including those of taxation and control, to whatever extent is necessary to achieve the result. Such a policy should not ignore the problem of varying stocks and

inventories, the quantitative importance of which is certainly large and possibly crucial.

7. *Public Works.*—Here again the principle, so long ignored or denied, is fully accepted. Public authorities should not cut down their expenditure in bad years, but should expand it. But here again the reader of the White Paper is left wondering whether it goes far enough. Those works that would be undertaken in any case are to be timed so as to assist the general policy. So much is excellent; but there is apparently no thought of having in reserve a large volume of projects that would never be undertaken at all unless idle labour and capital were available. Every effort should, it is true, be made to avoid the necessity for recourse to "unnecessary" public works. But if, in spite of those efforts, unemployment does arise, is it not better to use it for works that are desirable, even if not necessary, rather than to leave men without work?

8. *Maintenance of Consumer Purchasing Power.*—The proposal of variable rates of social insurance contributions is the chief novelty of the plan. Once again the proposal is excellent, but does it go far enough? It is estimated in the Appendix to the White Paper that by this means consumption expenditure might be increased by £70-£80 million a year. But the total of consumption expenditure in 1938 was over £4,000 million, and will be more at post-war prices. If social insurance contributions can be varied in this way, cannot the principle be applied to other personal taxes and exercise a much greater influence?

9. *Price and Wage Stabilisation.*—It would be idle to deny that a successful policy of full employment conjures up the spectre of inflation, which can only be avoided if the community will consent, in case of need, to exercise the same restraint as in wartime. The White Paper says all the right things, and that is all that can now be done. The rest is a matter of public responsibility.

10. *Restrictive Practices.*—Few sentences in the whole White Paper are more enticing or more ambiguous than the one that promises a Government inquiry into the extent and effect of restrictive practices and the taking of "appropriate measures" to check them. It may mean a great deal or it may mean almost nothing at all. In default of further information, and in the absence of any sign of willingness on the Government's part to take the initiative in its general industrial policy, it seems the more probable interpretation that the sentence means very little.

None of these comments should be taken as decisive criticisms of the White Paper. This is, after all, the very

first public appearance of a whole new conception of economic policy, and it would be unreasonable to expect more than a preliminary and generalised statement. The organism has unlocked the doors of the instrument and pulled out all the right stops; but he has not got sufficient wind in the bellows. The remedy is therefore simple. Hard work in keeping up the pressure will make it possible for the tune to be played in all its necessary harmonies. *C'est le premier pas qui coûte*, and much more than the first step has been taken. Expansion and development, rather than criticism, are now the need.

To this general judgment, there must unfortunately, even now, be an exception. The section of the White Paper devoted to the financial implications bears all the marks of a compromise. It starts with the statement that "none of the main proposals contained in this Paper involves deliberate planning for a deficit in the National Budget in years of sub-normal trade activity." But this, unless the word "deliberate" cloaks a verbal quibble, is equivalent to saying that "none of the main proposals in this Paper is conceived on a large enough scale." It is impossible to imagine a successful employment policy that did not involve a deficit in some years—as indeed a later paragraph seems to imply. Nor is it even quite certain that a successful policy is compatible with the balancing of the Budget over a longer period. In economic policy, as in war, it would be nice to combine victory with a balanced budget, but a deficit is better than defeat. In the very longest run, the test is whether the net interest burden of the National Debt is a rising proportion of the national income—as is also pointed out by the White Paper, which, in this section, is nothing if not catholic. But there are surely more ways of bringing Mahomet and the mountain together than by imposing any financial rigidities.

With this one exception, however, the blessing can be pronounced with some enthusiasm. It is very much to be hoped that the White Paper will not become the sport of sectaries. It has been produced by an all-party Government and its merits are such that, malcontents apart, any reasonable man should be willing to accept it at least as a basis for further exploration. It is, after all, a pioneering job and the difficulties of working it out in practice will be great enough in any case without the artificial obstacles of faction and prejudice.

## Colonial Progress

IT is just four years since the Colonial Development and Welfare Act was debated in Parliament, and nearly three years since the colonial governments were encouraged and requested to make use of its provisions by submitting schemes to be financed out of it. In the meantime, the wealthiest part of the colonial empire has been lost, and British imperialism has been under constant fire from critics in the United States. Mostly, this foreign criticism has been concerned with the political aspects of British colonial rule—with its right to exist at all. But at home criticism has tended to concentrate on its economic aspects—on whether the Colonial Office is wholehearted in its avowed policy of pursuing development and welfare in the colonies and whether it is going the right way about it.

The Colonial Office can certainly reply that it has not been idle. In the West Indies, whose troubles were the occasion of the new policy formulated in the Colonial Development and Welfare Act, Sir Frank Stockdale's organisation has been at work for three and a half years and has issued a report which illustrates very clearly the new attitude of mind towards the colonies. The Anglo-American Caribbean Commission has been set up to promote co-operation on the problems of the area between the United Kingdom and the United States. New committees have been set up to advise the Colonial Office on such matters as labour and economic policy. The advisory

committee on education has issued a report on mass education in Africa and proposed a bold plan for abolishing illiteracy. A commission on university education in the colonies has been set up and another commission on higher education has visited West Africa. The present Secretary of State has been out to Africa to see something of the colonies' problems for himself. It can be officially pleaded that the war has not prevented the last few years from being, on paper, one of the most fruitful periods in the history of the colonial empire.

But what does it all amount to in terms of the health, wealth and progress of the colonial peoples? There was published last week (Cmd. No. 6532) a return of the schemes made under the Act since it came into operation. These amount to £7,722,516 in grants and loans for development and welfare and £297,333 for research. Well over half of the schemes for development and welfare have been approved in the last financial year, which shows that the machinery is now getting into its stride. Nevertheless, these sums are for schemes approved; they are not necessarily for schemes carried out. It is quite true that the official answer to this perennial criticism is justifiable. Many schemes cannot be carried out in wartime because of the shortage of men, materials and capital equipment. But it is not only the sums of money they represent that are small; the schemes themselves are minute compared with what needs to be done. The largest

single grant is an amount of £525,000 for agricultural development in Jamaica, which is not for any specific service but will be merged with the ordinary expenditure of the local government, and will enable it "to meet the cost of extensive agricultural development throughout the colony at an estimated cost of £990,000 in the five-year period from 1943-44." There are a few other comparatively large grants, such as for soil conservation, drainage and irrigation, a new dredger for Lagos harbour, and agricultural development in Barbados. But on the whole there are very few instances of planning on anything like a large scale. For the rest, it is mainly a question of a nutrition experiment here and a tuberculosis survey there, of a rice station in the Gambia and a home for delinquent girls in British Guiana—all admirable and necessary but hardly amounting to a long-term policy of development and welfare.

The inadequacy of these schemes compared with the colonies' needs can be illustrated by the single example of elementary education in Jamaica. In the Stockdale report, it is stated that the number of teachers required to provide for a 90 per cent school attendance of children aged 5-15 would involve a rise in annual expenditure from £640,000 to £2,000,000, which is double the sum originally allocated to all the West Indies for all development and welfare purposes out of the total of £5,000,000 allowed to be spent out of the Fund every year. The estimate of £2,000,000 is, it should be emphasised, for Jamaica alone. No estimate was given of the cost of the scheme for abolishing mass illiteracy in Africa, but the proportionate increase over the present expenditure on education there could hardly be less. And elementary education is only one branch of education. And education is only one branch of development and welfare, which also includes health; communications; the combating of soil erosion and such pests as the mosquito and tse-tse fly; the promotion of a healthier and better agriculture; the establishment of secondary industries; the encouragement of the co-operative system, and so on, all projects which have received official recognition. It is small wonder that even officially it is recognised that the sum of £5,000,000 a year hardly touches the fringe.

But it is not only that the money is not enough. The question also arises whether the machinery of the Fund is the right one. The items enumerated cannot properly be dealt with by the present procedure, which means that isolated governments produce isolated schemes that are then approved or disapproved for a grant from the Fund. Even if its total were doubled or trebled or multiplied indefinitely, it is becoming clear that the method of passively drawing on a fund as occasion arises cannot meet the case.

It is easy to say that the fund is inadequate, but it is more difficult to say what sort of machinery should be

set up. It is possible, however, to suggest the conditions which it should fulfil. First of all, a programme of what is needed in each area should be drawn up—a five, ten or fifteen-year plan designed to attain a specific goal in terms of welfare and development—and then an estimate of the cost, not only in money but in physical resources, should be made, instead of, as at present, fixing the maximum sum in money which development and welfare throughout the colonies can be allowed to cost. Secondly, the areas should not be limited to the boundaries of individual colonies but should be regional, because many of the problems to be tackled—soil erosion and communications are the obvious examples—are regional, and this involves not only intercolonial co-operation but international co-operation as well. Thirdly, although development and welfare policy should thus be framed at the centre and on an inter-colonial basis, the co-operation and consent of the individual colonies must be secured. This rules out the main idea of the Development Board planners because they assume that the policy drawn up at the centre can be imposed on the colonial peoples willy-nilly, whereas it is essential that it should be related and modified to fit individual needs. Thus a large amount of discretion in the execution of the policy will have to be left to the administrations on the spot, and suggestions coming from the colonies, particularly from the colonial people themselves, should be welcomed and fitted into the general framework wherever possible. Finally—a condition which is linked to the preceding one—there must be no question of a colony's greater financial dependence on the United Kingdom, which will result from a big programme of development and welfare, postponing its progress towards political independence. In 1933, Newfoundland became financially dependent on the United Kingdom and lost its Dominion status. This, it is true, was also due to the inefficiency of the island's government; nevertheless, more than ten years have passed since the Commission of Government took office and though war conditions have made Newfoundland financially self-supporting again, responsible government has not been restored, nor, probably, are the people ready for it because government from without has led to political apathy. The history of Newfoundland in the last ten years is a good example of how colonial development, carried out at the expense of the British taxpayer but carried out in the wrong way, can retard political progress instead of helping it. There will, it is true, have to be assurances that money, made available to a colony to enable it to play its part in the general plan of colonial development, is spent in the right way, but this should not hinder its progress towards internal self-government. No development without representation is what the colonies will expect of the new colonial system. Taxation without authority is what the United Kingdom must be prepared to give.

## Reflections on Philadelphia

THIS is an age of Charters—first the Atlantic Charter and now the Philadelphia Charter. Future historians will perhaps record the middle 1940s as the years when, at the height of the war, the nations met to lay the foundations for a new peaceful society. Cynics may say that it was the same in 1918-20, when equally good intentions and goodwill were displayed at international conferences. But the delegates of forty nations who went "off to Philadelphia in the morning" for the International Labour Conference met in a very different atmosphere from pre-war Geneva days. With the Red Army's victories in the East and the Anglo-American preparations for the Western offensive, the prospects of peace seemed not too remote. The representatives of occupied nations, in daily touch with their underground resistance movements, introduced a sobering and realistic note in speaking of the problems of restoring freed Europe. Earlier conferences, on relief, refugees and food, had already established a basis for concerted inter-

national action in tackling the restoration of economic and social life in war-ravaged countries.

The ILO conference, seen from this side of the Atlantic, had a curiously patchwork effect. It was difficult to see the wood for the trees, or the trees for the wood, because the general outline of the conference as well as the details were blurred. In the day-to-day press reports, the divisions were given great prominence. Many of these differences arose on questions of procedure or personalities—such as the exclusion of the Argentine delegate—or on matters of policy, which would really seem to be outside the scope of the ILO. The controversy between Sir Walter Citrine and Mr. Robert Watt, the American labour delegate, about the war guilt of the German people was hardly relevant to the conference discussions. Reparations, and American labour's opposition to the suggested use of German labour to rebuild devastated areas in Russia and Europe obviously could not be settled by the ILO, and

the discussion, in the absence of any representative of the Soviet Union—after all the most interested party—became meaningless. The British Government showed good sense in moving the reference back of the resolution on the administration of Axis territories.

Most confusing to the outsider were the criticisms of the attitude of the British Government. The accusations of obstruction and sabotage were undoubtedly wild. There was a great deal to be said for the British proposal that the social security recommendations should be referred to the various Governments, with a view to framing a draft convention for the next conference. But Mr Tomlinson's motion was defeated by a big majority, thus appearing to be a resounding defeat for the British Government. He was supported by all the employers' delegates—except Peru—but opposed by all the Governments and the workers' delegates. It was suggested that the British Government's motive was the fear that adoption of the ILO recommendations might prejudice its own social security plan. Mr Tomlinson's speech, explaining the reasons for the motion, and his defence at a press conference, provided adequate reply to the critics. As he put it,

The Conference was called to enable Governments, employers and workers to exchange views and not to enforce the acceptance of views prepared in advance.

A charge which can more fairly be levelled against the British Government delegation is that it did not give the open and firm lead that could have been expected from the country that is furthest along the path of social security and labour rights. This gave an impression of belated acquiescence and of lagging behind the less advanced countries. It was significant in the discussions that the delegates most in a hurry for decision and action were the workers' representatives of the economically weaker countries. They probably hoped that they could use the ILO decisions as a lever for forcing the pace of social reform in their own countries. When M. Schevenels, secretary of the workers' side—though speaking purely in an individual capacity—accused the British Government of holding up the funds for future projects, Mr Tomlinson described the charge as "outrageous," and showed that last year the British Commonwealth contributed two-thirds of the ILO's funds, and Britain alone contributed a third, whereas the South American countries which showed most impatience were generally in arrears and many of them had failed to ratify conventions. Finally the sum of 12½ million Swiss francs was voted for next year's ILO budget.

Apart from these over-publicised differences, the general impression of Philadelphia is that it was a valuable and successful meeting. No conference would be healthy without divisions of opinion, and this is especially true of the ILO with its tripartite character. The workers' side, being the most vitally interested, tends to set the pace, and the comment of Mr Hallsworth, British workers' delegate, that "We have achieved 95 per cent of what we

set out to do" is a significant tribute to the positive achievements of the conference.

In the first place, the conference succeeded in putting the ILO firmly and squarely on the map. Until its Governing Body met in London last December, there were suspicions that the ILO was being side-tracked and left out of international discussions. These fears have now finally been laid. The ILO is assured of a place, in its own right, at the peace talks, and its relations with other international bodies have been placed on a stable footing. One important decision was the appointment of a negotiating committee, consisting of three representatives each of Governments, employers and workers, to conduct relations with other international agencies, and to deal with any world political agency that might be set up.

The Philadelphia Charter, formally the statement of the ILO's aims, is in effect the counterpart in the social field of the Atlantic Charter in the political sphere. It has been described as "not a programme of action, but a framework of reference for the achievement of an international code of rights for the common man." The Charter starts from four fundamental principles—that labour is not a commodity; that freedom of expression and association is essential to progress; that poverty anywhere endangers prosperity everywhere; that each nation must carry on the war against want with "unrelenting vigour."

Among the points stressed in the document are the opportunity for useful and regular employment at fair wages; the establishment of minimum standards of employment; the provision of child welfare; adequate nutrition, housing and recreational facilities; facilities for the training and transfer of labour; the extension of social security measures to provide a basic income and comprehensive medical care for all in need of protection. The Charter emphasises the recognition of collective bargaining and freedom of association, and the cooperation of management and labour in the improvement of productive efficiency—a recognition of the value of wartime joint production committees. The inclusion of this clause represents a great advance from the workers' point of view.

Although the Charter was the most significant and far-reaching decision of the Conference, covering the whole field of the ILO's work, important decisions were reached in other directions. For example, the recommendation on "minimum standards in dependent territories" was accepted unanimously. It proposes measures for establishing minimum wage machinery, for protecting women and young children's employment, for raising the standards of health, housing, social insurance and assistance. It also recognises the need for international cooperation in providing financial and technical assistance to colonial territories. Mr Tomlinson gave an assurance that the recommendation would be accepted throughout the British Empire, and that there would be immediate discussions with the governing authorities of all British Colonies.

Recommendation III—the organisation of employment in the transition from war to peace—was also carried unanimously, and proved to be one of the least controversial issues. The report of the Committee on which the recommendation was based covers demobilisation of the armed forces and of war industries; the machinery of employment exchanges; vocational guidance; training and retraining of labour; the employment of young persons and women; the employment and retraining of disabled workers; and the collection of labour statistics.

A great deal of the attention of the Conference was inevitably taken up with discussion of the organisation of the ILO itself. From the point of view of machinery, two important decisions were taken. The first of these was the setting up of a special committee of 18 members, in effect to bring the 1919 Constitution up to date and incorporate the 1944 decisions in it. The second was the appointment of a committee to work out the details of the industrial committees, proposed by the British Government. These committees will cover the main industries—coal, textiles, chemicals, iron and steel, engineering, building and civil engineering, transport, docks and distribution. Mr Bevin in particular has stressed the value of occupational, as opposed to purely national groups. A difference of opinion arose about whether they should be purely worker-employer groups or should include representatives of the Governments; the majority view was that they should be tripartite, as more in keeping with the character of the ILO. It was also decided to strengthen the regional activities of the ILO, and as a first step, it was agreed to call a conference of the Middle and Near Eastern countries. In this and other ways the structure and machinery of the ILO will be strengthened and developed, to equip it for the formidable programme of work which it has set itself. It is impossible to judge the practical results of the Conference until it is known what action the various Governments take to translate the recommendations into practice. The ILO is, after all, not an executive body. It can only make recommendations to the Governments on general lines of policy and on social objectives. It cannot enforce their application.

Though the Philadelphia Conference established the ILO's position as an international labour agency, it left the fundamental question of its powers and scope largely undefined. This was perhaps the most controversial issue

at the conference. The most enthusiastic supporters of the ILO tend to vest it with omnipotence and to impose no limitations on its scope. They argue that, since improved labour and social standards can only result from a general level of prosperity, the ILO should be responsible for economic action in the wider sense. The Australian Government's proposal that an inter-governmental conference on employment policies should be called was defeated, largely because it would be contrary to the tripartite character of the ILO. In the end, a compromise was reached—it was decided to recommend the Governments to call an employment conference in association with the ILO. On the suggestion of the American Government, it was agreed that if and when a fall in the general level of employment threatened, the ILO should call a special conference to discuss concerted action.

The Philadelphia Conference certainly resulted in extending the work of the ILO. The Charter lays down that it is one of the responsibilities of the ILO to "examine and consider all international economic and financial policies and measures." This does not mean that the ILO will have executive responsibility, but it does mean that it will want to be consulted on matters which before the war were regarded as outside its province. The ILO provides an unparalleled opportunity for a forum, and for obtaining the views of organised employers and labour on matters in which they are directly interested. It would, however, be a pity if its admirable work in the field of raising labour and social standards were to be defeated by too lofty an objective, or if it were to perform the functions for which it is eminently suited less well because it diffused its efforts. The ILO should be made to fit in to the post-war world economic framework, as an essential part, but rather as a specialist than as a general practitioner. Another question remaining to be solved is that of the membership. The fact that Russia has not rejoined the ILO—the chief obstacle in Soviet eyes is that it still regards the ILO as an "appendage of the League"—must weaken its effectiveness.

But it could hardly be expected that agreement would be reached on all these large matters in the three short weeks of conference. Whatever it has or it has not done, the Philadelphia Conference has undoubtedly laid the basis for international action in social and economic policies, and has been a pointer for the peace settlement.

## Conciliation in Greece

(By a Correspondent)

THE Greek Unity Conference held in the Lebanon from May 17th to May 21st was attended by twenty-nine delegates, representing the Greek Government in exile, all political parties including the Communists, and the three guerilla organisations, ELAS, EDES and EKKA. The Conference unanimously accepted a National Charter consisting of eight points: (1) The re-organisation of the Greek forces in the Middle East and the re-establishment of discipline; (2) the unification of all guerilla organisations in Greece under the orders of the Royal Government; (3) the cessation of arbitrary rule by the guerillas in territories occupied by them; (4) the sending of supplies of food and medicines to Greece; (5) popular freedom to decide on the constitutional issues after liberation; (6) the punishment of quislings and traitors; (7) the preparation of plans for post-war relief and reconstruction; (8) the satisfaction of Greek national claims on Bulgaria and Italy.

The result of the Lebanon Conference is a striking political success for the recently appointed Prime Minister, M. Papandreu. The basis of his broad compromise with the Communist-led Front of Liberation (EAM) and its guerillas (ELAS) is the agreement to form a Royal Government, including the representatives of all the Greek parties and guerillas. Had this concession been made earlier, many of the stormy conflicts which culminated in the recent mutiny of the Greek Forces in the Middle East might have been avoided. The only demand of the sailors

and soldiers who took part in the revolt was the formation of a Government of National Unity and the inclusion of the Greek Left in it.

In exchange for the concession now made by the King and his Prime Minister, the Communist party and the EAM have for the first time unreservedly recognised the authority of the Royal Government in exile. They have also agreed to give up the independent existence of their guerilla organisation, and have strongly condemned the mutineers without apparently making any specific demand for an amnesty. It is also significant that the National Charter does not repeat the demand, previously made by EAM, that the King should not return to Greece before a plebiscite is taken on the issue of Monarchy or Republic. It merely speaks in general terms about the people's "sovereign rights to decide on the constitutional and social regime and on the Government they want."

The conflict between the Royal Government and EAM and ELAS, as well as between the latter organisations and the two other guerilla groups—EDES and EKKA—has had its roots in the unhappy legacy of the dictatorial regime of Metaxas, which was established in 1936 and lasted until the occupation of Greece by the Axis. True, by military tests, the war record of the Metaxas regime was unimpeachable. During the campaign in Greece, Metaxas managed to arouse a wave of popular patriotism which for a while submerged all political feuds and

cleavages. But shortly after his death, this record was spoiled by the majority of his associates, who remained in Greece and formed the quisling administration, under General Tsolakoglu, the commander of the Greek army that surrendered to the Germans in the Epirus. The Metaxist military leaders have utterly compromised themselves in the eyes of the Greek people; and it has not been a matter of chance that the leaders of all guerilla bands, without political distinction, have as a rule been not generals but colonels. More important still, the fact that the monarchy had identified itself with the Metaxist regime has contributed greatly to a renewal of strong Republican sentiment all over Greece.

Traditionally the leading party of Greek republicanism was the Venizelist Liberal Party. This seems no longer to be the case. No Liberal leader of the stature of Venizelos has emerged since the latter's death in exile. The years of Metaxas' dictatorship resulted in an atrophy of the old party system. The strong constitutional sense of the Liberals prevented them from descending into the underground and waging an illegal struggle from there against the King and Metaxas; and the dictatorship left no scope for legal and political action. So Liberal influence shrank. Some of Venizelos' successors restricted themselves to ineffective forms of pressure on the regime, while others destroyed their influence by an equivocal attitude towards the dictatorship.

The gap left by Liberalism was largely filled by the Communist party, which had absorbed the bulk of the Socialist movement and monopolised the Republican programme. The Communist party had been illegal throughout the Metaxas period. After the occupation of Greece, therefore, it had a big start over other political groups; there was no need to make any fundamental re-adjustment in its political methods; the illegal activities of previous years had provided its membership with the best of training for the tasks with which it was now confronted under enemy occupation; and the newly awakened Republican mood in the country was strongly blowing into its sails.

In the first years of the occupation, the Communist-led Front of Liberation, EAM, attracted many non-Communists, and became a genuinely national movement. Later on, however, EAM seems to have lost some of its influence, because of the contradiction between its relatively moderate, popular and republican programme and its reckless and

often terrorist methods of action—against its Greek opponents. Even so, EAM has remained the chief factor in the Greek resistance. It has led mass demonstrations and strikes in Greek towns. Its armed forces, the ELAS, operating in the countryside, has been incomparably stronger than the National Democratic Army, EDES, which claims to continue the tradition of Venizelist republicanism, or than EKKA, the non-political guerilla band of officers.

The successive Royal Governments in exile have been coalitions of Metaxists and Right-wing Liberals, in which the Metaxists kept the key positions. Attempts to bridge the gap between the Governments in exile and the various sets of guerillas in Greece itself were made on several occasions. A delegation of the partisans went to Cairo in September, 1943, but the negotiations yielded no results; the King was not yet ready to include representatives of the EAM in his Government, while EAM was not prepared to waive or mitigate its republican claims. As late as February, 1944, an agreement was concluded between the various guerilla bands under which all internecine fighting was to cease; but the agreement was not observed because of the lack of political unity.

Shortly before the Lebanon Conference, the EAM created a Political Committee of National Liberation, a potential rival to the Royal Government. All evidence pointed to the possibility of a final breach. Paradoxically enough, the mutiny seems to have prepared the ground for a compromise. The King and the Metaxists could now appreciate the strength of the EAM, whose influence they previously tended to underrate. The leaders of the EAM, on the other hand, became frightened by the consequent split and the effect on the Greek contribution to the war effort. They came to the Lebanon Conference with something of a sense of guilt, which was reflected in their message to Mr Churchill.

The Lebanon agreement can become a turning-point in Greek politics. It can destroy the seeds of civil war in Greece. Whether it will do so depends now on the degree of willingness on both sides to carry out the terms of the agreement without indulging in any artful manoeuvring for position. It remains to be seen whether the Metaxist elements in exile are really prepared to share power with the Left. It also remains to be seen whether the radical following of the EAM in Greece itself will accept their leaders' decision to disband the party guerillas and to incorporate them into one national army under the King's orders.

## ✓ Employment: The White Paper

[The following is a full summary, prepared by The Economist, of the Government's White Paper on "Employment Policy." (Cmd. 6527.)]

THE White Paper is an outline of Government policy, a recognition of the Government's responsibility for the maintenance of a high and stable level of employment after the war. The problem is an international as well as a national one, and some steps have already been taken towards collaboration. Mass unemployment will not arise, however (apart from temporary unemployment due to dislocation) until after the transition period from war to peace is past. To implement the policy outlined in the Paper, legislation, though necessary to confer the requisite powers, will not be enough. The full support of industry and workers will be no less important than Government action.

### I.—THE INTERNATIONAL AND INDUSTRIAL BACKGROUND

Although the White Paper is concerned with domestic policy, it is apparent that a high level of employment depends also on the expansion of British exports above the pre-war volume, to make up for the loss of foreign investments during the war. Such expansion would be impossible without general economic stability and prosperity abroad. It will therefore be an essential part of the employment policy actively to co-operate with other nations to this end. As proof of their intentions, the Government have already concluded general international agreements in this field (Atlantic Charter, US Mutual Aid Agreement, acceptance of Hot Springs Conference recommendations). Further action aiming at the development of economic strength in the Commonwealth and Empire, with a consideration of the ILO conference recommendations, are among the first con-

tributions which the British Government can make.

A resilient and flexible industry, however, will bear the chief responsibility for the recovery of export markets. To give priority to the export industries in labour, raw materials and factory space does not mean that efficiency in industry can be left to those industries alone. The proposals made in the recent Budget speech for helping industry through tax-modifications for research and replacements will help British industry to improve its technique and efficiency.

### II.—THE TRANSITION FROM WAR TO PEACE

The duration of the transition period between the end of the European and Pacific wars is incalculable. It will bring an unsettling of economic conditions, starting with the release of some of the labour force. National service legislation and price control have served respectively to reduce unemployment from 1.3 million to 75,000, and to check the demand for consumer goods. The return to civilian production, for which there will be a great demand, will involve a change of employment for about 7 of the 23 million persons now in the Armed Forces and gainful employment. Government expenditure, now employing some 80 per cent of the manufacturing labour force, will be partially reduced, and these workers, together with those demobilised from the Forces, must be absorbed in expanding civilian production. The integration of the two movements, however, cannot be always and everywhere perfectly matched. There will be a threefold danger of local unemployment, of inflation and distorted expansion of civil industry. For the first, the danger of unemployment developing where local industries fail to adapt themselves quickly enough to civilian production can be exaggerated: immediately after the last war unemployment was neither great

nor of long duration. To reduce it to a minimum, the Government are preparing both to assist industry and labour to adapt themselves to changing conditions, and to regulate Government production and stock sales to meet the needs of priority civilian production so as to promote orderly expansion in the transition period. These plans will be assisted by experience of war-time transfers and by discussions with the industries concerned.

To avoid the second danger of inflation arising from an excess of purchasing power over supplies, both Government action and public restraint will be necessary. Rationing and price control will have to be maintained, though no definite level of prices can be assured since the cost of imports will depend on world prices. Savings must also be continued if a sufficient portion of increased civilian production is to be diverted to schemes of reconstruction and social development. Lastly, the uses of capital must be carefully regulated to avoid dear money and to direct expenditure to priority needs. These essential restrictions will not be altogether palatable, but the Government feel confident of the same popular support that has been given in time of war.

The danger of misdirected demand interfering with the production of essentials will necessitate a system of broad priorities for food, raw materials and labour. Lend-lease and credit will no longer be available for importing essential food and raw materials. To take their place export industries must be given the first opportunity to expand. In the home market, the necessities of civilian life and the capital equipment required by industry must be produced before anything else. How long these controls must be kept up depends on the length of the transition period. When that period comes to an end it will be necessary to take deliberate action to maintain an adequate level of expenditure on goods and services.

### III.—THE BALANCED DISTRIBUTION OF INDUSTRY AND LABOUR

The fact that the effects of localised unemployment in the transition period will continue long after it is ended necessitates a brief description of measures which the Government propose to take to check its development. Apart from seasonal unemployment, longer-term unemployment in particular industries and areas, which was a familiar feature in this country between the wars, is usually due to technical change, to the trend of fashion, or to foreign competition. The situation under conditions of depression is aggravated by a lack of industrial balance and, in particular, by the localisation of industries of one type or of industries with a common market. ("Industry," here as elsewhere in the White Paper, is used as a generic term for all types of productive process, including commerce and agriculture.) Besides promoting the prosperity of the basic industries in the areas concerned, the position can be eased by the encouragement of secondary industries within the area and by removing the physical and educational barriers to mobility of labour. By means of compulsory notification to the Government of new factory development, and the prohibition of development in areas already over-crowded, industrial expansion can be steered into areas which require greater balance and diversity of production. Further influence can be exerted by the Government through the location of continuing munitions production, the grant of priorities and Government contracts; the erection at the expense of the Government of factories in "development areas" for sale or lease to industry, and assistance with the capital requirements of industries in these areas. The Government will also ensure that they are adequately supplied with the basic services—power, communications, housing and other public services. In view of the constantly changing conditions from time to time no final list of these areas can be drawn up. Special Areas legislation can be dropped, since in all but a few cases, as the war has shown, there is no reason why they cannot be re-established on a sound economic basis. The main responsibility for the implementation of this policy will rest with various Government departments. A regional organisation will bring together representatives of those concerned in the local application of these measures—chiefly the Board of Trade, the Ministry of Labour and the Ministry of Town and Country Planning. On the national level, however, the Government propose to give responsibility for all questions of general industrial policy to the Board of Trade.

To increase the mobility of labour, the Government proposes not only to implement fully and make per-

manent the temporary resettlement schemes for ex-Service men and women and released war workers, but to give every encouragement to industry to make provision for the training of its own recruits. Many jobs will require only a short period of training, and it is considered that this can best be undertaken in the factory itself. To meet the need for a longer training, the present Government Training Centres and Technical Colleges can be developed and extended. This will facilitate the supply of trained workers as they are needed. Training allowances, at a scale higher than unemployment benefit but lower than the expected wage of the trained worker, will be made by the Government. These measures can only be successful, however, if there is full co-operation from employers and trade unions, especially in industries which have previously been apprehensive of admitting new trainees. The physical obstacles to mobility of labour are considered no less important. A substantial proportion of the houses erected after the war must be made available to workers at reasonable rents, and resettlement allowances made to workers transferred from one area to another.

### IV.—GENERAL CONDITIONS OF A HIGH AND STABLE LEVEL OF EMPLOYMENT

Even after the transition from production for war to production for peace has been smoothly accomplished, the long-term problem of cyclical unemployment remains. The three conditions of full employment are stated to be the maintenance of a steady and adequate level of expenditure on goods and services, the stabilisation of prices and wages relative to efficiency, and adequate mobility of labour. These are treated in turn.

#### (a) The Maintenance of Total Expenditure

The first step in a policy of maintaining general employment must be to prevent total expenditure from falling away. The Government accept full responsibility for taking action at the earliest possible stage to arrest a threatened slump. Experience has shown that a trade depression does not bring its own corrective.

In order to construct a policy to maintain total expenditure it is necessary to analyse its component parts, to see how widely each may be expected to fluctuate and how easily the fluctuations may be controlled or offset. It can be decided that neither public nor private consumption expenditure is likely to vary to any great extent, since buying habits, individual and collective, are fairly constant. While public capital expenditure, especially by local authorities, has, in the past, been greatly reduced in depressions, this need not be so in the future. The greatest danger lies in fluctuations in private investment expenditure and in the foreign balance of exports and imports. Neither is easy to control; nor will it be easy to offset a decline in either by an increase in one of the other categories of expenditure. So far as is possible, the guiding principles of policy must include an expansion of exports, a stabilisation of all types of spending, a public capital expenditure policy planned to offset variations in private capital expenditure and a reversal of the decline in private consumption expenditure as soon as it appears.

#### (b) The Stability of Prices and Wages

The effectiveness of the first condition, however, will depend on the fulfilment of the second. If stability of wages, other than changes due to increased productivity or the removal of anomalies, is not maintained, an increase in expenditure will have no effect on unemployment rates. Similarly if higher expenditure results only in higher prices, real wages will remain roughly constant and there will be no reduction in unemployment. The Government are prepared to do all in their power to fulfil this condition, but without the full co-operation of labour and employers their policy cannot be effective. In particular, everything possible must be done to neutralise the potential threat of restrictive agreements on prices and output. Powers will be taken to collect information of the extent and effect of restrictive agreements and of the activities of combines, and appropriate action will be taken to check restrictive practices.

#### (c) The Mobility of Labour

The third condition is equally dependent on public co-operation with the Government. A certain amount of temporary and seasonal unemployment is unavoidable, but the responsibility for reducing it to its minimum rests as much on individual initiative as on Government assistance.

### V.—METHODS FOR MAINTAINING TOTAL EXPENDITURE

After the transition period, in which it will be essential to keep the rate of interest as low as possible, the Government intend to see what can be done, through variations in the rate of interest, to influence capital expenditure for the promotion of stable employment. Monetary policy, operated collectively by the Bank of England, the Treasury and the joint-stock banks, will not always be an adequate weapon against depression, and the Government propose to supplement it with a more direct influence on the volume of public and private investment expenditure. In particular, larger private enterprises can be encouraged to plan their capital expenditure in conformity with the general stabilisation policy. The question of adjusting taxation policy to accord with this plan is being considered. Within the limits of its powers and of the urgency of some investment plans, the Government can also influence local authorities so that they increase expenditure at the onset of a depression and contract in periods of boom. This, it is proposed, should be done by means of co-ordination of five-year public works programmes submitted by each authority, in the light of the prospective employment situation. By using their control over loan sanctions and grants, the Government can set an annual target of public works for the succeeding year. By cutting out all possible causes of delay between decision and construction, the effectiveness of public investment expenditure as a stabilising influence can be greatly increased. This policy may be extended to the public utilities. The assistance and co-operation of industry is again stressed as a vital factor in facilitating and speeding-up any changes between private and public expenditure that are felt to be necessary.

#### (b) Consumption Expenditure

A second line of defence, should it prove impossible entirely to offset variations in capital expenditure, lies in the power to influence the national expenditure on consumption. This, it is believed, can best be done by a thermostatic control of social insurance contributions. The White Paper has an Appendix showing how purchasing power could be increased in the event of falling employment by a temporary reduction of contributions, so as to encourage an increase in demand for consumption goods and services and increase employment. It is not proposed that such variations should be introduced until after the transition period or that the policy should reduce the total contributions made over a number of years. An auxiliary system of deferred tax credits might also be undertaken should it prove both practicable and necessary. Lastly, the purchasing power of the Government and local authorities can be directed towards the same object of stabilisation.

#### (c) Central Finance

None of the proposals in the White Paper involves a

sudden or major change in past Exchequer practice; in stabilising the national income they will even assist the problems of national finance associated with periods of depression. With regard to a possible increase in financial assistance to local authorities undertaking capital expenditure for reasons of employment policy, and to the inevitable costs of reconstruction plans, however, some increase in national indebtedness on top of that incurred as a result of the war must be taken into consideration. Although in single years there is no need to adhere to a strict balance in the Budget, the principle that it must be balanced over a longer period cannot be abandoned. These facts will inevitably result in a high level of taxation which can only be met without excessive strain if the national income is fully maintained by means of progress in technical efficiency. A balance must therefore be struck between the need for a high national income and for budgetary equilibrium to ensure public confidence.

### VI.—THE POLICY IN PRACTICE

In putting forward the proposals outlined in the White Paper, the Government are fully aware that the suggested measures, involving as they do a great extension of state control over the volume of employment, are a new departure in practical politics. These untried plans must be flexible in order to adapt themselves to unforeseen difficulties and obstacles. Quick and accurate diagnosis of cause and effect in the national economy will be indispensable to success, and can best be undertaken by a small staff of statistical and economic experts able to advise the Ministers concerned. Their work will be impossible without accurate and up-to-date statistics, a need which only the full co-operation of industry can meet. Information will be needed, in addition to that already available, on present employment, unemployment and prospective employment in each industry and area; on savings and projected capital expenditure, both private and public; on the annual quantity and value of production; on monthly production and consumption and on stocks and orders on hand; and, lastly, annual and quarterly estimates of foreign capital movements and balance of foreign payments. An extension of the scope of the annual White Paper on National Income and Expenditure is also intended to provide a more complete analysis of the national economy. A parallel study of the manpower position by the Ministry of Labour will serve to complete a constantly changing review. The debates on the Budget can be adapted to provide an annual opportunity for Parliament to discuss the national economy and the general policy of the Government in promoting full employment and a rising standard of living. The latter objective, the White Paper emphasises in conclusion, cannot be achieved by full employment alone without a steady increase in the economic efficiency of the nation.

## NOTES OF THE WEEK

### Peace Plans

The American Government has taken the initiative in inviting their British, Russian and Chinese allies to consult together on the framework of the future peace organisation, the "new and better league of nations" to which President Roosevelt referred this week. The draft plan prepared by the Americans has not been published officially, but press reports speak of five main points: a United Nations Council of the Big Four with a few small states appointed by election and serving in rotation; a United Nations Assembly later to include all nations; a police power composed chiefly of the forces of the Big Four; a world court; and machinery for mediation. The plan obviously and rightly follows the old League idea and it is an improvement on it in so far as it lays military responsibility where it alone can lie—with the Great Powers. One of the chief drawbacks of the old League was, as Mr Mander put it in last week's debate on foreign affairs, that "the police power was everybody's business and therefore nobody's." It is too early to criticise a plan which at this stage is little more than bare bones. Such important questions as the setting up of adequate functional machinery to deal with all the economic and social questions which make up the substance of international life, the place of regional arrangements and groupings, such as the

British Commonwealth, within the larger framework—these are questions which can be discussed only when a fuller plan appears. But it can be said at once that the inclusion of China in a group of privileged Great Powers will lead to endless difficulties with other states, especially France, whose claim to greatness and efficiency is at least as great.

### To Rome

Last week's fighting brought striking successes to the Allied armies in the south of Italy, but also a certain amount of disappointment. The fall of Terracina was quickly followed by the linking-up of the forces on the main front with those from the Anzio beachhead. By their joint impetus these two forces overran about two-thirds of the Appian Way and struck towards Highway 6, the chief road connecting the Liri front with Rome. At the same time, an attack from the area of the beachhead threatened to outflank the Alban Hills, the last range of mountains in front of Rome. For a time it looked as if General Alexander had managed to achieve two objectives: to cut off the main roads of supply and retreat for Kesselring's forces and to destroy their chance of making a last stand to the south of

Rome. This, however, did not happen. The German defence stiffened in front of Highway 6, which the Germans were still able to use on Wednesday, in spite of stubborn Allied assaults on Valmontone. Similarly, the move to outflank the Alban Hills was temporarily halted in the area of Velletri and Lanuvio. Kesselring thus won a precious respite that may have enabled his divisions to achieve a relatively orderly withdrawal from the Liri sector and the Lepini Mountains northwards to the area of the Sabine Mountains. Reports from the line that runs from Valmontone to the sea and covers the Alban Hills also suggest that the Germans there were able to use the short breathing space to strengthen their defences, especially in anti-tank weapons. Even so, their losses have been already substantial—three German divisions are reported to have been destroyed and fifteen thousand prisoners taken. General Alexander has presumably also used his time to mass his forces for a telling blow in the west, which may be expected to turn the Alban Hills and to carry the Allies to Rome. The territorial gains are secure. What now looks less certain is the prospect that Kesselring's forces will be put out of action or "annihilated" to the south of Rome.

\* \* \*

### Reactions on Spain

Mr Churchill's references to Spain in last week's debate had a cool reception from Britain's two great Allies. This was understandable in Russia, where until recently a Spanish division has been fighting on the side of the German invaders. The Russian authorities marked their displeasure by omitting all mention of Spain from their broadcasts and newspaper reportings of Mr Churchill's speech. What is perhaps more surprising was the strength of the American reaction. The liberal and moderately conservative press were unanimously hostile to this portion of the Prime Minister's speech, and their attitude was given official force by President Roosevelt, who at his Press Conference, said, in contrast to Mr Churchill's "warm words," that "nobody is satisfied with what the Spanish Government is doing." One of the most frequent criticisms levelled in this country at British diplomacy is its supposed subservience to Washington. It is quite clear that on the Spanish issue, the British have gone their own way, and dragged the United States faintly protesting behind. It is perhaps a pity that Mr Churchill should have chosen this particular issue on which to take an independent line. It is a very questionable one, and the wisdom of the Prime Minister's policy is open to serious doubt. For example, if the deep motive behind it is, as some continental observers suggest, the buttressing of British power in the Mediterranean, why try to win a government which may not long survive the war and at the same time snub one in Turkey whose stability is not in doubt? In any case, now that the idea of British subservience to Washington has been proved—in this instance, at any rate—a myth, could not this newly demonstrated independence be used in a more fruitful cause? There is no doubt about the provenance of the Allies' distrust of Algiers. Washington has taken the lead in not recognising officially the French Provisional Government. But it is the British who will chiefly suffer from the consequences of this diplomatic blunder. If a joint attitude cannot and need not be taken on all questions—over Spain it apparently cannot—why should the British Government be at such pains to maintain a united front over Algiers and thus to prejudice their own relations with their vital French neighbour and Ally?

\* \* \*

### Farm Prices

In his four-year plan for British farming Mr Hudson has to pursue two not entirely compatible objectives. The first is to proceed on wartime lines in the production of the maximum quantity of food for human consumption, during a period in which both foodstuffs and the means of production and transport will continue to be scarce; and, if good fortune attends our arms, the needs of Europe will be added in the near future to our own. The second objective is to prepare for peacetime production, in which quality and economic efficiency will count for most in our domestic agriculture. The problem of combining these two lines of policy was the main theme of the Hot Springs Conference last year. In his latest addition to the four-year programme, the Minister of Agriculture has touched the heart of the dilemma so far as this country is concerned. He has promised that British producers of mutton, beef

and milk will have an assured market for the next four years at prices not below the present level. Meat and milk are key commodities in this problem because, while they will be urgently required during the period of emergency and transition both here and in Europe, they will equally be among the foundations of peacetime farming in this country, based upon the specialisation of function between one region of the world and another. Whether or not Mr Hudson will succeed in reconciling his dual aims depends upon the prices which he proposes to pay to the producers of these foodstuffs and upon the degree of efficiency in production which he requires in return for the payment of both prices and subsidies. The mutton subsidy, for instance, already amounts to about half the price that was charged before the war. Put bluntly, the duty of Mr Hudson is to refrain from guaranteeing prices which are too high, either in relation to the capacity of consumers to pay or in relation to the relative efficiency of British producers. During the war years Mr Hudson has not been conspicuous for his hard bargaining in the matter of farm prices; and if at the end of his four-year programme British producers have been given assurance of over-high prices for over-large quantities of produce, the whole future of British agricultural policy and of the standard of living may be disastrously prejudiced. About the principle of guaranteed prices and assured markets for agricultural produce, there can be no two views. About the arithmetic, that is, about the cost to the community, there can be several views; and only one—that which imposes the least additional charge in return for the maximum of efficiency—can be the right one.

\* \* \*

### Parliamentary Government

It is right and proper that the House of Commons should be concerned to keep its proceedings up with the times. It is somewhat disturbing, however, to find MPs in two minds about the correct way of doing this. Two recent examples illustrate the point. The Government recently accepted, in general terms, the suggestion that there should be a Standing Committee of the Commons to scrutinise the departmental rules and orders which constitute "delegated legislation." Last week Lord Winterton pressed for another Standing Committee, this time upon the actual procedure of Parliament; and the general view was expressed in debate that the way in which the Commons transacts its business is in need of "streamlining" to fit the press of modern business. These two aims—Parliamentary scrutiny and the efficiency of government—are not, of course, incompatible. The more swiftly and successfully that Parliament can conduct its several functions of deliberation, scrutiny and consultation, the better equipped will the Executive be to deal, either by direct or by delegated legislation, with the widening range of communal activities which come within its purview. Yet in Parliament itself there are plainly two opinions which are not complementary but contradictory. One would limit governmental action to the minimum that can be passed under deliberate Parliamentary review. The other would extend Parliament's powers of review to cover the maximum of governmental activities that modern conditions may require. There is little doubt that the second attitude is the right one. The outstanding advantage possessed by the British system of Parliamentary government over other democratic methods is the power to act possessed by governments which are at the same time representative of the people and responsible to Parliament. Anything that weakened that power would be quite as disastrous as anything that lessened that responsibility.

\* \* \*

### Mission to London

Almost on the first anniversary of General de Gaulle's arrival in North Africa it was announced in Algiers that he would visit London. General de Gaulle has gone a long way in twelve months. In the spring of last year his journey to Algiers was the subject of long and intricate discussion between himself and General Giraud, who formally was still free to allow or forbid entry to the leader of Fighting France. But now the "arrival from Carlton Gardens" is to all intents and purposes sole master at Algiers; and there is little doubt that the Provisional Government over which he presides has every chance of establishing itself as the sole

French authority in liberated France. True, that Government has not been given complete recognition by Great Britain and the United States. But, as an official statement issued at Algiers on Sunday points out, General de Gaulle does not now attach much importance to the formulae of recognition. This problem will therefore not figure on the agenda of his negotiations in London. Similarly, the transformation of the National Committee into the Provisional Government of France is "a purely internal French issue." In reply to reports in the press about the political prerogatives of the Allied Commander-in-Chief in France, the Algiers statement bluntly declares that

the question who is going to exercise the supreme power in France has also been resolved, and cannot be the subject of any negotiations. . . . Any other solution would have to be forcibly imposed by the Allied Command, and would lead to chaos.

Thus on the eve of his visit to London General de Gaulle has made it known with some vigour that he is not coming to London to discuss any suggestions that might be regarded as infringements of French sovereignty or place any doubt upon his right to speak on behalf of all France. Instead, he proposes to negotiate on two sets of problems: the forms of French military assistance to the Allies, and the economic and financial arrangements which an Allied descent on France will make necessary. Plain speaking on these matters will probably be all to the good.

\* \* \*

### France and the Franc

The crucial issue which General de Gaulle intends to discuss in London is the question of French currency. In Washington the Minister of Finance from Algiers, M. France, has just concluded negotiations on the proposed exchange rate between the franc and the dollar; and he will now accompany General de Gaulle on his mission to London. It seems fairly certain that the earlier intention to change the rate from 200 francs to the pound to 300 has now been abandoned, after considerable and widespread criticism. In the meantime, however, a new and even more important problem has arisen. The Algiers press has reported that the American military authorities have decided to issue their own "military francs" to their soldiers in France; and that eighty billion of those banknotes have already been printed in the United States. The reports have caused consternation among Frenchmen; and the Provisional Government has recorded its protest in semi-official statements. There cannot be the slightest doubt about the disastrous effect of any such arrangement on the relations between France and the Western Allies. The issue of francs by a foreign Power would be a grievous blow to the sovereignty of France. Actually, it is still doubtful whether this step has really been seriously considered by the American authorities. Financially, the pumping in of new billions of francs into the channels of circulation would turn the existing inflation of the currency in France into catastrophe; and it would seriously interfere with the plans of the Algiers Government to stem the inflation or to convert the Vichy francs into new French banknotes. Two methods are possible for the invading forces. Either the Allied soldiers in France can be issued with pounds and dollars or they can be issued with francs acquired by the military authorities from the Provisional French Government. From the French point of view the second method is by far the better. The spending of dollars and pounds by Allied soldiers is bound to stimulate the flight from the franc and the hoarding of foreign currency by private individuals. If, on the other hand, Allied soldiers are paid in francs issued by the Provisional Government, the Government itself accumulates in its hands a reserve of pounds and dollars or of claims to those currencies. Immediately after the war, France will badly need that reserve; and it is much more convenient for the Government to have it ready at hand than later on to force an inflation-scared population to dehoard the pounds and the dollars and to hand them to the authorities. Whatever the eventual arrangement, the need to restrict drastically the spending of money—even of French money—by Allied soldiers in France will be inescapable, as experience in liberated Italy has shown. Currency may be a technical matter, but it can easily become the festering sore in the relations between France and its Allies.

### Indian Reconstruction

Lord Wavell has decided to add a Department of Planning and Development to the Government of India. The new member of the Viceroy's Executive Council, responsible for the new Department, will be Sir Ardeshr Dalal, who recently assisted the group of Bombay industrialists in the preparation of their now famous plan for Indian economic development. He will have at his disposal, in addition to this and other plans—of varying usefulness—drawn up by other political groups, the reports already made by experts to the reconstruction committee of the Council. It is certainly a healthy sign that political discussion in India has taken a new turn away from the old and arid discussions of constitutional and communal forms which have so signally failed to produce any vestige of national agreement about India's political future. War and famine have diverted Indian attention to economic affairs; it has been realised that the dominant political fact in India is the poverty of its people. The plan of the Bombay industrialists for the rapid increase of India's national income was followed by a "people's plan" from the Moslem League, and by a plan for economic nationalisation from the Indian Federation of Labour. There is talk of a five-year plan from the Government of India before the end of this year. All roads for the moment lead in the ways pointed by the Bombay plan, though the political implications of the various proposals which are being matured differ most radically. It would be a grave misjudgment, however, to assume that, through this indispensable sphere of material improvement, a short cut has been found towards a solution of the political problems which have so far proved so intractable. It is one of the commonest errors of our times to assume that political difficulties can be by-passed by economic manipulation, whereas all the logic of history, recent and remote, tells precisely the opposite story. It may be, of course, that common thought and action in these economic matters can draw together political groups in India hitherto antagonistic. But it is nevertheless true that none of these economic projects, from the highest to the lowest, or from the most Right to the most Left, has the

*The merry  
monarch  
had a bright  
idea . . .*

He made good the deficiencies in his budget by personal borrowing from those early bankers, the City goldsmiths, on terms which were highly satisfactory—to His Majesty! No wonder the limits of the Royal Prerogative took so much thrashing out in Charles II's days. Subsequent and more enlightened Governments have deemed it wise to encourage the Banker, with the result that today the advantages of a complete banking service are available to every citizen. The Westminster Bank with its network of branches offers you the security and convenience of a Current or Deposit Account, while its Trustee Department offers the testator the advantages of corporate executorship. Call and discuss these and other services with your local Manager.

LIMITED

slightest chance of actual application without the coming together of a majority of politically-conscious in a common method of political progress towards Indian freedom.

### South American Recognition

Writing in January, *The Economist* rashly hazarded the prediction that President Arroyo del Rio would be the first President of Ecuador since 1924 to finish his term of office. Now within a week of the Presidential elections, a violent *coup d'état* has driven the President from power and the military leaders, backed, it is said, by a strong popular majority, have, apparently, brought back the former president, Dr. Ibarra, from his exile in Colombia. Since force has undoubtedly been used to by-pass the elections, the question is now whether the new government will come under the non-recognition ban agreed to last year at the Pan-American Conference at Rio de Janeiro. The lead lies with Washington and it seems likely that recognition will not be withheld. The revolutionaries are not Axis-inspired. They are simply the "outs," or opposition party, returning to power by what must now be regarded the traditional method in Ecuadorian politics, where changes of government are ensured not by regular elections but by quite as regular *coups d'état*. The new Government will be no more pro-Axis than the last. It will probably secure recognition for, however legalistically the formula of non-recognition may be regarded in theory, in practice it is not violent or non-violent change that decides the Allies' attitude, but the policy of the new Government towards hemisphere defence, Lend-Lease, Axis agents and Pan-Americanism generally. The Bolivian Government, for example, has recently shown its good will by sending prominent Axis agents to the United States for internment. The State Department has sent a special envoy, Mr Avra Warren, to enquire into the real state of affairs in La Paz. If his report reveals a Bolivian desire for collaboration, recognition may follow. This would be a blow to Argentina which has been priding itself on the possibility of building a "southern bloc." Here, there will be no change in Allied policy, at least so long as all the Axis statesmen remain in Buenos Aires, thus making the rupture of relations look a complete farce.

### Little Men Combine

The small shopkeeper is often the symbol of competitive independence. But the "little men" who own fruit and vegetable shops are beginning to display a corporative, even a monopolistic, spirit themselves. Their organisation, the Retail Fruit Trade Association, has come out in favour of the permanent registration and licensing of food traders. The shopkeepers fear competition from both above and below—from both the multiple store and the barrow man. Clearly, the greatest danger to their post-war prosperity lies in the probable expansion of multiple stores, which can sell at low and uniform prices and can spice their salesmanship by the variety of their attractions. Shopkeepers also dislike the street-vendor, because he sells cheap fruit and vegetables in times of glut at prices which, applied to shops, may not only be unprofitable but tend to interfere with the sale of higher-class goods. Through licensing, it would be possible to restrict supplies of fruit and vegetables to those who traded in them for twelve months in the year. Yet it is only this periodic cheap selling in the street or in the market which brings many kinds of produce within the reach of the poorer town dwellers. The aim of registration in fact would seem to be the exclusion, or at any rate the strict limitation, of new entrants, together with the stopping up of irregular outlets. This is not only most undesirable. It is very doubtful whether, in any case, it could be done. The Association is large—it has 35,000 members—but there are over 40,000 greengrocery shops in the country, in addition to the multiple and co-operative stores and street vendors against whom protection is sought. Some of the Association's suggestions for joint action are genuinely directed towards increasing efficiency. Such are the proposals for more standardisation in methods of packing, grading, and marketing, and for the creation of a market intelligence service, to even out the balance of gluts and dearths between areas. But these laudable aims do not require a monopolistic organisation. Such an organisation could serve only to prop up the present owners at the public expense.

### Wartime Hardships

One of the reasons why small shopkeepers fear for their future in peacetime is that so many have had to shut down under the pressure of war. Some 15,000 is the total of non-food shops (there are no figures for food shops) which have been registered as closed at the Board of Trade, with a view to securing the assistance promised them in re-opening after the war. According to Mr McCorquodale, the call-up has been an important, but not the major, factor in causing the closing of shops. He was replying, on behalf of the Government, in the adjournment debate last Friday, to the many MPs who had urged that mobilisation had pressed specially and unfairly hard on the little shopkeeper. A great number of distressing individual cases were quoted. But the general problem is clearly that, whereas the withdrawal of staff from a co-operative or multiple store does not put an end to the business, the call-up of the owner-shopkeeper or his staff frequently does. This difficulty has, in fact, received special consideration. Where the call-up is for military service, it is true, the shopkeeper can only use the normal hardship machinery. But where it is a question of directing him to war work, it is officially claimed that, as a rule, he is not taken if this would cause the closing of his shop. It is hard to see what more, in principle, can be done for the small shopkeeper in present circumstances. The complete exemption of any class of citizen from mobilisation would be impossible; and it is unavoidable that the dice should be loaded in war-time against the small shopkeeper's competitive position. The Government must be accordingly generous in giving post-war relief. These war-time difficulties explain the emergence of a self-protective instinct, born of doubt and fear and aimed at walling round the shopkeeper's position; but they do not justify the various attempts which are being made, with these hardships as an excuse, to make the occupation of shop-keeping into a permanently closed shop.

### The Government of London

The London County Council has rather more power than most county councils, and the Metropolitan boroughs rather less than most boroughs. How functions are distributed within the LCC area and, more especially, who bears their cost, has been set out in a Survey of London Local Government made by two members of the Institute of Municipal Treasurers and Accountants. London's problem here, as in so many of its other problems, is largely peculiar to itself—and, the cynic may add, largely insoluble. In theory, the whole of the Greater London area is administered on the "two tier" system of local government. But in practice, quite apart from the unique position and privileges of the City, duties are divided very differently from elsewhere. The LCC is (in peacetime) responsible for the Fire Brigade, infectious diseases hospitals, and main drainage, services which are elsewhere administered by the smaller authorities. It also undertakes the bulk of the more important and more costly services—all education (elsewhere, elementary education frequently belongs to the smaller authorities), public assistance, many of the health services, and town and country planning (elsewhere, again, a more local responsibility). The LCC is in a special position with regard to housing, since it is responsible for all rehousing undertaken outside its area, which now represents much the most of the country's rehousing. In 1936-37 the London County Council's expenditure out of rates was nearly £21 million, compared with about £7 million spent by all the Metropolitan boroughs. Yet despite the fact that the LCC's rates are raised by a more or less uniform precept—7s. odd in 1936-37—and despite further provisions for evening out charges, the rates levied by the boroughs in that year varied from 9s. 10d. in Westminster to 18s. in Poplar. These differences reflect great differences in the wealth of the boroughs—for the product of a penny rate brings in 20 times as much in Westminster as in Bethnal Green. Thus even the comparatively minor functions which they exercise put a heavy burden upon the poorer Metropolitan boroughs. The cost of the upkeep of highways, it is true, weighs more heavily upon them than on boroughs outside London. But even if they were granted relief in this respect, doubts arise whether they should continue to exist in their present form—for reasons of size and function as well as of finance.

### "The Great Wen"

The shape of London's local government was laid down at a time when its size and needs were very different from

the present. The area of the London County Council is roughly the same as that administered by the old Metropolitan Board of Works, which was set up in 1855 and superseded by the LCC in 1888. Nobody can say to exactly what point London should now be deemed to have spread, but certainly the Metropolitan Police district contains little that is not built-up. Within this district, in 1939, the population of outer London, and—for that matter—its number of industrial workers (though not of factories), was larger than for the County of London, although the density of the population of the former was under a quarter that of the LCC area. Defined in this way, Greater London includes the whole of another county, Middlesex, as well as large suburban areas in Surrey, Kent, and Essex. It is hard to see any logical reason why these three counties should continue to administer parts of London, which—in the case of Kent and Essex—are very different from the rest of their area and not at all necessary to its unity. There is a strong case for establishing one authority for the Greater London area, or, at least, for retaining Middlesex and having two. Cobbett described London as a great wen over a century ago, and it may be perhaps that words might have failed even him to-day. The power that would be possessed by a single all-purposes authority in the London region is frightening to contemplate. But unless the present structure of local government is modernised for the task of regulating London's chaotic spread, this remedy may yet be inescapable.

### Poor Persons Legal Aid

The appointment of a special committee to investigate the system of legal aid to poor persons in England and Wales is a welcome and progressive step. The Lord Chancellor's Committee, under the chairmanship of Lord Rushcliffe (who as chairman of the Assistance Board, had wide experience of social problems) is a representative and not a purely legal body. It will, it is to be hoped, take evidence from representatives of the various workers' and social service organisations, who know the "consumer's" end, as well as from professional bodies. Present facilities seem to be inadequate, and in many respects behind those of other nations. Except in criminal courts, poor persons have to depend mainly on charity for legal advice, and there is no provision for those of only moderate resources. The County Court was originally established as the Poor Man's Court, but losers of an action may have to pay costs from £20-£50. There is no official scheme of assistance for persons in County Courts. In London, the Bentham Committee for Poor Litigants assists in securing the services of barristers and solicitors, though there is often difficulty in finding lawyers willing to take up non-remunerative cases in court. The Bentham Committee, through its Poor Man's Lawyer Advice Centres, provides legal advice free of charge, but their effectiveness is rather limited. In other parts of the country, schemes for poor man's lawyers are run in connection with local councils of social service, and since the war, Citizens' Advice Bureaux have gone some way to meet the gaps. But they are not really qualified to give expert legal advice. The Haldane Society is putting forward a scheme for a chain of local legal advice bureaux on the lines of the Swedish Municipal Bureaux, which will assist with advice, correspondence and negotiations; it also suggests improved provision for legal assistance in the County Courts and in the High Court. Legal aid, it is argued, should be a right and not a charity. A recent article in the *Law Quarterly Review* sums up the position in these words:

Legal aid cannot be left to the initiative of private organisations. It is a service which the modern State owes to its citizens as a matter of principle. . . . The State is responsible for the law. That law is made for the protection of all citizens, poor and rich alike. It is therefore the duty of the State to make its machinery work alike for the rich and the poor.

### Shorter Notes

By a meeting in the Court of Appeal an important precedent has been set on the interpretation of the law with regard to divorce on the grounds of insanity. Under the present law, five years of "continuous care and treatment" were required for the respondent before divorce proceedings could be undertaken. Absence due to the trial of the patient,

to his being sent to a specified place for the benefit of his health, or absence for less than 48 hours with the permission of the medical officer of the hospital or institution, were treated as interruptions in his continuous care and treatment. It has now been held that absences of this kind should be treated as a part, rather than an interruption, of care and treatment.

A report published by the Aircraft Production Board of the US War Production Board on Anglo-American aircraft output enables figures to be calculated for British aircraft production since 1940.

|               | Combined Output | US Output | British Output | Monthly Average (British) |
|---------------|-----------------|-----------|----------------|---------------------------|
| 1940 . . . .  | 23,000          | 6,086     | 16,914         | 1,409                     |
| 1941 . . . .  | 42,500          | 19,290    | 23,210         | 1,934                     |
| 1942 . . . .  | 75,000          | 47,873    | 27,127         | 2,260                     |
| 1943 . . . .  | 114,000         | 85,946    | 28,054         | 2,337                     |
| Total . . . . | 254,500         | 159,195   | 95,305         |                           |

Since January, 1940, the numerical output of American aircraft has expanded by 3,400 per cent and the structural weight by 6,800 per cent. That is, the average weight of each unit produced has doubled, and British experience has probably been similar. The report estimates that US output is four times as great as that of Germany, whose present monthly output of all types is put at 1,800, or only about 75 per cent of its 1942 (peak) output. Japanese total output is estimated at between 1,000 and 1,400 a month; its output of fighter planes is believed to be only 13 per cent of US production.

There were 10,497 road casualties in April, 1,743 more than in April last year. Deaths increased from 396 to 567; the numbers injured from 8,358 to 9,930. The average number of children killed was nearly five a day.

## THREE NUNS SAVES MONEY

—because of its

### SLOW-BURNING CUT

There are two special reasons why 'Three Nuns' Empire Blend Tobacco saves the smoker money. It is scientifically cut to burn slowly, each ounce lasts longer, you smoke fewer ounces a week. It is made from fine leaf which is favoured by the lower duty on Empire Tobacco. To enjoy the fullest pleasure of smoking at a moderate cost, take to 'Three Nuns' Empire Blend.

## AMERICAN SURVEY

### Is Isolation Dead?

(From a Correspondent in Ohio)

THERE could be few more dangerous illusions about American public opinion to-day than to suppose that Isolationism has been dead as a political force ever since Pearl Harbour, or that the only region still haunted by its ghost is the Midwest. Isolationism is not dead but sleepeth. Signs of its wakefulness are now multiplying in many parts of the country. The isolationist press in New York and Washington, as well as in Chicago, has a larger circulation than newspapers with a more or less, internationalist editorial policy. On a recent Sunday, the circulation of the arch-isolationist *Chicago Tribune*, for the first time in its history, exceeded 1,350,000. On the same day, the xenophobic *New York Daily News* sold more than 3,850,000 copies—almost three times the combined Sunday circulation of the *New York Times* and the *Herald Tribune*, while in the Nation's capital the *Times-Herald*, a Washington version of *Daily News*, outsold its competitors. The daily circulation figures tell the same story.

Colonel McCormick credits this fact to "the forthright, unashamed Americanism" of the McCormick-Patterson press. The Colonel's critics attribute it to such things as better features, comic strips, local news coverage, or even to the appeal of the combative. Perhaps the Colonel is somewhat nearer the truth than his critics. The McCormick-Patterson press is the prototype for many other newspapers throughout the "Isolation Belt," stretching from the Great Lakes to the Gulf of Mexico. And it is abetted by the nationalistic Hearst Press in the East, the Midwest and the West. Kept warm in editorials and editorialised news, isolationism is hibernating until the winter of war comes to an end.

The delusion that Isolationism is dead, an opinion often expressed even in the United States until lately, was based mainly upon the fact that most "Keep-out-of-war" groups naturally disbanded and their leaders took to the storm-cellars when the bombs rained on Pearl Harbour. The "America First" movement, which claimed 15 million enrolled members in its heyday, expired on December 7, 1941, for the expressed and proper reason that all Americans would henceforth put America first. Colonel Lindbergh went to work for Henry Ford. Senators Wheeler, Nye and Reynolds temporarily dropped out of sight, though they bob up occasionally on the floor of the Senate, and—increasingly of late—on the lecture platform. Father Coughlin is still silent, despite rumours from time to time that he will return to the air. The Axis agents who infiltrated the isolationist movement before Pearl Harbour are either in jail or awaiting trial. Many of the women who were a prominent part of the movement before December, 1941, have joined one or other of the various "Mothers' Day" organisations, whose loyalty is open to question, or, together with their menfolk, have enlisted in the "Peace Now" movement, whose common sense is even more doubtful.

Most of the isolationists, unchanged at heart, belong to no organisation—the organisers, with the exception of Gerald Smith and the America First Party, are still waiting for the end of the war and counting on another postwar national reaction like that of 1919. But you can hear the undertones, often ignorant but nonetheless significant, in bar and restaurant conversations. You can detect its presence behind the innumerable worried public meetings on "How We Can Win The Peace," in the tenor of recent postwar discussions on the radio, and in sceptical or cynical Letters to the Editor.

To what extent the Republican upsurge is evidence of this revival it is impossible to say. The Republican victories in eight of the eleven by-elections since the 1942 general election reflect popular discontent with the New Deal. There has been no clear test of isolationist sentiment at the polls. The Republican primary election in Wisconsin eliminated Mr Willkie from the race and put Governor Dewey far in the lead, and naturally Colonel McCormick claimed this as a victory for "the principles of America First." But

Governor Dewey has often spoken out for "international co-operation" since Pearl Harbour, while Lt.-Cmdr. Stassen, who won the second largest number of delegates in Wisconsin, flatly endorses a world super-state. On the other hand, the Willkie supporters can hardly argue that isolationism had nothing to do with the result. Mr Willkie took a bold stand on internationalism and was snowed under, while General MacArthur, who ran second in the popular vote, was the undoubted favourite of Wisconsin isolationists. Bitter intra-party politics played a big rôle in this election. Most of the voters were plainly out to "stop Willkie," some because they disliked his international crusade, more because they believed him tainted with New Dealism.

As convention time approaches, however, more and more Republican leaders begin to voice doubts about post-war planning, air their suspicions of Soviet Russia, and refer to Uncle Sam as "Uncle Sap." Senator Vandenberg predicts that foreign policy will be an issue in the presidential campaign. Identical foreign policy planks in the two major party platforms are still possible, though the possibility is dimmer now than it was when the Republicans drew up their Mackinac Island Declaration and voted overwhelmingly for the Fulbright Resolution.

The growing Republican strength at the polls acts as a curb on the President in the exercise of foreign policy. Fearful of handing the opposition a campaign issue, Mr Roosevelt and Secretary Hull limit themselves to vague generalities in discussing the problems and responsibilities of the postwar world. This reticence is, in turn, one of the two main reasons why the isolationist spirit is growing. The other reason is political developments abroad, especially in Eastern Europe.

The United States still harbours three broad types of isolationists: (1) the traditional and most common type, relic of the Frontier, who dreads "foreign entanglements," puts his faith in the two oceans, and believes that faith is confirmed by the long delay in the invasion of Festung Europa across the Channel; (2) the moderate isolationist, who hoped against hope in 1939 that "this is one war we can stay out of," but who realised his mistake—and admitted it—after the fall of France; (3) the "isolationist with a difference," who believes that the United States should stand with the other English-speaking peoples behind sea and air power, but must avoid being "dragged into" land wars on the contentious Continent.

All three types are affected in varying ways by political events abroad, and the silences and confusions of American foreign policy. A curtain of official silence was dropped after the Teheran Conference. Nevertheless, it is pretty obvious that the Big Three have not been giving concrete expression to "the varying desires and consciences of a world family of democratic nations"—to quote the language of Teheran. Most Americans, isolationists and internationalists alike, are troubled by Stalin's disposition to play a lone political hand in Eastern Europe, regardless of his Moscow pledges. Few Americans pretend to know what to do with Germany after the war, but none, apart from the Communists and their fellow-travellers, feels that giving East Prussia to Poland as "hush-money" for acquiescence in Russian territorial claims in East Poland will make for lasting peace. As for Italy, the thorny maze of Russian and Anglo-American policy toward the Badoglio regime bewilders our internationalists as much as our isolationists, and naturally troubles them more. As for the Atlantic Charter, several foreign correspondents who have been lecturing over the country, report that Americans in general to-day regard that document as a dead letter.

The milder isolationists, who for four years have sincerely favoured mutual security, are confused and disillusioned. The pro-British, sea-power isolationists are perturbed by signs of a reversion to balance-of-power politics in London. The ingrained isolationists, who have never ceased to believe that "this is not our war," are daily more free with their "I-told-you-so's."

Isolationism as a political force is still in the minority. It has not yet fully recovered from the shock of Pearl Harbour; and besides, there is still a war to be won. It is not, at the moment, politically very articulate. But the conflict between promise and performance in the political conduct of the war is beginning to give it a voice. And the obscurantism of American foreign policy is making isolationist recruits every day.

## American Notes

### Remote Control

Within less than a fortnight of the opening of the Republican Convention at Chicago, the attitude of the leading contenders in both parties remains as ambiguous as it was at Christmas. The Lobster Quadrille, with its refrain, "Will you, won't you, will you, won't you join the dance," might well serve as the theme song for either convention. To heighten the general mystification, stories have been put out that both President Roosevelt and Governor Dewey may take trips abroad during the critical weeks, while Vice-President Wallace departs for Chungking. It is even said that Mr Roosevelt may make only one campaign speech, his acceptance of the nomination. It is all of a piece with the fantastic character of political speculation this feverish summer that Mr Wallace's chances of renomination are thought to be stronger if he is in China than if he remains in Washington; and that President Roosevelt and Mr Dewey should feel that distance would also lend enchantment to their candidature. Amid this ballet of the coy suitors there is at least one candidate who sturdily believes in the value of declaring his intentions in no uncertain voice. Governor Bricker pursues his courtship in the simple, direct, old-fashioned Ohio tradition—he calls round with a bunch of morning glories every other day, and makes it plain that the old American way of life is good enough for him, with no dangerous nonsense of New Deals at home, or entangling alliances abroad, or whimsical pretences that he does not really want the nomination. Mr Bricker is fortified by the knowledge that seven Ohio presidents before him wooed and won the electorate by that tried and true technique; and he may yet make a respectable showing at Chicago. There are strong forces in the Republican party that would be very happy with Governor Bricker. "We are folks, just folks," said Mrs Harding, at the start of the 1920 campaign, and that is still a powerful appeal in America.

### Full Employment

Some interesting estimates of the post-war demand for employment were made a fortnight ago at the annual meeting of the National Industrial Conference Board, an employers' research organisation. Both Mr Dave Beck, Vice-President of the International Brotherhood of Teamsters, and Mr Ralph Flanders, President of Jones and Lamson Machine Company, who addressed the meeting, estimated that to provide full employment, given a forty-hour week, between 50 and 55 million jobs would be necessary. Mr Flanders suggested that this would require a net national output of from \$130 million to \$140 million, and that though the aim was admittedly high, to set it lower would be tantamount to planning for a considerable volume of unemployment. High though the aim of 55 million jobs may be, it apparently is based on the assumption that most of the war increment to the labour force will vanish in peacetime. A recent publication of the National Bureau of Economic Research—"The Labor Force in Wartime America"—sets the labour force, including the armed forces, at 62 million at the end of 1943. The civilian labour force for that date is put at about 52 millions. At the end of 1940, before the enlargement of both the services and civilian employment, the total labour force stood at about 54 millions. Mr Clarence Long, author of the study, is confident that most of the wartime additions to the labour force will not remain after the end of hostilities. Nearly half the new recruits, he points out, have been persons of school age, who no doubt will wish to resume their education, particularly as Congress appears inclined to make generous provision for this purpose. He expects also that many of the women, who are a quarter of the increment, will leave the labour market, as employability standards rise, wage inducements drop, and the return of Service men makes

holding a job less necessary or attractive. Finally, most of the other accretions to the labour force have been from persons over 54, some of whom will drop out for the same reasons. The most surprising conclusion of this study of man-power mobilisation is that, when related to the size of the peace-time labour force of both countries, the United States has exploited its available labour force as thoroughly as Britain. While Britain has mobilised 70 per cent of its population from 14-65, and the United States only 60 per cent, Mr Long maintains that the gap is due to the larger number of American women with children, and the later school-leaving age in the United States, differences which equally affected the peace-time comparisons between the two countries. It should be pointed out that this is a purely numerical comparison; it takes no account of hours worked, or of the usefulness of the jobs undertaken. Nor does it explain the curious fact that compulsion has been applied, in America, only to young men for the armed forces, but in Britain to men and women of all ages. In short, it is incompatible with the plain facts.

### Bridges in Wonderland

The disciplined co-operativeness and stability of the Communist-controlled unions has for months been a cause of mingled wonder, relief and suspicion to employers. Mr Harry Bridges has now capped the fantastic climax by suggesting that the right to strike be forgone, not only during the war, but afterwards. Technically Mr Bridges may not be a Communist; West Coast employers failed in their attempt before the war to have him deported on this ground as an undesirable alien. But he is an outstanding example of the new party line. Even his enemies have to admit his effectiveness in getting the most out of West Coast longshoremen and grant that, without Harry Bridges, supplies for the Pacific war would have suffered. Presumably this last suggestion is one more step in the rehabilitation of the Communist party, which has started a sceptical public by discarding its revolutionary tenets and offering its cooperation in a capitalist society. More

## Conserving the FOOD VALUE of our Milk

MILK Chocolate is a convenient medium for carrying, storing and conserving milk, but there is much more to it than that. . . Fresh dairy milk consists of two elements—water, which averages 87½%, and 'milk solids' (fats, protein and milk sugar), which contain calcium, phosphorus and Vitamin D and which constitute the whole food value of the milk. As the chart shows, Cadburys Milk Chocolate retains all the milk solids of all the milk used, and only the water is eliminated.

**Cadbury means Quality**

## MODEL OF A VITAMIN

- CARBON
- ⊙ NITROGEN
- ⊙ SULPHUR
- ⊙ OXYGEN
- CHLORINE
- HYDROGEN

This model shows the complicated molecular structure of Vitamin B<sub>1</sub>. It took twenty years of research to arrive at the formula which this model illustrates.

THE MODEL in the photograph above might seem to be the elaborate plaything of the Twentieth-Century child. But it is a model of Vitamin B<sub>1</sub>. It gives a tangible representation of the chemist's formula, and shows clearly the very complicated chemical structure of this vitamin.

Since the beginning of the century, research chemists have been engaged on work to isolate this vitamin from natural sources (pericarp and germ of cereals), to elucidate its chemical construction, and to synthesize it. The task has been long and troublesome, for the structure of this substance is unusually complicated; but, as the photograph of the model shows, it has been successfully completed.

But this work was all in the realm of pure science, and little benefit could be brought to mankind if the labour stopped at this stage. Fortunately, it has not stopped there. In the Roche plants in Britain, Vitamin B<sub>1</sub> has now been synthesized in such quantity that it has become economically available. Vitamin C (of which the chief natural sources are fresh fruits and vegetables) is likewise produced at the Roche plants on a very large scale; Vitamin B<sub>2</sub> (riboflavin), Vitamin E, and a Vitamin K analogue are also made there.

The mass synthesis of vitamins is playing a very important part in the health of Britain at war. In America, on the recommendation of the Council of Foods of the American Medical Association, Vitamin B<sub>1</sub> is added to white flour, together with Vitamin B<sub>2</sub>, iron, calcium, and the P.P. factor, with the object of making the white bread equal in every known nutritive quality to high extraction wholemeal bread. In our own country—where the idea originated—plans had been made, before the outbreak of war, to correct Vitamin B<sub>1</sub> deficiency by introducing an enriched loaf.

Indeed, the world owes a debt to the research chemists and the chemical engineers who have collaborated in the tremendous task of making pure vitamins available to the masses in large quantities. It is well to remember that it was private industrial enterprise which enabled this knowledge to be utilized for the benefit of mankind.

ROCHE PRODUCTS LIMITED

SIR FREDERICK GOWLAND HOPKINS, whose work and writings first showed the significance of vitamins. He, in collaboration with many other chemists, has made it possible to bring many of the findings of science to the service of mankind.

conventional trade unionists are uneasy at the speed with which the CP, like a modern Eliza Doolittle, is dropping its rough language and tactics for a drawing-room refinement. And employers, while profiting from the transformation, are likely to think of the Communists in the terms of the old nursery rhyme—when they are good they are very very good, but when they are bad they are horrid. Mr R. J. Thomas, president of the United Automobile Workers, has been in the forefront of those defending the post-war right to strike against the enemy within the gates, although at the moment he is even more concerned by persistent "wildcat" strikes in violation of the union's no strike pledge. Mr Thomas's fear is that the union, if it appears to tolerate strikes in the war industries, may not survive the return of men now in the Forces. Mr Thomas's fear is well-founded, though it does not make his position or that of other cooperative Labour leaders any easier. They can hardly view with equanimity the fact that, by standing by the no-strike pledge, they are forfeiting some of their grip on the rank and file, and it is to their credit that they have stood firm so long.

### The Hog at the Door

Behind the present meat holiday in the United States stands the spectre of the corn-hog ratio. This is a traditional and crucial calculation of vast numbers of American farmers who, engaged both in growing corn and raising pigs, have the choice of selling their corn on the open market, or feeding it to the pigs, whichever is more profitable. The old rule of thumb standard is 10-1, that is, if the price of hogs, per hundredweight, is 10 times the price of a bushel of corn, the farmer can break even by raising more hogs and feeding his corn to them. The present price of hogs is \$13.75 a hundredweight, and of corn \$1.17 a bushel, so that it is distinctly to the advantage of the farmer to raise more hogs. Already live-stock populations are at all-time highs; hogs alone are more than 50 per cent above their 1933-42 numbers. And consequently grain for dairy farmers, poultry-keepers, and cattle feeders is alarmingly short. The logical move would be to cut the ceiling prices for hogs, making it less profitable to turn corn into pork. This, however, it appears, is politically almost as unpalatable as requisitioning grain would be; and probably out of the question in an election year. Hence the holiday on meat-rationing, the hope being that if the hog and cattle population can be reduced, there will be more feed for those that are left, and the production of milk—one of the most disappointing aspects of the farm programme—can be raised.

### Political Action

Unlike the AFL, which still pursues the policy of rewarding labour's friends and punishing its enemies at the polls, originated half a century ago by Samuel Gompers, the CIO, through its Political Action Committee, has entered this year's campaign on an ambitious national scale. The successes it has scored can be measured by the rising tide of alarm in Congress and conservative circles. Governor Bricker has referred bitterly to the \$5 millions with which the CIO is reputed to be backing Mr Roosevelt. Less restrained observers talk of the "Red kiss of death" to the Democrats, and Congress is being urged to curb the Committee in line with the provisions of the Connally Anti-Strike Act, which forbade campaign contributions by labour unions. So far the "Kiss of death" seems to have been extended largely to members of the notorious Dies Committee. The defeats of three of these are attributed largely to Mr Hillman and his committee; and the part of organised labour in other progressive victories has been emphasised. Liberal circles have tended to explain the Republican sweep in the last Congressional elections as the result of political inertia on the part of progressives. Presumably the Political Action Committee is determined not to see this November—in which its stakes are very much greater—go by default. There is no doubt that, in the past two years, the war production programme has brought the viewpoint of organised labour to areas formerly predominantly rural and conservative. The Republican tide, which seemed so strong in 1942, may find some of its familiar channels blocked this time. This feature of the campaign may be responsible for the markedly conciliatory tone of Congress this session when contrasted with its earlier rambunctiousness. The grass roots are becoming industrialised and unionised.

## Letters to the Editor

### Hire Purchase and Employment

TO THE EDITOR OF THE ECONOMIST

SIR,—The Government has produced an admirable White Paper on employment policy, and presumably one of the objects of doing so is to invite discussion and elicit suggestions for improvements. Here is one such suggestion. In the discussion of employment policy the question of the control of hire-purchase and instalment-buying has escaped notice.

The practice of hire-purchase and instalment-buying grew rapidly between the two wars, and by 1939 had come to exist on a huge scale in the United States, and on a much larger scale than most people realised in this country. When the present war-time measures of control are relaxed, if nothing is put in their place, the resumption of this unregulated growth may be expected.

The economic significance of the practice lies in the fact that this form of buying by a person as distinct from a business is the exact opposite of saving and investment (in the ordinary sense of the word). When a person spends less than his income and places the money which he refrains from spending at the disposal of a business or public borrower, saving and investment take place. When a person buys an article on the hire-purchase or instalment system, not being able to pay for it in full at the time of purchase, in effect the seller lends the buyer part of the purchase money in order to help him to buy the article. That is to say, a person spends more than his income with the aid of money placed at his disposal by a business. Saving and investment, on the other hand, diminish the demand for consumption goods and increase the flow of money available for meeting the capital requirements of private enterprise and for public borrowing.

The avoidance of cyclical unemployment depends, broadly speaking, on minimising fluctuations in the demand for every kind of goods—consumption, production, instrumental, export—so that producers may keep as fully employed as possible. The demand for durable consumption goods of all kinds may be powerfully affected by hire-purchase and instalment buying. It follows that, whether we like it or not, the control of the volume of such buying will be an essential part of an effective employment policy.

But this is not all. It is now commonly agreed that the main cause of cyclical unemployment is the saving of money faster than the savings are spent, and that the remedy must be sought in (a) the stimulation of capital expenditure, so as to keep pace with the rate of saving, and/or (b) the stimulation of expenditure on consumption goods, so as to reduce the rate of saving. If hire-purchase and instalment-buying can be controlled in such a way as to restrict them when employment is satisfactory and to relax the restrictions as soon as signs of cyclical unemployment begin to show themselves, the authorities will have at their disposal a useful additional weapon for combating such unemployment. The foregoing observations apply to hire-purchase and instalment-buying on the part of individuals as distinct from businesses. The question of such buying on the part of businesses is a separate question.—Yours, etc.,

The Gables, Amberley, Stroud. G. D. ROKELING.

[Mr Rokeling first raised this interesting point last September, but owing to pressure of space it was not possible to publish his letter then.—EDITOR.]

### Trade Policy

TO THE EDITOR OF THE ECONOMIST

SIR,—In your article on "Trade and Employment" you emphasise that monetary arrangements are important only as a precondition of trading arrangements. They should allow us "to join with other like-minded nations in measures designed to maintain their mutual trade in the event of depression elsewhere."

### THE WORLD OVERSEAS

Because of pressure on this week's space it has been necessary to leave out "The World Overseas" Section. It will appear as usual next week.

This, as I see it, is precisely what the proposed Stabilisation Fund scheme will do. For any state "expecting unemployment" on a substantial scale, whether owing to depression at home or protective policies or on undervalued currency, will, if it does not rapidly change its habits, find its currency declared "scarce" and membership of the club, as it were, suspended.

In these circumstances "bilateral" agreements are surely unnecessary and vicious. It may be excellent that we make a long-term purchase arrangement with New Zealand for butter, or she with us for cotton goods. But if in the process one party makes it a condition that the two arrangements be tied together (and the pressure will come from one side, though the acceptance of it be "voluntary"), or if there is a direct connection between the value of the latter and the value of the piece-goods, the whole structure of multilateral trading is undermined. Each state will use its "unfavourable" balances as a lever to increase its exports to the country in question: any number of relatively undesirable movements of goods will result, and bilateral exchanges will move in that marginal restricted space that was left to them in the later 30's. *Machtpolitik* and trade will again go hand in hand.

Surely the right course is for each state member of the club to buy what it requires from that state member which can best supply it. If total exports to all states members are insufficient to pay for purchases (apart from temporary difficulties), they must be made more attractive by devaluation or otherwise, but not rammed down the throat of suppliers. The object of international arrangement is to enable all states to adopt this relatively simple technique.—Yours, etc.,

E. C. K. KALIN.

Northwood, Middlesex.

### Swedish Credit Policy

TO THE EDITOR OF THE ECONOMIST

SIR,—In a short Note on Swedish credit policy in *The Economist* of February 19 you point to the large increase in gold and foreign exchange reserves as a potent source of inflation in Sweden during the last few years. This is undoubtedly true. But this increase is not, as contended in your Note, due to a large volume of foreign—especially German—purchases of goods in Sweden, nor is any support to such a view to be gained from the annual report of the Svenska Handelsbanken, which you quote.

As is probably well known in England, the Swedish-German trade is performed entirely on a clearing basis and thus cannot have contributed to the increase in the foreign exchange reserve of the country. It is true that there was a German deficit in the clearing for 1942, bridged by Swedish credits, to the amount of 115 mill. kr. The financing of that comparatively insignificant amount had, however, no obvious effect on the Swedish money market. Part of the credits was repaid in 1943 and no new credits were extended during that year.

The increase in the foreign exchange reserves of Sweden since the summer of 1940 is principally explained by the net income of that part of the Swedish merchant marine which is operating outside the Skagerrak blockade.—Yours faithfully,

LARS-ERIK THUNHOLM.

Stockholm.

## Anglo-Indian Finances

LORD KEYNES in last week's House of Lords debate on the Monetary Fund did well to remind his listeners of a fact which he wished was more generally appreciated in the country, namely that "we, and we alone among the United Nations, have burdened ourselves with a weight of deferred indebtedness to other countries beneath which we shall stagger." Why has this unenviable distinction been reserved for Great Britain? Lord Keynes did not attempt to answer that question. He merely stated that "with a fanatical single mindedness" for which few parallels could be found in history "we have sacrificed every precaution for the future in the interests of immediate strength." This burden of deferred debt is a partial measure of the war effort being exerted by this country over and above that produced by the materials and labour provided within its own borders or those bought from abroad with the products of current exports or sales of foreign assets. Some of that excess is fortunately covered by lend-lease and the Canadian mutual aid agreement. The rest is represented by sterling piling up in London to the credit of other countries and either kept in cash or invested in short-dated Government securities.

The tale of the "abnormal" part of this sterling debt is very largely a tale of the balances and securities accumulating here for the credit of India. It is in the agreement between India and Great Britain for the settlement of obligations arising out of the war that the best evidence is available of that "single mindedness" for which Lord Keynes' "fanatical" is not the only appropriate adjective. The results of that agreement on the debtor-creditor relationship of the two countries have been revolutionary. Since the beginning of the war India has increased her sterling assets from £52 million to £737 million, the last being the figure outstanding on May 12th last. The total of these assets has increased by about £300 million over the past 12 months. This accumulation of sterling assets was over and above the sterling used to repay sterling debt amounting to £360 million—that is, the whole of the Indian Government and railway sterling debt. This repayment, which has now been virtually completed, only leaves some £200 million to £250 million of private British investment in India. Allowing for the increase in India's sterling assets and repayment of sterling loans, the debtor-creditor relation between the two countries has in four years shifted by £1,045 million. In that short period India has, by the accident of the financial agreement between the two countries, invested in this country and repaid sterling debt to about twice the amount of British capital which found its way into India over the preceding three-quarters of a century. There is *prima facie* evidence of some serious defect in a financial agreement which can achieve this kind of arbitrary and fantastic result.

The financial settlement between the British and Indian Governments was signed in November, 1939. Under that settlement India undertook to pay for all land forces raised, trained and equipped from Indian resources as long as they remained in India. The moment they left India, expenditure on such troops become recoverable from the British Government. This agreement was made before the war in the Far East had been seriously envisaged, and was appropriate to the war situation as it was then developing. India seemed well outside the orbit of hostilities, and if Indian troops were to be used in the Middle East or East Africa, it seemed only right that the cost of such troops should be borne by the home Government. The whole basis of the agreement, however, was shattered when Japan entered the war and when Indian troops had to be used first in the outer defences of India, namely Malaya and Singapore, then in the inner defences in Burma and later on the Eastern frontier of India itself. This new situation gave the clause in the Financial Settlement apportioning the cost of Indian troops outside India a

measure of arbitrariness which was never intended in the original agreement.

The British Government proposed early in 1943 that the 1939 settlement be abandoned. This approach, however, met effectively stubborn resistance and the Indian Finance Member, when presenting the 1943-44 budget early in 1943 could announce "that the proposal to modify the settlement would not be pursued." Sir Jeremy Raisman in this year's budget debates gave a more detailed description than has hitherto been officially available of the way in which the agreement works. The troops whose cost India bears are those raised in India and deemed to be necessary for the local defence of the country. India also bears the cost of equipping them with such resources as she herself provides. All the heavy equipment even of these troops is provided under lend-lease by the US or, without charge, by the British Government. The cost of all Indian troops serving outside India is borne by Great Britain. This applies, for example, to the Indian forces engaged in Burma. The cost of airfields constructed in India is only borne by the Indian Government in so far as these are required for the local defence of India. The large number of airfields constructed in connection with the operations of South East Asia Command have been built at British and American expense. India provides some reciprocal lend-lease to the US and this help amounted to the equivalent of \$35 million in 1942, \$70 million in 1943 and \$35 million in the first two months of 1944. There is no comparable mutual aid to Great Britain.

The working out of the Financial Settlement can best be illustrated by giving the figures of defence expenditure incurred in India for the four years 1940-41 to 1943-44 showing the amounts borne by India and by the British Government respectively.

|               | (In £ million) |             |       |
|---------------|----------------|-------------|-------|
|               | Borne by India | Borne by UK | Total |
| 1940-41 ..... | 55             | 40          | 95    |
| 1941-42 ..... | 78             | 145         | 223   |
| 1942-43 ..... | 187            | 253         | 440   |
| 1943-44 ..... | 225            | 285         | 510   |
| Total .....   | 545            | 723         | 1,268 |

The striking feature of the above table is that since 1941-42, the first year in which the war began to extend eastwards, the cost of defence expenditure in India borne by the UK Government has been greater than that borne by the Government of India. This remains true if the comparison is made between the defence expenditure borne by the UK and the total expenditure of the Government of India. This was a situation which can never have been envisaged by the negotiators of the 1939 Financial Settlement. Its impact on India has proved both favourable in so far as it has improved the country's creditor position, and unfavourable because of the responsibility which this externally financed expenditure bears for the inflation from which India suffers.

These consequences of the Settlement can hardly be regarded as accidents of war. There has never, of course, been any question of repudiation of obligations already entered into; but there is nothing sacrosanct in the Settlement as regards future transactions and there would seem to have been ample grounds for some adjustment of its terms when the basis of the agreement shifted first with the entry of Italy and later of Japan into the war. These developments caused the threat to India to crystallise sufficiently to demand of the country a larger contribution to the cost of her own defence than that provided under the 1939 agreement. There can be no question of exploiting India or of placing additional burdens on the shoulders of a population which, by and large, lives all too close to the margin of bare subsistence. But India herself would have

something to gain from a renegotiation of the Financial Settlement which would give her the chance of a more favourable settlement of her rapidly increasing claims on Great Britain. The bigger that claim, the smaller becomes the chance of converting it from its present virtually blocked character into a multilaterally convertible asset. The whole of the Indian monetary structure is based on sterling and by undermining the latter, India will be injuring her own interests. The extent to which Britain will be able to meet these claims will ultimately depend, not so much on their size as on Britain's capacity to pay. As for the impossibility of increasing the burden on the poor Indian peasant, the argument loses most of its force if it is realised that the weight of the whole defence expenditure in India—whether financed by the Indian or by the Allied Governments—is currently borne by the population of India. In real terms, that sacrifice is being made to the full now. It is only a question of whether its financial counterpart shall be borne

by the British or the Indian taxpayer. In fact, by allowing the burden to be distributed through the crudest of all fiscal machines, namely that of currency inflation, a far greater sacrifice is currently being exacted from the poorer classes in India than if the whole of the defence expenditure were being budgeted for by the Indian Government and distributed according to capacity to pay. It is not suggested that any drastic redistribution of the financial burden of defence expenditure in India should be made. But a readjustment in the Financial Settlement in the light of the situation which exists in 1944 and not of that which obtained in the "phony" days of 1939 would be to the advantage both of Great Britain and of India herself. The matter is one of urgency because, as the plans of the East Asia Command unfold, externally financed expenditure in India is steadily expanding. Day by day, therefore, the capital account between the two countries becomes more distorted and the forces making for inflation in India gather momentum.

## Business Notes

### Full Employment for Capital

In financial circles generally, there was little evidence of any reaction, favourable or otherwise, to the Government White Paper on employment policy. In so far as it appears to entail less direction of industry than was expected it was hailed with some relief. It was difficult to discern in the stock market any direct effects. This is, perhaps, not unnatural as the full implications of the policy are difficult to assess from the outline provided. Nonetheless, there are some indications which a prudent investor ought to keep in mind. First there is the assurance of a continuance of cheap money for some time. This carries, as a necessary corollary, control of the volume and direction of investment. It is not clear, however, just what the investor is to make of the assurance that interest rates will remain low for a few years. The assurance is not sufficiently firm to influence to any marked extent the value of long-term fixed interest securities. But it does at least mean that the holder of equities will not have to reckon on the imminent possibility of a fall in the value of his security due to a rise in the rate of interest. Against this, there is of course the fact that there is no likelihood of large-scale swapping from fixed interest into equities in response to just that contingency. There remains, however, the possibility that there may be a tendency to switch as a hedge against rising prices, for the White Paper is by no means clear about the means by which price inflation is to be avoided.

### Equalising Returns

Where policy is more specifically directed to influencing industrial undertakings, it is evident that detailed interference is to be at a minimum. Full employment for labour should mean high employment for physical capital. But it seems that this is to be achieved, in part at least, by cutting the top off the boom. This suggests that the reasonably efficient firm will enjoy more stable earnings. Only if the policy enjoys an outstanding success will the average level of profits necessarily be higher. There are exceptions to this in the case of those industries where boom conditions impose special strains which reduce the true profit. Something rather better appears to be promised for basic industries in the depressed areas.

It is the aim of Government policy to help these industries to reach the highest possible pitch of efficiency, and secure overseas markets.

The industries given as examples are coal, steel, engineering and shipbuilding. May not cotton also come into this category? Further assistance will be provided by imposing on those who wish to establish new factories the obligation to site them in these areas. If direction is necessary, it may well mean that the new enterprises will be less profitable in themselves than would otherwise be the case. With the possible exception that the measures contemplated may fail to check inflationary tendencies, the outline of policy suggests a tendency to equalise the profits of a given concern over time and to reduce, to some extent, the force of factors making for a wide divergence of profitability

between one industry and another. Insofar as this will make equities rather less speculative, it is probably all to the good. Recent movements in the stock market are only in part a reflection of such considerations. The boom in some shipping shares is based on passing considerations and the sudden attraction of motor shares seems to owe little to any evidence that the companies are prepared to snatch the opportunities which will shortly present themselves. Behind these movements, which attract a disproportionate amount of attention, there continues a steady rise in the general run of industrial equities. This has carried the index of *The Financial News* to a new high for recent years of 109.6, while the yield figure is at a new low of 3.83 per cent. This rise ignores the possibility of weakness occasioned by a military setback, but, on a long view, it may well prove justified.

### Lord Portal's Houses

Within a fortnight of the opening for public inspection of the prototype of the temporary factory-made houses that are to be constructed in order to relieve the pressing housing shortage after the war, the Ministry of Works decided on substantial improvements and alterations to it. For example, there is to be a back door leading into the kitchen; the height of the ceiling is to be raised from 7 feet to 7 feet 6 inches; the cycle and store shed is to be detached; the layout of the kitchen is to be improved; the bathroom is to be increased in area and the W.C. is to be larger and adequately screened; the area of the hall is to be increased; and a direct entrance is to be provided from the hall to the living room. The Ministry's readiness to listen to constructive criticism and the speed with which alterations have been announced are commendable. It should also be possible, though naturally at a somewhat higher cost, to provide for the larger families by the construction of a second type of temporary dwelling with three bedrooms instead of two. It is to be hoped that the Ministry will press forward its preparations for the construction of these temporary houses, undeterred by the campaign which has been launched against them by vested interests. The demand for houses to be let at low rents will be very great after the war; Lord Portal's houses should assist in meeting it until they can be replaced by more permanent dwellings. They are expected to cost about £550 a unit, including £100 for fittings. No doubt the Ministry of Works will take care in obtaining the components of these dwellings as cheaply as possible; when preparations are completed it might usefully consider the publication of an analysis of their cost.

### Design of Accounts

While research which can make a direct contribution to victory has been greatly encouraged by the war, all too frequently other forms of enquiry, essential to the permanent improvement of peacetime conditions, have been completely neglected. It is all the more satisfactory, therefore, to find that the Incorporated Accountants' Research

Committee are able to publish a contribution to the improvement of accounts, both published and internal to the businesses concerned.\* There are two lines upon which the improvement in accounting must proceed. One is a matter of definition and presentation; the other, one of bringing the theory upon which items entering into the accounts are valued more closely in line with modern requirements. The latter is a matter for co-operation between management, accountant, economist and all others who have a contribution to make; the former is a field in which advance can only be secured by study and agreement among accountants themselves. It is to this aspect of the matter that the authors, Mr Sewell Bray and Mr Basil Sheasby, have primarily addressed themselves. The basic principle of design in accounts is, they say, to make clear the relation between groups of figures by which the course of operations over both long and short periods may be interpreted. The book contains specimens of accounts designed to suit the requirements of a number of manufacturing and distributive industries, and others for professional firms. It is admitted from the start that:—

At bottom it does not seem too fanciful to discern a relatively uniform basis of design common to all financial accounts, when proper allowance has been made for the different types of industries and for the different undertakings within those industries.

But the authors immediately go on to say that this does not mean that uniform accounts can be imposed by highly artificial means. A study of the detailed accounting forms for the manufacturing companies suggests, however, that the difference between the authors and those who ask for standardisation is largely one of definition, for little more than a re-arrangement of items is needed to bring about the degree of standardisation which is necessary in the public interest. Indeed, it is insisted that the accurate basis of design of accounts lies in uniformity of information, of classification and of choice and use of terms. There is good reason to suppose that, if all accountants were agreed about the real meaning of every item in the accounts they draw up, the barriers to a reasonable standardisation would disappear.

### Truthful and Unambiguous

In addition to detailed forms of accounts, the authors set out alternative forms for the presentation of published accounts, with schedules explaining the valuation of fixed assets and certain suggestions for the presentation of comparative figures for essential ratios over a period of years. Nothing but a reproduction of the actual forms can convey their full value, but their intention is that all important information shall be conveyed truthfully and in a manner free from ambiguity. In those cases where the valuation is in part a matter of opinion, the information suggested is sufficient to show how the valuation has been reached. This is essentially the demand which *The Economist* has been making for some years past, and the recommendations published by the Council of the Institute of Chartered Accountants during 1942 and 1943 are designed to achieve this end. These recommendations do not go quite so far as the forms suggested in *Design of Accounts* and, like them, they have unfortunately no power to influence the obdurate. In a letter published in *The Economist* of October 31, 1942, and quoted by Mr Sewell Bray, Mr F. R. M. de Paula stated, in substance, that the auditor has no power to alter one word or figure in the directors' accounts and that improvement must come by reform of the Companies Act and by further demands from the Stock Exchange. None the less, accounts have been improved, and must be improved further, if the status of the accountant is to be raised. Company Law is not concerned with internal accounts, but they are the basis of published figures, and the latter cannot be better than the former. At present, however, it is reasonable to assume that published figures are not as good as the underlying, detailed accounts would permit them to be. Until published accounts approach much nearer to giving a true and clear picture, it is useless to hope that the best will be made of existing economic system. Both the Institute and the Society have now published recommendations to that end, and the former, at least, has tendered evidence to the C-then Committee in that sense. *Design of Accounts* comes much nearer to a true prescription of what is necessary than the evidence of the

\* *Design of Accounts*, F. Sewell Bray and H. Basil Sheasby. Oxford University Press. 200 pages. 12s. 6d.

Institute. It would be encouraging to be assured that the Society stands solidly behind this publication of its Research Committee.

### Scientific Instruments

The manufacture of scientific instruments is a comparatively small but extremely vital British industry. What, exactly, can be counted a scientific instrument is difficult to define. But a working definition would be any instrument designed to possess a high quantitative or qualitative measurement of accuracy. The core of the industry is to be found in the seventy odd members of the British Scientific Instrument Manufacturers' Association, although there are a number of allied organisations. The industry may be said to have employed about 18,000 operatives in 1939, but nearer 50,000 in 1942-43, while during the same period the value of its products rose from £7½ to £50 million. This wartime boom, with its great increase of skilled workers and specialised machinery, can be said to have lifted the industry back to something of the leading position in the world which it enjoyed before the last war; a position that was reached in part through the work of a long line of outstanding and devoted scientists who, to start with, were often their own instrument makers. In the inter-war years the industry tended to lose ground under the pressure of foreign competition, especially German, which often came from larger firms and ones which were more willing to undertake the very expensive work of comprehensive research. It would be thought that an industry upon whose products the research of other industries is largely dependent would itself be fully alive to the benefits of research. The Government makes substantial grants to the British Scientific Instrument Research Association. But it may be questioned whether either the industry or the Government realises sufficiently the vital nature of research, for which a greater pooling of facilities and knowledge is necessary, and, in the case of production of instruments for scientific research, much greater co-operation between scientist and designer. The quantity and the quality of scientific instruments that are needed is a measure of the health of the chief manufacturing industries in this country; and, if industry is to progress, the use of such instruments must increase enormously. The British scientific instrument industry faces a large potential market. It is, in any case, well suited to this country. It requires highly skilled workers and highly specialised knowledge. It requires a comparatively small amount of raw materials against a high proportion of skilled workers, while its exports have a high monetary value compared with the shipping space occupied. It has an obvious military importance. But it is unwise to rely on the type of protection afforded by the Import Safeguarding Duty, imposed on scientific and optical instruments in 1921. Protection from foreign competition is at least as likely to promote inefficiency as efficiency. And it is only by a great increase in efficiency and in research that the scientific instrument industry can re-establish its world position and be of service to British industry.

### Science in Industry

The need for allowing full scope to the impact of science on industry, for a substantial extension in the range of scientific investigation and its speedier application to commercial practice is by now widely recognised; and the decision of the Chancellor of the Exchequer to relieve from taxation all expenditure on scientific research showed that the Government is fully alive to it. The time has now come for translating precept into practice, for surveying the field of research in each industry, and for making detailed plans on an adequate scale. To this end the memorandum on post-war policy approved last week-end by the Association of Scientific Workers is a useful contribution. The memorandum not merely criticises the present organisation of science for the lack of scope and adequate liaison between fundamental research, applied research and practice, but it suggests a programme of action by a survey of the field in which science can achieve the most-needed technical advances, from raw materials to manufactures. It suggests various ways for increasing the efficiency of coal-mining. Fundamental research is particularly required in metals, rubber, plastics and fibres, and on the inter-conversion of heavy organic chemicals, in chemical engineering, ceramic

and glass technology, building and road-making, on fermentation processes, and other materials and processes. There is great scope for research in manufacturing, and, particularly, in the application of war-time developments in the wireless industry. In drawing attention to the fields of research the Association of Scientific Workers has rendered a service, but the decision and responsibility for carrying it out must rest with industry.

### Dunlop's Record Profit

The profits of the Dunlop Rubber Company for 1943, including its share of the profits of subsidiaries, have reached the record total, struck after depreciation, of £5,359,614, or £1,000,000 higher than last year. Where this increase has come from is not adequately indicated, nor can it be said what part of the group's earnings—a very considerable proportion, certainly—has been earned overseas. There is nothing to show what is the trading capacity of the parent company itself, since its revealed profits include interest and dividends from a number of sources. It is revealed that the sales of the American subsidiary have increased, and of the Canadian subsidiary decreased (due to the reduction of rubber supplies), that the Irish company has overcome its shortage of raw materials, and that, as regards the manufacturing units in India and South Africa, "turnover increased and profits were highly satisfactory." It is possible that these last two countries account for an important part of the rise in turnover and profits, perhaps in connection with the development of new sources of crude rubber production. Although the group's profit is high, a very large proportion—77 per cent—is needed for taxation, due to its double incidence on overseas earnings, and the ordinary dividend, maintained at 8 per cent, absorbs the comparatively small net figure of £363,298. Dunlop is, in fact, carefully building up its reserve position. The allocation for income-tax of the parent company is made one year in advance and on a generous basis, the reserve for the 1944-45 liability being put at £1,000,000. War damage contributions are being treated as a current charge, and no allowance is made for post-war compensation. Further, with the transfer of £250,000 out of the year's profits, and another £250,000 from contingencies reserve, the special reserve in the accounts of the parent company in respect of its subsidiaries is now £3,750,000, which is only lower by a negligible amount than the value of its investments in enemy and enemy occupied countries. Altogether there is an increase of £643,000 in the surplus and reserves, and of over £1,000,000 in the net liquid assets of the group. Detailed figures for the last three years are set out on page 761. The Dunlop group is likely to enter the post-war era in a strong financial position. The development of synthetic rubber may bring new problems, but it will be long before the company ceases to need the supplies of plantation rubber which it obtains from its own properties. Granted efficient management, the factor of prime importance seems to be a rapid extension of the motoring industry, and it is not surprising that the chairman, Sir George Beharrell, should have suggested that some relief in the taxation of motor users is overdue.

### Policy for the Rand

The South African mining industry continues to be preoccupied with difficulties of rising costs and a shortage of native labour. These problems have arisen during the war, but they are unlikely to end with it; for while the supply of labour may then increase its cost is more likely to rise further than to fall. Many sections of low-grade ore have now become unprofitable to work. An easy way out would be to raise the grade of the ore worked and thus both release labour for secondary industries and increase profits, but it would shorten the life of the mines. Such a short-term course is unthinkable, since South Africa's prosperity—indeed her whole economy—depends upon the mines. This is so, despite the fact that under 3 per cent of the male European and under 1 per cent of the male native population works in the mines. Yet in 1939-40, 23 per cent of the Union's revenue came in mining taxation alone, while only 2.3 per cent of its expenditure was directed to mining and industry together, and only 3.7 per cent to labour and social welfare of all sorts. Mr Stallard, the Minister of Mines, has chosen to steer a middle course. He is prepared to allow from the Gold Realisation Fund a repayment equal to the cost of the increase in native wages. This will keep some mines in production which

would otherwise go out. But he is not prepared to grant a general subsidy merely to keep up gold output, nor will he countenance a raising of the general grade of ore mined to achieve the same purpose. The repayment from the Gold Realisation Fund may contain an element of subsidy, but it is not an item of substantial importance in the context of Union finance. The policy seems to strike a reasonable balance between current requirements and the maintenance of the gold mining industry to a ripe old age.

### Mining Royalties

One of the effects of war conditions in the coal-mining industry has been to increase the severity of the incidence of royalties on costs of production in those coalfields where the output has declined most. By the financial provisions of the Coal Act, 1938, the Coal Commission is provisionally authorised to reduce rents which are more onerous than the average in similar conditions in any particular district; this power has not yet been exercised, and colliery owners in the more necessitous areas are complaining of trading conditions much more disadvantageous than those in the more fortunate coalfields. For example, in the South Wales coalfield royalties now represent 10.69d. per ton on commercially disposable coal, compared with 9.16d. in the March quarter of 1939; for the industry as a whole the increase has been from 5.66d. to 6.01d. per ton. Moreover, in the Yorkshire and Midland coalfields, producing more than two-fifths of the national output, royalty charges average only about 4½d. per ton. There is, of course, another side to the picture. These disparities are in a very large measure offset by the financial assistance given to necessitous coalfields out of the Coal Charges Fund. Necessitous coalfields draw price allowances which in some cases actually exceed the 8s. per ton levy on output; on the strength of these allowances they are provisionally guaranteed credit balances above those earned by them just before the war. The question, however, of the exercise by the Coal Commission of its statutory powers to reduce abnormally high royalties has recently been under discussion; the Commission, it is stated, has adopted the view not only that it must conserve its surplus till the administration of the Act has been placed on a sound financial basis, but also that, in the fixing of rents under new leases, it must meanwhile adhere to the basis prevailing before the passing of the Act.

### Future of Linen Industry

The Linen Industry Post-war Planning Committee, which was set up in January, 1943, under the chairmanship of Mr H. L. McCready, recently submitted its report to the Minister of Commerce for Northern Ireland. The report is a comprehensive one, and recommendations are made under the following headings: supplies of raw materials, post-war finance of industry, research, publicity, internal structure of the Irish linen industry, compilation and interchange of statistics, technical education, labour conditions, and problems of the transition period. Foreign flax may not be available in the required quantities in the immediate post-war period, and the Committee recommends that about one-third of the industry's requirements—or the produce of 100,000 acres—should be produced each year within the British Isles. This could no doubt be done without difficulty, since the present acreage in Northern Ireland is about 90,000, in Great Britain about 58,000, and in Eire about 30,000. Nonetheless, such an acreage would only be planted if farmers were guaranteed an attractive price, in advance of sewing. The creation is proposed of a Flax-Buying Corporation, which would be the sole purchaser of home-grown and imported flax. The corporation would be controlled and managed by representatives of the industry, and would begin operations when the Flax Control is disbanded. The Committee envisages the continuance of the Flax Control for about eighteen months after the war, followed by the corporation for another two seasons. Technical progress has been made in the growing and processing of flax during the war. The Committee proposes that research should be unified under the aegis of the Linen Industry Research Organisation, and that £50,000 a year should be spent on it, of which half might be provided by the trade, and half by the Government. A similar sum is recommended to be spent on publicity. Although the Com-

mittee is in favour of fixed prices at the raw material stage, it does not favour price control throughout the industry. Instead it offers the suggestion that

... a continuance of the process of vertical grouping, together with a scheme for the centralised purchase and distribution of raw materials ... would go far to promote those conditions of stabilisation in the industry which price control schemes are designed to achieve.

The Report has been in the hands of the Minister of Commerce since last March, and it is being considered by the linen trade associations.

\* \* \*

### Postwar Perfumery

The two essentials for a return to peace time conditions in the perfumery and toilet preparations industry are the re-establishment of manufacturers in their own factories, and the restoration of a full supply of raw materials and packing materials. All other problems turn on these fundamentals, according to the first report on the postwar reconstruction of the industry, which was submitted in April to the President of the Board of Trade. The report has been unanimously adopted by the Perfumery and Toilet Preparations Manufacturers' Section, London Chamber of Commerce, the Perfumery and Toilet Preparations Export Group, and the Cosmetic and Toilet Preparations Trade Association of Great Britain. The main recommendation of the report is that control should continue until all firms are again in their own premises. The Committee would like to see new entrants to the trade excluded until deconcentration is complete, and the need for restriction is over. This is a familiar feature of many post-war reconstruction reports. On its raw material position, which during the war has been a poor one, the report says:

After the war, the various controls concerned in dividing up such raw materials among the industries claiming them should disabuse their minds of the war time idea that perfumery and toilet preparations must come after other products.

Despite the claim of the report that cosmetics are not luxuries, some scale of priorities has to be established in the allocation of raw materials. It is unfortunate for the industry that it was low on the scale at the start, but "first out, first in" cannot necessarily apply to the de-control of raw materials. Control of raw materials must continue in the transitional period, and cosmetics will have to take their turn. It is true that at the start of control, output of cosmetics and toilet preparations was severely restricted. But since last year, registered manufacturers have been permitted an output quota of 75 per cent by value of sales during the standard year (June 1, 1939, to May 31, 1940). Despite a claim that demand exceeds supply, the Board of Trade's surveys show, that, on the whole, consumers have no difficulty in purchasing their requirements. The report has much to say on the prospects of exports, which are considered to be good, provided alcohol—a main raw material—is freely available. Labour, it is thought, will provide no special problems, although more will be needed. Although the industry is a relatively small one—its turnover was about £15 million a year before the war—it was an expanding one, and its importance is likely to increase in peace conditions.

\* \* \*

### National Debt Milestone

The debt return for the four weeks ended May 27th is of special significance, for it lifted the total national debt over the £20 billion mark. The latest detailed account of the national debt was that given in the Financial Statement published with the last Budget. This showed the net debt outstanding on March 31, 1944, at £19,592,641,000. The April return showed a net amount of £266,100,000 raised by creation of debt in the four weeks, and the latest return adds a further £237,069,000 to the total. With these two monthly instalments the total national debt is thus carried to £20,095,800,000. Of this total £18,308,700,000 represents internal debt and £1,287,100,000 external debt (£1,032,427,000 of the latter being the dormant debt arising out of the 1914-18 war). Apart from carrying the total national debt beyond this new milestone, the latest monthly debt return is of particular interest for the light it throws on the financing of the repayment of 5 per cent Conversion Loan, which took place on May 1st. The actual amount redeemed was £313,198,255. The principal counterpart to

this is an expansion of £246,610,000 in Treasury bills, of which £80 million is accounted for by the increase in tender bill issues, and the balance of £166,610,000 represents an increase of bills issued through the tap. The latter must in large part reflect the conversion into bills of the maturing loan previously held by public departments. The return shows the issue of a new 3 per cent terminable annuity of £120 million announced earlier in the month for the investment of Savings Banks funds. These funds are normally used in ways and means advances, pending their more permanent investment, and the latest debt return, showing a reduction of £45,550,000 in ways and means advances from public departments, suggests that the customary precedent has been followed. The sign of the Salute the Soldier campaign is written clearly over the May debt return. National War Bonds yielded £87,120,000 in May, against £64,150,000 in the previous return, and Savings bonds, £73,940,000, against £29,510,000. At the same time the pre-encashment of Treasury deposit receipts jumped from £75 million in the return to April 29th to £97,500,000 in the four weeks to May 27th.

### Netherlands Indies Guilder

Now that hostilities in the South West Pacific have spread into Dutch colonial territory, arrangements have been made for paying American forces fighting in Dutch New Guinea in guilders. The necessary agreement has been reached between the Governments of the United States and of the Netherlands East Indies. It follows closely on the agreements made for the payment in Australian pounds of American forces campaigning in the sterling areas of the South West Pacific, and for those stationed in Australia itself. The interesting point about the NEI arrangement is the rate of 1.88 guilders to the US dollar, which has been fixed as the conversion ratio by the American and Dutch authorities. This is approximately equal to the rate of 7.58-7.62 guilders to the pound, which operates for the Netherlands West Indies guilder, and roughly corresponds to the rate of the Netherlands guilder before the invasion of the Low Countries. The further confirmation of this rate suggests that this is the exchange to which the Allied authorities will work when the Netherlands is being freed from German occupation.

### Mercury Supplies

In its second annual report, published last month, the Combined Raw Materials Board pointed out that the supply position of a number of raw materials has substantially eased. These include mercury, which is used in large quantities for scientific war instruments, explosives, detonators, anti-fouling marine plant, pharmaceutical products and other similarly important war applications. As consumption of mercury in war-time is considerably higher than in normal periods, and the Italo-Spanish cartel before this war controlled something like four-fifths of the world's mercury supplies, the easy supply position of the United Nations may, on the first view, appear surprising. Actually, the mercury supply problems of the United Nations have been solved through a decisive increase in production outside Europe, and especially in North America. According to the War Production Board, the United States, last year, had almost exactly 100,000 flasks (76 lb. each) of mercury at its disposal. Of this total, domestic production, according to the U.S. Bureau of Mines, accounted for 53,500 flasks (against 18,633 flasks in 1939), while the remainder was made up by imports, chiefly from Mexico and Canada. Like the United States, Mexico has appreciably increased its mercury production during the war, although up-to-date official figures for the Mexican output are not available, while Canada only started to produce mercury on a commercial scale just before the outbreak of the war. The Dominion's output, which was negligible in 1939, reached in 1943—according to Mr W. H. Lasee, head of the Minerals Branch of the Dominion Bureau of Statistics—almost 22,500 flasks. Although U.S. consumption in 1943 far exceeded the pre-war annual rate of 30,000 to 35,000 flasks, supplies, according to the WPB, were nearly double the rate of intake by the industry. According to the same source, the US Govern-

(Continued on page 761)

### COMPANY MEETINGS

## RAND MINES, LIMITED

(Incorporated in the Union of South Africa)

### GOLD MINING DIFFICULTIES

#### MR W. H. A. LAWRENCE'S REVIEW

Mr W. H. A. Lawrence presided at the annual meeting of Rand Mines, Limited, held in Johannesburg on the 19th ultimo. In moving the adoption of the report and accounts, he said that the profit earned had been £689,611, a decrease of £184,853 compared with the figure for 1942. The profit had been derived exclusively from dividends, interest and sundry revenue. As shareholders knew, it has been the established policy of the company not to utilise for dividend purposes profits which accrued from realisation of investments but to make them available for reinvestment in the undertaking. During the period under review the amount realised by the sale of investments less their book value had exceeded the amount written off investments by £194,464. Investment reserve account had been increased by £88,314, to the substantial total of £3,407,280. £46,263 had been added to the appropriation account, which now stood at £1,491,889, that sum being represented by cash and cash assets after allowing for all liabilities other than those of a contingent nature. Ample cash resources were available to meet all contingent and option liabilities, including commitments to subscribe for shares in and to finance certain undertakings. Investments in shares and Debentures had been brought into the account at a book value of £3,927,217, which was an increase of £88,414 compared with the total at the end of 1942. Investments for which share market quotations were available appeared in the books at or under cost, but in no case were above the market price at December 31, 1943. Unquoted securities had been entered in accordance with the conservative valuation placed upon them by the board and in no instance at a valuation exceeding cost. Where it had appeared prudent to do so, the book value of holdings had been written down below cost and below the market value. It was evident from the schedule of investments published with the annual accounts that the market value greatly exceeded the book value stated in the balance-sheet. The market value of the gold mining interests of the company at the end of the year had represented 72.861 per cent. of the market value of all investments and of those gold-mining investments 84.807 per cent. had been dividend producing.

#### REDUCED TONNAGE MILLED

The gold-mining industry had again experienced many difficulties during 1943, chief among which had been the acute shortage of native labour which had caused a serious reduction in tonnage milled throughout the year and which continued at the present time. Nevertheless operations had been maintained on a stable basis and the results achieved must be considered satisfactory in the peculiar circumstances attending the fourth year of the war. The output of gold by the mines of the Witwatersrand area had been 12,460,666 oz. fine, a decrease of 1,300,369 oz. compared with 1942. The profit earned had been £37,908,766, which had been £5,746,380 less than during the previous year.

The price received for gold and the rate at which normal income-tax had been payable by the gold-producing companies had remained unchanged throughout the year. As from January 1, 1943, however, the special contribution which was based on taxable income before deduction of redemption allowance and any tax loss brought forward from a previous year had been increased from 20 per cent. to 22½ per cent.

The taxation of gold mines in the

Transvaal, including the share of profits paid to the Government by leased mines, had amounted to approximately £23.7 million in respect of 1943, of which gold realisation charges had accounted for slightly more than £2,000,000.

The manufacture of munitions in mine workshops for the Department of War Supplies had been continued throughout the year.

Since the close of the period under review the report of the Witwatersrand Mine Natives' Wages Commission had been published. Shareholders would no doubt be aware that the Government had not accepted in full the recommendations made by the Commission but nevertheless had decided that as from April 1, 1944, certain increases should be made in the wages paid to mine native labourers. Briefly, the increases amounted to 5d. per shift for natives employed underground and 4d. per shift for natives employed on the surface, with payment of time and a half for all overtime and Sunday work. Since January 1, 1940, the gold mining companies had been obliged to pay to the Government a gold realisation charge, and since September 1, 1940, that charge had remained fixed at 38s. 3d. per cent. The Government had now decided to place in a pool the sums thus collected from the industry during the year ending March 31, 1945, and to distribute those funds among individual mining companies in proportion to their share of the increased costs of the industry in respect of native wages. It was hoped that the amount thus made available would be sufficient to meet practically the whole of the industry's additional direct burden.

#### SUPPLY DIFFICULTIES

Difficulties experienced in the previous war years of obtaining adequate supplies of essential materials from overseas continued during 1943, and in the case of certain commodities had become accentuated. The mine stores department of the Transvaal Chamber of Mines had continued to operate satisfactorily in those difficult circumstances and rendered great assistance to mine managements, to whose efficiency and unremitting endeavours in that connection credit must be given for the fact that work on the mines had not been more severely impeded. Development had again been carried out on a much reduced scale, and as a consequence it had been possible to effect considerable economies in the use of steel, explosives and other materials. "I must emphasise, however, that the ore reserves of many mines have now been reduced to the lowest level compatible with the continuance of future operations on a sound mining basis and in a number of cases it will be necessary to increase the development programme at the first appropriate opportunity."

Ore milled by the Witwatersrand mines of the group during 1943 had been 18,139,500 tons, a decrease of 2,292,700 tons compared with the previous year. The average yield of gold per ton milled had risen by 0.007 dwt. to 3.628 dwt. There had been a fall of £1,903,858 in the total working profit, which had amounted to £8,441,003. The total amount distributed as dividends had been £3,278,666, or £1,038,431 less than in 1942. The amount provided for taxation to the Government had decreased by £1,235,478 to £4,496,053.

#### DEVELOPMENT RESULTS

Development accomplished had totalled 277,231 ft., a decrease of 51,497 ft. The

available payable ore reserve (including the Blyvooruitzicht mine) had amounted to 62,554,200 tons, which had been a decrease of 6,209,000 tons compared with the preceding estimate. At the Blyvooruitzicht mine 124,000 tons of development rock had been milled and treated, the average yield being 10.372 dwt. per ton. Working costs had been 64s. 9.6d. per ton milled and the working profit had been £139,031, which had been utilised to meet expenditure on further development. During the year 31,686 ft. had been developed, of which 21,755 ft. had been sampled and proved payable.

At the Geldenhuis Deep mine operations had been continued throughout the year, the output of rock from the mine being supplemented by 36,880 tons of old slimes and surface accumulations which had been retreated. The available ore reserve had now been reduced to a very low level, while surface accumulations suitable for retreatment were nearly exhausted. It was hoped that increased output from pyritic bands would help to extend the period of operations at the mine, but it was clear that the position was more than ever precarious. The margin of profit was very small, and any serious decrease in tonnage milled or increase in working costs would immediately render further operations unprofitable.

The average number of Europeans employed by the Witwatersrand mines of the group had been 13,914, including those on active service, and "I take this opportunity to express our cordial appreciation of their continued loyal and excellent services." The average number of non-European employees had been 93,877, which had been a decrease of 16,171 compared with 1942.

The health record of native employees had continued to be good. The mortality rate from disease had fallen from 3.05 per thousand in 1942 to the record low figure of 3.04 per thousand, while deaths from mining accidents decreased by 0.20 per thousand, to the very low figure—which was also a record—of 1.27 per thousand. Compared with 1942, shifts lost per native per annum due to disease and accidents had risen from 5.36 to 6.17.

The present valuation of outstanding phthisis liability of the mines of the group was £6,354,189, a decrease of £53,930 compared with 1942. The twelve mines affected had provided with accrued interest up to the end of 1943 the total of £4,055,375 towards meeting that liability.

#### CURRENT YEAR'S RESULTS

Results during the first four months of the current year had in general been affected adversely, and in certain cases very seriously, by underground flooding caused by abnormally heavy rains which had fallen during the first fortnight of February. At East Rand Proprietary Mines conditions had also been aggravated by a serious underground fire and by a bad pressure burst in the Driefontein tertiary incline shaft.

Various South African industrial concerns in which the company was interested, such as coal mining and lime, pipe and cement manufacturing companies, had all been maintained in a sound position and had distributed satisfactory dividends. In response to the Government's request for increased coal production, output from the Witbank Colliery had been increased by 144,546 tons to a record figure of 1,329,389 tons during 1943.

Since the close of the period under review, additions and amendments had been made to the articles of association of the company in terms of the special resolution passed at the extraordinary general meeting of shareholders which had been held on February 4th last. The main purpose of revising the articles had been to ensure that control of the company was vested in shareholders who were nationals of the Union of South Africa or who were British subjects.

The report and accounts were adopted.

# ASSOCIATED PORTLAND CEMENT MANUFACTURERS, LIMITED

## EFFICIENCY OF BIG BUSINESS

### SIR P. MALCOLM STEWART'S VIEWS

The forty-fifth ordinary general meeting of the Associated Portland Cement Manufacturers, Limited, was held, on the 30th ultimo, in London.

Sir P. Malcolm Stewart, Bt., O.B.E., Hon. LL.D., D.L. (chairman and one of the managing directors), in the course of his speech, said:—

The profit and loss account shows a total profit of £1,662,395, which is £20,003 more than the profit of 1942. Profit on trading is down by £53,791, but interest and dividends on investments are up by £73,699, largely accounted for by the receipt of a dividend from the Alpha Company in respect of the year 1942. The proposed final dividend is 7½ per cent., making a total dividend for the year of 10 per cent. on the ordinary stock, which compares with 9 per cent. in the previous year. This modest increase of 1 per cent. in the dividend recommended for payment to our stockholders is mainly accounted for by the increased dividends on investments. We feel warranted in recommending this payment to the stockholders despite the decrease in the trading profits.

#### SUCCESS OF VOLUNTARY CONTROL

While there was a falling off in the tonnage of deliveries, this proved less than expected; consequently the financial results obtained are more satisfactory than anticipated when I addressed you last year. The accounts are final, for I am pleased to inform you that the Ministry of Works has now approved the basis of profits allowed to the industry, and of those we take our agreed share. The settlement is fair and made with good will. Meanwhile the voluntary control instituted by and under the supervision of the Ministry continues to work smoothly and saves the Government much work and expense.

Last year I dealt with the attacks on monopolies, monopolistic control and big business, and stated these are mainly misdirected as they are in effect attacks on organisation of which, post-war, we shall need more, not less, in order to cope with the vast and complex national and international problems. Those who have knowledge and take an impartial view of industry are, I believe, increasingly conscious that most big businesses are outstandingly efficient, and have led the way in setting the highest standards, particularly in the treatment of their employees, a standard which has out-paced that of most Government departments. The progressive spirit which has produced these results will be evinced even more strongly after the war and I am confident that the exercise of a sound policy, designed to foster national interests, will prevail more widely. Once the fight for efficiency is won success usually follows and there remains but the need for wise and fair distribution of the resultant profits between all parties concerned.

#### EFFICIENCY ESSENTIAL

The better Britain to which we look forward will not be built by impoverishing or cramping efficient industrial companies operating on a large scale and thus undermining a massive portion of the foundations of our prosperity. Some loss of efficiency is an unfortunate concomitant of war, experienced particularly by those industries not engaged in the production of armaments. Efficiency must be restored at the earliest moment post-war and can only be attained when arrears of maintenance have been made good and the demand allows for fuller production.

Further, it must not be assumed that controls set up in war-time with the Government as almost the sole consumer and virtually in the position of a dictator, will

work for efficiency when once we can return to normal trading conditions. Obviously there must be some degree of control during an interregnum period of short supply, and of assistance to impoverished countries, but such controls should be treated as exceptions calling for justification against a background of general assurance as to the restoration of the fullest possible degree of freedom from control at the earliest date.

While statesmen are planning the international framework of world prosperity it is to domestic productive industry that we must look to "deliver the goods." When the war and the fight for freedom are won, after a short spell for recuperation, we must settle down to hard work in dead earnest. A national programme of employment to be successful will call for harder work and clearer thinking than ever before.

The spirit of satisfaction and the enjoyment arising from work well done must permeate more widely. Every citizen should feel a sense of responsibility for doing his or her fair share to secure that measure of post-war prosperity which will promote the highest level of employment, a result which can but come from intense productive effort. Further, we shall not become fit partners for international agreements unless we can first show that we know how to build a well-ordered and happy industrial house at home.

#### BENEFITS OF RESEARCH

The Chancellor of the Exchequer, Sir John Anderson, in his masterly and helpful Budget proposals and review will render much assistance to industry when his promised improved scale of depreciation allowances comes into effect. He has also stressed the need for making more freely available the benefits to be obtained from research. This effort to widen the scope for progress and efficiency should be expanded as far as possible. The Cement Makers' Federation has already in part adopted this policy. Increased efficiency is essential to our survival as a great industrial nation.

To-day it is difficult to forecast the date when the projected future programme of building and constructional work will fully mature. It is generally anticipated that there will be a time lag and that building operations will wait on the return of operatives from the armed Forces; consequently, early progress may be somewhat slow.

The necessity of getting away from inflated war costs is paramount if house building and large constructional work, all so much needed, are to proceed on economic lines. We shall do our utmost in this direction, as doubtless will every other manufacturer of building materials. A successful building programme can only be assured through an increased output from the operatives, efficient production bringing reduced costs and selling prices of materials and through more economic distribution.

#### CURRENT YEAR'S OUTLOOK

With regard to the prospects for the current year, the trend of trade to date shows a marked falling off in turnover and deliveries will inevitably be further impeded by impending vital operations; to-day I cannot discern any factor which is likely to offset the resultant reduced sales. Consequently, I must warn stockholders that they should not rely on a repetition of the trading results attained last year.

However the strength of our ample reserves together with a possible improved export trade may offer opportunity for mitigating the worst effects anticipated from the more limited trading conditions which I visualise as setting in while we are completing the closing stages of the war with Germany.

The report was adopted.

## CITY DEEP, LIMITED

(Incorporated in the Union of South Africa)

### SHORTAGE OF NATIVE LABOUR

#### DR HANS PIROW'S SPEECH

Doctor Hans Pirow, the chairman, presided at the annual meeting of City Deep, Limited, held in Johannesburg on the 17th ultimo.

After reviewing operations for 1943, the chairman said that the total profit had been £731,847. Dividends had absorbed £286,125, provision for taxation had amounted to £391,952, expenditure on capital account had been £73,714, and further provision made in respect of miners' phthisis outstanding liability had been £12,034.

Net expenditure on capital account during 1943 had been £73,714, almost all of which had been in respect of winding equipment and electric power supply for No. 5 shaft. The engine house for a permanent hoist at that shaft had now been completed and the electrical portion of the plant had been installed. The mechanical portion was awaiting shipment from overseas. Last year shareholders were informed that an air cooling plant at No. 4 shaft had been brought into operation. The results obtained had been highly satisfactory and working conditions in the western and deeper section of the mine had been considerably improved by the provision of cooler air.

#### DEVELOPMENT CURTAILED

The drop in tonnage milled during the year had been due to the acute shortage of native labour which had seriously hampered operations at the mine and which continued at the present time. In conformity with the general policy followed by the gold mining industry to conserve essential stores to the fullest possible extent, development carried out during the year had been again on a much reduced scale. The total had amounted to 20,299 feet which had been 3,156 feet less than the previous year's figure. Main Reef Leader development had shown satisfactory results, but 1,020 feet of South Reef which had been sampled had been generally disappointing.

The available ore reserve as re-estimated at December 31, 1943, had been 3,530,800 tons of an average value of 5.5 dwt. over a stopping width of 43.5 inches. The available reserve showed a decrease of 162,200 tons compared with the previous year's figure, the value being 0.2 dwt. greater while the width remained unchanged.

The price received for gold and the rate at which normal income-tax had been payable by the company remained unchanged throughout the year. As from January 1, 1943, however, the special contribution which was based on taxable income before deduction of redemption allowance and any tax loss brought forward from a previous year had been increased from 20 per cent. to 22½ per cent.

#### WAGES COMMISSION'S REPORT

Since the close of the period under review the report of the Witwatersrand Mine Natives Wages Commission had been published. Shareholders would no doubt be aware that the Government had not accepted in full the recommendations made by the Commission, but nevertheless had decided that as from April 1, 1944, certain increases should be made in the wages paid to mine native labourers. Briefly, the increases amounted to 5d. per shift for natives employed underground and 4d. per shift for natives employed on the surface, with payment of time and a half for all overtime and Sunday work. Since January 1, 1940, the gold mining companies had been obliged to pay to the Government a gold realisation charge and since September 1, 1940, that charge had remained fixed at 38s. 3d. per cent. The Government had now decided to place in a pool the sums thus collected from the industry during the year

ending March 31, 1945, and to distribute those funds amongst individual mining companies in proportion to their share of the increased costs of the industry in respect of native wages. It was hoped that the amount thus made available would be sufficient to meet practically the whole of the industry's additional direct burden.

In order to conserve paper stocks the report of the proceedings at the meeting would not be circulated to shareholders. Copies could be obtained, however, on application to the head office in Johannesburg or to the London office.

A large number of the company's European employees was absent on military service, and in addition the mine had continued to carry out its share of munitions production.

The report and accounts were adopted.

## INDUSTRIAL AND GENERAL TRUST, LIMITED

### A GRATIFYING IMPROVEMENT

The fifty-sixth ordinary general meeting of this company was held, on the 22nd ultimo, in London.

Mr W. Sandford Poole (the chairman) said that he thought the statement presented was not unsatisfactory after 4½ years of the most devastating war in history. A year ago they had to report a reduction of £26,000 in their gross income. To-day they were able to show a partial recovery, gross income having risen by £13,000. It was interesting to compare the average gross income of the Trust in the five years preceding the outbreak of war with the average gross income of the five years during the war period. For the peace years to March 31, 1939, the average was £457,600; for the war years to March 31, 1944, it had been £481,000. Thus, despite the effects of war conditions and the restricting influence of E.P.T. on dividend distribution, their average gross income over the past five years had shown a gratifying improvement. They recommended a final dividend of 8 per cent. on the ordinary stock, making a total dividend of 12 per cent. for the year.

Their investments now number 979 and the total at which they stood in the balance sheet was £8,137,686. A valuation, based almost entirely on market quotations, showed a quite substantial appreciation over the total at which they stood in the balance sheet. It would be unwise to lay too much emphasis on that result, satis-

(Continued from page 758)

ment now has a mercury stockpile sufficient to meet requirements at the present rate for about two years. In order to prevent further accumulations, all restrictions on mercury consumption were removed in the United States last February. Simultaneously, the buying contract of the US Metals Reserve Company with the Canadian suppliers (Consolidated Mining and Smelting Co. of Canada) was cancelled, and producers in the United States were asked to reduce their output as compared with 1943 by 30 per cent. The war-time boom of the North American mercury industry can thus be regarded as ended. Production after the war will depend largely on the price of the metal. Most of the North American producers are high-cost producers. Last year the United States price fluctuated between 190 and 196 dollars a flask, which compares with pre-war prices of between 75 and 90 dollars a flask. At the latter price range, North America before this war used to rely on European supplies for between one-third and one-half of its requirements. After the development of new mines and the re-equipping of most of the older ones during the war, average production costs in North America after the war may be somewhat lower than they were before 1940. If, therefore, Italy and Spain wish to revive their mercury exports to the United States after the war—and their quicksilver industry is very much dependent on such exports—they will have to keep international mercury prices at a reasonable level, otherwise they may not only lose the American market, but may also find increasing competition from North American producers in other parts of the world.

## BRITISH ENKA, LIMITED

### MR A. D. CARMICHAEL'S REVIEW

The nineteenth ordinary general meeting of British Enka, Limited, was held, on the 26th ultimo, in London.

Mr A. D. Carmichael presided, and, in the course of his statement, said:—

The working profit for the year 1943 is £147,580. After providing for taxation and other outgoings, the net profit is £71,432. Despite the difficulties caused by the war, we have made each year since the outbreak of war more than our E.P.T. standard of profit.

Our production is still curtailed and controlled, and is used for direct war purposes, for utility clothing, or for export. So far as we know, all other rayon producing countries have largely increased their production of rayon during the war, with an almost certain resultant increase in technical efficiency.

In order to increase production rapidly in this country at the earliest opportunity, producers of rayon yarn and rayon fabrics should be given high priority for additional labour and increased supplies of raw materials, as both products use a very high percentage of British labour and a very small content of imported raw material. They are, therefore, excellent commodities for export.

The report and accounts were adopted.

## THE LICENSES AND GENERAL INSURANCE COMPANY, LIMITED

The fifty-fourth annual general meeting of this company was held, on the 31st ultimo, in London.

Mr Stanley Christopherson, J.P., presided.

The accounts for the year ended December 31, 1943, were approved, and the proposed final dividend of 15 per cent., making a total distribution of 20 per cent. for the year on the preference and ordinary shares, was confirmed.

The year's operations have been very satisfactory, and the financial structure of the company further strengthened.

Sir Herbert G. Williams, M.P., has joined the Head Office Board.

A copy of the chairman's speech has been sent to every shareholder.

## INDUSTRY AND TRADE

**Film Exhibitions.**—During the year ended September 30, 1943, the aggregate length (including repeated performances) of registered films exhibited in cinemas in Great Britain, was 44,768 million feet, compared with 44,278 million feet in the previous year. The length of British films exhibited was 9,013 million feet, or 20.13 per cent of the total, compared with 21.12 per cent for the previous year. The aggregate length of long films (those of 3,000 feet and over) was 41,084 feet, of which 7,712 feet, or 18.77 per cent, were British, compared with 18.8 per cent for the year ended September 30, 1942.

**Patents Committee.**—The Committee appointed by the Board of Trade under the chairmanship of Mr. Kenneth Swan, K.C., has begun its sittings and is considering (a) the initiation, conduct and determination of legal proceedings arising under or out of the Patents and Designs Acts, including the constitution of the appropriate tribunals; and (b) the provisions of those Acts for the prevention of the abuse of monopoly rights. An interim report on these subjects may be made. Evidence will be heard by the Committee, and those desiring to submit evidence should communicate with the Joint Secretaries to the Patents Committee, 1944, The Patent Office, 25, Southampton Buildings, London, W.C.2.

**"The Economist" Sensitive Index.**—There was no change in the index during the week ended May 31st. The complete index (1935=100) was 158.6; crops 135.6; and raw materials 185.5.

## FINANCE AND BANKING

**THE MONEY MARKET.**—There has been an exceptionally heavy turnover of credit in the money market this week. The tail-end of the clearing banks' making up for the May returns made its impact felt earlier in the week. The turn of the month and the early June dividend payments also stimulated the movement of funds. The discount market again had to take up a substantial amount of Treasury bills, since it obtained a 46 per cent. allotment on its applications which cover the £110,000,000 of bills on offer each week. The £50,000,000 odd of Treasury bills taken up by the market this week is the largest allotment ever received. The task of taking up these bills was eased by the readiness with which the banks bought bills from the market. The banks' position in its turn was eased by the fact that effective TDR maturities exceeded by about £2,000,000 the £60,000,000 of new money which had to be found in this form this week.

**MONEY RATES, LONDON.**—The following rates remained unchanged between May 25th and June 1st:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1¾%; 6 months, 1½-1¾%. Treasury Bills: 2 months, 1-1½%; 3 months, 1-1½%. Day-to-day money, 1-1½%. Short Loans, 1-1½%. Bank deposit rates, 1%. Discount deposit at call, 1%; at notice, 1½%.

**Exchange Rates.**—The following rates fixed by the Bank of England remained unchanged between May 25th and June 1st. (Figures in brackets are par of exchange).

United States. \$ (4.861) 4.02½-03½; mail transfers 4.02½-03½. Canada. \$ (4.861) 4.43-47; mail transfers 4.43-47½. Switzerland. Francs (25.22) 17-30.40. French Empire. Francs 197½-200½. Syria. p. 8.81-85. Sweden. Krona (18.159) T.T. 16.85-95. Dutch West Indies. Florin (12.11) 7.58-62. Portugal. Escudos (110) 99.80-100.20; mail transfers 99.80-100.30. **Fixed Rates for Payment at Bank of England for Clearing Offices.** Spain. Pesetas 44.00. Turkey. Piastres 520. Italy. 71.25 lire.

**Market Rates.**—The following rates remained unchanged between May 25th and June 1st.

Egypt. Piastre. (97½) 97½-98. India. Rupee (18d. per rupee) 17½-18½. Belgian Congo. Francs 176½-177. China. National \$3-3½. Iran. Rl. 128-130.

**Special Accounts** are in force for Chile, Peru, Bolivia and Paraguay, for which no rate of exchange is quoted in London. Rate for payment into Argentine special account: 16.23 pesos.

(Continued on page 768)

## GOVERNMENT RETURNS

For the week ended May 27, 1944, total ordinary revenue was £60,469,000, against ordinary expenditure of £114,292,000. There were no issues to sinking funds. Thus, including sinking fund allocations £1,180,028, the deficit accrued since April 1st is £501,288,000 against £562,620,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £130,574 to £2,876,835, the other operations for the week (no longer shown separately) raised the gross National Debt by £54,532,426 to £20,094 million.

The above tonnage includes ore developed on the Kimberley Reef Series, which totalled 68,200 tons, averaging 5.80 dwts. over a width of 55.00 in.

### DEVELOPMENT:—

| Main Reef Leader | Footage | Sampled | Percentage payable | Average reef width (inches) | Average assay value (dwts.) |
|------------------|---------|---------|--------------------|-----------------------------|-----------------------------|
| Kimberley Reef   | 22,659  | 17,840  | 43.8               | 31.04                       | 10.67                       |
|                  | 2,294   | 1,760   | 35.8               | 47.28                       | 10.96                       |

GENERAL.—Joint Ore Shaft.—The hoists on loan from Western Reefs Exploration & Development Company, Limited, and all necessary surface buildings have been erected, and essential equipment installed, to enable shaft sinking operations to proceed as soon as sufficient timber becomes available. No sinking was done during the year under review, but the shaft was concreted to a depth of 261 feet below the collar.

CAPITAL EXPENDITURE for 1944 is estimated at £120,000, most of which will be incurred in connection with the Joint Ore Shaft. Mining operations were seriously affected by shortage of Native Labour.

|----------|---------|---------|--------------------|-----------------------------|-----------------------------|
| 18,938   | 11,550  | 49.1    | 29.21              | 9.35                        |                             |

GENERAL.—Capital Expenditure for 1944 is estimated at nil. To facilitate the opening up of the south-westerly portion of the mine, and to permit efficient mining operations to be carried on in this area, it is considered that a sub-vertical shaft will have to be sunk. In order to obtain the necessary information for this project, two boreholes are being put down from the surface. A main haulage is being advanced from the Vertical Shaft to the proposed position of the Sub-Vertical Shaft. Mining operations were seriously affected by shortage of Native Labour.

GENERAL.—Joint Ore Shaft.—The hoists on loan from Western Reefs Exploration & Development Company, Limited, and all necessary surface buildings have been erected, and essential equipment installed, to enable shaft sinking operations to proceed as soon as sufficient timber becomes available. No sinking was done during the year under review, but the shaft was concreted to a depth of 261 feet below the collar. CAPITAL EXPENDITURE for 1944 is estimated at £60,000, all of which will be incurred in connection with the Joint Ore Shaft. Mining operations were seriously affected by shortage of Native Labour.

THE FULL REPORTS AND ACCOUNTS CAN BE OBTAINED FROM THE LONDON SECRETARIES OF THE COMPANIES, ANGLO AMERICAN CORPORATION OF SOUTH AFRICA LTD., 11, OLD JEWRY, LONDON, E.C.2.

## June the Sixth

FOUR years ago almost to a day the last man was taken off the beaches at Dunkirk. Then, under a pitiless and unopposed German bombardment from the air, the shattered remnants of an Allied army, without stores, without food, without equipment, were rescued from Europe in tugs and trawlers and yachts and rowing boats, in any odd scratch vessel that could make the Channel crossing. This is the picture of defeat and disarray which to-day can be set against the massive pageant of invasion—the armadas of 4,000 and 6,000 ships, the great armies equipped to the last detail of mechanised armament, the Allied air forces in thousands of sorties raking the French skies empty of all German opposition. It is a tremendous and exhilarating contrast, and in the first hour of relief and jubilation it is only right that the British people should offer their thanks to the one man who, before all, is responsible for the greatest reversal of fortune in this island's history. Mr Churchill is the supreme architect of this achievement. It was his leadership and inspiration that made possible Britain's resolve in 1940 "to ride out the storm of war and to outlive the menace of tyranny, if necessary for years, if necessary alone." It was his vision on the very morrow of Dunkirk that saw the forging of a future alliance, the new world stepping forth "with all its power and might" to the liberation of the old, the rallying of the world against tyranny, the long struggle and the

final success. This, in June, 1940, was not an easy or an obvious vision. When Mr Churchill said

we shall fight on the seas and oceans, we shall fight with growing confidence and growing strength in the air . . . whatever the cost may be, we shall fight on the beaches, we shall fight on the landing grounds, we shall fight in the fields and in the streets, we shall fight in the hills. . .

he spoke in terms only of defence and of no surrender. But his words had a prophetic ring, and now indeed Britain and its Allies fight on the landing grounds and on the beaches, not on British soil, but on the liberated soil of Europe. If there is any one man of whom it can be said that he won this war, that man is Mr. Churchill.

The vision was his, but it could not have been fulfilled without the forging of the Grand Alliance and the enormous efforts and sacrifices of Britain's friends. If British armies can enter the Continent in such strength and so well equipped, it is because the Americans are at their side and the flood of American war production has helped lavishly to swell their armament. And if they face a German army and a German air force reduced to a shadow of their former strength, it is because the Russians have whittled away Germany's military strength by their own stupendous sacrifices. The Russian cry for a Second Front was always a cry of bitterest need, and now that the Second Front has come, it is only fitting that the Allies in the West

IMPERIAL CHEMICAL INDUSTRIES LIMITED have a vacancy for an Economic Statistician at their Head Office in London. Candidates should have had five to ten years' practical experience and possess an Honours B.Sc. (Econ.) degree with statistics special subject, or equivalent degree. Write stating qualifications and experience to Central Staff Department, I.C.I. Limited, Welwyn Garden City, Herts.

TOWN AND COUNTRY PLANNING ASSOCIATION. Informal discussion Friday, June 9, 6.30 p.m., 2, Savoy Hill, W.C. Professor Abercrombie and Mr. F. J. Osborn will take part. For invitations apply 28, King Street, W.C.2. Temple Bar 50

should recognise the scale of their obligation to Russia's efforts on the Eastern front. But gratitude is the last thing the Russians want. They want heavy blows, hard fighting and rapid victory. The British and Americans are now in a position to repay their debt to Russia in the best and most acceptable coin.

Even if the Great Powers have been the chief engineers of Germany's deepening defeat, in the next weeks, the nations of Western Europe will bear the full brunt of the fighting. The hour for their active participation has not yet come, and all the Allied leaders have warned their peoples against premature uprisings which would lead to a loss of life and effort before the crisis is reached. But even during the passive phase, the peoples of Western Europe will be one of the factors in Allied victory. Their bearing under bombardment, their discipline in the midst and in the rear of the advancing armies have military importance, just as, in the past, their refusal to accept the New Order and their four years' underground struggle have been military factors of the highest significance. To them, too, the Allies owe a tremendous debt and one which they will pay only in part by the act of liberation. Inevitably the Allies' tanks and artillery and transport will add to the destruction which Allied bombing has begun. As passive or active agents in their own liberation, the peoples of Western Europe are paying a heavy price. It is not enough to free them. Behind the guns must come the food lorries and the mobile canteens. The physical basis of reconstruction barely exists in some areas. Invasion threatens to overlap the narrow margin of subsistence. The Allies will need to act vigorously if their friends are not to be liberated only to starve. Much, too, will depend upon the behaviour of the invading armies. The lessons taught by the Italian campaign on the dangers of overspending by the troops have presumably been learnt, and while it is too much to hope that men worn out from battle will always be the surest ambassadors of good will, each unit could at least go out with some instruction on the degree to which good behaviour, good discipline, good humour and kindness can oil the wheels of occupation and lay the foundations of lasting friendship. Britain and America are, with whatever tact and reserve they may be compelled to act, in some sense the trustees of the future political freedom of the peoples they are liberating. Darlanism and expediency belong to the phase of military weakness and

insufficiency. The Allies' overwhelming strength enables them to choose where they will. If their choice is faulty or compromised, they may play a decisive part in undermining the peoples' freedom and the nations' friendship.

Yet when all the thanks are made and all the contributions measured, there still remain the final artificers of victory, the men who, in the King's words "man the ships, storm the beaches and fill the skies." Although the first advances have been secured with surprisingly little loss of life, the hardest fighting lies ahead. In the weeks to come, thousands of men will lay down their lives or suffer disablement, will endure pain and hardship and strain, will throw everything they have into the balance of victory without particularly asking why or counting the cost. For them at the moment there is not very much that the people who stay behind can do. They can keep vigil, as the King has asked. They can face anxiety steadfastly. They can accept the losses when they come; but the real effort of gratitude will only be needed later on, when the men come home. They will not have been given victory, they will have toiled and sweated for it, all the way from Alamein to Bizerta, from Sicily to Rome, in the jungles of Burma, on the landing beaches in France. They have been the active agents of every military success. It is their courage and initiative and adaptability and common sense that have completed the historic reversal of the last four years. It will not be enough for their elders to give them "food, work and homes"—the essentials of a decent post-war society. They must be allowed their place in that society, they must be given scope and opportunity and responsibility to run it themselves.

The men who ruled the country in 1913 were still ruling it in 1923, and in all too many dismal cases were still doing so in 1939. After this war, let the debt of gratitude be more adequately paid. The men who are airmarshals and generals in their thirties must not wait until the sixties for honour and responsibility in civilian life. The change cannot be brought about overnight, least of all while the war continues, but now is the time, when the men are fighting and dying and everyone with a heart and conscience is deeply aware of a tremendous debt, to register the firm resolve that, after this war, youth and enthusiasm will not be actual disqualifications for responsibility and that the new world will not only be built for the war generation but round them and by them as well.

## Capital and Employment

THE White Paper on Employment Policy has had an amazingly tranquil reception. There can rarely have been a single statement of government policy which broke so much new ground in so many directions at once, or assumed for the state heavier new burdens of responsibility. Yet the contrast with the reception of the Beveridge Report eighteen months ago is most striking. Doubtless the pre-occupation of the public mind with impending events across the Channel is a large part of the explanation; the comparatively abstract nature of the discussion in the White Paper may be another part. But whatever the cause, the surprising fact remains that the Beveridge Report, which, with all its great merits, was not much more than a projection and completion of familiar and accepted principles, was received with a chorus of hosannas, while a much more revolutionary change in state policy now causes hardly a ripple. When the consequences of the two policies are fully seen, the contrast will provide material for one of those exercises in irony in which the historians delight.

Another part of the explanation lies in the complexity of the subject. In these columns last week, ten separate lines of policy, some of them of major importance, were listed. In such a case, the first comments cannot go much beyond an annotated catalogue. Clearly, there is material in the White Paper for a long series of articles. The problems of the transition, the future of cheap money, industrial location, wage policy, the restraint of monopoly,

the maintenance of consumer purchasing power, the efficiency of industry—each of these deserves extended treatment in the light of what is said upon them in the White Paper. But on the second reading, it will be as well to stay close to the heart of the matter. For a policy of full employment, two topics vastly outweigh in importance all the others. These two are the stabilisation of private capital expenditure and the budgetary policy of the state. To say that these two are the most important for this purpose is not, of course, to decry the urgency of any others. The general efficiency of British industry—the productivity of the average worker—is the basis on which all economic policy rests; but its primary importance lies in the contribution it can make to keeping the national income high, rather than to keeping it stable—and the latter is the object of full employment policies. The rescue of the depressed areas is another matter of the highest urgency; but it is a problem of a special character, which will be infinitely easier to solve if the rest of the country is prosperous than if it is depressed. A proper handling of the transition from war to peace is a third matter whose contribution is essential. But these are on the periphery of a full employment policy. The heart of it lies in stabilising the flow of total effective demand. And the heart of that lies in stabilising the flow of private capital expenditure. The present article is therefore concerned with this paramount topic.

The quantitative importance of private capital expendi-

ture is larger than might appear at first sight. In 1938, the total net national income of the United Kingdom was over £4,600 millions, but net private capital expenditure at home was only just over £305 millions. Nevertheless the smallness of the figure is deceptive. For one thing, it is not the *net* total of investment expenditure that matters but the *gross*. If industry fails to spend its depreciation and maintenance funds with due regularity, the effect is the same as that of erratic expenditure on new capital. Gross capital expenditure was over 13 per cent of gross national income in 1938, and would have been higher if that year had been one of full employment. Secondly, there is the problem of stocks and inventories of goods and materials of all kinds. A decision to allow stocks to run off is a decision not merely to reduce capital expenditure but to make it negative. It can be taken very quickly and the magnitude can be very large. Fluctuations in stocks, because of their timing and their magnitude, play a strategic part in the causation of industrial fluctuations.

The problem is, then, to seek means by which all these capital expenditures—on new capital goods, on the replacement of old capital goods and on the maintenance of stocks of all kinds—can be smoothed out. Complete and absolute stability is, of course, neither possible nor desirable, and an elastic, fast-moving public works policy is needed to offset small variations in private capital expenditure. But it is only the small variations that can be offset in this way. In the past, private capital expenditure has varied, almost from month to month, by amounts equivalent to annual rates of several hundred million pounds. No public works programme can be large enough, or quick enough on its feet, to counter fluctuations of this size. There must be an effective policy for bringing more stability into the private capital expenditure themselves.

There are possibilities of misunderstanding in the word "private" (which is used, in this connection, in the White Paper) that should be removed. A better word would be "normal," for it is not ownership that distinguishes "private capital expenditure" from "public works expenditure" but purpose. It would be foolish to put expenditure by the Southern Railway or the North-Eastern Electric Supply Co. into one category and exactly similar expenditure by the London Passenger Transport Board or the Manchester Corporation Electricity Department into another. The flow of expenditure which needs stabilising is the flow of capital expenditure which would be undertaken, irrespective of considerations of full employment, as part of the normal functioning of the business enterprise of the country, whether publicly or privately owned. This definition of the distinction has the further advantage that it sheds some light on the assumption, all too easily made, that publicly-owned enterprise would be easier to control, in respect of its capital expenditures, than privately-owned enterprise. This assumption is often made the basis of proposals to make the

nationalisation of transport, power and steel an integral part of a full employment policy. It may be that, say, a nationalised steel industry would be more responsive to control—but only if it were organised on a basis quite different from that usually put forward in nationalisation projects. If nationalisation carries with it the promise of a subsidy from the Exchequer, or of a guarantee of revenue, then control can be exercised. But it is usually made a merit of nationalisation proposals that the nationalised industry would be expected to cover its costs, and, if so, its managers will be at least as coy as the managers of private industry about launching out into heavy expenditures when there is no return upon them in sight. Nationalised industries would require special grants or subsidies or tax reliefs before they could go very far in stabilising their outlay; in short, they would be in exactly the same position as private industry. The point is not an academic one; it is of the very highest political importance. The chief danger of the full employment policy becoming the football of party politics lies in the risk that one party will say that far-reaching socialisation is an essential pre-requisite, while the other will just as stoutly claim that the slightest tincture of Socialism would be ruin to the policy. If this battle is joined, it will be good-bye to full employment. It will be a far sounder approach to inquire what persuasions, inducements or—if need be—compulsions can be exercised upon industry—private and public alike—to secure a reasonable degree of stability in its "normal" capital expenditures.

The White Paper, as was said last week, is very shadowy on this subject, and it is here that there is the greatest need for further exploration. The weapons at the Government's command are of two general kinds—controls of all kinds, and taxation policy. Control is a powerful weapon when it is limitation that is in question. The existing machinery of the Capital Issues Committee and of other official restrictions on capital expenditure is quite strong enough to prevent too much investment. There will be occasions in peacetime when damping down will be the need of the moment. But they will be the exceptions; the more characteristic condition is that of a threatened shortfall of capital expenditure. For inducing an expansion, control mechanisms are very much less powerful. There may, nevertheless, be something that can be done. An Investment Board might be in a position, not merely to steer funds in directions where they are needed, but even to offer facilities to entrepreneurs who are hesitating. A hint is dropped in the industrial location chapter of the White Paper of the possibility of providing capital facilities, including, where necessary, share capital, for new enterprise in the Special Areas, and if it can be done there, it could also be done more generally in times of threatening depression.

These possibilities require to be fully explored. But it is unlikely that they will lead very far. The taxation weapon is, potentially, far more powerful than any direct controls. It is important to be clear what is, and what is not, the

SAVING IS EASY . . .

only when it has become a habit. Systematic saving by way of Life Assurance enables you to plan a secure financial future

main contribution that taxation can make to employment policy. In other connections, it may be right to argue for a reduction of taxation on industry. But that is not the contention at the moment. What is relevant to the stabilisation of capital expenditure is that taxation on industry, whether high or low, should be varied from year to year in accordance with the needs of the general economic situation. Thus, it is agreed that the rate of taxation on maintenance and replacement expenditure (however those words are defined) should be nil. Would it be possible to contrive a mechanism by which a small rate of tax was paid on replacements expenditure in some years and a subsidy in other years, the average still being nil over a long period? Similarly, it may be right that profits re-invested in the improvement or extension of the business should bear tax at the full standard rate of income tax; or it may be right that they should pay a lower rate. But in either case, could the rate be made to vary about an average? And are there any means by which taxation can be used to induce greater stability in the holding of stocks? These are the questions to which inquiry should be directed. There is just one small hint, in the White Paper's reference to

deferred tax credits, that the Government's mind is moving in this direction. One of the most valuable points for the application of public pressure is to insist that the hint should be enlarged into a policy.

A great deal of progress has been made in the last four years with the modernisation of formerly accepted notions of the part that national finance can play in general economic policy. Though the total burden of taxation is now seen to be a vital element in the whole complex, the possibilities of variable taxation have hardly yet been taken into account—perhaps because the revolution in Treasury thought has occurred at a time when the steady maintenance of the maximum tax burden was clearly the only policy to pursue. It is to these possibilities—less revolutionary than other innovations already accepted—that Lord Woolton should invite the Treasury, the Inland Revenue and the economists of the War Cabinet Offices to address their attention.

Taxation cannot, however, be settled except in the framework of financial policy as a whole. This is the second of the two subjects of prior importance for a full employment policy, and further consideration will have to be given to it in a succeeding article.

## Russia and the Balkans

THE renewal of fighting to the north of Jassy appears to be the prelude to the summer campaign in the Balkans. The Germans at Jassy are obviously trying to spoil the Russian preparations for the offensive, just as, at this time a year ago, they attempted to do the same at Kursk. The course of the fighting suggests that the present spoiling attacks will similarly end in failure; and that the Russian armies will resume their march into the Balkans. Their drive from the Pruth to the Danube will alter at a stroke the whole military and political scene.

The Russian armies will draw nearer to the Bulgarian frontiers. This is almost certain to be the signal for Bulgaria to leave the sinking ship of the "New Order," and possibly also to apply for the privileges of co-belligerency on the Russian side. Through Bulgaria the Russians may hope to establish contact with the partisans who fight in Yugoslavia and Greece. The Battle of the Balkans will reach its climax this summer.

In this battle political warfare is going to play a vital rôle. In Roumania political warfare has so far been negative rather than positive. Its aim has been to demonstrate that the Russians, in Mr Molotov's words, have no intention "of changing the existing social order." The property of Roumanian landlords is being left untouched; and Russian officers "fraternise" with the Roumanian clergy. But Roumania is, for various reasons, not the most suitable ground for Russian political warfare. Roumania lost Bessarabia and northern Bukovina to Russia in 1940, and is now certain to lose them again. True, Marshal Stalin has promised to "recompensate" these losses by a return of Transylvania to Roumania. Even so, he can hardly hope that such "recompensation" will suffice to turn the Roumanians into Russia's friends. Moreover, Roumania is not a Slav country. The appeal to Slav solidarity, which is now the strongest weapon in the armoury of Russian propaganda, cannot be used there, though the appeal to Orthodox sentiments is likely to produce some effect now that the Orthodox Church has been reconsecrated in Russia.

Bulgaria and Yugoslavia (and Greece to a lesser extent) are the main assets in Russia's Balkan policy. In the first two countries Slavophile slogans are certain to excite a response from the people. In the last two, the strongest partisan movements—Tito's men in Yugoslavia and the EAM in Greece—look for inspiration primarily to Moscow. The victories of Soviet arms give new attractiveness to ideas and slogans that may have been no more than pale historical reminiscences two years ago. Russia reappears in the Balkan peninsula in the old rôle of the liberator of its peoples. This fact is important in the short as well as in the long run. In the short run

it will influence the outcome of the military operations. In the long run it will give Russia a unique position of strength after the war. In many respects this position may become much stronger than it ever was in Czarist days.

There can be no doubt that the new version of Russian Pan-Slav or Slavophile policies has a more effective appeal in the Balkans than the old Czarist version. The Pan-Slav movements of the pre-revolutionary era were handicapped by the fact that Czarism was a feudal autocracy. On the one hand the Czars themselves used to curb Slavophile and Pan-Slav propaganda, because they were afraid of the popular undercurrents of that propaganda and of its implied or open appeals to the solidarity of the Slav peasant-nations. On the other hand, among the Balkan peoples the response to Pan-Slav slogans was often only half-hearted, precisely because those slogans emanated from a state based on serfdom. Throughout the nineteenth century, progressive Serbs or Bulgars looked for new ideas to the West or wavered between Pan-Slavism and the Western orientation.

The Soviet version of these old ideas is largely free from such taints. However autocratic the system of government may be in Moscow, to the Balkan peoples it appears as the Republic of the workers and peasants. The appeal to racial solidarity is effectively strengthened by the motive of class solidarity, even if this latter motive has been relegated to the background in daily Slavophile propaganda. The Slavophile doctrine, which a century ago was based on the idealisation of the primitive rural community (the "mir"), and on hostility to the infiltration of the Western industrial civilisation, is now based on the ideas of industrialisation, planned economy, and cultural progress. And, last but not least, behind the programme of the old Pan-Slavism there lurked the threat of the compulsory Russification of the other Slav nations. The new propaganda holds out the promise of respect for the language and national culture of each Slav people. These are the elements which give to the present Slavophile propaganda its dynamic force.

But there are also circumstances which limit its scope. From the time of Peter the Great up to the Balkan wars in 1912 and 1913, Pan-Slavism was able to exploit the grievances of the Slav peoples against their Turkish or Austrian rulers. Pan-Slav ideas outside of Russia reflected the longings of the Czechs, Bulgars and Serbs for their independence. The collapse of the Ottoman and Habsburg Empires freed those peoples. German Imperialism in this war has brought about a temporary eclipse of their independence and allowed Russia to present the struggles in the Balkans as a continuation of the old wars

of liberation. But the eclipse has lasted only a few years; and liberation will be achieved with the expulsion of the German occupants. The ideals of national independence and sovereignty are likely to re-emerge with renewed strength from the war; and it is by no means certain that they can be entirely reconciled with the extreme forms of the Slav movement.

Russian policy, it ought to be said, is not committed to these extremist forms. Moscow insistently emphasises the difference between Pan-Slavist and Slavophile policies, rejecting the former and accepting the latter. True, the idea of a Balkan federation under Russian protection has at various stages re-appeared like a refrain in the history of Russian political thought; but it has never gained enough strength to dominate Russia's official policy, which preferred to exploit pro-Russian sentiments among the "Slav brethren" in more subtle and less direct ways. This seems also to be the case at present. Russian policy appears to aim at strengthening Russia's influence inside each Balkan country, but not at unifying the Balkans into one appendage to the "greatest Slav nation."

After this war, Russia will have a new and decisive opportunity to increase its power and influence in the Balkans because for the first time in history it will be the only Great Power in this part of the world. Throughout the eighteenth and the nineteenth century the spread of Russian influence in the Balkans was opposed and checked by both Turkey and Austria. Slavophile and Pan-Slav policies were the battering rams that contributed greatly to the crumbling of those two Empires. The vacuum left by their collapse was filled by German penetration in the thirties. After Germany's defeat there will be a new vacuum in which no Central European Power will be able to challenge Russian influence.

This is not to say that the Russian influence in the Balkans will not be impeded by various economic and political factors. Immediately after the war Russia is certain to have its energies absorbed in the enormous task of domestic reconstruction. There will be little ground for intensive trade between Russia and the Balkan countries during this period. The primary pro-

ducing countries in the South East of Europe can offer Russia none of the capital goods which Russia will seek to import. Similarly, Russia will hardly be able to export the manufactured goods which may be needed in the Balkans. Slavophile propaganda, not helped by trade between the Slavs, may well be reduced to an affair of sentiment or to a marginal political problem, at least for the Slav peoples in the Balkans.

Russia has, however, a permanent strategic interest in the peninsula, even if its economic interest is slight. In the present war it has been demonstrated that no large scale assault on Russia can be undertaken without control over the Balkans. Before Hitler set out to conquer the steppes of Russia he had to secure his right flank by occupying Yugoslavia and Greece. This lesson has hardly been wasted on Russia's leaders. The strategic approach to the Balkan problem raises a number of new issues. The Balkans themselves are torn by conflicting national aspirations, chief among them being the conflict between Bulgars and Serbs. To satisfy the claims of both nationalities is almost impossible. Russian diplomacy has not yet spoken its last word on this issue. But it may safely be assumed that it is not inclined to support any pan-Serb claims, and that it will be even less inclined to do so if in the last minute the Bulgars succeed in joining the victor's band-wagon. There is even a chance that Pan-Serb aspirations may be effectively checked by a coalition of Croat and Bulgarian interests.

The motive of security is also likely to induce Russia to seek a new settlement with the non-Slav states on the fringes of the Balkans, that is, with Turkey and Italy. Russia's unexpected recognition of Marshal Badoglio's Government and the friendly relations between the Soviet and the Italian Governments that have developed since then, point in this direction, while the future of Soviet-Turkish relations still remains shrouded in uncertainty. But Italy is not liked in several of the Balkan countries, and a complete reconciliation between Russia and Italy might in the long run greatly diminish the effectiveness of Slavophile propaganda. Russian diplomacy may be confronted with a Gordian knot of contradictions that can hardly be cut by a propaganda sword alone.

## Electoral Reform

THE interim recommendations of the Speaker's Conference on Electoral Reform and the Redistribution of Seats, which were published last week and will soon be substantially passed into law, represent the latest and nearly the last stage in the process that started a century and a half ago with the campaign to abolish "rotten boroughs" and to extend the right to vote from its narrow and haphazard property basis. When these proposals are implemented the two main principles for which the Chartists petitioned and fought in the Hungry Forties—equal electoral districts and adult suffrage—will be largely accomplished, in both Parliamentary and local elections. There will be only vestigial traces of the older principle of the representation of property; the definition of citizenship will be completely extended to include women as well as men; there are reservations to ensure that the original idea of representing places and communities as well as numerically similar aggregations of voters will not be departed from on mere grounds of arithmetic.

The Sixth Reform Bill, embodying both the final recommendations of the Speaker's Conference and the recommendations of the recent Departmental Committee on Electoral Machinery, will in this sense look backwards rather than forwards. It will round off, in the conditions of to-day, the work of the Parliamentary reformers of the past. It will not, unless—as is most improbable—the decision of the Speaker's Conference is reversed, introduce the much advocated principle of proportional representation, namely, "that each vote recorded shall, as far as possible, command an equal share of representation in the House of Commons." The supersession of constituencies returning each a single member by larger electoral

units in order to allow the mathematical allocation of seats according to votes, regardless of the accidents of local boundaries, will not be contemplated. Indeed, the Speaker's Conference has explicitly recommended that the few constituencies at present returning two members should be abolished and redivided.

It is scarcely possible to doubt that this conservative approach to the method of election is, in general, the right one. The chief strength of the British system of Parliamentary government, by contrast with other modes elsewhere, resides in the fact that British Cabinets can normally depend upon the assured support of a majority of representatives in the House of Commons. To endanger this advantage by attempting to secure the precise representation of minorities among the electorate would be to take an unwarrantable risk. The real purpose of a General Election is not to secure an exactly representative House of Commons but to put into power the Government that the electors like most or dislike least. It is of course true that, in a system of single member constituencies, it would be possible for a party to obtain just under half the total votes polled without securing a single parliamentary seat. It is equally true, however, that the House of Commons is by tradition and intention an assembly representative of the several local communities into which the country is socially and geographically divided; and it is only by means of the equality of single electoral districts that this communal foundation can be roughly reconciled with the desirable object of ensuring that each member shall represent an approximately similar number of votes. If three-cornered contests and members elected by a minority become usual, there is a strong case for

the Alternative Vote in single-member constituencies. But that is a different matter from Proportional Representation and would probably have a different result. Indeed, it would be intended to assist the object of getting a majority—vital for good government—rather than that of fully representative minorities.

It is in the redistribution of seats to match population that the main change in Parliamentary representation will be accomplished. The Parliamentary franchise has already been brought to the point of adult suffrage, with this important qualification: that a large proportion of adult citizens are not in fact able to make their right to vote effective, because of deficiencies in the machinery of registration. These deficiencies are to be remedied by the provisions for continuous registration introduced in the Parliament (Election and Meeting) Act of last year, which will be extended, according to the recommendations of the Speaker's Conference, to local elections also.

The chief reform—indeed the only fundamental one that is envisaged—is in the field of elections to the councils of local authorities. The introduction of adult suffrage locally by the assimilation of the Parliamentary and local Government franchises is a radical change. Hitherto the principle in local elections has been no representation without taxation. Broadly, the body of occupiers of rateable premises (and their spouses) have composed the electorate; and thus the basis of representation has remained, directly or indirectly, the ownership or use of property. It is now intended that the mere attainment of the age of full citizenship should be the basic qualification here as in the case of Parliamentary elections.

It is true that the right to cast an extra vote by virtue of the occupation of business premises will remain in all elections; and that university graduates will still be entitled, in certain conditions, to cast an additional vote in the university constituencies. But these are only small and not over-important exceptions to the general rule of manhood and womanhood suffrage.

What now remains in the long story of Parliamentary reform is the problem of the efficient administration of the principles which have now been finally accepted. The method of continuous registration may make the acceptance of adult suffrage fully effective, though there may still be doubts about its efficient working in any wartime or post-war election which may occur when large bodies of men and women are in uniform and away from their homes. The principle of equal electoral districts will, according to the latest proposals, be applied automatically; but as a matter of political fact, it is by no means sure that the most effective or indeed the most reasonable solution has yet been found. The Speaker's Conference recommends the immediate subdivision of abnormally large constituencies, for which 25 additional seats are to be provisionally provided. This would be followed, in the first place, by a complete redistribution scheme, carried through by Boundary Commissioners, with a view to securing that each member of the House of Commons should represent the "quota" of electors

ascertained by dividing the total electorate in Great Britain by the total number of seats in Great Britain (other than university seats) existing at the time of the Boundary Commissioners' report.

Secondly, there is to be a procedure of periodic review in order to keep the constituencies up-to-date.

In principle, this machinery is unexceptionable; but the proposals are accompanied by certain reservations which are perhaps more open to question. In the first place, it is recommended that—apart from the temporary addition of 25 seats, which is apparently to disappear when the redistribution is complete—the number of Parliamentary seats shall remain substantially as at present, that is 591, not counting university seats. Secondly, it is laid down, no doubt on sound grounds of effective regional representation, that there shall be no reduction in the present number of members for Scotland, Wales or Northern Ireland. Thus the suggestion is, in effect, that for every new constituency created by the subdivision of abnormally large ones (which will almost certainly be

English constituencies) some other abnormally small constituency (probably in England) should be abolished. In the first instance, for example, the proposal that a maximum of 25 new constituencies should be created in swollen towns, carries the implication that 25 other English constituencies may subsequently be suppressed. The logic of this arrangement may be impeccable, but its political practicability cannot be guaranteed.

From the outset of the movement for Parliamentary reform, when the first attacks were launched upon "rotten boroughs," it has always been harder to abolish old constituencies than it has been to create new ones. The parties are easily in agreement about the desirability of giving extra members to Hendon and Romford; they are, not unnaturally, much less ready to see the abolition of even the smallest of their "safe" seats. Is it really necessary to court this kind of controversy, with one party seeking to keep the small urban seats while another is equally anxious to preserve small seats in rural areas? In other words, can it be argued that a total Parliamentary strength of round about 600 members need be regarded as sacrosanct? It will not be forgotten that the House of Commons was probably in its prime when the number of members, with the inclusion of Ireland, exceeded 700. Nor is there any likelihood, in view of the probable trend of population, that to accept a smaller quota of electors per member than the 50,000 odd now proposed would invite the risk of a continuous swelling of Parliamentary numbers or an over-large House. Moreover, in a period of political history when it is increasingly the desire of members to keep in the closest contact with their constituents, there is much to be said for reducing the number of constituents to be served. Finally—and in one sense this is the most important consideration of all—it is only by the enlargement, within limits, of the number of members that the balance between office-holders and private members, which has been drastically disturbed by the multiplication of Under-Secretaries, Parliamentary Secretaries and Parliamentary Private Secretaries, can be satisfactorily restored. Plainly it will be necessary to abolish abnormally small constituencies whose number of electors has dwindled unduly; but there is a strong case for widening the margin of survival proposed by the Speaker's Conference (25 per cent below the "quota") and for permitting some increase in the total number of constituencies and members.

The Sixth Reform Bill, with these provisos, will surely be regarded as an important historical milestone. But it should not be thought that this final, or penultimate, exercise in the mechanics of representation will in itself furnish the political strength or democratic vigour upon which so much will depend for the future of this country in the next decades. It is as true now as it was in 1832 that Parliament is what it does. It has been a notable achievement to have preserved the strength of government while transforming its popular basis out of all recognition; and it is because of the critical necessity not to undo this achievement that the logic of those who advocate proportional representation is not acceptable. Even so, it is not enough simply to grant adult suffrage and to construct equal electoral districts. It is upon the quality of candidates and equally upon the good sense of electors that the outcome will depend; and the recommendation of the Speaker's Conference which has still to be announced upon the expenses of election candidates will touch at least the fringe of this crucial matter.

At present the way to Parliament for men of talent and character is doubly blocked; first by the expense involved; and, secondly, by the habitual preference of the main political parties for either money or seniority rather than for ability in their choice of candidates. It would not be unreasonable for the Speaker's Conference to recommend that the expenses of candidates at elections, and of members between elections, should be further limited in amount, and that, in the case of candidates at any rate, they should be paid out of public funds. The parties would then have no excuse for failing in their duty to put forward the right men and women to represent the people; nor would the electors have any excuse for omitting to elect the best.

## NOTES OF THE WEEK

### Great Events

Much has been said in this war about the common man. By this is commonly meant the less well-off who needs public aid to give him equal private opportunity. Sometimes he is the "little" man used by the big business men of the press to attack other big business. But the common man has another claim to fame, beyond his position as the object of social reforms or the subject of the struggle for free enterprise. He has fought the war, in the field and in the factory; and if there is any outstanding impression of these long war years in this country it is the ordinary behaviour of ordinary people when faced with extraordinary happenings. At every crisis in the war—September 1939, when the bombers were expected and never came; the catastrophe of Dunkirk which never became a calamity; the Blitz; the certain fall of Cairo which never fell; the German rout in Tunisia that was never expected; and now the grandest deed of all in the scale of history, the re-invasion of Europe—he has gone about his business with less excitement, less hand-wringing or less handshaking than seemed humanly possible. Eye-witnesses will always remember the ordinary behaviour of the ordinary people of Britain while history was making them and their kinsmen great.

\* \* \*

### The Initial Success

The opening of the invasion of Europe on June 6th brought initial successes that surpassed even the most optimistic expectations. The assembly of the expeditionary forces and their embarkation met with no interference from the Luftwaffe. The passage of the vast armadas across the Channel went on almost undisturbed; the intervention of the enemy's navy was too episodic and too feeble to cause confusion. The first vanguards of the invasion reached their destination on the coast of Normandy after the Allied air forces had partly destroyed the coastal defences. Elaborate anti-invasion obstacles under the water and on the shore proved less formidable than might have been feared. True, towards the end of the first day of the fighting and on the morrow some German coastal batteries were able to renew activity; but they could fire only on a reduced scale and for a short time. The first landings on the stretch of the coast between Cherbourg and the Seine Estuary were quickly followed up by a drive inland in which tanks took part on the very first day of the battle. The pattern of the operation has now emerged gradually as a design to establish the first large assembly base for the Allied forces on the continent. An advance inland from the beaches carried the attackers to Caen and into Bayeux on the second day of the fighting. This advance in the centre of the invasion area was supported by the landing of air-borne troops some thirty or forty miles behind the enemy's rear, between Argentan and Falaise. At those important road junctions the air-borne troops delayed the onrush of the German reserves towards Caen where the first heavy tank battle had developed. Similar massive landings of air-borne troops were reported from the east and south-west of the Cherbourg Peninsula. It seems that in the Cherbourg Peninsula their task was not only to protect the sea-borne landings, but also to play a more independent rôle in gaining territory. The central and western sectors of the invasion area have so far been the main scenes of the fighting, while little news has come from the eastern sector around the Seine Estuary.

\*

The first invasion days have shown technical excellence, precision of timing and a fine spirit on the Allied side. They have also revealed the striking inadequacy of the enemy's air-force, which compels him to hold back his reserves in aircraft—they are authoritatively estimated at 500 bombers and 1,750 fighters—for the most critical stage of the fighting. It should not be forgotten that this is the first baptism of fire for much of General Eisenhower's armies while the enemy has many seasoned and battle experienced soldiers. It is also important that the successful Norman prelude to the invasion should be seen in the right perspective. The Allied forces are still fighting for their first assembly base on the continent. Much remains

still to be done before this assembly base is established. Other assembly bases at key points on the Atlantic coast will have to be secured. There will be periods of intense activity and there may also be days or weeks of lull, before the drive into the heart of France begins, and before Allied blows make the Wehrmacht reel to defeat. But already the world has witnessed the great moment when History itself commanded the forces of freedom: "Hic mare, hic salta!"

\* \* \*

### An Administration for France

France is the first battlefield of the invasion. Paradoxically, it is still the only Western country with which Britain and America have concluded no agreement on the conduct of civil affairs. While in the very first hours of the battle, King Haakon spoke to Norway, Dr Gerbrandy to Holland, M. Pierlot to Belgium and M. Dupong to Luxembourg, France, the actual zone of operations, heard only the voice of General Eisenhower, and it was not until the afternoon that General de Gaulle spoke to the people of France. Nor do the messages of the two Generals throw much light on the question of a civil administration. General Eisenhower promised that Frenchmen would be in charge of France's civil administration and that Vichyites "would be removed." General de Gaulle told the people to obey the instructions of "the French Government." Does this mean that during his few days in this country General de Gaulle has succeeded in reaching a satisfactory solution? Are the plans worked out in Algiers by the French Committee and Assembly to be put into effect and will their Commissioners be assigned to each area as it is liberated? This seems the only alternative to the worst kind of political chaos. The French Committee claim that, whether they are recognised or not, their authority in France is such that only their writ will run. This is very

## WHITE HORSE

*was never better  
than it is to-day*

It would be easier to buy White Horse Whisky as and when you like to-day if there were not so many people trying to do the same thing. Like so many of the comforts of peacetime, White Horse is scarcer because of the war.

It takes long years to bring this famous whisky to ripeness and maturity. It took forethought and a provident care to provide the present regulated supply. And the same care and forethought are your assurance that to-day and in the years to come the quality of White Horse will be guarded as jealously as ever.

More White Horse could not be released without broaching stocks still growing old and ripe for your future pleasure. And for no consideration will the good name of this famous blend be put in jeopardy.

MAXIMUM PRICES:—Bottles 25/9d.; Half-bottles 13/6d.  
as fixed by The Scotch Whisky Association

probably true, but the mere suggestion that other groups can jockey for position may leave gaps where ex-attentistesses can find a niche, or, which would be worse, it may tempt ardent Gaullistes to abuse their popular appeal in order to make sure of their authority. An orderly arrangement alone will prevent excesses on both sides.

### The Fall of Rome

Everyone will be glad to hear that Rome has been liberated intact. The Germans made no attempt to fight a delaying action through the city. This might have gained them some time to extricate their forces more thoroughly from the positions south of Rome, but their withdrawal appears in any case to have been successful, and politics, not strategy, must have dictated their decision. The German Catholics—about a third of the population—have the most outspoken leaders of any potential opposition inside Germany. The German bishops have not minced words in their pastorals, and the pulpit is the only place where in recent years the Germans have heard public criticism of their rulers. The destruction of Rome might have had dangerous repercussions across the Alps. The Germans may also have been influenced, by a desire to preserve their doubtful rôle of “defenders of Western Civilisation.” By proposing that Rome should now be an “open city,” they are trying to make the city militarily useless to the Allies and to lay at their door the blame for any future damage. The weakness of the *Luftwaffe* revealed in the landings in Northern France suggests that the Germans will have little air strength available to attack Rome, whatever use is made of the city. For the Allies, its significance is now political rather than military. It is once again the capital of Italy. The King has resigned his powers to the Crown Prince, who, as Lieutenant of the Realm, has accepted Marshal Badoglio's resignation and asked him to form a new Ministry which will include political representatives of liberated Rome.

### The Italian Boot

The dramatic expedition across the Channel has up to a point overshadowed the great victories scored by General Alexander in Italy. Yet the advance up the Apennine Peninsula has now developed into a brilliantly conducted and lightning pursuit. The mopping up of the remnants of the German rearguard in Rome was completed on June 4th, while the main forces of the Fifth and Eighth Armies were already on Kesselring's heels to the west, north and east of the city. The main line of the pursuit leads northwards across the Campagna and along the coastal road. Here Kesselring's forces can no longer count on establishing defence lines as formidable as those by which they managed to delay the Allied advance to the south of Rome. They are also exposed here to the double and constantly present threat of bombardment from the air and of an Allied sea or airborne descent in their rear, based on nearby Corsica. The subsidiary line of General Alexander's pursuit runs to the east of Rome, along Highway Five, already reported to be dominated by the Eighth Army, which bars the way of retreat to the German forces, of unknown strength, that have not succeeded in disengaging or have been left behind as rearguards. General Alexander's objective is, as before, not merely or not even to capture territory, but to put out of action as large a proportion of the enemy's forces as possible. It is characteristic in this connection that the guerillas in northern Italy have now received the order not to interfere with the despatch of enemy forces to the south, but to do their utmost to upset their withdrawal to the north. The bearing of the Italian campaign on the western front needs no further explanation. The Italian boot is uncomfortably pinching Hitler's leg at the time when he must value freedom of movement above everything else.

### Weatherwise

In the silly season preceding the Second Front, the weather—in the Straits of Dover—began to reassert itself in the columns of the daily press. Day after day, the public was informed that there was a cloudless blue sky in the Straits—but not necessarily in any other part of the English Channel—that there was a heat haze, that thunder clouds were piling up, that there was a light breeze or a strong wind as the case might be; sometimes the reporter even

let his imagination flow in a description of the sea itself, which was choppy with breakers or calm and unbroken. Thus and thus did the press attempt to satisfy its readers' summer thirst for weather news without infringing the censorship regulations. It was a good enough joke while it lasted. But now that the Straits, or rather the Channel, have been crossed by Allied troops, is it not time that this silly secrecy should disappear with the silly season? Or is it at least not time that “They” should no longer get away with the plea of military necessity but have to show cause why news of the weather in London is of more value to the enemy than news of the weather in the Straits? In itself, the regulation is insignificant. But like the ban on church bells, which could only be lifted by slow stages, it is one more proof that the bureaucrat finds it easier to impose restrictions than to lift them, and with—it is hoped—the time approaching when many similar restrictions and impositions, such as the black-out and fire-watching, can be abolished overnight, it has a deeper importance. For the public will certainly, with a better grace, put up with the many necessary controls and regulations which will have to be maintained after the armistice, if those that are clearly unnecessary, and very irksome, are swept away unhesitatingly and at once. Cannot, therefore, that foolish pseudonym, the Straits of Dover, go the way of Parliament's “sitting days”? It would be a discard from strength.

### Location of Industry

Mr Dalton's explanation in the Commons on Wednesday of the policy of the Government on the location of industry, which was set out in the Employment White Paper a fortnight ago, met with much approval. The once-distressed areas will become “development areas,” to which it will be the Government's aim to “steer” the factories required to establish a balance between different types of industry. “Guidance, advice and suggestions” will be given by the Government on the location of all “important schemes for large extensions or new buildings”; and there will be a considerable enlargement of the powers of financial inducement and aid which were applied on a small scale before the war to the Special Areas. The chief criticism made in the debate was that the Government's intentions still do not go far enough; that there is still no proposal to direct particular industries to particular places or, in the case of London, whose congestion so much concerned the Barlow Commission four and a half years ago, to ban further industrial development altogether wherever necessary; and that the location existing industries will not be altered. It certainly cannot be assumed beforehand that the new location policy, which is consultative and persuasive in character, will prove sufficiently positive in practice to achieve its aims.

### Colonial Development

In last year's debate on the colonial estimates, Colonel Stanley dealt mainly with the political aspects of colonial rule, with the progress that had been made by certain colonies towards self-government in recent years and with the best means of encouraging that progress—by education in its widest sense of self-help. This year, he dealt with economic development, the second of what a year ago he called “the twin pillars upon which any sound scheme of political responsibility must be based.” He gave a full account of the machinery of planning in the colonies. In nearly all the big colonies there has been set up a Colony Development Committee, composed of the heads of the various departments of administration, some unofficial members, and one whole-time member, either official or unofficial, who is engaged full-time. The plans which these committees are drawing up are to be comprehensive and long-term—“real five- or ten-year plans covering the whole development of the colonies, and not just a new hospital here and a new road there.” Secondly, the Colonial Office is encouraging regional co-operation in planning—such as the Stockdale organisation in the West Indies, the Civil Members Committee in West Africa (which is composed of the Governors under the chairmanship of Lord Swinton, the Minister Resident, and to which outside experts have been attached), and the Governors' Conference in East Africa. Thirdly, the Colonial Secretary said that the part of his Department in colonial development is to stimulate and assist the formation of plans, helped by reports and investigations of the advisory committee, and also to make

certain that there is no one-sided development in any colony, but that detailed planning must be done by the colony itself. This machinery of planning is satisfactory. Colonel Stanley's emphasis on the need to encourage local enthusiasm and to allow a great deal of local initiative is reassuring. So, too, is his reiteration that the £5,000,000 a year allowed by the Colonial Development and Welfare Act is “quite inadequate for the needs which these plans will disclose.” But it is still doubtful whether the rôle allotted to the Colonial Office is positive enough, whether it ought not to give more of a lead to enable the local development committees to fix their targets high. Judgment must be suspended until more is known of the plans submitted by the colonies. They should be given the fullest publicity.

### Education in the Lords

“D” Day did no good to Tuesday's debate in the House of Lords when the Education Bill was read a second time. For the most part the few peers present came because they had prepared speeches which they were determined to make. Very naturally, there was very little of an audience. Yet the debate itself was a significant one. Never before, probably, has an Education Bill received such a cordial welcome from all peers, lay and ecclesiastical. Lord Woolton, who spoke for the Government, had an easy row to hoe. He voiced the opinion of the House when he claimed that the nation's greatest asset was its children; that the present system of schooling, for all its virtues, is not adequate to meet national needs; and that the most important advances proposed in the present Bill are the end of the existing class distinction between elementary and secondary education. Lord Nathan was largely concerned to stress the importance of what has now come to be called the McNair principle: that the recruitment of teachers should be as wide as possible from all sections of the community, with no type of talent or experience barred; and that teachers in training should have the closest contact, not only with the school in which they are to work, but also with the community to which they and their pupils inseparably belong. Lord Samuel, similarly, laid stress upon the physical conditions of good education, upon the achievements that have been made in the guarantee of nutrition and good health to school children. Significantly, too, he emphasised the dangers of mass production either of scholars or of teachers. Most outstandingly, the Bishops who spoke gave an unprecedented approval to the denominational clauses of the Bill. But both the Archbishop of Canterbury and the Bishop of Chichester were eager to add that the proposed arrangements for denominational teaching and the administration of religious schools should not be regarded simply as an organisational and financial compromise. Their approval of the Bill was determined by their belief that by it religious teaching is given an integral part in the new schooling. Briefly, but almost ominously, in these speeches, as in others, the still unresolved financial problem was indicated as the chief obstacle to these generally applauded reforms. It remains doubtful yet whether either local authorities, in view of the other extra administrative expenses to be laid upon them, or religious bodies will be capable, even with the proposed generous support from public funds, of bringing all the schools up to the standards which are to be obligatory upon the entire community. More and more, it is evident that some reconsideration of the local financial position, in face of new postwar tasks, is imperative and urgent.

### Change of Guard in Sofia

The protracted Governmental crisis in Bulgaria has ended in the formation of a new Cabinet under Ivan Bagrianov, former Minister of Agriculture. The new Ministry, which is described as a Government of experts, is politically almost colourless. The new Prime Minister himself has the reputation of being a friend of Germany, while his colleagues have no political reputation at all, and one of them, the Minister of Agriculture, Kostov, who was Professor at Leningrad University, can certainly be regarded as a friend of Russia. For the time being, the new Prime Minister is also the Minister for Foreign Affairs, but the permanent post is said to have been reserved for the present Bulgarian representative at Madrid, Draganov. This seems to indicate that, though the new rulers of Sofia have declared the intention of continuing the old foreign policy, they are nevertheless anxious to have as Minister of Foreign Affairs a personality who had established contacts

with non-Axis Powers in a neutral capital. On balance, it seems that, subjected to the double pressure from Russia and Germany, the Bulgars have decided to make no hasty move in any direction or to make haste very slowly towards Russia. Internal unrest in the country has grown, and though there are no symptoms of open civil strife, political disintegration has gone pretty far. A number of high Bulgarian officers have recently fled from their country and crossed the frontier to Turkey or to Russia or have joined the Yugoslav guerillas. Bagrianov's main pre-occupation is therefore to keep internal order in Bulgaria as well as in the occupied territories, where guerilla fighting goes on.

### Truce in the Balkans

King Peter of Yugoslavia has at last dismissed the old pan-Serbian Ministers by whom he was surrounded until recently, and he has entrusted Dr Subachitch with the task of forming a new Government. The new Yugoslav Premier is not a Serb but a Croat, a prominent member of Machek's Peasant Party. This may help him very much in finding a common language in discussions with the representatives of Marshal Tito, with whom he is expected to confer at Bari. Whether the choice of a Croat politician for the post of Yugoslav Prime Minister will be welcomed in Serbia is not at all certain, though Dr Subachitch has been an ardent supporter of the federalist conception of the Triune Kingdom and not a Croat separatist. King Peter has also invited General Michailovitch to send his delegates to the Bari conference. It looks as if the Lebanon conference, at which unity between the principal Greek parties was achieved, had provided the model for the programme of Dr Subachitch. The Lebanon agreement on Greek unity still awaits sanction by the underground groups in Greece itself. The leaders of the Greek Communist Party have in the meantime renewed their expression of confidence in M. Papandreou, the new Prime Minister, though the promotion of Admiral Voulgaris, who suppressed the mutiny in the Greek Navy, to be Commander-in-Chief of the Navy has brought some critical comment from the Greek

## From BURMA Cpl. Bennett reports: “An excellent smoke in tip-top condition”

This brief extract is typical of many similar letters on our files, all showing how much Gift Parcels of Rothman Cigarettes are appreciated by the men overseas. Here are two other statements from letters held at our Head Office.

“I have received acknowledgments in every case where I have instructed you to send parcels, including Africa, Italy, India, and a P.O.W. Camp in Germany. All have been delivered in good condition.” — R.C., Sheffield, 29.2.44.

“Over two years ago an order was placed with you for the delivery of 500 cigarettes per month. I have received every despatch to date — splendid cigarettes, fresh and compact.” L/Br. T.A., Royal Artillery, India, 25.1.44.

### DUTY-FREE SUPPLIES

Mailing these personal supplies of cigarettes, packed in sealed airtight tins, is a special feature of the Rothman Service. A duty-free parcel of 200 Rothman Navy Cut to H.M. Forces overseas costs 4/9d.; or to a Prisoner of War in Germany only 4/—, because no postage is payable. All orders are acknowledged by our Head Office, and are posted without delay.

Write to Rothmans Ltd., Folio 214, 5 Pall Mall, London, S.W.1 — or call at any branch — for special order form which includes details of cigarettes and tobaccos.

**Rothman** OF PALL MALL  
the best known tobacconist in the world

Left. Both the Greek and Yugoslav Prime Ministers, M. Papandreou and Dr Suachitch, are men of the Left Centre, and as such they are better qualified than their predecessors to work for a social and political truce in their countries.

### Local Administration

The recent Newcastle-upon-Tyne incident revealed a certain laxity of administration in the Civil Defence Services because of the blurring of responsibility between the officials of the council and the A.R.P. officers, who in several cases were one and the same person. This has led naturally to the suggestion from the Home Office that there should be a separation of powers in local administration at least in A.R.P. matters. This suggestion, from Mr Morrison, has not been well received, either by the local authorities most directly concerned or by other authorities in places where similar difficulties have not so far arisen. The view of several local councils appears to be that this directive represents yet another attempt by the central Government to impose forms of procedure upon locally elected representative bodies. It would be a gross error, however, if this kind of suspicion were to obscure the necessity for a clear division between the persons responsible for policy and those responsible for the policy's execution. It is reasonable that policy should be made by elected committees and that the chairmen of these committees, also elected representatives, should have a special concern in the business which is their committee's province. But it is wholly unreasonable, and dangerous in ways that hardly need specification, that these elected representatives, even though chairmen, should themselves be responsible for carrying out their own orders. There is a crucial need, in the interest of both efficiency and fairness, that the same distinction between elected and permanent personnel should be made in local government as is made between Parliamentary Ministers and the Civil Service. If on short-term and short-sighted views, Mr Morrison's plea in the matter of ARP is resisted, then many gloomy forebodings about the possible course of local administration will be given added justification. This is the more so because, owing to the suspension of elections, local committees and local chairmen cannot even claim to be properly representative of local opinion.

### Prosperous Countryside

The friend of the countryside often believes with all sincerity that, if people from the town would come to work on the land, a great deal of disease and poor physique could be eliminated at only a moderate cost in terms of industrial output. This time Sir John D. Barlow, speaking to the Farmers' Club, even maintained that such a policy was better than the "negative policy of spending untold millions on social services in urban areas trying to regain that which had been lost." The fact that agricultural communities are themselves already in great need of much increased social services always tends to be ignored in such arguments, and what is never made clear in statements like this is how the increased rural population can be at once large and prosperous. It is perfectly possible to have a prosperous agriculture, run by a small labour force and making the most of technical economies, or, alternatively, a large agricultural population whose average productivity would be considerably less than before and the cost of whose maintenance might be of the same order of magnitude as the cost of new social services in the urban areas. The real answer to ill-health and malnutrition in the towns of this country can never lie simply in our own rural areas, pleasant and restful though they may be. It can only be found in a high level of efficiency in the industries and trades for which we are suited, including the most suitable types of farming on an economic scale; in the provision of the cheapest possible food and raw materials, and in social services and redistributed income where necessary in both town and country.

### The Wolfram Ban

As a gesture of friendship and alliance, the Portuguese Government has banned all exports of wolfram to Germany. Mr Eden made it quite clear in the Commons that the British Government had conducted the negotia-

tions and that their success had been due to Portugal's desire to honour as far as possible their ancient alliance. Close contact was maintained with the American and Brazilian Governments, but the affair was clearly Anglo-Portuguese. As the Portuguese authorities put it:

In taking this grave decision the Portuguese Government wishes once more to prove its fidelity to the traditional alliance between the two nations.

It is therefore a little odd to learn from the State Department that the Americans in fact negotiated the agreement "in close co-operation with the British and Brazilian Governments." A short time ago when the negotiations with Spain did not end in one hundred per cent success, the State Department was quick to dissociate itself from the bargain and to blame the British. The Portuguese negotiations have obviously been very successful, and while the principle upon which the State Department seems to be working is understandable, it is not altogether designed to contribute to cordial understanding with the Foreign Office.

### The Polish Premier in Washington

The Polish Prime Minister, Mr Mikolajczyk, first planned to visit the United States at the beginning of this year. His trip was then cancelled. After the Soviet Government, having proposed a settlement with Poland on the basis of the Curzon Line, refused to enter into negotiations with the Polish Government, Mr Churchill offered his good offices as mediator. Private correspondence between Mr Churchill and Marshal Stalin failed to produce any positive results; and an earlier American offer of mediation was formally refused by the Russians. But further informal soundings have now apparently been made through American channels; and it was probably in connection with these that the Polish Prime Minister unexpectedly went to Washington last week. It is quite possible that Professor Lange and Father Orlemanski, the two American Poles who visited Moscow recently and conferred there with Marshal Stalin, have brought back some more specific proposals which will be the subject of Mr Mikolajczyk's discussions. Before his departure, the Polish Prime Minister repeated the Polish proposals for a temporary demarcation line between Poland and Russia which would leave Vilna and Lwów, the two largest ethnically Polish towns in the disputed area, on the Polish side. The Russians refused to consider this suggestion when it was first made; but it is not impossible that the gap between the Polish and Russian viewpoints may have narrowed since then.

### New Governments in Latin America

All Latin American governments are struggling more or less successfully with the tradition of lawlessness and arbitrary rule. In almost every state, the army tends to be a permanently disaffected centre and to be behind every violent change of government. It was true of Argentina and of Bolivia. It is true now of Ecuador. After last week's fighting, a provisional military government under General Alba has been set up at Quito and will hold office until President Ibarra returns from exile. The advent to power of the military clique in Ecuador is probably not dangerous in the wider context of United Nations relations. The army is not unfriendly to the United States and has received Lend-Lease material. But it may become dangerous in the narrower sphere of South American politics. The government of President Arroyo, the deposed President, settled the long-standing territorial dispute between Peru and Ecuador by an agreement which was to the advantage of Peru. Military leaders in Ecuador were not satisfied with the agreement and the change of government may lead to renewed trouble and even renewed fighting. The case of Ecuador shows how hard the habit of military intervention and arbitrary government is to break. This week's elections in Cuba are therefore all the more remarkable, for the tradition of Cuban politics was second to none in turbulence and bloodshed until President Batista assumed leadership in 1933. He rose from the ranks of the army and became the dominant figure in 1933 when after a "sergeants' revolt" he made himself Chief of Staff. From 1933 until 1940 he was the power behind the throne of a succession of presidents and used his influence to get the army out of politics and to reduce the inefficiency and corruption of the

regime. In 1940 he held a free and constitutional election and as Presidential candidate received an overwhelming majority. His four years of office have been peaceful, constitutional and on the whole progressive. The great question was whether he would allow a free election to supplant him, if this should prove to be the will of the people. Last week's elections suggest that his devotion to constitutional government covers even this concession. His nominee, Dr Saladrigas, has been defeated and the leader of the opposition parties, Dr. Grau San Martin, has been elected. The elections were perfectly free and there was no trace of army intervention. The question remains whether the new President and President Batista can now loyally reverse roles and continue the experiment of constitutional government in Cuba.

### Irish Election

The result of the general election in Eire has put an end to Mr De Valera's year-long government by a minority. The Prime Minister chose the moment for the election most skilfully, and found his opponents at their weakest. His party is once more in a position to govern with effective political backing in the Dail. Since the general election of June, 1943, Fianna Fail, of which Mr De Valera is the party leader, had been dependent on the support, or at least the acquiescence, of the minor parties, those of Labour and the Farmers, since it was in a minority of four in the Dail against the combined numbers of Fine Gael, the Farmers' Party, Labour and the Independents. Now the clear majority which Mr De Valera lost last year has been regained. The distribution of seats in the Dail among the various parties in the last three elections is shown below:

|                      | 1938 | 1943 | 1944 |
|----------------------|------|------|------|
| Fianna Fail.....     | 77   | 67   | 76   |
| Fine Gael.....       | 45   | 32   | 30   |
| Labour.....          | 9    | 17   | 8    |
| National Labour..... | ...  | 14   | 4    |
| Farmers' Party.....  | ...  | 14   | 11   |
| Independents.....    | 7    | 8    | 9    |

## AMERICAN SURVEY

### The South and the Fourth Term

(From a Correspondent in Virginia)

Richmond, April 20

IF President Roosevelt is nominated again for the Presidency, nearly all observers believe that he will carry the entire South. He probably will lose some of the "border states" on the fringes of the former Confederacy, such as West Virginia, Kentucky and Maryland, but the South proper is considered safe for him. It has been solidly Democratic almost continuously since the "reconstruction" era in the late nineteenth century; in addition, Mr Roosevelt, as President, has done more for that section than any occupant of the White House in modern times.

A year ago there was great speculation whether Roosevelt could carry the South for a fourth term, and numerous metropolitan newspapers in the North and Middle West sent correspondents across the Potomac and the Ohio rivers on tours of exploration, with a view to determining whether the rumoured "revolt" there against a fourth term was genuine. It turned out to be thoroughly *ersatz*. There was well-nigh unanimous agreement on that point in the ranks of the newspapermen.

This is not to say that the anti-Roosevelt sentiment in the South is less virulent than elsewhere. On the contrary, the enemies of the President there seem to be afflicted with a peculiarly deep-seated form of hatred, comparable to that found in the Chicago area. Nowhere are the President's critics more vociferous or more determined than between

These factors have probably contributed to the latest result. In the first place, the loss of five seats by Labour and National Labour combined was undoubtedly the result of the split in the labour ranks. Secondly, the party machine of Fianna Fail's nearest opponent has shown increasing inferiority and lack of grip. The third factor has undoubtedly been the difficulty of transporting the electors, of whom only 65 per cent voted, to the polls. The support for Fine Gael and for the Farmers' Party comes largely from the rural districts, where these difficulties are now among the most serious of the inconveniences arising from the war. The present result, however, cannot be taken as any indication of the future trend of Irish politics. Party policy and the choice of the electorate are both affected by the conditions of the war period and liable to considerable alteration.

### Social Security for All

Sir William Beveridge, in a speech last week, reiterated the political philosophy that lies behind his social security plan. This is that the state exists for all its citizens and not just for some of them. Translated into practice, this means that the community should assure to each of its citizens, as their right, a certain minimum standard of living. It follows that the same minimum should be forthcoming whatever the reason for the individual's inability to fend for himself, whether this be due to unemployment, illness or old age. The attainment of some minimum standard is in no way dependent on the attainment of any particular level of national income. It is a question, whether the country be poor or rich, of establishing priorities in production and consumption that will guarantee first a sufficient supply of essential goods and services for those at the base of the social pyramid. Every country can afford some level of social security. The only question is how high it can be in each case; and the higher the national income, of course, the higher the minimum. But Sir William's point is that the Beveridge plan for social security does not depend for its practicability upon the Beveridge or any other plan for full employment.

the Potomac and the Rio Grande, and they have been expressing themselves there since he ran for re-election the first time in 1936.

In the main they are persons of standing in their communities, with better than average incomes, and highly conservative points of view. Primarily it is the New Deal programmes in the realm of labour relations and race relations which have so aroused their ire. By providing legal protection for unions against the capricious and arbitrary attitudes of many employers, the New Deal has incurred the violent hostility of those employers, particularly in the South, where the anti-union tradition has been strongest. Sometimes, it must be confessed, Federal agencies and officials charged with the duty of providing fair treatment for labour have been excessive in their zeal, and unfair to management, but management would have been hostile in numerous instances anyway, simply because the unions were being given Federal protection.

As for the race situation, this probably has brought more bitter feeling against the President and Mrs Roosevelt in the South than any one thing. This region, as the former seat of the plantation slave economy, contains some 10 million negroes, or perhaps three-fourths of all those in the United States. The Roosevelts have been more largely concerned with bringing justice to this unprivileged element than any of their predecessors, with the possible exception

of President Abraham Lincoln. The result has been almost unprecedented antagonism towards both Mr and Mrs Roosevelt, especially the latter, who has espoused the cause of the coloured people with even more enthusiasm than her husband.

The recent decision of the United States Supreme Court that a state cannot legally confine participation in the Democratic party primary to white persons (as has been done in most Southern states heretofore), has brought scathing attacks on the Administration. The present court is largely the creation of Mr Roosevelt, since he has appointed seven of the nine members, and its decision reversed one which had been rendered unanimously by the same court on the same issue only nine years previously. Since nomination in the Democratic primary in the largely one-party South is practically equivalent to election, exclusion of Negroes from such primaries means that they have virtually no voice in the choice of their own public officials. The court's ruling that they must be admitted to the primaries was a particularly unpalatable dose in the so-called "Deep South," along the Gulf of Mexico, where the Negro population is highest. In the "Upper South" coloured voters have been admitted to the primaries in most states, although not on the same scale as the whites, since there is still very strong feeling among white Southerners—who remember the orgies of "reconstruction," when Negroes were given political control by the victorious North in various states—that "white supremacy" depends on keeping most Negroes from voting. This is accomplished in various ways—by educational requirements, by the "poll tax" of \$1 to \$2 which must be paid in certain jurisdictions annually in order to vote, and so on. A determined and prolonged effort in the Federal Congress to repeal these poll taxes, which have been levied by the state legislatures, is another cause of great antagonism to the Roosevelt Administration, which is supposed to be supporting the attempt.

Yet, despite hostility to the President, from those who object to his policies in the field of labour relations and race relations, to say nothing of his programme for the relief of tenant farmers through Federal loans, his "socialistic" measures, such as the great electric power and flood control development in the Tennessee River Valley, and his expansion of "bureaucracy"—despite all this, sentiment in the South has long been overwhelmingly favourable to him. This was demonstrated in 1932, 1936 and 1940, when he carried the South by huge margins, in the face of hostility sometimes just as violent as that of to-day.

There is nothing particularly surprising in this. The extremely vocal opposition to him comes largely from a relatively small coterie of manufacturers and business men. The Southern masses, on the other hand, recognise the substantial benefits which his three terms have brought them and the region.

For example, the cotton and tobacco farmers are getting some of the highest prices in history, a situation for which Mr Roosevelt's administration is partly responsible. The wage-earners are enjoying the benefits of a 35-cents-an-hour minimum wage, which will go to 40 cents next year, under the Roosevelt Fair Labour Standards Act. The reciprocal trade pacts, whose chief champion is Secretary of State Cordell Hull, are directly in line with the best interests of the South, which has long been handicapped by the fact that the tariff benefited the North, and Southerners had to buy in a protected domestic market, while selling their products in an unprotected foreign market. The small farmers of the South have had the benefit of loans from the Federal Government for the rehabilitation or purchase of their farms, a service which has been of inestimable help to them, and also has increased food production for the war.

Then, too, there is the fact that the South, the most belligerent and warlike and pro-Ally part of the United States, appreciates the leadership which Mr Roosevelt has given the country in the greatest crisis it has ever faced. The South is less anxious to shift to another leader while the conflict is in progress than some other regions are.

Just now the vocal group of anti-Roosevelt Southerners, consisting mainly of financial and business interests, is holding meetings throughout the South in an effort to work up enough sentiment behind Senator Harry F. Byrd, of Virginia, to nominate him for the Presidency over President Roosevelt. Senator Byrd is a direct descendant of the famous Colonel William Byrd, of "Westover" on the James, who founded the city of Richmond, and was the most talented writer and greatest bibliophile of the early eighteenth century in America. Senator Byrd has been at odds with President Roosevelt since the latter's first term, and he has just been

described in two *Saturday Evening Post* articles as "The New Deal's Hair Shirt." A wealthy man, who made his way through his own efforts, he believes sincerely in the old concepts of "rugged individualism," as opposed to what he terms the Administration's wasteful paternalism and extravagant bureaucracy. His chief function in the Senate has been to recommend means of saving money, and he did succeed in cutting down Federal outlays by over \$2,000 million in a two-year period, most of it in ways beneficial to the body politic. But if Senator Byrd were given *carte blanche* to do as he sees fit to the Federal establishment, he would eliminate most of the social services, and reduce the Federal mechanism to its simplest terms, retaining a minimum of "interference" with the individual, and a maximum of "free enterprise."

This is the man behind whom the anti-Roosevelt elements in the Southern States have been rallying of late. They have held regional meetings at various places, under the leadership of John U. Barr, a New Orleans rope manufacturer, who is vice-president of the ultra-conservative Southern States Industrial Council. Most, if not all, of the meetings have drawn small assemblages of anti-Roosevelt elements. The reason for the smallness of the response apparently lies in the realisation of most of the prospective Byrd supporters that their man cannot be nominated. If Mr Roosevelt wants to run again, he can do so. If not, he can control the convention. Fully aware of this, Mr Byrd himself has discouraged the movement in his behalf.

Whether the President will seek a fourth term remains uncertain at this time, with most of the uncertainty revolving about the question of his health. But if he wants the nomination, he can have it, and if he runs, he will certainly carry the South, despite the highly articulate nature of the opposition to him in this region.

## American Notes

### KNAPP

The Congress of Polish Americans, which took place at Buffalo last week, was preceded by Homeric disputes between the various political groups that compete for influence among the Americans of Polish descent. The ties between those Americans and their "mother-country" have always been fairly strong; and so Polish domestic affairs have always tended to produce repercussions among Poles in Chicago, New York and Detroit. The National Committee of Americans of Polish descent (KNAPP—Komitet Narodowy Amerykan Polskiego Pochodzenia) has provided the ground on which Polish political feuds have been fought out. In the election of 1940 KNAPP worked with great enthusiasm for Mr Roosevelt. All Poles were then, equally interested in helping to bring into the White House the man whose election provided the best chance of American participation in the war against the Axis. Since then, however, much has changed. To some Poles, at least, the President now seems to symbolise the policy of co-operation with Russia at the expense of Poland. Those Poles—grouped around Colonel Matuszewski, former Polish Minister of Finance, and Mr Węgrzynek, a big importer of Polish bacon before the war, and sympathisers with the old Colonels' regime—have now transferred their support to the Republicans. Some time ago they succeeded in gaining a dominating influence over the New York branch of the KNAPP, and decided to use New York as a jumping-off ground from which to conquer the key positions in the Polish American Congress. They hoped to win the Congress for an anti-Roosevelt vote, and to turn it into the forum of an extremist anti-Russian policy. At the same time, they intended to exploit the Congress for a show-down between the Pilsudskists and the present Polish Government, which they accuse of having sold Poland's interests to Russia and the democracies. The Matuszewski-Węgrzynek group have been opposed by the supporters of the present Polish Government, who were anxious not to involve the Congress in anti-Roosevelt manoeuvres, but who nevertheless desired that it should put pressure on the President and demand from him a "stiffer" pro-Polish attitude in the Russo-Polish conflict. A third group, led by Professor Lange, Krzycki and Father Orlemanski, has been unconditionally pro-Roosevelt and has hoped that Mr Roosevelt might, like Mr Churchill, speak out in favour of a Polish-Russian settlement based on the Curzon Line. This latter group was not admitted to the Buffalo Congress at all. The Matuszewski-Węgrzynek group remained in a minority, though Mr

Węgrzynek himself was elected to the new Board of the KNAPP. The Congress adopted a resolution which was neither for nor against Mr Roosevelt. Ostensibly evading the election issue, the Congress addressed to the President a very emotional plea in favour of Poland's pre-war frontiers with Russia and branded any change in those frontiers as a betrayal of civilisation. This appeal has brought a spate of accusations against the Polish Government in London, which is accused of using its influence in order to blackmail the President and meddling in internal American affairs, accusations against which spokesmen of the Polish Government have vigorously defended themselves. The effect of the Congress on the attitude of the Poles in the elections cannot easily be predicted. The suspicion that the President may have accepted the Russian viewpoint on the Curzon line at Teheran may throw many Polish Americans into Republican arms. Against this must be set the traditional Polish leaning towards the Democratic Party, which has always treated the American Poles—one of the not very wealthy and not very influential national groups in the United States—more liberally than the Republican Party. There can be no doubt that a just and satisfactory compromise between Poland and Russia, freely accepted by the Polish Government, would eliminate the Polish issue from American pre-election politics and kill at a stroke the many demagogic manoeuvres which are now being prepared. The present visit of the Polish Prime Minister to Washington may possibly yield good results.

### Lone Star State

The Lone Star State seems to be seeing double. A split in the Democratic Party in Texas has produced twin conventions and slates of delegates to the National Convention, the first concrete evidence of a rift in the Solid South. Conservative opposition to the Administration on the part of Texas Democrats rests, in the main, on wartime policies affecting the oil and cattle industries; but there is no doubt that it was the Supreme Court decision on the rights of Negroes to vote in the Texas primaries which brought it to boiling point. The anti-Administration group has adopted a resolution to the effect that if the National Convention seats a "rump" delegation, or does not accede to the anti-negro plank on the platform, Texas electors will not feel bound to vote for the Democratic nominee. (The final vote for President is technically cast by state "electors," but it is unheard of for electors not to follow the popular vote in their states, although, constitutionally, they have the right of free choice.) This is an ambitious try-on. Despite the speculations of the columnists, it is hard to believe that Texas, or other Southern states like Mississippi, Virginia, and South Carolina, would in the end allow their electors to misrepresent popular feeling in their states, or that the election might have to be decided by the House of Representatives, the solution if neither Republican nor Democratic candidate receives a majority in the electoral college. Where the revolt may have its effect is in the choice of the Democratic Vice-Presidential nominee. It is worth remembering that Mr Rayburn, often in the past tipped as a likely peace offering to the conservative South, comes from Texas. If the split is to be healed, as even most Republican commentators glumly assume, Mr Rayburn's name may yet supplant that of Mr Wallace as the President's running mate.

### Catechism Before Breakfast

Mr Hull showed some acerbity this week over criticisms that the small nations are being left out of the planning of the peace. His press conference was distinguished by an unusual tartness, as when he snapped—

I see no reason why the American people should be catechised every morning before breakfast as to their loyalty to liberty, or their consistent desire of liberty for everybody, and freedom for aspiring peoples everywhere.

Mr Hull's irritability is understandable. Although approval of his method of Senate consultation and of the reported American draft plan is growing, there is a genuine feeling among liberal elements that too much emphasis is being placed upon the rôle of the Big Four, and that at least one very important nation, France, is being treated cavalierly. Apart from this, there is also a disposition in some sections of the press to manufacture grievances and exaggerate scruples to discredit the scheme. The comments of some

Senators, like Messrs LaFollette and Vandenberg, that they do not want to commit themselves to collaboration until they see the terms of the settlement, are calculated to create suspicion and discouragement. Mr Hull's cautious approach may not be altogether of his own volition. The opponents of collaboration apparently are determined on a resurrection of the Fabian tactics which Senator Lodge pursued in 1919. Lodge thwarted Wilson, not by an outright assault upon the League, but by piling reservation on reservation until the thing was smothered. It is difficult not to read a similar danger of acceptance hedged by disabling conditions into some of the statements attributed to Senator Vandenberg. The sincere dislike of "power politics" held by many Americans may be made a strong element in this scheme of passive resistance.

### Wolf, Wolf

The War Manpower Commission has made so many optimistic pronouncements on the manpower position that a certain wariness is excusable in appraising the new controls to go into effect on July 1st. Nevertheless, it appears that Mr McNutt has plunged with some boldness into the vacuum created by the disinclination of Congress to take the warnings of the Services seriously. The new plan is labelled "semi-compulsory," and is an extension, on a national scale, of the scheme already in use in areas of acute shortage. Under its provisions, no employer will be able to hire any full-time male labour except through the United States Employment Service, or designated agencies. No man over 17 (with certain exceptions, including farm labour) will be able to change his job without getting a card from one of these approved agencies, its issue in general being dependent on his willingness to accept one of the urgent vacancies the agency has been asked to fill. There will be some freedom of workers' choice, but it is emphasised that the jobs offered need not be in the workers' home towns. The advantage of the scheme is that, if it is enforced, it should cut down turnover and direct at least a trickle of labour into essential work. What it fails to do is to get at men in non-essential

## KODAK FILM is helping to design better aero engines

Illustration is from a cine film made by Kodak's super-speed camera at 2,500 pictures a second. The film shows various aircraft fuel injection jets in action. On the screen the action can be studied in ultra-slow motion and this has enabled the jet with the best fuel distribution to be selected. If you have difficulty in getting 'Kodak' Film, one reason is because vast quantities are needed for vital work in industry.

jobs who are canny enough to stay put; and it does not touch female labour at all. Nor does it appear what penalties attach to evasion of the order, or how it is to be policed. In the first and third respect it is plainly inferior to the Bailey-Brewster bill now before Congress, which would use the threat of conscription into the Army to freeze essential workers in their jobs, and to force men from non-essential industry without waiting for them to make the first move. Mr McNutt's directive has, however, one decisive advantage: to go into effect it need not wait, perhaps indefinitely, upon legislators reluctant to compromise themselves, at this critical time, with their constituents.

### Guaranteed Wage

It was from the steel industry that the formula for war-time wage stabilisation came. The formula is once more on trial, in the steel industry, with the CIO demanding a wage increase of 17 cents an hour. To grant the increase in the very industry which set the standard for nation-wide stabilisation could hardly be disguised as anything but the smashing of the formula. For that reason, particular attention is being directed to the subsidiary demands of the union, in the thought that if these can be satisfied, the frontal assault on the wage freeze may be averted. These include such items as severance pay, the union check-off, sick leave, company establishment of group insurance plans; but the most spectacular is the request for a guaranteed annual wage, over the next two years, in an industry noted for the violence of its employment swings. Mr Murray, head of the steel union, appealing for congressional approval of the principle, argued that farmers have been guaranteed a postwar 90 per cent of parity prices, and that industrial profits are protected for two years through tax provisions; and that the same sort of provision should be extended to labour. A variety of such schemes, on a small scale, already exist in the United States, notably in soap (Procter and Gamble), in shoes (Nunn-Bush), and packing (the Hormel Company). The "sit-in" strike staged by Brewster workers last week, when the company lost its Navy contract, and consequently had no work to offer, can hardly fail to stimulate interest in methods of stabilising post-war employment. Senator George, chairman of the Senate Postwar Committee, somewhat surprisingly gave the Murray proposal a mild blessing. The steel industry, less surprisingly, finds the

plan "impractical," "revolutionary," and calculated to force the industry into bankruptcy. The possibilities of stabilising the industry into bankruptcy. The possibilities of stabilising steel production plainly are on a slighter scale than those of stabilising the production of soap or shoes, standard consumer products capable of being warehoused. But Mr Reuther, head of the Automobile Workers' Union, made it clear that labour is thinking along these lines by suggesting a plan for spreading car purchases more evenly through the year. If the steelworkers are not determined to freeze steel employment at war-expanded levels, the proposal may have some chance of success.

### Enfranchising the War Worker

The census bureau has just released figures showing that men and women of an age to vote have increased over 8 million since the last Presidential Election. This large increase is due mainly to the advancing age of the population as the birth-rate declines. In 1940 62.4% of the approximately 80 million able to vote took part. In 1942, the proportion was much less, partly because it was not a Presidential year, partly because so many war workers were disfranchised owing to having moved across state boundaries. Recent New Deal victories suggest that this immense migration—calculated at over 3 million—has now settled down enough to allow war workers the opportunity to register, and thus to vote. One of the main functions self-imposed by the CIO's Political Action Committee has been to get its voters registered where outside stimulus was needed. Should it prove that war workers are now eligible to vote in substantially greater numbers, it may prove a central factor in a Democratic victory, for one of the main sources of President Roosevelt's strength is with labour. It will help to offset the inevitable loss of votes resultant upon the inadequate soldier-vote bill. The Democratic party is peculiarly dependent upon its young voters, not only for numbers, although these are important, but for party workers and enthusiasm, and it has suffered disproportionately, therefore, from conscription and the calls of war work. At a time when considerable numbers of the party organisation stalwarts find their devotion to the Administration somewhat tepid, and the power of the "state-house machines" has been lessened by the loss of so many state governorships, the need of getting out the working vote is particularly acute.

## THE WORLD OVERSEAS

### Credit for Canadian Industry

[FROM OUR OTTAWA CORRESPONDENT]

In its Industrial Development Bank legislation, the Canadian Parliament took one of its first steps in implementing post-war policy. In the field of intermediate credit, besides the industrial bank, the Canadian programme will include credit measures in the fields of housing and agriculture and, in addition, a scheme of export guarantees. These were forecast in the 1944 speech from the Throne, and the industrial bank was the first legislation brought in. "If we are to maintain employment and income after the war," said Mr D. C. Abbott, Parliamentary Assistant to the Minister of Finance, introducing the Bill, "we must envisage a high level of industrial activity." His outline of the functions of the proposed bank showed that it would be supplementary to the lending activities of commercial banks and other private lending institutions.

In general outline, the problem of maintaining "a high level of economic activity" in Canada after the war is clearly recognised. The 1943 report of the Bank of Canada stated it in terms of the employment problem. In 1939, Canada had 4,000,000 persons gainfully employed and 300,000 unemployed. At present, 5,100,000 Canadians are gainfully employed, of whom 1,900,000 are in the Armed Forces or in war production. Thus, the civilian sector of the Canadian economy at present employs only 3,200,000 persons. After the war, it is estimated, 4,700,000 persons will be available

for employment, or 1,500,000 more than now employed in civilian categories.

A working force of this size [the report says] at present rates of efficiency, will be able to produce a vastly greater volume of civilian goods and services than Canada has ever known. By the same token, a vastly increased volume of consumption and capital development will be necessary if this output is going to be fully absorbed and high employment maintained.

The chief agency of capital expansion in industry during the war has been the Department of Munitions and Supply. Down to the present, the sums it has provided as capital have amounted to more than \$1,750 million; of which about \$900 million has been distributed as working capital and about \$850 million as fixed capital. Against these immense sums, the provision of only \$60 million for "additions and extensions to plants" in the Department's 1944-45 estimates seems a paltry sum. It indicates that the momentum of industrial activity must begin to rely on other credit agencies.

For the most part, the Canadian viewpoint accepts private lending as the answer. But in bringing forward the Industrial Development Bank Bill, the Government argued that a serious gap existed in the Canadian financial structure for the provision of intermediate credit for new or existing small industries. Parliamentary speakers debated at length the meaning of "small," and the definition of enterprises coming within the scope of the new bank, contained in the Bill, showed a generous intention. It was:

A business in which the manufacture, processing or refrigeration of goods, wares and merchandise or the building of ships and vessels, or the generating or distributing of electricity is carried on.

The new bank will be a subsidiary of the Bank of Canada, with that bank's governor, Mr Graham Towers, as its president. Its directors will be drawn from the Bank of Canada's board. It will have an authorised capital of \$25 million subscribed by the Bank of Canada and the right to raise an additional \$75 million by the issue of debentures. This is not a large sum, though, since the width of the gap in intermediate credit is a matter of dispute, it may be more than sufficient. The gap will obviously depend on the extent to which ordinary sources of credit come into play again. The business likely to find its way to the door of the ID Bank will be small or medium, of the kind that has difficulty in financing through issue of stock and which needs credit beyond the short-term limits imposed by statute upon the commercial banks.

Precedent for making the new bank a subsidiary of the central bank rather than a separate Government-owned institution, was found in the Bankers' Industrial Development Corporation, the Bank of England's industrial salvage subsidiary, and Section 13 of the US Federal Reserve Act, which permits federal reserve banks to make industrial loans.

In the Canadian Parliament, the Bill drew forth a variety of views. On one thing, general agreement existed. It was that industrial development in Canada will proceed in future at an expanding rate. Two or three Conservatives argued that no justification existed for the Government entering the field of industrial credit. The small Social Credit group renewed their arguments that not production, but consumption, was the proper field of Government intervention in the field of credit.

The Co-operative Commonwealth Federation Party, betraying some lack of unity, argued for continuance of the wartime controls of credit and investment, in the interests of "national planning and a national investment authority." The nationalisation of the banking system, one of the CCF objectives, found one dissenter in the CCF ranks.

I do not visualise a time in the future [said Mr Gillis, the Nova Scotian CCF member] when the state will be supreme in this country, nor do I believe the organisation of state banks is the answer to the extension of a democratic order of society.

Mr Gillis argued for a wholesale development of co-operative credit unions.

Yet most of the CCF opposition, ardently in favour of political democracy, advocated the adoption of state control in economic policy.

### West African University

[FROM OUR ACCRA CORRESPONDENT]

THE Elliot Commission on higher education in West Africa has returned to Britain and its findings are not expected until the end of the year, but interest, especially in the question of a West African University, is kept alive by repeated editorials in the West African newspapers, and debates and discussions in educational centres in all four colonies.

From the evidence given before the Commission and the opinions aired in discussion it is clear that the location of a West African University tends to take precedence over the question of the actual desirability of a university. The prior claims of Fourah Bay, Achimota, and Yaba as the possible nucleus of a university are the subject of keen discussion in Sierra Leone, the Gold Coast and Nigeria. The major problems of establishing the functions of an academic institution in West Africa and its rate of growth are apt to be dismissed by African opinion as already solved. When the Principal of Achimota, recently addressing a meeting under the auspices of the Old Achimotans at Accra, pointed out that there would have to be a greater appreciation of the academic and corporate aspect of the undergraduate life and of the value to be gained from the student's "rubbing his mind against a better mind" if a university was to make a substantial contribution to West African society, he received a friendly press report. But it was clear that he had presented a new idea to many people who look on a university as a bigger and better secondary school.

The social position and the economic security which a university might bring to its graduates is readily appreciated here. Parents who send their children will be looking at the hall-mark conferred upon them and the grade of salaried

post in the Civil Service and business which an academic qualification might bring. This will probably be a weightier argument in the eyes of educated Africans for an expansion of the university's activities than the possible prestige value it would have in the eyes of the rest of the world.

If this were condoned with to the exclusion of more academic activities, the problem of the secondary school would have been raised again in another form. Educational thought in West Africa is now turning away from the fostering of cramming courses for the Cambridge school leaving certificate at secondary schools. It looks towards "the introduction of a type of education more suitable to the needs of the country" (Advisory Committee on Education in the Colonies), and to a leavening of the whole mass of illiteracy through adult education. But to superimpose a university on top of the educational system will require a very high standard of teaching in those secondary schools which are now in existence.

### The Scope of Employment

Yet it remains true that a university must be judged to a considerable degree by its ability to train graduates for employment. Where are the jobs for the graduates to take up? Some will go to the teaching profession and many, no doubt, will expect in time to oust Europeans from the Civil Service. Others with B.Sc. degrees will find openings as engineers in the railways and as research officers in government departments. The field for research in economics and sociology in West Africa is wide and, as yet, largely unexplored. Moreover, there is more than ample scope for the doctors in the field of health and nutrition. But the openings will be limited, especially on the managerial and technical sides, unless educational expansion and economic expansion march together. A buoyant revenue from taxation must be achieved to help bear the cost of the consequent expansion in government departments.

Those responsible in the four colonies for post-war reconstruction plans are aware that the solution to this problem does not lie merely in equating a given number of potential graduates to a number of jobs. Once he is graduated, the West African will still need in many cases more education in managerial responsibility than his opposite number in the old industrialised countries. He will also need more time to adjust his ideas to a new post-graduate environment. Nevertheless, the problem remains of providing employment, if necessary with European supervision, to absorb the output. The demobilisation of tradesmen and clerks, trained by the Army, after hostilities cease in the Far East, gives further urgency to the problem, for a great number of these will expect employment in an industrial environment as machinists, lorry drivers and clerks. Their reabsorption is a short-term problem, but its solution would materially assist the more permanent difficulty of absorbing graduate labour.

The organisation of cocoa marketing, by helping the farmers to learn a less haphazard method of cultivation and freeing them from the worse consequences of price fluctuation and the burden of usury would provide clerical, managerial and research employment, and, with similar schemes for groundnuts, palm-oil and cotton, would be the basis for an orderly economic expansion. To these must be added the employment value of stable conditions in the gold, manganese, tin and other extraction industries. Stable commodity prices would give an opportunity for an estimate of the economic possibilities of processing industries in cocoa, leather, palm-oil and other products.

But in the case of the cultivation of the oil palm, for example, improved methods might involve a revision of the land-tenure system. No matter how undesirable such a step might be in the eyes of a conservative older generation, it might yet have to be regarded as a part of the price of advancing with the times, the price of the higher education which is everywhere demanded.

### Egyptian Cotton

As a result of the cutting off of the European and Japanese markets, all the major cotton-growing countries have had to restrict their production in some degree to avoid burdensome surpluses. The degree of restriction has been most severe in Egypt, where the acreage is now cut to less than half what was normal before the war.

The necessity of increasing wheat crops to supplement food supplies was another potent reason for this cut in

Egyptian cotton growing. Present legislation imposes on all growers a maximum acreage for cotton and a minimum for wheat. This is an indication of the fact that, if left to themselves, growers would prefer to grow more cotton, and it is probable that the acreage under cotton will quickly expand to pre-war dimensions as soon as the free play of individual choice is allowed.

Higher wheat prices have only approximately made up for the lower yields which have been the result partly of a shortage of artificial fertilisers and partly of the unbalanced agricultural rotation which has been made necessary to achieve the required acreage.

Yields of cotton, on the contrary, have been maintained remarkably well. The average for the war years has been as high as for the previous five-year period, while prices have steadily risen. The basis fixed for FGF ("Fully Good Fair") Ashmuni by successive official buying commissions has been as follows:

- 1940—14½ British Government Commission.
- 1941—16½ Joint Anglo-Egyptian Commission.
- 1942—20 Egyptian Government Commission.
- 1943—24 Egyptian Government Commission.

The earlier commissions took delivery of fairly large quantities of cotton. In 1941, they tendered for more than half the total crop. But the free market has remained open the whole time, and a combination of genuine trade and keen speculative interest has now carried FGF Ashmuni to 29, so that the current commission has taken practically no cotton.

Total stocks in the country were estimated by an official census in August, 1943, at 10 million kantars (1 kantar=

100 lb.), which is only slightly larger than the pre-war crop of one average year. On the present limited acreage, which is to be maintained in 1944, crops of 3 to 4 million kantars are being grown, which about equals the requirements of the local industry and of Britain, the United States and India. The Egyptian cotton industry, which is working round the clock, is now consuming up to one million kantars a year, in place of 600,000 before the war. Stocks are not at present increasing, and local hopes are that a large demand from liberated Europe will provide the opportunity for a flourishing trade, at any rate in the immediate post-war period.

Cotton as a speculative investment is attracting large quantities of the surplus purchasing power at present available in Egypt, and more and more of the carry-over is now coming to be privately owned in this way. Unfortunately this is likely to lead to inflated ideas of the post-war value of cotton by the local public which still has memories of the cotton boom following the last war.

If, on the other hand, no attempt is made to hold out for inflated prices, such a situation might be avoided, even with keen competition from rayon and the newer synthetic fibres. There are several factors which are likely to operate in favour of a steady demand for Egyptian cotton in the longer period. As a quality product, it enjoys a premium over the cheaper American varieties, although the demand for it is closely dependent on a rising standard of living. In addition, yields per acre are the highest in the world, and are steadily being improved, while modern methods of spinning and weaving prefer a longer-stapled and stronger yarn, to minimise stoppage due to breakages.

## Germany at War

### Fight to the End

THE actual invasion of France has ended the "phase of expectation" during which the Germans have been on the defensive in all theatres of war for more than twelve months.

Obviously the Nazi politicians and generals must have some hopes that the defence may in some way prove successful. The question is how and when and where they hope to gain this success. Economically and militarily German strength is much inferior to the accumulated power of the Allied Nations. There is no chance that the Germans will be able to go over from the defence to the attack again. Looked at like this, the defensive would seem to be useless and only a fruitless prolongation of mutual destruction. Yet the leading spokesman of the Wehrmacht, General Dittmar, recently rec'd and stated the conclusion that the political and military conditions of "totalitarian war" had changed the classical view that a defensive, however actively conducted, cannot win a war. "Totalitarian war," on the contrary, according to Dittmar, has created conditions in which the side which carries on a defensive actively and successfully can reach a favourable decision.

There is little doubt that Dittmar expressed the attitude of the Nazi politicians and generals. What exactly he meant—apart from the obvious purpose of stiffening morale—is hard to say. More than morale is clearly involved, for the Germans are still fighting hard—with what hopes? Immediately, of course, the question is simply how long they can hold out. How far do the material conditions exist in Germany to continue an active defensive against a co-ordinated and prolonged Allied attack? No power of propaganda or subtle tricks can create such conditions. Dittmar himself has been the advocate of a policy of husbanding resources, and his statement came after a period in which, from a military point of view, the Germans had been using their forces as sparingly as possible on land as well as in the air.

There is no clear-cut method of finding out what Germany's material situation is like at present. During the course of this war every imaginable difficulty that can happen to a belligerent power has happened in Germany. Economic problems that were discussed and solved at the beginning of the war recurred at different stages even before large-scale bombing became a permanent feature. As before, on occasions such as the winter reverses of 1941-42, the Stalingrad disaster and the fall of Mussolini, the first sustained air onslaught on a large scale created a situation of the utmost muddle and even political crisis. Each time the regime recovered and achieved some measure of very temporary stabilisation.

It seems that, in spite of the destruction of the major part of Germany's big towns, war production, war transport and some degree of civilian life, at an extremely low level, go on. No comprehensive picture of Germany at this important stage of the war can be drawn on the analogy of the situation in 1917 or 1918. The political and social tensions of that period have ostensibly been eliminated by a centralised totalitarian regime. Economic conditions are different in every aspect. Shortages which would have been crippling in 1918 have been overcome by tremendously wasteful substitute production. With regard to large-scale bombing, modern industry, using electric power, has been dispersed over the country ever since the reconstruction period after the last war. Apart from the extractive industries German industry has become highly mobile; and after the vast muddle of last summer, the centralised economic administration has succeeded in dispersing essential war production over the whole country.

This dispersal occurs in the most diversified forms. It is a process rather than a temporary evacuation of

factories from bombed towns. The present phase of the process has two distinctive features. One is the repair and evacuation of bombed factories; the second is the planned dispersal of new factories. Sometimes a Wehrmacht order placed with a manufacturer carries the condition that the plant where the order is to be executed is to be established at a specified place. Over a long period, the prefabrication of factory shops and the standardisation of machine tools and designs has been carried very far.

Another feature is that evacuation and the dispersal of people and factories into the countryside has obviously tapped new sources of labour. The children, the old people and the housewives in remote places and villages have been drawn into war work during recent months. Manufacturers have established a method which makes it possible to engage whole villages in assembly work and part time work in which the working processes are broken down into the most simple operations.

On balance, of course, there can have been no increase in war production. There has undoubtedly been a very big decline. But all these methods, combined with a further reduction in civilian production and consumption, may have arrested the serious decline caused by heavy bombing. Family relations or political and social conditions present no obstacles; the totalitarian regime does not know of such things. The only concern is to maintain physical conditions sufficiently for the workers to retain their ability to work.

#### Hopes of a Stalemate

At the beginning of the large-scale bombing, the Nazi authorities showed real anxiety and even alarm about the possibility of a physical breakdown of the bombed people. Whether this anxiety has been dispelled is impossible to say. Additional food rations after each heavy bombing raid, the utmost expediency in supplying bombed towns and areas with emergency shelter and household commodities, and above all the frantic efforts to restore places of entertainment show the direction of Nazi policy.

From a material point of view, then, it certainly seems that there is no safety margin left for the German war economy. The withdrawal and retreat from southern Russia and Italy has made Poland and Czechoslovakia Germany's

more valuable conquests in an industrial and particularly in an agricultural sense. The conquests in Western Europe, on the other hand, have become potential theatres of war. In Germany itself, the central and especially the eastern provinces are now the more important regions. Northern Italy, the Balkan countries and Hungary are actual or potential battlefields; and there is no doubt that the general strategy has taken into account further withdrawals when the grand Allied offensive begins.

Yet the Nazi politicians and generals alike have a fixed idea, that is, the idea that to gain time is to win a battle. What do they expect to get out of it? It is perhaps hard to attribute to them any higher purpose than Micawberish waiting for something to turn up. They admit that at present the advantage is with the Allies. They also seem convinced that the final Allied offensive, when it begins, will end without a clear-cut decision. This active defence, then, is designed to create a situation of military stalemate. If they can go on defending, they apparently argue, the war will end without their being beaten. They are like a football team that continually kicks the ball into touch and waits for the final whistle to blow. How the fight will end or what referee will blow the final whistle with the outcome still undecided is not made clear.

Meanwhile they have left nothing undone for the great defensive. This is the "fight to the end" that will prevent the end from arriving. Germany, and for that matter the whole German-occupied continent, has changed out of all recognition during this period of German defensive strategy. Manufacturing industries are scattered all over central, eastern and south-eastern Germany, Czechoslovakia and Poland. More than one-third of the workers in industry and agriculture are foreigners. Dominant among them are Russians, who have recently been raised to the status of other foreign workers in pay and treatment. The Nazi party with its million of members has no opponent, and the SS formations have been active in recruiting new members all over Europe. How much of this is propaganda and how much of it is fact will not be shown until the battle is fully and finally joined that will decide the issue and settle all the arguments. We shall soon know.

## BENEFACTORS OF MANKIND

JAMES WATT (1736-1819)

No greater personal tribute could have been paid to him than that by his partner Boulton: "I am sure it is impossible we can disagree in the settling of our accounts, as there is no sum total in any of them that I value so much as I do your esteem."

*Improvement*

IN the world of science and invention the name of WATT is numbered among the great improvers. He did not invent the steam engine, but his patented invention in 1769, consisting of a steam condenser and pump separate from the engine cylinder, led to economies in steam consumption so enormous that many Cornish mines and other industries received a new lease of life as a direct

consequence. He also invented the sun and planet system for converting reciprocating into rotary motion. Not without opposition and litigation were his achievements consolidated. "Only at trees bearing fruit do people throw stones."

The development of BRUSH Products is a record of improvement—to-day the name is a synonym of Quality.

TURBO-GENERATORS, TRANSFORMERS, E.H.T. and M.T. SWITCHGEAR, A.C. and D.C. MOTORS and GENERATORS, CONVERTORS, ELECTRIC TRUCKS, BUSES and COACH BODIES

# THE BUSINESS WORLD

## Liberated Currencies

THE invasion of the Continent of Europe must for some time remain a grim military operation. Nevertheless, it begins to lift the curtain on all the problems of civil administration, including those of finance, that will have to be tackled in the liberated countries. Those problems have for some time past been receiving the constant attention of the exiled Governments in London and of a committee of Allied Nations experts in Washington. In the case of all occupied Western European countries the plans for dealing with public finances and the currency position as the Germans are evicted have been completed. They are ready to come into operation the moment a sufficient part of these territories is liberated to allow a local civil administration to be set up.

The actual details of the arrangements cannot now be divulged, but some indication can be given of the broad lines of approach to the problem together with some factual information on the position with which the reoccupying authorities will be faced. Those facts are presented in the accompanying table which was prepared by French experts for the guidance of the discussions taking place in Washington to determine the rates of exchange at which the liberated currencies should be fixed in terms of sterling and dollars. The table does not show the position as it will be found on the liberation of the occupied countries. The 1943 figures are those for the month of September, and it is known that considerable further inflation of the currency has occurred since then, especially in France. But the general picture it presents is one in which the divergence of currency, price and wage movements from the "norm" set by the experience of the United States and Great Britain is not too great to put out of court all hopes of a reasonably "normal" solution of the problem. Exchange relationships not unduly removed from those which existed before the war will be possible, without imposing on the liberated countries any excessive deflationary effort in the crucial sectors of the economy, namely, in the level of wages and of controlled prices.

An important distinction must at the outset be made between the situation in France and in the other countries

here considered. It is a distinction which arises not necessarily from differences of economic experience, but from the contrast between the political status of the French National Committee and that of the recognised refugee Governments in London. For the latter the task of tackling monetary problems will be immensely facilitated by the fact that they are the recognised authority. They will have sole and unfettered discretion in dealing with the old and in issuing new currency. The French National Committee, though charged with the main responsibility for maintaining order and carrying on the civil administration, will not have that advantage. The new currency taken into France by the invading forces is not issued under any French authority, and will enter into circulation without that degree of control and centralised supervision which would have obtained had a French and not an Allied military authority been the issuer. In practice these drawbacks may be found unimportant and the difficulties involved overcome without undue damage having been caused. But it must be admitted that the political vacuum into which the forces invading France enter, and the arbitrary discretion left to the High Command in deciding how that vacuum is to be filled, must much increase the difficulty of solving the financial problem.

In envisaging the financial problem of the liberated countries as a whole, the main fact that springs from the appended statistics is the remarkable degree to which the economic structure of the occupied countries has been kept insulated from the currency and credit inflations which all of them have suffered. The slowing of the tempo of economic life in these countries has kept a large part of the increased circulation idle. Much of the currency is hoarded, while the turnover of bank credit must have fallen very considerably. The main task of the reoccupying authorities, therefore, will be the reabsorption of this redundant credit and the continued defence of the structure of costs and prices against the monetary expansion that has occurred under German occupation. This expansion has mainly come about through the financing of the occupation costs and of the surplus of exports to Germany reflected in the clearing accounts with that country.

### FINANCIAL STATISTICS OF THE OCCUPIED COUNTRIES

(In millions of each national currency)—(a)

(e) Includes demand and time deposits for all banks. (f) Deposits for five principal banks as reported in Netherlands press. (g) Average hourly earnings (25 industries)/N.I.C.B.

In facing up to this task of monetary reabsorption (it should not be regarded as deflation) two methods of approach have suggested themselves. The first is the precise detailed, juridical approach in which all eventualities are, as far as possible, foreseen and provided for in decrees and laws the texts of which are now ready to the last dotting of the i's and crossing of the t's. The other is the less formal, though not necessarily less carefully prepared, approach, which depends for its success on the voluntary co-operation of the liberated population in schemes of debt funding, savings campaigns and the like, and which will rely more on traditional fiscal discipline and pride in the domestic currency than on rules and regulations. There is no need at the present time to assess the relative merits of these two techniques or to try to apportion them to the countries concerned. Experience will show where each of them is applied and what measure of success it attains.

Whichever method is attempted, one fiscal weapon will probably have to be wielded by all the countries concerned. This is heavy retrospective taxation of profits made during the war in the occupied countries. There will be widespread support for such taxes in all occupied countries. The biggest profits will probably have been made by collaborationists. They may be completely sequestered after full investigation has been made. Even if they escape that financial retribution, they should in any case be heavily taxed. The same holds true of the profits made in black market transactions, especially by the agricultural population. They should in all cases be taxed heavily and retrospectively. The yield of the war profit taxes should go a long way to reabsorb redundant currency and credit for, given the lack of consumer goods, a large part of these abnormal profits will be found in the form of hoarded notes, bank deposits or negotiable securities.

The other feature which should be common to the financial policy of all the returning Governments in the immediate post war period is the maintenance and, in some cases, the reinforcement, of rationing and of controls of prices, wages, capital and exchange markets that have operated during the occupation.

The juridical approach to the monetary problem would, at its most extreme, have the following steps in mind. All currency in liberated territory, except for coins and perhaps notes of very small denomination, would have to be deposited with the authorities. New notes would be issued against the old at par—but only up to a given and comparatively modest maximum for each holding. The balance would be blocked and provisionally credited to a

bank account. Up to a certain figure, these blocked bank balances would be released over a period as supplies of consumer goods became available. The balance over and above this figure would be converted into a loan to the Government. This loan would be available for payment of taxes and, if tendered to any extent in respect of the amounts due for war profits tax, might play a considerable part in the reabsorption of redundant currency. The loan in question could only have limited negotiability and transfers would have to be made subject to the consent of the Government or of some authority appointed by it. Bank deposits would be treated in the same way as currency. They would in the first place be blocked. Then a comparatively small fixed amount would be credited to a free deposit. A further amount would be liberated over a period so as to keep pace with the reconstitution of stocks of goods in the liberated country. The balance would be converted into Government securities. In determining what proportions of currency and deposits to free and to block, the authorities would have to be guided by the true requirements of circulating media, by the trend of costs and prices and by their relation to comparable movements in Great Britain and the United States, bearing in mind the rate of exchange fixed for the currency.

This is one solution, on which some of the liberated countries will mainly rely. The other solution, which some of the exiled Governments prefer, would tamper neither with notes nor with the bank credit found in the reoccupied territory. Rather would it rely on the introduction of as rigorous a rationing of consumer goods as the situation will demand, on effective control of prices and wages and on an intense but voluntary savings campaign designed to reabsorb redundant currency and credit. Where the psychological atmosphere makes it possible, this solution has a great deal to commend it. It is more likely to achieve success where the liberated country has an efficient administrative machine, a naturally well disciplined population and traditional pride in the stability of the national finances and of the domestic currency.

It is not likely that, in practice, either policy will be pursued without some tincture of the other. It is unlikely that any country will be able to dispense with all forms of blocking; and it is certain that some reliance will be placed in every country on the position and confidence of the liberated peoples. But the different governments, according to their different circumstances, will lay emphasis on the two principles in different measure. Both methods will be seen at work before long.

## Business Notes

### Invasion Currency

The arrangements for supplying currency to the Allied troops in France are still far from clear. The American troops taking part in the invasion have taken with them franc notes printed in the United States for the military authorities. The notes have the tricolour flag prominently printed on them. The responsibility for their ultimate redemption has not yet been defined. No proclamation has yet been issued regarding their legal tender status in France or regarding the ratio at which they are to be accepted by the local population in exchange for the existing Bank of France notes. The British troops have been supplied with some of the old Bank of France notes that were brought to this country at the time of the Dunkirk evacuation. The stocks of these notes, especially in the smaller denominations, are too small to meet the current requirements, and the balance of currency required is being made good from the tricolour notes printed in the US. The prevailing confusion concerning the currency position in liberated French territories is merely part of the picture created by the unwillingness of the US Government to recognise the French Committee as a *de facto* Government and to make it responsible for the issue of fresh currency. General de Gaulle had intended to discuss this, among other problems, on his visit to London, and for this purpose he brought financial experts with him. The issue, however, had been decided and forced before the crucial discussions could be started, and for the time being the American printed notes are going into circulation. It has been reported that some 80,000 million francs of these notes have been printed, a figure which compares with the current Bank of

France circulation of around 500,000 million francs. The addition of these tricolour notes to the circulation could, therefore, introduce a new and serious inflationary element in the position. Agreement in principle has been reached on the rate of exchange to be applied to the metropolitan franc. It is to be 50 francs to the dollar and 200 francs to the £. It is on this basis that the troops' pay is being issued, though it should be added that the British—though not the American—troops are unlikely, for the time being, to receive their full pay in francs, some part being retained in this country. Presumably the military notes will ultimately be redeemed in dollars and sterling, the amounts in question being credited to the recognised French Government. The National Committee, if it becomes the recognised Government, is unlikely to accept responsibility for the military notes now going into circulation. These currency arrangements appear to be the one part of the invasion preparations that could have been vastly improved.

### Second Front Markets

Industrial equities rose steadily during the weeks preceding the invasion of Western Europe. The Budget speech, the Finance Bill, the White Paper on employment policy and the successes in Italy, all seem to have contributed to encourage the investor in equities. The latest figures of *The Actuaries' Investment Index*, of which some particulars are given on page 798, show that the rise for the month to May 30th was approximately treble that of April. The general price index was at its highest at the end of last month since September, 1937.

and it is necessary to go back three months before that to find anything as low as the yield index of 4.26 per cent. At that figure the yield was only 1.10 points per cent above that obtainable on 2½ per cent Consols. The first news of the invasion caused feelings of jubilation in the inner circle of the market, while the sole reaction of jobbers was a slight widening of the margins between buying and selling prices. Since then, prices of industrial equities have been well maintained. The Index of *The Financial News* stands at 111.1, a rise of 3.2 points on five weeks and a new high since September, 1937. There has been some switch from speculative buying of shipping and motor shares into European securities, particularly French guaranteed railway bonds and Imperial Continental Gas. The volume of business has fallen only moderately and price margins are almost normal. The investor continues to back his view, but is not prepared to bid prices up. It seems, however, very doubtful whether the new high level can be held without a setback, unless the supreme effort of the United Nations meets with earlier and more continuous success than it seems prudent to expect.

\* \* \*

#### Future of Engineering

The wartime expansion in the armament industry has been largely concentrated on the industries that may be classified under the umbrella heading of engineering. The labour force of these industries has been increased by millions, and their capital equipment has been augmented by the expenditure of hundreds of million pounds. In a thoughtful paper read to the Institution of Electrical Engineers, Professor Postan addressed himself to the conditions that are likely to shape the future of British engineering—these will no doubt also be discussed at the conference of the Amalgamated Engineering Union, planned for next week. Part of the wartime accretion to engineering is probably too specialised for peacetime use, but the industry is assured of a large market during the immediate post-war years. Professor Postan, as an economic historian, is more concerned with long-term tendencies. He foresees the need for a strong engineering industry as a source of potential military strength, and as a source of exports, and he would

rightly regard it as a sorry waste if the immense volume of skill acquired during the war were not turned to good account in peace. Of the past Professor Postan was able to give a picture of steady expansion in the labour force of the engineering and allied industries, from 985,000 in 1924 to 1,104,000 in 1935, accompanied by an equally steady increase in the net value of production, from £148 million to £249 million, and by a rise in output per head. But the balance between the various sections of the industry has altered quite considerably. A decline in shipbuilding and marine engineering, and in the railway carriage and wagon branch has been offset by a great expansion in the motor and aircraft sections, and in electrical engineering. The machine-building industry proper has grown rather slowly; it employed 390,000 persons in 1924 and 401,000 in 1935, and the value of its net output rose from £135 million to £159 million. The balance within this section has substantially altered; while the production of machine tools, machinery for printing, tobacco and food manufacture, weighing, refrigerating, road-making and construction grew or remained stable, that of textile machinery, agricultural, mining, gas and chemical machinery tended to decline. In Professor Postan's view any overall expansion of the industry from pre-war levels will again involve continuous changes in its balance. He does not hold out much hope of permanent expansion in the shipbuilding and railway carriage and wagon sections, but he envisages a further growth of the motor, aircraft and electrical engineering industries.

\* \* \*

#### Conditions of Progress

Professor Postan reserved his most interesting comments for mechanical engineering, though they are equally applicable to many other branches. The future of the machine-making section of engineering depends, of course, on its ability to turn out specialised, advanced and high-quality machinery. Price, though important, is not the only determinant. If the industry has not always kept in the forefront, this has been due, not so much to its inability to design and develop specialised machinery, as to the difficulty of placing it on the home market. In other words, the prospects of British mechanical engineering, not only at home but also abroad, are largely in the hands of British industry, its main consumer. British industry, regrettably, has been slower than other countries, such as the United States and Germany, in modernising its plant and equipment. In Germany, for example, the ratio between the production of machine tools and other machinery to total industrial production was appreciably higher than in Great Britain; Professor Postan estimates this difference as three to two. The low rate of physical turnover of machinery in this country is not due merely to an inefficient system of taxation but also to bad habits of management, inadequate attention to research, the prevailing approach to costing and to the lay-out of production, and, finally, to the behaviour of labour and trade union practices. Professor Postan's diagnosis of the shortcomings of the machine-building industry carries two important implications. First, it underlines the need for speedier modernisation of the productive equipment of British industry as the only sure means of raising industrial productivity and the national income. Sir John Anderson's taxation proposals are a first step in the removal of the defects of the present system of industrial taxation; but a new outlook among industrialists and workers is equally necessary. Secondly, the speedier modernisation of Britain's industrial equipment, by providing a home market for the most advanced machines, is also essential to a flourishing export trade in machinery. And a large export trade in machinery is particularly desirable after the war, because the co-efficient of imports in the value of exports has been estimated to be only about 9-11 per cent, a proportion that is lower than in almost any other commodity exported by this country.

\* \* \*

#### Aircraft Industry

On Saturday last week, Sir Stafford Cripps, Minister of Aircraft Production, amplified the aircraft production figures previously released by the Aircraft Production Board of the US War Production Board, and given on page 749 of *The Economist* of June 3rd. Deliveries from factories rose from under 1,830 units in 1936 to 2,287 in 1938, 7,940 in 1939, 15,049 in 1940, and 27,273 during the year ended March, 1944. The weight of airframe production last year, at nearly 200,000,000 lb., was over 50 times as great as in 1936, and

nearly four times that in 1940. In other words, the growth in numbers produced has been accompanied by a substantial increase in average weight, by bigger and better aircraft. For example, the bombload capacity at 1,000 miles range of bomber aircraft production was nearly 35,000 tons during the year ended March, 1944, against only just over 4,500 tons in 1940. Some 60,000 aero engines were delivered in 1943-44. These, too, have grown in power, for their horse-power equivalent last year was five and a-half times as great as that of production in the first twelve months of the war. To achieve this measure of expansion the man-power employed by the aircraft and its subsidiary industries has been increased about twenty times. The vast expansion of the industry inevitably prompts the question how much of it is likely to be permanent. The answer depends, not merely on the growth of civil aviation, but, for some years at least, primarily on the rate of military production. A year ago Sir Stafford Cripps mentioned one-tenth as a possible proportion of the industry's capacity that may find employment after the war. His guess—it could hardly be more—was held to be somewhat low in an article in *The Economist* on August 21, 1943. Professor Postan, in a paper discussed on page 788, suggested that one-quarter of the industry's present size might be needed after the war. Whatever the ultimate proportion may be, the industry will be faced with the problem of a substantial contraction after the war. It remains to be seen how far this problem can be solved by the withdrawal of the motor and other industries that have temporarily joined forces with the established aircraft industry.

\* \* \*

#### Tax Reform

It may be recalled that the late Sir Kingsley Wood asked the recognised bodies of financial accountants of England and Wales and of Scotland to submit a memorandum on post-war fiscal policy. It is now evident that this document contributed largely to the framing of Sir John Anderson's tax reliefs. It is also clear that Sir John was not prepared to go so far as the accountants thought desirable. The memorandum starts out from the contention that profits for taxation purposes should be measured on sound accounting principles; it maintains that this has not been the practice in the past and that the need of industry to modernise and re-adapt itself, on a scale never before necessary, will greatly accentuate the damaging effects of tax anomalies. Space does not permit of giving a detailed list of anomalies and their suggested cures, but the central thesis of the profession is clear enough: all monies retained in a business for the purpose of maintenance or extension should be allowed some measure of tax relief and, for this purpose, there should be no distinction between fixed and floating capital. All distributable profits, whether paid out or not, would bear full tax. This is certainly sound, although it might be that the proportion which it was reasonable to retain for fixed assets might differ from the proportion retained for floating capital. Here is, evidently, the plea for exemption from tax on all retained profits which the Chancellor felt he must reject. The memorandum suggests as possible means of carrying out this policy—one, the granting of a lower rate of tax on retained profits used for extension; two, the deferment of tax payments on such retained profits during the development; and, three, "a lump sum allowance to be granted directly expenditure is incurred on major additions, extensions and renewals of fixed assets." Of the three choices it favours the last as being most likely to meet the case of concerns in the greatest need of assistance after the war, when many will, it is stated, be making only very moderate profits and so would not benefit greatly from tax reliefs.

\* \* \*

#### Upkeep and Expansion

The suggestions put forward by the accounting profession have the same objectives as those advanced from time to time by *The Economist*. They have also much the same scope, but they differ in at least one important matter from what appears to be the most helpful approach to the problem. Provided the administrative difficulties can be overcome—and there seems no reason why they should be greater than under the present system—all business should be granted as of right, probably, total exemption from tax on all retained profits which are necessary to maintain production, provided production is maintained. This would apply to floating as well as to fixed capital. This extension

of what may be called maintenance allowances is particularly important under a regime of rising prices, such as is likely to prevail after the war. In addition, encouragement should be granted to all true investment. To achieve this only by making a grant for expansion to existing firms would tend still further to hinder the setting up of enterprise under new management. Any tax relief given in connection with expansion of production, whether in old fields or in new, would need to have its counterpart in some system of relief to new enterprises financed by raising money in the market. The relief must be sufficient to ensure that new entrants are not discouraged. If this principle were accepted, it would place in the hands of the authorities a very powerful instrument for influencing the volume of new investment in capital goods. By varying the margin between the special rate on income so invested and the standard rate of tax, it would be possible to influence the extent to which money savings were directly invested in physical capital. From the standpoint of the investor, it is reasonable to seek a higher initial return on a new enterprise, owing to the increased risks involved. With a standard rate of, say, 7s. 6d. in the pound, and a rate on re-invested profits of 5s. in the pound, the return obtainable by direct investment in new capital goods would be one-sixth higher than if the relief were not granted.

\* \* \*

#### Curbing the "Grey" Market

It appears that, as one result of protracted conversations between the authorities and the Stock Exchange, further measures are under contemplation designed to restrict the activities of the "grey" market in stocks and shares. As previously pointed out, under the prevailing system anybody but members of the London market has been able to deal in unquoted securities, with the result that the investor tended to get the worst of both worlds and the desires of the Treasury were not met. Now, it is understood, the Bank of England has addressed a letter to the Association of Investment Trusts, the Accepting Houses Committee, the British Bankers' Association, the Associated Stock Exchanges and the Provincial Brokers' Stock Exchange asking them to give certain undertakings with regard to dealing in unquoted securities. It is not perfectly clear what these undertakings are, but, apparently, members of these bodies are not barred from taking blocks of shares from outside bodies or persons. If, however, they wish to re-sell them, they are asked to apply to the Capital Issues Committee for permission. This would mean that the need of individuals and firms for

# WHEN will you get *Black Magic* again?

[WE GIVE YOU ONE GUESS]

All the nice things that used to be in Black Magic Chocolates — are they dead?

No.

They exist.

But they might as well be dead, for all the use they are.

The Mauritius sugar that gave the tang to the Black Magic caramel — it's in Mauritius.

The Valencia almonds that went into the Black Magic truffle-and-nougat and montelmar — they're in Valencia.

Brazil is no longer where the nuts come from. It's where the nuts stay.

Venezuela no longer sends us its peculiar fruity cocoa beans. It sends us petrol.

We didn't use petrol in Black Magic.

All the nice things are in all the nice places—except Britain.

They'll come again. When they do, so will Black Magic.

You can call that a threat or a promise, as you please.

# ROWNTREES

liquidity would be met, but that no widespread offer of the shares would be feasible, so far as these bodies are concerned. It is possible that these bodies may be prepared to take over blocks of shares on such terms and to that extent the needs of the Treasury would be met. There are, however, two large and significant absentees from the list, namely the insurance companies and the issuing houses. The absence of the former may be explained by the fact that insurance companies do not directly engage in detailed distribution of shares. The issuing houses are in a different category. In the first place they rely almost entirely for their profits on the type of business which it is sought to ban, in the second they cover so various a collection of firms that it has never been possible for them to create a representative body. No doubt some of them would be prepared to accept further sacrifices. But until methods have been found to persuade the others to comply, there is at least a danger that the effect of the new suggestions will be to canalise into the hands of those bodies which do least to protect the investing public the whole of the business in unquoted securities.

### Plaster Board Fusion

The announcement that negotiations have been completed for a fusion of the interest of the Distillers Company in the plaster board business with British Plaster Board is representative of a tendency which seems to be gathering weight. The concern which BPB is to acquire is Gyproc Products, established in 1933 to take over the UK business of Gypsum, Lime and Alabastine, Canada. The Canadian owners retained a 40 per cent interest in the new concern at that time. Gyproc Products has now factories at Rochester and near Glasgow engaged on the production of building and other materials containing gypsum. It is a private company, and no information is available as to assets. Presumably some disclosure will be made when the terms of fusion are announced. It is stated that the object of the fusion is not to increase profits, but to avoid overlapping expenditure on development and research. To pool research is an excellent procedure, but it may be asked whether a complete fusion of interests is necessary to secure that end. There can be little question but that, subject to the terms being reasonable, it is advantageous to BPB to obtain the support of the Distillers resources and remove a possibly dangerous competitor at one stroke. It is also symptomatic of the outlook of the largest concerns in this country at the present time that they prefer to widen their sphere of influence in fields of ancillary activity by agreement rather than by competition. Whether this movement towards the concentration of the control of even the newer industries in a few hands can be anything but disadvantageous to the country may be questioned. The effect of the announcement was to raise the shares of both companies. At present prices of 97s. 9d. for the £1 stock units of Distillers and 34s. 6d. for the 5s. shares of British Plaster Board the yields, on the basis of the latest dividends, are £3 7s. per cent and £3 13s. 3d. per cent respectively.

### Institutional Savings

The Chancellor of the Exchequer, opening the Leeds "Salute the Soldier Week," devoted a considerable part of his speech to a defence of the big institutional subscriptions that have contributed so much to the success of these weeks. Sir John Anderson pointed out that "all such investments represent very satisfactory forms of borrow-

ing" and that "a big proportion of these institutional investments represent indirectly the savings out of income of individuals." Sir John has little difficulty about proving his case in so far as it concerns the investment of insurance company and building society funds. The former are derived from premiums, the latter from depositors' savings and both represent personal savings in their best and most permanent form. If such savings are allowed to accumulate in liquid form and are then invested in a lump sum in order to help the local savings week the slight subterfuge involved is one that can readily be allowed and that does not in any way detract from the genuineness of the operation. As regards direct subscriptions from the banks, Sir John pointed out that a considerable part of them could be regarded as the accumulated savings of their customers. He refused to be drawn into the metaphysics of the rest of the problem, namely that part of the banks' subscriptions which may be regarded as the mere by-product of credit creation. The Chancellor merely contented himself with the safe and sound injunction to individual savers to invest their savings direct in Government loans and not to let their banks do it by proxy. His review of the savings campaign since the beginning of the war gave some impressive facts on the achievements of the small saver. Since the beginning of the war savings campaign, the number of holders of savings certificates has risen from 7 to 17½ millions and the number of savings bank depositors from 14 to 21½ millions. The proportion of small savings to total borrowing has risen from 21 per cent in 1942 to 25 per cent in 1943 and amounts to 22 per cent for the war period as a whole. As regards the current campaign, 560 "Salute the Soldier" weeks have been held, and of these only five failed to reach the target. The certified results so far available refer to 328 localities. They show a total of £272,539,000, which represents an increase of £6,451,000, or 2.4 per cent, on the amount raised in the same localities in the "Wings for Victory" weeks last year.

### Industrial Diamonds

The diamond industry's post-war policy for industrial diamonds is taking shape. Last year Sir Ernest Oppenheimer pointed out at the annual meeting of De Beers that the price stability for industrial stones, imposed during the war—at pre-war levels—in favour of the Allied war industries, should, after the termination of hostilities, be continued in order to encourage demand. He also pointed out that industrial diamonds, and especially crushing board, "should be stripped of their spurious mantle of preciousness and rarity," and quoted by the kilogramme instead of by carats (0.2053 gram). At this year's annual meeting of De Beers, Sir Ernest pointed out that the Diamond Trading Company, the industry's selling channel, has established a research department in London to study the properties of diamonds, their preparation for use, and especially their application in industry. Technical information on the basis of this research is available to industry free of charge. These steps are encouraging, and will not only prove of value to users of industrial diamonds, but may also increase the stability of the diamond trade. Last year, the syndicate sold industrial diamonds valued at £5,500,000, compared with £4,250,000 a year before, and a normal pre-war figure of £1,500,000 to £2,000,000. As the price of industrial diamonds has not been altered since the outbreak of war, this increase reflects the expansion in the volume of demand. Industrial diamonds in 1943 accounted for about one-quarter of the syndicate's total sales. In 1938 world diamond sales—gems plus industrial—did not exceed £4,050,000, and in 1939 they were no higher than £6,000,000. A wide market for industrial stones, therefore, will have an important influence on the industry's total sales turnover after this war. In pursuing an expansive policy for industrial diamonds—in contrast to the inevitably restrictive policy for gem stones—it will be necessary to make provision for securing a regular and adequate supply of industrial diamonds. Since the heavy stocks of gem stones, accumulated by the syndicate during the depression period of the early thirties, have been virtually exhausted during the war, fully adequate supplies of industrial diamonds from new production can at least be guaranteed for a number of years without there being any danger of undermining the stability of the gem stone market.

### Wool Textile Problems

In its domestic and international contexts the wartime experience of the British wool textile trade—formerly one of

Great Britain's major export industries—closely resembles that of the cotton industry. The Cotton Board Committee's report on the post-war problems of the cotton industry, discussed in *The Economist* of January 29th, told a story of markets lost by Great Britain through Government restriction on exports and gained by other countries, and of a drastic cut in British consumption and expansion elsewhere. As the facts quoted by the National Wool Textile Export Corporation in a booklet entitled "Exports of Wool Textiles, 1942-43," show, the British wool textile industry has suffered a contraction in its labour force of about 40 per cent, one that is comparable in magnitude to that imposed on the cotton industry. And, as the accompanying table shows, the reduction in exports has been severe. The main difference between the two industries is that curtailment took place earlier in the cotton trade than in the wool

U.K. WOOL TEXTILE EXPORTS

|            | Tops<br>(million lb.) | Yarns<br>(million lb.) | Woollen and<br>Worsted Tissues<br>(mill.sq.yds.) |

| 1937 ..... | 40.2                  | 41.4                   | 122.9                                            |
| 1938 ..... | 32.5                  | 34.7                   | 90.5                                             |
| 1939 ..... | 33.8                  | 32.0                   | 93.5                                             |
| 1940 ..... | 28.5                  | 17.7                   | 83.0                                             |
| 1941 ..... | 16.2                  | 13.2                   | 86.3                                             |
| 1942 ..... | 11.8                  | 10.5                   | 73.2                                             |
| 1943 ..... | 8.2                   | 9.0                    | 44.2                                             |

textile industry. In the United States the labour force of the wool textile industry in mid-1943 was still 10 per cent above the average for 1939. Moreover, as a result of an increase in working hours, mill consumption of apparel wool in that country almost doubled between 1939 and 1943, whereas the volume of output in Great Britain was barely two-thirds of the pre-war level. Canada, too, doubled its output of cloth between 1938 and 1943 and, as was to be expected, the four great raw wool-producing countries—Argentina, Australia, New Zealand and Uruguay—all converted a growing volume of raw material into finished goods. The report expresses the view that at the end of the war the British wool textile industry will be faced with a pent-up demand much in excess of that at the end of the

last war. But its difficulty in meeting this demand will also be much greater because its labour force has been reduced more severely than in 1914-18. The industry is thus faced with two major problems: the short-term problem of restoring its labour force and the long-term one of maintaining a large volume of exports after the fulfilment of the immediate needs of importing countries.

### The Syncrophone

Government, employers, trade unionists and educationists alike are coming to realise the importance of training in industry, if Britain is to maintain its position in a competitive postwar world. One problem is to make training attractive, and to stimulate the interest of trainees in their work. In this connection, the use of films in industry has been discussed. A device which may play an important part in industrial training after the war is the Syncrophone. Invented four years ago by Mr Nicholas Sandor, of ISM Ltd., the syncrophone is a combination of a radiogram and pictorial charts, on which illustrations light up as the recorded talk proceeds. The syncrophone has been extensively used in training servicemen—over a million RAF men have been trained with it—and in training unskilled labour in war factories. Instruction in such subjects as safety first, the care and handling of machines, and what is perhaps the most important, the relation of factory jobs to the war effort, is given in a graphic and original form. The instrument has the advantages that it is easy to operate and adaptable; its lectures can be repeated to fit the pace of the slowest. It can be adapted to any language, and from this point of view it offers considerable possibilities in connection with publicising this country's exports in world markets.

### The Bombay Disaster

During the past weeks there have been discussions among insurers in London on the subject of the disaster in  
(Continued on page 795.)

Throughout the world the name of MILNERS is a synonym for SECURITY. The same sound craftsmanship which has made MILNERS' SAFES and STRONG-ROOMS so universally respected is embodied in MILNERS' STEEL EQUIPMENT, which is designed to promote office and factory efficiency. When peace returns MILNERS' organisation will be ready to resume its world-wide service, using past experience to ensure efficient designs for the future.

## COMPANY MEETINGS

GEORGE WIMPEY AND COMPANY,  
LIMITED

## HIGH LEVEL OF PRODUCTION

## 20 PER CENT FOR TENTH SUCCESSIVE YEAR

The 25th ordinary general meeting of George Wimpey and Company, Limited, was held, on the 7th instant, at Incorporated Accountants' Hall, Victoria Embankment, London, W.C., Mr. G. W. Mitchell (chairman and managing director) presiding.

The secretary (Mr. T. A. Mitchell, F.C.I.S.) having read the notice convening the meeting and the auditors' report,

The chairman said: Gentlemen, the directors' report and accounts have been in your hands for some time and I presume that, as usual, you will take them as read. (Agreed.) This is our twenty-fifth ordinary general meeting, and it marks a quarter of a century of steady growth and solid achievement since the business was made into a limited company in 1919. During the previous forty years the business had been carried on as a partnership from the same premises at Hammersmith—premises to which we are already planning to return at the earliest possible moment.

## MAGNITUDE OF COMPANY'S OPERATIONS

The accounts before you cover the fourth full year during which your company was wholly engaged on war work—the year during which the Government's building programme rose to its peak and, as you would expect, the company achieved its highest level of production. You will realise that I cannot enter into any description of the work carried out; but it was really a very great achievement, and perhaps I can broadly indicate something of its order of magnitude by mentioning a few figures. During 1943:—

We erected 5,612 buildings.  
We laid down concrete equivalent to a carriageway capable of taking two lines of traffic from London to Russia via Berlin.  
Our excavating machinery moved 24 million tons of materials.  
Our lorries—most of which we own, some of which we hire—ran 100 million ton miles.

We laid 3½ million square yards of asphalt and tarmacadam.

We used 375,000 tons of cement.  
And employed throughout England, Scotland and Wales about 16,000 men.

These figures will enable you to appreciate that all our departments, with the sole exception of the housing department, were very fully engaged; and that the company as a whole and every member of its staff made the utmost possible contribution to the winning of the war as quickly as possible.

The Government's construction programme in this country for war purposes is now substantially completed and we are anticipating during the current year a much reduced volume of work. Perhaps that will not be wholly a disadvantage if it affords our staff a little respite to get their second wind for the reconstruction programme which lies ahead.

## VALUE OF TEAM SPIRIT

Before the efforts of the past four years are forgotten you will wish me to pay tribute to the eager spirit and ungrudging service of the whole of our staff of whom I cannot really speak too highly. For four years they have worked together with a fine team spirit to drive their jobs through to completion—working always against time and under very great difficulties.

To an increasing extent our board of management bears the responsibility for organising the work of the company. They have been most effectively helped by a somewhat enlarged planning and progress

department in which a group of expert and specially trained engineers plan in advance the exact sequence of each operation on the jobs and thereafter compare in graph form the actual with the planned progress. As a result they are able to detect and throw out into relief delays actual or impending, so that the cause may be found and removed.

The only new class of work undertaken during the year was the winning of Open-cast Coal in two districts of England, and also in Scotland.

## RIVALRY FOR WIMPEY SHIELDS

Some of you may have seen reference in the Press to the presentation of a Wimpey Shield. We have two shields—one for civil engineering work and one for building work. The shields are competed for monthly and won by the gangs on civil engineering work or building work, as the case may be, who have during the month achieved the highest output for each class of work. The names of the charge-hand and his men are inscribed on the shields, and they are hung with pride in the canteens on the jobs for a month. All the jobs have live production and welfare committees, which as well as facilitating by discussion and suggestion all methods for increased production or better welfare, also enter into keen rivalry for these shields. Half of the members of these committees are elected by the men and half are from the job staff. Prominent Navy, Army and Air Force officers, trade union officials, and public men have presented the shields, thus linking the men's efforts to the total war effort of the country.

A large number of our staff have been drawn away on active service during the year. We keep in the closest possible touch with them, circulating to them an occasional little bulletin, giving news from men serving, with excerpts from their letters, so as to keep them informed about one another.

The number of members in the Pension Fund is now 550, and it is proposed to admit during the current year a selected number of our drivers, gangers, and manual workers who by outstanding work for the company have fully earned this privilege.

## THE ACCOUNTS

The only items on the balance-sheet which call for any comment are that our reserves are increased by £50,000 to a total of £250,000, and the amount of £188,000 for plant. The latter covers a fine fleet of some 600 lorries and a very wide range of the most up-to-date contracting plant, all maintained in good working order and conservatively valued.

Turning to the profit and loss account you will see that the profit for the year is £228,000 compared with £192,000 last year. Adding to this the £39,000 carried forward from last year and deducting provision for income tax and payment of dividend to the preference shareholders there remains an available balance of £152,000. Your directors recommend that the dividend on the ordinary shares shall remain at 20 per cent. for the tenth successive year; that we add £50,000 to our general reserve and carry forward £62,000.

I cannot give you any forecast of the future, but we have an efficient and widespread organisation—in addition to our London and Edinburgh offices we have provincial offices in Newcastle, Manchester, Cardiff, Bristol, Birmingham, Nottingham, Glasgow and Worthing—and I have no

doubt we shall participate in such works, consisting mostly of the smaller but none the less vital jobs, that still remain to complete the war programme.

The report and accounts were unanimously adopted and the dividend recommended was declared.

The retiring director (Mr. J. F. Chadwick) was re-elected, and the auditors (Messrs. Saker and Davis) having been re-appointed, the proceedings terminated with a hearty vote of thanks to the chairman, directors and staff.

GUARDIAN ASSURANCE  
COMPANY, LIMITEDANNUAL GENERAL MEETING—  
5th JUNE, 1944COLONEL LIONEL H. HANBURY'S  
REVIEW

The annual general meeting of the Guardian Assurance Company, Limited, was held, on the 5th instant, in London, Colonel Lionel H. Hanbury, C.M.G., the chairman, presiding.

The following is an extract from the chairman's statement circulated with the report and accounts:

## LIFE DEPARTMENT

New life assurances were completed during 1943 for a net amount of £1,341,000, compared with £1,577,000 in the previous year. The decrease is due to the volume of business in connexion with staff assurance schemes being considerably less. Owing to deaths by enemy action there was a small loss from mortality.

## FIRE DEPARTMENT

There has been an increase of £106,000 in the premium income to which both home and foreign business contributed, and the balance transferred to profit and loss is £166,000, equal to 15.3 per cent. of the premium income.

## ACCIDENT AND GENERAL DEPARTMENT

The premium income shows an increase of £47,000, a further fall in the home motor business having been more than offset by an increase in premiums in respect of workmen's compensation and other classes of business.

The amount transferred to profit and loss is £89,000, equal to 12.2 per cent. of the premium income.

## MARINE DEPARTMENT

The premium income shows a decline of £152,000, largely due to changes in the American market and to the reduction in the rates for war risk insurance.

Owing to the first year's settlements only amounting to about 19 per cent. of the premiums as compared with nearly 49 per cent. in 1942; there is good reason for anticipating that the 1943 account will be satisfactory.

After providing for taxation and transferring £10,000 to profit and loss the fund at the end of the year was £804,000, equivalent to 160 per cent. of the 1943 premiums.

## VALUE OF INVESTMENTS

There has been a further appreciation in the total market value of Stock Exchange securities, and a valuation at the end of the year disclosed a substantial margin over book values. Holdings in British Government securities have been further increased.

and to date the Company with its associated companies has invested more than £2,000,000 in Government War Loans since the outbreak of war.

The general reserve at the end of the year stood at £1,985,000.

## ASSOCIATED NEWSPAPERS, LIMITED

## SATISFACTORY TRADING PROFIT

## LORD ROTHERMERE'S STATEMENT

The thirty-ninth annual ordinary general meeting of Associated Newspapers, Limited (proprietors of *The Daily Mail*, the *London Evening News*, and the *Sunday Dispatch*), was held on Thursday, June 8, 1944, in the Memorial Hall, Farringdon Street, London, E.C.

The following statement by the chairman, Lord Rothermere, has been circulated with the report and accounts:

During the past year we have suffered the loss of one of our highly esteemed directors and colleagues—by the death of Mr. William Graham. His passing is a matter of the keenest regret to all of us who knew him so well during the many years he was associated with our business.

During the year Mr. Kenneth Layton-Bennett and Major E. McN. Cooper-Key have been elected directors of the company and shareholders will be asked to confirm their appointments. Our accounts this year are presented in a slightly different form for the purpose of clarity and in accordance with modern practice.

## STRONG FINANCIAL POSITION

We are very pleased to be able to show the satisfactory profit of £623,405, an increase of £56,281 over last year, and the balance sheet once again reflects the very strong financial position of your company, and it is with confidence that we recommend a final dividend of 12½ per cent. on the deferred shares.

The investments in British Government securities now stand at the substantial sum of £1,100,000, and tax reserve certificates to the amount of £400,000 have been maintained to meet future tax liabilities.

Full reserves have been made for taxation and paper and generous depreciation charged before arriving at the profit mentioned above.

In the appropriation account a sum of £108,000 has been transferred to provision for pensions, the total of which now stands at £300,000. The effect of this is to reduce the amount carried forward by £104,662 to £306,374.

## PENSIONS

At the outbreak of war your directors had under active consideration a contributory pension scheme for the employees of our company. In view of the uncertainties of the position created by the war it was decided to postpone these deliberations until the end of hostilities, but we are pleased that events have, in fact, enabled us to continue paying non-contributory retiring allowances to many of our old and faithful employees who have retired during the war. It may well be that some legislation will be introduced by the Government after the war which will make the introduction of a contributory pension scheme neither necessary nor practicable, but in any event your directors feel that this increased provision is fully justified in view of our existing list of pensions which are at present charged against current profits.

## RESTRICTED ADVERTISING SPACE

The net sales of *The Daily Mail*, *The Evening News* and *Sunday Dispatch* continue at the highest possible level under present restrictions in the supplies of newsprint. The slight general increase recently allowed was helpful, but it was far from being sufficient to enable us to print the number of copies needed to meet the demand from the public.

A similar position exists on the advertise-

PROFIT AND LOSS ACCOUNT AND  
APPROPRIATION

After providing for a final dividend of 6s. per share proposed to be paid, the balance of profit to be carried forward is £231,713, compared with £190,515 at the end of the previous year.

ment side of our business. The demand for advertising space far exceeds the limited amount of space available, and although the standard size of advertisements has been gradually reduced—allowing us to accommodate a larger number of advertisements—the waiting list of orders for advertising space from both old and new advertisers increases rather than diminishes.

The demand for space from Government Departments is still considerable, and receives first consideration.

*The Daily Mail* still retains its great reputation, enhanced so appreciably during the period of the war, as the world's greatest advertising medium.

## THE EVENING NEWS WORLD RECORD SALE

The new world record net sale set up by *The Evening News* during the current year of a million copies daily has also contributed to the increased and increasing demand for space in that paper.

A policy similar to that of *The Daily Mail* of reducing the standard size of advertisements and rationing the amount of space has had to be adopted in *The Evening News* as well as in the *Sunday Dispatch*.

All our papers continue to strengthen their positions in the advertising world in a manner which speaks well for their prospects when normal conditions apply once again to the newspaper industry.

The accounts of the Anglo-Newfoundland Development Company, Limited, will, I understand, be issued shortly, and although they must reflect another difficult year in view of the restrictions imposed by the war upon their most remunerative market—the United Kingdom—the strength of that company, to which I referred last year, is reflected in their recent announcement giving notice to repay the whole of their outstanding debentures on July 1, 1944.

## DEMAND FOR NEWSPAPERS

The problem of our company to-day is that of meeting the demand of the public for our newspapers, and once again I wish to pay tribute to the Newsprint Supply Company and its Rationing Committee for the highly efficient manner in which our raw material has been rationed and distributed. It is difficult to see a greater supply of newsprint for more newspapers or bigger newspapers at the moment, but just as soon as the position justifies it every effort will be made to secure more newsprint for a larger production of bigger newspapers, thus ensuring the fullest information to the public by a Free Press in the post-war period.

With keen satisfaction I once again record that our scheme of salary allowances to the 1,361 members of our staff serving with the Forces has not only been maintained but improved by the addition of special payments for young children, and to all of them I send our best wishes for a safe and speedy return.

To my colleagues on the board and the entire staff I extend my grateful thanks for their efforts in the interests of our newspapers.

The report and accounts were adopted, the retiring directors were re-elected and the auditors, Messrs. Lever, Honeyman and Co., were reappointed.

The proceedings terminated with a vote of thanks to the chairman, directors and staff.

## EVER READY

REGD. TRADE MARK

MANUFACTURERS OF  
DRY BATTERIESCELLS, ACCUMULATORS,  
RADIO EQUIPMENT,  
MOTOR CAR ACCESSORIES,  
PORTABLE ELECTRIC  
LAMPS.

Net Trading Profit for Year to  
31st March, 1944 - £621,813.  
Total Reserves and Carry  
Forward - £1,253,518  
Dividends on Ordinary Stock,  
40%.

*The Annual General Meeting of the Ever Ready Company (Great Britain) Limited, was held on June 5th, 1944. The following are Points from the Comments of Mr. Magnus Goodfellow (Chairman), circulated with the Report and Accounts.*

## STRONG POSITION.

The accounts before you show a small increase in profit after providing for Excess Profits Tax and Deferred Repairs to our factories.

Two important matters have been settled during the year. I refer to the ascertainment of the depreciation on Buildings, Plant, and Establishments under war conditions, and to the settlement of that complicated tax—E.P.T.

The effect of these settlements has been to deplete our Reserves by £368,000. We have met this charge as follows:—

|                                                    |          |
|----------------------------------------------------|----------|
| Transfer from the Profits of the year under review | £178,000 |
| Reduction of Contingencies Reserve                 | 130,000  |
| and the Balance from the General Reserve of        | 60,000   |
|                                                    | £368,000 |

You will agree with me on the importance of these transactions when I say that we now go forward in the operation of our business with a clear knowledge of our financial position.

It is worthy of note that the expenditure of £992,000 on Buildings, Plant, and Establishments referred to in our Report, has been provided entirely out of our own resources, and that our liquid financial strength improved during the year, our net Current Assets having risen from £1,000,000 to £1,220,000.

FAVOURABLE POST-WAR  
PROSPECTS.

The business again achieved a substantial increase in production, but this increase was not available for civilian consumption, the supplies so available being approximately the same in quantity and price as in the previous year.

Our post-war prospects are favourable, for the change over to peace-time requirements will not take any considerable time. The renovation of our large plants will be a costly matter, but our service to the public should be quickly available in increased quantity and many improvements in design.

I am happy to be able once again to inform you that our Managers, Staff and Workpeople have continued their service faithfully and well, and I express my appreciative thanks to them for their efforts.

## IMPERIAL CHEMICAL INDUSTRIES, LIMITED

### ACTIVE RESEARCH POLICY

#### LORD MCGOWAN'S STATEMENT

The seventeenth ordinary general meeting of Imperial Chemical Industries, Limited, was held, on the 6th instant, at Grosvenor House, London, W., the Rt. Hon. Lord McGowan, K.B.E., D.C.L., LL.D. (chairman of the company), presiding.

The following is an extract from the statement by the chairman circulated with the report and accounts:

Some further light may be thrown on our finances by the following particulars of the company and its 96 subsidiary companies aggregated in the consolidated income statement for the year 1942. (The complete figures for 1943 are not yet available). The aggregate gross manufacturing and trading proceeds for 1942 were £105,000,000; £56,000,000 was spent on raw materials and purchases for re-sale, maintenance of plants, freight charges, factory, sales and administration expenses (exclusive of personnel), and £3,500,000 was set aside for obsolescence and depreciation of plants. That left £45,500,000 as the net proceeds of manufacturing and trading activities, to which there must be added the company's investment, property and miscellaneous income of £1,500,000, making a total of £47,000,000.

Of this £47,000,000, wages, salaries, pensions and contributions to pension funds took £30,500,000 and £12,500,000 became due to the British and Overseas Governments as E.P.T., National Defence Contribution and income-tax (inclusive of tax deductible from dividends and interest), leaving £4,000,000 net, after taxation, available for the company's reserves and dividends to stockholders. Of this sum, £3,000,000 was distributed as net dividends and the company retained £1,000,000 for addition to its reserves.

#### RESEARCH AND DEVELOPMENT

We have always recognised that the progress of a company such as ours depends to an outstanding degree on the steady pursuance of an active policy of research and development. During 1943 our expenditure on research and development in our own works and laboratories was approximately £2,200,000—a figure which we expect substantially to exceed during the current year. About a fifth was on work for H.M. Government, while practically all the remainder was spent on projects connected with essential war materials.

Our research organisation consists of nearly 900 fully qualified chemists, physicists, biologists, engineers and other scientists, together with more than 1,000 skilled assistants. In addition to this substantial force of our own, we also maintain close and cordial relations with Government and University research organisations and with 24 Industrial Research Associations, to whose funds we contribute.

#### PERSONNEL

On December 31, 1943, 12,800 of our employees were serving in H.M. Forces. I regret that our casualties show a substantial increase. Up to the end of 1943, 418 of our men had been killed in action, 428 are prisoners of war, and 81 are missing, while the number of civilian casualties through enemy action during the year was five, bringing the total number of civilian employees who have lost their lives to 59.

The Trade Unions have again co-operated with us in the settlement of the numerous problems which arise from the continuation of the war. I have to express my thanks for the helpful manner in which they collaborate. Collective bargaining, inspired by mutual trust, has

solved all our difficulties. No major trade dispute has marred our work. The high sense of responsibility and breadth of co-operative understanding displayed by our great Trade Unions is a national asset which no man can measure.

#### THE FUTURE

Since my last statement the Government have thrown a little more light on the future. We have had a White Paper and a Bill for the development of the educational system of the country and also a White Paper outlining the Government's proposals for a National Health Service. We welcome these steps. Our success will rest upon the relation between the wage level and the level of productivity emerging from our men and machines. The high standard of craftsmanship and work of our people must be matched by ability and skill in management. We cannot claim that productivity is as high in the United Kingdom as in the United States. Our workers must be armed with more capital instruments per head of a technical standard equal to that to be found anywhere else.

Public attention has recently been focussed on great undertakings such as your company. Much of the criticism is ill-informed and political in origin. The word monopoly is widely used as a term of aspersion, and the facile assumption is made that large industrial organisations and monopolistic malpractices are inseparable. My answer is that your company is an industrial organisation with 180,000 stockholders and 100,000 employees in its own home factories. Its primary interest is in its adventures in industry, carried on by this large human community of individuals associated together in an enterprise of world-wide benefit. Industrial continuity, progress and expansion, with continually rising standards for our employees, growing satisfaction to our customers and a reasonable return to the members of the company are more important to us than a maximisation of profit.

We are inferentially charged with maintaining high prices by restricting production. My reply, and I think it effective, is a pre-war falling price-level for our products, the magnitude of our expenditure on research and development, all directed to an expansion of production and not to its restriction, and our capital expenditure in the 16 years from 1927 to 1942 at our home works only, on land, plants, buildings, machinery and equipment of £62,000,000. In the first five post-war years, I may add, we plan to spend many more millions on new works and extensions.

The chairman, addressing the meeting, said: May I take this opportunity of offering congratulations to Sir John Anderson, the Chancellor of the Exchequer, for his most encouraging Budget speech? The concessions he proposes to make on scientific research expenditure, on which our future so much depends, and his agreeing that we shall have liberal concessions on new construction work, are a very great encouragement to industry as a whole.

In the past, when trade was depressed industry was indisposed, in the absence of any expansionist outlook by the Government of the day, to risk expenditure on capital projects the fruits of which they could not foresee. Today we have not only the new and concrete proposals of the Chancellor of the Exchequer, but an expression of an expansionist attitude towards the future which is ably set forth in the Government White Paper on "Employment Policy."

The report was adopted.

## FRIENDS' PROVIDENT AND CENTURY LIFE OFFICE

### FAVOURABLE RESULTS

The annual general meeting of the Friends' Provident and Century Life Office was held, on the 7th instant, in London.

The chairman, Mr Hugh E. Seebohm, J.P., said: The new life business exceeded two million, and 1943 was the best year in this respect since 1938. The life premium income advanced by £36,000 and reached £825,000. Our continuance of the practice which was adopted early in the war of giving civilian war risk cover free of charge to new members, as well as to existing holders of policies has been a helpful influence. Our mortality experience continues to be favourable.

In pursuance of our policy of simplification of our organisation, we have arranged to concentrate our sinking fund (or capital redemption) and continuous disability business in the Century. At the end of 1943 the Friends' Provident sinking fund account has been closed by the transfer of the fund, amounting to £927,000, to the Century. The small Friends' Provident continuous disability account has also been closed by the transfer of appropriate amounts to the Century continuous disability account and to the Friends' Provident life and annuity account. Commencing with 1944, therefore, there is likely to be only one fund—the life assurance and annuity fund—in the Friends' Provident balance-sheet, leaving all the other classes of business to the Century, which already had a substantial business in the two departments now dealt with.

The interest income of the Friends' Provident was exceptionally favourable for the past year. The value of our investments, whether in the Friends' Provident or the Century, has had a marked upward trend during the year, and is well above the figure in our balance-sheet.

#### QUINQUENNIAL VALUATION

Turning to the general departments associated with the Century side of the business and taking the figures from the amalgamated accounts, I will first refer to the excellent results of the continuous disability account. The actuary has completed his quinquennial valuation, as a result of which, after providing for taxation on profits, it has been possible to transfer £40,000 to profit and loss account, while strengthening the basis of valuation so that only 2½ per cent. interest is assumed.

The premium income of the fire, accident and marine departments at £1,588,000 showed a decrease of £324,000 from the high level of 1942. This reduction is accounted for by the fall in marine premiums. The total of the net profit transferred to profit and loss account, namely £65,000, was £4,000 less than for 1942. The fire department has suffered the loss of £9,000, compared with a profit of £25,000.

In the accident and general account we were adversely affected by workmen's compensation legislation, which had a considerable retroactive effect, and that account was therefore unprofitable. Fortunately, the results of motor and other sections were satisfactory, so that on balance the profit of £41,000 was only £1,000 less than in 1942.

The marine account, after an anxious period in 1942, ran much more smoothly in the past year. The transfer to profit and loss account of £33,000 relates to years prior to 1941.

It has been decided to revert to the pre-war annual rate of dividend of £90,000, and, in addition, having special regard to the continuous disability profits, to pay a bonus of £60,000, making the total dividend for the year up to £150,000. It has been gratifying to be able to present to you to-day a report which is so generally favourable.

The report and accounts were adopted.

## DUNLOP RUBBER COMPANY, LIMITED

### IMPORTANCE OF ROAD TRANSPORT

#### SIR GEORGE BEHARRELL ON POST-WAR PROBLEMS

The forty-fifth ordinary general meeting of Dunlop Rubber Company, Limited, was held, on the 7th instant, in London, Sir J. George Beharrell, D.S.O., the chairman, presiding.

The following is the chairman's statement circulated with the report and accounts:—

The supplies to Allied Governments have substantially increased, and other business, all generally concerned with the war effort, has been maintained. This has been materially assisted by the steps taken to conserve rubber supplies and to increase the output of reclaim, in all of which the company's technical staff has co-operated energetically with the authorities. Our home business was still subject to the readjustments necessitated by war conditions, and the year had its special difficulties, including shortage of labour, especially at the cotton mills at Rochdale, where, in common with other mills in the district, the position is still far from satisfactory.

#### RESTRICTED EXPORTS

With regard to our export trade from this country, the system of control by market quotas instituted in 1942 remained in force and exports were restricted to those territories allocated to Great Britain and to the volume allowed by the rubber supplies position. Nevertheless, the year saw a substantial increase in profit. It is to be hoped that these limited opportunities for the maintenance of export trade will not be further restricted.

Our manufacturing units in India and South Africa continued in full production. Turnover increased and profits were highly satisfactory. The Irish company was faced by serious difficulties of raw material supplies, but the assistance given by the Ministry of Supply and by the Eire Government has permitted the continuance of production at Cork and the dividends from that company have been maintained. The American company enjoyed substantially increased sales, in spite of shortage of labour, and continued to make profits. The sales and profits of the Canadian company were lower than in 1942, the decrease being solely due to the reduction of rubber supplies.

#### FEATURES OF THE ACCOUNTS

I will now refer briefly to the main features of the accounts. The net profit for the year amounted to £2,765,797, compared with £2,433,307 for 1942. The provision for United Kingdom excess profits

tax again includes adjustments in respect of previous periods and amounts to £869,000, which brings the total provision made in the parent company for U.K. excess profits tax up to December 31, 1943, to £5,163,000, and for the Dunlop group of companies to £7,440,000.

The directors' report shows that the transfer to taxation reserve out of profits has been increased from £700,000 to £944,000. We have thus achieved the object which we have for some time had in view, of providing the full reserve for income-tax on the profits up to the date of the balance-sheet.

I need not remind you of the many factors which may adversely affect world trade after the war. There is also the unknown quantity of damage to our continental and Far Eastern properties. The policy of your directors is to set aside such surplus profits as may be available in order to ensure that the company enters the post-war period in the strongest position possible to withstand the shocks which will inevitably arise. Accordingly we have transferred £250,000 from the profits of the year and £250,000 from the reserve for contingencies to the special reserve for investments in and advances to subsidiary companies, which now amounts to £3,750,000.

#### HUGE TAXATION BURDEN

The aggregate profits of the group for 1943 amounted to £5,384,000 against £4,472,000 last year. The huge burden of present taxation is shown by the provision by the subsidiaries of £2,206,000, bringing the total provision for the group for 1943 to £4,142,000.

A not unimportant part of this burden is due to the failure of the British tax laws to give adequate relief to British firms who export to overseas markets and who have to pay taxes at home and abroad on the same income. The same disability, of course, applies to British firms who manufacture and sell in overseas territories. In this respect British companies are at a disadvantage in relation to most of their foreign competitors, and strong representations on the subject are being made to the Government by various national organisations. The directors' report adequately explains the major features in the Dunlop Rubber Company's balance-sheet.

The consolidated statement of assets and liabilities is submitted on the same lines as last year, and it will be seen that the

investments in subsidiary and associated companies in enemy and enemy-occupied countries is now reduced from £4,138,000 to £3,829,000, an improvement of £309,000. This figure, of course, is after deducting the surplus funds of some of these companies deposited in England and the U.S.A. These funds increased during 1943 from £1,129,000 to £1,405,000. There is also an increase of £643,000 in the total surplus and reserves of the group, which now amount to £8,546,000. The liquid resources of the group have further improved, the total amount in Government and other securities, tax reserve certificates, and bank balances being £7,215,000 compared with £6,427,000 last year.

#### INDUSTRIAL CONDITIONS

I now turn to the general condition of the industry and the problems facing us in the future. The increasing quantities of synthetic rubber now reaching this country tend to create the impression that the rubber crisis has passed. This is not the case. The greatest economy of usage is still essential.

Having regard to the tremendous events which have taken place during the past year, and to the great developments to which we confidently look forward in the next few months, our thoughts naturally turn to the all-important problems which must confront us in the post-war reconstruction period, both at home and overseas. In all departments of the company's organisation these are the subject of careful study by your board and the management, but only so far as war-time conditions allow.

Much of our prosperity must depend on that of the motor industry of Great Britain. This has been the source of an immense volume and variety of munitions, and the maintenance of its strength in post-war years is clearly essential. Road transport will play a prominent part in reconstruction, and it is to be hoped that the taxation applied to it will not obstruct its future development. Road transport can no longer be regarded as a luxury, to be taxed as such. It is a main artery of our national life.

The name "Dunlop" is primarily associated in the public mind with tyres and transport, although for many years before the war your company was engaged in a far wider sphere. To-day our activities are even further extended, and when it is possible for full details to be given you will be surprised and gratified by the record of your company's war-time achievements. The extensive experience gained in new and varied fields will be put to good use when normal conditions return, and I know you will all join with me in the hope that this time may not be long delayed.

The report and accounts were adopted.

(Continued from page 791)

Bombay on April 14th, when a fire which broke out in a ship in dock spread to ammunition and caused explosions resulting in numerous casualties and damage to property running into many millions sterling. Lack of information in the early days left insurers no option but to reserve their position, especially as any admission of liability on inadequate grounds might be considered a precedent in future similar occurrences. The Government of India, however, was desirous of taking prompt measures to relieve distress and therefore proposed an immediate compromise settlement which would avoid the delays inevitable in litigation. This was agreed to following negotiations. By the settlement, which embraces both companies and underwriters at Lloyd's, the Government of India will indemnify fire losses to the extent of 100 per cent in respect of insured property and 75 per cent in respect of uninsured property, recovering from insurers in the former case 12½ per cent of damage on the basis of insured values; marine and accident—including workmen's compensation—losses will be settled by insurers as is covered under their policies, recovering respectively 40 per cent and 50 per cent from the Indian Government. These varying proportions of contribution may be regarded as reflecting in some measure the degree of likelihood of

insurers being held responsible in the absence of the compromise and the arrangement whereby fire losses are paid by the Government and not by insurers stresses their inability to admit liability; needless to say, the local organisations of the companies will be at the disposal of the Government for investigation and ascertainment of fire damage. The disaster will not unduly affect British insurers, who derive their income from world-wide interests, but may prove more serious for Indian companies, most of whose operations are localised; it furnishes one more example of the advantage in insurance of spreading commitments over the widest possible area.

## Company Result

# RECORDS and STATISTICS

## INDUSTRY AND TRADE

**Ironstone Industry Survey.**—In accordance with a recommendation of the Scott Committee on rural land utilisation, the Minister of Town and Country Planning has appointed Mr A. H. S. Waters, consulting engineer, to make a technical investigation of the ironstone industry of Northamptonshire, Lincolnshire and adjoining counties. Mr Waters will report on the scope and efficiency of the measures now employed to restore land damaged by quarrying and on what extent they could be improved now and in the future. Some developments in the use of machinery to restore land laid waste by the industry have taken place since a departmental committee of the Ministry of Health, under the chairmanship of Lord Kennet, reported in 1939.

**Marine Turbine Research.**—The Parsons and Marine Engineering Turbine Research and Development Association has been formed, with the support of shipbuilding and marine engineering firms which are manufacturers of marine turbines. Its object is to further the development of steam and gas turbines for marine propulsion, for merchant ships and warships. A representative council of directors has been appointed, and nineteen firms have joined the Association. It will be independent of the recently formed British Shipbuilding Research Association, but will maintain close liaison with it.

**Price Control in Loose-Leaf.**—Price Control in Loose-Leaf, compiled and published by Mr. U. H. E. Croner, at £1 7s. 6d., is designed to assist traders to keep abreast of Orders controlling prices of goods other than food. It will be kept up to date by means of a monthly amendment service, the charge for which will be 7s. 6d. per quarter. The book is in five parts. Part I outlines the principles and general rules of price control based on the 1939 and 1941 Acts; Part II deals with raw materials price control; Part III deals with consumer goods, except apparel and textiles, which are covered in Part IV. Part V contains the price schedules referred to in the foregoing chapters. They are reproduced from the official Statutory Rules and Orders by a photographic process.

**Textile Design Exhibition.**—An exhibition of new textile designs was opened at the Cotton Board's Colour, Design and Style Centre in Manchester on June 7th, and it will remain open until July 7th. Nearly two thousand designs were submitted and some 750 have been "hung." The object of the exhibition is to show how far the need and desire for new textile designs can be met. All the designs are for sale at prices varying from three to twenty guineas. They show originality in pattern and use of colour, and well-known artists have contributed.

**Trade Disputes in 1943.**—Detailed statistics of industrial disputes involving stoppages of work during 1943 appear in the May Ministry of Labour Gazette. The number of disputes was 1,785, compared with 1,303 in 1942. The total number of workers involved, directly or indirectly, was about 559,000, compared with about 457,000 in 1942. The aggregate number of working days lost is estimated at about 1,810,000 in 1943, compared with about 1,527,000 in 1942. The following table analyses, by industry groups, the number of stoppages, the workers involved and the number of working days lost in 1942 and 1943:—

| Industry group                            | 1942                                  |                                                                 |                                               | 1943                                  |                                                                 |                                               |

## FINANCE AND BANKING

**THE MONEY MARKET.**—Credit has been in abundant supply in the money market this week. The latest Bank return shows a reduction of £6,035,000 in Public deposits and a balancing increase of £6,762,000 in bankers' deposits. This movement ends a comparatively large immobilisation of cash in Government accounts which has persisted for four successive weekly returns. The latest total of bankers' deposits, £171,895,000, illustrates the prevailing ease in the market. The banks had to pay £80,000,000 against TDR's this week, a figure which exceeded the current effective maturities by nearly £10,000,000. On the other hand the taking up of this week's Treasury bills gave the discount market little difficulty as the syndicate's allotment fell from 46 per cent. the previous week to 28 per cent. The results of last week's tenders showed a considerable expansion in official applications for bills. The banks have been ready buyers of July bills from the market.

**MONEY RATES, LONDON.**—The following rates remained unchanged between June 1st and June 8th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1¾%; 6 months, 1½-1¾%. Treasury Bills: 2 months, 1-1½%; 3 months, 1-1½%. A change has been made in the method of showing an excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £286,741 to £2,590,094, the other operations for the week (no longer shown separately) raised the gross National Debt by £92,193,626 to £20,186 million.

THE CHARTERED BANK OF INDIA  
AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

CAPITAL (PAID UP) - £3,000,000

RESERVE FUND - £3,000,000

Branches and Agencies throughout INDIA and the EAST  
AFFILIATED BANK IN INDIA

THE ALLAHABAD BANK LTD., with 15 Branches & Sub-Agencies  
The Bank offers a complete Banking Service and provides  
exceptional facilities for financing every description of trade with  
the East.  
Deposits for Fixed Periods or repayable at call or at short notice  
are received at rates which may be ascertained on application.  
The bank also undertakes Trusteeships and Executorships.

Head Office: 38, BISHOPSGATE, LONDON, E.C.2

West End Branch:

28, CHARLES JI STREET, HAYMARKET, S.W.1

Manchester Branch: 52, MOSLEY STREET

New York Agency: 65, BROADWAY, NEW YORK CITY

LLOYDS BANK  
LIMITED

## EXECUTORS AND TRUSTEES

The appointment of individuals as Executors and Trustees  
imposes on them heavy burdens and duties which they  
are not always in a position to fulfil. Especially is this  
the case in wartime, when life is so uncertain and so  
many difficulties arise in the administration of estates.

When the Bank is appointed, continuity is assured and  
a Testator can rely on his estate having the benefit of  
skilled and experienced management in connection with  
his investments and with the many other matters incidental  
to its administration.

The services of the Bank's Executor and Trustee  
Department are available to customers and non-customers  
of the Bank. A pamphlet giving terms and particulars  
will be sent free of charge on application to any Branch.

Head Office: 71 Lombard Street, London, E.C.3

## REFUGE ASSURANCE COMPANY LTD.

Chief Office: OXFORD STREET, MANCHESTER, 1

ANNUAL INCOME EXCEEDS - £14,500,000

ASSETS EXCEED - £85,000,000

## The Government of France

GENERAL DE GAULLE has visited France and  
received a warm welcome in Bayeux. His visit may  
be taken to symbolise a slight improvement in the rela-  
tions between Britain, the United States and the Algiers  
Committee. The statements made by President Roosevelt  
and Mr Churchill also register a slight clearing of the  
fog which surrounds the problem of the American-printed  
French currency. It says not too much for Allied co-  
ordination that Mr Churchill, questioned in the Commons,  
clearly had very little idea what Mr Roosevelt had said  
or what he had meant by it, but it is possible to deduce  
from the two statements that the American and British  
Governments accept responsibility for the new currency  
and are to take some precautions to counteract its infla-  
tionary tendencies.

Yet, even admitting these minor clarifications, the  
general situation remains ominous and confused. No agree-  
ment has been reached on the civilian administration of  
France. With Bayeux and Carentan in Allied hands, there  
is still no French authority with whom the British and  
Americans will deal, and although talks are going on in  
London to cover the dangerous gap, the United States  
Government for some incomprehensible reason refuses  
to allow an accredited representative to take part in them.  
During question time on Wednesday, Mr Churchill  
deplored further debate at this moment. He could not,  
however, reassure the House, which obviously shares the  
country's conviction that the political preparations for

the invasion have been as inept as the military planning  
was brilliant.

The French situation is being so incredibly mishandled  
that one is at a loss to understand the reasons. It is gener-  
ally agreed that Mr Roosevelt is primarily responsible for  
the policy of snubbing General de Gaulle and ignoring the  
French Committee. One can dismiss the story that his  
reason is pique at a supposed or real discourtesy on the  
part of the General. Mr Roosevelt is too great a man to  
allow his attitude to be determined by such considerations.  
Is it that he believes some other alternative government to  
exist? There have been a number of well-documented  
accounts of a group of Frenchmen gathered round General  
Noguès at Lisbon and of American contacts with them.  
These Frenchmen are out of sympathy with collaboration,  
but as nervous as Vichy of Jacobinism and communism  
and "anarchy." Here again, it is difficult to believe that  
the President seriously considers setting up in France a  
neo-Vichy régime. Even a conservative figure as reputable  
as General Giraud was unable to impose his authority,  
although his experiment was made in North Africa, which  
has few of the radical tendencies of metropolitan France.

The most plausible explanation, and the one which most  
commands respect in this country, is that the President  
fears the dictatorial tendencies of General de Gaulle's  
régime, and is determined to let nothing stand in the way  
of the French people's freedom to choose their own future  
government. The reasons for distrusting certain aspects of

General de Gaulle's policy need not be reviewed again. They are disturbing, and the behaviour of the General in the last week has not given much reassurance. The provocation has been great, it is true, but so has the military tension and the sense of crisis. At a time when thousands of British and American soldiers were being killed on the beaches and fields in Normandy, General de Gaulle has apparently been preoccupied with one thing only, the status of his administration. He is right to be concerned, but one cannot but admit that the manner of his concern suggests an unpleasant readiness to make political capital out of a military situation which might well have proved more risky and uncertain than it actually was. He has earned by his behaviour the stern hostility of many of the Allied military leaders, whereas their support would have been invaluable in persuading Mr Roosevelt and Mr Churchill to hasten negotiations and modify their intransigent point of view.

General de Gaulle has not earned respect or quelled suspicions by his handling of this crisis. Must it then be conceded that the President is right and that the present equivocal policy can be justified as a serious attempt to prevent the setting up of an authoritarian régime in France? The answer is, surely, that, even allowing for the worst the President can suspect, the present American attitude is calculated to bring about exactly those dangers which it is designed to prevent. Neither Mr Roosevelt nor Mr Churchill has ever said why he hesitates to accept Algiers as a Provisional Government. In these circumstances General de Gaulle can perfectly legitimately suggest that their attitude to him is an attack on French sovereignty and that they will not negotiate with him because they wish to see British and American forces control France. In France's mood of exasperated pride, the mere suggestion is enough to turn the tide of popularity against the Allied armies once they are established on French soil. The enemy is well aware of this weak chink in the Allies' armour. On the first day of the invasion, Laval broadcast a message to France, in which he said:

As a Frenchman and as the Head of the Government, I felt great sadness this morning when I read the proclamation of an American General. He addressed himself to you and claims the right to give you orders. He does not know and he misunderstands French temperament. Frenchmen receive orders only from the French Government.

In the mood excited by such hints and suggestions, the French people will come to regard General de Gaulle and the Algiers Committee as martyrs in the cause of French freedom, and it is precisely in an emotional atmosphere of this kind that the *mystique* of dictatorship can flourish best.

Thus, even if all the fears and suspicions were true, the

present line of policy is certain to secure the opposite of the safeguards it seeks. And the fears are grossly exaggerated. The National Committee has given every kind of guarantee that it will respect Republican ways, and all the evidence from France suggests a strongly libertarian spirit among the resisters. The majority of the people are "gaulliste," in the sense of "anti-Vichy." The General is the symbol of endurance and liberation. There are no alternative leaders, and it is not only in America that "you cannot beat somebody with nobody." The only wise course for Allied statesmanship is to complete without delay the negotiations for the civil administration of France.

It would be disastrous if agreement were to be delayed until General de Gaulle had visited the President—a visit which, it appears, cannot take place until July, by which time large sectors of France will be under Allied control. Is there anything that the British Government can do? Clearly, a new policy could not be put into operation without consent; there is no British Army or American Army in France, but only a combined Army. But perhaps the principles of an agreement could be drawn up in London and initialled, subject to the President's agreement, which in those circumstances he could hardly refuse. Clearly, the British Government would be justified in asserting its view and carrying its action a long way towards finality. No accusation of breaking the principles of the alliance could properly be made, since every opportunity has been given for agreement. It is a well-established principle of legal contract that, where the consent of one party is needed, it should not be unreasonably withheld. Consent is now being unreasonably withheld—and in a matter which concerns the future security and good neighbourliness of Great Britain far more intimately than those of the United States.

Together with the agreement on civil authority there should go a revised settlement of the currency question. And in all negotiations and settlements, now and during the next months, the British and Americans need to learn to handle French problems with a less crassly heavy hand. Readier friendship would not tie the hands of the American and British leaders. On the contrary, once they had fully recognised the French Committee as the competent authority, they could be far more vigilant over the manner in which it exercises its power. At present any criticism of General de Gaulle can be twisted to mean an insult to the French people, and the Americans and the British get the worst of both worlds. In the end they will have to recognise some civil authority. The only possible choice is the Algiers Committee. By delaying the decision, they are helping to make the Committee itself a less sane and suitable administrative body. There is only one way out of the deadlock—recognition and negotiation. Every day lost in taking it, is a day lost for the Entente.

## Balanced Budgets?

THE weakest part of the White Paper on Employment Policy is the section devoted to "Central Finance." The other sections of the document are, in the main, drafted with what, for an official document, is a refreshing absence of ambiguity; there are not likely to be many misunderstandings about the directions that policy should take, even though the White Paper does not proceed very far down any of the roads to which it points. But in the financial section all is ambiguity. The first of the six paragraphs of the section opens with the statement that "none of the main proposals contained in this Paper involves deliberate planning for a deficit in the National Budget in years of sub-normal trade activity"—partly because the burden of fluctuating revenue and expenditure will be largely borne by the social insurance fund and by the capital revenue and expenditures of local authorities. The second paragraph, however, qualifies this by saying that if local authorities undertake additional capital expenditure "for reasons of employment policy" they

will have to be assisted. But, says the third paragraph, the growth of public indebtedness needs to be watched. "Whatever problems may arise from the growth of productive or semi-productive debt," it would be pleasant to think that a steady reduction in the deadweight war debt could be made. Paragraph four, moving a little further round the circle, says that the policy of increasing one form of debt and reducing another "does not mean a rigid policy of balancing the Budget each year regardless of the state of trade." (This can be reconciled with the opening sentence of the section only by supposing that deficits in bad years are to be achieved by accident and not deliberately—a strange policy for a programme of planned management.) But, the document hastens to add, lest it should be accused of heresy, it "certainly does not contemplate any departure from the principle that the Budget must be balanced over a longer period." Up to this point, then, the meaning would appear to be that the Budget must be balanced over a longer period, but

that it can be unbalanced in any particular year, provided it is done accidentally.

But the fifth paragraph immediately throws doubt on this doctrine. If only it were possible to rely on a rising national income, this paragraph says, the total debt could be allowed to increase "by quite appreciable amounts" (a magnificent phrase). Unfortunately, nobody can tell whether the growth in technical productivity will offset the decline in the birth rate. And the sixth paragraph settles the whole matter by promising that the Government will bear equally in mind what would generally be regarded as two contradictory policies—namely, "the need to maintain the national income" and "the need for a policy of budgetary equilibrium."

It would be wrong to be too severe on the Treasury for thus wrestling with its conscience in public. It is a very good thing that the Treasury has a conscience; it is its duty to adhere, even with some blindness, to the faith that is in it. One of the glories of the British system of government is that it does not often get into financial difficulties. The list of monarchs and republics, kings and cabinets who have led their lofty causes to irreparable ruin through inadequate attention to the lowly logic of the account book is too long and too conclusive to encourage any departure from prudence to-day. One of the many respects in which Governments are in a less fortunate position than high heaven is that they cannot reject the lure of nicely calculated less and more.

Moreover, it is not as if there were some nice, simple, clear-cut doctrine that the Treasury could be chidden for not enunciating with all clarity and precision. There are, to be sure, two simple statements that could be made about budgetary policy. One would be that receipts and outgoings should be balanced every year. The other would be that the size and frequency of the Government's deficits are of no concern, and that pounds, shillings and pence are mere "meaningless symbols." But the trouble about these statements, as with most simple doctrines, is that neither of them is acceptable. Budgets can, indeed, be balanced; but not if there is a war to be fought or a slump to be cured. And all the rules of sound finance can be allowed to go hang—provided that the authors of such a policy are also prepared to go hang when the consequences become visible. Somewhere on the slope between these two unacceptable extremes a lodgement for sound policy must be found. The Government's attempt to find one in paragraphs 74 to 79 of the White Paper is not very successful. The greater is the desirability that the attempts should be continued.

Perhaps the matter can be best approached by stages. First, what can be said of the Budget for a single year? Clearly, it cannot be expected to balance in every year. What happens in a year of depression is that the community's effective demand for goods and services is less than the output of which the labour force is capable. Every practicable step should be taken to induce the

public (meaning by that word every individual and institution other than the Exchequer itself) to increase its effective demand. But the process of inducing costs money. And even when it is carried to an extreme there is probably still a gap which can only be filled by the Government. If the Government is not prepared deliberately to unbalance the Budget when need arises, it cannot expect to be able to offset fluctuations in the public's expenditure or to prevent a slump. There are signs in the White Paper that the Government hopes to create a sufficient elasticity in the total finances of the state while still preserving the fiction that the Budget (called, in one place, the Revenue Budget) is always balanced. Thus the tax that is selected for fluctuation in accordance with the state of employment is social insurance contributions. It is a good tax for the purpose of quickly influencing consumers' expenditure, though not so good as the rate of "pay-as-you-earn" income tax would be. The wording of the White Paper suggests very strongly that the chief reason for choosing insurance contributions is that they do not enter into the Budget. Similarly, there is a suggestion that the state can assist local authorities to increase their expenditure, without unbalancing its own Budget, by the device of giving guarantees. Something of the same order of thought is also often to be found behind the suggestion of a double Budget. The White Paper does not mention this proposal, though the phrase of "the Revenue Budget" which is used in one paragraph may be thought to reflect it. The double Budget has a very great deal to be said for it—but not if it is to be an obstacle to clear thinking, or if, in setting apart some forms of expenditure which need not be balanced by revenue every year, it should impose purely formal limits on freedom of action. These devices are rather unworthy and possibly dangerous. It would be better to leave the illusory shelter of subterfuge, to admit that the Budget can and should be unbalanced, quite deliberately, in years when a deficiency of effective demand threatens, and to leave it to the Chancellor of the Exchequer of the day to choose the method of unbalancing which, in the circumstances then prevailing, is likely to be of greatest effect. It would be foolish to prescribe limits, which, if laid down beforehand, cannot be other than formal and without relation to the needs.

The second stage is to ask whether the Budget should be balanced over a longer period—say, over the eight years which can be taken as covering the average length of a trade cycle. That within an eight-year cycle some years should show a deficit and others a surplus can readily be accepted. But does this mean a balance? Can the surpluses be expected to be as large in the aggregate as the deficits? The White Paper, on the whole, seems to think so. Indeed, there is a hint, in the reference to deferred tax credits, that deficits should only be incurred to the extent that surpluses have already piled up. If deliberate tax reductions are permissible, there is no point in talking about rebates.

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

It would, of course, be an advantage to avoid a steady rise in the National Debt if it can be done. And perhaps it can be done. It may be that sufficient boldness in the anti-depression policy, developed at an early enough stage, will so quickly rally the natural forces of recovery that the deficits will be small and the subsequent surpluses large. It may be that a policy of spending for prosperity will lead to a reduction in the National Debt, while the opposite policy of economy in bad years would, by intensifying depressions, lead to a larger deficit. These possibilities are not conceded in any grudging spirit. They may be of the order of paradoxes which turn out to be the greatest truths. If so, no special budgetary problem of employment policy exists. But equally they may not be true—or not true enough to solve the problem. There are two powerful reasons for suggesting that the deficits may turn out to be larger than the surpluses. The first is the political reason. Eight years is a long time, and an electorate which will, in any event, have to bear heavy taxation, would be hardly human if it did not exert pressure for tax remissions in the good years, however large the preceding deficits. The second reason is economic. It may be that an advanced industrial community such as ours, has a persistent bias towards under-investment and a deficiency of effective demand, and that to keep on the even keel of full employment requires more injection of deficit-spending in the bad years than can be recouped by the extraction of funds in good years. If this is so, then the consequences should be squarely faced. On a vote of the electorate it will always be decided that it is better to have a steady rise in the National Debt than a steady volume of avoidable unemployment. The decision may or may not be unfortunate, but it will certainly be given.

But if the possibility must be faced of a budget that is not balanced even in the long run, is there any reasonable and enforceable limit that can be set to the rise in the National Debt? As a matter of pure disembodied theory, the economist would answer that debt which is incurred in order to maintain the volume of effective demand and to prevent the price level from falling cannot, by definition, be inflationary, and that the interest upon it, being a transfer payment, imposes no burden on the national income. But, as the White Paper points out, Governments cannot deal with disembodied theories. The spending may be overdone, and taxes levied to effect transfer payments are just as unpopular as any others. The White Paper itself, in one of the antiphonic sentences that are more concerned with income-maintenance than with budget-balancing, suggests the answer that the net annual interest burden of the National Debt, even if it is allowed to rise, should not be allowed to become a rising

proportion of the National Income. This looks like the first hard rock of principle in the shifting sands. So long as the community does not find itself compelled to raise in taxes and pay out in interest a rising proportion of its income, it is not losing control of its finances.

But before this principle is accepted as the new orthodoxy, its implications must be examined. When worked out, it leaves a substantial margin for deficit-financing. With cheap money and high taxation, the net cost of the National Debt is low—probably not more than about 1½ per cent per annum in post-war conditions. If, therefore, over an eight-year cycle, a deficit of as much as £2,000 million were incurred—say, £500 million a year for four years—the net addition to the burden of interest would only be some £33 million for the whole eight-year period, or a long-term rate of increase of about £4 million a year—that is, by between 1 and 2 per cent of the present net burden. If the national income were rising at the rate of only 1½ per cent per annum, the principle would be easily observed. It is true that, with a fall in population in sight, a steady rise in the national income can no longer be relied upon. But it is also true that, for comparison with the national debt, it is the money total of the national income, not its real content, that matters. If the real national income were stable (that is, if the rise in the productivity of the individual worker exactly offset the fall in the total number of workers), a steady price rise of only 1½ per cent per annum would be enough to preserve financial equilibrium without being enough to be perceptible to those who lived through it or alarming to those, either at home or overseas, who have claims in sterling. Indeed, monetary history would seem to suggest that, in all ages save the nineteenth century, mankind has needed a steady and gentle fall in the value of money to rescue it from the mortmain of the debt it creates as it goes along. The sums that would be required to maintain purchasing power are small relatively to the magnitudes of war finance or to the present total of the national debt. There is no inherent reason to believe that the national income cannot be increased at an equal rate.

This principle of a stable ratio between the net interest burden of the national debt and the national income may, therefore, possibly provide the lodgement for prudent finance, the foundation for the new orthodoxy, for which this article has been searching. It would set a limit, transgression of which should rightly be regarded as a danger signal. But at the same time it would almost certainly not pit "sound finance" against the attainment of stable and adequate employment. Perhaps this is what the Treasury meant to say. If so, it might be invited to take an early opportunity of saying so more clearly.

## The Bombay Plan

FEW, if any, privately prepared documents on the problems of India have ever created such an impression as the Bombay industrialists' recent well-timed "Plan of Economic Development"; and the publication of the Plan in this country as a Penguin Special is a commendable piece of enterprise. Indians are nowadays deeply conscious of their poverty and deeply anxious about the economic possibilities of the future. The war has had a double effect. On the one hand, it has expanded Indian industrial output in many directions, secured a steady overseas sale for much Indian produce at stable prices and enlarged Indian bank balances abroad. On the other hand, it has confronted wartime India with a sharp contrast between rising money incomes and a severely restricted stock of consumers goods. Last year's famine in Bengal and elsewhere, the effects of which still persist, was a very clear pointer to pressing economic requirements; and both the Government of India and the political parties have followed the Bombay Plan with planning of their own. It is not without significance that the new Planning Member of the Viceroy's Executive Council should be Sir Ardesahir Dalal, once a member of

the Indian Civil Service, recently in charge of the Tata Iron and Steel Co., and one of the eight signatories of the industrialists' proposals.

It is not the purpose of this article to recite again the political implications and repercussions of the Bombay Plan. The important question about the Plan is whether it is practicable. It is perhaps worthwhile, however, to point out that the authors of the Plan have taken for granted, almost light-heartedly, that the political and social conditions for over-all economic planning by the state can and will exist in India after the war. The economic problem is thus set in isolation, and the crucial and fascinating problem of the necessary conditions of planning, of the kind of community and the kind of state required, is left undiscussed. To this statement, one reservation must be made: the authors of the Plan, while following Soviet precedent in many of the general outlines of their scheme, explicitly repudiate any intention of resorting to the extremes of regimentation and forced saving which, with consequent hardships, have accompanied the Russian experiment.

In one sense this Plan is not a plan at all. It is a state-

ment of aims rather than a working model of economic development, and it deliberately refrains, for the most part, from referring to "such essential matters as the organisation, methods and techniques required." It is, however, made plain at several points that the process envisaged will require the most rigorous control by the Government over individual liberty and private enterprise; and that (though this is not stated outright) there will have to be controls over the exchanges, prices and the money market, priorities in the allocation of imports and in the use of skilled labour and, in the Indian context, very high taxation. The important point for the economist to fix attention upon is not the political feasibility of these proposals, which must be doubted, but rather the question of where the resources are to come from to make this Fifteen Year Plan possible and how, as a symbol and measure of real resources, the money needed is to be raised. Here the Plan seems to contemplate resort to inflation on a large scale. In part this is because of the methods of financing which are proposed, with their emphasis upon "created money." In part it is because of what appears to be a serious underestimation of the costs involved (which are calculated in terms of 1931-39 values), of some actual omissions in the reckoning of recurrent expenditures, and of some defects in the reasoning by which the major item is arrived at.

Briefly, the process of argument is as follows: The aim is to double the national income per head in fifteen years after the beginning of the Plan, which may take another three or five years to get under way. Since the population of India is likely to continue to increase by some five millions a year, this will require a trebling of the total national income. This, it is proposed, should be done by more than doubling the net output of agriculture and by increasing the income from industry and from services six-fold and three-fold, respectively. The expansion will be financed, it is suggested, as to one quarter by external means and as to three quarters by internal means. The use of external sterling balances will account for one tenth of the total investment required; "created money" will account for one third, and domestic savings for two-fifths.

Two points emerge from this summary account. The first is that the arithmetical objectives which are set out are almost entirely "notional." That is to say, they are not based upon any research into the degree of expansion in agriculture, industry or the service occupations which is in fact practicable. An increase in the national income of all-India (including the states as well as the provinces) from £1,650 million to £4,950 million at pre-war prices is simply postulated. In other words, the practicability of the Plan is not discussed in even remotely precise terms. It is true that the figures used are described explicitly as "illustrative" rather than "absolute." But the fact that these figures afford no real quantitative guide to the scale or pace of possible development tends to reduce the Plan to a mere agenda for further study. Its authors admit that it does not represent a programme capable of being implemented. But they do claim that it defines the economic and financial "possibilities," which is actually not true. This is no more than a statement of aims in the provision of food, clothing, shelter, health and education, with suggestions, made on no sure grounds, as to the kind of expansion in industry, agriculture, the service occupations and communications that would be required to "finance" those aims, in both real and money terms.

The aims stated are no doubt admirable and eminently to be desired: a minimum diet; housing accommodation of 100 square feet per person; proper sanitation and water supply; a dispensary in every village; hospitals and maternity clinics in every town; primary schools for every child; high schools for one child in every five; and an adequate system of adult, technical, university and scientific education. These or similar objectives must be the target of all plans for India. Almost exactly the same aims are set out in the "People's Plan" produced by the Indian Federation of Labour. (The People's Plan, incidentally, proposes to finance them initially from "the income resulting from the nationalisation of land; in-

heritance tax and the mobilisation through Government borrowing of the accumulated wealth which at present remains out of the process of production" and, thereafter, from the increased income derived from the "rationalisation and modernisation of agriculture.") But the official plan for the economic development of India will have to improve considerably upon the method of "finance by affirmation" which is common to the proposals of both the Bombay industrialists and the Federation of Labour.

The second point that emerges from a summary of the Plan relates to the credibility of the figures, even as illustrations. The beginning and end of the calculation is the statement that capital investment of 10,000 crores of rupees, or £7,500 million, would be enough to treble the national income. The figure is arithmetically doubtful, since it excludes (except in the first year) the recurring items, which are treated for the remainder of the period as "working capital" and therefore largely self-financing. This is a very odd procedure. A recurring item is not a revolving fund; in fact, it is almost the opposite. Of the total of recurring items of nearly £900 million, at least a third (that expended on public health, education and, to some extent, housing) cannot possibly be regarded as "working capital," except in the very broadest sense, and is certainly not self-financing. On the contrary, these "recurring items" would impose a very heavy annual charge upon the public finances and the taxable capacity of India.

But even if this omission could be set aside, it would still be difficult to accept the figure of 10,000 crores of rupees. Everything in the Plan turns upon its being approximately correct. If it is too small, then there would have to be a much greater reliance upon internal sources of finance—that is, either upon a large increase in savings, which could hardly be produced voluntarily in India and would create great hardship if exacted compulsorily, or, more probably, upon creation of money, which already bulks disturbingly large in the original calculation. Yet the most obvious point about this crucial figure is that it is wholly arbitrary. The possible increase in national income is obtained by the simple device of multiplying the national income of 1931-32 (with an allowance for the Indian states) by three. The total of investment required to bring this about is obtained by no less cavalier assumptions about the relation between investment and output. It is taken for granted without proof or evidence that new investment in capital equipment, including land and buildings, will produce additional net industrial output in the ratio of 2.4:1—that is, that the capital investment of £2,400,000 will produce an annual output of £1,000,000. In spite of the fact that, on the Plan's own showing, industrial investment in India would have to be largely in the heavy industries, the authors of the Plan have chosen to assume a ratio of investment to output much more favourable than the examples they themselves quote. It is assumed similarly, quite without demonstration, that a capital expenditure of £930 million on agriculture over the fifteen years will increase net agricultural income from £874.5 million to £2,500 million. It is taken for granted, too, that the physical and human means of development—the imports, the machinery, the skilled labour, the managerial ability and the organisational aptitude—will be available, at every point of the Plan, in the right quantities and at the right time. The figure thus arrived at is then divided among industry, agriculture, communications, education, health, housing and miscellaneous items in a similarly arbitrary way.

All this might not seem to matter in a purely illustrative statement of aims, if it did not lead inevitably to the impression that the sums stated do bear at least some relation to the money which India will have to find to put its house in order in the next generation. But, as already emphasised, the figures have no basis in fact; they merely represent, on the one hand, a very rough costing of the reforms that the authors of the Plan would like to see carried out if they were practicable; and, on the other, a wholly arbitrary assumption of the amount of capital investment necessary to enable India to meet those costs. Moreover, even if the basis of calculation could be roughly

accepted, there are the two serious errors already referred to: the underestimation by a large margin of the extra burden upon the annual budget; and the omission to take into account a probable increase in prices, compared with the pre-war base period, of between 50 and 100 per cent.

It can be said, of course, that higher post-war prices will increase the figures on both sides of the account—both the total of investment required and the value of output achieved. This is true, but in one very material way—namely, the financing of the Plan—the picture would be radically altered by a higher price level. It is not only likely that the total capital cost, even on the assumptions given, would be nearer £15,000 million than £7,500 million. It is also almost certain that the funds available from outside sources, such as sterling balances, would not be increased in proportion to the rise in prices, so that the amount that has to be obtained from internal sources—that is, from savings, and in particular from “created money”—would have to fill the greater part of the very large gap in the arithmetic. It is probably reasonable to suggest that, instead of “created money” representing, as suggested, 3,400 crores out of a 15-year total of 10,000, this source might be called upon to supply something between 8,000 and 10,000 crores out of a total of 20,000 crores, or going on for 50 per cent. Certainly this proportion of 50 per cent. could be expected in the final stage of the Plan, when a large part of the external sources—sterling securities, hoarded wealth and foreign borrowings—would have already been drawn upon.

This point can be quite simply stated in another way. The only justification for relying upon “created money” to the extent envisaged would be the expectation that the output of goods and services could be expected to expand correspondingly and *pari passu*. In fact, the rates of expansion in output quite arbitrarily set out in the Plan are almost certainly too high. It is the view of many

experts, for instance, that the increase of 130 per cent contemplated in agricultural production is perhaps four times too high. This view may be on the pessimistic side; but generally it is fair to say that, since the need for created money would almost certainly have to be larger than allowed for in the Plan, and the additional production achieved would almost certainly be smaller, a serious price inflation would almost certainly be the result.

It would be unjust to finish this very cursory examination on an entirely critical note. Obviously, the social and economic aims set out in the Plan, which will receive general approval, were worth stating. Few experts, for instance, will quarrel with the policy proposed for agriculture: co-operative farming; the liquidation of rural debt; the remedying of soil erosion; and the improvement of yields by more irrigation, better rotation, better seeds, more fertilisers and improved tools. The proposed large increase in road and rail mileage will be equally approved—as a necessary objective. There will be general acceptance also of the emphasis laid upon the development of power resources and upon the holding of a balance in development between basic industries and the production of consumption goods, in order to avoid the “heavy cost” of planning “in terms of human suffering.” All these items are, in general terms, identical in both the Bombay Plan and the People’s Plan. But without a precise calculation of ways and means, the best-laid plans must lead to grave disappointments and dangerous frustration. It is a truth as well as a truism that the coat must, in one way or another, be cut according to the cloth. No effort should be spared during the next generation to achieve the aims set out in the Bombay Plan. They must have priority before all other considerations. But it will take much harder thought, much more laborious effort and, it is to be feared, a much longer space of time to reach the goal.

## West Indian Regionalism

THERE has been much discussion lately of colonial regionalism. Thrown off as an afterthought by the Colonial Secretary in replying to a parliamentary debate a year ago, his acceptance of the principle fell on fertile and well-prepared ground. But it is not certain whether, say, Colonel Stanley, General Smuts and the Joint East African Board mean the same thing when they advocate it. To some people, it merely means the grouping of adjacent territories under one administration—a tidying up process. To others, it is something functional—the *ad hoc* planning and execution of projects by an agency such as the Middle-Eastern Supply Centre. To others, it means dealing with problems common to several areas by joint action of the Governments concerned. To others, again, it means international co-operation in colonial affairs. It is all too rarely considered is the participation of the colonial peoples in regionalism. It tends to be regarded as an instrument for their government or an instrument for their betterment, but not as an instrument which would help them to govern and better themselves.

There has now appeared, however, a description of regionalism in practice in which the people of the region have themselves participated. The Anglo-American Caribbean Commission is, on the surface, an example of co-operation between two nations with adjoining colonial possessions. It was established

for the purpose of encouraging and strengthening social and economic co-operation between the United States of America and its possessions and bases in the area . . . and the United Kingdom and the British colonies in the same area.

But neither the two sovereign Governments nor the Commission itself took this limited view of its purpose. In its first Report it was stated that the two Governments had agreed

that the democratic approach to the solution of the Carib-

bean problems must envisage arrangements for conferences and consultation with local representatives of the territories and colonies.

These arrangements took the form of “a regular system of West Indian Conferences” to which each territory should send two delegates. The Conference was to be a standing body—not composed of the same representatives, but with “a definite continuity of existence”—and it would meet when the occasion should arise and suitable subjects come up for consideration.

The first session of the Conference was held in March, and a report of the proceedings has now appeared as a White Paper (Colonial No. 187). On the agenda for discussion were means for raising the nutritional level by local food production and the expansion of fisheries; the reabsorption into civil life of persons engaged in war employment; the planning of public works for the improvement of agriculture, education, housing and public health; health protection and quarantine; industrial development; and the possibilities for expansion of the Caribbean Research Council. These items were first discussed in public meetings of the whole Conference; they were then referred to committees for detailed consideration, and the reports of these committees are reproduced in the White Paper.

From the point of view of the West Indies, the Conference was an undoubted success. The recommendations of the various committees show a deep understanding on the part of the delegates of the needs of the Caribbean area and an earnest desire for co-operation in fulfilling them. For instance, one of the worst defects of living conditions in the West Indies is overcrowding. The committee on the planning of public works recommended that Governments should be given power to zone land for specific uses and to plan its development accordingly, and to acquire land in the public interest at fair and economic

values. It further recommended that regional planning boards should be appointed in the various islands or groups of small islands, and that their work should be helped by a Caribbean Planning Commission, to form part of the Anglo-American Caribbean Commission, which would promote the exchange of experience and ideas and also assist in the allocation of available materials. Minimum standards of space and equipment should be established throughout the Caribbean and applied to all new projects. All Governments in the Caribbean area should collaborate in immediate steps to complete topographical contoured surveys, the lack of which is at present a serious barrier to comprehensive planning in the British colonies. In view of the shortage of technical personnel throughout the Caribbean area, the Governments should arrange to pool and exchange available personnel where possible. Finally, the committee recommended that a sectional committee of the Caribbean Research Council should be set up to undertake research in building and engineering, and in particular the possibility of standardising building units in various materials and of prefabricating such units in the Caribbean area at suitable distribution centres. The recommendations of this committee are, it should be emphasised, only one instance of the absence of insularity and the sense of a wider—a Caribbean—interest which marked the proceedings of the whole Conference.

But the Conference scored more than a local success. It is also an object lesson in colonial regionalism. In the first place, there is the international factor. The parent body, the Anglo-American Caribbean Commission, is, as its name suggests, composed of representatives of the United Kingdom and the United States. But the possibility of associating other Powers with its work has always been envisaged. To the Commission itself, representatives from the Netherlands and Canada are attached as observers. The Caribbean Research Council, which is an advisory body to the Commission, has a representative from the Netherlands. The Conference itself was attended by delegates from the British and American territories

only, but the official communiqué announcing that it was to be convened stated that it would “be free to invite participation of other countries on occasions.”

More important, however, is the fact that it was democratic. The method of selecting the delegates cannot be regarded as entirely satisfactory, and some means of popular selection should be found when the Conference is firmly established. Nevertheless, it was not just another case of sovereign Powers meeting to discuss matters of common interest to their territories, nor of colonial Governments meeting for the same reason. The chief merit of the representation at the Conference is that one of the two delegates from each of the colonies was an unofficial one. It was thus a quite genuine instance of the people themselves participating in plans for their own betterment. And, as the Report of the Conference shows, they proved themselves capable of it.

When, therefore, a move is made for colonial regionalism, it should first be asked what sort of regionalism the promoters have in mind. The present Secretary of State has always held out the Caribbean Commission as the model to be followed elsewhere. But it is not so certain that when General Smuts asks for the High Commission territories to be transferred to the Union of South Africa, or when European settlers plead for closer union between the East African colonies, or when Southern Rhodesians demand amalgamation of the Rhodesias and Nyasaland, they also have in mind a similar democratic process. It is quite true that the delegates to the West Indian Conference had no powers. Like its parent body, the Conference is only advisory, and action on its recommendations still lies with the colonial Governments and the sovereign Powers. But the British and American Governments, in their announcement of the Conference, mentioned the possibility of powers being entrusted to it by the participating Governments; and the hope has been officially expressed that it “would attain a really influential position.” The account of the first meeting of this West Indian Parliament shows that this hope is likely to be achieved.

## NOTES OF THE WEEK

### Hitler's Dilemma

The main Allied achievement in Normandy in the first week of the invasion was the fusion of the many footholds gained on the coast into one bridgehead, sixty miles wide and about twenty miles deep, in the centre of the penetration. The enemy's efforts to contain the extension of the bridgehead has developed only gradually. At first it was made in great strength on the left Allied flank around Caen. It was relatively weak both in the centre, where the Allies had succeeded in clearing the network of roads radiating into all directions from Bayeux, and on the right flank, where the Americans had taken the road centre of Carentan and, advancing to Montebourg, threatened Valognes, the most important road junction in the Cherbourg perimeter. The beginning of the second week of the fighting saw the enemy's determined and partly successful attempt to contain and to push back the right flank of the bridgehead in the Cherbourg Peninsula. The next days will show whether the enemy will continue to press on the flanks of the bridgehead or whether he will now concentrate on stemming the Allied advance in the centre. The real question at this point is whether Rundstedt is capable of a concentration of forces that would give him local superiority before General Eisenhower has completed the building up of his striking force inside the beachhead. This depends on the size and character of the reserves which he is prepared to throw in the battle of Normandy and on the speed with which he can move them from the rear to the front. That the enemy's mobility in shifting reserves has been decisively reduced is already beyond doubt. It is a fact that General Eisenhower's lines of communication in the Channel have been incomparably safer than Rundstedt's lines of communication inland. This seemingly paradoxical situation has been entirely due to General Eisenhower's overwhelming superiority in the air. The German commander might, at least in theory, offset the slowness of his concentration by its

mass. But this he can only do at the risk of engaging in the battle of Normandy forces that sound strategy would advise him to keep in readiness against new Allied landings on other sectors of the Atlantic (or Mediterranean) coast.

If Rundstedt now saves his forces for future battle, then the result is that he allows his reserves to be paralysed by the mere threat of new landings, and so gives General Eisenhower enough time to extend and consolidate his bridgehead in Normandy into a solid jumping-off

ground for a major offensive. If, however, he disregards the rules of prudence, and engages a high proportion of his reserves in the fighting now, then, whatever temporary success he scores in Normandy, he facilitates General Eisenhower's task of making new landings elsewhere. The dilemma is not only Rundstedt's. It is Hitler's also. It confronts the German High Command not only along the Atlantic Wall but all over the Continent. Everywhere the thunder hangs over Hitler's head. Nowhere does he know when and where the bolts will fall. Everywhere his forces are numerically inferior to those of his opponents and shaken in their confidence; and everywhere the danger stares him in the face that the many protracted retreats of his armies may merge into one final rout. In Italy General Alexander is approaching Orvieto and may soon be half-way from Rome to Florence. Mackensen's 14th Army has been routed in the retreat. In the east the Russians have struck against Finland, taken Terioki and advanced towards Viipuri. The Soviet High Command apparently hopes to press the Finns to their knees in a short lightning campaign. It would hardly engage its forces in a slow operation at a time when it is making ready for the decisive blows on the White Russian, Polish and Roumanian sectors of the Eastern front.

### Exit Badoglio

Shortly after the liberation of Rome King Victor Emmanuel, without abdicating, gave up his royal functions and appointed the Crown Prince Umberto to be Lieutenant of the Realm. The withdrawal of Victor Emmanuel was foreshadowed in the agreement of last April, on the basis of which the leaders of the six Italian parties joined the government of Marshal Badoglio. What was really unexpected was the resignation of Badoglio himself. It seemed that he had secured the goodwill and the co-operation of the anti-Fascist leaders. But anti-Fascist and anti-militarist feeling has apparently been much stronger in Rome than it was in Naples; and the Marshal could not withstand it. A conference of leaders of the anti-Fascist parties decided unanimously on his removal. The role of the Communists in this incident has still to be explained. It was they who previously persuaded the democratic parties to support the Marshal. The initiative to withdraw support came from Count Sforza's Party of Action, a somewhat nebulous but most energetic group of politicians, which includes in its ranks liberal Radicals and ex-Socialists and has shown itself more intransigent towards the dynasty and Marshal Badoglio than either the Socialists or the Communists. Probably, the Party of Action was able to carry the day so easily because its uncompromising hostility to the Marshal was in tune with the mood of the rank and file of the other parties. The Badoglio experiment is now closed; and some lessons may be drawn from it. There was an undoubted advantage for the Allies in having the armistice terms accepted and loyally carried out by the King and by a prominent soldier. To parley with them in the first instance was a military and political necessity, but the experiment seems to have been prolonged until it provoked an irresistible reaction. It was clearly an illusion to believe that Italy would accept the Marshal as a bridge between a fascist past and a democratic future.

### Enter Bonomi

It is comparatively easy to say at this stage what post-Fascist Italy will not accept. It is much harder to say what it will accept. In the eyes of the Italian people, Marshal Badoglio was a relic of the Fascist past. His successor, Ivanoe Bonomi, combines the rôles of a herald of the new era and a survivor of the pre-Fascist past, whose chief, though not only, attraction is its remoteness. He was one of the foremost spokesmen of the reformist tendency in Italian Socialism long before the first world war. In the critical years after the last war he was Minister of Defence in one of Giolitti's Governments and Prime Minister on the eve of Mussolini's march on Rome in 1922. At present he is not only Prime Minister, but also Minister of Foreign Affairs and Minister of the Interior. His inner council consists of leaders of all parties, most of them able and sincere anti-Fascists as well as Bonomi's contemporaries. They, too, belong to the pre-Fascist rather than to the post-Fascist era. Will these men, who once proved incapable of preventing the decline of democratic Italy, now be able to secure its second birth? Certainly they will need the aid of younger leaders who have worked out new ideas and

conceptions about their country's future in the hard school of the anti-Fascist underground. Unfortunately, those leaders of the younger generation have not yet appeared on the stage. They may, perhaps, still be making ready in the industrial north, which so often served in the past as the hot-bed for political movements and programmes. Only after the liberation of Milan and Turin and Genoa will it be possible to say with certainty who, if they exist, are the real claimants to the political succession to Mussolini. The only fact that seems well established already is that the popular desire to make a clean sweep of the legacy of the past twenty years goes deep and expresses itself in radical forms. This is reflected in the decision of the new Government not to take the oath of allegiance to the dynasty. Prince Umberto, the Lieutenant of the Realm, has not assumed his office under the brightest of auguries.

### Legislative Lull

There are presumably two reasons why no announcement has yet been made, since Parliament reassembled after Whitsuntide, about the Bills and White Papers which were promised, and eagerly awaited, before MPs and peers dispersed. They are the present concentration of attention upon the invasion of France and, rather more casuistically, the time needed to digest the White Paper on Employment Policy. The former reason for a pause in reconstruction will quickly lessen though the fight goes on. The bombed cities of Britain, for whom a Reconstruction Bill was all but ready a month ago, must prepare to go about their business of rebuilding even while France is being freed. The latter reason, insofar as it suggests that the reform of social insurance or the planning of land-use is dependent upon a successful policy of high employment, is deliberately misleading. Indeed the argument could quite plausibly be reversed. A comprehensive and uniform system of social security might powerfully assist the mobility of labour that high employment requires, while the guidance of industrial location that is promised in the Employment White Paper is scarcely possible without the long-delayed decisions on land-planning. The real question is whether the Government is itself prepared, even now, to publish its uncommonly well considered views on these matters. It is still being said that the chief obstacle in the case of both social security and the control of land, with compensation, is cost. Certainly in the case of land, the longer the decision about 1939 values is put off—the Uthwatt proposal to peg land prices at this level was made as a matter of urgency two years ago—the harder it will be to fix any datum line without considerable apparent injustice to some interest, public or private.

### Your MP

Brooding over the political scene, behind the deep sense of nation-wide responsibility caused by the invasion of France, is the certainty among the professional politicians that the next General Election is not far off. The practical signs of this conviction are most evident on the Conservative side, where an immense amount of hard work and hard thought is being applied to the refurbishing of the party machine and party programme (largely provided by Mr Churchill's Coalition agenda) to fit the needs of electoral conflict. The Conservative Central Office has taken on specialists on particular topics and is seeking for a new figure of front-rank importance to direct its activities. Both the party and its enclave of Tory reformers are reconstructing and expediting their research work for propaganda purposes. All this is in itself good news for voters, even though it throws into somewhat sad contrast the apparent floundering of the Labour Party, which has been too much engrossed by its several fissures to set about the task of preparing to be an alternative Government with any real will. On the other hand, the pointers that have been given to the direction of Conservative policy, both centrally and among the Reformers, are by no means so encouraging. Two things seem to have been determined, apart from the election value of Mr Churchill, as the planks of the platform. One is the ceaseless fight against almost all forms of public control, guidance or planning, which is reflected in that naïve sheet, *The Recorder*, now exposed for sale in some quantity on the London streets. The other is the resolve—gallantly led and inspired by Captain Hogg and by certain advocates of Sir Samuel Hoare, whose return to high office they devoutly and doggedly seek—to vindicate

the so-called "men of Munich." This is a project which tends to take the form of an intensive and widespread campaign of bitter charges against the Left-wing writers who have spent a good deal of time, with impunity, in recent years in drawing up their now over-drawn bill of indictment against the "guilty men." This second line of approach to the new Toryism must appear to any outside and non-partisan observer to be sterile in the extreme. It is not only at least three years too late. It also does no justice at all to the common sense of electors, who will look for policies and leadership, not for excuses or for the somewhat ominous repudiation by a party which steadily had a majority in the critical years before the war of the responsibility which belonged to it and to it alone. That the strident recriminations of the Left, which have gone on for far too long, are also becoming both distasteful and irrelevant (the latest example is the very prejudiced "Your MP," which caused a storm in the Commons last week) is no reason at all for diverting the energies of the Conservative Party bodily into this miserable *cul de sac*—unless it is that the Right does not wish, by having a policy, to embarrass the Left, which has none.

### African Event

An important and welcome move has been made in Kenya. For the last half century or so there have been two views in Africa about the representation of Africans on legislative or consultative bodies. One has asked for direct representation of African by Africans. The other, strongly represented in the Union of South Africa, in Kenya and in Northern Rhodesia, has steadfastly maintained that representation must be indirect by nominated Europeans—on the ground that Africans are not capable of participating personally in public affairs. The appointment of a single African to the legislative council of Kenya is therefore a dramatic, if not very considerable, breach in an old and entrenched attitude. The one Kenya African may not count for much in an assembly which may number nearly 40 in all, but he is a symbol. The wish of Kenya settlers, which has been often and frankly stated, to exclude Africans is no longer fully accepted; and the question at once arises whether what is good for Kenya ought not also to be good for Northern Rhodesia. The case of Northern Rhodesia is particularly apt. Representative Africans from the native councils in that territory recently met for the first time in a newly-formed regional council. They expressed their opinions freely; they showed both judgment and good sense in their discussions of public policy; and, more specifically, they resolved in favour of increased and direct representation on the legislative council of Northern Rhodesia, on which they are at present represented by one European. Now that Kenya has shown the way there is surely no obvious reason, apart from prejudice, why this modest request should be refused.

### Revising Montreux?

The British and Russian Governments recently made representations to the Turks about the passage of German ships through the Straits. Under the Montreux Convention, which still governs the Straits, merchant vessels have the right of innocent passage in peace or war. The rights of warships are more complicated. In time of peace, the Black Sea Powers can send any number of warships out (provided they go singly), while other Powers may only send in a limited number. In wartime, the decision of the transit of warships rests with the Turks. If they are belligerents, they can decide absolutely. If they are neutral, they can refuse the passage of all warships except those which are being used to fulfil obligations under the League Covenant. The British and Russian complaint is that German light military craft, disguised as merchantmen, have been escaping through the Dardanelles, only to resume military activities when they reach the Aegean. Mr Eden reported to the House on Wednesday that the Government considered the Turkish reply very unsatisfactory and the matter would be pursued further. The incident thus raises the question whether the Montreux Convention needs revision. It is not simply a question of re-defining the naval categories to include the small military craft which have since 1936 come to play such an important part in naval warfare. There is the larger question whether the Convention in its present form best suits the interests of the international community. There are two alternatives—Turkish control or an agreed inter-

national arrangement, following perhaps the new pattern of joint bases which the British and Americans have developed. If the solution of continued national Turkish control is accepted, then a Montreux Convention modified to cover the death of the old League and the birth of a new international organisation, would probably be the solution. If, however, the Allies were to decide that they cannot realistically accept the likelihood of their mutual aid having perpetually to pass through a neutral Turkish filter, the problem of re-negotiation would be much more severe. Would the Turks oppose internationalisation? The obvious answer is that they would reject it unconditionally as an affront to sovereignty. Yet there are certain conditions under which such an arrangement might serve Turkey's interests better than independent sovereignty. Throughout this war Turkey's chief objection to joining the war was Allied unpreparedness and the danger to which this exposed the Turks. If a joint base were established on the Bosphorus, Turkey would be less likely to have to fear the domination of any one Power and would not have to depend again on the narrow margin which separated the Allies from utter defeat and the Turks from slavery at the time of El Alamein and Stalingrad. This is, perhaps, too long-term a policy of interdependence to appeal to Turkish statesmen, who are likely to be more concerned with the short-term diminution of national independence.

### Dispossessed Farmers

Anxiety is felt about the right of the Minister of Agriculture, conferred upon him under an Order in Council, to dispossess farmers on the advice of the County War Agricultural Committees. Mr Williams assured Parliament last week that the committees only suggested this step after trying every means of persuasion, and that actual responsibility for evicting was not theirs but the Minister's, who investigated every case through his land commissioners. Mr Williams argued ingeniously that the farmer who could put his case to a committee, most of whose members were themselves practical farmers, was being tried by his peers. The fact remains that the farmer's fate is decided exclusively by agents of the Minister of Agriculture, and in this particular case a great deal is at stake for the farmer—his home as well as his job. It is doubtful whether the War Agricultural Committees, constituted on a rather casual basis to meet an emergency, are in any case suitable bodies to exercise such a drastic influence. They are necessarily not always free from local bias, and they vary greatly in efficiency between districts. Clearly, they need to be made more representative and more uniformly efficient, especially if, as is likely, they are to be continued in some form after the war.

### The Right of Appeal

Quite apart from the powers of the War Agricultural Committees, the farmer feels himself threatened by "dictatorship." The right of appeal against wartime eviction has been refused him; and there is a distinct threat, in more than one way and on grounds of wartime emergency, to his freedom to enter or remain in his trade, a threat which clearly calls for the utmost vigilance in Parliament. In Tuesday's debate on the Food and Drugs (Milk and Dairies Bill), Mr Hudson again resisted the demand that the farmer should be free to appeal to an independent tribunal if his registration as a milk producer was cancelled. Such disqualification may, of course, put him completely out of business and is not far short of eviction. The wartime powers of eviction have had justification in con-

## THE BRITISH LINEN BANK

ditions of siege which make efficiency, and speedy efficiency, all-important. It is true that, in peacetime as well, some control to ensure the efficiency of agriculture will probably need to continue. This would be the price of public aid. It is all the more important that the farmer should be protected against abuses of power. The only certain safeguard lies in the right of appeal to an independent tribunal, and it is hard to see why this should not cover equally wartime evictions, with necessary precautions for ensuring speedy decisions. On the dairying issue, the strong opposition of MPs forced Mr Hudson back from his original demand to be the ultimate arbiter of satisfactory standards of clean milk production. After a long and heated debate, in which the demand for right of appeal to the county court was defeated in a division—from which many members abstained—by 178 to 76, the strong feeling of the House was partially met by the Minister. Mr Hudson finally proposed that a farmer denied or deprived of his registration could appeal to a tribunal consisting of the regional veterinary inspector, and a representative each of the Milk Marketing Board and the National Farmers' Union; if the decision of the tribunal were unanimous the Minister would be bound by its ruling. It is doubtful if this is going far enough. The tribunal would at all events be better constituted if it contained an independent chairman instead of two representatives of the producers.

### Dives and Lazarus

One of the chief reasons put forward in recent months for the continuation of food rationing in this country, even after the armistice, was the need for feeding Europe—a Europe whose nutritional level is plainly, though not uniformly, well below our own. To this appeal to their sense of generosity the people had reacted well. The principle was accepted that some at least of what we had and others had not should be sent in the wake of the liberating armies. It was an earnest of that genuine unity among the nations which lay behind a formal military alliance. Now, it appears, "it would be absurd for this country to send foodstuffs." It is, of course, obvious from the facts that the lion's share of whatever foodstuffs may be sent to relieve Europe will have to come from across the Atlantic; and it may be that Colonel Llewellyn's somewhat surprising statement, made in the Commons debate on the Ministry of Food, was only loosely phrased with this in mind. But the impression left by the remark that it would not be right or reasonable to cut down our already reduced standard of living in order that provision should be made for Europe has not been entirely a happy one. To place the whole responsibility entirely on the best-nourished members of the United Nations will not be possible. Indeed it would be as inexcusable as if Dives were to tell Lazarus to go a-begging next door from a still richer neighbour. It has been shown—for example, by the survey of comparative levels of food consumption in Canada, the United States and Britain (*The Economist*, April 29th, p. 567)—that the United States is better able to allocate supplies to Europe. Undoubtedly, the major part of the supplies must come from North American resources. But an appreciable part of our own present wartime diet comes from North America; and one of the obvious ways in which the gap in European supplies will (rightly or wrongly) be filled, is by the diversion to Europe of some of the imported food coming to this country. The impression should not be given that some sacrifice, largely invisible though it may be, will not have to be made by us in this way; and other commodities may be needed, for a time, direct from Britain. Certainly, the Minister's statement calls for further explanation.

### Food Purchase Plans

In the debate on the Ministry of Food, Colonel Llewellyn declared that, come what may, existing ration scales (except in milk) can be maintained for the rest of the year. For at least the next four years guaranteed markets will be provided for home producers of milk and meat at prices not lower than the present ones; and long-term contracts with overseas producers are being negotiated. Australia and New Zealand have agreed to send their surpluses of meat and dairy products up to June, 1948, to the Ministry of Food, which will act on behalf of the United Nations Combined Food Board. Canada has been offered a bacon contract up to 1947, which will provide for deliveries totalling 1,850 million lbs. Canada is also to send 125 million lbs. of cheese in each of the two years

to March 31, 1946. The whole exportable sugar production of the Dominions and Colonies until the end of 1946 is to be bought by the Ministry. For some months, the Ministry has turned its attention to introducing variety into the nation's diet. Ham has appeared again, lemons from Sicily, oranges from Palestine, South Africa and Spain, dates from Irak, raisins from Cyprus, and 32,000 tons of dried fruit from Turkey. The national loaf has been improved by leaving out oats, rye and barley. Although the Minister declared that he wished to abolish milk rationing as soon as possible after the war, he did not warn the public that it will probably take more than four years for milk producers to add 360 million gallons to yearly output. This is the additional quantity of milk required to abolish rationing if the National Milk Scheme, with its priority consumers, is to be continued. The benefits derived from the scheme are too great for it to be sacrificed to give the "ordinary consumer" a larger allocation of milk, if milk rationing has to remain for some years after the war.

### Lend-Lease to Russia

On June 11th the Soviet Government published an impressive and detailed list of "armaments, strategical raw materials, industrial equipment and foodstuffs" received from the United States, Great Britain and Canada from the beginning of the Russo-German war up to April 30th this year. American deliveries naturally head the list with 8½ million tons of supplies despatched to Russia, compared with 1,150,000 tons despatched from Great Britain and 450,000 tons from Canada. Interestingly, the differences are given between the quantities of goods despatched to Russia and the quantities received; and they amount to between 10 and 15 per cent, which is presumably the proportion of supplies lost on the way through enemy action. The list does not relate these losses to the various periods of delivery; but they were obviously incurred mainly during the months of intensive U-boat warfare in 1942 and 1943. The losses then must have been disturbingly high. But equally, the flow of supplies to Russia must have been going on for some time past almost unimpeded. The table below compares some of the items received from all three countries.

|                  | United States | Great Britain | Canada     |
|------------------|---------------|---------------|------------|
| Aircraft .....   | 6,430         | 5,826*        | ...        |
| Tanks .....      | 3,734         | 4,292         | 1,188      |
| Lorries .....    | 206,771       | 5,239†        | 3,410†     |
| Shells .....     | 22,400,000    | 17,000,000    | 827,000    |
| Cartridges ..... | 991,400,000   | 290,000,000   | 34,800,000 |

\* 2,442 of these were despatched from the U.S.A.  
† Armoured troop carriers included.

In the American deliveries food and clothing take an important place with 5½ million pairs of Army footwear and nearly 23 million yards of cloth. In the British deliveries industrial equipment forms a very impressive item (6,491 metal cutting lathes, 15,084 electric motors, power plant equipment of a total capacity of 374,000 kilowatts, and so on). Light metals have been delivered in great quantities from all three countries. It is interesting to note that the Soviet Government has already put the dollar sign into the list and given the value of the American Lend-Lease deliveries in money terms (American Lend-Lease supplies, unlike British, must of course be valued for the purpose of Congress appropriation). The total value of the American goods despatched is \$5,357 million, and of those received in Russia \$4,612 million. The money value of British deliveries is not specified, and in any case nearly one-third of the tonnage of British supplies has been delivered as "military aid without payment." The total value of the Canadian deliveries is given as 187,600,000 Canadian dollars, of which supplies to the value of \$116,600,000 were delivered as "part of the British undertaking." These figures tell a really striking tale of the contribution of Allied factories to Russia's victories in the field, a contribution made long before the landings in France made the military operations on the Continent merge into a single campaign.

### Industrial Location

The Government has accepted the principle of controlled industrial location as a means of ensuring—in the words of the White Paper on Employment Policy—"a balanced industrial development in areas which have in the past been unduly dependent on industries specially vulnerable to unemployment." Obviously, the efficacy of this

remedy depends on whether a sufficient volume of factories can be "steered" to transform industrially unbalanced areas into balanced areas within a limited number of years. As Mr Dalton, President of the Board of Trade, admitted during the debate on the location of industry in the House of Commons on June 7th,

Unfortunately, for good or ill, most of our industry is located already. It is only in the field of the construction of new factories, or extensions to existing factories, that the Government can influence the location of industry at all. Existing buildings, until they either fall down or become obsolescent, must remain located where they are now.

In the past the number of new factories constructed annually has been small in relation to the total number in existence. In a year of active business, such as 1937, the number of new factories and factory extensions recorded by the Board of Trade were 541 and 237 respectively, but the majority of new factories were comparatively small. True, heavy investment in capital equipment will be necessary after the war if the equipment of British industry is to be brought into line with the best practice at home and abroad. But a substantial proportion of capital expenditure will take the form of new equipment for existing factories and of partial rebuilding. Although this type of expenditure does not seem to fall into the category of projects eligible for "steering" as defined by Mr Dalton, it may be found in practice that, where modernisation involves the purchase of a complete set of new machinery or the rebuilding of the greater part of existing factories, the undertaking can occasionally be transferred to another district without adding to cost. A policy of controlled location, to be effective, should involve a careful examination, not only of projects for new factories and extensions, but also for large-scale re-equipment and partial re-building.

### Germany Speaks

The Germans have always relied on the propaganda arm and made greater and earlier use of it than any other Power. One might have expected the invasion of Europe to have been the signal for a new and active phase in the propaganda campaign. On the contrary, the German radio has never had less to say than at present. To its own people, it reports in great detail the fighting, stresses the Allied losses, declares that they are throwing in their troops at a spendthrift rate while Germany is shepherding its own reserves. No leading political figure has gone to the microphone. Even the old familiar themes—European civilisation, the Bolshevik bogey—are heard less often. There is nothing but defence, defence, defence. Similarly in foreign broadcasts, the same emptiness of content is noticeable. To the Dutch and the Belgians, the chief line is: "See what might

happen if the horrors of invasion reached your shores." To the French, through the mouthpiece of Pétain, Laval, and Henriot, the word is: "Keep quiet. Don't get into trouble. Do as you are told. Spare yourselves by avoiding the war." To the British and American forces, though here the theme is varied by half-hearted attempts to play off Britain against American and both against the Russians, the staple propaganda is atrocity stories from the front line, of thousands of Allies killed in horrible ways, with the question asked at the end "What is the use of it all?" Here, blatantly, the German propaganda machine is betraying its own mood. The anti-invasion propaganda is an open confession of bankruptcy. There is nothing left worth saying. There is nothing to be said for the German cause. They can still hold out—yes, defence for a month, for two months, three months. And then? "What is the use of it all?" This is not a propaganda that can give an Allied soldier a moment's hesitation or quell for a moment the rising excitement and fury of the subject peoples. On the whole, they have obeyed the appeal of their leaders to remain quiet until summoned to attack. But in France, in many regions, the hunt is already up. The Maquis has risen in the mountainous areas. Swiss reports speak of communications with Vichy interrupted and of the surrounding of towns by the patriots. Grenoble appears to be cut off. As the Allies advance and every city in Europe sends out its army of enraged resisters, neither words nor deeds will prevent the final German disaster. The voice is already a whisper. Before long, it will be the echo of an echo.

### Shorter Note

The following table gives the number of civilian casualties in air-raids since September, 1939:—

|                         | Killed | Injured and Detained in Hospital | Total Serious Casualties |
|-------------------------|--------|----------------------------------|--------------------------|
| Sept., 1939-Aug., 1940. | 1,494  | 1,980                            | 3,474                    |
| Sept.-Dec., 1940 .....  | 22,282 | 28,522                           | 50,804                   |
| Total, 1941 .....       | 20,863 | 21,839                           | 42,702                   |
| Total, 1942 .....       | 3,221  | 4,149                            | 7,370                    |
| Total, 1943 .....       | 2,357  | 3,462                            | 5,819                    |
| 1944—                   |        |                                  |                          |
| January .....           | 107    | 270                              | 377                      |
| February .....          | 961    | 1,712                            | 2,673                    |
| March .....             | 279    | 633                              | 912                      |
| April .....             | 146    | 228                              | 374                      |
| May .....               | 68     | 75                               | 143                      |
| Totals to date .....    | 51,778 | 62,868                           | 114,646                  |

Those killed during last month's air-raids included 26 men, 32 women, and 10 children under 16.

## AMERICAN SURVEY

### The Sugar Beet Industry

(By a Correspondent in Colorado)

THE president of a great beet-sugar processing company once remarked that of all US industries this is the most closely tied to Government, and it has been more closely tied since the war began. It is also closely integrated in its internal structure, each element dependent on the other. It is protected by the Government through the tariff and through quotas limiting the amount of foreign sugars that may be imported, and in return the Government exacts many stipulations. Physically much the greater part of its production is in the semi-arid American West, wholly dependent for growing the beet plant, which requires much moisture, upon the water stored behind huge dams.

The pattern of the industry is a familiar one throughout the West. A huge immaculate processing plant (there are about 90 of these and the total investment in the industry is estimated at about a quarter of a billion dollars) stands out on the prairie. Surrounding it are neat farms. The

farmers each contract yearly to plant so many acres of sugar-beets, with seed supplied by the company, often with mechanical assistance furnished by it, and with technical advice—the companies maintain research departments which work constantly for better ways of growing and processing. Before World War I, seed was wholly imported from Europe; now it is wholly grown in the US on huge farms maintained by the companies for that purpose alone, and many thousand pounds are currently grown for lend-lease and other export to England.

The sugar-beet farmers are general farmers also, and most of them integrate the growing of beets and other crops with the fattening of livestock in the winter, largely on the cured beet-tops, and on the pulp from which the sugar has been extracted.

Formerly, growing sugar-beets was almost wholly a matter of hand-labour, especially since the beet-seed in its natural state consists of a woolly clump containing several

germs. Therefore, after the plants came up, workers had to crawl down the row removing the surplus shoots by hand. Whole Mexican and Spanish-American families were brought by the thousands into the beet country to do this work, and the industry had a bad reputation for child labour and other exploitation of the workers. More recently, child labour has been forbidden; importation of Mexicans is under the supervision of the War Food Administration, and wages and working conditions are set on an area basis by the Secretary of Agriculture under the Sugar Act of 1937.

But more potent than any law in the increasing emancipation of the "stoop" workers—so called because they have to stoop along the rows—is the increasing mechanisation of the industry. A few years ago, Roy Bainor, of the Department of Agriculture, perfected a cracking machine which is now coming into use. It breaks the seed-balls up into single germs, which can be planted singly and so come up singly, at somewhere near the proper spacing, about ten inches apart. Unwanted plants can be scooped out by machines, or at the worst by long-handled hoes in the hands of workers who move rapidly and upright along the rows. After the war the growing of beets will be almost wholly mechanised. Harvesting machines have been devised which move along the rows, "feel" for the crown of the plant, cut the beet-top off at the right height, plough out the beet, gather both beets and tops on conveyor belts and deposit them in trucks or in rows at the side as desired. The trucks carry the beets direct to the factory, or dump them in huge piles at railway sidings to be loaded into open cars. The sweetish-sour smell of these piles of livid beets pervades the whole countryside in the autumn.

Meanwhile the factories, which operate only three months yearly, have been prepared for the fall "campaign" and additional help has been hired. The beets are washed, tumbled into slicers which cut them into thin strips, and cooked in vats. The syrup is poured into huge centrifuges that whirl the syrup into dry sugar clinging to the sides; this is scraped off, washed and sacked. By the time the factories are silent in late winter, the farmers—through their associations—are again signing uniform contracts, have learned the governmental conditions laid down for the coming year, and are deciding how many acres to plant, with the companies extremely urgent for as large an acreage as possible.

When the war cut off all Philippine sugar, and almost all the Hawaiian crop—though imports have since been resumed from Hawaii—the sugar-beet industry saw its chance to demonstrate the wisdom of the governmental policies protecting it, always under fire from critics who said it was an uneconomic industry, and that sugar should be bought from countries that produced it more cheaply.

About a million acres were planted in 1942, with a yield of nearly 2,000,000 tons of sugar. But in 1943 only about 600,000 acres were harvested, due to the lateness of the government in setting forth conditions, and to uncertainty as to the labour supply, and other factors, including the fact that the Government offered comparatively high support-prices for competing crops, such as potatoes and dry beans. This was much harder on the processing companies than on farmers, since the farmers can grow other crops, but the expensive factories are useful for only one purpose. About 25 out of the 90 in the US remained closed in 1943. For 1944, the Government has offered the most attractive support-prices in history—it will pay \$12.50 per ton for sugar-beets (against \$11.00 in 1943), then will resell the beets to the factories for \$9.50 per ton, in order that the price of sugar to consumers may remain stabilised. Also wage minimums are to be the same as in 1943, and the support prices of competing crops remain approximately at the 1943 level, so that sugar-beet growing is relatively more attractive.

Despite all these incentives—and despite a final resort by which the Government offered an extra 25 pounds of sugar, ration-free, to farmers' families for each acre of beets grown—farmers by March 1, 1944, had signified to the Department of Agriculture that they intended to plant only about the same acreage as in 1943, or 600,000 acres, betokening another short crop. However, there was still time in most of the northerly regions—Colorado, Utah, Montana, Idaho, Nebraska, etc.—for them to change their minds. In California the season was probably too far advanced.

A feature of the industry is the golden flood of cash which pours into beet-sugar regions in the autumn. Complete settlement for any year's crop is a slow process extending over nearly a year, because of the fact that part of the return to farmers, under the price-and-quota system, is

made up of the proceeds of taxes imposed on the processing companies by the Government. But the beet companies are able to pay, in the first payment during the autumn, between 80 and 90 per cent of what they owe farmers, so that in the case of one great company alone, about \$20 million in cash is poured out at once to the farmers, in a region covering not much more than 1,000 square miles.

The nearby towns hum with farmers buying, and the large cities, such as Denver and Salt Lake City, are flooded with farm families. From the mountains come millions of lambs, and thousands of cattle, for the winter-activity of the sugar-beet regions. In huge feeding-lots these are fattened on the rich tops and pulp, mixed with protein feeds, an activity that has also been recently straitened by the smaller acreages of beets. The manure goes back on the land. This integration and the multiple usefulness of the beet make it, according to the industry, one of the most useful of American farm products.

The domestic sugar industry is united against the incursion of foreign sugars, and even hostile to the importation of too much from American soil, such as Puerto Rico and Hawaii. But beet and cane advocates—considerable cane is grown in Florida and Louisiana—struggle between themselves for the patronage of the American consumers, even though united against the foreigner. Beet-sugar, as the late-comer—its processing on a large scale began about 1900, coincident with the development of huge irrigation projects in the West—has had to struggle against consumers' prejudices, and ordinarily sells to consumers for a slightly lower price. This is a matter of prejudice only, for not even the skilled chemist can say which sugar crystal came from the beet and which from cane.

In ordinary times, the market for beet-sugar is circumscribed by the limits of economical transportation, and it is the standard sugar only of the West. However, during the war it has been distributed more widely, and many a New York and other Eastern family has, perhaps unknowingly, used beet sugar for the first time.

## American Notes

### Snail's Pace

It is reported that both Mr Bernard Baruch and Mr Hancock, his chief assistant, have offered their resignations in token of their impatience with the slow progress being made in plans for the reconversion of industry. Mr Byrnes, Director of War Mobilisation, in effect passed this message on to Congress when he urged immediate formulation of legislation to deal with post-war unemployment and readjustment. The Senate committee dealing with post-war plans has pointed out that there are at least 16 aspects of demobilisation calling for Congressional action in the immediate future, but so far even the proposal to create an agency to supervise reconversion has not been put into the form of a Bill. The only field in which a start has been made is that of contract termination, admittedly the problem simplest of solution. It is not even clear whether the Administration or Congress is to have control of the programme. Mr Donald Nelson, testifying before the House Post-War committee, somewhat surprisingly insisted that private industry must take the lead in settling reconversion problems. There is no question that specific industries are well advanced in their own plans; and that they have definite preferences on the character of reconversion. There is no doubt, for instance, that they would prefer to see Congress in the saddle, as being more open to business representations and less inclined to budget for continued heavy government participation. There is also agreement in hoping for the speediest possible disappearance of wartime rationing and price control. But the lead must come from Washington before specific industrial plans can even be determined upon, let alone put into effect. The kind of abdication Mr Nelson seems to be suggesting could lead to nothing but chaos. Unfortunately this summer the thoughts, if not the steps, of Congressmen turn to their districts rather than to problems of reconversion. There may even be a lengthy recess to enable members to attend the party conventions with a free conscience.

### Farmers' Favourite

A Bill to extend the Price Control and Wage Stabilisation Act to December 31, 1945, was approved this week by the Senate. It is reckoned a defeat for the Administra-

tion, however, for included in the Bill as it now stands is Senator Bankhead's amendment directing the Office of Price Administration to raise cotton textile price ceilings with a view to raising the price of raw cotton. The Senate did, however, reject a proposal to increase crude oil prices. It is characteristic of the distorting effect of political pressures on agriculture that cotton should have been chosen for preferential treatment, for cotton is the outstanding example of a commodity whose production should be discouraged. The cotton carry-over is still so large that there are no firm prospects of restoring production in the South as it was in the days when "cotton was king." In the *Review of Economic Statistics* for February, a monograph on "The War and American Agriculture" points out that the greatest need now is to work out price schedules which will diminish production of farmers' favourites like cotton and hogs, and increase, on the other hand, the production of milk and other dairy products, soybeans, peanuts, edible beans and peas. It is the contention of the authors that parity payments should be used not only to maintain the income of the farmers, but to finance the redistribution of resources, and that these shifts in production should be begun now. War experience suggests, however, that this is easier said than done. Planting for the 1944 harvest has proved to be considerably out of line with the goals of the War Food Administration. Farmers have failed to come up to scratch in planting soybeans, peanuts, peas, beans, and potatoes; they have also refused to produce the 50 per cent sugar-beet increase that the War Food Administration hoped for. Feed grains, on the other hand, will be nearly 12 per cent above the Government goals, because of the feed shortage. In part, this is due to lack of manpower and new machines; in part to disappointment over the ability of the Government to peg prices successfully. The catastrophic drop in the wholesale price of eggs has done the War Food Administration great damage in recent months.

### Revolting Democrats

The revolt against the "New Deal" elements in the Democratic party is spreading. South Carolina and Mississippi have followed the example of Texas in laying down conditions for the Democratic National Convention and threatening that, unless these are satisfied, their delegates to the electoral college will not feel bound to vote for the official Democratic nominees. A meeting at Shreveport, Louisiana, of southern democrats from six states is said to be conferring on joint strategy. The conditions which are suggested make it plain that the South has two aims: the elimination of Vice-President Wallace, and the blocking of any move to include a racial or social equality plank in the party platform. The insistence that the party revive the requirement of a two-thirds vote for its nominees is obviously aimed at Mr Wallace. What the South is asking is a restoration of its minority veto over Democratic party procedure. The demands for an inclusion of a states' rights plank and for the elimination of any plank favouring federal control of voting qualifications arise from the Supreme Court's decision on negro participation in primaries. The Deep South is united in its determination that "white supremacy" shall not be imperilled at the polls. Georgia has ordered officials to keep Negroes from the polls, arguing that, unlike the situation in Texas, Georgia primaries are purely party concerns, unaffected by statute. South Carolina, relying on the same reasoning, in one hectic session abolished all its laws affecting primaries. This zeal may be misapplied, as in 1941 a decision in the case of *United States v. Classic* held that "where, in fact, the primary effectively controls the choice" the elector's right to have his ballot counted is protected by the Constitution. But the South may be relied upon to continue its search for an alternative proof against court rulings. Linked with this Southern drive is the resignation of Mr James Farley from the New York State Democratic Committee. The organiser of Mr Roosevelt's early victories is said to hope to lead an anti-fourth term group at the Convention, but at best this would be a forlorn crusade. No doubt, however, he will join up with the anti-New Deal elements in the Southern wing of the party. The choice of Mr Roosevelt's running-mate is said to be still undecided. Presumably Mr Wallace's popularity with liberals and labour will be coldly balanced against the advantages of choosing a conservative southerner like Mr Rayburn, or Senator Barkley, hero of

the tax-bill veto revolt. Unless the present drive fizzles out, the calculation may go against Mr Wallace, in the belief that liberals and labour have, in any case, no choice but to stand with Mr Roosevelt.

### Insurance is Commerce

By a vote of 4 to 3, the Supreme Court has ruled that insurance companies are engaged in interstate commerce, and, therefore, are subject to such federal statutes as the Sherman Anti-trust Act and the National Labour Relations Act, which guarantees employees the right of collective bargaining. This ruling upsets a precedent established 75 years ago, when it was determined that insurance business was not commerce and, therefore, was immune from Federal regulation even when it crossed state boundaries. The closeness of the decision is somewhat surprising in view of the progressive attitude of the court in recent sessions; and the fact that it was upheld by less than half the full court does not augur well for its reception. On the basis of incomplete reports, it seems that Justice Black, who wrote the majority opinion, held there is no reason why insurance companies alone should be "entitled to enter into combinations to destroy competition by coercion and intimidatory practices," a contention with which it is difficult to disagree. Nor does there seem to be any valid reason why the employees of insurance companies should not enjoy the same rights of collective bargaining as are extended to other workers. The dissenting opinion, written by Chief Justice Stone, one of the two remaining justices who were on the bench when Mr Roosevelt entered the White House (though his appointment as Chief Justice is more recent), urged that the decision would unleash a flood of litigation that would harass both the companies and the individual states for years to come. The Attorney-General has promised that there need be no conflict between state regulation and Federal prohibition of monopoly, but this has failed to assuage the "trepidation" with which the companies view the decision. The standards of regulation vary substantially between the states, and prudently exercised Federal supervision might be invaluable in bringing the backward states up to a more satisfactory level. There is, however, a bill before Congress which would maintain state regulation while permitting Congress to pass additional protective legislation, and would exempt insurance companies from the anti-trust laws. The Court's decision will increase the pressure on Congress to pass this measure, although it faces a determined opponent in Senator O'Mahoney, who has predicted that it will die in Senate committee.

### Shorter Notes

The Treasury expects corporation profits to decline this year for the first time since 1938. Renegotiation of war contracts and cost increases are held responsible for a decline of profits of \$1.1 billion to \$8.5 billion.

The Senate has restored the \$350 million cut in funds for UNRRA originally made by the House.

President Roosevelt has announced the creation of a refugee camp at Fort Ontario, in New York, to house approximately 1,000 refugees at present in Southern Italy. The camp is to be administered by the War Relocation Authority. This step is an answer to the agitation for "free ports" for refugees. It is made clear that the refugees will be expected to return to their own countries after the war, and thus no infringement of the immigration laws is involved.

### THE WORLD OVERSEAS

Because of pressure on this week's space it has been necessary to leave out "The World Overseas" Section. It will appear as usual next week.

## NEW HOUSES

are not being built yet . . . what about  
buying the house you are renting?

Your landlord may be willing to sell you the house in which you live. Consider the advantages. You know the house. You avoid the worry of house-hunting and the expense of moving. The price may in your case be as favourable now as at any time for years. So if you want to make sure of a home now talk the matter over with your landlord. We are very willing to help you; ask for our Home Ownership booklet.

## THE BUSINESS WORLD

### The Gas Industry

THE decision of the Ministry of Fuel and Power to appoint a committee of inquiry into the gas industry, headed by Mr Geoffrey Heyworth, chairman of Lever Brothers and Unilever, Ltd., does not mean that it has selected one branch of coal utilisation for special examination. The inquiry will form part of a comprehensive investigation into the whole complex of coal production and utilisation preparatory to the formulation of a national fuel policy. The problem of rationalising the production of coal has been under review for some time, while, on electricity, the Ministry has at its disposal the report of the McGowan Committee on the distribution of electricity, published in 1936, and the reports recently issued by the various sections of the industry. The report on the planning of the gas industry, issued last November by the British Gas Federation, contains much valuable material, but, in the absence of an official national survey of recent date, the Ministry has decided to supplement it by an independent investigation.

The terms of reference of the Committee are to "review the structure and organisation" of the gas industry and to "advise what changes have now become necessary in order to develop and cheapen gas supplies." They suggest that the committee may not specifically consider the wider problems of the relationship between gas and electricity; the inquiry is apparently to be based on the assumptions that the two industries are to be given equal opportunities for development and that the consumer is to be given freedom of choice between them. But it is reasonable to assume that the scope of the inquiry will include, not only the supply of gas from coke ovens but also the by-products of the industry, such as coke, tar and sulphate of ammonia. The quantity of coal carbonised at coke ovens before the war was nearly 20 million tons, that is, it was broadly of the same volume as that consumed by the established gas industry. The main difference between the two branches of the industry is that the chief purpose of coke ovens, as the name implies, is to produce coke for the blast furnaces of the steel industry, while that of the gas industry proper is to supply gas for the community. Consequently, the ratios in which the two branches produce gas and coke are different; though coke ovens consumed, before the war, about as much coal as gas undertakings, they produced more coke and only about two-thirds as much gas. While the gas and coke produced by coke ovens are used mainly by the steel plants of which the ovens form part, there is frequently a surplus available for outside sale. During the inter-war period the volume of coke oven gas purchased by the established gas industry grew rapidly and now probably forms about a tenth of the total volume of gas used for general purposes. Another product produced both by the gas industry and by coke ovens is tar, the chief raw material of the coal-based chemical industry. The two branches of coal carbonisation, in fact, are so closely related that they can hardly be examined in isolation from each other. Moreover the gas industry's receipts from the sale of coke and chemical by-products represents so significant a proportion of its total receipts—broadly 20 per cent before the war—that they also cannot be left out of account in any serious investigation into the economics of the industry.

The salient facts about the gas industry, of its structure and organisation, can be stated briefly. Contrary to a widespread impression, it is not a declining industry, being gradually cut out of business by electricity. While it did not expand as rapidly as the electricity supply industry during the inter-war years, it showed no signs of decadence. The output of gas by authorised undertakings in Great Britain rose from 250 billion cubic feet in 1921 to 340 billion in 1938 and nearly 400 billion in 1943.\* The reason for this expansion

is that gas has been used increasingly for purposes of heating in the home and in industry. Before the war about two-thirds of the industry's supplies were used by domestic consumers and the remainder for industrial and commercial purposes. The number of consumers in 1938—11,215,000—suggests that the proportion of households without gas supplies, mainly in rural districts, was small. Apart from the iron and steel industry, gas has been used increasingly by such industries as aircraft manufacture, the light metal trades, bakeries, and in the paint and varnish, and the printing trades. The scope for further expansion both in the home and in industry is by no means negligible, especially if the industry can secure further improvements in technique and reductions in cost. There are no indications that it is likely to be swept off the field by electricity, which supplies mainly power and light. At present, the two are largely complementary, though in future the size of the area of competition will, of course, depend on relative cost and convenience.

In electricity, municipal enterprise is larger than private; in gas, private enterprise is larger than municipal. The reason for this contrast is probably to be found largely in the historical circumstances of each industry's growth. Before the war, the gas industry comprised 669 statutory undertakings—396 owned by companies and 273 by local authorities—and 410 non-statutory undertakings. The non-statutory undertakings are generally small in size, providing, in the aggregate, less than two per cent of the gas sold in Great Britain. The share and loan capital of the gas industry is £238 million; the issued capital of statutory company undertakings is £149 million, the loans raised by municipal undertakings amount to £84 million (of which £58 million has been redeemed), and the capital of non-statutory undertakings is £5 million. The statutory undertakings vary enormously in size, from the Gas Light and Coke Company which sold more than 50 billion cubic feet of gas in the London area in 1938—nearly a sixth of the total sales in Great Britain—and the Birmingham Corporation with sales of nearly 16 billion cubic feet, to many undertakings selling less than 10 million cubic feet a year. There has been a steady process of consolidation of undertakings in contiguous areas by amalgamation, while many of the smaller undertakings have been financially linked up by the so-

### GREAT TRADITIONS.

Although the history of Martins Bank goes back to the earliest days of Banking, its methods to-day are modern and up-to-date and combine the best features of the old-time Banker with the wide range of service of the Joint Stock Bank.

Both will be willingly placed at the disposal of customers by the Bank's many Branch Managers.

**MARTINS BANK**  
LIMITED

\* In *The Economist*, 1 billion = 1,000,000,000.

called gas corporations; at the end of 1937, 19 gas corporations controlled 310 gas companies, including 179 statutory undertakings and 131 non-statutory undertakings. Inevitably costs vary appreciably with size, conditions of supply and differences in managerial efficiency; the larger undertakings are generally more favourably placed than the small ones, though the gas corporation movement has provided opportunities for cost reductions to small concerns through improved management, bulk purchase of raw materials and access to capital at low interest rates.

There are at least two directions in which the overall efficiency of the industry can be raised, that is by further consolidation and through improvements in technique and management.

Although a good deal has already been achieved by way of technical and financial consolidation and by using coke oven gas as a source of public supply, there is still much scope—as the report of the British Gas Federation recognises—for further technical integration. Progress should be sought not by some ambitious scheme for a national gas grid which, though technically feasible, is at present uneconomic because of the high cost of transmission, but by further district amalgamations with the object of reducing the number of works and inter-linking the remainder, where practicable. In a paper submitted to the World Power Conference in 1928, Dr E. W. Smith, a well-known expert, gave some estimates on transmission costs. For a moderate quantity of gas, such as 5 million cubic feet a day, he calculated that it is cheaper to convey gas and coke distances up to five miles than to rail the coal necessary for gas making; beyond distances of five miles, however, it is cheaper to rail the coal than to convey gas and coke. The economic distance of conveying gas and coke increases with the load and is between 25 and 50 miles for a daily supply of 25 million cubic feet of gas. Even if Dr Smith's calculations should need revision in the light of technical progress since 1928, they not only provide some indication of the limits of economic transmission but also of the scope for further technical consolidation and inter-linking of gasworks. The procedure in such consolidations might be that suggested by the McGowan report for the electricity supply industry,

that is to say, the most efficient of the works, whether owned by a company or a municipality, might become the nucleus of an amalgamation; in areas where there is no obvious nucleus, the consolidation could take the form of a public board.

Again, while the established gas industry has by no means lagged behind other industries, in the matter of research—over half a million pounds have been spent annually on research and development—its continued progress depends in no small measure on an intensification of research, from the carbonisation of coal to the gas-consuming appliances and on the industry's by-products. The British Gas Federation suggests a three-fold development scheme: long-term research, whether conducted by the industry itself or carried out by its initiative and support; technical development work by manufacturers of plant and appliances in accordance with the needs of the gas industry; and the extension of applied research and technical investigation through area technical development centres. The results of organised research, needless to say, should be placed at the disposal of all members of the industry.

While the gas industry has by no means been unprogressive and has, in fact, raised its overall efficiency appreciably during the inter-war years—partly, no doubt, through the stimulus of competition from other fuels—the time has come for a speeding up of integration and technical progress on a broad front. An official investigation into the industry will provide evidence on the scope for improvement through integration and technical progress; on the basis of the technical facts ascertained, the Ministry of Fuel and Power will be in a position to create the conditions most favourable to progress and to guide the industry's development as part of a national fuel policy. There will have to be careful investigation before long of the merits of technical and financial integration of the various branches of the fuel industry—coal, gas, electricity and petroleum. But there is first need for important and difficult decisions to be taken within each branch—perhaps less difficult in gas than in any of the others. A piecemeal approach is right as a beginning—provided that it is only a beginning.

## Engineering Wages

THIS has been called an "Engineers' War," and it is therefore natural and appropriate that the National Committee of the Amalgamated Engineering Union—meeting less than a week after the invasion of Europe—should concentrate largely on the issues of war production. The AEU has been one of the most persistent prodgers of the Government to open a Second Front. Now that its wish has been granted, the union has pledged its members in the workshops to ensure that the men in the fighting forces in Europe shall be equipped with the necessary offensive weapons in the final stages of the war.

Apart from the immediate questions of the war—such matters as, production committees, transference of workers, factory health and welfare, the Essential Work Order and Regulation 1Aa bulked large on the agenda—the 1944 Conference of the AEU has defined in a far more concrete form than hitherto the lines of its approach to postwar reconstruction. The Amalgamated Engineering Union, with nearly a million members, is the second largest union in the world, and with reserves amounting to £6 million, by far

the richest. These facts, together with the key position which engineering occupies in the national economy both in peace and war, makes the AEU a force to be reckoned with in postwar organisation.

The war has brought about tremendous changes in the engineering industry. A wide range of new materials has been developed, new processes and new machines, new techniques and new scientific aids to production have been introduced, while jobs have been broken down into component parts, so that they could be performed by less skilled and diluted labour. The general tendency has been towards mass production, even of products which would normally be regarded as strictly the craftsman's province. At the same time, the growth of joint production committees—whatever their limitations may be in practice—has provided the workpeople with a new interest and experience in production matters. These wartime developments are not only having a profound—almost revolutionary—effect on the industry to-day, but many of them are bound to be carried over into the postwar period, in all probability in an intensified form.

That is one of the reasons why, looking to the future, engineers are anxious to build up their own organisation and to bring about a revision of the industry's wage structure, so as to fit in with the postwar situation. Mr Jack Tanner, President of the AEU, described it as "the most complicated and unsatisfactory wage structure of any industry." Recently, mining wages, which undoubtedly surpassed engineering wages in complexity, have been simplified and consolidated. The mining wage agreement represented an important industrial trend, even if it was perhaps hardly the "fundamental overhaul" of the wage structure recommended by Lord Porter. In the same way, the structure of engineering wages needs to be overhauled and simplified. To quote Mr Tanner again "the ordinary working engineer cannot sort out his pay packet without being a mathematician." The trouble in the industry over the National Arbitration Tribunal's wage award of March, 1943, which culminated in the Barrow strike last October, was due to the inherent complexity of engineering wages as

much as to any obscure wording of the Tribunal's award.

This complexity is due mainly to the character and history of the industry. Engineering is, after all, a comprehensive term, covering a whole range of processes and types of industry, and no simple formula is possible. The present method has developed in a haphazard, piecemeal fashion over the past 40 years, with the different districts working out their own arrangements. Additions and bonuses have been grafted on to the original basis. Since wages are the main source of controversy in any industry, and the engineers' efforts are directed towards a simplification of their wage structure, it is worth examining, as briefly as possible, the way in which it operates.

The basis is the minimum district base rate plus the national bonus, which was introduced first in 1922. There are separate minima for skilled adult males (the skilled turner or fitter is taken as the standard); for the unskilled worker or male labourer; for adult women; for juvenile boys and juvenile girls under 18. Rates vary from district to district, the highest rates being paid in London. At present the average weekly rate for an adult male labourer, including national bonus, is 74s. 6d.; the skilled man's rate is 91s. 6d. for a time worker (this is composed of the average district rate of 66s. plus 25s. 6d. national bonus), and the average piecework skilled rate is 101s. 8d., which includes the national bonus and the premium of 27½ per cent which a "skilled worker of average ability" is entitled to earn over and above the district rate. A number of national agreements in the industry provide additional remuneration for certain categories of skilled workers, such as toolmakers, inspectors, maintenance men, patternmakers.

Since 1938 there have been a number of advances in engineering wage rates. In June, 1939, an increase of 2s. a week in the national bonus was secured by agreement, and in February, 1941, a further increase of 5s. a week, also by agreement. Additions to the national bonus of 3s. 7d. a week and 5s. a week were secured as a result of arbitration in January and December, 1941. The Tribunal's award of March, 1943, transferred 20s. from the national bonus to the base rate, with an addition of 6s. per week to the national bonus for timeworkers, and raised the minimum piecework percentage from 25 per cent to 27½ per cent, to be calculated on the new consolidated base rate. Finally, in May, 1944, after hearing the unions' claim for an increase of 10s. a week on base rates for time and pieceworkers, the Tribunal awarded an increase of 4s. per week on the national bonus. The total advances in the national bonus since 1938 have therefore been 25s. 6d. for time workers and 19s. 6d. a week for pieceworkers, of which, in each case, 20s. has been transferred to the base rate. By agreement with the unions, maintenance men, inspectors, setters-up and markers-off receive 8s. a week above the skilled fitters' district rate, while patternmakers receive 10s. 9d. a week over the fitters' rate, or 12s. in London.

In all cases the standard of a 47-hour week is adopted. Actual earnings are, of course, considerably higher than these wage rates. The Ministry of Labour's survey of earnings in the principal industries for July, 1943, of this year showed that the engineering group averaged 138s. 3d. for men, the highest single group of any industry surveyed. But this can be attributed to overtime, Sunday work and extraneous wartime conditions which would not obtain in peacetime.

The Tribunal's latest award does not apply to women engaged on "work commonly performed by women" in the industry. The low rate of women's wages in engineering is one of the burning issues at the moment. There is sometimes a tendency to forget that women are engineers in peacetime as well as in wartime. Indeed, the number of women who have entered the industry since the war is probably small in comparison with those already in it. Women employed "in their own right" are paid according to the National Women's Schedule, which lays down a minimum rate of 50s. a week for timeworkers and 47s. a week for pieceworkers. A relaxation agreement between the unions and the employers in May, 1940, providing for the dilution of skilled labour, states that where a woman is doing a man's job, without additional supervision or assistance, she shall, after 32 weeks, be paid the full man's rate. There are proportionate rates, varying according to the woman's length of time in the job. In practice—and the experience of this war has been no different from that of the last war—the "rate for the job" seems still to be largely an academic concept. There is unfortunately evidence that the Agreement is not always observed. The difficulty from the employers' point of view is that so many new processes

have been introduced and skilled jobs broken down that there is no rate appropriate for the job.

In this connection the judgment on women's wages given last autumn by Lord Wark's Court of Enquiry into a dispute at a Scottish aero-engine factory set an important precedent. The Court recognised that there were a number of operations in the factory for which neither the men's rate nor the women's rate were appropriate, and it recommended that the processes should be graded and suitable rates negotiated. Thus, for the first time, women's engineering rates were separated from the low level of the National Women's Schedule.

As an interim measure, in order to close the gap between men's and women's rates, the unions which cater for women engineers—the Transport and General Workers' Union, the General and Municipal Workers' Union and the AEU, which only admitted women last year—have just presented a claim to the employers for an increase in women's rates. The employers' counter-offer was apparently not acceptable and the claim—which has not been made public—has been referred to arbitration. The unions' aim is for unskilled women to be paid the same rate as unskilled males. This is in accordance with the principle of equal pay for equal work, which has been generally accepted by the trade union movement.

As a longer term measure, the unions' aim is to establish some form of grading for the industry as a whole, whether the jobs are performed by men or by women. Negotiations for grading, opened early this year, will however take a long time.

Wages are of course only one item in post-war reconstruction, but they have tended to obscure all other issues, and until some *modus vivendi* is worked out the prospects of industrial peace are not very bright. In particular, the question of women's wages is of vital importance. On the limited evidence available, it seems likely that many women who have come into industry since the war will wish to remain, and from the point of view of their suitability for the work, it is highly desirable that they should do so. But the cry of "cheap labour" will not be tolerated after this war by the unions.

## Making the most of the NATION'S MILK

THE demand for liquid milk is constant, but the supply is less in winter than in summer when there is a surplus. This surplus can be conserved in a number of ways, one of which is to make Milk Chocolate. Cadbury's Milk Chocolate retains the valuable milk solids (fat, protein and lactose) which contain calcium, phosphorus and vitamin D. Only the water which comprises roughly 87½ per cent. of the milk bulk is eliminated.

Milk Chocolate is a compact and highly concentrated food, easily kept and transported and requiring no elaborate packaging. It retains the full food value of the milk almost indefinitely without special storage or canning.

## Cadbury means Quality

## Business Notes

### Currency in France

Little by little, official information is being given about the invasion currency arrangements. The Chancellor of the Exchequer announced in the House of Commons this week that the rate of exchange had been fixed at 200 francs to the £ and that this figure been chosen after fullest consultation with the French National Committee. Asked whether this rate applied equally to the authorised francs circulating in France and to the US military issue of French currency, Sir John Anderson answered that "this is a separate question." The Chancellor's unwillingness to be drawn on such dangerous ground by a supplementary question can be understood, but his answer, with its implied suggestion that there may be a difference in the rates of Bank of France and military francs was not calculated to clarify an already confused situation. In fact, the two types of francs are interchangeable at par, and the pay of Allied troops is being made in military francs at the rate of 200 francs to the £ and 50 francs to the dollar. The French authorities broadcast the following statement in French from London this week:

One learns that each British and American soldier has been provided with 200 francs in Bank of France notes, taken from reserves of paper money which exist abroad. Because of the small number of notes of small denominations in these reserves each British and American soldier has at the same time received a part of the sum allotted to him in military currency.

President Roosevelt, questioned this week about the arrangements made for invasion currency, said that there was no fear of Frenchmen being cheated by the issue of military notes. He stated that this currency had been issued "after consultation with representatives of the French National Committee" and that it had the backing of the United States and British Governments. According to the President, the notes had been printed in the United States and shipped to London in readiness for D day; "This had been done because there was no recognised French authority within France in a position to issue currency." President Roosevelt added that all possible measures had been taken to prevent unnecessary expenditure by the troops, and that, in particular, troops were forbidden to buy rationed goods. It is to be hoped that no one will interpret the President's references to prior "consultation with the French National Committee" as meaning that the military notes were issued with the consent of the Committee. That is most certainly not the case. As for the statement that there was no recognised French authority within France in a position to issue currency, it should be noted that the National Committee had made all the necessary arrangements for issuing Provisional Government currency and that these arrangements were ready to come into operation at a moment's notice.

### Post-War Equities

Up to the time of writing, the Second Front has developed so smoothly that there has been no opportunity, unfortunately, to test whether or no the confidence of the investing public would stand up to news of a reverse, however temporary it might prove. Instead, the uniform success on all fronts has promoted a new wave of buying which has affected all British industrial equities, but has ended more and more to be concentrated upon post-war recovery securities, whether they are the bonds of nations of Continental Europe, raw material shares or the equity capital of concerns catering for consumption trades. In a sense it was, perhaps, the turn of the last-named, since the buying caused by the budget speech and the White Paper on Employment Policy had tended to favour the capital goods industries. The buying, however, has clearly been of a rather speculative character. Jobbers have in most cases listed prices to whatever point was necessary to attract buyers, mainly institutions or professional "punters," and they have consistently refused to sell short. The current level of the index of industrial equities, compiled by *The Financial News*, is 112.7, or some 14.1 per cent above the west of November last. The rise has been almost continuous throughout the period, and has recently been accentuated to an extent which almost invariably precedes

a recession. In the absence of a chart, this can be expressed by saying that the average weekly rise was 0.15 points in the first 16 weeks of the year, 0.79 in the five weeks succeeding the budget, and 1.24 points in the past 2½ weeks on the combined effects of the employment White Paper and the opening of the attack in Normandy. While some of the buying is for capital appreciation, it is a fact that the whole industrial list, not merely the leaders, is being combed repeatedly to find any security which promises a post-war return above the average. According to *The Financial News*, the yield on its selection of active equities is 3.73 per cent, or only 0.57 points above that on Old Consols. A week ago the margin was 0.63. The figure would, of course, be wider if securities with a more restricted market were included. Even so, it is very narrow and suggests that, at least under the influence of the prevailing optimism as to the duration of the war, investors have little doubt of a substantial recovery in both earnings and distributions in the near future.

### Playing for Safety

During his budget speech on April 25th, Sir John Anderson, Chancellor of the Exchequer, informed the motor industry that he was willing to reconsider the present horsepower tax on private cars and the annual tax on commercial vehicles, and invited suggestions. Short of leaving the system of taxation unchanged, the industry had the choice between two major alternatives. It could ask for the introduction of an annual licence duty on the original cost of private cars and commercial vehicles in place of the present system, or it could recommend, for private cars, the substitution of a tax on the cubic capacity of the cylinder for that on the diameter of its bore and, for goods vehicles, the re-grading of the weight tax in smaller steps. The second alternative would free designers from the handicaps imposed upon them by the present method of taxation; the first would not merely give more freedom to designers, but, in the case of private cars, it would probably assist in creating a larger home demand for cars of a bigger type that could find a readier sale on the world market. The industry has now decided to recommend the second alternative to the Chancellor, together with a plea for an all-round reduction in motor taxation. It may be that it has good reasons for believing that the future lies with the baby car; but, again, it may be that it has its eyes mainly on an assured home market for a type of car in which it need not fear American competition. It is, of course, quite possible that the heavy American car will give way to a lighter one; but it would be surprising if equally efficient and roomy cars could be produced to run on an engine of about ten horse-power. If the industry's decision has been influenced by fear of American competition in the home market, it not only admits a preference for bigger cars in this country but also inability to bring down costs to a level which would ensure the efficacy of an import duty of 43½ per cent. Again, if it is frightened by the capital expenditure required to tool up its plants for the production of bigger cars, it is shunning risk and enterprise. It is hardly for the layman to pit his opinion against that of the whole array of motor manufacturers; the future may show that their decision was right, that foreign markets will absorb baby cars by the million. But he may, perhaps, be forgiven for suspecting that one of the industries that could, with drive and vision, assist in restoring Britain's exports, is playing for safety.

### Wheat Supplies

In consequence of the blockade and the difficult shipping position, the carry-overs of the four main wheat surplus countries at the beginning of this season on August 1, 1943, showed a record total; according to the *Corn Trade News*, the combined carry-over was 1,550 million bushels, compared with the already high figure of 630 million bushels at the outbreak of war. But the enormous increase in industrial consumption is expected to reduce the carry-over to about 1,000 million bushels at the end

of the present season; it has been realised that this tendency, if continued, might lead to a serious depletion of supplies next year, when large quantities of wheat may be required by Continental countries and Russia. But the latest developments suggest that a new turning-point may soon be reached. On the wheat supply side, the US Department of Agriculture last week-end published its official June crop estimate. This exceeded all expectations; the current American winter wheat crop, harvesting of which has already started in some areas, is now put at 714 million bushels, an increase of 52 million bushels on the estimate of last month and one of 185 million bushels on last year's crop. The condition of the country's spring wheat crop, sown on a considerably increased area, too, is encouraging, and it appears that the United States may this year gather a total wheat crop of over 1,000 million bushels, against 836 million bushels a year ago. Simultaneously, Canada has extended its wheat area from 17,487,000 acres in 1943 to over 21,000,000 acres this year. Owing to the inadequate rainfall last autumn and winter, the subsoil moisture reserve of the chief Canadian wheat areas is below normal, but late last month rains have fallen and have thus assured good germination. Current reports from Argentina and Australia are encouraging. Field work there is proceeding in favourable conditions and the area under wheat will probably be considerably extended. These improved crop prospects, however, would not prevent further substantial withdrawals from stocks next season unless demand for feeding and alcohol production, especially in the United States, is reduced. During the past fortnight, however, the U.S. Government has taken steps which will tend to reduce wheat consumption other than for human purposes. Wheat in the manufacture of alcohol next year is to be replaced largely by Caribbean molasses, and wheat consumption as feed is to be drastically cut by the import of coarse grain and other feeding-stuff. Early this week the U.S. War Food Administration announced that, as a part of this plan, some 6 million bushels of Latin-American maize are to be imported during July, and that further heavy imports—made possible by the rich Argentine maize crop this season—will follow later. With prospects for the new crops approaching record figures, and with the recent enormous non-human wheat consumption subsiding, there should be adequate supplies of wheat for all essential needs, even if the military campaigns in Europe should result in the destruction of part of the European wheat crops, the harvest of which is due to begin within the next four weeks.

### Production Census

Inevitably there will be a reaction against the filling in of forms by business men after the war—a reaction that may well develop into an organised campaign against the filling in of any forms at all for the Government. This will, to a point, be both natural and reasonable. It is easy to sympathise with the growing dislike of the multitude of questionnaires with which business men have been inundated since the beginning of the war, necessary though they are; but it would be positively harmful to carry it to an extreme. The plain fact is that if the Government is to have the factual basis for a successful employment policy it will require much more information from business men than it received before the war. Among other things, the Government will require, at monthly intervals, returns of production, consumption, stocks and orders on hand, and, as is stated in the White Paper on Employment, it is intended to hold a census of production annually instead of at five-yearly intervals. An annual census of production should cause less difficulty than a five-yearly one. In any case, it does not represent a complete innovation, for partial censuses had been held regularly before the war under the Import Duties Act of 1932. But it is not enough to hold an annual census of production; it is equally important that the facts should be published as speedily as possible instead of leisurely and at long intervals. One reason for the long delay in the past has been the difficulty of maintaining an adequate and skilled staff so long as a full census was taken only every fifth year; this difficulty will disappear automatically if there is an annual census. It is of great importance that business men should realise the continuing need for a substantial volume of statistics; and it is of equal importance that Government Departments should be capable of dealing with them expeditiously and that they should make them available for publication.

### Market Research

The campaign for an intensification of scientific and applied research after the war is bearing fruit. In his budget speech, the Chancellor of the Exchequer proposed to exempt from taxation all expenditure on research from the laboratory to the commercial production stage. Industrialists are preparing bigger research budgets or, at least, talking about the need for them. Altogether, it is now reasonably certain that British industry will pay much more attention than it did before the war to the problems of research in the sphere of production. But making both new products and old ones better and more cheaply is one thing; selling them, especially on the world market, is quite another. Other countries, too, will intensify research on production, but unless the problem of marketing research is tackled with equal boldness, British exporters may find themselves in the possession of crumbs rather than loaves. In essence the object of market research is to find out the kind of goods overseas producers would like, the form in which they like them and the price at which they are willing to buy them. The actual process of carrying out research effectively requires expenditure and effort far greater than has been devoted to it in the past, and it requires a high degree of skill. Unfortunately, the importance of market research is still by no means fully realised by British industry. The time has come for bringing this problem to the fore and for giving it as much thought as has been devoted to industrial research during the past year.

### India's Sterling

Sir Purshottamdas Thakurdas, who may be regarded as the doyen of the commercial community in India, has made some comments on the case for a renegotiation of the financial settlement between the British and Indian Governments which has recently been argued in this country. He has pointed out that the allocation of expenditure in India between the Indian and the British Governments has had "nothing to do with inflation," that inflation has been

## You can't afford FRICTION in your office

There will be no latitude for friction in post-war business. Drawers and doors that are stiff and stick mean a loss of temper and time. Ball and roller-bearing steel furniture is the answer. ● Sankey-Sheldon will have a range of steel business furniture to offer you after the war—furniture that will add to the strength and efficiency of steel a new comfort and elegance. New contours, new colourings and warm coverings will give your office a new note of functional beauty to tone with the times.

**SANKEY-SHELDON**

caused in India because "the expenditure on goods has been much too large and this has caused such scarcity of goods that it has not been possible to meet it by the usual monetary methods." Sir Purshottamdas sees in the suggestions for a renegotiation of the settlement "a veiled threat that the bigger the claim the less the chances of India converting it from a blocked into a multilaterally convertible asset." He ended his remarks by claiming that renegotiation of the settlement, unless it were made with Indian representatives fully responsible to the Government of India, "would rightly be regarded by the people of India as a unilateral decision forced on India by virtue of political dominance." All this avoids most of the issues which were discussed in *The Economist* of June 3rd and which, contrary to all that Sir Purshottamdas may say, were presented without any sinister intent or inspiration. The case for revision does not merely rest on a complete change of the conditions—caused by Japan's entry into the war—that formed the basis of the original financial settlement. It also rests on the fact that Allied purchases in India have been made at inflated prices which, owing to the control of the exchange market have not been allowed to reflect themselves in the exchange rate of the rupee. The Indian wholesale prices index calculated by Sir Theodore Gregory was 243 on June 3 last and the index for foodstuffs alone was 285—both figures being based on prices in August 1939. For Great Britain the comparable figures are 156 and 157. The accumulation of sterling assets by India has, therefore, been considerably stimulated by the rise in rupee prices. Assuming the price stabilisation policy in Great Britain to be successfully maintained after the war, that sterling will represent purchasing power over a considerably greater volume of goods than that which went to building it up. If only on this comparison of the real terms of trade between the two countries there would seem to be strong grounds not merely for a renegotiation of a settlement, but for some retrospective reconsideration of the debt to which it has given rise.

#### Paratroops of Industry

Mr H. M. Harwood, chairman of Fine Cotton Spinners, treated the shareholders to a fine display of metaphors at last week's annual meeting. Although he was rather critical of Government control in general, and although he sees in the White Paper some support for the slogan "Production for use not for profit," his main thesis appears to be a warning to fellow-members of the cotton trade that to expect any substantial assistance from outside powers is likely to lead to disappointment. It is depressing to hear that there are still many members who think they can shelter permanently behind price control, and that there are even some who think that a minimum price can be held which will give them a steady profit, whatever the demand for their product and whatever their efficiency. This he describes as a profound delusion. He is equally certain that, after the period of extreme scarcity, there is nothing to be said for the fixing of maximum prices. Further, as regards exports, he foresees grave handicaps if sales are to be directed to securing wanted currencies or political ends. It is possible to agree with most of this, but, unfortunately, it does not add up to a statement of policy. The nearest which Mr Harwood comes to that is a suggestion that business must be so conducted, and business men must be free so to conduct their affairs, that equity capital will be attracted to the industry. He describes the ordinary shareholder as "the old paratrooper of the industry," and in that he puts his finger on the spot. It is, perhaps, particularly true of the cotton trade that its prosperity has been due to the enterprise of individuals who, with a few friends, risked their savings in development of new lines. It is certainly a fact that to-day investors in general have to be made to understand that they must be prepared to take reasonable risks; that they are not, quote again from the speech, "buying a cheap ticket to some immediate El Dorado," but are undertaking a temporary abstinence in the hope of a substantial, but not extravagant, reward. Mr Harwood has no suggestions as to how this desirable result is to be achieved beyond an indication that Government control is not one of them.

#### AEU and Technical Progress

The views expressed this week at the conference of the National Committee of the Amalgamated Engineering Union

reflect a realisation of the need for flexibility in the engineering industry. The older demarcations and craft practices are beginning to be regarded as "hindrances rather than advantages," though many engineers will no doubt cling blindly to their craft traditions. This change of outlook is to be welcomed, for adherence to traditional practices is incompatible with technical progress. If the proposals for closer unity between the AEU and the other unions in the engineering industries are realised, they may well have the effect of breaking down still further the existing craft rigidities. The AEU's ultimate object is to effect a complete amalgamation of the various engineering unions, but this is a slow and delicate business. Its National Committee has decided to seek affiliation to the Confederation of Shipbuilding and Engineering Workers. The Confederation is now half a million strong, and the fear is expressed that the AEU might dominate its policy. But it is among shipbuilding workers especially that the lack of flexibility and excessive emphasis on trade demarcations have acted as a hindrance to the increase in productivity. On the general issue of post-war reconstruction, there is so far little evidence of definite plans for engineering. The Board of Trade have requested industries to formulate plans, in consultation with the appropriate trade unions, but there appear to have been as yet no joint talks between employers and the AEU's post-war reconstruction sub-committee which was set up in December, 1943. The sub-committee has so far not got beyond formulating a series of questions to the Board of Trade in order to obtain information which, in the Union's view, is essential to the formulation of post-war plans.

#### Chain Store Prosperity

The statement by the chairman, Sir Simon Marks, which accompanies the full accounts of Marks and Spencer for the year ending March 31, 1944, does not do much to explain the rise of some £100,000 in gross profits. Comparative figures for the last three years are set out on page 827. The high money turnover was achieved with a counter space of half and a staff of under half 1939 levels. The majority of the present staff are, as well, new and presumably inexperienced. Within the limits set by utility production, there have been some improvements in the quality and the design of goods. These facts may indicate a lower expense ratio and the capture of a larger share in some markets. But they are inadequate pointers. The figures are for 53 weeks, and include the profits of the Export Corporation from its inception. It may be that the accounts happen also, to include a comparatively active period of trading which is now being followed by a recession. The balance-sheet shows stock in trade at its lowest war-time level. The export business to America, developed recently, is now completely suspended. At all events the directors, despite the very high war-time earnings of 66.3 per cent. on equity, have preferred to strengthen considerably the carry forward rather than to increase the ordinary dividend. This may be explained by the need to counter more immediate difficulties as well as to prepare for post-war expansion. Nevertheless, Marks and Spencer is likely to emerge from the war with its strength undimmed. And despite recent setbacks to Woolworths and other stores, it seems likely that, on the shopping front, the multiple stores, however their positions may have changed vis-a-vis each other, will find their home market position strong as a result of the war.

#### John Lewis' Good Profits

John Lewis has had a more successful year than appeared likely, even after its good recovery in 1942-43. The accounts of the group, which exclude the earnings of the Suburban and Provincial complex, are shown in a slightly different form, gross profit being struck before, instead of after, the deduction of debenture and other charges on the profits of subsidiaries, and taxation being shown as a single item for the whole group. On this new basis the trading profit of the group for the year to January 31, 1944, after providing £19,585 in depreciation, amounts to £500,782 against £461,285. Taxation and national defence contribution, however, require little more than last year—£221,000 odd against £217,000 odd—due to past over-provision. In fact, the net profit of the parent company, at £165,147, is up by nearly £50,000. This enables arrears of preference dividend to be finally cleared, with the payment of 2½ years interest on the 7 per cent cumulative preference

stock. The profit figure includes £12,361 withdrawn from reserves; excluding this, earned for ordinary, after charging only one year's service on the preference capital, amounts to 19.8 per cent. After charging full arrears on preference dividends, it amounts to 11.0 per cent. Yet only 4 per cent has been paid, enabling the carry forward to be again strengthened handsomely, this time by £44,000. The board intends to pursue a very conservative policy over ordinary dividends for the time being. The increased profits are explained by the management as being partly due to a higher turnover and partly to lower expenses. The higher turnover is largely explained by increased purchase tax as is the fall in the rate of gross profit. Even so, the increase of over 10 per cent in the rate of money turnover which is reported is a good deal higher even than the general rise for central London over the same period.

The same factors that are helping John Lewis are working against the other end of the business, the Suburban and Provincial complex. These factors are the flow of trade back to the West End of London, and the favourable supplies of clothing when compared with house-furnishing goods. The recent removal of austerity restrictions on men's clothing was another blow to the Suburban and Provincial group. In the result the trading profit of this group, at £255,387, is lower by some £85,000. Past over-provision for taxation, however, again comes to the rescue, and the amount required from current earnings for taxation is lower by some £100,000. The holding company is able to resume full service on both classes of its preference capital, and EPT liability has now been fixed on a basis which will have a margin sufficient to cover preference dividend requirements for the future. No ordinary dividend can be considered, however, until the discrepancy between the actual and the book value assets of the group is adjusted.

#### Clothing Shops Statistics

The Board of Trade has compiled statistics of the numbers and turnover of retail shops in the United Kingdom which sell rationed clothing. They are published in an article in the *Board of Trade Journal* for June 3rd. Applications made in May, June and July, 1942, to open coupon banking accounts are the source from which the statistics have been compiled, and in addition sample investigations were made. All but the very smallest shops, those whose coupon transactions with wholesalers involve the transfer of fewer than 50 coupons, and which are estimated to number about 10 per cent of all clothing shops, are included in the statistics covering 86,150 shops which have coupon banking accounts. The following table, compiled from the figures in the article, classifies shops according to money and coupon turnover, and indicates how far sales are concentrated in the hands of large firms:

| Turnover per annum | Approx. Weekly Coupon Turnover | Percentage of Total Shops | Approx. Percentage of Total Sales |
|--------------------|--------------------------------|---------------------------|-----------------------------------|
| Under £2,500       | Up to 300                      | 48                        | Under 10                          |
| £2,500 to £12,000  | 300 to 1,500                   | 43                        | About 25                          |
| Over £12,000       | Over 1,500                     | 9                         | „ 66½                             |

Although the "small man" is represented in large numbers in the clothing trade, his share of the total turnover is small. This does not, of course, mean that the small man has no part to play in the trade. Another interesting classification of shops is by economic type. Multiple shops, defined as firms with more than five branches, account for 8,250, or 10 per cent of the total; there were 2,460 co-operative stores, 3 per cent of the total; independent shops dealing wholly or mainly in rationed clothing amounted to 70,440, or 81 per cent of the total, and other independent shops, selling rationed goods as a sideline, represented 5,000, or 6 per cent of the total. A further breakdown of shops according to their general description has been compiled from a sample analysis. The second column in the next table shows the margins of error, which are regrettably large in some cases, notably that of department stores. On the other hand, the figures for footwear and co-operative stores compare well with the known actual numbers (11,950 footwear and 2,460 co-operative shops). Some light is thrown on the number of people served by shops of different sizes. The overall average is 521 people per shop. More people are served by each shop in the South than in the North—a reflection

## NIPPED IN THE BUD

THE British countryside can show few sights more charming than an orchard in blossom. Yet its promise may never be fulfilled. The brief but glorious period between bud-break and petal-fall is critical. Bugs as well as buds awake to life in spring and the eggs of insects hatch out as well as those of birds. Against their menace the fruit-grower must be prepared. He turns to the labours of the research chemist made available in the products of the British chemical industry. In fruit-growing, unlike warfare, defence is the best method of attack. The professional opens the battle in autumn by girdling the trunks with sticky compounds to prevent wingless moths from crawling up to lay their eggs in twig and branch. In winter, when the trees are dormant, he applies a "winter wash" to destroy insect eggs and pests hibernating in the bark. Lime wash and cresylic or caustic soda solutions were used for this purpose until, in 1921, the British chemist provided a far superior article—tar oil distillate, which is now indispensable in orchard routine. Pests which escape are met in spring by a barrage of chemical sprays. The usual method is to apply lime, sulphur or Bordeaux mixture (copper sulphate and lime) to prevent "scab," a fungus disease of apples and pears which blasts the foliage, blemishes the fruit and blisters the bark. Lead arsenate may be added as a stomach poison for beetles and caterpillars, nicotine to kill sucking insects like greenfly, and chemical wetting agents to make the spray spread evenly. The campaign closes in summer when pests meet a dusty end from derris or nicotine powders—notably the young larvae of the Codlin moth which so neatly tunnel apples to the core. Spring, summer, autumn and winter, the fruit-grower relies on the chemical industry to help him produce fruit without blemish and in full measure.

of the larger size of shops in the South. A table gives the number of shops and buying population in the Civil Defence regions. A census of distribution has never been taken in this country, and these statistics are a useful

| General Description                        | Number         |
|--------------------------------------------|----------------|
| Drapery .....                              | 35,800 ± 1,800 |
| Outfitting (men's and/or women's) .....    | 15,900 ± 1,400 |
| Footwear .....                             | 11,700 ± 1,200 |
| Tailoring (men's and/or women's) .....     | 5,500 ± 900    |
| Wool .....                                 | 2,500 ± 600    |
| Costumiers and gown shops .....            | 1,900 ± 500    |
| Variety chain stores .....                 | 1,500 ± 500    |
| Department stores .....                    | 300 ± 200      |
| Co-operative stores .....                  | 2,300 ± 600    |
| Other: wholly or mainly clothing .....     | 3,600 ± 700    |
| Other: not wholly or mainly clothing ..... | 5,200 ± 800    |
| Total .....                                | 86,200         |

guide to at least one section of the distributive trades. It will also be a valuable aid in the preparation of the full census, which, it is understood, is to be taken at the earliest opportunity after the war.

### Coupon Releases and Expenditure

The pattern of apparel sales since clothing rationing was introduced has normally been that a coupon release was followed by large sales, which lessened month by month, reaching their lowest level in the month before the next release. The normal seasonal fluctuations in the clothing trade have been smaller than the influence of coupon releases. It is interesting, therefore, to compare the sales of apparel in the last month before, and the first three months after the last two clothing coupon releases. The following table gives the index of the average value of daily sales, as reported in the April retail trade report in the *Board of Trade Journal* for June 10th.

| APPAREL INDEX (1942=100)                  |     |                                       |     |
|-------------------------------------------|-----|---------------------------------------|-----|
| Last Period<br>(from Sept. 1, 1943)       |     | Present Period<br>(from Feb. 1, 1944) |     |
| August .....                              | 73  | January .....                         | 68  |
| September .....                           | 115 | February .....                        | 107 |
| October .....                             | 100 | March .....                           | 105 |
| November .....                            | 87  | April .....                           | 112 |
| Average, first three months of period ... | 101 |                                       | 108 |

The first notable difference is the higher average coupon expenditure in the current period, which may be due to the fact that 24 coupons were released, against 20 on September 1st. The second is the difference in buying trends between the two periods. Although less was spent in February than in September, the increase over the previous month was roughly similar. By April, the third month of the current period, the normal seasonal influence appears to have reasserted itself. The figures may also indicate that as the public becomes more accustomed to rationing, the influence of coupon releases on buying will be weakened, and the planning of individual expenditure will be wiser. (The monthly retail trade table appears on page 828.)

### Monopoly by Electrical Contractors?

The desire for the "closed shop" continues to spread to different sections of traders. The Electrical Contractors' Association has in point of fact advocated compulsory registration for 25 years and has set up a voluntary register which has 1,400 members. But outside it there are some 10,000 traders, mostly small ones, whose business is the installation of electrical equipment. It has recently been suggested in a speech by Mr Penwill, the director of the Association, that the consumer ought to be given protection against the inefficiency of some of the unregistered traders. This would be secured by the qualification test which would form part of any scheme of compulsory registration. It is true that to run wiring and to provide connections for such things as wireless sets and electrical fires are comparatively simple jobs which may encourage inexperienced workers to set up business. But it seems to be forgotten that the consumer has his own check on inefficiency without any outside help. This is especially so where, as in this business, the trader's reputation is local and usually well known and there is plenty of competition.

Another argument is that defective wiring is a danger to safety. Unfortunately for this plea, a great deal of wiring is done by householders themselves. Because of this fact it would be difficult to make defective wiring a criminal offence, nor is there evidence that traders are often guilty of it. A practical safeguard, suggested in a recent report of the Institution of Electrical Engineers, would lie in the general adoption by supply undertakings of the practice, which many already follow, of inspecting consumers' installations. On the main issue, the present conditions of open competition and of hardly earned reputations are better guarantees of efficiency, and much better guarantees of cheapness, than would be a closed trade guild. In choosing this method of getting safe installations, the consumer would, as so often, lose much more on the swings than he would gain on the roundabouts. Left to himself, he certainly would not choose it—nor would the average contractor.

### More Bills for the Banks

The effects of the Salute the Soldier savings campaign continue to affect the banking figures. The clearing banks' statements for May show a further rise of £8,987,000 in investments and an accompanying decline of £4,500,000 in Treasury Deposit Receipts. These are comparatively small movements and the former brings further evidence of the comparatively modest extent to which the banks are swelling the savings total by their own direct contributions. The main feature of last month's banking figures is the concurrent increases in bills discounted and short loans. These rose by £25,500,000 and £8,401,000, respectively, and are a measure of the increased flow of Treasury bills into the banking system. A substantial part of the increase in bills issued through the weekly tender is finding its way to the banks. A smaller part, on the evidence of the May returns, remains with discount market houses and provides the collateral for increased short loan accommodation from the banks. Advances at £755,633,000 show very little change on the previous month's total. The reaction from the seasonal peak in this item has been small. From a figure of £723,962,000 last November, advances rose to £772,245,000 in March, and the incidence of this rise suggested that the customary seasonal explanation of "tax loans" was appropriate in accounting for the movement. This argument was further supported by the drop to £754,297,000 in April, but the subsequent recovery to £755,633,000 in May suggests that a more permanent influence may have been at work in the previous months' recovery in this item.

### Merchant Banking Deal

It was announced this week that the merchant banking firm of Matheson and Company had acquired from the British Overseas Bank the entire capital of Huth Produce Sales, Ltd, and Huth Coffee Sales, Ltd. These two companies had been acquired by the BOB in 1936 with the business of Frederick Huth and Company. Since then these two subsidiaries have provided the produce department of the BOB, the first acting as importers of general produce, including vegetable seeds, wool, gum, hides and skins, and the second as importers, exporters and dealers in green coffee of all growths. This produce business has, inevitably, suffered a serious decline during the war. The position of the BOB does not provide the best jumping off ground for the redevelopment of these merchanting activities after the war. The bank was caught in 1939 with substantial frozen commitments in Germany and other areas later to become enemy—or enemy-occupied—territory. The latest balance sheet showed that on October 31, 1943, assets of £3,805,854 included £2,048,237 in enemy or occupied territory. The report for the last financial year showed a debit balance of £374,269 carried forward. The produce side of the business is being transferred to a firm which will bring to it a more genuine merchanting tradition than it can have found in the BOB.

### Outlook for Silver

Silver to-day has two strings to its economic bow—industrial and monetary. The rapid growth in the industrial use of the metal since 1939 is in marked contrast to the comparative stability of consumption in peace. It is used,

among other things, in chemical equipment, solders and brazing alloys, electrical apparatus, powder metallurgy, containers for special food and pharmaceutical products and silver-clad base metals. As the following table shows, the absorption of silver by industry in the United States increased nearly five-fold between 1939 and 1943; the figure for 1943 is equivalent to more than half the world's annual output of silver of some 270 million ounces:—

INDUSTRIAL USES OF SILVER IN THE UNITED STATES  
(In million troy ounces)

Source: *Engineering and Mining Journal*, February, 1944.  
\* Not shown separately, included under unclassified uses.  
† Estimated less than one million ounces. ‡ Not available, but known to be small. § Including silver used in the production of silverplate ware for Army and Navy.

An answer to the question, "what is the post-war outlook for silver as an industrial metal?" was furnished by the US Tariff Commission's report published last September under the title "Silver in Wartime." Those uses of silver which have resulted from the scarcity of other non-ferrous metals will presumably disappear after the war as the supply of the latter for civilian consumption increases. On the other hand, some of the new uses found for the metal during the emergency will continue. There will probably be a larger use of silver for electrical purposes and in bearings than before 1939. The silverware industry, the largest pre-war consumer, will have piled up a considerable backlog of orders and will need substantially larger supplies of silver annually than the pre-war average of about 30 million ounces a year. Taking it altogether, the US post-war demand for silver for subsidiary coinage and industrial uses will, assuming a fair measure of general prosperity, probably materially exceed the pre-war demand. The output of silver in America and elsewhere will depend on the price of the metal and upon the price of the normally associated lead and copper. In the past the price of silver was greatly affected by US legislation with respect to Government purchases of domestic and foreign production. The US Tariff Commission, perhaps somewhat optimistically, believes that post-war silver demands may be such as to result in prices sufficiently attractive to sustain a large production of the metal throughout the world whatever the policy of the American Administration for the purchase of silver.

### Corporate Profits in USA

Despite the continued expansion of business in the USA, it appears, from the figures of the National City Bank of New York, that the net income of 2,625 leading corporations rose by only 4 per cent last year as against 1942. This means an appreciable fall in profit margins, and 920 manufacturing companies, reporting sales figures, achieved a net income after tax of \$1,927 million on a turnover of \$53,239 million. This is equal to 3.6 cents per dollar of sales, compared with figures of 4.3 cents, 6.5 cents and 7.5 cents for the years 1942 to 1940, respectively. No doubt most of this fall is due to higher charges and increased taxation, but the figures appear to be struck after certain reserve provisions, which may have been substantially increased. Nonetheless, it is the case that the system of fixed selling prices, coupled with higher taxation, has absorbed a very large part of the expansion in declared net income. Turning to the entirely provisional figures of all active corporations, some 469,000 in number, gross income has risen by 11.1 per cent to a computed figure of \$250,000 million and net income after tax at half that rate to \$8,550 million. The estimated return on the net worth of the corporations rose from 6.8 per cent to the 1941 level of 6.9, which compares with an average of 2.2 per cent for the preceding eleven years, but with 7.2 and 7.5 per cent in the two boom years

(Continued on page 827)

## END THOSE SKYLINE SCANDALS

There are *still* quick savings of coal to be made without impairing factory production—but *only* a concerted drive by management really brings results. In order to safeguard next winter's coal supplies, search your plant to eliminate *every* possibility of fuel waste—but *do it now*.

Start with those spouts of steam clouding the factory skyline. Track each one to its source. This steam *can* and *must* be put to useful work. Whether exhaust steam from engines and pumps, vapour from process plant or 'flash' steam from trap discharges, remember that in every lb. of steam blowing to waste there is only a trifle less heat than in the steam leaving your boiler at 100 lb. or 200 lb. pressure. Remember that steam escaping is fuel wasted.

YOUR FUEL EFFICIENCY BULLETINS WILL TELL YOU HOW. The Bulletins you need are Nos. 22, 25 and 28. They show you how to make the best use of exhaust steam, flash steam and process vapour. Look them up straight away. If you've mislaid them send TODAY to your Regional Fuel Office for further copies.

ISSUED BY THE MINISTRY OF FUEL & POWER

## COMPANY MEETINGS

SMITH'S POTATO CRISPS  
(1929) LIMITEDSIR HERBERT MORGAN'S  
SPEECH

The fifteenth ordinary general meeting of Smith's Potato Crisps (1929), Limited, was held, on the 14th instant, in London, Sir Herbert E. Morgan, K.B.E. (the chairman), presiding.

The chairman, in the course of his speech, said: The net profit for the year, after provision for taxation, amounts to £84,148, as against £83,761 last year. We propose to pay a final dividend of 20 per cent. with a cash bonus of 5 per cent., both subject to income-tax (making 32½ per cent. for the year). The results prove that in spite of our special problems and difficulties there is no lessening in the efficiency with which the business is conducted, the strength of your company, or the popularity of Smith's Potato Crisps.

While such a large proportion of our output of Smith's Potato Crisps are on national service—that is, being provided for His Majesty's Forces as well as thousands of canteens, both civil and military—we have still done our best to supply the general public.

During these days of limited staffs, curtailment of heating facilities for cooking, and pressure on the time of the housewife, our commodity has increased its hold on the people. For more than a generation now our Crisps have been the stand-by of innumerable families, and in recent years of rationing, because our 2d. packets provide a perfectly prepared and nourishing meal, they have become more than ever a necessity.

## RECONSTRUCTION PLANS

You are all aware of the almost innumerable plans for the reconstruction of practically everything and everybody that are finding expression to-day. I hope that in these plans certain reforms in our licensing laws will be effected enabling licensed houses—who have always been such a valued source of distribution to us—to render even greater service to the public.

The licensees of the country are a body of men and women well fitted to give a full measure of co-operation in supporting legislation for continual improvement in the lives of the people. They have rendered a humane service to the whole community with whom they are in constant and sympathetic touch.

Before the war, through the enterprise of our brewers in all parts of the country, the houses built for public entertainment and refreshment led in architectural design and quality of craftsmanship, as well as in amenities for the public. In the long period of housing shortage which is generally envisaged, the provision of food and drink in these comfortable surroundings would have an added value.

## CORDIAL RELATIONS WITH DISTRIBUTORS

While manufacturers have all had problems, they are shared by wholesalers and retailers alike. It is a pleasure to acknowledge the cordial relations that exist between ourselves and the hundreds and thousands of distributors who co-operate with us. Grocers, provision stores and all purveyors of food render us a nation-wide service—they fully understand our difficulties. These groups of distributors have been a vital asset to the country in feeding the people.

With regard to the future, all we ask for to ensure continued prosperity is to be relieved of restrictions and be enabled to employ all workers necessary to fulfil demands made on us. These are some of the blessings we, as a company, look forward to in the peace which we feel sure is approaching.

The report was adopted.

UNITED KINGDOM GAS CORPORATION  
LIMITED

## SUCCESS OF GROUP WORKING

## MR BRUCE OTTLEY'S SPEECH

The ninth ordinary general meeting of the United Kingdom Gas Corporation, Limited, was held, on the 13th instant, at Shell House, Bishopsgate, London, E.C.

Mr. Bruce Ottley (chairman of the corporation) presided.

The representative of the Secretaries, Close Bros., Limited, having read the notice convening the meeting and the report of the auditors, the Chairman said: Another year of war has passed since I last had the pleasure of addressing you, and once again I am precluded from giving you more than a cursory view of the corporation's activities and present condition.

The net revenue for the year amounts to £119,000, as against £115,000 in the previous year. It should be borne in mind that no effort has been made to extend the sale of gas, but, on the contrary every effort has been made to encourage economy in its use in every direction.

There has been expended £136,206 in service to our subsidiary companies; of this amount, £96,877 represents the cost of wages and materials for work carried out in the maintenance of works by our constructional and repair squads.

The standard of efficiency has been well maintained, notwithstanding the circumstance that we have been called upon to continuously operate at high cost carburetted water gas plants originally provided as standby for the meeting of peak loads.

An outstanding feature of your corporation's activities during the past year has been the extension of group working, whereby subsidiary undertakings conveniently situated geographically, and of such size as to be convenient for unified operation and administration, are placed under one combined management. The corporation's first group, formed some six years ago, was the Castleford group of companies, comprising eight subsidiaries under centralised management. Uniformity has been evolved throughout with excellent results and greatly reduced price of gas.

## REDUCTION IN GAS PRICE

As an indication of the results achieved by this group, I would point out that it has been possible by reductions to standardise the price of gas throughout the area, the net result being that the average price received for all gas sold as a result of the economy of centralised control and administration, is 25 per cent. below the average price received at the time the group was formed. All units of the group have derived benefit, not only in reduction of administrative and operational costs, but in the greatly improved service to the consumer made possible by specialised staff backed up and reinforced by that of your corporation which could not be made available to an independent unit.

It should be noted that while there is a limit to the size of a group which can be economically and efficiently operated under one management, it was decided, after careful survey and investigation, to extend the Castleford group of companies, to include a further seven companies, the whole now being known as the West Riding Group of Gas Companies with headquarters based on the principal unit, the Wakefield Gaslight Co.

Group working has also been established as between the York, Harrogate, Malton and Easingwold undertakings, and other schemes are under survey.

The West Yorkshire Gas Distribution Company, which is now linked up to municipal undertakings as well as to companies controlled by your corporation, continues to expand, and has amply proved the soundness of its original conception.

It is important that planning of gas supply both as regards production and distribution should proceed in line with the planning of the great housing schemes, so that the essential gas fuel service may be available as the new houses are erected, also to meet extended industrial requirements that are likely in many areas to follow upon the change-over to peace-time production.

We welcome, therefore, the announcement by the Minister of Fuel and Power of the setting up of a committee to inquire into the gas industry, and we hope that their deliberations will result in the industry as a whole being permitted to proceed with the development of the plans for integration and co-ordination of gas supply and that we may be enabled to continue our successful development work in those areas in which we are interested.

## SERVICES IMPROVED

In spite of the difficulties of war-time, and the restrictions imposed upon us, we have been able to improve our services to the public, and they will be further improved and cheapened as and when we are permitted to continue our development.

It is beyond question that a public utility should be developed to give the cheapest and most efficient service that is possible. We have, in a comparatively short space of time, been able to build up a business edifice, the results of which indicate tremendous potentialities for the speedy co-ordination of the industry.

Appreciating, as we do, that our primary responsibility is the service we are able to render to the consumer, we would welcome Government supervision, and believe this supervision can best be operated by a measure of statutory control being applied to your corporation as well as to its subsidiaries. It will then be for our corporation to satisfy the Government that any development which it may propose is in the best interests of the public it is designed to serve.

I cannot close without reference to the excellent work of the staffs of the corporation at our headquarters and of the companies. During the year Mr Hodgkinson who has been the principal assistant to our managing director, Colonel Carr, has been appointed general manager.

The resolution was carried unanimously the dividends as proposed were approved the retiring directors were re-elected, the auditors were reappointed, and the proceedings then terminated.

SIMMS MOTOR UNITS,  
LIMITED

The twenty-fourth ordinary general meeting of Simms Motor Units, Limited, was held, on the 8th instant, in London.

Mr Tom Thornycroft, the chairman, in the course of his speech, said: I told you last year that the directors were determined to press on with all possible schemes for the improvement and efficiency and the general well-being of your whole organisation. The increase in the net profit from £95,268 to £149,910 definitely shows that our efforts have been successful. But, we are to ensure that we provide the utmost possible employment after the war and to the support of the Ministry of Labour in providing the additional technicians.

Our profits have materially increased but our low profit standard only allows us to retain a small part of these profits. The report was adopted and the proposed dividend of 10 per cent., less tax, was approved.

THE FINE COTTON SPINNERS' AND  
DOUBLERS' ASSOCIATION, LIMITED

## MR H. M. HARWOOD'S SPEECH

At the annual meeting of stockholders of the above company, held in Manchester on the 9th instant, the chairman (Mr H. M. Harwood) said, in the course of his speech:

The factor chiefly responsible for the comparatively modest results, is, of course, the labour difficulty. The explanation for this state of affairs I gave last year; the high average age of our women, and the multiplicity of their other duties. To these have now been added another year of war conditions.

As regards post-war labour conditions, the long and the short of it is that we are underworking our machinery and wasting our human resources. Anything I may say later about our prospects is contingent on this question of labour deployment being adequately dealt with.

## FINANCING RE-EQUIPMENT

I shall refer later to what seems to me the unduly optimistic estimate of human nature taken by the Government White Paper, but the willingness to examine, and the necessary discard, many of the economic practices of the past, is a great tribute to the new influences now making themselves felt amongst the priesthood of national finance.

When the war is over we shall be faced with two conditions. On the one hand, a very large amount of savings covering wide sections of the public, on the other, an unprecedented demand for money for capital investment. How are we to deflect these savings from a rush for consumer goods into the channel of capital investment?

You can, of course, do this by compulsion—by taxation—in which case your capital will be found by the State. In other words, nationalisation. This has been advocated in some quarters. It is the death-knell of political economies.

I cannot see any Government of any complexion; jumping at the cotton trade as an opportunity of practising state ownership.

## CAPITAL FOR THE COTTON TRADE

If we want capital, we must get it where we have always got it, from those who are our faith that the game is worth the candle. In other words, from that old ratrooper of industry, the ordinary shareholder. And to do that you have to persuade him that it is worth his while to forgo some immediate satisfaction for the sake of future advantage.

If there were some reason to suppose that some future Government would take the view that the holder of ordinary shares—so far from being a useful citizen, is to be looked on as an incubus, whose interests could be safely disregarded, there could be a distinct falling-off in the number of people willing to invest their money in this way. Either they would cease to invest, or they would take their money elsewhere—not a difficult thing to do in the world with its tongue hanging out.

## MISLEADING SLOGANS

There is a rather ominous slogan going the rounds, and it receives some support from the White Paper. It is to the effect that the first duty of a business is to serve the national interest. A variety of the same theme is "Production for use, not for profit," of which we hear a good deal. During war time—and that includes the immediate post-war period—this is true. It is easy to carry out. The needs of a nation in war time are well defined. The largest possible production—the lowest

possible price—and the lion's share of any resulting profit. These are the national needs, and it is right that they should be satisfied, but in normal times the interests of the state are by no means so well defined—nor are those in charge of an industry necessarily in a position to estimate those needs accurately.

I am probably out of date, but, in my opinion, a man who conducts—on whatever scale—an honest and profitable business, is serving the state much better than he would by mixing business with vague and often ill-directed philanthropy. This is particularly true when the state takes half his profit.

Altruism is, I suppose, a virtue, but it is one that should not be exercised at other people's expense. Do not let us be led astray by these amiable self-deceptions. There is one person who makes no pretensions to this form of altruism—that is, your shareholder.

The would-be investor is influenced by two things—the risk factor and the profit factor, and of the two he rates the profit factor much the higher.

The White Paper indicates an intention of minimising his risk, but it also seems to have the intention of limiting his profits.

## QUESTION OF PRICE CONTROL

This brings us to the much debated question of price control. I am afraid the trade are inclined to place too much reliance on this. Lulled into security by present conditions, they see price control as something behind which they will be able to shelter. Some even believe that a minimum price can be held, which not only protects them against loss, but gives them a steady profit, whatever the demand for their product, and whatever their efficiency.

This seems to me a profound delusion. You cannot produce prosperity by any form of price control. All you can do is to avoid disaster when it is due to temporary causes.

A Mae West is useful when you are torpedoed. You do not put it on to swim the channel. You can use a straight waistcoat to restrain a man from committing suicide in a fit of depressive mania. You do not expect him to wear it when he has recovered.

A minimum price can only be an instrument of permanent prosperity if it is associated with a guaranteed off-take. In the case of agriculture, this is recognised. I have never heard anyone suggest that there should be a guaranteed off-take of textiles.

As for maximum prices. These will undoubtedly operate to some extent during the period of transition, but in normal times they are both undesirable and impracticable. This is particularly so in the case of exports.

On the whole the less you say about price limitation the more likely you are to attract the investors' money. I have a feeling that this pre-occupation with price control is largely due to fear. Fear on the one hand of insecurity, and on the other of prosperity. Do we, perhaps, lay too much stress on security?

Does security come first in the picture of the future as seen by all these young men and women who are today living the greatest adventure in our history? I only ask the question, I do not attempt to answer it. If that is what they want above all else we should do what may be done to ensure it, but also let us be a little careful that we do not buy security at the price of stagnation. There is only one place where I think security is complete—the grave.

## PROBLEMS OF BOOMS AND SLUMPS

And, as to fear of prosperity, why do we all speak of a boom as though it were the "Black Death"? Because of the inevitable slump? It is not inevitable at all, unless you choose to call every recession of trade a slump. A man with his head screwed on is no more likely to fall off the top of a ladder than off the bottom. If he does fall, he is, of course, more likely to break his neck, but it is quite possible to come down the usual way. What happened in 1920 and 1925 is irrelevant. What happened then was that the men in charge panicked. Directly the horse started to gallop they lost their stirrups, and then fell off. That need not happen again.

The investor today takes more than the normal risk. The future is necessarily obscure. We do not know what kind of world we shall have to cater for. We do not know how far new processes and new materials may supplant our products, and we are, as always, at the mercy of the whims of fashion. On the other hand we do not know how far we shall find compensation in new uses for our products. The war record of cotton is not discouraging. If science threatens us with one hand, she beckons us with the other.

## WORLD'S INCREASED BUYING POWER

Last of all, we do not know how soon the buying power of the world will be re-established and increased. That it will be increased, and enormously, there can be no doubt. I have had figures of the relative consumption of cotton goods in India, China and Russia, and the United States of America:—

32 lbs. a year a head in U.S.A.;

8 lbs. a year a head in Russia, and

3 lbs. a year a head in India and China,

but you don't have to go to India or China, you need go no further than our own country, where the rise in the national income since 1938 is around 80 per cent. Nor is this all. We believe that as this buying power increases, it will be felt more and more in the direction of better class goods, to the making of which, this country is especially adapted.

So far as this company is concerned, our target is not only the recovery of old markets, now closed, but the discovery of new markets for new products, adapted to new purposes.

Taking the whole picture, the ground seems laid out for a period of trade expansion. But if we take the view that a rich crop is in the making, we must realise that the harvesting will not be tomorrow or the day after, and this harvest will be gathered only by those who have equipped themselves for the job.

I have spoken of encouraging the man who lends his money to industry, and I have urged the necessity of not limiting his chances from political or other reasons, but I hope that no one will think that I am thereby encouraging him to expect fantastic returns by way of swollen dividends, or otherwise. We want no new gold rush. Do not let the investor imagine that he is buying a cheap ticket to some immediate Eldorado. Those who act on that assumption are likely to find that the ticket is a week-end return.

If prosperity comes, the first claim on it must be the consolidation of our position, the extension of our research, the modernisation of our plant. There must be no "scalping." If those responsible for the conduct of business neglect this duty, the question may indeed arise whether the resources of the country can safely be left in their hands.

I have spoken at this length about the investor—and this includes the smallest of one-man businesses—because we have reached a point when it is necessary to estimate the future attitude of the community to these people. It is not a question of any particular regulations—it is a question of attitude to private enterprise as a whole, and to the profit motive, which is its sparking plug.

## DERBYSHIRE STONE, LIMITED

### LARGER PROFITS OF THE GROUP

The eighth ordinary general meeting of Derbyshire Stone, Limited, was held, on the 15th instant, in London.

Mr S. D. Clements, the chairman, in the course of his speech, said: I should like to draw your attention to the satisfactory result of the year's trading. The combined profits of the Derbyshire Stone group of companies amounted to £79,537, after providing for Excess Profits Tax, this figure comparing with profits of £73,450 for the year 1942.

### PROFIT AND DIVIDEND

Out of the profits of £79,537 we have made, as in previous years, a substantial provision for depreciation, amounting in the year under review to £19,162. This provision, together with a charge of £18,359 for income-tax of the group on the basis of the legal liability, leaves a profit for the year of £42,016. Your directors recommend that there should be paid a dividend at the rate of 10 per cent. on the ordinary shares.

I should be glad if you would now turn to the consolidated balance-sheet. Fixed assets stand at £392,452, compared with £386,258 in 1942, and the depreciation reserve has been increased to £135,812. The excess of current assets over current liabilities in the consolidated balance-sheet amounts to £85,294, by comparison with £51,663 in the previous year, an increase of £33,631, which I have no doubt you will note with satisfaction.

### SHORT AND LONG TERM PROSPECTS

I have no doubt that you will expect to have a few words from me as to our prospects, and in this connection I should like to divide my comments into two sections, relating to what I may call short-term prospects and long-term prospects. By short-term prospects I refer to the period which will elapse between the present time and the end of the war and for some little time after, until the normal activities which provide our peace-time markets begin to be developed, and during this period I fear that there must be some uncertainty as to the profits which the company will be able to earn.

As regards long-term prospects, however, your directors feel that the shareholders have every reason to look forward with confidence, for we anticipate that the extensive limestone quarrying activities of the company, with which is associated the manufacture of numerous by-products, will play a useful part in the work of post-war reconstruction in rendering efficient service to our customers, with resulting benefits to our workpeople and shareholders alike. In addition to this, we must not forget the returns we expect to secure from our basalt, slag, tar distillation, and Fluorspar interests.

Whilst on this subject of prospects, I must not omit to refer to the activities of our subsidiary company, the Hopton-Wood Stone Firms Limited, for here we are engaged on the production of Hopton-Wood stone and Hopton-Wood marble, for which we anticipate a greatly increased demand for high-class architectural and decorative work, as compared with the opportunities afforded by our pre-war markets.

Before concluding my remarks I should like to refer not only to the continued efficient and loyal service given to us by our staff, but also to those employees of the company, about 180 in number, who are serving our country in the armed forces. I know that you will join with me in wishing them all good luck and a safe and speedy return to their homes.

The report and accounts were unanimously adopted.

## EAGLE STAR INSURANCE COMPANY, LIMITED

### FURTHER PROGRESS

The annual general meeting of the Eagle Star Insurance Co., Limited, will be held, on the 22nd instant, in London.

The following is an extract from the statement of the chairman (Sir Edward M. Mountain, Bt.) circulated with the report and accounts:

In the life department, during the year, 1,743 policies were issued for £14,760,809 gross. Our mortality experience is favourable. The premium income at £1,822,166 shows an increase of £221,358, the total funds have increased to £17,345,257, and the expense ratio was reduced to 9.40 per cent.

In the fire department income at home and abroad increased and now exceeds £1,000,000, and the profit is £77,000. Home results were very good. All three accounts in the accident department have yielded good results. In the marine department the fund is considerably in excess of requirements after making full allowance for future liabilities.

In the profit and loss account the net interest income has again improved, and now exceeds the net cost of the dividend by over £16,000. In addition, fixed fees amounted to £32,717. The transfer of £30,310 from the life department represents the shareholders' portion of the quinquennial distribution of profits of the Star Fund. The shareholders' portion of the Sceptre Fund are carried to next year. The total transfer from trading departments amounts to £347,000 compared with last year's total of £268,000. The carry forward in this account has increased to £703,580.

The increasingly heavy burden of taxation is making it impossible to obtain a reasonable remuneration in many overseas countries, and we must in future look more to the home market.

## F. FRANCIS AND SONS

### INCREASED NET PROFIT

The forty-third ordinary general meeting of this Company was held, on the 8th instant, in London, Mr John Ismay (chairman of the company) presiding.

The secretary (Mr F. Skade, A.C.I.S., A.C.W.A.) having read the notice convening the meeting and the report of the auditors, The chairman said: With your permission we will take the accounts and report as read. (Agreed.)

The net profit for 1943 at £73,777 shows an increase of approximately £6,677 on the previous year, and after providing £48,000 for taxation we have an available balance of £25,777. After writing off the cost of the preference share issue made in April, 1943, amounting to £2,027, and payment of preference share dividend to December 31, 1943, we are left with a balance of £18,709 available for distribution.

Your board recommends the payment of a final dividend on the ordinary share capital of 10 per cent., less tax, making 14 per cent. for the year, being at the same rate as for the previous three years. I do not think there are any items in the accounts to which I have to draw particular attention, but you will observe from the consolidated statement that the current assets show a balance over current liabilities of £185,352.

Your directors have given a great deal of thought to the post-war position, and are confident that the change-over to a peace programme will not incur a great deal of dislocation.

The report and accounts were unanimously adopted, and the dividend as recommended was approved.

The retiring director, Mr F. Skade, was re-elected, and the auditors, Messrs Jas. Williamson and Co., having been re-appointed, the proceedings terminated with a vote of thanks to the chairman, directors and staff.

## G. BEATON AND SON, LIMITED

### INCREASED PROFIT

The annual general meeting of G. Beaton and Son, Limited, was held, on the 13th instant, at the Waldorf Hotel, Aldwych, London, W.C., Mr Stuart C. Goodwin, J.P. (chairman of the company) presiding.

The following is the statement of the chairman which had been circulated with the report and accounts and was taken as read:

The profit for the year amounts to £12,683 compared with £11,945 last year and is arrived at after making provisions for the estimated liabilities for income tax and excess profits tax arising on the accounts under review. When the balance of £1,085 brought forward is added there is a sum of £13,768 to be dealt with, and it will be noted that the directors' recommendations for the disposal of this figure are embodied in the accounts.

Reserves and undistributed profits amount to approximately £70,000, a substantial amount in relation to the share capital, and it is interesting to note that this figure is more than represented by the excess of liquid assets over liabilities.

During the year certain formalities were completed which resulted in your company's acquiring a controlling interest in E. H. Fuel Injection, Limited. This transaction does not involve any increase in the amount of the investment, but represents the conversion of a loan into fully-paid shares.

It is not yet practicable to give more than a brief outline of the affairs of your company, nor to indicate the scope of its activities on the cessation of hostilities. Members may, however, be assured that the latter question is receiving the fullest possible consideration by your directors.

In expressing appreciation of the services rendered by the company's employees during the year, I am sure I shall be voicing the wishes of all shareholders.

The report and accounts were unanimously adopted, and the payment of a dividend of 10 per cent. and a bonus of 5 per cent. (both less tax) was approved.

The retiring director, Mr Gerald Sturt, was re-elected; and the auditors, Messrs Dixon, Wilson, Tubbs and Gillett, having been re-appointed, the proceedings terminated with a vote of thanks to the Chairman.

## VAB PRODUCTS, LIMITED

### LARGER TURNOVER AND PROFITS

The seventh ordinary general meeting of Vab Products, Limited, was held, on the 14th instant, at the Connaught Rooms, Great Queen Street, London, W.C., Mr A. H. Redfern (the chairman) presiding.

The secretary (Mr B. C. Gotele, F.C.A.) read the notice convening the meeting and the report of the auditors.

The chairman said: The net profit for the year under review as shown by the accounts was £37,921, as compared with £23,137 for the previous year, an increase of some £14,784. This increase is due mainly to the fact that the profits of British Button Industries Co., Limited, one of our subsidiary companies, which was acquired during 1942, have been included for a full year, in addition to which there has been considerable expansion in certain of our other departments.

After providing for taxation and contingencies, a dividend of 12½ per cent. for the year on the ordinary shares, also a participating dividend of 4 per cent. on the preference shares, making 10 per cent. for the year, transferring a further sum of £1,000 to preference share redemption fund and making an increased allocation

to general reserve there remains to be carried forward £4,026, as against £3,838 brought in.

### INCREASED RESERVES AND SURPLUS

There is an improvement in the current assets, particularly in the item of cash at bank and in hand, which appears at £11,147, as against £8,246 at the date of the previous balance-sheet. The provision for taxation and contingencies has been increased to £20,000, which in my opinion is a conservative figure.

I think you will agree that the results shown are very satisfactory, and that the company's position has been strengthened considerably during the period under review. There is now, in effect, a surplus made up of the preference share redemption fund, general reserve and profit and loss account carry forward of £14,706, after providing for all dividends, taxation and contingencies.

### POST-WAR PROSPECTS AND EXPANSION

Although your company is engaged to considerable extent on direct and indirect Government work, the various units are of an essentially peace-time nature, and when the time comes, which sincerely hope will not be very far distant, we should be able to revert to the manufacture and supply of the purely domestic articles, for which the company is well known. I might mention that the activities of the group include precision and general manufacturing engineering, electro and other plating, plastic moulding, patented curtain rail, buttons, lenses, reflectors, etc. Your directors, at the present time, have under consideration plans for the expansion of certain branches of our business which it is proposed to put into operation shortly. This will enlarge the scope and activities of the company,

(Continued from page 823)

1928-29. Meanwhile, the actual dividend payments continue to fall and are estimated at \$4,000 million for 1943, or \$100 million less than in 1942. The 1943 figure was exceeded in nine of the fifteen years 1928-42, inclusive. Returning to the net profits of the 2,625 leading corporations, the results are summarised below:

| NET INCOME AFTER TAXATION OF 2,625 USA CORPORATIONS |                         |            |       |                   |                       |      |

| 497                                                 | Finance.....            | 68         | 74    | +10               | 6.9                   | 7.9  |
|                                                     |                         | 448        | 517   | +15               |                       |      |
| 2,625                                               | Total.....              | 4,776      | 4,986 | 4                 | 8.5                   | 8.6  |

\* Before certain charges.

This summary conceals the most diverse trends. Taking manufacture alone, there are percentage rises in the net incomes of concerns providing aircraft and parts of 34.8 per cent, rubber products 34.7, motor and electrical equipment 14.5 and 15.6, respectively, petroleum products 16.7, distilling 18.8, and printing and publishing of no less than 62.2 per cent. Against this, there are falls of 8.6 per cent in iron and steel, 21.7 and 18.5 in lumber and furniture, respectively, 16.3 in cotton and no less than 33.2 in sugar. Without the figures of gross profit, it is not possible to say just what factors caused these movements, but they do indicate an experience which is substantially different from that of UK manufacturers.

### Correction

Professor Postan's paper on the future of engineering, discussed on page 788 of *The Economist* of June 10th, was not read to the Institution of Electrical Engineers as stated, but to the Institution of Production Engineers, on May 12th.

and I think we may look forward to the future with the greatest confidence.

In conclusion, I would like to thank the managers and employees generally for the excellent co-operation and services they have rendered to the company under war-time conditions, and also the managing director and my co-directors for their loyal support and hard work, which has contributed very largely to the present position.

The resolution for the adoption of the report and accounts was carried unanimously.

The retiring directors (Mr A. H. Redfern and Mr Ivor Lloyd, A.M.I.A.E., F.C.S., M.Inst.B.E.) were re-elected and the auditors (Messrs Layton-Bennett Billingham and Co) were reappointed.

## MILNERS SAFE COMPANY, LIMITED

### STATEMENT BY THE DEPUTY-CHAIRMAN, MAJOR G. A. FROST

The annual general meeting of the above company was held, on the 15th instant, at the registered offices of the company, 21 Hampstead Lane, N.6. The following statement was issued to the shareholders by the deputy-chairman, Major G. A. Frost.

Your chairman, Major Sir James Ritchie, is unable to make his usual statement this year owing to absence on military duties. Major Dodge is still a prisoner of war in Germany, and I am pleased to say that news of him is satisfactory. Under the circumstances I have pleasure in reporting briefly to you on the position of your company after another year's trading.

During the past year we have not been able to resume the manufacture of our normal products, but the works have continued to be employed at high pressure. I feel certain that the balance-sheet submitted

to you shows that the company is in a sound position and is well equipped to face the future with confidence. Our plant—to which several additions have been made—is maintained at an efficient standard in spite of the extra work it has been called upon to carry out.

In his statement last year the chairman pointed out that the incidence of the Excess Profits Tax was specially burdensome to this company. Our increased productive capacity, which we planned before the war, has never been applied to our normal business and consequently our E.P.T. standard does not, in my opinion, appear equitable. The year under review has felt the full weight of this tax, but nevertheless the board feel that the resources of the company justify us in maintaining last year's dividend and bonus.

We have given serious thought to our post-war activities as far as the present circumstances have permitted. The immediate full resumption of our normal business will necessarily depend upon the Government's attitude towards the lifting of controls on manufacture and supply; but as any limitations imposed on our industry in this connection will have serious repercussions both on our ability to maintain employment and to compete in export markets, we hope the Government will give the matter that sympathetic and urgent attention which it demands.

The loyalty and energy of all employees of the company have been fully maintained, and our thanks are due to them for the interest they take in all our activities. In particular, the managing directors, Mr Dyer and Mr Hitches, have been indefatigable in furthering the interests of your company under the present difficult conditions.

Finally, your managing directors join with me in sending greetings to our absent colleagues on the board and to all employees of the company who are in the Services.

## Shorter Note

The comparative costs of harvesting by the binder-thresher method, and by combine, have been worked out for a farm in Staffordshire, and reported in the *Farm Economist*, October-December, 1943. The comparison relates to similar crops and other factors were more or less equal. The average cost per acre of harvesting by binder was £3 9s., while that of harvesting by Combine-Harvester was £1 5s. 9d. There are, of course, other factors which may lead the farmer to prefer the binder method, despite the difference in costs. Principally the farmer is concerned with whether his acreage justifies the capital expenditure on a combine harvester. On the other hand, by threshing and selling the grain when ripe, the risks of loss by fire or pests or deterioration due to unskilled stacking or thatching, are eliminated.

## Company Result

### Marks and Spencer.

# RECORDS and STATISTICS

## INDUSTRY AND TRADE

**Herring Scheme.**—A scheme to operate from June 27th to the end of August to promote maximum herring fishing has been devised by the Ministry of Food. The catch will be first offered at the maximum price of 91s. per cran to buyers on the rota. When bids are exhausted free sale to any licensed buyer for freshening, kippering, or canning, will take place down to the minimum price—78s. per cran has been proposed, but not yet fixed. The herrings which remain unsold will be allocated to pickle-curers (who salt herrings into barrels) at 55s. per cran. The main outlet for the British herring catch before the war was for these herrings, which were exported to Northern Europe. The Ministry of Food is to buy the output of the pickle-curers at 40s. per barrel, plus the cost of the fresh herrings. The stocks accumulated after the small home demand has been met will be held for European relief. Efforts are being made to increase the production of kippers for home consumption.

**"The Economist" Sensitive Index.**—There was no change in the index during the week ended June 14th. The complete index (1935=100) was 158.6; crops 135.6; and raw materials 185.5.

### FINANCE AND BANKING

**THE MONEY MARKET.**—Although the banks have not been buyers of bills on a substantial scale this week, credit has been in fair supply. The banks were again called upon to pay £100,000,000 against Treasury Deposit Receipts this week, a total which equalled the current nominal maturities, but which, owing to pre-encashments, involved the finding of about £13,000,000 of new money. At last week's tender for £110,000,000 of Treasury bills, the discount market obtained a 38 per cent. allotment as compared with the previous week's 28 per cent. The task of taking up the new bills presented no difficulty, as the banks, though unwilling to buy bills freely, were ready lenders to the market. The abstention from bill purchases must be explained in terms of the approaching turn of the half year. The Bank return shows few important changes. A drop of £3,718,000 in bankers' deposits is, in the main, balanced by a rise of £2,523,000 in Public deposits. Government securities have fallen by £7,625,000, but to the extent of £3,083,000 this is balanced by a rise in Other Securities, while a contraction of £2,679,000 in the circulation is another offsetting factor.

**MONEY RATES, LONDON.**—The following rates remained unchanged between June 8th and June 15th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1½%; 6 months, 1½-1½%. Treasury Bills: 2 months, 1-1½%; 3 months, 1-1½%; Day-to-day money, 1-1½%. Short Loans, 1-1½%. Bank deposit rates, 1%. Discount deposit at call, 1%; at notice, 1½%.

**Exchange Rates.**—The following rates fixed by the Bank of England remained unchanged between June 8th and June 15th. (Figures in brackets are par of exchange).

United States, \$ (4.86) 4-02½-03½; mail transfers 4-02½-03½. Canada, \$ (4.86) 4-43-47; mail transfers 4-43-47. Switzerland, Francs (25-22) 17-30-40. French Empire, Francs 197½-200½. (Continued on page 832)

## GOVERNMENT RETURNS

For the week ended June 10, 1944, total ordinary revenue was £34,882,000, against ordinary expenditure of £116,874,000 and issues to sinking funds of £500,000. Thus, including sinking fund allocations £1,840,027, the deficit accrued since April 1st is £676,470,000 against £737,098,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £73,018 to £2,517,076, the other operations for the week (no longer shown separately) raised the gross National Debt by £82,624,271 to £20,269 million.

By order of the Board, FREDERICK BRAMLEY, Secretary. Montreal, June 12th, 1944.

## Through the Atlantic Wall

FOR over a year now, the war which had been thrust out in every direction beyond the German frontiers—to the Atlantic, to Alamein, to Stalingrad—has been steadily and relentlessly returning to the Reich. For the German people, it is not only a question of bombing and casualty lists. Underlying everything else, there has been a steady shrinkage of their already very straitened personal *Lebensraum*. In recent months, a new conversion of industry, which is apparently still in progress, has transferred the last margin of production from consumer goods to armament production. This reflects the loss of industrial capacity or the expected loss of capacity on the outer fringe of German Europe. The call-up of the seventeen-year-olds has recently been accelerated. The mobilisation of women has been tightened up. Food supplies are more stringent than they were a year ago. The clothing and housing situation is disastrous. Yet the reaction of the German people is still one of passive acceptance. The mood was broken for a short period at the time of Mussolini's overthrow, but the Nazis were able to "re-stabilise" the situation with the picture of victory and survival to be attained through an inevitable stalemate and an invincible Atlantic Wall—or—as the only alternative—defeat and the total destruction of Germany.

Such was the background of the Allied invasion. Yet now the Atlantic defences have been breached and

the Allies are fighting on the soil of France. True, German counter-propaganda has replied with a good dose of flying bombs and reassuring references to the reserves which have yet to be thrown in and will drive the enemy out again. But this is only tactical day-to-day fencing. The two great myths which sustained the German people are being exploded. They have behind them a run of disasters as long as Italy's last year and, before them, an outlook quite as bleak. Inevitably the question has been raised whether Germany will not now follow in Italy's footsteps and end a hopeless war with an appeal for an armistice.

The analogy is false. Totalitarianism in Italy was not complete. It did not bring about the *Gleichschaltung* of either the Monarchy or the Church. There were rallying points for resistance. The pre-Fascist structure of society continued in a submerged and vestigial fashion, and was able to re-assert itself against Fascism when defeat came. In Germany, this is not the case. There are, of course, bankers and industrialists and churchmen, but they are not part of well integrated and self-confident social groups. They are atomised and impotent. Even the *Wehrmacht*, which is the only non-party structure to maintain some independence, could not, like Badoglio, overthrow the regime to seek an unconditional surrender.

This is really the crux. No German group—not even the most influential group, the Army—can take an

initiative in the matter of peace talks. This is not to say that, if terms were offered, the fact alone might not bring the groups into existence. Definite terms might prove a catalyst capable of organising the split and atomised elements of responsible German society. Obviously "unconditional surrender" is not such a catalyst. If it meant simply that the Germans would not be allowed to bargain over dictated terms, it would be correct and justified. Unfortunately, whatever its original meaning, it is being taken today to mean not terms unilaterally imposed, but an absence of terms. Apparently the British, American and Russian Governments have not yet agreed on the shape of the peace and, to judge by the meagre information which has reached the public, they are not likely to do so. The European Commission is working on the more limited project of an armistice, but so far, even that has not been achieved. There is, therefore, not much point in saying that the production of reasonable peace terms at this stage—not in the form of a promise to the Germans but of a unilateral statement of intentions on the part of the Allies—might, in the next weeks, bring the war to a rapid conclusion. It might quite possibly do so, for the German situation may very soon be ripe for it. But unless there is a radical change of Allied policy in the immediate future, no initiative will be made.

The decisive factor in determining the duration of German resistance is not, therefore, the war weariness and despair of the German people, nor even the readiness of this or that group to attempt the overthrow of Nazism. The decisive factor is the Germans' remaining military strength and the likely outcome of the summer's campaigns. Here there are too many imponderables to permit prophecy with any certainty. The Russian summer offensive is not yet launched. Further Allied landings have been promised. The military operations in Italy and the Balkans may develop on a much greater scale. Yet, with all these uncertainties, it is impossible not to accept the probability of a comparatively rapid German defeat. Mr Churchill, whose estimates of the war's duration have not in the past been over-optimistic, expressed his confidence last week that

although the execution of the plans adopted there [at

Teheran] is far from being complete, it is being steadily unrolled, and the months of this summer may, by the victories of this Allied campaign, bring full success to the cause of freedom.

Mr Churchill's optimism is borne out by a good deal of evidence from Normandy. It appears that the Germans' remarkable shortage of guns has compelled them to bring a large proportion of their armoured reserves into Normandy. There is a limit to which they can repeat the manoeuvre in the face of further landings. It is thus possible to envisage a situation in which France as a whole would become the scene of a genuine *Blitzkrieg*, a war of extreme mobility, with the German High Command ceasing to control its western armies as a single fighting machine.

Even though the Allies cannot make use of the political opportunity of inducing a German surrender now, the need for agreed armistice terms is no less urgent. After the bitter lessons of 1940, 1941 and 1942, the tendency in Britain has been to fear excessive optimism and to accept grimly the likelihood of a very long war. Yet excessive pessimism at this stage might have as inhibiting an effect on sound policy as did the over-optimism of the first war months. Pessimism can easily become an excuse for delaying vital decisions and a cause of catastrophic unpreparedness when the moment of victory arrives. Even if peace terms acceptable to all the Allies have not yet been evolved, it is essential that agreement should be reached at once on the content and methods of a purely military armistice. Such questions as the zones to be occupied, the methods of demobilising the German army, the treatment of enemy civilians and so forth, should not wait for *ad hoc* settlement by military commanders on the spot. The Allies have waited so long for victory that they hesitate to look it in the face now, that it is almost upon them. But it is as necessary to plan for the unfolding of victory as it was for the unfolding of the war. Lack of preparedness sent the Allies into war on the wrong foot. It would be disastrous if, after retrieving the earlier error with so much pain, they were to undermine their victory by the same mistake.

## Policy for Monopoly

IT was widely hoped that time might be found during this week's lengthy and important debate (which is still in progress when this is being written) for a critical examination of paragraph 54 of the White Paper on Employment Policy, which makes a glancing reference to the problems arising from the restraint of production or trade by monopolistic or quasi-monopolistic activities. All the facts required for a precise estimate of the amount of employment which may be withheld from the community by the proceedings of monopolists or trade associations are not, unfortunately, available. But it has been plain for a long time that such facts should be made available and, more important, that remedies should be devised to prevent any distortion of the national effort or any subtraction from the national income arising from these causes.

The large scale of production frequently associated with the most characteristic monopolies has made possible economies in the costs of production and opened new avenues of technical efficiency. This is the answer commonly given by the defenders of the familiar combines in chemical and other branches of production. But monopoly gives no assurance whatsoever that these benefits will be passed on in terms of price or the availability of products to consumers. Moreover, the commonest form of the restraint of trade or production is not the much publicised combine, but rather the combination or trade association, formed ostensibly to further the joint technical and economic interests of the producers or distributors concerned, but in fact operating, in a majority of cases, by one means or another, to protect and advance

the political and purely financial interests of a sectional group. Nor is this a matter which concerns only producers, such as the makers of steel, or distributors, such as the sellers of branded retail goods. It concerns also the buyers of raw materials and semi-finished commodities, for it is possible by monopolistic methods for a single buyer or group of buyers to determine the price at which raw materials or semi-finished goods are sold.

It is necessary, however, to be quite clear about what is at stake in this development towards the greater concentration of economic power in the hands of single firms or single associations. To denounce monopolists simply as restrainers of trade, restricters of output or subtractors from employment would be to miss the point. This is the thesis of a short, timely and clearheaded essay on "The State Control of Business," by Mr. E. F. Schumacher. The problem is not that combines or combinations are by their nature impediments to economic progress. Indeed, by and large, the contrary might be argued. The problem is rather the all-important one of responsibility to the community, of how this power is in fact used—whether for or against the public interest.

It is not possible to put the clock back to an earlier and more primitive stage of technical development. "Combinations," Professor Schumpeter has written, "largely create what they exploit." The question is whether technical efficiency on the one hand can be combined with economic duty to the community, on the other. As Mr Schumacher himself puts it:

the clash of autonomous private power-groups—employer's federations and trade unions, for instance—may

produce open conflict or result in a temporary negotiated peace; it may occasionally lead to what appears as friendly co-operation; but, except by accident, it never leads to policies, or even the formulation of objectives, conducive to the well being and harmony of society as a whole.

"Consumption," said Adam Smith, "is the sole end and purpose of all production." This is what producers and distributors, by the organisation of their power, are in a position to forget. Nor is the consumer in a position to resist them. In general, all consumers are also producers. Mr Schumacher's description of the consumer is again apt:

He is more deeply interested in raising his money wage than in safeguarding the purchasing power of the money he has earned. He is more concerned with obtaining a high price for what he has to sell than with getting cheaply what he has to buy.

Thus, it is only the state itself, by making itself the champion of the consumer, that can finally solve these problems. It is not—or at least not wholly—a question of ethics, of the moral priority of the consumer and the producer. It is a question of economic efficiency. Competition reconciles the individual producer's interest with the community's interest. In seeking to enlarge his own slice of cake, the producer is compelled to assist in enlarging the whole cake. But in a society of monopolies, each individual would be doing his best to shrink the size of the cake. It is the state's duty to prevent such an economic suicide pact among the citizens.

What does the White Paper say on this subject? It admits that there is a tendency towards combines and agreements, both national and international, by which manufacturers seek to control prices and output, to divide markets and to fix conditions of sale. It goes on:

Such agreements or combines do not necessarily operate against the public interest; but the power to do so is there. The Government will, therefore, seek power to inform themselves of the extent or the effect of restrictive agreements and of the activities of combines; and to take appropriate action to check practices which may bring advantages to sectional producing interests at work to the detriment of the country as a whole.

Thus the problem is stated without any solution whatsoever being offered. Mr Morrison's speeches against monopoly are still fresh in mind; but they find no echo here. The language is rather that of Sir Andrew Duncan—and Mr Bevin.

The task is to secure scrutiny and, if necessary, control over the activities of combines and combinations (whether of capital or of labour) in the interests of the community of consumers, without sacrificing or impeding the technical efficiency and potential cheapness which arise from large-scale organisation. The need is not to put brakes on private enterprise, but to ensure that it is in fact enterprising and that the results benefit the community at large. Plainly this will not be done simply by securing from trade associations or trade unions periodic reports

of their activities as they see fit to divulge and interpret them. There is a clear need for a much more independent, impartial and positive policy on the part of the State if responsibility in industrial practice is to be secured.

Without such a policy a solution is being developed by default. That is to say, the aspiration of trade associations (and of trade unions), to be regarded as the sole spokesmen of the industries in which they operate, and to be the sole channels of communication between those industries and the Government, is being in practice accepted. It is largely on this assumption that plans for the reconstruction and re-equipment of British industry and trade are being worked out. Each trade association is asked to state its case and provide the figures. Each trade association inevitably acts, honestly, according to its lights. Its first duty, as the chairmen of trade associations often say, is to its members' shareholders; its obligation is to speak to a sectional brief. Nor is the Government, with its lack both of power and of civil servants possessed of either the authority, the experience or the knowledge to pass judgment in industrial and commercial matters, capable of taking an independent line on behalf of the consumer. The picture of Britain's industrial future is being written piece by piece by organised producers—and the only check to the inevitable bias that must result is the "appropriate action" referred to in paragraph 54 of the White Paper.

Much more than this is required and should be demanded. Indeed, there is reason to believe—and this perhaps should be said in justice to Mr Dalton—that something appreciably more than this was proposed by the Board of Trade to be part of the White Paper, but was turned down in the Ministerial discussion. The obvious purpose of community control or surveillance is to secure that, in the case of an industry or group of industries organised in a monopolistic or quasi-monopolistic fashion, the efficiency of production should be as high as possible; that the level of prices should be as low as possible; and that the quality of production should be as good as possible. No Government policy for industry will be complete unless it is based upon an examination of these problems and propounds solutions.

Certain lines of action seem apparent enough. One, which should be passed into law as soon as possible, is to make it definitely illegal for associations or agreements to fix minimum prices or maximum quotas of output without specific permission from some public authority—a move which would make necessary at once the recruitment to the service of the state of a body of men capable of making correct decisions in these matters, with reference equally to the public interest and the technical requirements. But this would still leave largely unaffected the combine or monopolist proper. Nor would it solve the problems of efficiency, price, profit and quality over a large field of industrial activity.

Here more direct methods, at least of scrutiny and vigilance may be necessary. It is wrong that the Board

SAVING IS EASY . .

only when it has become a habit. Systematic saving by way of Life Assurance enables you to plan a secure financial future

of Trade should be content to rely for its information about all these topics on the single channels or "closed shops" of trade associations. Ministers should be in a position to discover precisely what is going on in every branch of industrial activity without the filter of sectional selection. If the Government's intention "to seek power to inform" itself means merely being the recipient of certain confidences from trade associations, it will mean very little. If it means the collection by independent and impartial means of all the relevant data, and their analysis by experts capable of the kind of costing and "efficiency auditing" of which Mr Morrison at one time used to speak, then it can provide the basis for a more positive policy, wherever such a policy may seem necessary in the public interest.

It is certain that a reform of the company law to ensure the fullest publicity and intelligibility of company accounts is desirable. It is probable that a reform of the patent law to ensure the freest possible pursuit and use of invention is equally desirable. Both these questions are already the subjects of the discussions of Government committees. But the Government still has no comprehensive attitude whatsoever to the wide range of common problems of which these two instances are only parts, and probably minor though important ones. The Government, that is, has as yet no industrial policy. Nor will it acquire one simply by collecting the right statistics, even though this is the indispensable starting-point.

The right to know what is going on, the ability to understand it, and the authority to license or forbid certain activities, even these powers will not go all the way in all cases. It may be that in some instances the appointment of Government representatives on the boards

of companies, or as chairman of cartels or trade associations, would be of some value. It may be that, in other cases, the state's participation should be more direct, by the actual acquisition of a financial interest with a corresponding voice in policy; nationalisation, which is not in itself a policy, is only one extreme form of this method, valid in rare cases. It may be again that, as Mr Schumacher and others have several times suggested, there are instances, such as the supplying of "consumer's goods that play an important part in mass production and enter into the cost of living," where the Government might, in peacetime as in wartime, go into business itself, by acting as the bulk-purchaser of such goods, and so be in the position to determine the quantity, price, profitability and quality of the majority of these goods produced for sale.

Plainly the method adopted must vary from case to case. Plainly there is no single, simple solution. Plainly, however, there must be solutions—and the vague and ambiguous wave of the hand made in the White Paper is not even the beginnings of a programme to deal with monopoly. Is it the Government's view that the British national economy should be based on high costs, on markets protected against competition both from abroad and from enterprise at home, and on the restricted production that these things inevitably entail? That would mean stability and security, of a sort. Or does the Government conceive it to be in the community's interest that the pace of technical progress, of commercial ingenuity and of managerial skill should be forced, even if it be to the harm of existing producers? To these all-vital questions nobody can yet give the first faint outline of an answer.

## Canadian Politics

**T**WENTY-FIVE years ago, the discontent and social strains that inevitably follow a major war assumed in the Dominion of Canada the forms of a more vigorous nationalism, of agrarian political action, and of industrial strife in the larger cities. Canadian nationalism secured its expression through the Liberal Party under Mr Mackenzie King which replaced the Conservatives as a result of the general election of 1921. The anxiety and discontent of the farmers of the prairie provinces who, after the years of the wartime wheat boom, found prices falling and markets contracting, brought strength both to the Liberals and to the newly formed Progressive Party. The malaise of the industrial worker as post-war re-adjustments led to mounting unemployment was reflected in the rise of disparate but not ineffective Labour parties in both eastern and western cities and in the wave of strikes which culminated in the prolonged Winnipeg strike of May, 1919. Thus two out of the three main currents of opinion led directly to the triumph of the Liberals, and the third did nothing to obstruct it.

Somewhat similar currents are again flowing in Canada and this time the focus of at least some of them is the new farmer-labour party, the Co-operative Commonwealth Federation. In August, 1943, this relatively new party gained 34 seats in the Ontario provincial elections, failed by a very small margin to become the largest party in the provincial legislature, and is now the official Opposition to the Conservative Government. Last week, the CCF swept the Liberal Government out of office in Saskatchewan and carried 43 out of the total of 52 seats in the legislature. The new government being formed by Mr. T. C. Douglas, who resigned from his seat in the Federal House of Commons at Ottawa to lead the CCF in his province, will have a clear majority of at least 34. Not a single riding in Saskatchewan returned a member of the Progressive-Conservative Party (as the Conservatives have renamed themselves since Mr. John Bracken assumed the national leadership of the party) and this must be regarded as a severe blow to the theory that Mr

Bracken, as a Westerner and a farmer, would be able to rally the farm vote to the Conservatives. The results of these two elections confirm trends that were already apparent in other recent provincial elections or in federal by-elections in English-speaking Canada. In the provincial general election in British Columbia last October the CCF secured a majority of the votes but not of the seats, and now forms the official opposition. By-elections, both federal and provincial, west of Quebec, have, on the whole, favoured the new party and its socialist programme.

The weakness of the Liberals in provinces such as Ontario and Saskatchewan, where they were formerly strongly entrenched; the somewhat confused conditions of the parties in French-speaking Quebec; and the growth of the CCF in the five provinces west of Quebec

INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

(Ontario, Manitoba, Saskatchewan, Alberta and British Columbia) as well as to a lesser extent in the Atlantic Provinces—these are the three forms that war and post-war political emotion and thought seem to be taking. There are 245 seats in the House of Commons at Ottawa and a party, to command a majority of them, must carry a very large proportion either of the 82 seats in Ontario or of the 65 seats in Quebec, and it must also secure at least a majority of the 55 seats in the three western prairie provinces. At the present time, an almost unique situation prevails in the House of Commons, for the Liberals have a majority in each of the three decisive areas—Quebec, which not unusually votes solidly for one party; Ontario, which usually divides between Conservative urban regions and rural Liberal regions; and the Western provinces, which divide between the Liberals and agrarian protest movements such as the United Farmers or Social Credit parties. More often, however, the power to form a Government at Ottawa is based upon strong majorities in Ontario or Quebec plus strength drawn from Western Canada.

The present trends in Canadian voting, so far as they have been revealed in provincial elections or in federal by-elections, suggest that the great majority of 176 which Mr. Mackenzie King secured in the general election of March, 1940, is now being threatened seriously in Ontario and the West and to some extent in Quebec. In Ontario, the Liberals, after being in office, are now by far the smallest of the three parties in the provincial legislature. In the Western provinces, Saskatchewan has decisively expressed its support for the CCF; in Alberta, which since the last war has been governed by the United Farmers or Social Credit parties, the Liberals are in a minority. Only in Manitoba do they remain powerful, but even there the CCF is gaining. The trend in the West appears on the whole to favour the new party. It is at least certain that in the West the Liberals are very much weaker than they were and that the Progressive-Conservatives have met with almost no success whatever.

But provincial elections are not an infallible clue to what the voters will do in a national election. And the trends in the third area, French-Canada, where the effervescence created by the competition of several old and new groups appears to be settling, may perhaps give pause to those who are already confidently burying Mr King's Government. Provincial elections in Quebec are to be held shortly, and Mr Godbout, the Liberal Premier, may hold his own, though with reduced strength. His rivals represent the more extreme aspects of French-Canadian nationalism, and nationalism has never been without its hold over French-Canadian minds. But the opposition groups are divided, and Mr Godbout's own effective administration may carry the day. If he fails to do so, then the third base of Liberal power will, like the other two, be seriously endangered and Mr Mackenzie King's defeat at the federal general election, which must come within a year, would not be unlikely. On the other hand, if the Liberals are strongly supported in French-Canada and the Atlantic Provinces, this support, joined with scattered strength elsewhere, may enable Mr King to command a reduced majority or at least be the largest party in the next House of Commons. The Canadian people faced, as they might well be, with the prospect of a House of Commons divided more or less equally between three or even four parties (the Liberals, the CCF, the Progressive-Conservatives, and such French-Canadian groups as emerge), may decide to vote for Mr. King once again.

This, however, is carrying the possibilities beyond immediate evidence. It is more solid ground to accept the trends only so far as they have gone. The agrarian west fears the post-war problems of marketing and its present discontents with the Government are based on the feeling that the urban areas have acquired a disproportionate share in the greatly increased national income. The industrial workers of the cities have their comparable discontents. Both the farmers and labour have, in large measure, turned to the CCF, as a vehicle for

their hopes and fears, and the CCF has benefited, apparently, even to a greater extent than the Conservatives, from the inevitable criticism that gathers about a Government long in power, and bearing, with whatever skill and efficiency, the burden of the conduct of a war. To somewhat the same extent, the forces of Canadian nationalism also loom to the CCF, which, perhaps as the result of its compromising attitude at the outbreak of the war, has inherited such isolationist or "continentalist" views as remain among the Canadian electorate.

The CCF is thus in some respects an expression of those same three forces which, operating then as now in the conditions of war or its aftermath, brought down the Conservative Government of Sir Robert Borden in 1921 and placed Mr Mackenzie King in office for two almost uninterrupted decades. The manifest difference between the position of the Liberals in 1921 and that of the CCF to-day, however, is their relative strength in French-Canada. In Quebec, the CCF has a few ridings more or less organised, but it has made no serious impact whatever, even in French-Canadian industrial areas, and in spite of the recent withdrawal of the opposition of the Catholic hierarchy. In 1921, the Liberals gained power largely through the almost solid sweep they made of the province. There is little likelihood that the CCF will make much headway in Quebec, and it is not, perhaps, too much to suggest that the fate of Mr King's Government, in view of the strength of the CCF in the West and of the Conservatives and the CCF in Ontario, will be determined by the extent to which it retains the long-standing loyalty of the French-Canadian and Catholic voters of Quebec. This fact of domestic politics goes a long way to explain some of the external attitudes of the Canadian Government in recent months.

If Mr King, by retaining his hold on Quebec, should scrape home in the general election, then the CCF might turn out to be less comparable with the Liberals of 1921 than with another phenomenon of that period, the Progressive Party. Led by Mr T. A. Crerar, who is now a member of Mr King's Government, the Progressives won some 60 seats in Western Canada and Ontario in 1921. The CCF, like the Progressives, began in the prairie provinces, and the Progressives, like the CCF, had Labour support, particularly in the provincial field, where the combination of rural and urban discontent returned United Farmer governments to power in Manitoba, Alberta, and Ontario. Indeed, it is to these post-war days of twenty years ago that the origins, if not the organisation, of the CCF itself dates back. Associated with the Progressives, both nationally and provincially, there were Independent Labour Parties. When the main body of the Progressives merged at Ottawa with the Liberals, there remained a group of some 16 members, led by the late J. S. Woodsworth, representing the United Farmers of Alberta and the Independent Labour Party of Manitoba. This "ginger group," as it was known, survived the next two elections and in 1932, on the initiative of Mr Woodsworth, a conference of political farm and labour movements was called in Calgary to discuss the position of the unemployed and the distressed farmer. A further convention was held in Regina in 1933, and there the CCF adopted a constitution and a programme known as the Regina Manifesto. From the "ginger group" that first came into the House with the Progressives in 1921, the origins of the CCF may thus be traced; from the Regina convention, there flowed a new and expanding organisation and an assertion, for the first time on a national scale, of a socialist ideology.

Socialism is not an entirely new phenomenon in Canadian politics. The isolated labour parties of Winnipeg, Vancouver, and Toronto have long professed it, but it has not before been the creed of a party organised on a national scale. Nor has it hitherto been received with approval by any substantial proportion of the electorate. The CCF brand of socialism is that of the British Labour party and of the Fabian Society, imported partly by former members of the British Labour party or by Rhodes scholars (two of whom are Chairman and Secre-

tary of the CCF while a third is the leader of the CCF opposition in Ontario). But British Labour socialism has not been imported unaltered, and one of the modifications, the recognition of the individual farmer's ownership of his land, is an important evidence of the individualist outlook of Canadian agriculture and of the CCF's dependence upon the English-speaking farmer's support. With respect to industry and finance, the CCF programme is wholly socialist and it is stated with determination. The CCF is a party of "planners" and its outlook may be roughly compared with that of New Zealand in agriculture and foreign trade and with that of the British Labour party in industry and finance. Mr M. J. Coldwell, who succeeded Mr Woodsworth as leader three years ago, has demonstrated a high capacity as a parliamentarian and as an able, sincere, aggressive critic of the present order. Among his followers are others of comparable if not equal ability, and they have shown some skill in political manoeuvring and electioneering as well as in the exposition of the CCF creed. In twelve years, the new party has moved from

the position of a divided and sometimes clamorous protest movement to a responsible organisation with an established programme and a strong position in the country. The CCF, in some circumstances, might perhaps be the largest party in the next House of Commons and thus give emphasis to the comparison between the present and the conditions of some twenty years ago. This is, however, no subject for safe prediction, and Mr King, whose tactical skill and readiness to respond to changes in Canadian opinion are unmatched, may outmanoeuvre the CCF as successfully as he has the Conservatives.

But it is quite clear that the rise of the CCF has changed the balance of forces in Canadian politics—and in a direction completely contrary to the trends of opinion in the United States, which might be expected to overflow the border. While American parties are moving to the right, all the Canadian parties are moving to the left. Indeed, the present rhythm of Canadian politics seems to be much less in step with that of the United States than with the trends of political thought in the United Kingdom and throughout the Commonwealth.

## NOTES OF THE WEEK

### The Battle of Normandy

The week's fighting in Normandy has seen the swift American surge across the neck of the Contentin Peninsula and northwards towards Cherbourg. The situation in the centre of the front around St. Lo, and on the eastern flank, around Caen, has not greatly changed. The surprising feature of the fighting has been the extremely heavy concentration of the enemy's armour in the Caen area. Four or five Panzer divisions out of the total of between seven and eight which Rundstedt is believed to have at his disposal in France have been identified here. That the enemy should have thrown so high a proportion of his armour against General Montgomery's eastern flank suggests that he either

contemplated the carrying out of an offensive move against the Allied bridgehead in this sector, or that he anticipated an attempt by General Montgomery to thrust out eastwards towards the Seine estuary. As it happened, however, while the British and the Canadians contained the enemy's superior armoured forces on the river Orne, the task of the Americans in the Contentin was thereby decisively aided. The German defence of the Peninsula was clearly handicapped by shortages of men and equipment. The only hope here lies in the fortifications of Cherbourg, which, as German military spokesmen boast, have been strengthened and supplemented by landward defences. But the likelihood that the Germans may turn Cherbourg into another Sebastopol is very slight indeed. Cherbourg is completely cut off from German reinforcements and supplies; and the morale of its garrison, which consists of two second-rate divisions, does not seem to warrant the expectation of unusually heroic deeds. The puzzle that emerges from all re-

ports from Normandy is still the question of what reserves in men and equipment the German Command possesses. If it is true, that Rundstedt has already thrown in more than half of his armour against the Allies, with so poor results, then the outlook for the defence must be bleak indeed. But it may be that the Panzer divisions engaged in the Caen area form a much smaller proportion of the reserves than reports suggest. Even so, the fighting in Normandy has revealed the striking inadequacy of Rundstedt's artillery, the weapon that was regarded as largely eclipsed by the tank in the first two years of the war, and that has since regained its prominent rôle. The Allied air force has remained undisputed master over the battlefields and over communication lines in the rear, in spite of unfavourable weather. Wednesday's 1,000 bomber raid on Berlin gave the Germans tangible proof of the sufficiency of the Allied reserve in aircraft that makes possible simultaneous strategic and tactical bombing. It is still conceivable that behind the armoured screen on the river Orne the Germans may be massing forces for a major battle in Normandy. But, with every week and day that passes, General Eisenhower is pouring more and more men and supplies into the Norman bridgehead; and it is obvious even to the layman that the forces allocated to this sector of the French coast can form only a fraction of the invasion armies at his disposal.

### The Abatement of Nuisances

Probably the most intractable problem raised by the German "flying bomb" is that of finding a fitting name for it. The official description of "pilotless aircraft" is not satisfactory; nor, for different reasons, are either the characteristic and attractive title of "doodle bug" given by American flyers, or, though it fits in with ordinary conversational usage, the BBC's characterisation of them as "things." Probably "flying bomb" is the term that history will accept, rather than "robot," which is much used in the press. There are two outstanding facts about these missiles, apart from their nuisance value. The first is the remarkably light weight of the attack compared with the air bombing to which the people of this country once became hardened. Compared with the blitz, this is fuss and bother—no more. Compared with, say, the shelling of Leningrad, it is puny. Compared with the Allied bombing of Germany, it does not register at all. The second fact is that Allied defence measures cut down the threat, such as it was, from the outset. It is not necessary to accept in full detail the Air Ministry's estimates of what might have been our fate, if Bomber Command had not hit the projectors of these things before they were used, to see what an effective defence has already been provided by the combination of bombing, gunfire and fighter interception. In fact, when the earlier experiences of the people of this country are remembered it is with more than a blush that we accept the very warm tributes of the American press to our national fortitude, in this new situation.

### Offensive Defence

It seems that the "military idiocy" so vigorously attributed by the Fuehrer to the successful war-making of the Allies has gained the upper hand in one sector at least of the German war effort. It may be true that one practical reason for the use of the flying bomb has been the inability of the Germans to find men and materials for more conventional and more effective weapons of attack from the air. Even so, something of the effort, ingenuity and resources which have been put into these things might have been of no inconsiderable use to the *Luftwaffe*. The diversion of some part of the immense Allied air strength to deal with these missiles has caused them to be described by some anxious persons as "Hitler's ARP." But the diversion is, proportionately, nothing like so big as this would suggest. No near or distant aid to the Allied troops is in the least lessened; and the programme of "strategic" bombing is only slightly affected. No civilians will ask for a weakening of the Allied attack. The commonest explanation for these disturbing antics is that they have cushioned the shock caused to the German people by the success of the invasion of Normandy. Certainly the fantastic stories told by Goebbels and his minions about the catastrophic effect of the flying bombs upon life and property in this country suggest an almost exclusively propaganda motive—especially since it has been accompanied by the hint that this may be only the first of a series of so-called secret weapons. This fantastic episode, executed with all the serious solemnity so characteristic of its authors, would appear to be an instalment of the much-trumpeted "offensive defence" about which such a lot has been written and spoken in Germany. Maybe there are other tricks in store, other shifts and devices to hide, without any success, the writing on the wall. Maybe in another war the flying bomb, perfected, might be a real military factor. No doubt, in the course of this odd process of proving some sort of neo-Clausewitzian doctrine, a very few people and families here will suffer tragically. But, in terms of military strategy—and whatever other peculiarly German ingenuities may yet be in store—this is, historically, just nuisance and farce, of no moment at all compared with the bombing which the Allies can and will inflict upon both the German troops and the German people. The latter may be the last to realise the futility of it all, but it will not take them very long to do so.

### Advance on Tokyo

During the last months American forces in the Pacific have steadily encroached on the inner groups of islands defending the home waters of Japan. The Japanese garrisons have fought ferociously; but a curious feature of the defence has been the relative absence of opposition

in the air and on the sea. Indeed, on the sea, there has been no major naval engagement since the Battle of Midway two years ago. The only obvious reason for this inactivity is the reluctance of the Japanese High Command to risk their shrinking resources in anything but a really decisive action. Now, however, the successful American landing on Saipan seems to have convinced the Japanese that the dangers of delay are even greater than the dangers of engaging battle. They have already staged over Saipan the largest Japanese air attack in the Pacific area, and been decisively beaten off with heavy losses. The turn of the Japanese Navy has followed. The American Navy has been in contact with a Japanese fleet between the Philippines and Saipan. Admiral Nimitz has tempted the big ships into action. The reason is obvious. Saipan, only 1,300 miles from Tokyo and an important naval base, is the last but one of the stepping stones to the Japanese mainland. It matters very little whether the Japanese forces still hold the Dutch East Indies, Malaya or the Philippines if American ships, based on Yap, Palau, Guam, Saipan and Bonin, can cut across their sea lanes and snip off the tentacles of the octopus near the body itself. Nor will the holding of Sourabaya or Singapore protect the mainland if American aircraft can strike at it from nearby Pacific bases. From air bases in China a new and improved design of Fortress was used last week to bomb Japan. Bases on the Pacific side would make possible a bombing shuttle service. The Pacific islands must be cleared if war is to be kept from the Japanese homeland. So at last the Japanese reserves—aircraft and the Grand Fleet—are being moved into the open.

### Solitur Ambulando

An extremely paradoxical situation has arisen over the question of civil administration in France. Normally, when a policy of such vital importance has to be decided, the procedure is to pass from a general agreement on principle to a theoretical working out of detail, and thence to the concrete application of the agreed plan. In France to-day, however, this procedure is being exactly reversed. When General de Gaulle returned from France last week he left behind him M. Francois Coulet as French Commissioner for Normandy and Colonel de Chevigné as commander of the liberated areas in the Third Military Region. It does not seem that this move had been either forecast or agreed upon. But M. Coulet has already been at work, in *de facto* co-operation with the Allied military commanders, for some days; his office is established in Bayeux; known collaborators are in gaol; and the Vichyite *sous-préfet* has been dismissed. In London negotiations on the technical details of administration have started between a French team of experts under M. Viénot and a British team led by Sir Henry MacGeagh. Yet at the very highest level, in Washington and in London, there is apparently still no agreement, even in principle. Such a situation is obviously a potential trouble breeder. General de Gaulle has, however, returned to North Africa satisfied with his visit, and it is generally felt, in London and in Algiers, that an understanding is on the way. The first reason is the excellence of the General's first choice of representatives. M. Coulet is apparently a man of judgment and commonsense. His work of organising liberation in Corsica gives him a solid factual experience on which to draw. His relations with General Eisenhower are said to be good, and it is likely that the military leaders at Washington will themselves press for a more general agreement. The atmosphere surrounding the London talks is also optimistic. The British and American agreements with the other Allied Governments are serving as a model for the proposed treaty, and it will no doubt be possible to include in it sufficient safeguards of the provisional nature of the French administration to reassure President Roosevelt. If, when General de Gaulle visits Washington, he has behind him both the warm recommendation of the Allied military leaders in France and the text initialled in London of an Allied agreement, it is hard to believe that the President will hesitate any longer. It is only unfortunate that he has had to hesitate so long.

### A Finnish Armistice?

The men in Finland who opposed the conclusion of a separate Russo-Finnish peace in March did so

The letters which passed between Lord Wavell and Mr Gandhi early this year, when the latter was still in detention, have now been published. They add little to what was already known; but they throw a significant light both upon the policy of the new Viceroy and upon the political background of the present move towards economic planning, among officials and politicians alike. Broadly, Lord Wavell makes two points in his letter to Mr Gandhi. The first is that the policy of the Congress Party, represented by the resolution calling upon the British to quit India, and by the violent disturbances which followed the arrest of Mr Gandhi and his colleagues, has been a direct threat, not only to the wartime safety of India, but also to "India's progress to self-government and development." The second point is an appeal for co-operation in the solution of India's economic problems by "hard steady work." In his reply, Mr Gandhi denies the charges of political sabotage and refuses the plea for economic co-operation—an attitude which he apparently still maintains since his recent release. "Congressmen (he

Because of shortage of manpower, many local authorities are unable to carry out the provisions of the Bill passed last year to secure electoral registration on the basis of two months' continuous residence. Mr Morrison has therefore decided to introduce a Temporary Bill which will simplify the procedure of registration. Under this Bill, instead of the continuous residence qualification of two months, a civilian will be registered if he is living in the constituency on the date on which the election is started, and the qualifying date will be put back one month. This will ensure that any newcomer to a constituency will have lived there for not less than a month before the issue of a writ, or not fewer than eleven weeks before polling day. The Bill is a makeshift measure. It will only apply to by-elections, and will be withdrawn as soon as the necessary clerical staffs are available to cope with the more complicated machinery of registration under the 1943 Act. The new register, on this basis, should be completed within the next two or three months. By-election results will be more representative than hitherto, and it will be interesting to see the effect of the enfranchisement of the younger age groups who at present, being unregistered, have no votes. Criticism has been expressed by many MPs that Service people will not be covered by the new arrangement. This, Mr. Morrison declares, is largely the responsibility of the Service departments, which have now agreed to

The new Yugoslav Prime Minister, Dr Subachitch, has met Marshal Tito on liberated Yugoslav soil. The first serious attempt has thus been made to bridge the gap between the King and the Partisans. These attempts could and should have been made much earlier, before internal strife produced so much bitterness and violence between the contending factions in Yugoslavia. The present difficulty in the Balkan countries seems to be not so much to get the political leaders to agree as to persuade the guerillas on the spot to accept the agreements signed by their leaders. To conclude a political truce on paper is one thing; it is quite a different matter to make the rank and file of the various factions "cease fire." Resentments have been allowed to grow on all sides. This difficulty has again been illustrated by the hitch that has occurred in the realisation of the Lebanon truce recently concluded by the Greek leaders. M. Papandreou has set up his new Greek Government. But the leaders of the EAM resistance movement are still trying to persuade their followers in Greece to accept the truce. M. Papandreou has declared that if the EAM leaders do not join his Government within the next few days he will denounce them before the whole Greek nation. Whether these threats will help to make the much-desired Greek unity any more of a reality is doubtful, to say the least. The leaders of the EAM, on the other hand, have evidently shown a poor grasp of the situation if they hoped that the truce, as it was formulated in the Lebanon, would be readily accepted in Greece. An amnesty for the sailors of the Greek Navy in the Middle East would probably be an earnest of good will on the part of the Royal Government, and would perhaps facilitate the task of the EAM leaders in Greece.

There can be no quarrel with the decision of the London County Council to spend £1,000,000, spread over a period of five years, upon improving the amenities of its parks and gardens. But it is generally felt that what is wanted in the first place is not so much the betterment of present open spaces as more of them. There are, at present, 8,600 acres of public open space in the County, or less than 2½ acres per thousand of the population. If the minimum basis is taken of 4 acres per thousand proposed by the County of London plan—a basis only made on the assumption that an extra 3 acres per thousand are to be provided outside the County area—and if allowance is made as well for the proposed decentralisation of population, a formidable gap will have to be filled. In any case, absolute figures for the whole County give a false picture of the real problem, which lies in the maldistribution of existing open spaces between districts and between functions. The East End and the South bank boroughs not only contain hardly any public open space at all; they possess virtually none of the limited amount of privately

The full story of the mobilisation of the nation's manpower and of the industrial preparations for the offensive will perhaps *not* be known until after the war. In the meantime the public must be content with the broad outlines of the picture and with the knowledge that the very impressive military achievements have been made possible by the no less impressive achievements of the productive machine. It seems a pity that the authorities should be so reticent in giving details. The Americans are more frank in publishing their production and manpower statistics—as they have been also in giving the invasion casualty figures. At this stage of the war, comparative figures for British industry would hardly be of assistance or solace to the enemy. Mobilisation is now over four years old, and the smoothness with which the present results have been achieved has been largely due to the co-operation of the people, their compliance with directions and especially to the part played by women in industry. In all, more than 30 million people have been registered, and over 7 million

**SINGER MOTORS LTD** COVENTRY AND BIRMINGHAM

interviewed. According to a Ministry of Labour statement, the peak of mobilisation was reached in November, 1943, and for the past six months, industry has been geared up for "the maximum impact on the enemy." The task has been to transfer the available labour from work of lesser to higher priority, and to produce specialised invasion equipment, such as landing craft and waterproofed tanks and vehicles. Often the jobs were so secret that the workers did not know the purpose of their transference, and in the process, many complaints of redundancy and idle time have been heard. The most fascinating part of the story has yet to be told—the method and pattern of mobilisation, the compilation of the manpower budget, the allocation of labour to the various jobs, with the periodic revision of the budget to meet changing strategic requirements. The lessons learned in the war can be invaluable both in the transition to peace and in the post-war period. A manpower budget, complementary to the capital budget, is recognised in the Employment White Paper as an essential part of post-war policy. Labour exchanges, too, have become better equipped; their officials, though often short-handed and not infrequently ill-suited for this work, have at least acquired added experience of dealing with human problems; and they have had constructive instead of negative work to do in placing people in jobs rather than merely paying out unemployment benefit.

### The Man and the Job

Whatever decisions, by the influence of policy on general economic conditions, may be taken to secure and maintain full employment, there will always remain the problem of fitting individual men and women into individual jobs. The better the machinery for securing that men and jobs fit one another the higher the dividend, not only in physical output, but in political stability and human happiness. But the task of securing this result, difficult enough in normal times, will be much more so in the context of remobilisation when the German war is ended. This is the problem to which Sir Ronald Davison addresses

himself, in the latest number of the "Target for Tomorrow" series ("Remobilisation for Peace." Pilot Press. 4s. 6d.), and for which he propounds the outlines of a solution. The basis assumed is that war will end in Europe early next year; that hostilities will continue for two years or so in the Far East; and that this will mean substantial demobilisation from the Army and from war factories, the release of civil defenders, but only a very moderate reduction in the strength of the Navy and Air Force. On this basis, Sir Ronald sees a possibility of a reasonable balance between the numbers available and the jobs which will have to be filled within a matter of months; but he foresees also that many of the jobs will not be those desired by the workers, and that many will also not be permanent. His solution, in the very broadest terms, is, on the one hand, the continuance, possibly even the extension, of existing powers of direction—with corresponding obligations upon employers—and, on the other, a complete modernisation of the machinery and facilities of the Labour Exchanges. The Labour Exchange, when it can only offer a man a job for which he is not suited, should retain his name and qualifications, and on its initiative advise him of any vacancy which he is well suited to fill. The aim should be to provide for all trained employees the sort of service which professional vacancy organisations have attempted to secure to their members.

### Time for Action

Mere machinery, however essential, will not be enough to ensure success in the solution of either short or long term problems of finding suitable employment during the demobilisation period for all those with definite qualifications. The individual will need advice about what jobs may be "suitable." Sir Ronald Davison appears to favour the continuance of the system of grading which has been adopted by the armed Forces during the war. The employer will have to find some means of enforcing discipline other than the right to sack on the spot, and the main concern of the trade unions will not have to be merely to exact fair terms, but rather to advance the economic progress of their industries. Five years ago it might have been considered that these suggestions amounted to a "change of heart" too large to be expected. But the sharing of responsibility during the war may have brought some change. Certainly everyone must share the hope expressed by Sir Ronald that "our trade unions will play a direct and active part in modifying any rules and practices which impede progress." Without this sort of attitude on the part of both employers and workpeople, individually and collectively, it is difficult to see how either full employment or the fitting of the man to the job can in practice be secured. Sir Ronald's suggestions appear to represent the sort of compromise which the British might be expected to accept. They are, essentially, a continuance of trends already present. But, if the machinery is to be ready when the cease fire sounds in Europe, a good deal must be done in a very short time.

### Menemenjoglu Resigns

The Turkish decision to ban the passage of all German warships through the Straits and the resignation of the Foreign Minister, Mr Menemenjoglu, are two more twists to the rather involved and tortuous course of Turkish foreign policy. In so far as it is permissible to speak of different trends of policy in a system as unified as that of Turkey, it has been apparent for some time that two lines hold the field, competing with each other and supported by different groups. On the one hand, a policy of strict neutrality is naturally favoured by the German Embassy and is advocated by Turks sympathetic with the German point of view and by strong believers in complete Turkish "independence." Menemenjoglu probably belongs to the last of these three groups. On the other hand, most of Turkey's leading statesmen and Turkish public opinion in general support the alternative policy of "all aid to the Allies short of war." The Turkish Government has pursued neither policy consistently, for although its leading personalities would have preferred the second policy of friendship and co-operation, the emphasis was always on the limiting factor "short of war," and whenever the risk of direct participation grew to any proportions, then

Turkish policy veered back to strict neutrality. Since the turn of this year the risk of actual fighting has steadily receded. Turkish policy has therefore returned to insistence on the alliance with Britain and on the obligations of friendship. The complete ban on chrome exports to Germany was one aspect of this policy. The ban placed on the passage of German ships is another. Unfortunately for the Turks, the very neutral character of their past policy has left its mark on the attitude of the Allies; and Turks are beginning to realise that their country, which started the war on the best of terms with both Russia and Britain, is ending it rather out of favour with both victors. This is the background of Mr Menemenjoglu's resignation. It is partly his personal dissent from any departure from neutrality; but he is also being made a scapegoat for the unfortunate consequences that neutrality has brought about.

### Delegated Legislation

After the Home Secretary's speech in the debate a month ago on the dangers of delegated legislation, accepting the proposal of a Select Committee of scrutiny, the Government has now tabled a motion proposing the members and the scope of the Select Committee. The Committee will have the task of watching over the Orders, Rules and Regulations made by Government departments under the powers delegated to them by Parliament. The House of Lords already has a committee of this kind, but its work is confined to Orders concerned with the public utilities, gas, electricity, water and so on. As a method of making the Civil Service more wary of seeking powers, the proposed committee may indirectly have many good results. Its terms of reference are wide. It will be given the responsibility of drawing attention to any regulation which involves payment to or by the Exchequer or a local authority, which is exempted from the challenge of the courts, or which is believed to go against the intention of Parliament, as well as to any regulation whose publication has been delayed or whose meaning is not altogether clear. It will not have power to question Ministers, whose responsibility must always be to the whole House; but it will be able to call for a spokesman or a memorandum from the department concerned. The MPs whom the Government propose should sit on the Select Committee have almost all taken an active interest in the question, although those who had shown themselves most emotive on the subject have been wisely excluded. Most of the agitation had come from Conservative benches, and half the committee will come from that Party. Among the rest, such members as Mr Moelwyn Hughes, it is to be hoped, will provide a useful balance against any tendency to delay the implementation of urgent post-war legislation. It was he who in last month's debate opposed the suggestion on the grounds (used by Mr Morrison a year before) that its results would be obstructionist rather than progressive.

### Orders for Reconstruction

Recognition that reconstruction will require some adaptation of Parliamentary procedure was given by Mr Churchill on Tuesday. He told the House that the Government intended to ask for powers to make Orders for certain purposes (particularly in connection with a national water policy) which in normal circumstances would be dealt with by Private or Provisional Order Bill. In view of the urgency of many post-war measures, the protracted stages necessary for the latter would be undesirable. The procedure with regard to Private Bills could be hardly less suitable, since although petitions may be brought against the Bill by all those with a *locus standi*, yet this opposition is not directly brought to light on the floor of the House, where, moreover, the passage of the Bill can be delayed for six months on a resolution moved by a Member. The new Orders are unlikely even to be entirely suitable to the procedure of a "hybrid" Bill (i.e. a public Bill which affects the rights of a particular person or group of persons, as opposed to a Private Bill proper which secures powers additional to or in derogation of the general law, usually for the benefit of any person or persons). The Government is to propose a compromise solution, by which national policy can be protected against private interests and *vice versa*. This is to be achieved by establishing the rule that national policy can only be challenged on the floor of the House, and that amendments to the Order, which, in any case, will not be allowed against its main purpose, shall be made through the mechanism of a Select Committee of both Houses. The Government's intention to take the sense of Parliament in matters of this kind is much to be welcomed. It has seldom been more important that the methods of Parliamentary procedure should be fully adapted to the changing needs of the time.

### The New Republic

Iceland has celebrated the achievement of its independence in a ceremonial gathering in the ancient fields of parliament, the Thingvellir. Messages of goodwill were received from the Governments of the United States, the United Kingdom, the Scandinavian countries, the exiled Governments of Poland and the Netherlands and the Provisional Government of the French Republic. King Christian of Denmark, who had pleaded with the Icelanders in vain to delay the separation, has apparently become resigned to the determination of the country to achieve its full sovereignty. He has expressed his best wishes for the future of the people and for the strengthening of the ties uniting Iceland with the other northern countries. The constitution of the new Republic, so far as it differs from the old one, has now been promulgated and the Regent elected President for the coming year. This final act of separation, carried out in peace by the oldest democracy in Europe, is, in a sense, an act of faith in the future of European security.

## AMERICAN SURVEY

### Dewey Before Chicago

With the opening of the Republican Convention only a few days off, Governor Dewey has pledged or publicly claimed delegates amounting to 391; Governor Bricker, 65; Lieut.-Commander Stassen, 34; 484 delegates are uninstructed; and there is a scattering of delegates for "favourite sons." Governor Dewey's strength still falls short of the necessary majority by 138; and the general assumption that he will be nominated may possibly be upset. There are reports that since Mr Willkie's massacre in Wisconsin the party's high command has regretted the vigour with which it removed its main possibility of hedging against the New Yorker. In ridding itself of Mr Willkie, the party gave Governor Dewey something of a free ride, and there are fears that if he should win in November he may fail to exhibit suitable gratitude. With Mr Willkie still in the ring the possibility of a deadlock would have allowed greater freedom of choice and scope for bargain-

ing. Governor Bricker's supporters still assume a confident air; and it is likely that the anti-Dewey movement is stronger than Governor Bricker's 65 delegates suggest. It is said, indeed, that Governor Bricker may be a stalking horse for Senator Taft, who of all Republican figures is potentially the most powerful, should Governor Dewey fail to win on the first ballots and a period of horse-trading set in. This is the hope—admittedly rather remote—of such dark horses as Lieut.-Commander Stassen, Senator Burton, and Supreme Court Justice Roberts. No doubt powerful influences in the party would prefer a more amenable and more "regular" candidate than Governor Dewey. But far outweighing this is the folly of passing over such a vote-getter as he has proved himself. It is assumed that he can carry the critical state of New York for the Republicans, and any faint doubts in Republican breasts about the result in November will reinforce his claim to the nomination. Even more potent in crowding the bandwagon is a strong sense of the desirability of being recorded

WHEN will you  
get *Black Magic*  
again?

[WE GIVE YOU ONE GUESS]

All the nice things that used to be in *Black Magic*  
Chocolates — are they dead?

No.

They exist.

But they might as well be dead, for all the use  
they are.

The Mauritius sugar that gave the tang to the  
*Black Magic* caramel — it's in Mauritius.

The Valencia almonds that went into the *Black*  
*Magic* truffle-and-nougat and montelmar —  
they're in Valencia.

Brazil is no longer where the nuts come from.  
It's where the nuts stay.

Venezuela no longer sends us its peculiar fruity  
cocoa beans. It sends us petrol.

We didn't use petrol in *Black Magic*.

All the nice things are in all the nice places—  
except Britain.

They'll come again. When they do, so will  
*Black Magic*.

You can call that a threat or a promise, as you  
please.

ROWNTREES

as "for Dewey before Chicago." Governor Dewey may not reward his friends; his record for appointments in New York State has been kept on a high level. There is a legend, however, that he does not forget his enemies. Few politicians do.

### The President's Plan

On the eve of the Presidential campaign, Mr Roosevelt has made public his thoughts on the nature of an international organisation to preserve the peace and guarantee stability in world relations. Mr Roosevelt emphasised the non-partisan spirit in which the consultations on the plan had been carried on; and the nature of the plan, as well as its timing, reflect his hope that the issues it concerns may be lifted out of the party conflict and that an early agreement may be reached. The outstanding features of this compromise are Mr Roosevelt's flat rejection of a

super-state with its own police forces and other paraphernalia of coercive power.

and the proposal, very much on the model of the League, for the participation of the small nations, through their elected representatives, in the deliberations of the Council. The plan envisages an Assembly, of which all nations would be members, and a Council, elected annually by the Assembly, to include permanently the four major nations and a "suitable" number of other nations. Under this arrangement, the nations would individually provide the force, according to their capacities, for the joint action necessary to prevent war. The plan has been criticised in America for not being sufficiently concrete; for merely veiling the tyranny of the Big Four; and, on the other hand, for abandoning the plan for an international police force. In particular, there have been demands for more information about the machinery proposed to set the forces of law and order in action against an aggressor. So far neither Mr Roosevelt nor Mr Hull has felt free to expand the bare outline of the scheme. No doubt many of the American people are ready to accept more than they have been given. But it is essential to have the plan accepted on a truly national scale. Should its principles be endorsed in the Republican platform drawn up at Chicago this week, the way will be clear for further elaboration.

### Price Control

The Bill to extend the life of the Office of Price Administration has now been approved by both House and Senate. In the Senate there was attached the Bankhead amendment, designed to raise price ceilings for cotton textiles, and thus the price of cotton. The House has defeated this proposal, but has added two of its own, over the protests of the Administration. The first provides that OPA's orders may be challenged in Federal district courts, rather than merely in the Emergency Court of Appeals created for that purpose, and which business men feel is very much another arm of OPA. The Administration's opposition is based on the belief that the result would be a flood of conflicting decisions which would paralyse price control until the Supreme Court could make decisive rulings. The other House amendment would deprive OPA of the right to suspend a dealer's licence for violating the price ceilings. These more general restrictions are more dangerous to the efficiency of price control than attempts to promote special interests, like the Bankhead amendment. In fact, Senator Bankhead may not have been sorry to see his proposal drastically modified by the conference between the two Houses, now that he has shown his constituents a degree of activity in their behalf. It is even possible that in the conferences the Administration may succeed in eliminating the House amendments, although the right of appeal to ordinary Federal courts is one on which most business groups feel very strongly. It is being widely suggested that the President would have no hesitation in vetoing a Bill crippled by amendments, and as the deadline for extension is June 30th this may hasten a compromise. The most striking feature of the whole debate has been its tameness. Even subsidy payments are allowed to be continued for a year as a part of price control. The change from this time a year ago, when complete abandonment of price control was being openly advocated, is very marked. In part, no doubt, it is due to the fact that many modifications have been made in the operation of the OPA, and

that its present head, Mr Bowles, is far more acceptable both to business and to Congress than Mr Leon Henderson was. In part, the disinclination of Congress to fight for the other amendments desired by pressure groups is due to a desire to propitiate the labour and white collar votes. But in part it is also due to the incontestable fact that OPA, with all its defects, has succeeded so far in keeping the price rise in this war substantially below that of the last war.

### Reconversion Programmes

The Senate Committee on Post-War Economic Policy has made public a list of 16 recommendations which it urges Congress to put into legislative form without delay to meet the impact of unemployment and necessary readjustment during the reconversion period. Mr Byrnes, head of the Office of War Mobilisation, has also submitted a programme. Most of Mr Byrnes' recommendations are covered in the Senate report, which is exactly twice as long. Both the Senate Committee and the Administration are in agreement on the urgency of legislation to meet the following problems, although it is too soon to say that there will be agreement on details: contract termination, the creation of an Office of War Demobilisation; liberalisation of the unemployment compensation laws; disposition of surplus war property; the drawing up of a post-war Tax Bill so that war taxation may end with hostilities; and the provision of transport for war workers from areas of labour excess. Two points advanced by Mr Byrnes alone concern the need to extend the authority and loaning powers of the Small War Plants Corporation, to make greater aid available to small business, and the provision of unemployment compensation for federal industrial workers who do not benefit from the state unemployment laws. The Committee, on the other hand, emphasises the need for advance planning to ensure supplies of materials for industrial and public works construction, and the stimulation of housing. The other points the Committee raises, however, are either very general, like the expansion of foreign trade, or are concerned less with the practical problems for reconversion than with the elimination or modification of Government controls, either those of the war period or those dating from the early days of the New Deal, such as the Securities and Exchange Act. It cannot be said that the Committee underestimates the employment problem. It anticipates a civilian labour force 11 or 12 million larger than that of earlier peak periods; and estimates that in the year which it assumes will elapse between the end of hostilities in Europe and the defeat of Japan, approximately 2.5 million men will be released from the Forces and 4 to 5 million from war industry. The danger seems to be that its sketch of needed legislation is so comprehensive that unless a system of priorities is established some of the more urgent issues may be delayed.

### Pearl Harbour Politics

The admonition to remember Pearl Harbour is not being forgotten. It was decided after the disaster that the court-martial of Admiral Kimmel and General Short should be postponed indefinitely in the interests of military security, and both men signed a waiver of the Statute of Limitations. The relevant statutes were extended by Congress last December. By resolution last week the Senate and the House extended them again, to December 7th, directing that in the meantime the Army and Navy should investigate the facts and commence proceedings. Contrary to the advice both of the Army and Navy, President Roosevelt has approved the resolution, expressing the belief that Congress did not intend the investigation to be conducted in a way which would involve the withdrawal of serving officers or would imperil military security. Mr Roosevelt's decision has caused some surprise. It has been widely argued that to hold the trials now not only might mean recalling essential witnesses from their posts, but that it would also introduce politics into the trial, and the trial into politics, in a way which would be disadvantageous to both. Already the McCormick-Patterson newspapers have charged that the Administration was postponing the trial to conceal its own responsibility and have demanded immediate action, from patently political motives. President Roosevelt may have been stung to scotch this allegation. Admiral Kimmel has hinted, in a letter to a Republican Congressman, that the full story of Pearl Harbour has yet

to be told. Presumably, Mr Roosevelt, who ought to know, feels that the investigation would clear the air. A full-dress trial at least would put an end to piecemeal and perhaps partisan inquiries, such as that of the House Military Affairs Committee, whose report, made public last week, charged that construction of the Hawaiian defences was entrusted to a German-born contractor, suggested that delay was intentional, and censured the military command. If the trial takes place this summer, it is a safe guess that the press of the "Pacific First" school will make it an opportunity for trying the Administration in its columns. Mr Roosevelt has refused to be intimidated by this prospect, but it is not so certain that his hand has not been forced.

### Shorter Notes

The War Ballot Commission has announced that certifications have been received from 35 state governments, legalising the use of Federal war ballots under the terms of the Servicemen's Voting Law. Further certifications may be made up to July 15th. It appears that the state governments are proving more co-operative than was anticipated by President Roosevelt in his message criticising the Bill.

## THE WORLD OVERSEAS

### Normandy and France

A JOURNEY by train from Cherbourg or Caen to Paris used to take no more than three or four hours. Yet the two departments of Normandy—Manche and Calvados—where the invasion forces are now fighting are borderlands of France in more than the geographical sense. This is not only because centuries ago they were the scenes of so many wars and invasions or because the population of Normandy has retained its distinct ethnical character. In their social outlook and in their ways of life the departments of Normandy differ from the rest of France and even from neighbouring Brittany.

Normandy is one of the most completely agricultural regions of France. The peculiar feature of Manche and Calvados is that, apart from Cherbourg and Caen, the towns there, like Bayeux, Carentan or Valognes, are tiny in size. They have many old historical monuments, but no industry. They are chiefly market places for the farmers of the countryside around. The only two towns with a more urban and industrial background are Cherbourg, with its commercial harbour and naval fortress, and Caen, which is not only a cultural centre—the "Athens of Normandy"—but has developed iron ore mining since the last war.

Small villages consisting of a few cottages are scattered over the countryside. Groves and woods separate village from village, and often cottage from cottage. This is the typical Norman scene, a country of narrow horizons, overcast with mist and haze. Each peasant family lives its own life, only very loosely linked with the outside world, a type of existence which has moulded the character of the Norman peasant. He is "dour," uncommunicative, conservative and not much interested in what happens beyond the narrow confines of his own holding. His attitude towards life has little in common with the sort of conservatism that made Vendée a symbol in French history. In his conservatism he is indifferent rather than militant; and his political temperament harmonises well with the sleepy mood of his surroundings.

### Well-to-Do Farmers

Norman agriculture has been very prosperous. It specialises in cattle breeding and dairy produce. Lorries of the Société Gervais used to carry loads of butter and cheese to Paris from the Manche and Calvados, and especially from Isigny, famous for its trade in butter. The farmers of the coastal region had a steady and secure market, though they were extremely dependent on the Société Gervais, which monopolised distribution. Another important source of income for the local peasant is fruit

The first major war contract to be terminated, International Harvester's agreement for \$217 million worth of tanks, provides an interesting footnote to the reconversion debate. The year's delay in settling the claim is due, not to failure on the part of the Government, but to the failure by sub-contractors to keep adequate accounts. Inability to file claims, owing to lack of company records, has been the prime cause of delay in terminating contracts.

The decision of the Supreme Court on the constitutional status of insurance has aroused considerable criticism. It is being recalled that Chief Justice Marshall, 110 years ago, laid it down that constitutional questions should be decided by a majority of the full court. Justices Roberts and Reed did not sit in the case, so that the case was decided by only four justices out of nine. Justice Frankfurter's warning last February, to the effect that the tendency to upset precedents is shaking confidence in the Court, is also being revived. In the more practical sphere, a number of states are planning joint action to speed through Congress Bills reserving to the states control over the insurance business and the revenues it brings them.

growing. The region of Bayeux in particular is known for its apple orchards and Bayeux itself for its cider.

Four years of German occupation have apparently not changed much the ways and habits of the local peasants. However strongly the people there may have disliked the German invaders, they were by temperament not inclined towards active resistance. Members of the Resistance did emerge suddenly from the underground immediately after the entry of Allied soldiers. But they were few, and they did not lead any broader popular movement. Similarly, the Revolution Nationale of Pétain scarcely made any deeper traces on this countryside. Vichy is remote, and the local officials of the administration and the police have carried on their routine work more or less undisturbed by the great storms that have been raging outside.

The well-being of local farmers has not been much affected, to say the least, by the economic distress of the rest of France. German requisitioning has been a nuisance. But the Norman peasants know a hundred ways of evading requisitioning—or tax collection. True, they could not buy industrial goods in exchange for their dairy produce. So they either hoarded banknotes without reckoning on the depreciation of the currency or—more frequently—they cut down their sales and kept more than a normal proportion of their produce for home consumption. Small quantities of butter and cheese sold on the black market brought in large money returns, while stocks of food at home remained plentiful. This explains the stories of the war correspondents—puzzling at first sight—about the abundance of provisions in the liberated villages and townlets. It would be a gross error to draw from this any conclusions about the reserves of foodstuffs in the rest of France.

Experience in Normandy has provided a first direct

glimpse into one of the great problems—social and political—that have arisen in recent years and will remain in the immediate post-war period. Not only in Normandy, and not only in France, but in nearly the whole of Europe there is now a striking contrast between the conditions of life in the towns and in the countryside. Almost a year ago *The Economist* wrote:

Among the . . . economic developments which have taken place in France under the Vichy regime, the following major changes are bound to affect the economic and social outlook for some time to come: the shift in the distribution of the national income in favour of the peasantry. . . . The shift . . . has been due to the shortage of foodstuffs and to the ever-growing rôle of the black-markets. . . . According to a German estimate the total money income of the French peasantry has grown by about 1,000 per cent. since the outbreak of the war. The price of land has increased six times compared with pre-war prices. The industrial wages bill has diminished during the same time by one third.

Out of a decreasing national income, an ever higher proportion has been going to the countryside. The enrichment of the peasantry has, of course, been merely nominal to a very large extent. Grain crops in recent years have been some 30 per cent. less than the pre-war average; and there have been considerable losses in agricultural machinery and in cattle. Even so, the peasantry has undoubtedly been much better off than any other section of the French population—a fact that is likely to accentuate the traditional French antagonism between town and countryside.

Recent reports from Normandy seem fully to confirm this picture. A great and determined effort on the part of a new French administration will be needed in order to redress the present position and to restore the nutritional balance between town and countryside. Only an administration which enjoys the confidence of the large sections of the French people and can count on their willing co-operation will be able to cope with this task.

## Supplies to Russia

LAST week *The Economist* published a short summary of the statement on Lend Lease deliveries to Russia issued by the Commissariat of Foreign Trade in Moscow

on June 11th. From this statement the Russian people have learned the full extent of the aid given to them by their Western Allies from since the beginning of the Russo-German war up to April 30, 1944. An equally full and detailed list of deliveries to Russia has not yet been published either in this country or in the United States. In the tables below the figures given by the Commissariat of Foreign Trade have been re-arranged and grouped under five separate headings: 1. Ready-made weapons and ammunition; 2. Means of transport and communication; 3. Strategic raw materials; 4. Industrial equipment; and 5. Clothing, footwear and food.

### 1.—READY-MADE WEAPONS AND AMMUNITION

|                                                    | (numbers)   | United States | Great Britain | Canada |
|----------------------------------------------------|-------------|---------------|---------------|--------|
| Aircraft . . . . .                                 | 6,430       | 5,826*        | ...           | ...    |
| Tanks . . . . .                                    | 3,734       | 4,292         | 1,188         | ...    |
| A.A. guns . . . . .                                | 3,168       | 562           | ...           | ...    |
| Orlikon guns . . . . .                             | 1,111       | ...           | ...           | ...    |
| Anti-tank guns . . . . .                           | ...         | 548           | ...           | ...    |
| Minesweepers . . . . .                             | 10          | 12            | ...           | ...    |
| Big U-boat chasers . . . . .                       | 12          | ...           | ...           | ...    |
| Torpedo cutters and small U-boat chasers . . . . . | 82          | ...           | ...           | ...    |
| Devices for detection of U-boats . . . . .         | ...         | 116           | ...           | ...    |
| Shells . . . . .                                   | 22,400,000  | 17,000,000    | 827,000       | ...    |
| Cartridges . . . . .                               | 991,400,000 | 290,000,000   | 34,800,000    | ...    |

\* 2,442 of these were despatched from the U.S.A.

On balance, the British Lend Lease supplies of ready-made weapons have been of the same order as, or not very much less, than the American supplies. Only in the case of cartridges have the Americans delivered more than three times the quantity despatched from Great Britain to Russia.

The figures in the next table provide a striking contrast. In means of transport and communication practically the whole contribution has come from the United States.

### 2.—MEANS OF TRANSPORT AND COMMUNICATION

|                                                       | (numbers) | United States | Great Britain | Canada |
|-------------------------------------------------------|-----------|---------------|---------------|--------|
| Lorries (including armoured troop carriers) . . . . . | 212,168   | 5,239         | 3,410         | ...    |
| Motor cycles . . . . .                                | 17,017    | ...           | ...           | ...    |
| Telephones . . . . .                                  | 245,000*  | ...           | ...           | ...    |
| Locomotives . . . . .                                 | 241       | ...           | ...           | ...    |
| Platform cars . . . . .                               | 1,154     | ...           | ...           | ...    |
| Artillery wireless installations . . . . .            | ...       | 214           | ...           | ...    |

\* Plus 1,229,000 km. of field telephone wire.

In the table of strategic raw materials the United States heads the list; but the British and Canadian contributions are also very impressive. Some of the items in this list, for instance, copper and steel include also semi-manufactured articles.

### 3.—STRATEGIC RAW MATERIALS

|                               | (in tons) | United States | Great Britain | Canada |
|-------------------------------|-----------|---------------|---------------|--------|
| Aviation fuel . . . . .       | 476,000   | ...           | ...           | ...    |
| Rubber . . . . .              | ...       | 103,500       | ...           | ...    |
| Aluminium . . . . .           | 99,000    | 35,400        | 36,300        | ...    |
| Copper . . . . .              | 184,000   | 33,400        | 23,500        | ...    |
| Zinc . . . . .                | 42,000    | 7,400         | 6,700         | ...    |
| Nickel . . . . .              | 6,500     | 2,700         | 1,300         | ...    |
| Steel (incl. rails) . . . . . | 1,160,000 | ...           | 13,300        | ...    |
| Tin . . . . .                 | ...       | 29,400        | ...           | ...    |
| Lead . . . . .                | ...       | 47,700        | 9,100         | ...    |
| Cobalt . . . . .              | ...       | 245           | ...           | ...    |
| Jute, sisal, etc. . . . .     | ...       | 93,000        | ...           | ...    |
| H.E. . . . .                  | 217,900   | 17,300        | 5,000         | ...    |

\* The United States delivered more than 2,000,000 tyres to Russia.

The total quantities of light metals delivered to Russia were one and a half or two times as large as Russia's own output of those metals in the last pre-war year, that is, in 1940. The deliveries of aluminium have been more than twice as large as Russian domestic output in that year.

In industrial equipment Great Britain has led in delivering power plant equipment and electric motors, while the

United States has come first in metal cutting lathes and heavy machinery.

### 4. INDUSTRIAL EQUIPMENT

|                                      | United States | Great Britain | Canada |
|--------------------------------------|---------------|---------------|--------|
| (numbers)                            |               |               |        |
| Power plant (in kilowatts) . . . . . | 327,000       | 374,000       | ...    |
| Electric motors . . . . .            | ...           | 15,084        | ...    |
| Metal cutting lathes . . . . .       | 20,380        | 6,491         | ...    |
| Ship engines . . . . .               | 4,138         | ...           | ...    |
| Oil refineries . . . . .             | 4             | ...           | ...    |
| Aluminium rolling mill . . . . .     | 1             | ...           | ...    |
| Presses and hammers . . . . .        | 2,718         | 104           | ...    |
| Cranes . . . . .                     | 524           | 24            | ...    |
| Excavators . . . . .                 | 209           | ...           | ...    |
| Diamonds (value in £) . . . . .      | ...           | 1,206,000     | ...    |

### 5. CLOTHING AND FOOD

|                              | United States | Great Britain | Canada  |
|------------------------------|---------------|---------------|---------|
| Army boots (pairs) . . . . . | 5,500,000*    | ...           | ...     |
| Army cloth (yards) . . . . . | 22,800,000    | ...           | ...     |
| Foodstuffs (tons) . . . . .  | 2,199,000     | 138,200       | 208,600 |

\* American sources give the figure of 7,500,000 pairs.

The difference in the number of boots given by American and Russian sources—amounting to 2,000,000 pairs—is probably explained by the fact that the Americans count among the deliveries the goods lost on the way through enemy action. The following table shows the total tonnage of the goods despatched from each country and the tonnage of goods received in Russia.

|                              | United States | Great Britain | Canada  |
|------------------------------|---------------|---------------|---------|
| (in tons)                    |               |               |         |
| Despatched . . . . .         | 8,500,000     | 1,150,000     | 450,000 |
| Received in Russia . . . . . | 7,400,000     | 1,041,000     | 355,000 |
| Presumable losses . . . . .  | 1,100,000     | 109,000       | 95,000  |

It may also be interesting to compare the quantities of goods received in Russia year by year since the beginning of the Russo-German war up to the end of last April.

|                                 | United States | Great Britain | Canada  |
|---------------------------------|---------------|---------------|---------|
| (in tons)                       |               |               |         |
| 1941 . . . . .                  | ...           | 158,000       | ...     |
| 1942 . . . . .                  | 1,200,000     | 375,000       | 125,000 |
| 1943 . . . . .                  | 4,100,000     | 304,000       | 124,000 |
| 1944 (up to April 30) . . . . . | 2,100,000     | 144,000       | 106,000 |

The table illustrates the great importance of British and Canadian deliveries in the first period of the Russo-German war when the United States could not yet supply Russia on the scale which its supplies assumed later on. American deliveries show a steep increase in 1943, the year in which British deliveries decreased. In the first four months of this year the tonnage of American deliveries was more than half of last year's. On May 1st, 684,000 tons were on the way from the United States, 44,000 tons from Great Britain, 60,000 tons from Canada to Russia.

The United States have made their deliveries on the basis of the Lend-Lease Act. The total value of the supplies despatched from the United States is given at 5,357 million dollars, while the value of supplies received in Russia is given at 4,612 million dollars. Of the British supplies

319,000 tons of armaments were despatched without payment as military aid; and that part was certainly the most valuable since the bulk of it consisted of ready made arms. The rest of the supplies, consisting of raw materials, industrial equipment and food, were delivered partly on credit and partly for cash payment; and their value is given at £83,700,000. The total value of Canadian supplies amounts to 187,600,000 Canadian dollars, of which supplies worth 116,600,000 were delivered as "part of the British undertaking," before a separate agreement on credit was concluded between the USSR and Canada on July 1, 1943.

It would be interesting to compare Allied aid with Russia's own war production. Naturally enough, the facts about Russian production have not yet been published; and so the basis for the comparison is still lacking. But there can be no doubt that the Lend-Lease deliveries have formed a high proportion of the weapons and materials used on the Eastern Front. In two respects the present Russian commanders have been more fortunate than their predecessors in the First German War: the Russian industries were this time incomparably better prepared to meet the needs of the armies in the field than they were in 1914-1917; and—similarly—the present abundant flow of Allied supplies to Russia has provided a striking contrast with the lack of Allied response to the Russians' desperate demands for weapons throughout the last war. In 1915, a British military observer in Russia wrote about one of the Russian leading military personalities: "He has trusted too much to the promises of Vickers and Creusot, whose failure has upset all calculations. . . ." No such words could have been written from Moscow in recent years.

## To MEMBERS of the Scottish Widows' Fund

Most of our new-business staff is on war service but the utmost will be done to maintain the Society's life assurance service.

In two ways MEMBERS can do much to help:—

1. Keep correspondence with the Society at a minimum, and
2. Either to us or to your agent, give introductions to likely new members.

REMEMBER, we cannot now send anyone to urge you to increase your own life assurance—just DO IT WITHOUT BEING ASKED.

Write to your agent or to the Secretary,

**SCOTTISH WIDOWS' FUND**

Head Office:

## The Cost of Service

THE White Paper on Employment Policy has emphasised as a fundamental aim of future national policy that productive power should not only be employed fully but employed efficiently. It is highly important that the aim should be realised in the large employment group consisting of the distributive services. Complaints about increasing and unnecessarily heavy costs of distribution in retail trade were frequent before the war, and "service" was often marked down as a major culprit.

Service in retail trade—and the term includes not only the ways and means of general efficiency and courtesy, but all the extra and special amenities of everyday shopping—is certainly of value both to sellers and buyers. It is manifest in the presentation of goods in elaborate and original packing (which may help the housewife and satisfy modern hygienic requirements); in "home service" and house-to-house delivery; in the many amenities offered by the department stores through additional personal service and the provision of attractions sometimes far removed from the normal purpose of retailing.

It may well be that such amenities are responsible for increased trading and consequently reduced prices. In that case service is an obvious advantage to the consumer. But in general it must be assumed that the customer pays for additional service. The retailer may charge for it directly. He may try to recover his increased overheads by raising the prices of a wide range of his goods. Where this happens the consumer may be in the unfortunate position of having to pay for something he does not want. The modern butcher (sometimes called a meat purveyor) may raise his prices to offset the cost of elaborate van services, but the customer who carries his purchase home will not have his share of the burden refunded. Many people might be prepared to obtain their milk over the counter; but they will not, for their trouble, pay less than those to whom milk is delivered in bottled condition. Again, many people who buy in department stores may have little interest in, or use for, luxurious tea-rooms, roof gardens, escalators, exhibitions and demonstrations; but the cost of these services will be reflected in the prices that they have to pay. There may be a "host of unwanted services"—to use the phrase of Mr Henry Smith, who has written so well and so critically of retail distribution.

It is here that the danger for the future lies. Nobody wishes to undo the development of better-organised, more convenient and sometimes more hygienic methods of purchase; but a careful watch must be kept for expenditure on services that are extravagant and wasteful. The supply of "service" may be exploited by the retailer simply to attract customers, and may degenerate into a succession of competitive ruses. The overlapping of retail services is no less uneconomic than the overlapping of retailing itself. It ends, inevitably, in a lament from the retailers that their overheads are so heavy that reduced prices are impracticable. The "progressive" greengrocer constantly stresses his increased costs (for wrappings, modern display and lighting) when his prices are subjected to critical examination. Moreover, the introduction of "service" may involve problems of organisation which, if not properly solved, result in acute loss to the retailer. "A systematic delivery service should prove an asset to the retailer and a boon to his customers, but if that delivery service is not systematised waste and loss are bound to occur"—that is the warning given to retailers by a specialist in retailing method. Lawrence E. Newell, another authority and one who cannot be suspected of belittling the advantages of large stores, has shown that many difficulties of transport and delivery service are inherent in the very conception of the department store. In his opinion "it is open to question whether the costs of so elaborate a system do not in some cases outrun justification." With the smaller shop and its

casual errand-boy this problem does not arise. His service is of a personal character and requires no heavy capital outlay in display, shop space and advertisement.

Much more statistical information is needed about the cost of retailing in general and the cost of "service" in particular. Where such information is available, as in the case of the milk trade, the situation disclosed is not very reassuring. Here is an example where price competition is ruled out by the existence of minimum retail prices, and where the drive to increase turnover by attracting customers is likely to prove expensive and wasteful. Reporting on the milk trade in 1939, the Food Council made the frank observation that since prices were fixed competition could not develop except "in rendering luxury services, which increase the cost of distribution and are pleaded as justification for increased margins to distributors." It frequently happens, then, that the so-called "service"—not unlike the present method of house-to-house collections in industrial assurance and similar schemes—is represented as a function of high social value on the part of those who practise it. To the Ministry of Food's Committee, which in 1940 examined the cost of milk distribution, it was earnestly suggested that there was "a tendency on the part of the consumer to regard the roundsman as a guide, philosopher and friend." But the report was anxious to show that such "courtesy services" were apt to increase the cost of milk distribution—by introducing "second visits" for instance. Many of the recommendations of this excellent report, so much criticised by opposed interests, were concerned with the "refinements" of service—the exclusion from the milk round of sales of other goods (thus entailing another "courtesy service" and increasing the distributive cost of milk); the abolition of the half-pint bottle; and "further reduction of expenditure for competitive purposes."

There can be no doubt that many factors in modern economic development tend to increase the potential dangers of exaggerated and wasteful "service" competition. Retail trade associations, sometimes in combination with manufacturers, have adopted a policy of price maintenance. Their members are thus driven to increase turnover by attractions other than lower prices. Any further adoption by retail trade of the fixed-price branded article will foster and increase this tendency. For the small, old-fashioned retailer, the only tests of service were efficiency and cheapness; for the modern department store success is measured all too often by the number and quality of the amenities offered—amenities which bear no real relation to the practical purpose of the commodities put up for sale. The costs of these items, added to those for competitive display and advertising, constitute the charge *pour le service*. If the customer could identify it as a part of the price he pays he would be less ready to applaud some of these costly extravagances.

Many trades are trying to "professionalise" themselves in the expectation that a "qualified" retailer may charge more for rendering special services. The undertaker who becomes a "funeral director," the ironmonger and radio-dealer who develops into an "electrical contractor," the spectacle-maker and optician who graduates to "optical practitioner" and the shoe-shop attendant who becomes a "foot anatomist"—all will expect to be paid for the extra service they are proud to render. This development cannot produce any downward movement in costs of distribution. Many people who live in luxury flats would gladly dispense with their liveried porters, the luxurious entrance-halls, even the squash-courts, in exchange for a few more square feet of living-room, a larder and a private box-room. The tendency to impose ostentation upon the unhappy customer was strong and growing stronger before the war.

It would be interesting, if space permitted, to examine the problem of "service" regionally. One suspects that the facts would reveal great differences in the vulnerability (or,

to speak plainly, the gullibility) of the average customer as between North and South and between (say) the West Riding and the West End.

A very deep and earnest hope at present is that peace will restore many of the comforts and conveniences which war must necessarily deny. But never before in Britain's history

has wise spending, thrift and well-balanced economy been so essential for the process of economic rehabilitation as it will be after this war. Among the expenditure, which may entail much irrational buying and waste, that for non-essential "service" should not be overlooked, and certainly not encouraged.

## Building Material Shares

OF all the wares displayed in the British equity share market, building material shares are the subject of most discussion among the queues waiting at the door marked "Transitional Department." Almost every piece of news that comes from Westminster emphasises and re-emphasises the part that re-housing must play after the war. Months ago, it was clear that housing had, departmentally, succeeded in getting first off the mark with its "planning," and had effectively staked out a claim to an early and (to say the least) adequate share of available post-war resources. While other key industries were, like Brutus, pressing petitions Caesar could not grant, or arguing who should own them in the post-war world, the building industry was settling with the Government how many men would be wanted and how many were to be trained to carry out an agreed programme of completing  $x$  houses in  $y$  years. Mr Churchill included homes, with food and work, in his trinity of post-war objectives. The Employment White Paper, by inference, put housing among the leading "civilian requirements" with post-war priority only a little after the export industries—and perhaps not even that. And even the Chancellor of the Exchequer threw in a welcome, if unexpected, donation to the pool of post-war building activity by his Budget announcement of tax concessions, in due time, on capital outlay on industrial buildings. In a context of investment, all this means that holders of building material shares can assume a high level of post-war activity for a longer period than most investment probabilities generally allow. They can be assured, at the same time, that a prosperous building industry will have a direct contribution to make to national wellbeing.

When the argument proceeds from general to particular, however, investors are at once confronted with the difficulty that the industries which cater for building are an extremely heterogeneous collection, whose internal organisation, financial structure and profit-earning experience, before the war and still more during its course, have varied widely. Almost the only industry whose products are materials for building, and nothing else, is brick-making. Others, like cement, have wider constructional uses, and modern civil engineering has already learned ways and means of economising their use. The cement in Waterloo Bridge represented only 2½ per cent of the contract price, and it has been expertly declared that the chief source of demand for it in future civilian building is likely to be for the construction of concrete roads on new estates rather than for buildings. When the universe of discourse is extended to industries like paint-manufacture, steel-making, timber production and, still more, to domestic furnishing, linoleum manufacture, wallpaper, glass-making, electrical apparatus and the host of trades whose output goes inside a house before the tenant comes in, the share of housing demand to total demand varies so widely that investors may have no ultimate option but to take each individual share on its own merits and work out its investment possibilities for themselves.

All the companies whose results are shown in the table at the bottom of this page are interested, directly, in the prosperity of the building industry. The table contrasts their results in the best pre-war year (the year, that is, when profits after depreciation were highest) with those for the latest war year available. The comparison, unfortunately, is blunted by the fact that most of the companies are holding concerns and do not publish consolidated accounts. More serious, however, is the difficulty that in some instances wartime results are shown only after taxation, which means after income tax or EPT or both. It is, in such cases, virtually impossible to learn how much current earnings have fallen from their pre-war peak level or even whether, in one or two instances, they have fallen at all, if EPT be allowed for.

So far, however, as a tentative generalisation can be drawn from the figures, it is that the makers of materials for building houses have suffered a severer setback, on the whole, during the war, than the manufacturers whose products go into houses—the makers of essential fixtures, decorating materials, etc. Thus, the wartime setback to London Brick, by all appearances, has been considerable, despite the amount of wartime construction of shelters, etc., in which bricks have been employed. Possibly difficulties of transport have accounted for at least as much, in this result, as falling off in demand; for London Brick was organised to fulfil orders over a wide—practically a nation-wide—area, and has suffered considerably under the "zoning" arrangements laid down by the Ministry of War Transport. The cement companies, naturally, have had considerable war orders, since there is little on the "capital" side of preparing a country as a war arsenal and advance base, from the building of factories to the making of cement runways at aerodromes, into which cement does not enter as an essential raw material. For this reason, the cautious tenor of chairmen's speeches may perhaps need more literal interpretation to-day than at any other time since the beginning of the war, so far as the immediate outlook is concerned. The heavy constructional part of the national preparation for the war's supreme crisis is virtually complete, and it is to post-war developments that investors in cement shares must now look.

On the whole, the showing made by other companies in the table has been remarkably consistent and satisfactory during the war—much more so than any commentator, arguing from first principles, could have ventured to predict five years ago. Subject to difficulties arising out of tax deductions, etc., the figures go some way to suggest that the level of gross trading profits among these companies, in recent months, has been little if at all below the best pre-war figures, and in some instances may even be higher. There can, of course, be only one explanation—special war demand. Equally noteworthy, however, is the fact that this relative stability of earnings has not been reflected in dividend payments, except in a minority of instances. Rates of distribution to shareholders have shown reductions comparable with those paid by building companies in the

| Company (and Balance Sheet Date)       | Date of           |             | Profits (£000) |           | Earnings for Ordinary (%) |        | Dividends on Ordinary (%) |        | Current S.E. Price of Ord. | Yield (%) |

(a) After taxation. (b) And share bonus of 1 in 9. (c) Eleven months only in 1939. (d) Profits figures are from consolidated accounts, both years. (e) Year to Aug. 31.

literal sense. Undoubtedly, even after the extra demands of the tax gatherer have been allowed for, dividend policy among directors of these companies has been markedly conservative.

In the light of these facts, the generally favourable verdict on the prospects of building material shares as a whole, after the war, which economic considerations appear to justify, tends to be reinforced by more purely financial arguments. Some companies, it would seem, already have a substantial EPT "cushion," and many others are living, dividendwise, well inside their current means.

Whether shareholders can look for a return fully comparable with that of the best pre-war year, even in the period after the war when civilian demand will be greatest, may, however, be questionable. For one thing, the best pre-war year, for some companies, occurred in the culminating period of the housing quasi-boom of the '30's, and shareholders may be better advised to look for a consistent, though moderate, return over a fair number of post-war years than a very high return in only one or two periods of exceptional activity. Taxation, in one form or another, will certainly be higher than in pre-war days. Finally, it seems to be beyond question that some form of official control of prices will endure for a considerable time after hostilities. And it may well last longer in the case of building materials than with many other essential commodities, partly because building will be an industry in which the authorities will have an intimate and direct interest; partly because, rightly or wrongly, producers of building materials had in pre-war days a reputation for appreciating the value of internal price-regulating methods, but mainly because present building costs, based on stringently limited civilian supplies, will have to be greatly reduced if a big building programme is adequately to benefit those for

whom it is designed. Earlier this year, it was officially stated in Parliament that timber for building cost 160 per cent more than before the war and accounted for 25 per cent of the cost of materials in a "typical" house. This is an extreme case. The rise in prices of bricks, cement and steel, for example, is much more moderate, and may not greatly exceed that of prices in general. But whatever the differential, some form of official control may well be the consequence of the industry's own social indispensability.

From the investment angle, therefore, the conclusion seems to be that while almost every soundly established member of the widespread group of companies catering for the building industry may have reasonable prospects of post-war prosperity, outlasting the purely transitional period, the scope for a really marked increase in returns to shareholders may be more limited than has generally been assumed. The current yield figures given in the table must be interpreted with that proviso. The "recovery" element, in a company whose current profits, for various reasons, do not compare very unfavourably with its pre-war earnings, but whose shares, nevertheless, are priced to give a relatively modest present return, may be more limited than has generally been assumed. Broadly speaking, the companies which offer the greatest possibilities in that direction are those whose current dividends make the most unfavourable contrast with those of peacetime; and in their case, frequently, a particularly low yield figure attests the market's discounting of a fair measure of recovery in advance. Altogether, the combination of a *more than average* present income return with a considerable amount of post-war earnings' leeway to be made up, is enough of a rarity in this group to suggest that the publicity given to building prospects, inside and outside Parliament, has already had its inevitable effect in a market where investors are nothing if not recovery-minded.

## Business Notes

### Production and the Invasion

It is too early to measure the effects of the invasion on production, and no statistics of output during the past fortnight have been published. But such evidence as is available suggests that there has been, not so much a spectacular spurt, as a general improvement in the level of production. With the relaxation of the nervous tension of the past few months, time-keeping and attendance—a sure reflection of industrial effort—have improved, and there is a general lift in morale and willingness to cooperate. Moreover the nation is now strike-free. The 600 dockers out at Aberdeen returned to work early this week and so did the miners on strike at one or two collieries in Fife. The Scottish Mineworkers' Union, strongly condemning the irresponsible minority who disregard the majority decision, has called a special emergency conference for July 3rd, to deal with unofficial strikes. Monthly figures of coal output are no longer being published, but Major Lloyd George told the House of Commons on Tuesday that output had been steadily improving since the settlement of the wages question in April. Tonnage lost through coal disputes has been negligible. Particular credit must be given to the transport workers, who have contributed to the smooth working of the transport system, in spite of the enormously increased load it has had to carry. Although the Government expected that certain factories might have to close down because of the lack of transport to carry raw materials, it is claimed that not one worker has been unemployed and no raw materials have been held up through transport shortage.

### Bombs and Share Dealings

For some weeks jobbers have regarded the fresh outburst of buying with some disfavour and not a little suspicion, while many brokers have been even less complaisant about business, which added to the difficulties of an over-worked staff—without adding appreciably to profits—and promised, in their view, to herald an awkward recession in prices. The flying bomb has performed the accidental service of discouraging investors who had refused to listen to warnings that prices were rising to levels which could not be maintained. Jobbers, who had had their meagre supplies of stock exhausted,

marked down prices in the hope of getting some cheap stock. Usually this just brought in fresh buyers, but there were, just before and after last week-end, some very moderate falls in quotations. These have, however, since been made good in large part, and the equity index of *The Financial News*, at 112.7, is within one-tenth of one per cent of the peak established on June 15th. With all this, however, there has been some reduction in the volume of business. Figures of bargains received are not very helpful. So far as they can be used they suggest that the number of individual transactions is back to the level prevailing before the special stimuli of the budget speech, the White Paper on Employment Policy and the opening of the invasion. The market itself is prepared to accept some such figure for money turnover, but suggests that the comparison overstates the decline in the number of transactions. There is also some surprise that the falling off in business has brought no real recession in prices. There is a very widespread feeling that this will come, but it is frankly admitted that a new peak may be attained before the reaction sets in.

### US Silver for India

The US Secretary of the Treasury announced towards the end of last week that by a special lend-lease agreement the United States had undertaken to supply 100 million ounces of silver to the Government of India. The operation, as with similar deliveries of US silver to Great Britain, remains outside the normal category of lend-lease transactions, for the Government of India has agreed to return the silver after the war on an ounce for ounce basis. The silver in question represents between one-third and one-half of the annual world production of silver. Together with the recently announced purchase of 16,000,000 ounces of the metal from the National Bank of Iran the latest transaction promises a very considerable increase to the stocks of silver held in India. These additional stocks are intended to be used in three ways: First, for additional coinage; secondly, for India's expanded war production; and, thirdly, to keep prices stable. The need of silver for coinage must be pressing. The demand for subsidiary coin must at least have kept pace with the rise in the rupee note circulation. The reminting of silver rupee coins to 500/1,000 fineness must have provided considerable additional sup-

plies of silver, though not as much as simple calculations would suggest, for it should not be forgotten that a considerable part of the old coins of 11/12 fineness disappeared into hoards when they were recalled from circulation.

The silver holdings of the Reserve Bank have been falling away persistently. The rupee coins held amounted to Rs. 1,38,00,000 on June 1st last, compared with Rs. 1,68,00,000 a year previously and Rs. 7,50,00,000 at the beginning of the war. The need for silver in India's war industry need not be reckoned very high. It is in the fight against inflation that the other main use will be found for the silver received from the United States. This suggests that before long the authorities in India will begin official sales of silver in the open market. Indian operators have been quick to anticipate this development, and since the beginning of last week the Bombay price has fallen from Rs. 135/2 to Rs. 127/12 per 100 tolas. Assuming half the 100,000,000 ounces and a similar proportion of the Iran silver to be used for open market operations, the Indian authorities will have a considerable *masse de manœuvre* at their disposal. Official sales of silver would be particularly effective as a counter inflationary solvent because the metal will reach classes which by reason of their low purchasing power can hardly be affected by gold operations. At the same time, the anti-inflationary effect of such silver sales should not be exaggerated. The 58,000,000 ounces of silver in question (half the recent acquisitions) only represent a value of under £6,000,000 at the official sterling price and of about double that figure at the current rupee price for the metal. The market in India has rightly seized the significance of the proposed initiation of official silver sales, and for a time the authorities will be able to dictate the open market price. But such sales, useful as they may be, are not a complete answer to the problem of inflation in India, and if the fundamental forces making for inflation continue to operate as at present, it can only be a matter of months before the additional reserves of the Indian authorities are swallowed up by the open market.

### Russo-Czech Currency Talks

Negotiations between the Russian and Czechoslovak Governments for a currency agreement are now fairly advanced. Their conclusion is likely to be announced soon. The Russians have an obvious political interest in showing their generosity towards Czechoslovakia in the treatment of the currency problem, at a time when the arrangements for the issue of French currency by the Allied military authorities on the other side of Europe have caused so much criticism. The Russians have proposed that the Czechoslovak Government itself should put the new currency into circulation, placing notes at the disposal of the Russian forces if and when they enter Czechoslovak territory. The banknotes are already being printed—in Russia. A representative of the Czechoslovak Ministry of Finance is soon to go to Moscow to supervise the technical side of the arrangements. What has not yet been settled is the rate of exchange between the rouble and the new Czechoslovak krone. Before this is done, a rate of exchange has to be fixed between the new Czechoslovak currency and the four currencies—the Czech Krone, the Slovak Krone, the Reichsmark and the Pengö—that are now circulating in the various provinces of the Czechoslovak Republic. Of these four currencies, the Reichsmark (in the Sudetenland) and the Slovak krone have depreciated less than the other two, though in the final phase of the war the Reichsmark and the Slovak krone, too, are likely to lose much of their value. Finally, the "real value" of the rouble presents another puzzle. This is the first case in which the rouble, after many years of utter seclusion, has come in direct contact with a foreign currency.

### Currency and Trade

An agreement on the exchange rate between the rouble and the new Czechoslovak krone would still leave open the question of what the Czechoslovaks will do with their assets in roubles, when their rouble account soars in consequence of the occupation of their country—or of parts of it—by Russian forces. They will, of course, be free to use that account in payment for imports from Russia.

But it is doubtful whether, immediately after the war, Russia will be able to export many of the goods which Czechoslovakia will especially need, such as cotton, woollen goods, fats and oils. There is no truth in the reports about a trade treaty between Czechoslovakia and Russia that have appeared in London newspapers. The Czechoslovak Government has denied them; negotiations about trade with Russia, it is stated, would be premature while the war still lasts. There is at present something of a contrast between the direction of Czech political moves and trade requirements. Politically, the Czechs look to the east. In economic matters, the structure of their trade causes them still to look to the west. Czechoslovakia used to sell no more than about one per cent. of its exports to Russia. It is hoped that in future export to Russia may be larger. But the limits of expansion will probably be dictated by Russia's ability to pay in cash, since Czechoslovakia will hardly be able to export on credit. Before the war the largest foreign markets for Czechoslovak goods were found in Germany, Austria, Great Britain and the United States. The rôle of Germany as a buyer will be greatly reduced after the war; and Czech economists think that, at least in the first years of peace, Czech exporters will have to look for new customers in the United States and in this country.

### Productivity in Industry

The Industrial Health Research Board which assists the Medical Research Council in promoting scientific investigations into problems of health and efficiency among factory workers, has issued a report on variations in labour productivity, based on a sample inquiry.\* In an earlier study, published in 1942, it was stated that, except as a temporary emergency measure, working hours in manual operations involving a fair amount of physical effort should not exceed 60-65 a week for men and 55-60 a week for women. As the experience of the last war had shown, long spells of work in excess of these limits eventually bring a fall in output through a reduction in efficiency and an increase of lost time and of spoiled work. The latest report is of particular interest since it is concerned with the effect of the reduction in working hours in the latter part of 1942 in a number of factories on war production; the investigation was carried out chiefly among women workers. The reduction in the weekly working hours of women in the majority of the factories examined varied from 3 to 8 per cent, and the reduced working week varied from 52 to 55 hours. It was found that, while on an average output per hour during the 12 weeks after the reduction was 4.1 per cent higher than before, the results for individual groups of workers varied considerably. Careful investigation showed that the shorter working week was only one of several factors responsible for the overall improvement in productivity. According to the report, the chief causes of fluctuations in output were changes in the type or design of product; mechanical difficulties and machine breakdowns; variations in the quantity and quality of the material used; progressive improvements in the methods and conditions of work; changes in the type and layout of machines; personal factors, such as dissatisfaction with the method or rate of payment, and occasional friction between the management and workers. Small but progressive improvements in the methods or conditions of work, accelerated in some groups by fairly large-scale measures of reorganisation, were found to have contributed substantially to the rise in productivity per head. The investigators reached this conclusion:—

The cumulative effect of gradual but almost imperceptible improvements has been very noticeable since the outbreak of war and the results obtained in this and in a previous investigation (Emergency Report No. 2) suggest that, of all the factors studied, technical improvements and reorganisation are the most likely to lead to an increasingly high and steady level of efficiency.

The conclusion is encouraging in that it reveals a steady improvement in productivity achieved through technical progress; but its real significance lies in the fact that it points the way to that increase in productivity which is essential if Britain is to remain in the vanguard of industrial nations and if the standard of living is to be raised after the war.

\* Emergency Report No. 5 of the Industrial Health Research Board: A study of Variations in Output by S. Wyatt. H.M. Stationery Office, 4d. net.

The *Federal Reserve Bulletin* for April contains an interesting analysis of consumers' incomes and expenditure in the United States during the war. Perhaps the most significant of the facts revealed is that "the supply of goods for civilians during the war period has been maintained." There has been a reduction in some items—especially durable goods—and increases in others. For example, the production of clothing for civilians in 1943, though lower than in 1942 and 1941, was 6 per cent above the average for 1935-39. The output of food last year exceeded the average for 1935-39 by 32 per cent; although large quantities of food were needed for military and lend-lease purposes, consumption per head of the civilian population was 6 per cent higher than in the years of comparison. The volume of transport and other services available to civilians was somewhat smaller last year than in 1941, but considerably above that of the preceding years. The analysis of civilian supplies suggests two conclusions. First, the enormous output of military stores by the United States has been achieved almost entirely by utilising its large "reserve" of productive capacity; the British war effort has involved a cut of one-fifth in civilian consumption. Secondly, the increase in the consumption of food and clothing is evidence of an improvement in the standard of living of the lowest income categories, brought about by full employment at good wages; Great Britain has achieved a similar result, but by way of strict rationing of a volume of consumer goods substantially smaller than before the war. America's wartime experience is a reflection of the high productivity of its industry and yet another reminder of the need for raising its level in this country.

Exceptional changes both in the size and composition of the London short loan fund have occurred since the beginning of the war. Disregarding that part of the fund which was used on the Stock Exchange—at no time an important element in it—the estimates of its size can best be made through a study of the balance sheets of the discount houses. In their latest balance sheets the big four showed short loans, deposits, etc., of £294,970,000. This represented 27 times their published capital and reserves. For the six smaller firms whose balance sheets are not published, an estimate of their borrowing can be made by multiplying their capital resources of £3,665,000 by 25, giving a product of £91,900,000. Thus at the date of the last balance sheet (for the most part December 31st last) the total short loan fund employed in the discount market amounted to about £387 million. That figure has to be reduced somewhat to allow for the fact that most of the discount houses include contingency accounts and even provision for accruing expenses with their deposits and short loans. Against this, it may be estimated that about £10 million of short money is lent to running brokers and market houses excluded from the above calculations. This is unlikely to be a complete offset to the first of these reservations, but it will not be far wrong to assume that the short loan fund employed in the discount market is now running at around £380 million. On December 31st last the clearing banks' money at call and short notice amounted to about £150 million. Allowing for a small proportion of this total employed outside the discount market it will be seen that the funds used by the discount market are at present obtained to the extent of little more than one-third from the clearing banks.

It is interesting to compare this position with that at the end of 1938. The published capital resources of the "big three" then amounted to £11,969,000 and their short loans, etc., to £175,494,000, giving a multiplier of 14.5. The first contrast shown by the comparison of the 1938 and 1944 figures, therefore, is the virtual doubling of the ratio of borrowed resources to capital resources. The ten private firms in the market at the end of 1938 had capital resources of about £3,400,000 and multiplying this by 15—a reasonable ratio for that period—their borrowed funds amounted to about £52,500,000. The total short loan fund in the discount market before the outbreak of the war seems, therefore, to have amounted to about £176 million. The clearing banks at the end of 1938 had money at call and short notice amounting to £159 million. In those days a far greater proportion of clearing bank short money was employed in the Stock Exchange than to-day when the *contango* has disappeared. Taking as a rough proportion the figures of 3:1 to measure the short loans made by the clearing banks to the discount and stock markets respectively, the amount lent to the former at the end of 1938 should seem to have been in the neighbourhood of £120 million. Thus, before the war, clearing bank money represented over 65 per cent of the discount market's borrowed funds, whereas the latest indications suggest a ratio of slightly under 40 per cent. This change in the composition of the short loan fund is but one of the many manifestations of the phenomenon of abnormal sterling area balances. Much of that money temporarily in London is being used in the short loan market. Examples of this abound. According to the published figures, the Commonwealth Bank of Australia is now the largest individual lender to the discount market. The Indian and Irish banks have on the market many times the sums they normally employed in this way before the war. This change in the composition of the short loan fund is a development to which, perhaps, insufficient attention has until now been paid by the market itself. Much of this additional money, on the basis of which the market has built up its holding of bills and bonds, is an unstable element in the short loan fund. As the overseas countries in question utilise their abnormal sterling balances, these funds, though they will not be cancelled, will tend to be withdrawn from the short loan market. They will make their way in large part from the overseas to the clearing banks, and there is no reason to suppose that the clearing banks will, after the war, keep a larger proportion of their resources on the money market than they have done hitherto. It would, therefore, be unwise to count on the permanent maintenance of the present favourable gearing of capital employed in the discount market where £1 of capital will attract between £25 and £30 of borrowed resources.

The banks have now closed their ranks for the new attack on the problem of agricultural loans. The Midland Bank, which refused to co-operate in the establishment of the Agricultural Mortgage Corporation when it was founded in 1928, has now decided to become a member bank. Its decision is based on the view "that financial measures forming part of the Government's policy of securing a healthy and well-balanced agriculture call for the united support of the banks." Another reason for the Midland Bank's change of mind is the new lease of life which is being given to the Agricultural Mortgage Corporation by the Agriculture (Miscellaneous Provisions) Bill now before Parliament. Certain provisions in this measure will enable the corporation to make long-term loans to agriculture for capital purposes at the favourable rate of  $3\frac{1}{2}$  per cent. Since the Corporation financed the bulk of its existing capital resources by 5 per cent and  $4\frac{1}{2}$  per cent debenture issues, this further reduction in the basic rate for loans will call for additional Government subsidies. The annual subsidy to the Corporation has amounted to £60,000 since 1934, the year when the basic loan rate was reduced to  $4\frac{1}{2}$  per cent in order to prevent the complete disappearance of the Corporation's business. The further reduction to  $3\frac{1}{2}$  per cent will involve an increase in the annual subsidy to a maximum of £150,000, and this is being sanctioned until the year 1959. The original shareholders in the Agricultural Mortgage Corporation were promised a maximum dividend of 5 per cent. The Bill proposes to reduce this maximum figure to  $3\frac{1}{2}$  per cent. Even this modest return to the shareholding banks seems remote since for many years to come the Corporation

must, by reason of its heavy debenture debt burden, depend on Government subsidies for making ends meet. The composition of the Corporation's board is being changed by the nomination of two additional directors by the Treasury. It has long been the contention of a particular school of thought that it only needs cheap and abundant money to make good farming. With the help of the taxpayer's money that proposition is about to be put to a prolonged test.

The Government's determination to promote a healthy and well-balanced agriculture in this country in the post-war years has received further confirmation from the setting up of two committees on agricultural education. One is a permanent committee, set up jointly by the Minister of Agriculture and the President of the Board of Education, to advise them on all aspects of agricultural education to be provided by local education authorities, and particularly on the educational policy and methods to be adopted at farm institutes. The other committee has been set up by the Minister of Agriculture to consider the character and extent of the need for higher agricultural education in England and Wales, and to make recommendations on facilities which should be provided to meet the need. This committee will deal with agricultural education at agricultural colleges and universities, and will take over the functions of the Ministry's wartime committee on higher agricultural education. Dr Loveday is chairman of both committees, indicating that agricultural education is being co-ordinated and visualised as a whole, from the elementary school to the university. It is gratifying to observe how much emphasis is being placed on agricultural education. Among the problems which the committees will have to solve is the bridging of the gap between the student straight from the agricultural college, well primed with theory, and the farmer, wise in experience, but conservative in method. It is not sufficient to provide an army of trained agriculturists if no preparations are made for their reception at the farms. Valuable educational work is at present being done among farmers by the county war agricultural committees. It is not, perhaps, too much to hope that some way will be found to

continue this education among the practising farmers if after the war these committees were to be disbanded. A healthy agriculture demands the application to the land of the best and latest knowledge.

Particulars are now available of the deal between the Rank interests and the British and Dominions Film Corporation. That company is to reduce its capital from 500,000 shares of £1 to the same number in shares of 12s. It is then to issue a further 810,000 such shares to the Rank group in exchange for 475,500 shares of £1 in D and P Studios. With existing holdings, direct and indirect, this will give British and Dominions 89.3 per cent of the capital of this concern. In the absence of full accounts, it is impossible to form any idea of the financial merits of the transaction, but it plainly gives the Rank group full control of British and Dominions. The group, of course, retains full control of D and P Studios, together with some 86 per cent of their financial interest in that concern and obtains roughly a 62 per cent interest in any financial benefits obtained by British and Dominions from any source other than D and P Studios. When the operation is complete, Pinewood Studio Films, which owns—or owned—50 per cent of the capital of D and P Studios, will be placed in liquidation, a welcome, if minor, simplification of structure. British and Dominions apparently own the Denham and Pinewood studios and hold for realisation assets at Elstree, valued at £50,000, which are at present let on a satisfactory basis. Other assets of the company are the D and P Studios holding, valued at £769,825, and net floating assets of £32,380. In view of the heavy losses of the past, the advantage to British and Dominions shareholders of association with the Rank group is evident. That group is, presumably, satisfied to extend its control over studio space.

Burmah Oil is fortunate in being able to maintain its ordinary dividend of 12½ per cent., a result which would

ONE HUNDRED AND TWENTY-SEVENTH REPORT OF THE BOARD OF DIRECTORS, to be submitted at the Ordinary General Meeting to be held on Wednesday, 28th June, 1944, at Winchester House, Old Broad Street, London, E.C., at noon.

The Directors have pleasure in submitting the Profit and Loss Account in respect of the unoccupied office for the year to 31st December, 1943, together with the Balance Sheet as at that date. In view of the continued occupation of the majority of the offices, the Profit and Loss Account covers only the results of these offices under the control of the Directors. Owing to the obscurity of the location in the Far East, the Directors regret that they are unable to recommend the payment of a Dividend, and have resolved that the profits for the year, £216,075 18s 11d., be transferred to Contingencies Reserve.

Yours faithfully,  
 W. G. Mitchell & Co. Chartered Accountants (offices).

The retiring Auditors, Messrs. Pent, Marwick, Mitchell & Co., Chartered Accountants, offer themselves for re-appointment.

By Order of the Board,  
A. MORSE, *Chairman*.

London, 8th June, 1944.

BALANCE SHEET as at 31st DECEMBER, 1943.

A. MORSE, Chairman.

|                                                                                                                 |     |                   |            |    |   |   |    |    |  |            |    |    |
|                                                                                                                 |     |                   |            |    |   |   |    |    |  |            |    |    |
|                                                                                                                 |     |                   |            |    |   |   |    |    |  |            |    |    |

NOTES: 1. The figures included in the Balance Sheet in respect of Offices in enemy occupied territories have been taken from the last Returns received. In the case of certain Offices in enemy occupied territories no Returns have been received in London.  
2. No official information is available as to the steps taken by the enemy in attempting to liquidate or carry on the occupied Branches.  
3. The figures in respect of the Indian Offices have been taken from the Returns as at 30th November, 1943.  
4. Balances in the currencies of enemy and enemy occupied territories have been converted into Sterling at approximately the last quoted rates.  
5. There are contingent liabilities in respect of confirmed credits, guarantees given and forward exchange contracts entered into in the ordinary course of business.

We have examined the above Balance Sheet with the Books of the Corporation kept in London in which are incorporated the Returns received from the Offices abroad which have not been audited. The Assets in Enemy Occupied territories and other Assets unreliable owing to war are under present conditions incapable of valuation or verification. We have not verified the Balance of Remittances and Drafts in Transit as the detailed records of this item are not fully available in London. Subject to these observations and the notes appearing on the Balance Sheet we have obtained all the information and explanations we have required and in our opinion such Balance Sheet is properly drawn up so as to exhibit a true and correct view of the state of the Corporation's affairs according to the best of our information and the explanations given to us and as shown by the Books kept in London.

seem to exceed the most sanguine expectations that could be entertained last year by the chairman, Mr. Robert Watson. The wholesale disposal of stocks and the bringing in of credit balances with subsidiaries, normally left at their disposal, disguised the effect of the loss of Burma on the 1942 accounts. But the present accounts, for the year ended December 31, 1943, cover the trading profit of only two wholly owned subsidiaries and of the tanker company. Their profits of £1,862,893 compare with trading profits of £3,444,389 for 1942. This result is not unsatisfactory, in the circumstances, and indicates the great demand, created by war developments in the Far East, for the products of the two subsidiaries still in business, the Assam Oil Company and the Tinplate Company of India. This same factor—the pressing expansion of war production—is partly responsible for the considerable increase of £377,122 in dividends and interest, which reflects a much higher dividend received from the Anglo-Iranian Oil Company. Altogether, gross profits amount to nearly £4 million against nearly £5,200,000. (Comparative figures for the past three years are set out on page 860.) Taxation, however, requires £779,740 less, due largely to the lower trading results. It is possible that, if anything, it has been overprovided for. Earned for ordinary thus works out at 12.9 against 16.4 per cent, which enables £100,000 to be allocated to general reserve while the carry forward is again strengthened. The chairman is able to say that, granted the continuation of present conditions, the 1943 results should be maintained, despite the complete loss for the time being, of considerable sections of the Company's business.

#### Cable Company's Strong Position

Callender's Cable and Construction Company, whose accounts for the last three years are compared on page 860, is, as its chairman, Sir Malcolm Fraser, points out, in a strong position from the viewpoint both of earning capacity and of capital reserves. Its profit after taxation for the year ending December 31, 1943, is £566,000 odd, or roughly the same as for 1942. But the fact that the redemption of the debenture stock was completed last year leaves earned for equity at 51.9 against 45.0 per cent. The ordinary dividend of 20 per cent is repeated, but not increased, thus enabling £175,000 to be allocated to the reserve for war contingencies, where it is especially earmarked for covering the reinstatement of employees now in the Services. The laudable aim is to end any anxiety that may be felt by absent employees about the transition period, but it is pointed out that expenditure under this head should be self-liquidating. If this should prove to be so a total war contingencies reserve of £675,000 will become available, and it is pointed out that this sum, added to the general reserve, amounts to rather more than the company's total issued capital. This strong capital position and the provisions available for employees' welfare has been made possible, as Sir Malcolm points out, by the renunciation of past profits by shareholders. Turning to post-war prospects, Sir Malcolm Fraser does not believe that there will be a scarcity of either raw materials or of shipping space. The real danger, he suggests, is that a sudden termination of Government contracts, resulting from its large accumulation of stocks, will find the company in ignorance of probable demand. The company could switch over from war to peace-time production without a week's delay, even though the cable required were of an entirely different character.

if only it knew the nature of the orders that will be placed. Co-ordination between industry and its potential customers, such that plans for the future can be prepared now, is rightly demanded. It is likely, however, that the termination of Government contracts will be more gradual than

suggested. In any case, the abandonment of controls after the war, which Sir Malcolm also wants, is the worst way to secure a smooth and balanced change-over to peace-time production. As was indicated in the White Paper on Employment Policy, the Board of Trade is to be responsible for advising industry on the nature of post-war demand. While its ability to do this is clearly limited at the moment, there is no reason why the co-ordination which Sir Malcolm wants should not be increasingly helped along from this quarter.

#### Radio Engineers Look Ahead

The report on the post-war scope and prospects of the radio industry, issued by the British Institution of Radio Engineers is a reflection of the confidence of the technicians in the future of a new industry which has made rapid technical progress during the war. During the last few years much effort has been expended in the field of communications; the progress achieved will, in the view of the engineers, have a "tremendous" influence in future designs of ultra short wave transmitters and receivers, as well as on the design and use of valves, aerial systems and cathode ray tube equipment. Recent developments in the use of high frequencies and the ability to restrict transmission to narrow paths by directional means will make it possible to use radio extensively for telephone services; institutions such as newspapers, for example, might operate their own communications systems. Electronic devices are already used extensively in industry; they include voltage regulators, speed and process controllers, motor controllers and welding timers, as well as equipment for the detection and control of radiant energy, the control of heat in resistance welding, and the control of temperature in resistive and inductive heating. On the entertainments side, there is great scope in television and in the improvement of broadcasting services. Fundamental research, it is held, should be prosecuted on a "far more vigorous scale," and to this end the Institution has proposed the formation of a British Radio Research Institute. Inevitably, the report is a technical one and concerned mainly with technical progress and its application. But the engineers are well aware of the cost factor; for example, they advocate standardisation wherever this is possible, as in valves and other components. Nor do they overlook the need for developing exports. In their view, the scope for expansion will be considerable; quite apart from the pent-up replacement demand, a new demand may arise as a result of the spread of the knowledge of the advantages and possibilities of radio.

#### Gas Research

The fourth annual report of the Council of the Gas Research Board provides an indication of the scope for research as well as of the progress that is being made. The recent establishment of the Board does not mean that the gas industry has not been aware of the need for research in the past; the industry, in fact, has been one of the most progressive in the matter of research and, as an article on page 815 in *The Economist* of June 17th showed, it has been able to hold its own in competition with other fuels. The Board's function is not so much to supersede research carried on by gas undertakings and manufacturers of plant and appliances as to supplement it, especially in the field of fundamental research. One of the most interesting problems which is being studied by the Board is the complete gasification of British coals; the results of this research have already shown that coals and semi-coke can be converted to gaseous and liquid hydrocarbons by the action of hydrogen under pressure. The idea of complete gasification, of course, is not new; but its commercial development might bring substantial economies.

#### Labour on Transport

In a report on the Post-War Organisation of British Transport, the National Executive Committee of the Labour

UNIVERSITY OF LONDON.—The Senate invite applications (1) for the University Chair of Economic History tenable at the London School of Economics and (2) for the Cassel Chair of Economics (with special reference to banking and currency), tenable at the London School of Economics. Salary not less than £1,250 a year in each case. Applications for the Chair of Economic History must be received not later than July 17, 1944, and for the Cassel Chair not later than August 14, 1944, by the Academic Registrar, University of London, Richmond College, Richmond, Surrey, from whom further particulars should be obtained.

Party has outlined a scheme of nationalisation involving central control and public ownership. The ownership of all transport undertakings—with the exception of "C" licensed goods transport—would be acquired by a National Transport Authority, on the basis of "fair and reasonable" compensation. A Council or Executive of the Authority would be appointed by and responsible to the Minister of Transport. Separate boards, working under the general direction of the National Transport Authority, would be set up for each of the various forms of transport—that is, for the railways, road haulage, road passenger transport, docks and harbours, canals, coastwise shipping and civil aviation. Public control and ownership are advocated as the only means of ensuring effective co-ordination, on which there is, of course, a wide measure of agreement. Like earlier reports advocating the nationalisation of other industries, the plan for transport lacks the factual basis which must be the starting point for any scheme of reorganisation. There is no evidence to suggest that the proposed scheme is the most likely to achieve maximum efficiency. To suggest that the wartime system of control should not be discarded "at the behest of profit-makers" begs the question. It is perhaps inevitable, though nevertheless a pity, that the National Executive Committee is choosing the political approach to the solution of technical problems.

#### The AEU National Committee

The major decision reached by the National Committee of the Amalgamated Engineering Union at its continued conference in Edinburgh was to press for a wage increase of 10s. a week on the base rates of all adult male workers. An alternative proposal, to seek a national minimum wage of £6 a week for skilled workers, was rejected. This decision is separate from the proposal to build up a new structure of engineering wages, which, as indicated in an article in *The Economist* last week, will be a long process—Mr. Tanner said that the Executive Council would probably not be able to formulate a detailed scheme in less than six months. The engineers' most recent claim for a 10s. a week increase was rejected by the employers—the National Arbitration Tribunal awarded an increase of only 4s.—so it seems improbable that the new claim will be successful when it is presented. More pressing is the question of closing the gap between men's and women's rates, and securing the payment of the "rate for the job." The AEU has been seeking evidence about the numbers of women employed on men's jobs, under the Extended Employment of Women Agreement, but according to its General Secretary, Mr. Ben Gardner, so far only 3,000 registrations have been made of jobs transferred from men to women, though there must be very many thousands in fact. The union is concerned about the position under the Restoration of Prewar Practices Act, and it seems that no machinery for registering departures from trade practices, as laid down under that Act, has in fact been set up. At the Conference, a resolution to prevent further entry of dilutees was abandoned, on the representations of the President that this might jeopardise the Second Front, but one, calling on the Executive Council to consider the menace to the standard of skilled workers of continued dilution after the war, was carried. Similar fears about the employment of dilutees and the evasion of the Restoration of Prewar Practices Act were expressed during the last war, but they proved to be groundless. As Mr G. D. H. Cole, in "Trade Unionism and Munitions," wrote:

It was anticipated during the war period that very great difficulty would arise in securing the effective restoration of pre-war practices on the conclusion of the war. In fact this was not the case. Restoration took place. . . . It was carried through . . . with far less friction than any one had supposed to be possible.

It remains to be seen whether history will repeat itself.

#### Hongkong and Shanghai Bank

The accounts of the Hongkong and Shanghai Banking Corporation for 1943 inevitably reveal a picture of suspended animation. Of the bank's eastern branches, only three, those at Calcutta, Bombay and Colombo, remain open to transact profitable business. The bank has an office in Chungking, but the fact that it has moved to larger premises last year should not be taken to suggest that this branch in Free

(Continued on page 859)

## END THOSE BOILERHOUSE BLUNDERS

MANAGEMENTS who put their boilerhouses in order will reap their reward in quick savings of coal—a safeguarding of their production next winter. If you have not thoroughly overhauled your plant, start now. Watch especially for the following points:

- ? Is there any leakage of air through boiler brickwork?
- ? Do the fire doors fit properly?
- ? Do the dampers work properly and are they easily controlled?
- ? Are the boiler heating surfaces clean and free from scale?
- ? Are exposed parts of the boiler and all steam mains, hot-water pipes and feed-water tanks properly lagged?
- ? Is the boiler feed water heated by 'waste' heat and can you increase its temperature by using hot condensate from steam traps?
- ? Is your stoker in need of expert instruction in any part of his job? (If so, it can easily be arranged through your Regional Fuel Efficiency Committee.)

CHECK YOUR ANSWERS WITH YOUR FUEL EFFICIENCY BULLETINS. Those you need are Nos. 1, 2, 9, 10, 20, 27. If you've mislaid them send TODAY to the Regional Office of the Ministry for further copies.

## COMPANY MEETINGS

## HONGKONG AND SHANGHAI BANKING CORPORATION

## CONSERVATION OF LIQUID RESOURCES

## CHINA'S POST-WAR PROBLEMS

## MR A. MORSE'S STATEMENT

The ordinary general meeting of the Hongkong and Shanghai Banking Corporation will be held on 28th instant, at Winchester House, Old Broad Street, London, E.C.

The following is the statement of the chairman, Mr A. Morse, C.B.E., circulated with the report and accounts:—

## PROFIT AND LOSS ACCOUNT

We have been able to prepare a profit and loss account covering the results of our offices not in enemy occupation for the year ended December 31, 1943. Figures in respect of the offices in enemy occupation are, of course, not available, and it will no doubt be realised that as the bank's main field of operations is at present closed to us, the statement before you must be accepted merely as an account reflecting the results of our stewardship of the bank's assets outside enemy control.

The profit of £216,075 18s. 11d. has been arrived at after charging the whole of the running expenses of the free offices and also certain items relating to Far Eastern offices which we have had to provide for, although trading operations in that sphere are temporarily suspended.

## TWO IMPORTANT MATTERS

Among the important matters which your board have constantly in mind, I will refer to two which we consider to be of the utmost importance. One is the primary duty which rests on us of conserving and keeping intact the liquid resources under our control, which amount to a figure of some magnitude and represent a considerable proportion of the bank's total assets. The other is the question of maintaining our organisation in such a state that when conditions permit of resumption of trading in the Far East, we will be in a position to recommence business as speedily and as effectively as possible. We feel sure that our policy in these matters is in the ultimate interests of the shareholders. In pursuance of this policy, and having regard to the fact that it is impossible at present even to estimate with any degree of certainty as to what will be the eventual position of our occupied offices, the board have decided to transfer the balance of £216,075 18s. 11d. to contingencies reserve, and although this means that we are again unable to recommend the payment of a dividend, we know that our reasons will be fully appreciated by all shareholders.

## FAR EASTERN ASSETS

There is relatively little change in the balance-sheet figures during the year under review, and I think I need only mention that the position as regards the Far Eastern assets and liabilities remains substantially the same as it did a year ago, and although we have been able in the interval to realise nearly £700,000 of these assets, it is unlikely that any material reduction can be made in this item until we can resume possession of our occupied offices. The addition during the year of some £350,000 to the liabilities in currencies of enemy-occupied countries is mainly due to the fact that we have now obtained returns in respect of certain offices covering periods prior to enemy occupation, which were not

available when we prepared the 1942 balance sheet.

I regret that we have been unable to make arrangements to legalise the transfer of shares of the Bank on the Hongkong Share Register. The Register is in enemy hands, and our legal advisers have stated emphatically that until we obtain possession of it again, no legal transfers can be made of shares on that Register.

## THE CHUNGKING OFFICE

During the year our Chungking office moved to larger and more suitable premises. Our manager there keeps in close touch with the trend of developments and maintains excellent relations with the official and commercial community. Our offices at Calcutta, Bombay, and Colombo, which are the only other Eastern offices we have operating, continue to do a satisfactory business.

The official exchange rate of the Chinese dollar has throughout the past year remained at a middle rate of 3d. Since 1942, owing to the steadily increasing cost of living in China, this fixed rate has been causing hardship both to charitable and relief organisations dependent on foreign funds, and to foreigners, including diplomats, missionaries, relief workers, etc. The Chinese Government have partially met the situation by granting concessions to certain categories of foreign remittances.

## ECONOMIC SITUATION IN CHINA

As regards the economic situation in China, you all know that the war has caused serious dislocations. President Chiang Kai-shek himself referred in a speech last September to the "deep concern and anxiety" which existed. On March 8th the Government spokesman in Chungking stated that the general index of prices was 230 times the pre-war figure (i.e., of 1937), and the rise continues. It is difficult to evaluate such figures; allowances should be made because of the various steps taken by the Government to alleviate hardship by means of food and other subsidies, and consideration must also be given to the remarkable resiliency of China's internal economy. Yet the danger signals are serious.

China deserves all our sympathy, for no country could have come through the experiences which she has suffered in recent years, without financial strain or worse. Dr H. H. Kung, the Chinese Finance Minister, has had a long struggle against the steadily rising tide of inflation. However, China has the happy assurance that her allies, with their immense resources, will be standing by and, as time passes, their help both for war and post-war needs should be available in a far more practical way than is at present possible.

## HOPE OF INTERNATIONAL ACTION

I think that most business men interested in post-war trade hope for concrete international action to secure collaboration in regard to monetary problems and trade developments. It seems that this view is also widely held in China. You will remember that China adhered to the Moscow declaration of last October, which

recognised the necessity of establishing a general international organisation as soon as possible. Chinese experts have also taken part in the Hot Springs and Unrra conferences, as well as in the discussions which led up to the recent proposals for an "International Monetary Fund."

It is, therefore, to be expected that the Chinese Government will adhere to any joint measures which may eventually be worked out for the promotion of stable currencies and the expansion of world production and trade.

## RELAXATION OF RESTRICTIONS

Last September the Chinese Government made a welcome announcement in regard to the relaxation of restrictions on joint Sino-foreign enterprises. In practice there have rarely, I believe, been any serious difficulties about any such joint concerns, and I do not myself expect the adoption of abnormally restrictive legislation in regard to foreign investment and the operations of foreign companies in China. Such action would not help China's industrial expansion nor her overseas trade. Meanwhile, it is very necessary that the British merchant community should watch developments and in broad outline be agreed on how to set about post-war trading problems. I am glad that the China Association have been directing their energies towards this matter, as those of you who have read their last annual report will be aware.

We were all very glad to see the Chinese Goodwill Mission over here towards the end of last year. I am a great believer in the making of contacts in this way.

The paper restrictions prevent this review from being a more comprehensive one, but I wish to assure shareholders and customers that we are keeping in close touch with all developments in the East, and our information is at their disposal should they wish to direct enquiries to us.

## CALLENDER'S CABLE AND CONSTRUCTION COMPANY, LIMITED

## GOOD RESULTS

The forty-eighth annual general meeting of Callender's Cable and Construction Company, Limited, will be held on July 3rd next in London.

The following is extracted from the statement of the chairman (Sir Malcolm Fraser, Bt., G.B.E.) which has been circulated in full to stockholders, with the directors' report:—

It will be observed that the profit, after making provision for taxation, is £566,363; and that when we have debited depreciation at the same figure as last year (£80,000) and directors' fees, there remains a balance of £485,115.

After adding the balance brought forward from the previous year, £306,552, we have a total available of £791,667. Dividends paid during the year upon both classes of preference stock, and an interim on the ordinary stock, amount to £112,196, and leave us with a figure of £659,471.

Your directors have decided to transfer to reserve for war contingencies, etc., the sum of £175,000, earmarked as a contingent reserve for reinstatement of employees in the fighting services, under the Reinstatement in Civil Employment Act, 1944, to pay a final dividend upon the ordinary stock of 10 per cent., absorbing £112,391, and, in addition, a cash bonus of 5 per cent. (both less tax), on all the issued ordinary stock which would take another £56,196.

These altogether total £343,587, leaving a balance to be carried forward of £315,884—an increase of £9,332 on the preceding year. As the figures show, the general trade of the company has been satisfactorily maintained. Stockholders will, I believe, regard the results of the year with considerable satisfaction.

## J. LYONS AND COMPANY, LIMITED

## ANOTHER SATISFACTORY YEAR

## MR HARRY SALMON'S STATEMENT

The fiftieth ordinary general meeting of J. Lyons and Company, Limited, was held, on the 21st instant, at the Trocadero Restaurant, London, W.

## REPORT OF THE DIRECTORS

## FOR THE YEAR ENDED MARCH, 31, 1944

The directors report that the balance of the trading account for the year ended March 31, 1944, after providing reserve for contingencies, is £905,890, which, together with the balance of £399,579 brought forward from last year makes a total of £1,305,469 available for distribution. The sum of £490,353 has been paid or provided for dividends on Preference and Preferred Ordinary Stock to March 31, 1944, and the sum of £92,814 has been paid for interim dividends on Ordinary, "A," Ordinary and Proportional Profit Stock and "B" Proportional Profit Shares.

The Directors propose to deal with the balance by paying a final dividend of 3s. per £1 unit of Ordinary and "A" Ordinary Stock, absorbing £249,941, and a final dividend of 7.2d. per £1 unit or share respectively on the Proportional Profit Stock and "B" Proportional Profit Shares, absorbing £28,500. The balance to be carried forward to next account is £443,861.

The dividends received from subsidiary companies have been included in the company's trading account. In the aggregate the results of the subsidiary companies' trading show a profit. Losses of subsidiary companies so far as they concern this company have been dealt with in this company's accounts.

Messrs Geo. W. Booth and L. Gluckstein, ordinary directors, and Messrs. L. H. Lampitt and W. H. Gaunt, employee directors, retire and, being eligible, offer themselves for re-election.

Messrs Turquand, Youngs, McAuliffe and Company, the auditors, retire and are eligible for re-election.

(Signed) HARRY SALMON,  
M. SALMON,  
Managing Directors,  
CADBURY HALL, LONDON, W.14.  
June 5, 1944.

## MR HARRY SALMON'S STATEMENT

The accompanying report and accounts are those of the fiftieth year of the company. This is a landmark in its history; but, in the midst of the greatest war the world has known, the event loses some of its significance. I feel, too, that it is inappropriate to attempt to survey the company's growth and progress over that long period—a record of which its members may, I venture to think, justifiably feel proud.

## CONTINGENCY RESERVES STRENGTHENED

We must be satisfied that we have been able to continue a steady rate of dividend, though something less than the rate in pre-war periods, and that we have been able to add further to our contingency reserves, the need for which must, in the days to come, be greater than ever. We shall have a flood of contingencies to meet, at the end of the war, which will make great inroads on those reserves, for there are many things which we have had to leave undone during the war period, the cost of which cannot at present be calculated.

I do not think it necessary to comment on any of the figures in the balance-sheet.

A comparison of the assets and liabilities with those of last year is set out as usual, and the differences are no more than normal. The business has been maintained throughout the year, in so far as that has been possible, for output is limited by the material and labour available. It is obvious that the volume would have been greater but for these shortages. In the fifth year of war, we may, perhaps, hope that the need for further curtailment of business, by reduction of materials and transference of labour, will shortly have passed.

Apart from the contribution to the war effort which the nature of our business enables us to make—for feeding the nation is an important war task—we continue to carry out for Government departments various undertakings, the nature of which we cannot, of course, mention in detail. These undertakings, being outside the range of our ordinary activities, have entailed some dislocation which, in turn, has meant reorganisation and extra effort, not to be measured only by their volume.

## POST-WAR PROBLEMS

We have been giving attention to the many problems which will have to be solved when the war is over. I mentioned, last year, that control of distribution and concentration of production brought about by Government orders, had resulted in the exclusion of our products from certain parts of the country. The recovery of these lost areas of distribution will be one of these problems. There are others, even more important, such as the restoration of standards which, unfortunately, we have been forced to lower. But this will only mean getting back to where we were, and will not be enough; there must also be further improvement and development. In our view industrial efficiency, which will be so essential to the country after the war, can be maintained only on a basis of originality of thought and hard work, and we hope that freedom to exercise these qualities will be restored at the earliest date. We are convinced that under a system of Government controls this company's progress during the last fifty years would have been impossible; nor would the public have been so well served. In the meantime, the day-to-day running of our varied and complex business is a very arduous task, for every transaction demands greater vigilance and greater effort than in normal times.

## TRIBUTE TO STAFF

I want, once again, to pay a tribute to the staff who have given us their loyal support throughout the year. A happy relationship with them has always prevailed; indeed, the maintenance of it has been our constant care. It still prevails; not less among the newcomers than among the now greatly reduced number of pre-war employees.

I regret to have to say that, during the year, a number of our employees have lost their lives in the service of the country. I am sure members will share our deep sorrow in this loss and our sympathy with the bereaved families. We greet, in your name and in ours, the very large number of employees who are serving in the Armed Forces in all parts of the world—a number which has again increased since last year. We maintain touch with them, and have continued to assist them by allowances according to their needs and circumstances. They know, and appreciate, our interest in their welfare and that of their families. We look forward to the happy day when victory will return them to us.

## WHITEHALL ELECTRIC INVESTMENTS LIMITED

## TEN YEARS' ACHIEVEMENT

The twenty-second ordinary general meeting of Whitehall Electric Investments, Limited, will be held, on the 28th inst., at Winchester House, E.C.2.

The following is a summary of the report of the directors for the year to March 31, 1944:—

|                                                                                                                                                                                                                           |         |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|
| The consolidated gross income of the three companies amounts to £228,056 and the net income, after charging £17,510 for expenses, £55,259 for loss on realised investments and after transferring £32,701 to reserves, is | 122,586 |
| The provision for U.K. and Canadian income tax and the payment net of the preference dividend absorb a total of                                                                                                           | 102,385 |
| and the undistributed balance at £394,406 shows an increase in the year of                                                                                                                                                | 20,201  |

## CONSOLIDATED ASSETS

Consolidated assets have been valued by the directors at March 31, 1944, as follows:—

|                                                                                                                           |            |
|---------------------------------------------------------------------------------------------------------------------------|------------|
| West of England, at cost                                                                                                  | 865,000    |
| \$6 preferred stock of American and Foreign Power, at market price \$77½                                                  | 1,989,235  |
| Other electrical and non-electric investments, at market prices, except £15,571 at or under cost; and net floating assets | 1,085,512  |
|                                                                                                                           | £3,939,747 |
| The value of the net assets attributable to the company, excluding Athens, is                                             | 3,853,032  |
| Deduct therefrom the preference stock, namely                                                                             | 1,250,000  |
| Leaving for the ordinary stock, excluding Athens                                                                          | £2,603,032 |

Greece remains in enemy occupation and no information is available regarding the Athens undertakings.

## RECORD OF PROGRESS

The West of England companies may not give any information about their wartime activities; but it is considered opportune to record the progress made during the ten years prior to the war.

The area is mainly rural and sparsely populated, the number of inhabitants being only 151 per sq. mile and the industrial load relatively small. Nevertheless, by 1939 the companies were supplying over 41,000 consumers, which is equal to 70 per cent. of the total number of occupied premises. Consumption was raised in the decade from five million units annually to 26 million units, all alternating current at the standard voltages. There is a uniform system of tariffs, and up to the outbreak of war development was actively encouraged by facilities for rental, wiring and the hire of appliances.

The development during these ten years has enabled the companies to make their due contribution to the war effort and affords an example under private ownership of initiative, enterprise and achievement.

# MARKS AND SPENCER LIMITED

## JUBILEE YEAR—WONDERFUL GROWTH

### MR SIMON MARKS'S STATEMENT

The 18th ordinary general meeting of Marks and Spencer, Limited, was held, on the 20th instant, at the registered office of the company, Michael House, 82, Baker Street, London, W., Mr Simon Marks, D.Sc. (chairman and managing director), presiding.

The secretary (Mr B. W. Goodman, A.C.A.) read the notice convening the meeting and the report of the auditors.

The following is the statement of the chairman which had been circulated with the report and accounts, and was taken as read:

The following statement has been prepared for the information of shareholders in place of the chairman's speech at the annual meeting of the company on June 20, 1944.

Although this is our eighteenth annual general meeting, this year is, in fact, the jubilee of the foundation of Marks and Spencer. In 1894, fifty years ago, my father, Michael Marks, took Thomas Spencer into partnership in the business he had started some years previously, and with a capital of £753 the firm of Marks and Spencer came into being.

We are glad to have Mr I. M. Sieff with us again. He has returned from America, where he initiated and developed the company's export business. A substantial amount of dollars was made available to His Majesty's Treasury as a result of these activities, which have had to be suspended owing to the Government policy of limitation of production for export.

### ALLOCATION OF PROFITS

The net profits for the year (53 weeks' trading) are £1,574,029, compared with £1,457,467 last year (52 weeks' trading).

Before determining these profits we have made our usual provision for depreciation, and have allocated a further £50,000 to the deferred repairs reserve, which now stands at £250,000. The results include the profits from the trading operations of the Marks and Spencer Export Corporation since its inception.

Provision for taxation is £790,000, compared with £863,000 a year ago, but last year's figure included £150,000 to complete the provision required to meet income-tax payable in the future on profits earned to date. The company's tax liability on profits for the five years to date has not yet been finally determined, but it is considered that adequate provision has been made.

With £704,015 brought forward, there is available for distribution £1,488,044, which compares with £1,166,407 a year ago.

The directors propose a final dividend of 20 per cent. on the Ordinary and "A" Ordinary share capital, making 35 per cent. for the year, leaving £1,024,852 to be carried forward.

### RESERVES AND SURPLUS

Reserves and surplus, £3,636,152, compared with £3,300,020 a year ago.

Assets.—The freehold properties depreciation reserve which formerly stood on the liabilities side of the balance-sheet is shown as provision for depreciation and deducted from the freehold properties. This item capital assets, which are all shown after the provision for depreciation.

The increase in the amount invested in subsidiary companies represents the purchase of the share capital of a business which came into the market on the death of the principal shareholder.

Our investments in national securities at £1,207,600 have increased by £234,000 during the year, and we have earmarked another £200,000 for investment during the various "Salute the Soldier" weeks.

### GENERAL SURVEY

The stock-in-trade at £1,139,436 shows a decline of £160,637 compared with last year and is at the lowest level since 1936. The fall is the inevitable result of war-time restriction and regulation of production of consumer goods.

Within the limits set to initiative by utility production we have been able to make some improvements in quality and design, which should beneficially affect the range and standard of our goods after the war.

Over 1,000,000 square feet of space in our stores throughout the country are being utilised by the Government for a variety of war-time national purposes. This reduction of space, together with the decreased range and quantity of goods available, has caused us to reduce our counter footage by over 50 per cent. as compared with 1939.

There has been a further drop in our full-time staff, which now numbers some 9,000 as against 20,000 before the war. Of our pre-war staff, the great majority of whom are in the Services or engaged in other work connected with the national war effort, only 2,500 remain in our employ.

We have continued to maintain close and cordial relations with our suppliers. We are glad to say that by effective co-operation we have been able, together, to surmount many difficulties. We thank them for their valuable collaboration.

### WELFARE AND STAFF

We are maintaining our welfare services at as high a level as is possible in present conditions. A number of our employees are now receiving pensions from the Marks and Spencer Benevolent Fund, after long and faithful service with the company. This fund was established in 1936, primarily for the benefit of staff not covered by the group pension scheme inaugurated in the same year.

Over 1,500 of our men have joined H.M. Forces. They have suffered further casualties during the year and it is with deep regret that I have to inform you that up to date 56 have been killed in action, 10 are missing and 53 are prisoners of war. To their families we extend our deepest sympathy.

A number of distinctions have been awarded to our men in the Services and we congratulate them on the honours they have earned.

Our scheme of supplementary allowances for the men in the Forces continues in operation. We maintain contact as much as is possible with them, and we look forward to their speedy return.

I would ask you to join the board in thanking all members of the staff for their loyal service to the company in times of much difficulty.

The chairman then moved the adoption of the report and accounts and the confirmation and payment of the dividends recommended.

Mr Israel M. Sieff, B.Com., the vice-chairman and assistant managing director, seconded the resolution, which was carried unanimously.

The retiring directors having been re-elected, and the auditors re-appointed, Mr H. M. Wolff proposed a hearty vote of thanks to the chairman, directors and staff and in doing so congratulated the chairman on the honour he has received, and himself and the board for the excellent results achieved.

Mr Gordon Jacobs seconded the vote, which was cordially approved, and a brief acknowledgment by the chairman brought the proceedings to a close.

# LONDON AND MANCHESTER ASSURANCE COMPANY, LIMITED

## SATISFACTORY RESULTS

Mr A. H. Dawes, chairman, presiding at the seventy-fifth ordinary general meeting of the shareholders, held in London, on the 21st instant, in the course of his speech, said: I think you will consider the results very satisfactory.

The premium income for the year was £4,149,988, an increase of £245,172 over the previous year. The income from all sources passed the five million mark for the first time—the actual figure, £5,301,438, showing an increase of £304,562. The total funds advanced during the year by £1,878,526 to £27,279,546.

The new sums assured for the year in the ordinary branch at £2,716,430 exceeded the previous year's figure by £173,745. The premium income amounted to £1,730,385, an increase of £138,072. Claims by death (including £37,549 in respect of war claims) amounted to £248,666, compared with £257,172. The amount paid on maturity of endowment assurances was £814,836, an increase of £73,639. Surrenders were again lower at £24,339. The ratio of commission and expenses to premium income was slightly lower at 12.77 per cent. The ordinary branch fund at the end of the year amounted to £15,420,507, having increased by £835,041. The rate of interest earned on the fund, after deduction of tax, at £3 ros. 4d. per cent. was higher than for the previous year.

In the industrial branch the premium income amounted to £2,329,593, an increase of £108,961. Death Claims (including £34,372 in respect of war claims) amounted to £768,845, being £88,437 more than in the previous year. This increase was due mainly to the influenza epidemic experienced during the winter months. Until the middle of November the amount paid in death claims was almost the same as for the corresponding period of the previous year. Maturities amounted to £143,145 and surrenders to £10,674. A noteworthy feature was the further decline in the expense ratio—it fell from 32.1 per cent. to 30 per cent. The fund at the end of the year amounted to £10,738,087, showing an increase of £944,940. The rate of interest earned on the fund was £4 ros. 11d. per cent. gross and £3 17s. 4d. per cent. net.

The valuation of assurances has actually been made on a basis of 2½ per cent. interest throughout, coupled with the most modern tables of mortality. The surpluses disclosed after this strengthening, apart from the interim bonuses allowed during the year, are in the ordinary branch £1,313,356, including £942,337 brought forward, and in the industrial branch £415,789, including £153,405 brought forward.

It has been decided to pay on ordinary branch participating policies which become claims by death (except policies less than one year in force at date of death) or survival during the current year, an interim bonus at the rate of £1 per cent. on the sum assured in respect of each year's premium paid due between March 24, 1939, and March 24, 1944. In the industrial branch it has been decided to allow interim bonuses on the same basis as a year ago.

After reserving the sum of £55,000 for the trustees of the staffs' pension fund and transferring £100,000 to the investments reserve fund and £80,273 to the profit and loss account the balances of surplus £1,228,356 and £265,515 have been carried forward in the ordinary branch and the industrial branch life funds respectively.

The premium income in the fire and general branch amounted to £86,713, compared with £88,566 in the previous year. A profit of £5,340 has been carried to the profit and loss account.

# FORSTER'S GLASS COMPANY LIMITED

## WORKING TO CAPACITY

The twenty-fifth annual general meeting of Forster's Glass Company, Limited, was held, on the 22nd inst., in London, Colonel Charles E. Ponsonby, T.D., M.P. (the chairman) presiding.

The following is an extract from the chairman's statement circulated with the accounts: There is a decline in trading profit. Various causes have contributed to this—transport, materials and labour. It will be readily understood how restrictions of transport in all forms—often sudden and unexpected—affect our business. Not only do they involve additional handling and storage charges, but upset regular deliveries to our customers. Transport troubles also affect the return of empties, and this accentuates the shortage of packing materials. With regard to other raw materials for manufacture, the supply has not been unsatisfactory. While the factory has been working to full capacity, we (like all manufacturers) have suffered from shortage of labour.

The profit for the year, after meeting all expenses and after adjustment of taxation reserves, amounts to £57,095, as against £69,255 last year. The directors recommend the distribution of a dividend of 10 per cent. and a cash bonus of 5 per cent. on the ordinary shares, both less income tax, making a total distribution of 15 per cent. for the year (the same as last year).

The cash position at a first glance would appear to compare unfavourably with that of last year (£65,499, as against £161,101). A closer examination, however, reveals that

(Continued from page 855)

China is increasing its contribution to total earnings. The value of this office is to be assessed in terms of future profits. It maintains contact with the Chinese authorities and provides a springboard from which the bank will ultimately make its return to the ports where the bulk of the business and the profits are normally to be found. The statement of the chairman, Mr A. Morse, to shareholders stresses the difficulties through which China is now passing. He pointed out that on March 8th the general index of prices in Chungking was 230 times the 1937 figure, which suggests that the rate of inflation has been considerably stepped up in recent months. Even though exchange concessions have been made in personal and other remittances to China, these have in no way compensated for the depreciation in the domestic value of the currency, and considerable hardship has been caused to foreigners who have had to subsist on remittances from abroad. Mr Morse, however, recalled the astonishing traditional resilience of economic life in China. These powers of recovery, allied to the help that should reach China from the great powers after the war, should quickly restore the situation. The latest balance sheet of the bank shows an abnormal liquidity in free assets. Of total assets of £85,309,905, those in enemy-occupied territories or otherwise immobilised by the war amount to £40,785,847. Of the balance, £21,289,880 was at the end of last year invested in gilt-edged securities, £10,850,000 was lent at call and short notice and £2,532,436 was kept in cash. This may not represent a very remunerative state of affairs, but it is one from which the bank will find it easy to resume more active business when the opportunities for it recur. For the first time since the Japanese occupation of Hongkong it has been possible for the bank to prepare a profit and loss account. The account for 1943 shows a profit of £216,075, the whole of which is being transferred to contingencies reserve.

## Southern Rhodesian Production

The impact of the war on Southern Rhodesian industry has resulted in a well defined tendency toward self-sufficiency typical of many countries which find themselves cut off from former sources of supply. The recently published second report on the Census of Industrial Production, 1938-42, compiled by the Southern Rhodesian Government's Department of Statistics, surveys the progress of industrial development during those years. The figures refer only to the type of productive and repair

every other item of liquid assets shows an increase and that creditors and taxation liabilities both show decreases. Our liquid position has in fact been further strengthened during the year.

We are still receiving very heavy demands for our products, and are doing our utmost to meet those demands.

## CONSOLIDATED AFRICAN SELECTION TRUST, LIMITED

### MR. A. CHESTER BEATTY'S REVIEW

The adjourned nineteenth annual general meeting of this company will be held at Selection Trust Building, London, E.C., on the 29th instant.

The following is an extract from the report of the directors which embodies the annual statement by Mr A. Chester Beatty, the chairman. The net profit for the year ended June 30, 1943, was £912,230, compared with £440,427 for the preceding year, and the application of this sum is shown by the annexed appropriation account. Out of this profit a provision for taxation has been made totalling £494,000, as against £157,500 in the preceding year. This provision for taxation, which includes Excess Profits Tax, has had to be estimated on a somewhat uncertain basis as there is an outstanding tax question, and also the Excess Profits Tax standard has not yet been agreed with the authorities.

The incidence of Excess Profits Tax is such that, so far as can now be judged, the portion of the total profits which will remain available for distribution in any subsequent year when this tax is payable is unlikely to exceed an amount sufficient to pay somewhere about 1s., free of tax, per stock unit.

The total of the two dividends for the year of 1s., free of tax, compares with 7½d. for the previous year. An interim dividend of 4½d. per unit of stock, free of income-tax, in respect of the year ended June 30, 1944, was paid on June 12, 1944.

The 178,825 preference shares which remained outstanding were redeemed on July 31, 1943, at 22s. per share, in accordance with the preliminary announcement made in the directors' report for the year ended June 30, 1942. The effect of this redemption will be reflected in the accounts for the financial year to June 30, 1944.

## RIO DE JANEIRO CITY IMPROVEMENTS COMPANY LIMITED

The eighty-second ordinary general meeting of this company was held on June 14 in London, Lieut.-Col. Francis M. G. Glyn (the chairman) presiding.

The following are extracts from the chairman's statement circulated with the report:—After providing for all contingencies, there remains a profit for the year of £67,008.

The board has therefore decided to recommend a special bonus of 8½ per cent., free of income tax, relating to the arrears of drainage rents for the years 1933 to 1936. I must emphasise that this bonus is non-recurrent and is only available because the Brazilian Government acknowledged, in a fair and equitable manner, our claims for arrears of drainage rents payable in those years.

The report was unanimously adopted.

work normally found in the Colony in peace time. Production of a military nature has, of necessity, been disregarded. The accompanying table is taken from the report, and is a total of all factory and workshop trades.

### PRODUCTION IN FACTORY TRADES.

|      | No. of Establishments | Gross Output | Cost of Materials, Fuel, etc. | Net Output  | Nos. Employed | Salaries and Wages | Net Output per £100 Salaries and Wages |
|------|-----------------------|--------------|-------------------------------|-------------|---------------|--------------------|----------------------------------------|
| 1938 | 303                   | £'000 4,561  | £'000 2,465                   | £'000 2,095 | 14,794        | £'000 970          | £ 216                                  |
| 1939 | 292                   | 4,859        | 2,590                         | 2,269       | 15,166        | 1,038              | 219                                    |
| 1940 | 300                   | 5,768        | 3,194                         | 2,574       | 17,729        | 1,198              | 215                                    |
| 1941 | 303                   | 6,796        | 3,724                         | 3,072       | 19,891        | 1,201              | 256                                    |
| 1942 | 294                   | 7,811        | 4,293                         | 3,518       | 21,523        | 1,353              | 260                                    |

\* Excess of gross output over cost of materials, fuel, etc.

The figures do not take into account changes in prices, but there is no doubt that an increase in production has been achieved. This has been accomplished almost entirely by drawing upon native labour. Their numbers rose from 12,319 in 1938 to 18,833 in 1942, while Europeans in factory and workshop trades added only 215 to these numbers in the same period, to bring the total in 1942 to 2690. The most spectacular rise in net output is in the section covering oils, seed crushing, soap, perfumes, candles, polishes and allied trades. Net output rose from £44,936 in 1938 to £128,195 in 1942. Net output per £100 salaries and wages rose from £200 to £379 in the same period. Net output of the tobacco trades almost doubled, and other sections which show great progress are some branches of the food trades, the clothing trade and the metal manufacturing trades.

## Correction

In a Note entitled "Currency in France," on page 818 of *The Economist* of June 17th the following statement was erroneously attributed to the French authorities in London:

One learns that each British and American soldier has been provided with 200 francs in Bank of France notes, taken from reserves of paper money which exist abroad. Because of the small number of notes of small denominations in these reserves each British and American soldier has at the same time received a part of the sum allotted to him in military currency. This statement is part of an official communication from SHAEF.

## FINANCE AND BANKING

**THE MONEY MARKET.**—The position in the money market has been comfortable, but without any superabundance of funds. With the end of June in sight, the banks are not buying bills on any sizeable scale, and the market's portfolios are increasing appreciably. Last week the market obtained a 40 per cent. allotment at the tender for Treasury bills, and the bills sold to the banks this week cannot have matched in volume the new bills that had to be taken up. The banks, however, have had ample resources to lend to the market. The TDR call on them this week amounted to £100,000,000, but was approximately matched by effective maturities. Floating debt borrowing has, therefore, been small, amounting to no more than the £20,000,000 excess of Treasury bills issued over current maturities. The Bank return shows an expansion of £11,759,000 to £179,936,000 in bankers' deposits, a movement in keeping with the conditions apparent in the short-loan market. A further reduction of £4,071,000 in the note circulation has contributed to this movement. The Salute the Soldier campaign is said to be unearthing a considerable amount of money previously hoarded in the form of notes.

**MONEY RATES, LONDON.**—The following rates remained unchanged between June 15th and June 22nd:—  
Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1¾%; 6 months, 1½-1¾%. Treasury Bills: 2 months, 1-1½%; 3 months, 1-1½%. Day-to-day money, 1-1½%. Short Loans, 1-1½%. Bank deposit rates, ½%. Discount deposit at call, 1%; at notice, 1%.

**Exchange Rates.**—The following rates fixed by the Bank of England remained unchanged between June 15th and June 22nd (Figures in brackets are par of exchange).  
**United States.** \$ (4.861) 4.021-031; mail transfers 4.021-031. **Canada.** \$ (4.861) 4.43-47; mail transfers 4.43-47. **Switzerland.** Francs (25.223) 17.30-40. **French Empire.** Francs 1974-2004. **Syria.** p. 8-81-85. **Sweden.** Krona (18.159) 1.1. 16-85-95. **Dutch West Indies.** Florin (12.11) 7.58-62. **Portugal.** Escudos (110) 99-80-100-20; mail transfers 99-80-100-30. **Panama.** \$4-02-04; mail transfers 4.02-04. **Brazil.** 83-64 cr. (buying); mail transfers 83-56. **Uruguay.** 7.6597 p. (buying).  
**Fixed Rates for Payment at Bank of England for Clearing Offices.** **Spain.** Pesetas 44-00. **Turkey.** Piastres 520. **Italy.** 71.25 lire.

**Market Rates.**—The following rates remained unchanged between June 15th and June 22nd.

**Egypt.** Piastres (971) 971-1. **India.** Rupee (184. per rupee) 174-18. **Belgian Congo.** Francs 1761-2. **China.** National \$3-34. **Iran.** R. 128-130. **Special Accounts** are in force for Chile, Peru, Bolivia and Paraguay, for which no rate of exchange is quoted in London. Rate for payment into Argentine special account: 16-13 pesos.

**Forward Rates.**—Forward rates for one month have remained unchanged as follows: **United States.** ½ cent pm-par. **Canada.** ½ cent pm-par. **Switzerland.** 3 cents pm-par. **Sweden.** 3 ore pm-par.

## GOVERNMENT RETURNS

For the week ended June 17, 1944, total ordinary revenue was £36,810,000, against ordinary expenditure of £91,940,000 and issues to sinking funds of £100,000. Thus, including sinking fund allocations £1,940,027, the deficit accrued since April 1st is £731,699,000 against £802,315,000 for the corresponding period a year ago.

## ORDINARY AND SELF-BALANCING REVENUE AND EXPENDITURE

A change has been made in the method of showing an excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £333,053 to £2,850,129, the other operations for the week (no longer shown separately) raised the gross National Debt by £55,696,632 to £20,324 million.

(Continued from page 860)

## INDUSTRY AND TRADE

**Milk Marketing Board.**—During the year ended March 31, 1944, the Milk Marketing Board paid £97,120,563 to wholesale milk producers, against £88,052,530 in the previous year. The total number of wholesale producers increased by 2,679 to 128,429, and registered producer-retailers decreased by 2,172 to 55,943. The Board's expenditure rose by £39,486, or the equivalent of 8 per cent.

**Standards Review.**—The British Standards Institution has begun the publication of a quarterly, *Standards Review*, which will be obtainable by non-members at 2s. per copy. The first number contains articles on the work of the Institution, on standardisation in housing, organisation, packaging and electrical equipment. The review has been issued "in response to many suggestions that the work of the Institution be given greater publicity." It will include also information on the progress of standardisation overseas.

**This Year's Acreage.**—The dry winter and spring has affected crops in many parts of the country, and this year's harvest is not expected to produce bumper crops. On the other hand, the area

under crops exceeded last year's records, as can be seen from the accompanying table. Although the area under wheat smaller, the acreage is larger than was expected. The wheat has not affected wheat as much as some other crops. Hay and root crops are expected to be lighter. This year's potato acreage is approximately the same as last year's, but efforts have been made to improve yields in areas not specially suitable for the crop. Volunteers for the harvest are urgently needed, since this year no help can be expected from the Services.

## CROPPING IN ENGLAND AND WALES

## United Kingdom

## Industry and Trade

If the process of mobilising Britain's resources for war was largely completed in 1942, the past year has been one of sustained and total effort probably unequalled in its history.

The civilian sector of industry and trade had to give up such resources as it could still spare without depriving the population of the essentials of life. The minimum need for food, clothing and other essentials was met; this distribution was probably as fair as it could be made in times of war. Price control ensured that even the lowest income categories could purchase their share of the small supply of essential goods and services; efficient rationing ensured distribution according to needs rather than money demand.

The war sector of the British economy rose to new heights of achievement, in output as well as in flexibility. War production could not be raised by another 50 per cent as between 1941 and 1942, but it reached a record over the whole field of munitions.

As important as the total volume of munition output was the production of the types required in the proportions needed by the Services. During 1943, as Mr Lyttelton, Minister of Production, has pointed out, the emphasis in production has shifted more and more, in accordance with changing strategic needs, to the newest types of aircraft, weapons and devices of every kind. The fulfilment of changing demands called for a high degree of adaptability and flexibility on the part of workers and managers. The number of workers was increased by 203,000 in the manufacture of aircraft, and by 64,000 in naval construction and other Admiralty work, while those engaged on the production of equipment for the Army was reduced.

The reduction in merchant shipping losses and the growing volume of shipbuilding in North America has ensured a steady flow of the raw materials required for the fulfilment of the production schedules of civilian goods and munitions. On the other hand, coal, the main home-produced raw material, was in short supply; production in 1943 was smaller than in 1942.

## Agriculture

The dispute between the National Farmers' Unions and the Government over prices in the winter of 1943-4 generated much political heat. It appears, however, that farmers were in fact more concerned over the Government's still unannounced plans for post-war agriculture than the details of the prices then under discussion. Much interest was shown during the year in unofficial plans; memoranda on this subject were published by the Royal Agricultural Society, the Central Landowners' Association, the National Farmers' Union, the Council of Agriculture and the Conservative Agricultural Committee. The Luxmoore report dealt with the future of agricultural education; the Forestry Commission produced a plan for post-war forestry; the Hill Sheep Committees for England and Wales and for Scotland reported in favour of further Government assistance to restore and maintain the hill sheep industry.

## Manpower and Labour Conditions

The stringency in manpower which was already beginning to be felt in 1942 became more marked in 1943. Two measures in particular indicate the strain placed on labour resources: the extension of women's registration age to 50 and the decision to conscript men for the mines as an alternative to service in the armed forces.

The extent of mobilisation at the end of the year can be seen from the following facts: Out of a total adult population of 33.1 million available for work (i.e., those aged between 14 and 60) 22½ million were engaged in the Services or in vital employment. Of these 15 million were men and 7½ million women, while a considerable proportion of the remainder were housewives or engaged in voluntary service. There was a further expansion in the numbers of women employed. It was estimated that 90 per cent of the single women and over 80 per cent of the married women without children between 18 and 40 were engaged on work of national importance. Whereas in 1940

(a) From March, 1942, figures are exclusive of men classified as unsuitable for ordinary industrial employment, and women unsuitable for normal full-time employment.

\* Number of working days lost.

women represented only 12 per cent of the labour force in aircraft production, the proportion had been increased to 40 per cent in 1943. In munitions industries as a whole, including shipbuilding, about a third of the workers were women.

Unemployment figures showed a substantial reduction. The average for the year was 93,408, compared with 125,311 in 1942—the lowest figure for nearly 20 years. About 8½ million workers were covered by Essential Work Orders.

Important changes in the production programme, in order to meet operational requirements, came into effect and overriding priority was given to aircraft production. This involved a large-scale transference of productive resources and a curtail-

THE CHARTERED BANK OF INDIA  
AUSTRALIA AND CHINA

ment of the Ministry of Supply programme. Recruiting for the Women's Auxiliary Services and the Women's Land Army was suspended, the comb-out of workers in less essential industries and services was accelerated, and wherever possible labour was directed into aircraft factories. The numbers engaged on aircraft work increased by 203,000 during the year. There was also an increase of 64,000 in the numbers engaged on naval construction. The changes, on balance, were carried out smoothly, but a certain amount of hardship was inevitably incurred over the transference of labour in individual cases.

There was some increase in industrial unrest, which was due not so much to wages grievances as to an increase in general war strain. Most of the stoppages were of short duration. In 1943, 1,810,000 working days were lost as a result of trade disputes, affecting about half a million workers, compared with 1,530,000 days lost in 1942. Over half the stoppages occurred in coal-mining, but one of the longest was that of 7,000 engineers at Barrow in October, which cost nearly 100,000 working days. There was little change in industrial relations; the number of joint production committees increased to about 3,000. An important development was the creation of national conciliation machinery for the coal-mining industry.

Increases in rates of wages were granted in most of the principal industries. In agriculture, the national minimum was raised to 65s. a week; the National Arbitration Tribunal awarded engineers a 6s. increase for timeworkers, the consolidation of part of the national bonus in the basis rate and an

(a) Index (1924=100) compiled by Prof. Bowley, eliminating seasonal fluctuations.  
(b) Ministry of Labour Index for 1st of month (July 1, 1914=100).

addition to the pieceworkers' minimum percentage; railway workers were awarded a flat rate increase of 4s. 6d. a week. Other industries in which increases were granted include cotton spinning and weaving, clothing, food, drink and tobacco, chemicals, building and contracting, and distributive trades. The only industry in which there was no general change in rates was coal-mining, though the miners applied at the end of the year for higher minimum wages.

There were few changes in normal working hours, though less overtime was worked than in earlier years of the war. The

general working-class cost of living showed little change, owing to the stabilisation policy adopted by the Government.

Increased attention was paid during the year to industrial health and welfare. An important conference on Industrial Health was called by the Minister of Labour in April. By August (latest date for which figures are available) there were 10,462 works canteens in operation, including canteens on docks and building sites. By the end of the year there were 881 colliery canteens, covering 96 per cent of the miners, though only about half this number provided full meal services.

A great deal was done, largely on the initiative of the Minister of Labour himself, to raise the standards of the lower-paid sections of the working-class and to extend the principle of national minimum wages. The Catering Wages Bill, introduced in February, was designed to improve the pay and working conditions of catering workers. The Hetherington Committee was appointed to make recommendations for improving the wages and conditions of domestic staff in hospitals and institutions; the Rushcliffe Committee did the same for nurses in hospitals and public health service. The recommendations of both these Committees were accepted by the Government.

Apart from their effect on recruitment for such jobs as domestic service in institutions and nursing, which were given high priority by the Ministry of Labour, these improvements have a long-term significance. Two other measures initiated during 1943, the Reinstatement in Civil Employment Bill and the Disabled Persons Bill, provide further evidence of the increasing attention which was paid during the year to the problems of the demobilisation period and the transition from war to peace.

### Commodity Prices

THE trend of costs and prices remained upwards in 1943, but the rate of increase has generally been small, thanks to the efficiency of price control in essential civilian goods and military stores.

The Economist's index of wholesale prices, given in detail on page 16, as well as the Board of Trade's, were only slightly higher at the end of 1943 than a year earlier. Coal is one of the few important raw materials with a more than average rise in price, due mainly to higher wages unaccompanied by an increase in productivity.

The Ministry of Labour's cost of living index remained virtually unchanged throughout the year, though this has meant an increase in the subsidy required for its stabilisation.

Wage rates, as distinct from earnings, have shown a further small rise. According to the Ministry of Labour, the average level of full-time weekly wage rates in all industries for which information is available was between 4 and 5 per cent higher at the end of 1943 than a year before.

Changes in the average prices of manufactured goods are not recorded by monthly index numbers, but there are indications that price control has remained effective, both for essential civilian goods and munitions.

Where money demand was free to exert its pressure, as in luxuries and in existing uncontrolled durable goods, substantial price advances have indeed been recorded; but those exceptions merely emphasise the continued success of price control over the broad field of goods and services.

## Finance and Investment

### The Stock Exchanges

POSSIBLY the feature of the British stock market during 1943 was the virtual stability of the general level of fixed-interest securities taken as a whole. The old year ended with the average yield on industrial equities rather above that on industrial preferences, according to the figures of *The Actuaries' Invest-*

ment Index. January saw the position reversed; by August the equity yield was well below the other, and not until the November recession did it rise well above once more. On the year both these yields fell by 0.04 per cent. As to prices, the

#### BRITISH AND AMERICAN INDUSTRIAL SHARE PRICES DURING THE PAST TWO YEARS

British: *Financial News* Index of 30 Ordinary Shares (July 1, 1935=100)

American: *Standard Statistics* Index of 50 Common Stocks (1926=100)

rise was, absolutely, very similar to that of 1942, but the bulk of the net appreciation occurred in the first half of 1943, whereas the whole of the 1942 rise came about in the second half of that year. Apart from twin humps and the resultant reactions in July and October, the rise was fairly continuous. At present the curve is flattening out and tending to run parallel with that for fixed-interest securities. Meanwhile, the American experience has not been very dissimilar, but there the 1943 rise was, absolutely, rather greater than that of 1942. With the approach of final victory, the trend of prices has been more and more dependent upon estimates of the Government's intentions for the period of post-war transition and of the success which they will meet. Information on any progress which may have been made has so far been slight. News of actual intentions, or even guesses as to what these may be, will influence special securities from time to time, but the general level of prices is not likely to rise appreciably until it is clear that distributable profits will be allowed to increase materially.

### New Capital Issues

As will be seen from the figures below, the temporary setback to the general level of borrowing experienced in 1942 was reversed last year. Of new borrowing, whether by issues or by "permission to deal," there is a rise in every category, and, with the sole exception of Empire borrowing, the latest figures exceed those of 1941. The feature is, of course, the renewed expansion in Government issues, which exclude, however, floating debt and tax reserve certificates. It seems probable that by now the production of munitions has reached its maximum, so that no further expansion in borrowing is to be looked for on that account. There is no certainty that price rises have ceased, and this may continue to push up the cost of production for our own purposes, and for reverse lease-lend. The expansion of activity under heads other than Government issues is too small to suggest any real relaxation in conditions governing such operations, and none has occurred. The sharp fall in conversions reflects the incidence of maturities as well as the fact that the rise in the general level of fixed-interest securities was virtually halted shortly after the beginning of the year.

### Industrial Profits

FOR the first time since the outbreak of war, the profits of companies, as published, but after deducting debenture interest, show a rise on those of the same concerns for the preceding year. The rise is small, but it means that the index, which had fallen from 120.7 for 1938 to 90.0 for 1942, rose last year to 93.1 per cent. Actually recalculated gross profits appear now to be on the up-grade. Dividends are increasing, and the share of net profits distributed is rising. The quarterly published figures show a decline only in the first quarter, with very moderate rises in the others. The poor showing of the rubber

industry exercised a depressing effect on the early figures. It should be pointed out that, if gross profits are substituted for published profits, the share of the total going to shareholders is falling, although the absolute amount of distributions is rising.

\* 1940 to 1943 figures are not strictly comparable with previous years.  
† Whole year. New basis.

### The Money Market

EXPANSION of currency and credit again provided the background for the history of the money market in 1943. Clearing bank deposits averaged £3,275 million in 1942 and £3,677 million in 1943. Almost the whole counterpart of that expansion of credit was provided by increased holdings of Treasury Deposit Receipts, which by the end of the year had become the largest of the banks' assets, taking precedence of investments, which themselves had ousted advances from first place in 1941. To maintain this expanding pyramid of credit the authorities automatically provided the required basis of bank cash. It follows that at no time was the operation of credit policy originated through the money market. The disturbances that occurred in the market were the result of temporary disequilibria between the heavy income and expenditure of the Government, and these temporary disturbances were quickly and smoothly remedied by appropriate open-market operations initiated by the Bank of England. At no time was the money market forced to borrow from the Bank at penal rates during the year, but on many occasions the Bank went to the assistance of the market in a variety of ways. Given this ready assistance whenever the credit position showed the slightest indication of tightening, the structure of money and discount rates remained rigidly fixed throughout the year. The money market was always able to finance its requirements of bill money from the

clearing banks at 1 per cent, while the Treasury bill rate kept steadily at about  $\frac{1}{2}$  over this figure.

The main feature in the history of the discount market last year was the number of amalgamations and increases of capital. These furthered a policy of concentration which has had official inspiration for some years past and which has accompanied the gradual change of the discount market from a bill to a bond market. The change in the main character and interest of the market has called for a stronger capital structure. This has been provided by amalgamations and by the influx of new capital. Some of the additional capital has come from insurance companies, while in one interesting case it was provided by a hire-purchase finance company.

## Foreign Exchanges

No changes occurred last year in the official list of exchange rates quoted in London. The equivalent of such a change occurred in the autumn, when a 50 per cent concession was granted to certain diplomatic and personal remittances to Chungking. This was the result of the big rise in the Chinese cost of living and of the fact that the fixed Chinese exchange rate had remained oblivious of the changes in the true parity of the currency. The concession was later increased to 100 per cent. With the invasion of Italy a rate of 400 lire to the £ was fixed by the Allied military authorities. The invading armies took their own military currencies with them, while, in addition, a supply of "Amgot" lire notes was also part of the invasion equipment and was put into circulation. In the New Year, the francs circulating in ex-de Gaulle territories and in North Africa were unified and given an exchange value of 200 francs to the £. Paraguay last year introduced a new unit of account, the guarani. The Belgian and Dutch Governments entered into a formal monetary agreement providing for the stabilisation of their currencies and for clearing balances of mutual indebtedness. This bilateral agreement was stated to be without prejudice to wider international exchange agreements into which the Belgo-Dutch grouping could readily be merged. The steady improvement in the Brazilian exchange position made it possible last year for the Bank of England to tackle the problem of blocked cruzeiro balances held for residents of the UK. Thanks to the accumulation of sterling balances on Brazilian account, an arrangement was made providing for the compensation of these balances against blocked cruzeiro assets. The balance of payments of the UK with other countries in the sterling area has continued heavily unfavourable to this country, and this has again reflected itself in a persistent accu-

mulation of abnormal sterling balances. India continues to provide the main creditor, but Eire, Canada, Australia, New Zealand, Argentina and the Middle East countries have all contributed their quotas to this phenomenon.

## The Bullion Market

THE London bullion market remained quiet and featureless during 1943. Gold was held at the official price of 168s. per ounce, with sovereigns at 39s. 3d. each. Small amounts of gold were sold to the Bank of England from non-residents' holdings. The Bank also made available small quantities of gold required for essential industrial purposes. Silver was held throughout the year at 23½d. per ounce. At this price the Bank of England sold metal for essential industrial requirements. During the first half of the year the silver thus sold on official account was of Indian origin and represented metal acquired from the Indian Government's reserves both in London and in India at earlier dates. These reserves were exhausted in the summer of 1943, and from then onward their place was taken by United States and Canadian silver. As early as April, 1943, it was announced that requests had been made by the British to the US Government for shipments of silver. These were made on lend-lease terms—but with the special provision that an equivalent amount of silver be retransferred to the United States after the end of the war. Canada's silver shipments have been made available under the agreement for pooling resources and have thus passed without the creation of any debt.

The real interest in bullion has switched from the London and New York markets, where prices are rigidly fixed, to the Indian and Middle East countries, where prices have moved freely and have established themselves at high premia over the London and New York parities. The feature of these free markets has been the development of heavy official sales of gold effected in each of them by the appropriate central bank. The gold in question has been provided by Great Britain and the United States, and one of the objectives of these sales has been the mopping up of redundant purchasing power created by abnormally high allied expenditure in these countries. In India the gold sold on official account has gone to meet this expenditure. The price of gold in Bombay, which touched the equivalent of £19 an ounce, has been falling under the pressure of these official sales, and had settled down to the equivalent of £14 an ounce by the end of the year.

There has been no official selling of silver, but the substantial hoards of the metal in India have provided an adequate stock in trade for the free market, where the price has fluctuated around a mean of Rs. 127 per 100 tolas.

## Overseas Countries

### United States

IN 1943, the American economy supplied goods and services to the war effort in an amount that corresponded to its maximum peacetime output, and, at the same time, aggregate civilian consumption continued in excess of the highest peacetime volume. The problems of obtaining adequate supplies of raw materials and of providing sufficient industrial facilities for war needs had been largely mastered by the end of 1943, but manpower shortages became increasingly restrictive during the course of the year.

These overall achievements were not accomplished without many severe adjustments in the distribution of employment and consumption. With full employment and with individual incomes far in excess of the amount of goods and services available for consumption, increasingly severe controls over supplies, prices, and manpower were necessary in order to assure full accomplishment of the war programme, and equitable distribution of available civilian supplies, and to restrict the development of inflationary price advances. Application of these controls was made difficult by political and other pressures of organised special-interest groups. Notwithstanding the strong economic and political pressures, the controls applied, together with the public's willingness to save large amounts, were generally effective in keeping price increases down to moderate proportions. The cost of living index continued its previous rise during the early part of 1943, but subsequently levelled off at about 25 per cent above the pre-war level.

**War Production.**—Expenditures of the Federal Government for war purposes reached a peak of about \$7½ billion a month by the middle of 1943, and continued close to that level during the remainder of the year. The total for the year 1943 was \$82 billion, compared with \$50 billion in 1942 and \$13 billion in 1941. Schedules called for a somewhat greater rise in expenditures, but scattered instances of reduced prices, cut-backs in programmes, and inadequate capacity for some products resulted in actual expenditures somewhat below schedules. As planned, and there were some cut-backs in ammunition output, as munition equipment was further expanded. About two-thirds of the total physical volume of the output of factories and mines, according to estimates of the Federal Reserve Board, was for

war purposes, and there was an increase of about 50 per cent in war products over 1942.

**Civilian Supplies.**—Consumer expenditure on all types of goods and services, according to Department of Commerce estimates, rose to a level of about \$90 billion a year early in 1943, and continued at that level during the remainder of the year. This compares with \$62 billion in 1939 and, even after allowance for the rise in prices, represents a larger volume of goods and services than in peacetime, although a somewhat smaller volume than in 1942. Private expenditures for capital purposes were negligible in amount in 1943, compared with \$11 billion in 1939.

The physical volume of the production of manufactures and minerals for strictly civilian purposes has declined since 1941, according to estimates of the Federal Reserve Board, and in 1943 was less than three-fourths of the 1939 output. Total consumption, however, was able to remain at about the maximum peacetime level, owing to increases in the production of non-manufactured foods, and the use of services, and to drains upon previously accumulated stocks. Consumer goods have been scarce because of increased consumption by a great number of people who, in normal times, received low incomes, while the fixed-income groups, including many in the higher brackets, have been unable to obtain as much as usual.

**Construction.**—Expenditures for construction declined sharply from the high level of 1942, reflecting sharp reductions in the construction of military and naval installations and of publicly financed industrial plants, as well as a further decrease in private residential building. For the year as a whole, construction expenditures were somewhat larger than in 1939, but at the end of 1943 the level of activity was considerably lower. Publicly financed housing construction was in somewhat larger volume in 1943 than in the previous year. Both publicly financed and privately financed housing construction was limited to that needed for essential workers in congested war-production areas, and a large part of the private building was financed by Government-guaranteed loans.

**Agriculture.**—The physical volume of agricultural production in 1943 was estimated by the Department of Agriculture as slightly larger than the record output of 1942. The total yield of crops was somewhat smaller than in the previous year, but larger than in other years, while the output of livestock and livestock products increased further. Prices of farm products continued to rise during the first half of the year, but in the latter

half some farm prices declined. Although operating costs also increased somewhat, the net income of farm operators increased to the record figure of \$12.5 billion in 1943, from \$10.2 billion in 1942 and \$4.5 billion in 1939.

**National Income and Savings.**—Individual incomes in 1943 totalled about \$142 billion, according to Department of Commerce estimates, compared with \$116 billion in 1942 and \$71 billion in 1939. The rate of increase slackened somewhat in the latter part of the year, and it is likely that at the beginning of 1944 individual incomes were at the rate of about \$150 billion a year. After payment of about \$18 billion in personal taxes in 1943, compared with only \$3 billion in 1939, and consumption expenditures of \$90 billion, there remained a surplus of \$34 billion available to individuals and unincorporated business for savings. This compares with \$27 billion in 1942 and \$6 billion in 1939. Most of the additional income has gone to the greatly enlarged number of factory workers and Government employees, including those in the armed forces, and to farmers. Amounts received in the form of interest, dividends, rents, royalties, and profits of individuals and partnerships have increased less rapidly.

In addition to the large volume of savings by individuals and unincorporated business, corporations have also accumulated substantial surpluses which are being held in the form of liquid assets. These accumulations have arisen from large retained earnings, depreciation and other reserves, with reduced expenditures on plant and equipment.

Both corporations and individuals have used their savings largely to purchase Government securities and to increase their cash holdings. There has been some debt retirement and also some continued increase in insurance and pension reserves, the proceeds of which have been in turn largely invested in Government securities. Holdings of Government securities by investors other than banks increased by about \$32 billion in 1943, following an increase of \$24 billion in 1942; bank deposits of individuals, partnerships, and corporations increased by about \$18 billion in 1943 and \$10 billion in 1942; and currency in circulation increased by over \$5 billion in 1943 and \$4 billion in 1942. Altogether the accumulation of liquid savings by businesses and individuals during 1942 and 1943, according to estimates of the Federal Reserve Board, amounted to nearly \$100 billion, of which probably \$60 billion represent individual savings and the remainder the accumulations of businesses. These funds are available for use at any time and are a powerful potential for inflation. They also provide a cushion to ameliorate the effects of possible post-war declines in income and employment.

**Government Finance.**—Rising war expenditures by the Federal Government during 1943 were accompanied by an even more rapid increase in tax receipts, resulting from the imposition of additional taxes and the inauguration of withholding taxes on current incomes. The deficit in the last half of the year was less than in the two preceding half-year periods. The Federal Government borrowed \$57 billion in the course of the year, compared with \$48 billion in 1942.

**Banking and Credit.**—Banking conditions in 1943 continued to reflect primarily the influence of Government finance. Bank holdings of Government securities, including those of the Federal Reserve Banks, increased by \$25 billion in 1943, compared with \$23 billion in 1942, representing respectively 44 per cent and 49 per cent of the total increase in the outstanding Government debt. There was little net change in bank loans.

The continued demand for currency on the part of the public, and the need for required reserves to back the growing volume of deposits, caused a continued drain on bank reserves. Reserves held in excess of legal requirements declined from over \$2 billion early in the year to about a billion at the end, and other reserve funds needed were supplied through the Reserve Bank's open-market purchases of Government securities, which amounted to about \$5 billion.

In addition to supplying needed reserves, Federal Reserve operations were also directed toward maintaining the prices and yields of Government securities at prevailing levels. These cover a wide range of yields, varying from  $\frac{1}{8}$  of 1 per cent on short-term Treasury bills to 2 per cent on ten-year bonds, which are purchasable by banks, and 2½ per cent on 20- to 25-year bonds, not purchasable by banks. In view of this wide range of yields and of the publicly announced policy of maintaining prices at existing levels, there was a growing tendency on the part of banks and other investors to buy the higher-yield issues and to sell to the Reserve Banks the lower-yield securities. Thus, in the latter half of the year, the commercial banks reduced the amount of their bills while adding to other types of securities in their portfolios. The Federal Reserve Banks, on the other hand, bought short-term bills and certificates of indebtedness and sold Treasury notes and bonds. Bank portfolios, nevertheless, continued to be dominated by short-term securities.

## Canada

**War Production and Trade.**—The past year was one in which economic activity reached a top limit at about double that of 1939, so the problem of further expansion became secondary to that of adjusting production to changing war needs while maintaining a high rate of output. As the year ended, Mr C. D. Howe, Minister of Munitions and Supply, said:

Our war production is at its peak and is being subjected to frequent changes and adjustments which cause temporary readjustments in employment.

The department's objective of \$3,500 millions' worth of munitions and war supplies in 1943, it is believed, was achieved. To the end of November, 1943, Canadian exports were valued at \$2,700 million, an increase of \$600 million over the corresponding period of 1942, and of \$305 million over the entire export total of the previous year. Commodity imports for 11 months were \$1,600 million, of which \$1,312 million originated in the United States and \$120 million in the United Kingdom. Canadian exports in the 11-month period were \$1,019 million to the USA and \$943 million to the UK. The Canadian active balance of trade in 1943 was the highest in history. Aggregate external trade, exclusive of gold, was valued at \$4,294 million in the 11-month period, an increase of \$673 million over the corresponding period of 1942.

A comparison produced by the Wartime Information Board gave the value of exports from Canada in this war to the end of December, 1943, of munitions, strategical materials and foodstuffs at \$6,700 million. The figure for the last war was \$1,003 million. The figure for this war did not include items amounting to \$2,275 million of production for Canada's own armed forces at home and abroad, nor foodstuffs exported to the United States since that country entered the war.

**Manpower.**—Each month in 1943 brought an increase in employment in war plants, and the recorded employment in all lines in Canada of 1,952,000 persons, including 511,000 women, in October, 1943, is regarded as a peak not likely to be exceeded. New employment since the war started was thought to have absorbed 1,000,000 persons, a figure including the armed forces. The stage where 60 per cent of the population over 14 years of age was in military service or at work had been reached. Housewives were among the main groups omitted from this estimate.

The required intake of the armed forces, of 15,000 a month, was not reached in the later months. The policy of giving round figures while protecting many salient details has permitted publication of main war groupings as follows: men in armed forces, 725,000; women, 37,800; peak employment in direct and indirect war work 1,100,000, including 260,000 women.

**Agriculture.**—Canadian agricultural production values, when finally computed, were expected to be somewhat less than the figure of \$2,079 million recorded in 1942. The Department of Agriculture estimated the value of field crops in 1943 at \$1,102 million, compared with \$1,204 million in 1942.

While wheat production was 293.6 million bushels, compared with 556.1 million in 1942, the Canadian surplus stood at 670 million bushels on October 1, 1943. For 1944 the wheat farmers are asked to plant no more in wheat than they did in 1943, when the acreage was 17,488,000. Four years ago the Canadian wheat acreage was 28,726,000, and, while this has declined, substantial increases have been attained in coarse grains. An important change in wheat marketing policy occurred last September, when wheat trading was discontinued in the Winnipeg market and the Canadian Wheat Board was directed to acquire all commercial stocks of wheat at an initial price of \$1.25 a bushel, compared with the previous guaranteed minimum of 90 cents.

Marketing and processing of meat products exceeded all previous records in 1943. The meat-packing industry produced 1,577 million pounds of products. Supply of 675 million pounds of bacon to the United Kingdom was completed in 1943, and an agreement for 900 million pounds in 1944 and 1945 had been reached. Efforts to exceed this figure were put in hand. By April 1, 1944, it was expected the shipment of 150 million pounds of cheese to the United Kingdom would be completed. Egg production in Canada increased by 20 per cent in 1943. Apart from wheat, production of flour mills is being increased to provide 1,000,000 tons of flour for the United Kingdom.

**Aggregate figures of the Canadian chartered banks at the end of October, 1943, were as follows:**

| (Millions of dollars)  |       | Change from<br>prev. Year |      |
|------------------------|-------|---------------------------|------|
| Deposits—Demand .....  | 1,827 |                           | +218 |
| Time .....             | 1,961 |                           | +252 |
| Others .....           | 319   |                           | +33  |
|                        | 4,107 |                           | +503 |
| Foreign deposits ..... | 601   |                           | +73  |
| Assets—                |       |                           |      |
| Securities .....       | 2,870 |                           | +491 |
| Loans—Canada .....     | 1,076 |                           | —27  |
| Abroad .....           | 167   |                           | —4   |
|                        | 4,113 |                           | +460 |

Federal expenditures in 1943-4 were estimated at \$5,500 million, a figure reasonably close to actual expenditures. For eight months of the fiscal year, to November 30, 1943, the Federal Government spent \$3,121 million, or \$1,369 million more than its revenues other than the proceeds of loans. The fifth victory loan, falling in that period, yielded \$1,383,275,250 from 3,008,336 cash applications. Earlier in the calendar year of 1943 the fourth victory loan yielded \$1,308,985,500.

At the year's end Mr Ilsley, the Finance Minister, said: "Our economic mobilisation, after long years of urgent development, has been largely completed." In the field of price control, the index based on pre-war levels, stood at 118.5 on November 1, 1943, compared with 117.7 on November 1, 1942.

**Mining.**—The single greatest mining development in Canada in 1943 was the Steep Rock iron ore project, from which commercial production will begin shortly. Despite a lower output, gold remained the single biggest item of value in Canadian mineral production. Gold production was 3,649,671 fine ounces, valued at \$140,512,334. Total mineral production was valued at \$524,426,850, a decline of \$42,300,000 from 1942. Production increased in copper, nickel, lead and zinc.

Manpower shortages reduced the output of fuels, though a compensating factor developed in an unusually mild winter season of 1943-44. Production of coal declined 5 per cent, and 1943 output was 17,878,778 tons. Crude petroleum production was 9,938,000 barrels, 3 per cent below 1942, but this figure did not include oil production in the new Northwest Territories field. Value of structural materials, cement, lime and stone, declined 12 per cent.

**Finance.**—The Canadian national income increased more than 18 per cent in 1943. The Bureau of Statistics estimated the cumulative total of the first 11 months of the year at \$8,072 million. The indicated national income for the year was in the neighbourhood of \$9,000 million. This high level was due to heavy munitions production, a record volume of exports, deficit financing, and a considerable advance in money supply both in bank deposits and the circulating media. Bank notes in public circulation rose to \$745 million in November, compared with \$595 million in November, 1942.

## Australia

(Except where stated to the contrary, currency figures in this article are expressed in Australian pounds.)

**Finance.**—The national income in the financial year 1942-43 was officially estimated at £1,223 million, and the total expenditure of the Commonwealth Government amounted to £670.3 million, including £561.7 million military and £108.6 million non-military expenditure, compared with an original budget estimate of total expenditure of only £549 million. The Budget for 1943-44 provides for an expenditure of £715 million, including £570 million for military purposes and £145 million civilian expenditure; the increase in the latter figure is mainly due to higher expenditure for the social services and for price-pegging measures. The 1943-44 revenue is expected to be £312 million (compared with last year's £267.5 million); £300 million are to be raised by public loans and £103 million by Treasury bills. The revenue increases will be mainly due to a reform in the income tax law of March, 1943, which provides, *inter alia*, for a reduction in the tax-free minimum income for bachelors from £156 to £104 per year. The Treasurer, in his Budget speech in September, 1943, pointed out that the response to war loans, though improving, is still far short of what is possible. Deposits in Australian cheque-paying banks increased from £482.7 million in the second quarter of 1942 to £616.5 million in the second quarter of 1943; between June 30, 1942, and 1943, savings banks deposits rose from £274.3 million to £358.1 million, and subscriptions to War Savings Certificates from £26.2 million to £35.1 million.

**Industry and Trade.**—Nearly 99 per cent of all trade union members are in employment, and the total number of employed wage and salary earners, outside rural and domestic employment, was fairly stable, at between 1,880,000 and 1,890,000, in the first half of 1943. The index of factory employment (based on 1928-29 = 100) increased from 165 in May, 1942, to 170 in May, 1943, while the index for employment in retail stores (based on July, 1933 = 100) fell, during the same period, from 126 to 112; a decrease in employment also took place in other branches of commerce and finance, as well as in transport, building and even in mining. Sales of electricity in the six State capitals, was only £272,000 in 1942-43, compared with £1,128,000 in the preceding year. The total value of the retail trade in Sydney during the three months ended May, 1943, was 9.8 per cent below the level of the same period in 1942, in spite of higher prices, but it was still considerably above the pre-war level. The manufacture of fighter aircraft was started on a large scale; but a larger proportion of industrial capacity has now been devoted to the production of agricultural machinery. The shipbuilding Commission has been occupied with repair work. A Government of Australian secondary industries.

**Price Policy.**—The main Australian price indices (all based on 1928-29 = 1,000) have developed as follows:

|                                           | Export Prices | Primary Production Prices | Whole-sale Prices | Retail Prices  |
|-------------------------------------------|---------------|---------------------------|-------------------|----------------|
| June, 1942 (for retail prices: Apr.-June) |               |                           |                   |                |
| June, 1943 (for retail prices: Apr.-June) | 902<br>973    | 952<br>975                | 1,231<br>1,268    | 1,060<br>1,121 |

A new Price Stabilisation Scheme, with the object of maintaining the cost of living at the level of April, 1943, is reported to be working smoothly.

**Food and Agriculture.**—In addition to tea and sugar, rationing was introduced during the year. In June, 1943, butter was rationed (½ lb. per week) and eggs in July; meat was rationed in January, 1944 (over 2 lb. per week). Australia, in spite of its depleted agricultural labour force, is now feeding the equivalent of 12 million people, and a programme for an increasing output of meat, dairy produce and vegetables, in order to fulfil its obligations to the American forces and to Britain, now holds first priority in the national war effort. On the other hand, the area under wheat in 1943-44 is one million acres smaller than in 1942-43 and six million acres smaller than in 1938-39. The wool clip amounted to 3,521,000 bales in 1942-43, compared with 3,578,000 bales in the preceding year, but, owing to higher prices, this clip brought in the unprecedentedly high revenue of £73.5 million.

## New Zealand

(Except where stated to the contrary, currency figures are expressed in New Zealand pounds.)

**External Trade.**—The external trade figures show striking changes during the past year. Normally, exports must exceed imports by about £12 million to ensure a balance of external payments. Taking the years ending September 30th, in 1942 the excess of exports was £30.72 million, while in 1943 imports exceeded exports by £24.06 million. War conditions account for most of the changes. Last year, a few months' abundant shipping cleared out stocks after a good season and exports reached a record high figure. This year the season has been less favourable, the spring late and wet, and stocks awaiting export are more nearly normal, while some exportable goods are diverted under reverse lend-lease to the United States' forces in New Zealand. In addition, owing to shortages of fertilisers and manpower and to the greater attractions of rival occupations, there is some decline in farm production for export. The increase in imports, which include lend-lease and defence materials, indicates heavy receipts from abroad of goods formerly in shorter supply, both on lend-lease and ordinary account. Despite the markedly adverse balance of trade, the movements of exchange funds held overseas by all the banks give no indication of any large movement in the balance of payments. The trade figures for the past five years compare as follows:—

| Year ended<br>Sept. 30th | EXTERNAL TRADE<br>(£ millions) |         |             |         |
|--------------------------|--------------------------------|---------|-------------|---------|
|                          | In New Zealand Currency        |         | In Sterling |         |
|                          | Exports                        | Imports | Exports     | Imports |
| 1939.....                | 57.72                          | 53.94   | 46.21       | 43.20   |
| 1940.....                | 68.01                          | 47.57   | 54.41       | 38.06   |
| 1941.....                | 68.58                          | 45.34   | 54.86       | 37.07   |
| 1942.....                | 82.52                          | 51.80   | 66.02       | 41.44   |
| 1943.....                | 66.26                          | 90.32   | 53.01       | 72.25   |

**Banking and Finance.**—Money has continued to expand during the year, mainly on account of the Government's use of bank credit to finance its deficit. An increase of £25 million in Government securities, etc., held by the Reserve Bank and the trading banks was offset to some extent by a reduction of £5 million in net funds held overseas, and advances to private customers remained practically unchanged. The note circulation, of which probably half appears to be closely held, increased by £6.5 million and total bank deposits by £16 million. But returns of bank debits indicate that free deposits are now circulating only about half as rapidly as before the war, or, alternatively, that only half are circulating at the pre-war rate. Money is abundant, but controls limit its expenditure in most channels. Investment opportunities are limited, interest rates are low, share prices are rising, and the latest war loan, for £35 million at from 2½ to 3 per cent, was over-subscribed. The major items in the bank returns at the end of September, 1939, and in the last two years are summarised below.

| End of September                                         | COMBINED BANK RETURNS<br>(£ millions) |               |               |               |
|----------------------------------------------------------|---------------------------------------|---------------|---------------|---------------|
|                                                          | 1939                                  | 1942          | 1943          | War Increases |
| <b>Liabilities:—</b>                                     |                                       |               |               |               |
| Note circulation.....                                    | 13.42                                 | 22.59         | 29.07         | +15.65        |
| Total deposits.....                                      | 68.88                                 | 103.40        | 119.59        | +50.71        |
| <b>Totals.....</b>                                       | <b>82.30</b>                          | <b>125.99</b> | <b>148.66</b> | <b>+66.36</b> |
| <b>Assets:—</b>                                          |                                       |               |               |               |
| Investments, Advances to Government, and securities..... | 35.16                                 | 59.00         | 84.10         | +48.94        |
| Other advances.....                                      | 53.63                                 | 42.40         | 42.14         | -11.49        |
| Net Overseas Funds.....                                  | 8.57                                  | 40.39         | 35.06         | +26.49        |
| <b>Totals.....</b>                                       | <b>97.36</b>                          | <b>141.79</b> | <b>161.30</b> | <b>+63.94</b> |

Public finance has changed little in the last two years. For 1943-44, total receipts, including £88 million from taxation, £68.5 million from loans, £40 million from lend-lease receipts, and £6.4 million from other items, are estimated at nearly £203 million, or £4 million less than was recorded last year.

Estimated expenditure is £12 million greater, and totals £208 million, including £148 million for defence and slight increases in expenditure on social security, the consolidated fund, and public works. Surpluses carried forward from last year should more than cover the excess of this year's expenditure over revenue. The results for the first half of the present financial year indicate that all the accounts are conforming closely with the estimates. In the field of private finance, reductions in bank advances, mortgages outstanding, etc., indicate that the abundance of money is being used in part to reduce liabilities and increase liquidity.

The Government's stabilisation plan has been continued throughout the year with reasonable success. While many imported goods, both for consumption and production, have been closely controlled and in limited supply, and much local production has been diverted to defence purposes, price and wage control and rationing have succeeded in distributing the limited supplies equitably and in keeping consumers' prices fairly stable. Complaints against shortages which should be preventable are common; appeals for higher wages or special rations are made by various groups; the prices of farm produce are low relative to other groups; and farmers complain of their inability to meet rising costs, occasioned by higher import prices, indirect taxation, and greater labour costs in other industries.

## South Africa

**Finance.**—Mr Hofmeyr's 1944 Budget speech, the fifth since the beginning of war, constituted a compliment to what he called the "resilience" of the country. The estimate for national expenditure in 1944-45 has taken another big jump to £180 million (compared with an estimate of £100 million in 1943-44), of which as much as £112,288,500 is to be paid for out of revenue; of this £102.5 million goes for defence, and £16.75 million on capital works and housing, while another million added to the bill for social services is regarded as a sign that the Government plans for social improvement are only waiting for the end of the war. Mr Hofmeyr's warning, however, that such plans would be completely neutralised if redistribution of wealth were not accompanied by a rise in the National Income, underlined the central problem of social policy in the Union. The Government would not be able to go on borrowing at the present rate of £50 million a year, he said, without instituting a disastrous decline in the value of money. At the moment the Government is attempting to attack inflation in land values. By altering the basis of farmers' income-tax, the Government hopes to curtail the activities of the mushroom, or townsman, farmer, who has been evading tax liable on surplus income derived from normal business sources by buying up farms and stock. This will also, incidentally, help the meat shortage by eliminating cattle-hoarding.

**Trade.**—War conditions continue to limit severely the volume of overseas trade. Minerals for war take precedence of fruits, wine, and wool in priorities for shipping-space. Exports of citrus fruits to the United Kingdom declined still further in 1943, though shipments of jam, fruit pulp and fruit juices have been greatly expanded. The wool market has maintained its activity as a result of the British-South African Wool Agreement, though movement in the related hide-and-skin market was restricted.

**Agriculture and Industry.**—Increased production for war has been achieved, even, as in some parts normally dependent on imported fertilisers, at the expense of soil fertility. The area of cultivated land has been increased and most crops have done well. Maize, suffering from drought in 1942, and likely in 1944 to suffer equally from an excess of rain in the planting season, did well in 1943, and wheat production almost came up to the domestic demand. An enquiry into the severe market shortages of meat revealed that the supply position was sound and the livestock population little reduced in numbers. Shortage had resulted from a heavy demand for draught oxen and heavy stocking of farms newly acquired by the "townsman-farmer" class. Land values increased, and agriculture generally, with the exception of fruit-growers, had a prosperous year. The demand of the Union and Allied armed forces for increased quantities of munitions, transport, food, clothes and other war supplies has further stimulated secondary industry in South Africa. Development has been assisted by an Overseas Supply Mission which visited the Union during the year, while the civilian market, cut off from overseas supplies, added to the demands on home production. In the food industry, particularly, there have been important developments, and the production of canned fruits, jam and dehydrated vegetables has been greatly expanded.

## Northern Ireland

The general improvement in trade and employment which had characterised 1942 continued in 1943, and by October the number of unemployed persons over 18 had fallen to 11,305, although there has been some slight increase since then, partly seasonal in character. There has been an increasing concentration of manpower and resources on direct war production.

**Finance.**—The financial relations of Northern Ireland and Great Britain are always complicated, but especially so in war-

time. The Northern Ireland Budget for 1943-1944 shows an estimated expenditure of £19,914,000 and an estimated revenue of £31,825,000. After allowing for a small surplus of £111,000, the estimated Imperial contribution for the year is placed at £31,800,000. As a wartime arrangement a datum line has been agreed with the British Treasury to represent normal peacetime expenditure in Northern Ireland. The effect is virtually to stabilise the Budget. The total revenue of Northern Ireland, in excess of the datum line, from whatever source—but ignoring certain self-balancing items—is regarded as the Imperial contribution. On the other hand, expenditure over the datum line is regarded as expenditure due to war causes, and, as such, is recouped by Northern Ireland from Imperial votes of credit. The receipts from this source are placed at £3,568,000 in the current year.

**Agriculture.**—The wartime expansion in agricultural production continued during the year, and the maximum expansion in the acreage ploughed has now been secured. Efforts in 1944 will be concentrated on an increase in yields through the greater employment of fertilisers. Favourable growing weather was experienced for the 1943 crops, although conditions were less favourable for harvesting. The production of oats, the principal cereal crop, is stated to be nearly 50 per cent greater than in 1939; flax has increased more than fourfold compared with that before the war. The decline in pig numbers continues, and the pig population is now stated to be only two-fifths of pre-war numbers, but poultry is estimated to have increased by 50 per cent above 1939. Cattle numbers have been maintained, while cows and heifers in milk are stated to be 10 per cent above pre-war numbers.

## Eire

The area under tillage increased by 7,586 acres over 1942, but the area under wheat declined by 65,494 acres. Further measures, including an extension of the area compulsorily tilled and an increase in the guaranteed price, have been taken to encourage the production of wheat. The estimated value of the agricultural output rose from £76 million in 1941-2 to £86 million in 1942-3, but the volume declined by 7.7 per cent owing to difficulties in procuring fertilisers, feeding-stuffs and other raw materials. The index number of the volume of production of transportable goods (1936 = 100) in the third quarter of 1943 was 80.7. Severe unemployment was avoided owing to the very large volume of emigration. The cost of living rose by 70 per cent since August, 1939. Wages have been fairly successfully stabilised. Real wages have therefore substantially declined. The external trade was as follows:—

|              | (£'000) |        |
|--------------|---------|--------|
|              | 1942    | 1943   |
| Imports..... | 34,630  | 26,102 |
| Exports..... | 32,666  | 27,477 |

The invisible account was very active owing to the increase in emigrants' remittances. Eire consequently acquired a large increase of external balances. The net sterling assets of the Irish banks rose to the record figure of £110 million. Bank deposits expanded as the result of the impossibility of finding profitable use for money, owing to the reduction of imports and the slowing down of investment. In the first nine months of the current financial year revenue increased from £25.2 million to £28.2 million, and expenditure from £29.4 million to £31.9 million. The deficit of £3.7 million was met by the sale of savings certificates, ways and means advances, and the repayment of advances from the local loans and other funds.

## India

**Industry and Trade.**—Throughout 1943, Indian industrial output was almost wholly diverted to war purposes. Cuts in imports, however, have begun to stimulate production for domestic needs, and led to a recent Government pledge to increase supplies of consumer goods. Many of the usual production statistics are no longer available, but the output of the principal industries in 1943 would appear to be lower than in 1942, if only because coal and transportation shortages have been more pronounced than in previous years. It seems likely that the high-water mark of the combined output of all Indian industries was reached in July, thereafter declining sensibly but with production going up again by December. Overseas trade was restricted throughout 1943 to essential exports and imports. Latest available figures show that for the first five months of the 1943-44 administrative control the balance of trade in merchandise in India's favour amounted to Rs.39.14 crores, which compares with Rs.32.12 crores for the corresponding period of 1942-43. Imports and exports during the period from April 1, 1943, to August 31, 1943, totalled Rs.43.21 crores and Rs.82.35 crores respectively, compared with Rs.46.30 crores and Rs.78.42 crores during the corresponding period of 1942, whereas imports for the same period of 1941 were shown at Rs.85.06 crores and exports at Rs.88.44 crores. Of total imports of all kinds, for April to

August, 1943, Empire countries accounted for Rs.20.09 crores, against Rs.27.81 crores in 1942, and other countries for Rs.23.12 against Rs.18.49 crores in 1942. Imports from the U.S.A. and Egypt increased from Rs.1.57 crores and Rs.67.03 lakhs in 1942 to Rs.2.06 crores and Rs.2.76 crores respectively, while United Kingdom imports dropped from Rs.2.94 crores to Rs.1.70 crores, and Canadian imports from Rs.80.89 lakhs to Rs.1.70 lakhs. Total exports during April to August, 1943, at Rs.79.37 crores, were Rs.5.44 crores higher in the corresponding previous period, the United Kingdom taking Indian goods of the value of 22.78 crores, against Rs.21.60 crores, and the USA Rs.14.68 crores, against Rs.10.42 crores.

**Finance.**—The chief feature of India's finances in 1943 has been the fight against inflation, wherein the authorities are entitled to claim at least partial success. From January 1, 1943, to December 4, 1943, the note issue rose from Rs.591.77 to Rs.839.19, an increase of Rs.247.42 for 51 weeks, against an increase in the note issue of Rs.297 crores in 1942. This slowing down of rates of increase suggests that the Government's anti-inflationary drive is having some effect. Sterling securities increased from Rs.412.83 crores on January 1, 1943, to Rs.722.83 crores on December 24th, representing a monthly payment to India of over Rs.25 crores on account of war goods and services. Gilt-edged markets have been steady throughout, most prices having advanced in the second half of year; 3½ per cent. paper, for instance, which was quoted at Rs.94.0 in December, 1942, was up to Rs.97.8 by the end of 1943. The Reserve Bank steadily raised the tap selling rates of paper throughout the year, while successive issues of 1953-55 Defence Loan at a slightly less favourable yield has been an annual convention since the beginning of the war. Provincial Government loans have received slightly less general support.

**Agriculture.**—Between January, 1943, and September, 1943, the Economic Adviser's General Price Index (August 19, 1939, = 100) rose from 195.6 to 236.3; the index of the wholesale price of rice advanced from 218 to 847 during the same period, the peak point of 1035 having been reached in August. The increase in the price of rice is not representative of agricultural products as a whole, which revealed considerable variations. By the end of April, 1943, the price index of wheat stood at 308, against 216 a year earlier; that of groundnuts was 303, against 117; sugar 127, against 143; raw cotton 242, against 105; and raw jute 219, against 120. Even the rise in the price of rice was not uniform throughout India, for, during 1943, it rose six to seven times above the pre-war level in Bengal, but only two to three times in Madras. The Secretary of State's recent estimate places the new acreage of food crops in 1943 at 12 million.

## The Soviet Union

**Industry.**—Information about the state of Soviet industries in 1943 has been very scanty. Official reports have spoken in general terms about a continued increase in the output of weapons and munitions. The year was the most difficult of the war so far as the supply of industry with fuel and raw materials was concerned. During the first half of 1942 the coal basin of the Donetz was still in Soviet possession and at least partly exploited. For the greater part of 1943 it was occupied by the Germans, and when in the autumn it was regained by the Russians, the destruction made coal output on a large scale impossible. Similarly, the shortage of iron ore caused by the loss of Krivoi Rog was still felt, though it was partly mitigated by the opening and expansion of new mining centres in the eastern territories. Even so, there was an indisputable stabilisation of conditions in the evacuated industries on the Volga, in the Urals and in Siberia, and consequently also a steadier rhythm of production than in the previous year. (The most remarkable achievements of 1943 were the completion of new furnaces at Magnitogorsk, described as "the largest in Europe," and the opening of the Pechora railway which connects central Russia with the sub-Arctic raw material area of Komi.) While the armament industries worked at high pressure they also had to satisfy some of the pressing civilian needs. During the second half of the year some sections of armament plants were reconverted to the production of agricultural implements.

**Finance.**—The figures of Russia's wartime budgets were published for the first time in January, 1944. The table below compares expenditure and revenue for 1943 with the figures for 1940, the last year before Russia's entry into the war.

| (In Billions of Roubles)        |      |      |
|---------------------------------|------|------|
|                                 | 1940 | 1943 |
| Revenue                         |      |      |
| Turnover Tax                    | 108  | 210  |
| Expenditure                     | 105  | 71   |
| Defence                         | 174  | 210  |
| National Economy                | 56   | 124  |
| Social and cultural development | 37   | 31   |
|                                 | 43   | 37   |

The crucial features are:

- The decrease in the yield from the turnover tax, in spite of an increase in its rate. The yield of the turnover tax is the most important index of consumption.
- The increase in defence expenditure from 56 to 124 billion roubles. Compared with the rise in the war expenditure

of other belligerent nations, this increase is not very spectacular. This is due to the fact that already in 1940 defence absorbed about one-third of the budget. In addition, expenditure on "national economy," that is, on the construction of new plant, was by its very nature also expenditure on defence.

(c) The drastic decrease in expenditure on "national economy" reflects the reduced scale and scope of industrial construction in 1943 compared with the rate of industrialisation before the war.

**Agriculture.**—The position in agriculture was hardly easier than in 1942. Reliable reports about the harvest are not available. But it is known that 1943 was a year in which the fertile regions on the Volga suffered from drought, and that dislocation in the mechanised equipment of Soviet agriculture was further aggravated, which explains the conversion of some sections of tank factories to the production of ploughs and spare parts for tractors. The year has also seen the liberation of the Caucasus, the Don region and the Ukraine, the three richest agricultural areas of the Soviet Union. The recovered larders were, however, found to be devastated and more or less empty. The chief preoccupation in the second half of the year was the redistribution of herds and tractors. More than one and a half million cattle were moved from the east to the freed provinces; but despite that redistribution the farms in the liberated provinces received only a small fraction of their pre-war cattle population.

## Portugal

In spite of a general improvement in commerce in 1943, the Portuguese economy is being progressively crippled by inflation and black market trading. An all-round increase in wages has been far outrun by rising prices. Government bonds are in constant demand, and the majority of the consolidated liabilities have been successively converted to pay only 3 per cent. Poor harvests, higher-priced imports, and an entirely ineffective rationing system have led to much criticism of the *quermios*, or trade groups, which run the rationing system entirely in their own interests.

### Trade and Finance:

(1 conto = approximately £10)

|                        | Total Imports<br>Contos | Total Exports<br>Contos |
|------------------------|-------------------------|-------------------------|
| January-November, 1942 | 2,137,018               | 3,414,169               |
| January-November, 1943 | 2,770,209               | 3,578,730               |

Total exports of tin and wolfram for the first nine months of the year are published:—

|               | 1,000 Kilo<br>Tons | Valued in<br>Contos |
|---------------|--------------------|---------------------|
| Wolfram: 1942 | 3,864              | 1,163,242           |
| 1943          | 6,305              | 770,334             |
| Tin: 1942     | 1,610              | 198,064             |
| 1943          | 2,148              | 333,531             |

There has been a heavy increase in the currency in circulation, attributable mainly to the extensive black market trade in metals, and to the activities of the black market in general. The actual circulation continues to be covered by gold and gold credits held abroad.

## Italy

THE collapse of Fascism in the middle of the year was preceded by a grave economic crisis which was the combined result of exhaustion through war, disorganisation by heavy Allied air-raids and increasing social tension. In the first half of the year, price control became utterly ineffective. The inflation of prices caused open opposition in business circles against Fascist state

control and the ineffective policy of subsidies. In northern Italy, air-raids resulted in a general run on the banks and a heavy withdrawal of deposits, which in its turn made it difficult for the Government to obtain credit. As revenue covered only about one-third of expenditure, this inevitably resulted in a big currency inflation. By the time of Mussolini's downfall, the currency in circulation was already more than 100 billion lire, that is, five times as much as in 1939 and four times as much as in June, 1940, when Italy entered the war.

Italy's war budgets were published for the first time after Mussolini's downfall:—

(In Millions of Lire)

| Year      | Total<br>Expenditure | Extraordinary<br>Expenditure | Revenue | Deficit |
|-----------|----------------------|------------------------------|---------|---------|
| 1940-1941 | 107,223              | 57,735                       | 34,234  | 72,989  |
| 1941-1942 | 118,669              | 71,318                       | 41,223  | 77,446  |
| 1942-1943 | 135,158              | 81,019                       | 48,884  | 86,274  |

According to Fascist estimates, the national income of Italy had risen from 90 to 170 billion lire in the course of the war. Thus, in the year of the Fascist collapse, the Budget nominally absorbed about 80 per cent of the current national income. The public debt amounted to 451 billion lire in June, 1943. The floating debt was 43 per cent of the total debt; and payment of interest amounted to 35 per cent of the national revenue.

In the second half of the year the economic chaos was aggravated both in northern and central Italy, under the German occupation, and in southern Italy under Allied occupation. During their retreat the Germans applied the "scorched earth" tactics from which Naples suffered very badly. In the whole of Italy, the administration showed signs of a breakdown. Food distribution became disorganised, black markets flourished, and famine appeared in many regions. In northern Italy, the threat of social disturbances led to the doubling of wages, while the "wages stop" was still maintained in the south. The exchange rate for the lira was fixed at 400 lire for one pound.

## German Europe

TERRITORIALY, German-occupied Europe has become much smaller. The agricultural and industrial resources of Western Soviet Russia are no longer available even potentially. Allied bombing of Western Germany and the greater part of Germany's large towns reached new heights of intensity, so that, in addition to being on the defensive on all military fronts, the German economy had to be adapted to almost ceaseless large-scale bombing. The so-called total mobilisation announced in February, although largely designed as a political campaign, completed the concentration of all industrial activities for war purposes. Great numbers of small shopkeepers and independent artisans had to close down their businesses. Civilian consumption was reduced to the barest minimum, and during the course of the year all essential industrial activities came under the command of A. Speer, the Minister for Weapons and War Production. Essential manufacturing industries from the Ruhr area and other heavily bombed towns in Western Germany were moved to Central and South-eastern Germany, to the Sudetenland, Bohemia, Silesia and occupied Poland. By these means, the German war economy was able to carry on, in spite of the loss of conquered territory and the large-scale bombing. The major production centres of the continent, in industry as in agriculture, remained in German hands. The utmost effort was exacted from the German population, as well as from millions of foreign workers. No decisive shortage in raw materials, munitions, weapons or military equipment could be observed. The air war, the large movements of people and armies all over the continent, impeded production. But though there were critical phases, the general situation always allowed some respite for reorganisation.

**Manpower.**—The number of foreign workers employed in Germany increased during the year by roughly 4,000,000 to more than seven and a half million. If prisoners of war and foreign workers employed by the Todt Organisation in occupied countries are included, a total of perhaps 12 million foreign workers are under direct German command. The labour force in the occupied countries was depleted, and most of these and the satellites report shortages of labour. Only the most essential industries are maintained outside Germany. At the end of the year, the manpower resources of the continent were fully stretched and the greatest economy of men in the Wehrmacht, as well as in agriculture and industry, could be observed.

**Agriculture.**—For the first time during the war, all continental countries reported an average cereal harvest. In Germany and in most of the other countries, bread rations were increased, and reached, with some exceptions, the amounts of

the first year of the war. In contrast, root crops, particularly potatoes and vegetables, were far below the average. The general shortage of feeding-stuffs, especially for pigs, was therefore more pronounced than during 1942. Early in the year, pig-breeding was encouraged in Germany and in most of the occupied countries. During the autumn and winter, the number of pigs had to be reduced again; but herds of cattle, particularly dairy cows, remained fairly stable. Although a determined effort has been made to increase the cultivation of oilseeds in all countries, the lack of fats, which is characteristic of the continental food situation, could not be improved. The staple diet on the continent, German included, consists of cereals, potatoes, and vegetables, and supplies cannot be increased. Only a minimum supply of fertilisers was maintained. The number of draught animals further decreased, but more tractors have been adapted to use generator gas.

**Industry.**—The output of coal, iron and steel has been largely maintained. Longer working hours and the direction of more foreign workers into key industries, combined with another drastic cut in coal supplies for civilian use, made it possible to meet the demands of war industries. Hydro-electric power stations further increased their output, and the production of natural and synthetic oil seems to have been sufficient for essential purposes. The compulsory rationalisation of working processes was continued. Efficiency competitions, and the campaign to induce workers to suggest improvements in working methods and economies in materials was intensified. Production is limited by the available number of skilled workers.

The system of Committees and Rings, created by Minister Speer, has given several thousands of engineers absolute technical control in all war factories. The introduction of fuel and employment engineers, who enforce economies in the consumption of fuel and supervise the distribution of labour, is now the general rule. Shock production—that is, the direction of material, capacity and labour for particular manufactures—became the most characteristic feature of industrial activity in 1943. A greater variety of substitutes in all industries has come into use, particularly in the metal-working sections.

**Finance.**—Prices and wages, which in Germany have hardly changed since the beginning of the war, have now been almost entirely stabilised in the occupied and satellite countries, but although price indices show no great changes in most occupied countries, the real prices are made on the black markets, so that price stabilisation, as in Germany, is only nominal. Germany's system of war finance showed no change. No new taxes were introduced, and total revenue remained on the 1942 level. In spite of the capitalisation of the house-rent tax, more borrowing was necessary to meet war expenditure. The public debt rose as follows:—

### REICH DEBT

(Rm. milliards)

|                 | August,<br>31, | December,<br>31, | October,<br>31, |
|-----------------|----------------|------------------|-----------------|
|                 | 1939           | 1942             | 1943            |
| Long-term debt  | 25.01          | 87.6             | 105.6           |
| Short-term debt | 12.32          | 98.0             | 137.0           |
| Total debt      | 37.33          | 185.6            | 242.6           |

During the first ten months of 1943 the average monthly increase amounted to Rm. 5,700 million, against Rm. 4,000 million in 1942. At this rate of increase, the total debt at the end of 1943 can be estimated at Rm. 254,000 million. The trend towards a proportionately greater increase in short-term borrowing continued, and there was a correspondingly greater rise in the notes in circulation, from Rm. 24,375 million to Rm. 33,683 million, an increase of Rm. 9,308 million, against Rm. 5,950 million in 1942. Notes in circulation have now increased by 310 per cent compared with August, 1939. In most of the occupied countries, notes in circulation rose from between 300 and 400 per cent during the same period, but the accumulation of the national debt in occupied and satellite countries during the war has remained far behind the seven-fold increase in Germany's debt.

**Continental Trade.**—A rough estimate suggests that the volume of foreign trade between the different countries of the continent decreased again in 1943 and is now below 50 per cent of the volume of the total foreign trade of these countries before the war. Germany's share has been both proportionately and actually increased, so that its foreign trade is not far below the level of 1938. During 1943, Germany made a great effort to increase its exports to neutral countries. Deliveries of coal, iron, steel and chemicals to Sweden and Switzerland were either maintained or even increased compared with 1942. Export and import prices showed a proportionately greater advance than internal prices. Large clearing credits in south-eastern countries were used for the redemption of loans in German hands, and in occupied countries clearing credits were transformed into national debt of the countries concerned.

# Industry and Trade

## Foodstuffs

THE few changes that occurred in individual rations are given on page 11; otherwise, the Ministry of Food continued unaltered its previous arrangements. There was an increasing number of canteens in approved factories and collieries and of British restaurants in urban areas; there were 2,144 of the latter at the end of July, 1943, serving 618,000 meals daily. Stricter control was exercised over the transport of foods, including certain soft fruits and vegetables, and considerable progress was made with the rationalisation of retail deliveries of bread, groceries and milk, in order to economise in manpower and petrol. Plans for feeding Europe were drawn up by the United Nations Relief and Rehabilitation Administration, and principles of a permanent nutrition and production policy were laid down by the international conference on essential agricultural products held at Hot Springs, Virginia, in June. A draft constitution for a Permanent Organisation of Food and Agriculture has been submitted to the participating Governments. The Combined Food Board, at Washington, continued its functions as the co-ordinator of the purchases and distribution of the Allies' food supplies.

### Imports

**Cereals.**—The following statistics of wheat production and stocks in the four major exporting countries are compiled from the *Corn Trade News*:—

|                   | Production   |              |              | Estimated Stocks on Aug./July 1 |              |            |
|-------------------|--------------|--------------|--------------|---------------------------------|--------------|------------|
|                   | 1941/2       | 1942/3       | 1943/4       | 1942                            | 1943         | 1944       |

| <b>Total.....</b> | <b>1,646</b> | <b>1,965</b> | <b>1,517</b> | <b>1,371</b>                    | <b>1,676</b> | <b>990</b> |

(a) Assuming net imports of 100m. bushels.

The 1943 harvests were generally considerably smaller than those of 1942, as restrictionist policies encouraged the planting of a smaller acreage; the Argentine crop now being harvested may be an exception. The dominating feature of the past year was the tremendous use of wheat to feed the increasing animal populations of North America. In the United States, some 390 million bushels of wheat were expected to be so used in 1943-4, compared with a normal use of 100-200 million bushels; in addition, 100 million bushels were allocated for alcohol production. American import duties were temporarily suspended in December to encourage a still greater inflow of cereals from Canada. Wheat prices rose sharply in the spring, and by the end of the year had exceeded 170 cents a bushel (No. 1 Hard Cash Winter Wheat at Chicago), the highest level since 1925. The target area has been stepped up from 54.2 million acres in 1943 to 67 million acres in 1944; the target for maize has been similarly raised from 96.3 to 100.3 million acres. The huge 1942 wheat crop left Canada with a record carry-over of 600 million bushels in August, 1943; the new crop, estimated at just half of that of the previous year, was harvested from 17.5 million acres, compared with 21.6 million acres in 1942; the yield was only 16.6 bushels per acre, against 27.3 bushels previously. This low yield accentuated the shortage in the eastern provinces of feed grains for the greatly increased head of livestock. About 50 million bushels of grain were moved eastward in 1942-3 under the Freight Assistance Programme, which provided for a small subsidy for this purpose; in the current season the general arrangements have been similar, but the subsidy has been removed from the higher grades of wheat in order to reserve them for human consumption. For the large stocks of wheat held in Canada are being drawn upon by the United States as well as by the other Allies, and this increasing demand has been reflected in the rise in price. "Dollar wheat" was quoted at Winnipeg in June and the quotations moved steadily upwards through the summer, until the futures market was closed by order on September 28th; the price paid to farmers for the 1943 crop has been fixed at 125 cents per bushel, compared with 90 cents in the previous season. A fixed price applies for neutrals have been sold at higher prices, ranging to 140 cents per bushel and over. Canadian exports of wheat and flour in million bushels, compared with 222.0 million bushels in 1941-2. Australian wheat acreage in 1943 was limited by state measures and the guaranteed price of 4s. per bushel was paid only on the first 3,000 bushels marketed by each grower; any surplus was accumulated of wheat which could not be shipped, coincided with a severe drought, and the crop being harvested is expected to be less than 60 per cent of its predecessor. In addition, the

Indian famine has, it is believed, meant a considerable volume of wheat and flour exports, and with higher internal consumption, both for the Allied forces and by animals, a considerable fall in wheat stocks is probable by next summer. A higher price and an easing of the acreage restrictions have both been promised for the next harvest.

The striking failure of the Argentine maize crop in 1943 was reflected in the low level of exports, which totalled 178,000 tons in the first 11 months of 1943, compared with 219,000 tons in 1942 and 1.9 million tons in 1940. The Grain Board was forced to release 500,000 tons of wheat for feed in the latter part of 1943, and 2,000,000 tons were released for fuel to supplement the reduced imports of coal. The ten per cent reduction in the wheat area planned for the current harvest was cancelled. Thus in these four major exporting countries the increasing demand for wheat, mainly for non-human use, has at the moment outstripped production, and a considerable fall in stocks is probable in 1944. There is no question of any absolute shortage of wheat for human consumption, such as existed in 1917-18; it is doubtful if the four chief wheat-producing countries will be called upon for exports exceeding 400, or at the most 450, million bushels, while their combined carry-over at the end of the 1943-4 cereal year, even assuming an abnormal use of wheat for feed, is likely to be about 1,000 million bushels. But the large animal populations overseas, kept to provide the growing demand for livestock products, are absorbing wheat and other cereals faster than they are at present being grown.

**Meat and Dairy Produce.**—No statistics have been published of British supplies, either imported or home produced, nor of the exports of other Allied nations. In most of these countries, however, unmistakable symptoms of scarcity developed in 1943, in spite of increased output. Low levels of unemployment, high earnings, the increasing proportion of the population enlisted in the armed Services with a standard of diet above the average and the necessity to provide stocks for post-war relief all contributed to increase the demand for meat, cheese, eggs and milk. Canada introduced meat rationing in May, after earlier measures to control slaughtering. The census of livestock in June showed a record number of pigs—8.15 million, against 4.29 million in 1939—and a further increase in cattle numbers to 9.6 million. But rising prices and local shortages of feed grains have reduced the profit margin on livestock production, and the marked increase in pig and cattle slaughtering in the winter of 1943-44 (which caused a temporary glut of meat) indicated a reversal of the upward trend in animal numbers. The 1944 contract for bacon exports to the UK was reduced to 450 million lb. against the target of 675 million lb. in 1943. Shortages of livestock products also developed in the United States, where a system of points rationing was introduced to safeguard supplies for the Services and for export under Lease-Lend. Although numbers of cattle, pigs and hens increased during 1943, there are signs that this movement has been checked, partly by higher prices and more stringent supplies of feeds and partly by the shortage of farm labour and machinery. Similar developments occurred in Australia and New Zealand, which were called upon in the course of 1943 to feed increasing numbers of allied troops engaged in the Pacific War. Australian output of all livestock products is likely to be seriously affected by the disastrous bush fires early in 1944. It was announced that the Ministry of Food had again contracted to purchase all the meat exports of Argentina on behalf of the United Nations.

### Home Production

As more than one million acres of arable land were obtained in 1942-43 from the ploughing of grassland, the area of arable land in the UK must have approached 19 million acres in 1943, compared with nearly 13 million acres in 1939. In order to economise still further in shipping, the area under wheat was expanded by 900,000 acres; sales between August 1st and February 19th totalled 4.4 million quarters in 1943-44, against 2.7 and 1.5 million quarters in the same periods of 1942-43 and 1939-40 respectively. This increased output and the growing use of combines (of which 2,000 were employed for the 1943 harvest) led to considerable difficulties over the handling, drying, and storage of grain. Both barley and oats were used in 1943 as bread grains in varying proportions, with a maximum of ten per cent. In July, a four-year plan was announced for agriculture; no further increase in the arable acreage would be attempted, but the ploughing of old grassland and the reseeded of cropped fields would be continued in order to enlarge the supplies of animal fodder. Greater emphasis was to be placed on improving livestock and the restocking of land for post-war needs. A White Paper on Milk Policy announced the payment of 4d. per gallon extra for TT milk, the inspection of all dairy herds at least once a year, and the compulsory pasteurisation of all milk sold for human consumption (except for milk from accredited herds) in areas to be designated. In view of the official policy for improving milk supplies, it was unfortunate that the payment on a quality basis for milk sold wholesale had to be postponed indefinitely, owing

### Rationing

THERE were few changes in food rations during 1943, except for cheese; the allowance for the ordinary consumer was reduced from 8 oz. per week to 6 on January 10th, to 4 on February 7th, and to 3 on May 2nd. The special allowance for vegetarians and certain classes of workers was reduced from 1 lb. to 12 oz. per week on January 10th. The minimum allocation of liquid milk to the ordinary consumer was raised from 2 to 2½ pints per week on March 14th, to 3 on April 25th, to 4 on May 2nd; it was then reduced to 3 on July 4th, to 2½ on July 23rd, and to 2 on November 7th. A double allowance of jam was available for three four-weekly periods in the autumn to absorb surplus stocks of canned jam; the normal ration remained at 1 lb. per period throughout the year. For jam making, 1 lb. of sugar was issued in July in addition to the normal ration of 8 oz. per week; a further 1 lb. could also be obtained instead of jam from April 4th. From September 19th the jam and sugar rations were made fully interchangeable. The other rations, which remained unchanged, were bacon 4 oz., butter 2 oz., margarine 4 oz., cooking fats 2 oz., meat 1s. 2d., tea 2 oz. per person per week. The number of points remained at 20 per period; no new products were included in the points rationing scheme in the course of the year, and a few minor ones were removed; various changes were made in the points value of individual foods, in order to adjust demand to changes in supply. The points banking system was introduced on September 19th to facilitate traders' dealings in points. New arrangements were made in July for the special allowances for pregnant women; the presentation of a certificate of pregnancy enabled the holder to obtain a second ration book entitling her to an extra half ration of meat and the current non-priority allowance of milk in addition to the priority allowance of one pint per day. She could also obtain two eggs per allocation, three packets of dried egg, and the children's allowance of oranges. The special distribution of fruit juices and cod-liver oil to babies was continued.

### Price Control

THE maximum price of tea was raised by 4d. per lb. in January, 1943, and that of sugar for domestic use by 1d. per lb. in September; these increases were designed to offset the fall in the price index for clothing caused by the greater sales of utility garments and thus to keep stable the combined cost of living index. The index of retail food prices, as calculated by the Ministry of Labour, is given below:—

INDEX OF RETAIL FOOD PRICES

|                      | Sept., 1939 | Dec., 1942 | Mar., 1943 | June, 1943 | Sept., 1943 | Dec., 1943 | Jan., 1944 |
|----------------------|-------------|------------|------------|------------|-------------|------------|------------|
| July, 1914=100.....  | 138         | 164        | 165        | 165        | 166         | 168        | 168        |
| Sept., 1939=100..... | 100         | 119        | 120        | 120        | 120         | 122        | 122        |

In reply to a question in the House of Commons in February, 1944, it was stated that the annual cost of food subsidies was then £205.8 million. The individual items were: bread, flour and oatmeal, £60.4 million; meat, £23.1 million; potatoes, £28.6 million; eggs, £11.3 million; domestic sugar, £10.5 million; milk production, £10.5 million; cheese, £3.7 million; bacon, £1.6 million; other (including the National Milk Scheme and the Milk in Schools Scheme), £56.1 million.

### Raw Materials

THE raw material position of the United Nations underwent a decisive change during 1943. In the early months of the year the supply picture was one of widespread and pronounced scarcity, which in some instances threatened the fulfilment of the war production schedules. For the most critical materials, such as copper, aluminium and rubber, special Combined Committees were formed to break the existing bottlenecks, and increased attention was paid to raw material conservation, in which considerable progress was achieved.

In the early summer the supply position improved gradually and by September a better balance between supplies and requirements was attained. At the end of the year the production of the majority of raw materials exceeded essential demand, so that stocks began to accumulate; the only materials in short supply were crude rubber, paper, some types of timber and certain special oils. Apart from the suspension of the working of some marginal mineral deposits in the United States, secured through the discontinuation of the Government premium payments to these mines, production was kept at the largest possible scale throughout the year. At the beginning of 1944, however, the first steps towards a curtailment of production were taken. They include the forthcoming cut in the Northern Rhodesian copper output by 20 to 25 per cent and the closing of a number of United States aluminium reduction plants.

There were a number of reasons for the much improved raw material supply position in the second half of the year. The majority of raw material expansion projects, initiated in 1942, were completed or at least brought very near to completion,

which resulted in increased supplies. These increased supplies were reflected in deliveries to war plants, as the shipping position, through the successful offensive against submarines and increased new ship constructions, showed a decisive improvement. Command over the main battlefields in 1943 helped the Allies to secure more "battle scrap." On the demand side, requirements of raw materials for the construction of war factories greatly declined, so that a much greater part of total supplies was available for the production of munitions. Towards the end of the year the munition production programmes approached their peak and in some instances it proved possible to reduce the volume of production.

The pooling of resources was fully maintained throughout the year and greatly facilitated the solution of the raw material supply problems. There was no relaxation of raw material controls, and despite the improved supply position, allocations for civilian uses were not materially improved, especially as a pronounced shortage of manpower required maximum restriction of output in civilian industries. While the control system of the United Kingdom did not require any further strengthening during 1943, the United States Government introduced its "Controlled Materials Plan" (referred to in last year's *Commercial History*) on July 1st, after having subjected it to a preliminary practical test in the second quarter of 1943. This plan, together with the smooth working of the "Production Requirements Plan" (in operation since October 1, 1942) assisted in overcoming the difficulties of raw material distribution in the United States and thus proved of great value to the regulation of all United Nations'

supplies. The policy of price stabilisation was maintained in 1943, both in this country and the United States; no important changes in prices took place. The prolonged controversy over the stabilisation of prices between the United States Government and Congress was in the main confined to foodstuffs and ment and services.

Towards the end of the year future problems, such as production for relief and the readjustment of raw material production after the war, began to attract increased attention. These problems are likely to become issues of primary importance in 1944. One decision of future importance can be recorded, that is the new approach to the problem of international commodity regulation. The international rubber regulation agreement of 1938 terminated on December 31, 1943. In contrast to the other pre-war Government restriction schemes, which had terminated earlier in the war, it has not been extended for a longer period. Four months' grace has been given to the existing Rubber Regulation Committee to form a new Committee on which all Governments interested in rubber or rubber substitutes, whether as producers or consumers, can take part. The new Committee will have no regulatory powers over production and exports, including new plantings; it is expected that it will work out plans for the post-war regulation of rubber in a way which will assure the long-term interests of the rubber producing and consuming industries and will have due regard to the well-being of the inhabitants of the producing areas. The full significance of this move cannot yet be assessed, but it may prove the end of the former methods of commodity restrictions.

## Coal

THE chief difficulties with which the coal-mining industry had to contend in 1943 were a declining manpower and a contracting productivity per shift worked. In the early months of the year—thanks to the recall of ex-miners from the Forces and munition works, the upgrading of underground miners and the transfer of surface workers to underground employment, the option to recruits to choose the mines instead of the Forces, a reduction in the number of workmen leaving the industry through sickness other than silicosis, and an increase in the number of juvenile entrants—the improvement in the supply of labour recorded in 1942 was maintained, and in March the peak figure since 1940 of 714,000 was reached. With the exhaustion, however, of these labour reserves recruitment was steadily overtaken by natural wastage. In the second half of the year the decline was aggravated by the operation of the Pneumokoniosis Compensation Scheme and the autumn influenza epidemic, and notwithstanding the employment of more men at the coal face, the total number of workers on colliery books in the December quarter averaged approximately 702,000, compared with nearly 712,000 in the first three months of the year. It was therefore decided in December to place work in the mines on an equality with service in the armed Forces, and to direct men—chosen by ballot—into the coal industry.

Relatively more serious in their combined effects on production were increased absenteeism, the working of fewer shifts per week, and a further serious reduction in the output per man-shift worked. The official provisional returns for 1943 give a coal-face rate of absenteeism of 15 per cent (6 per cent voluntary and 9 per cent involuntary), compared with 12.81 per cent the previous year and with a pre-war rate of approximately 8 per cent. To this abnormally high rate is chiefly attributable a fall in the weekly average number of shifts worked from 5.33 to 5.13, and a drop in the average output per man-shift worked at the coal face from 57.20 cwt. in 1942 to 56.90 in 1943, compared with 59.60 cwt. in 1939. There was a slight loss of production through wagon shortage and other transport difficulties.

Such was the manpower and productivity background of the industry last year, and it fully explains the fall in the national output from 212.6 million tons (pithead weights) in 1942 to 206.7 million tons in 1943, a loss, however, that was partly compensated by an outcrop production of about 4½ million tons, against 2½ million tons. The commercial disposals in the inland and export trades were approximately 4 per cent less than in 1942, and of the sales, exports accounted for roughly 4 per cent as in the previous year. Essential industries suffered little supply inconvenience, but the maximum allowances for domestic consumption were lower than they have been at any other period since the war, and in November and December were restricted to 6½ cwt. per month in the north and 4 cwt. in the south. The output bonus scheme failed to fulfil expectations, and the Greene Board and the Ministry of Fuel and Power, with the acquiescence of the miners, recommended its replacement by a pit bonus scheme. The owners revived the considerations that had originally led to the adoption of a district instead of a pit scheme, and suggested instead a continuance of the district scheme supplemented by an extra attendance bonus of 2s. 6d. for five shifts and 5s. per week for six shifts.

The only important change in the Government's method of operational control was the combination of pits into groups under a new Production Director for each group appointed by the state, and responsible solely to the Regional Controller, but affecting neither the ownership nor the existing financial structure of the undertakings concerned. This scheme is now in the course of application, and a solution of the manpower problem is being sought through the conscription of youths of military age for service in the mines. There was no alteration in prices other

than that of the 1s. per ton which became operative on January 1, 1943, but the income of the Coal Charges Account fell far short of the financial needs of the industry. On February 1, 1944, there was an average rise of 3s. per ton in the price of coal and of a corresponding increase from 5s. to 8s. per ton in the levy payable by colliery owners into the central pool in order to repay Treasury advances, to provide for the financial effects of the Pneumokoniosis Scheme and the Workmen's Compensation Act, and to secure the owners the credit balances promised by the Government, but which in 1943 fell appreciably short of the standard figure of 1s. 9d. per ton for the industry as a whole.

Apart from minor local variations, wage rates were stationary throughout the year, but earnings per person employed averaged over 19s. per man-shift worked, compared with 11s. 6d. in the first half of 1939; under the pressure of a labour agitation over control and wages, which persisted almost throughout the year and which involved the industry in a loss of approximately 900,000 tons through disputes, juveniles were granted at the beginning of 1944 a weekly minimum wage scale ranging from 38s. 6d. at 14 to 80s. at 20 years of age (underground), and adults a national weekly minimum for underground workers of 100s. and for surface workers of 90s. Overtime rates were raised to a minimum national level of one-and-a-third and week-end rates to double time, and a new agreement secured for all miners 12 days' holiday during the year, including six days with pay based on average earnings in the preceding year. Continued progress in welfare arrangements was made during the year and the expenditure on research greatly increased.

## Oil

INCREASED military demand resulted in a substantial extension in oil production. The United States recorded a new peak output in 1943 of 1,500 million barrels, compared with 1,387 million barrels in 1942 and the previous maximum of 1,402 million barrels attained in 1941. Despite this record rate of production, the oil shortage in the Eastern States of the country continued throughout the year, and since the autumn of 1943 a growing scarcity of supplies made itself felt on the United States Pacific seaboard. As President Roosevelt pointed out in his end-year Lend-Lease Report to Congress, 88 per cent of the country's oil production was absorbed by its war industries and fighting forces. Lend-Lease exports reached 132 million barrels in 1943, while commercial exports totalled 47 million barrels. These total United States overseas shipments of 179 million barrels remained 37 million barrels behind the country's oil exports in 1938.

Outside the United States, production remained well behind the former maximum, mainly owing to tanker shortage. This refers in particular to the Caribbean producing companies. In the Middle East production has again reached—and in some areas exceeded—the pre-war level, but the tanker shortage resulted in such curious steps as the re-pumping of heavier oil products into the oilfields. Russia's production, helped by supplies of equipment from the United States, showed a marked recovery, but no reliable information about production in Axis-controlled areas is available. On the whole, world production in 1943 has probably remained somewhat short of the 1942 record of 2,245 million barrels, but there are prospects of a new world production peak in 1944.

One of the main features of the international oil industry in 1943 was the extension of refining capacity. Such extensions have been carried out in 1943 both in the United States and elsewhere. In particular all Near and Middle Eastern refineries (Abadan, Haifa, Suez and Bahrain) have been enlarged and adjusted to produce oil products of special military importance, such as aviation spirit. These Middle Eastern expansion projects will be continued in 1944 and will include the erection of a large oil refinery in Eastern Arabia. The United States aviation petrol programme made rapid headway in 1943 and by the end of the year was approaching completion. In November it was officially announced that the United States was then producing four times as much 100 octane petrol as in 1942 and that within a few months production would again be doubled.

Apart from the steps designed to increase immediate oil supplies to the highest possible rate, plans were initiated in the autumn of 1943 to develop the Middle Eastern oil resources to the full. The United States Government is supporting this plan by a project for the construction of a 1,250-mile pipe line from the head of the Persian Gulf to the Mediterranean. This move forms part of a wider programme for the fuller development of non-United States oil resources, through which the United States authorities hope to conserve their domestic oil reserves.

Oil and petrol prices in this country remained unchanged throughout the year. In the United States only small price increases in a number of refined oil products were recorded. There has been a determined effort, supported by Mr Harold Ickes, the Petroleum Administrator for War, to obtain the sanction of the Price Administration for an increase in the country's crude oil prices. This, however, was refused.

## Non-Ferrous Metals

THE production effort for non-ferrous metals reached its peak in 1943. Supplies, which were generally short at the beginning of the year, therefore, became more plentiful in the course of the summer, and by the late autumn the supply problems had in the main been solved. Since September, indeed, stocks have

tended to accumulate, except for tin, for which extra-Pacific supplies were only just sufficient to prevent major withdrawals from the United States reserve.

The comparatively easy supply position for non-ferrous metals in the latter part of the year is the more remarkable as consumption for munitions purposes was at a high rate. It appears, indeed, that the production of new metals—except tin—established new all-time maximum in 1943. Present indications suggest that through the wartime expansions the capacity of the world's copper mines has now reached over 2,750,000 metric tons a year, compared with slightly over 2,500,000 tons in 1939. For both lead and zinc the potential annual output now appears to be in excess of 2,000,000 metric tons, an increase of between 20 and 25 per cent on the pre-war figure. With the expansion of mines production, refining facilities have been extended, particularly in zinc, for which important expansion schemes, designed to replace the lost customs refining facilities in Europe, were completed in the early part of 1943. These developments, incidentally, have greatly extended supplies of high-grade zinc, of which there was a shortage before the war, a fact which is likely to assist the development of certain new zinc uses, such as die-casting, to a greater extent.

While the war supply problems for base metals have been solved, the adjustment of post-war supplies attracted much attention in the closing months of 1943. Intensified research into new potential uses is one of the means adopted by the producers of the various metals to solve their post-war problems. As the shortage of manpower does not at the present stage favour large additional releases of base metals for civilian uses, metal production generally may have to be restricted in 1944. As a first step in this direction the British Government has already ordered a cut of 20 to 25 per cent in Rhodesia's copper production, to take effect in stages, from April onwards. Metal prices both in the United States and this country remained unchanged throughout 1943, although the British price for tin was raised by £25 to £300 per ton on January 1, 1944.

**Light Metals.**—Supplies of light metals increased rapidly in 1943. By the early autumn magnesium supplies began to exceed demand and before the end of the year aluminium was produced in excess of requirements. Allied production of magnesium is believed to have reached the rate of about 300,000 metric tons a year—ten times the world output of 1939—while that of aluminium is reported to have reached the annual rate of 2,000,000 tons, that is over three times the last pre-war world figure. In the early weeks of 1944, the first steps were taken in the United States to curtail light metal production, although both aluminium and magnesium are now being used to a considerable extent to replace other metals.

**Steel-Alloy Metals.**—One of the most remarkable achievements in the field of metals in 1943 was the solution of the alloy-steel supply problems. An announcement that the "battle of alloy steels has been won" was made by Mr John T. Whiting, Director of the Steel Division of the US War Production Board, in September. Official figures were subsequently issued in the United States, which showed that large reserves of a number of steel alloying elements, including molybdenum and vanadium, have been accumulated, and that production continued to be well in excess of requirements. Moreover the International Nickel Company of Canada announced that its production had to be curtailed owing to a shortage of miners, which can only mean that nickel supplies are sufficiently large to make special priority allocations of workers to the nickel mines unnecessary. Apart from the larger supplies of steel alloying elements the remarkable increase in the production in alloy steels, which appears to be one of the outstanding features of the war in the field of raw materials, has been due to changes in the composition of alloys, which allowed considerable savings in a number of alloying elements.

## Textile Raw Materials

WHILE world consumption of raw cotton declined from the revised figure of 25,678,000 bales in 1941-42 to 24,799,000 bales in 1942-43, the world crop of the last season, at 26,624,000 bales, showed an increase on the year of 526,000 bales. This improvement in supplies was due to the better United States crop, which, at 12,824,000 bales, was more than 2,000,000 bales in excess of the previous season's crop. Cotton consumption outside the United States—and especially in Europe and the Far East—continued to fall. For the first time since the outbreak of war America's consumption showed a downward trend; it was 10,658,000 bales in 1943, against 11,438,000 bales in 1942. A further slight decline is expected in 1944, as the labour supply position of the United States textile industry has become tight. In this country the activity of the cotton textile industry, and in direct connection therewith, raw cotton consumption, appear to have passed the wartime "low." Stocks of raw cotton throughout the world at the end of the 1942-43 season registered a new peak of 23,586,000 bales, an increase of over 1,000,000 bales on the year. The greater part of the carry-over, however, consisted of lower-grade cotton. Prospects for the 1943-44 crop are more or less unchanged on the year. The current United States crop, according to the preliminary final estimate of December 1st, will be 11,478,000 bales, a decline of 1,346,000 bales on last season's final figure, but this reduction appears to have been made up by increased supplies of "outside growths."

While wool allocations in this country remained limited in 1943, the United States Government removed restrictions on raw wool consumption in November, 1943, after having increased its releases from the beginning of the year. The wool appraisal and clip figures respectively remained high in the 1942-43 season. Australian appraisals were reported at 1,120 million lb., against 1,108 million lb. in the preceding season. In New Zealand sales totalled 331 against 336 million lb. South Africa recorded a decline of 9 million lb. to about 230 million lb., while production of Plate wool—Argentina and Uruguay—advanced from 588 to 638 million lb. Argentina experienced sales difficulties, and heavy stocks had to be carried over into the current season. In the three British wool producing Dominions, the Imperial Wool Buying Scheme continued in operation, and as prices under this scheme were raised by 15 per cent at the beginning of the 1942-43 season, Empire wool cheques have risen substantially. The heavy accumulations of raw wool during this war together with the rapid growth of rayon and staple fibre are causing concern in the wool exporting countries. During the year under review steps to increase the competitive strength of wool were discussed in Australasia and South Africa. One of the main post-war aims of wool producers appears to be intensified research to improve the quality of raw wool and wool products. An Imperial Raw Wool Conference to discuss post-war problems has been suggested by Australia and has found the approval of the other large Empire producing areas. It will probably take place in 1944. Towards the end of the year Dominion wool producers expressed the view that the war-time wool buying scheme should be extended well beyond the end of the war—on the present basis it will lapse after the first post-war season—but it is uncertain whether this proposal will be accepted.

Amongst other textile raw materials, supplies of flax and soft-hemp improved in 1943 owing to greater production in the British Empire and increased supplies from Russia. Hard hemp fibres, too, were available in greater quantities, and steps were taken in 1943 to intensify production still further, especially in East Africa, Mexico and Central America. Owing to the record demand for marine tows and similar essential hard hemp products, however, supplies of sisal and other agave fibres remained inadequate and required strict allocations. The occupation of Southern Italy does not appear to have improved silk supplies last year, as Germany had taken over all Italian supplies before the Allied landings. This year, however, Italian supplies should assist in meeting Allied demands. Free China, too, has enlarged its production. Chinese supplies have been transported by air to India and by road to Russia; at the end of 1943 the Chinese Government was preparing increased shipments following the reopening of the land route via Burma. To prevent the disappearance of valuable silk supplies into civilian channels, the Chinese silk distribution was placed under Government control early in 1943. Mexican silk production still finds itself in an early stage of development, but Brazil has made considerable progress as a silk producer and had a sizeable supply in 1943.

## Rubber

RUBBER remained one of the few raw materials the supply of which caused difficulties in 1943. The reserve of natural rubber, both in the United States and in this country, had fallen to the safety limit by the end of 1943. Ceylon, where slaughter tapping has been introduced at a substantial rate (the planters are compensated by the Government for the damage thus done to their plantations), is believed to have extended its production to about 125,000 tons, against 90,000 tons in 1941. In Africa, too, the collection of rubber has fulfilled expectations, but the development of the Amazon basin rubber resources has so far been disappointing. Brazil's production in 1943 remained slightly below 30,000 tons—against 50,000 tons hoped for at the beginning of the year—and present official expectations for 1944 are no higher than 40,000 tons. On the other hand, the synthetic rubber programme of the United States has made much headway in 1943, and in the last quarter of the year 124,219 long tons of the various types of synthetic rubber were produced, raising the year's total to over 200,000 tons. All plants now under construction are expected to reach their production stage by March, 1944. The total capacity of these works together with those already in operation is 850,000 long tons a year, sufficient to meet all requirements. Synthetic rubber is now also produced in Canada, and in this country a project to produce synthetic rubber on a limited scale was initiated by British Celanese, Limited, in the closing months of the year. According to official sources, synthetic rubber cannot replace crude rubber to more than 70 to 75 per cent, so that the main problem remains the supply of crude rubber. In tyre manufacture supplies of high-tenacity rayon cords appear to constitute an additional bottle-neck, which by the end of the year was being vigorously tackled. At the beginning of the year the Combined Raw Materials Board formed a special Combined Rubber Committee to facilitate the solution of rubber supplies, both natural and synthetic. In November a similar Combined Committee was formed for rubber tyres. The international rubber regulation agreement of 1938 terminated at the end of 1943.

## Manufactures

THE output of civilian goods remained at its prescribed wartime minimum, standardised where possible and concentrated in a reduced number of firms—the nucleus firms. The production of many durable goods, such as motor-cars and houses, remained suspended. Utility furniture was made in limited volume, but in the main the public had to make the best of pre-war supplies of durable goods. The production of war stores as a whole was further expanded. Some statistics that have been released show the magnitude of production from the beginning of the war to the end of 1943. Army equipment includes 83,000 tanks, armoured cars and carriers; more than 115,000 guns of calibres exceeding 20 mm.; nearly  $\frac{5}{8}$  million machine guns, rifles, sub-machine guns and automatic pistols; more than 1,000,000 wheeled vehicles of unarmoured types. Air Force equipment includes some 90,000 aircraft of all types, mainly combat types. A large proportion of production consisted of heavy bombers—one heavy bomber is equivalent in man-hours to four fighters and 40 primary trainers. In 1943 British factories provided three-quarters of the total structure weight of new aircraft delivered to the Royal Air Force and the Fleet Air Arm. Figures of naval construction have not yet been released, but output has been substantial. Some 70 per cent of the total "effort" in new construction has been concentrated on naval work; at the end of 1943 naval strength in most types of vessels was greater than it was at the beginning of the war. Neither the statistics nor the space is available for a comprehensive record of industrial production; a few industries have been selected for brief reference.

### Iron and Steel

CRUDE steel production was maintained at a high level, though statistics of ingot output have not been published. Raw material supplies—mainly coal, ore and scrap—though not plentiful, were adequate for meeting essential crude steel requirements.

The adjustment in the munitions production programme involved consequential adjustments in the manufacture of steel products, calling for a high degree of flexibility. In particular, there was a heavy demand for special steels. On the whole, production was successfully kept in line with changing needs, and there appear to have been no major difficulties.

The scheme for the allocation of steel supplies to the different purposes has worked smoothly; it has ensured supplies for essential needs and assisted in avoiding bottlenecks and waste in the steel-using industries.

The general level of iron and steel prices has again remained unchanged, though wages and raw material prices continued to advance. The scheme whereby high-cost producers whose plant is needed in wartime are subsidised from a general levy on ingot production has remained in force.

It is not known to what extent the rise in wages and raw material prices has been compensated by economies. The industry as a whole has been by no means unprofitable; but there will be a need for heavy replacements and modernisation of plant after the war.

### Shipping and Shipbuilding

THE two outstanding features of the past year were the marked reduction in shipping losses and the massive volume of construction in North America and the United Kingdom. The volume of new construction has steadily exceeded losses in both merchant and naval vessels; merchant and naval tonnages have been mounting. In other words, the renewed attack last year on the communications of the United Nations was decisively defeated and they were able to mass and concentrate their striking power.

The United Kingdom's share in the defeat of the enemy's attempt at cutting or interrupting the communications of the United Nations was a large one. Some 70 per cent of its total effort in new construction was devoted to naval vessels. Although the British output of merchant tonnage was by no means negligible, the task of providing the many millions of tons of standardised merchant ships fell mainly to the United States. The shipbuilding effort of the United Nations has been essentially a joint effort.

The losses of the past 4½ years have seriously reduced the volume of British-owned merchant shipping tonnage, but the United Kingdom's naval strength at the end of 1943 was greater than before the war in most types of vessels. Although British shipyards have concentrated mainly on specialised naval construction, there has been much technical progress and improvement in the building of merchant ships, as a result of the extension of welding, for example.

### Cotton Textiles

DURING 1943 increasing quantities of cotton yarn and piece-goods were required for the Forces, the Allies, and the home services. The war emergency scheme for the production and distribution of goods was tightened, and there was less output for private deals.

No important changes occurred in the regulations of the

Cotton Control and the Cotton Board for securing adequate quantities of goods to be sent to the right quarters. Adjustments of one kind and another had to be made, but the original scheme was generally maintained.

The Planning Department at the Control Office continued to operate; although some changes have had to be made from time to time, owing to unforeseen difficulties, the system worked satisfactorily.

There was a tendency for more difficulties to be experienced in carrying on commercial export trade. Partly owing to the fall in production, a fresh survey had to be made toward the end of the summer, and it was then decided by the Board of Trade not to issue any export allocations for the fourth quarter of the year.

The concentration of production scheme was maintained. It is reported that the Controller gave permission for a few of the closed spinning and weaving mills to be restarted, but on the whole the output of yarn and cloth was only about 60 per cent of capacity.

The most serious problem in the industry was the labour shortage. Managers of mills found that when operatives left for one reason or another it was virtually impossible to replace them. New entrants into the industry were few in number. Even nucleus firms found it impossible to run at full capacity. In December the operatives in both spinning and weaving branches secured a further advance in wages, the agreement with the employers providing for an increase of 4s. a week for adult occupations and 2s. a week for juvenile occupations. Since the outbreak of war in September, 1939, all cotton operatives have received wages advances amounting to 35 per cent on list rates, and also flat rate increases of 9s. a week for adults and 5s. for juveniles, and it is estimated that average earnings are about 70 per cent above pre-war.

Owing to the rise in wages, yarn and cloth margins were increased in February and again in December. Throughout the year, however, there was virtually no rise in the price of goods, as in February there was a reduction of 1d. per lb. in the price of raw cotton in order to prevent any general advance in rates for manufactured goods.

Exports of cloth in 1943 amounted to 374,323,000 square yards, against 484,230,000 square yards in 1942; in 1939 they totalled 1,393,038,000 square yards. Shipments of yarn in 1943 were 19,196,000 lb, compared with 18,738,000 lb in 1942, and 113,604,000 lb in 1939.

The report and recommendations of the Cotton Board Committee, appointed to inquire into post-war problems, caused some controversy. The document deals with the organisation of the post-war industry, the size of the industry, problems of excess capacity, raw cotton, plant and equipment, labour force, research, de-concentration, taxation, price management and distribution of goods. The outstanding feature of the proposals is the emphasis which is laid upon the need for price management. The recommendations are now being considered by the Board of Trade.

Trading results of cotton firms for 1943 showed that the average profit of 62 spinning mills was £7,959 per company, compared with an average of £8,078 for 65 companies in 1942. The average dividend of 102 spinning mills was 10.68 per cent, against 10.22 per cent in 1942.

### Wool Textiles

DURING 1943 production on Government account, at first well maintained, began to fall; other output was little changed, but exports were further restricted.

The wool supply position was good, but while a large stock of Australian wool continued to be maintained in the United States, imports to this country remained restricted. During the wool year ending June, 1943, the Australian clip was 3,591,457 bales, compared with 3,656,013 in the previous season, whilst New Zealand's was 962,359 bales, against 985,812. The United States stock of foreign wool, according to an American source, is 330 million lb., mostly fine greasy Australian; in addition there are 460 million lb. of home-grown wool in the hands of dealers, and 130 million in the hands of the Commodity Credit Corporation. Great Britain's stock of wool in the United States is 525 million lb. It is estimated that if the war ends this year the British Government will own anything from seven to eight million bales of wool.

The Government's issue prices for wool have been unchanged in the home trade since September, 1940, and for export since July 1, 1942. The great majority of mill men regard these steady prices as an unmixed blessing. The export issue price is based on the actual cost of the wool; the maintenance of the home issue price involves a payment of one of the Government's minor subsidies.

Margins for spinning and weaving have been fixed by one of the most comprehensive experiments in price control—the Wool Yarn and Wool Cloth (Maximum Prices and Charges) Order, 1943. Medium and low quality crossbred yarns rose by about 1d. a lb. during the year, fine crossbred by 3d. to 5d., and merino by 5d. to 7d. for home civilian trade.

The wool textile industry's labour force has been further

depleted by transfers to munition factories and the forces. A high proportion of the remaining labour is immobile and advanced in age. The mills engaged on apparel are running at half capacity, while the carpet industry throughout the year operated at not more than ten per cent capacity. On the apparel side the purchase of cloth and clothing for UNRRA has replaced direct khaki and Air Force orders with some manufacturers but is still of small proportions.

There has been no new development in the rationing of raw materials to mills except that shoddy and woollen wastes came under ration in January, 1943. The effect has been to maintain stocks of rags and shoddies which were rapidly becoming scarce owing to the cessation of imports, clothes rationing and lack of labour to collect them.

### Rayon

PRICES of rayon yarn remained stable throughout the year, apart from minor increases in yarn of staple fibre to cover increased costs in the spinning trade. It is unlikely that these increases actually compensated the makers for the full increase in labour costs, and in effect it would appear that compensating reductions in other costs are made as the use of staple fibre becomes more general. The increases generally in rayon costs compare favour-

ably with increases in other textiles and, as subsidies have been freely granted in the case of cotton, the relative price position has moved in favour of rayon, a state of affairs which will reveal its importance after the close of hostilities. During the past year the demand for rayon has exceeded supply, but strict control at all points has avoided bottlenecks. The allocation of rayon through the Rayon Allocation Office has been one of the most successful elements of control. The demand for certain of the cheaper utility fabrics and lower-grade hose was less than estimated. A rearrangement of the utility specifications and the transfer of some of the surplus low-grade goods to "relief exports" eased this position. A better utility stocking is now on the home market. The outstanding feature of the year was the setting up of the British Rayon Federation, representing all sections from producers to merchants. The main work of the Federation still lies ahead; the programme outlined by the President, Mr Samuel Courtauld, offers hope that rayon will be able to provide not only for its own future but for many developments in conjunction with the older textiles. Export trade has been continued under strict control and at a higher level than in pre-war years. The general world shortage of rayon has increased. The industry has continued to provide for the Services, and has made particular progress in tyre fabrics. Experimental work has proceeded on post-war developments on a limited scale.

## Retail Trade

THE year 1943 may be described as a period of consolidation of earlier measures for control of production for the home market, and no major development (except that distribution of utility furniture began in January) took place. Retail turnover was lower in 1942 than in 1943. Turnover in non-food merchandise was lower in every month in 1943 compared with 1942, except in September, when a new issue of clothing coupons became valid. Sales of food and perishables varied more from month to month. The table shows the percentage changes in 1943 from 1942 in the various departments, and by districts. In the fancy, sports and travel and miscellaneous departments, stocks declined substantially during the year, so that it can be assumed that rising prices (partly accounted for by the raising of purchase tax in the Budget to 100 per cent on some luxury goods) were responsible for the higher turnover. Shortage of supplies did not press as heavily on retail trade as was expected, although pre-war stocks in most departments were virtually exhausted and the "cushion" of stocks had disappeared. Numbers of stores began to buy and re-sell second-hand goods in most of the unrationed categories. Perhaps the greatest problem encountered by traders was the call-up of assistants and the difficulties in replacing them. At the end of 1942 the reservation age for women was fixed at 45, with an upper limit of 35 in the more essential branches such as clothing. In the autumn of 1943 reservation by age was removed. The employment of inexperienced assistants has led to a noticeable, although perhaps inevitable, deterioration in the standard of salesmanship.

The clothing ration continued at the level of four coupons per month throughout the year, and extra coupons were granted to children and manual workers as before. The "industrial ten" was extended to cover a further three-quarters of a million workers, bringing the total eligible for the 1943-44 ration period to over 13 million.

The tendency to demand quality for coupons was marked, and it led in September to the down-pointing of certain low-quality grades of utility clothing, the demand for which was small. About seven to eight per cent of utility clothing was affected. Shoes were in short supply, and their rationing was raised on August 15th from five to seven coupons for women's and seven to nine coupons for men's shoes. About 20 per cent of women's shoes were made with wooden soles, and ten per cent of men's; and some cheaper shoes remain at the lower pointing.

There were other small changes in coupon values: men's socks were reduced from three to two coupons, and women's seamless (now 80 per cent of production) from two to one and a half coupons; women's pyjamas were reduced by a coupon; woollen jumpers weighing less than 10 oz. to six coupons. Utility clothing continued to amount to 100 per cent of production; increasing supplies in the shops in the clothing component of the cost of living index between January 1, 1943, and January 1, 1944, from 134.5. The drop enabled the price of tea and sugar to fall without a rise in the total index.

The Board of Trade began in January to compile its register of retail traders; and by the end of February, 1944, 11,000 names. Those eligible for inclusion must be in business for a minimum period, and must have been so during the war. In December, the President of the Board announced that it was intended to continue the licensing of shop premises in the post-war period. He said that some increase in numbers would be desirable and that preference would be given to ex-shopkeepers on war service and to disabled persons.

The concentration of clothing production, which began in July, 1942, was virtually complete, except for London, by the end of 1943. The aim of the scheme was to release 20 to 25 per cent of the labour force. No general compensation fund was established, and financial arrangements were left to the firms concerned.

From December 1, 1942, only utility furniture was permitted to be manufactured, and on January 1, 1943, the allocation of permits to buy it was begun. In January 7,000 permits were granted, and in February 11,500; no figures are available for the rest of the year. In April two new classes of persons were added to those eligible for permits. In addition to couples married after January 1, 1941, and bombed-out families, couples with children setting up home for the first time, and those rehoused by local authorities became eligible. The demand outstripped supply and the granting of permits was suspended on July 20th. When allocation was resumed on September 1st, the maximum

AVERAGE DAILY VALUE OF RETAIL SALES AND STOCKS IN GREAT BRITAIN COMPARED WITH A YEAR AGO

number of units for each couple was halved, but extra units were granted for each additional member of the family. Some reduction in the number of units required for individual pieces of furniture was made at the same time. More firms were designated throughout the year, and there were 170 at the end of 1943, employing a labour force which was probably in the region of 7,000.

In December, an Act was passed which gave the President of the Board of Trade power to issue general licences to traders enabling them to discriminate between customers in the sale of specified goods. This measure is designed to limit the sale of certain goods in short supply to those who need them most. The first licence came into force on January 7, 1944, and the list includes a number of items on which sales limitations had previously been placed. The weakness of the Act is that it puts the power of discrimination into the hands of traders, itself an undesirable thing, but it does not compel them to exercise their power.

Shortages were most felt in household linens, particularly sheets, and in domestic utensils, but on the whole supplies of civilian goods for the home market exceeded earlier expectations for the fourth year of war.
